Eschewing my parents offer of music lessons in early adolescence and settling thereafter for intermittently enjoying 'the noise it makes', I only came alive when a trip to New Orleans was on the cards and I bought a handful of jazz cassettes (yes, it was 30+ years ago). I discovered not only pre-eminent players like Louis Armstrong and his 'Hot Fives', but also the Creole-like mix of blues and jazz in all its pre-modern guises. As for the visit itself, I fell in love with this African-cum-European outpost in southern USA. I was totally unprepared for a city that oozed its own musicality. There were plenty of jazz venues, including the legendary Preservation Hall and the dives of Bourbon Street. But there were ubiquitous jamming sessions: tram drivers would carry their instruments at their sides, primed and ready for opportunities to play. I collected more cassettes, Jelly Roll Morton in the brothels of North-of-French-Quarter 'Storyville', following Armstrong's shift to King Oliver's band in Chicago, and encompassing the distinctive styles, post-traditional as well as pre-modern, to be found in other US cities. I liked much of what I was hearing. Over time sax players drifted to the top of my list of favourites, but then there was Bix and Miles and, uniquely, Billy Holiday, whose voice came hard and straight out of her disjointed lifeworld.

I like what I like, which is quite a lot of jazz (although I draw my lines, often at 'white' West Coast efforts). But – an occupational hazard this – I began to ask sociological-type questions. I was aware of Howard Becker’s
shrewd, semi-autobiographical and seminal essays, but my interests were different. I rapidly came to see (blues-based) jazz as ‘black music’. I felt almost affronted listening to ‘white’ performances or recordings. But what did this mean? How can music be black or white? And, a query beyond, how can music communicate? And within what parameters? A side-issue: how come musicians like my all-time hero Charlie Parker could improvise sublimely while out of his socks on heroin?

In this blog I suggest an answer or two to these questions, and I do so – with cool if risky abandon – without consulting the views of others, musicians or fellow-academics. In other words, I am on a learning curve and inviting feedback and dissent.

Here are a number of hypotheses up for grabs and ‘testing’:

**AGENCY IS STRUCTURED, AND JAZZ PERFORMANCE TRACKS THE INDIVIDUAL ‘SOUL’ AS IT EMERGES, EVEN OCCASIONALLY ESCAPES, FROM ITS SOCIAL HINTERLAND**

This may need a comment or two of elucidation. The notion that agency is structured merely recognizes that we are all in part products of our social circumstances (as well as of our genes, psychological makeup and so on). Class, gender, ethnicity and the like demonstrably matter for who we are, who we become and the decisions we take day-to-day; which is not to say that we are lacking in free will, merely that we use it more sparingly than we think. For the jazz player, this translates as structural and cultural conditioning, contingency or happenstance (what cops up), plus a potential to differ, to improvise. We are what we do and not what we say we are; and, as Sartre spelled out, we must and do ‘take decisions’, in the process turning our back on all the alternative decisions we might have taken. Maybe this is the social source, the tap root, of the blackness of jazz. For the best part of a century, and most conspicuously in the American south, black musicians translated their lived-experience into ‘their sounds’. In doing so they drew upon an oral tradition. Classical music’s roots lie in written scores (open to interpretation of course); not those of blues and jazz. The voice of jazz, to me at least, remains obstinately and importantly black in this sense.

**JAZZ IS A POLITICAL STATEMENT AGAINST RACISM**

Marxist historian Eric Hobsbaum, faking an identity, tracked jazz to its black and radical basics: it has always been associated with leftwing politics and rebellion as well as beards and sandals. The southern states of the USA remained resolutely racist until, and in many ways through, the civil rights protests of the 1960s. Billy Holiday and her black consociates had grown used to entering and exiting venues by their own ‘back door’. In the postwar era of bebop, black musicians fought back in ways they may or may not have been able to articulate if challenged. Not only were blues and jazz their music; but they consciously performed solos no white counterpart could cope with. Nor did they need a political manifesto to do so. Listen to Parker’s ‘Ornithology’, high on drugs or not; and then Coltrane; and ultimately, I guess, Ornette Coleman’s free jazz. And who could miss out Miles Davis (as competent at reinventing himself as David Bowie in quite another genre, even onto the electronic scene)? Musicians, to my mind, made (and continue to make) statements, sometimes reflexively, sometimes not: and no black citizen of the USA, Britain or other Occidental countries past and present has not experienced racism as a personal or family affront and grown angry in consequence.

**MUSIC COMMUNICATES, BUT MOSTLY VIA CONVENTION AND IN CONTEXT**

Holst’s planet suite sets parameters. Mars seems invites thoughts of war. It is readily reminiscent of bagpipes soliciting red-bloodied aggression prior to battle. There is surely something we might call, in shorthand, ‘biological’ here? Certain music stirs the blood, which is why it has been put to military use. If it falls short of commanding combat, it facilitates an appropriate mindset. But how much of this is in us? And how much is a product of convention and context? No music, or for that matter statement, is or could be interpreted in a social vacuum. I tend to think that when black jazz players strutted their stuff – style-by-style – in New Orleans, Chicago and New York, even as
visitors to overseas, they not only transmitted certain messages deliberately, but even despite themselves. You can hear the angry rebuff of racist rejection or patronage, but only, or at least more acutely, if you have learned to do so.

**DRUGS DISINHIBIT**

Drugs from soft to hard *disinhibit*. They release performers. I suspect improvisers are more readily released than interpreters of inscribed scores. Listen to Grappelli ‘versus’ Menuhin (and the former was ‘clean’ as far as I know). So maybe drugs clear the way for the statements jazz players may or may not be aware they are depositing in the public sphere.

**THE CAPACITY OF JAZZ TO MOTIVATE ‘COLLECTIVE ACTION’ IS DEPENDANT ON STRUCTURE, STRUCTURED CULTURE AND AGENCY AND THE MOMENT**

Catch the moment! Music can favour fascism as well as visions and commitments to a ‘better society’, ask Wagner. But when structure in its manifold guises, the coming together of convention, context and an opportunistic ‘taking advantage of the moment’ coincide, well …

Any interventions to help me out here would be greatly appreciated.

Sam Watts (2013-09-03 12:29:18)

Hi Graham, I am a professional jazz musician and as such feel qualified to respond to your post in an engaging way based on my own experiences and knowledge of jazz. The first thing I would say is that this idea of jazz as "black" or "white" music or even of jazz being divided into those respective camps is an idea that exists outside the jazz community a lot more than it does within it. Only a very small number of practising jazz musicians hold any views of this kind and in my experience are usually ostracized for these views. I think this has historically been the case too. Throughout history jazz musicians have always been pioneers in breaking racial barriers and there are countless examples of mixed race groups playing together despite the social environment of the time. People often cite bebop musicians as sort of “black warriors” who made their music too complicated so that the white people couldn’t play it. I am perhaps missing your point but you did say: "Not only were blues and jazz their music; but they consciously performed solos no white counterpart could cope with." I think that these musicians did not have any kind of racial ideology behind their solos and the notion that no white counterpart could cope with them is in my opinion completely absurd. Throughout the history of jazz people like Parker are sometimes viewed as being against white people in their musical statements and any new developments in jazz are often mis-labelled as movements of black separation. But all of the black musicians cited in this way frequently collaborated with white musicians in these very endeavours and I have not really heard many statements from them about race being a factor. For a few examples: - Buddy rich (white) was one of Charlie Parker’s favourite drummers. - The Ornette Coleman album "this is our music" (often wrongly cited as a statement about race) features white bassist Charlie Haden. - free jazz pioneer Albert Ayler (another movement which is frequently falsely cited as being black-separatist) frequently performed and recorded with white bassist Gary Peacock - Billie Holiday collaborated and toured with Artie Shaw There are countless other examples of this. While I am not denying that jazz developed in an
atmosphere of racial oppression or that jazz is capable of statements about race, to say that jazz is about race is I think incorrect and also takes away from the higher meaning of jazz which is often love and personal expression. I am also not saying at all that black musicians haven't been persecuted and that there has never been any racial tension around jazz. But this idea that musicians are in anyway racially divided is simply not true in my experience and I think you will find that actual jazz musicians have always been very open to all different racial and cultural backgrounds on the whole. It's easy to forget as a listener that when you listen to Charlie Parker or Billie Holiday or anyone who is playing jazz standards that a lot of the tunes they choose to play were written by white composers like Gershwin, Cole Porter, Hoagy Carmichael, and Rodgers and Hart. These composers are probably responsible for writing around 60-70% of what are now considered among musicians to be "jazz standards". I think this shows pretty clearly that black jazz musicians haven't generally been particularly interested in any kind of separation from white musicians and that the music they make isn't a statement about that. I believe that it is instead about expressing themselves as individuals and also simply about playing something that communicates emotionally with the listener and makes them feel as though they relate, rather than any kind of political idea. Again in my experience with other musicians this is what we talk about much more than any kind of political message in the music. The political ideas are often attached to the music more by outsiders like critics and historians. I would also challenge your statement about not enjoying white performances as much as black ones. I can 100% guarantee you that I could give you a "blindfold test", where I play you recordings without telling you who the artist is, and that you would be unable to sort the white from the black performances. I hope that didn't sound too aggressive but I really wanted to make it clear that this idea is not one that is prevalent within the jazz community itself!

R. E. "Music Communicates" - I completely agree that music communicates! (well, good music anyway...) I think the beauty of music is that it communicates in an abstract way. Music cannot definitely be about something (lyrics are a different matter, but if we are just discussing music as sound - jazz is often instrumental music anyway). The intention of the artist can be to be about something and the idea behind a piece can definitely be a concrete thing, but music heard on its own without any context of why the composer has written it or what their message is can be interpreted differently by every listener. We all have particular pieces of music that are associated with a person or a place or a particular time in our lives, and that meaning is completely personal and has nothing to do with the artist's original intention. There is a wonderful quote from John Coltrane relating to this: "I never even thought about whether or not they understand what I'm doing... the emotional reaction is all that matters as long as there's some feeling of communication, it isn't necessary that it be understood." The idea that drugs disinhibit is an interesting one, but one that I think is misunderstood from the outside. Unless you really understand the mental process of improvisation it is quite confusing I think to see how it can happen. I personally never use drugs so I am also probably unqualified to talk about it completely clearly, but my thoughts are that when you learn to improvise to a high level, even just the act of improvising becomes something that doesn't require as much concentration. To clarify, this is different to saying that the musician just uses muscle memory of patterns of hand movements to achieve something that sounds fairly improvised, but that they are still actually improvising. For example if you are highly intoxicated in some way, you often still retain some basic faculties like speech, even if it is impaired slightly, you are still often able to speak and to maintain some sort of thought process of reacting to what people are saying around you, as well as muscular control of the voice to speak. I think that musicians like Parker would have reached a similar relationship with music and their instrument through hours and hours of practice, where it gets to the point where improvising fluently is as easy as something like speaking and that there isn't really much mental calculation that needs to happen consciously in order for him to play, in the same way that the complex movements of the voice box during speech don't have to be consciously calculated as you talk. Maybe that is a bit far-fetched, but it is a thought that I had about the topic. Anyway I hope that is of interest to you and I'd love to hear your thoughts on it :)

Catherine Pope (2013-09-04 09:06:50)
Cool blog! (I think that's the jazz vernacular) When I was studying surgery as performance I also liked Bourdieu's practice in the moment idea (used by Stephen Turner also) which applied well to Jazz. And of course Sennett riffs on similar theme in his book on craft. Anyhow thanks for another provoking blog post and the injection of some more theoretical thinking into my day.

Aidan Kelly (2013-09-09 11:05:30)
1. The sociology of jazz is enhanced by making links between the social context and the major periods of innovation and musical development in jazz. We could look at four periods (a) the emergence of jazz and the dominance of Louis Armstrong (b) consolidation in big band era (c) radical innovation in post wW2 USA (d) early 1960s modality and free-form. 2. These are
times when social events (like the end of Civil War and thus widespread availability of instruments) conjoined with collective and individual artistry - for virtuosity and expressiveness are political statements challenging dominant white views of black people - as in the case of the boxer Jack Johnson (see Ken Burns DVD Unforgivable Blackness). Armstrong wanted to remain 'in front of the people' and this compromised some of his output, but his outstanding solos were never really challenged by any other musician of his period (Bechet might not agree!) and were undeniable creative giant strides. See Andrei Hodier Jazz its evolution and its essence for an analysis of West End Blues. 3. The middle period of the economic depression is characterised by the contrast between the regimented white big bands (see Adorno's hopelessly limited analysis of jazz) and the expressive freedom of the Basie Band and Lester Young - no set written down arrangements. Lester's wonderful solo on Lady Be Good summarises this in his first recording session! I recently heard this solo played note for note by a professional jazz musician in a UK pub. Parker recognised the power of this solo and played it in double time as a warm up routine! 4. The post-war upheavals reflected the social contradiction of separate black regiments fighting for human rights and freedom in Europe and Asia-Pacific and underlined the new self confidence of Bebop (although routinised in Films such as 'The Best years of their Lives'). The harmonic revolution created something of a distance between artist and audience - jazz became a thing in itself - music for musicians to some extent - like most high culture is became somewhat exclusive - Armstrong got mixed up with the opposition. Jazz had moved and developed at an outstanding rate of change compared with classical music. 5. The emergence of movements linked to civil rights (and their more radical alternatives - e.g. back to Africa) coincided in a further extension of artistic sensibility in the music of Miles Davies with at the same time the development of greater freedom from chord sequences (shift to modes) and abandonment of chord structures entirely (as in the career of Coltrane from 1963 onwards). There are then lots of subtleties to be brought out in a deeper analysis of such links between the social and the musical development of jazz. Politics is involved in a much more sophisticated way than comparing the outputs of black and white musicians, or in the crude analysis of writers like Kofsky.

JAZZ IS A DISTINCTIVE ELEMENT OF AMERICAN CULTURE AT LEAST AT A SUPERFICIAL LEVEL. DURING COLD WAR JAZZ HAD VERY LIMITED ENTRY THROUGH THE IRON CURTAIN BECAUSE THE DOGMATIC COMMUNISTS FEEL THAT IT WAS A SELF INDULGENT LIGHTWEIGHT DISTRACTION OF MARKETED CULTURE. TOO UNFORTUNATE FOR A MUSIC WHICH HAD STRONG PROLETARIAN ROOTS. I AM SAYAN BISWAS AN INDIAN FAR AWAY FROM THE EPICENTRE OF THIS MUSIC.BUT THIS MUSIC TOTALLY UNCONNECTED WITH MY CULTURAL AMBIENCE HAS THRILLED ME WITH ITS MYSTERIOUS QUALITIES. TO ME JAZZ IS THE PROFOUND MUSIC DEALING WITH EVERYDAY RHYTHMS OF LIFE.IT HAS SIMILARITIES WITH THE SLAPSTICK TRADITION OF HOLLYWOOD AND AMERICAN VAUDEVILLE.I AM NEITHER A SOCIOLOGIST NOR A JAZZ MUSICIAN .PLEASE RECTIFY THESE PERCEIVED IDEAS FROM A NAIVE HOBBYIST.

per (2016-12-20 19:44:24)
sounds right to me, but i will say that jazz's similarities to slapstick are pretty superficial. Slapstick Comedy and Jazz share very little in common besides that they may have been seen alongside each other in our culture for a time.

BSA Gender Study Group CfP Gender and Quality of Life (2013-09-01 08:00)

Gender and Quality of Life
BSA Gender Study Group One Day Conference:
Friday 17th January 2014, University of Lincoln, UK
Keynote TBC

What constitutes a good life has captured the minds of thinkers across time and cultures. In Aristotle's terminology, eudaimonia, people were called upon to realize their full potential in order to achieve a "good life." Kant's approach was to understand the good life through rational thought. Others have seen the good life in terms of utility of resources and economics and individual desires, whilst some have sought to understand quality of life through affect and experience. The contemporary focus on quality of life is often conceptualized as social indicators, such as longevity, crime or human rights policies or through the measurement of medical and health outcomes. These diverse approaches perhaps are most consistently found in the health and social care tools that measure disease specific quality of life outcomes. Gender and feminist accounts have hardly scratched the surface on this contested ground. Whilst gender differences are understood as providing indicators about the variations in quality of life evaluations, gender and feminist work has rarely considered the 'who,' 'what' 'how' and 'why' in quality of life debates. For instance, who are selected in the evaluation process, what theoretical concepts are used and how are quality of life tools constructed, how do they work, why are these tools used and for whose benefit? How do we assess individuals' and groups' perceptions of their positions in life in the context of wider culture and value systems in which people live and in relation to their goals, expectations, social standards and political concerns? How can we combine these conceptual, philosophical and methodological differences to understand a comprehensive view of gender and quality of life. This to some extent returns us somewhat to more philosophical questions and tempts us to broaden the scope of quality of life evaluations, which encompasses broader socio-cultural and psychosocial factors that may affect someone's evaluation of what quality of life means.

This conference will examine issues in relation to gender and quality of life: How do current feminisms speak to quality of life issues? How do grass roots gender and feminist politics respond to quality of life concerns? How can feminism constructively interact with quality of life debates? How are local and global systems implicated in our fascination to evaluate quality of life outcomes? What are the similarities and differences - the unifying and dividing features - of national and international quality of life themes? How does culture contribute to the debates about quality of life? How can feminist and gender scholarship account for embodied diversities in relation to quality of life? How does feminism contribute to the debates on quality of life themes in the 21st Century?

We seek papers that will address themes concerning (but not limited to):
Sites of activism Political agendas and political and healthcare economies
Feminisms at local, global, spaces and places
Intersections of class, race, ethnicity, faith, age, gender, sexuality and embodiment
Leisure and work
Agency and affect
Methodological and analytical inclusions and exclusions
Trans* and Queer Feminisms
Representation, media and new technologies

Dear Guilt-Ridden #PhD Students: Structure your procrastination and turn a vice into a virtue (2013-09-01 08:00)

For years I’ve tended to chronically over-commit myself in all areas of life. I find it difficult to say ‘no’ if I encounter an interesting opportunity or have an interesting idea. However I periodically get quite exhausted and have brief phases of dropping projects left right and centre. Clearing up the free time is an unfallingly disappointing experience however... it doesn’t help me focus on the things I’d identified as ‘priorities’ and I get bored very easily. This is exactly what the idea of ‘structured procrastination’ argues would happen in such circumstances and given how useful I’ve found it, I’d suggest anyone who shares my twin problems of procrastination and over-commitment should read this astonishing and insightful essay:

Structured procrastination means shaping the structure of the tasks one has to do in a way that exploits this fact. The list of tasks one has in mind will be ordered by importance. Tasks that seem most urgent and important are on top. But there are also worthwhile tasks to perform lower down on the list. Doing these tasks becomes a way of not doing the things higher up on the list. With this sort of appropriate task structure, the procrastinator becomes a useful citizen. Indeed, the procrastinator can even acquire, as I have, a reputation for getting a lot done. […]

Procrastinators often follow exactly the wrong tack. They try to minimize their commitments, assuming that if they have only a few things to do, they will quit procrastinating and get them done. But this goes contrary to the basic nature of the procrastinator and destroys his most important source of motivation. The few tasks on his list will be by definition the most important, and the only way to avoid doing them will be to do nothing. This is a way to become a couch potato, not an effective human being.

At this point you may be asking, “How about the important tasks at the top of the list, that one never does?” Admittedly, there is a potential problem here.

The trick is to pick the right sorts of projects for the top of the list. The ideal sorts of things have two characteristics, First, they seem to have clear deadlines (but really don’t). Second, they seem awfully important (but really aren’t). Luckily, life abounds with such tasks. In universities the vast majority of tasks fall into this category, and I’m sure the same is true for most other large institutions.

BSA Annual Conference 2013 Plenary - Polly Toynbee, Guardian columnist (2013-09-01 12:00)

Howard Becker’s 23 Thoughts About Youth (2013-09-02 08:00)

[youtube=http://www.youtube.com/watch?v=3bJBRYLhhEE &w=420 &h=315]

This interesting little post on Howard Becker’s site is worth a quick read for anyone interested in youth studies and/or Becker’s work. HT Kip Jones for the video of Becker playing at an ASA conference.
Everyone (at least everyone above a certain age) knows—it is no more than common sense—that, in every historical era, “youth” cause all, or certainly most, of the troubles of the world. They have no respect for tradition or authority, they do things which harm them physically and, especially, mentally: alcohol and drugs, but also (depending on the era) spending too much time at the movies, watching television, or playing computer games. They take too many chances. They aren’t prudent. They are always a major pain in the ass and it is because of them that our country and the whole world are going to hell. [...]

Young people usually get blamed for society’s troubles. (Said it before, I’ll say it again. Can’t say it too often.) Students don’t work hard enough. That’s why they don’t learn what they should. Yes? Maybe not. Maybe teachers and schools don’t teach properly. Maybe that’s why students don’t learn what someone wants them to.

* * *

Try that out in some area you know about. I did, with this result. Older jazz players complain that younger players “don’t know any tunes,” that is, the tunes the older players grew up playing and regard as the minimal repertoire a literate player must have. It’s true, the younger players often don’t know all those songs, and that makes trouble when a hastily assembled musical group has to perform without rehearsal.

* * *

Older players, however, don’t know the more complex compositions younger players grow up on. But, since older players have more control over employment and performance opportunities, this makes less trouble for collective performances. The older players needn’t know the newer compositions. They can just say “No, we won’t play that.”

* * *

Symmetry: Both groups “don’t know any tunes,” so you can’t use that observation as a “fact” that explains what’s wrong with younger players and why the music business is going to hell.

* * *

Symmetry pays off in a better understanding of the situation, which is good whether you are a sociologist trying to understand social organization, a musicologist trying to understand the development of a musical genre, or a jazz player trying to get along in the world of contemporary jazz.

* * *

“Youth” is a relational term. It doesn’t describe a stable characteristic of someone or some group. It tells
you where that person or group stands in relation to some other people or some other group. “Youth” are older than “teenagers” but younger than “adults.” That’s a possible meaning. But this innocuous relational description carries other, less innocent, less symmetrical, and less neutral overtones we should be wary of.

1. [http://home.earthlink.net/~hsbecker/index.html](http://home.earthlink.net/~hsbecker/index.html)

Birds (2013-10-05 16:03:06)

“Youth” are older than “teenagers” but younger than “adults.” - Youth is not tied to age imo.

Sociology’s ‘Moments’: Democracy, Expertise and the Market by John Holmwood (2013-09-03 08:00)

The videos from this year’s British Sociological Association conference have been released. You can find the full set [here](http://player.vimeo.com/video/72177565) - the video above is from John Holmwood’s plenary. As we paraphrased its conclusion while live tweeting at the time:

1940
The task of Sociology in an age of austerity is to occupy public debate and make inequality matter [3] #BritSoc13

“Oh there are other people just like me? I’m not so weird after all”: the internet, social change and social integration (2013-09-04 08:00)

I’ve been preoccupied recently by parallels I keep observing between common features of asexual biographies and those of other groups who share a common trait. In the case of asexuality this ‘common trait’ is *not experiencing sexual attraction*. Exactly what this entails about the individual’s experience and what, in turn, this experience has come to mean to them biographically is a more complex issue. But underlying the diversity which exists within the asexual community there does seem to be a common set of experiences. This ‘lack of sexual attraction’, whatever causes it if indeed such a question is meaningful, is rendered problematic through the normative pressures which are enacted with concrete others (peers, friends, family etc) whether directly or indirectly. This brings about an experience of feeling ‘broken’ or ‘damaged’ and self-questioning as to why this might be the case i.e. “what’s wrong with me? why aren’t I interested in sex like everyone else?”. The biographical specifics can be very variable from this point onwards and, given this is the starting point of a blog post rather than its main topic, I’m going to sidestep them somewhat. Suffice to say, if someone does come to identify as asexual (at least post 2001/2002) then they probably did so either through stumbling across it in the media or as a result of encountering asexual blogs, forums, videos etc online (with the former in fact often leading to the latter).

What has always fascinated me is the experience that comes next, as something that had been self-interpreted as pathology comes to be reinterpreted as a non-pathological characteristic which is shared with geographically remote others. Exactly what this means is again biographically specific. For some people it’s just a *useful label* to make sense of oneself and convey that understanding to others. For others it can lead to the emergence of a deep sense of collective identity. But what I think unites the range of responses people have to this discovery is the transformation of a difference into a commonality. Within their local context and existing social networks, this characteristic of ‘not experiencing sexual attraction’ has been rendered *problematic* by the explicit judgements and implicit attitudes encountered in other people. It thus emerges as a *difference* which interrupts a shared frame of reference. It will intrinsically generate a *tendency* towards introspection because, given that this recognition of difference is provoked by experience of implicit or explicit censure, it will become increasingly less attractive to try and talk through this difference (“why am I this way? what’s wrong with me?”) with others who, inductively, can be expected to only confirm the assumption of pathology and thus intensify distress. Their pool of *available* interlocutors shrinks dramatically as a result which, in turn, leads them to seek alternative routes towards self-clarification. This might be to consult expert systems (go to a doctor, to a councillor, to a sex therapist) or, more likely, it’ll be to go online. if you go to google and type in ‘does not experience sexual attraction’ then you will
immediately find a whole plethora of asexual resources. This allows what was a difference (in relation to the immediate context) to instead be established as a commonality (in relation to this dispersed reference group). To summarise:

1. The local normative environment rendered P’s experience of X problematic (“Why am I X when everyone else seems to be Y!? What’s wrong with me?”)

2. This experience of normative censure dramatically reduced the pool of available interlocutors with whom P could talk about X (“I can’t talk about X with anyone. They’ll just think I’m weird”)

3. P looks beyond the normative environment with the aim of coming to a better understanding of X (“Why am I X? What could be making me this way?”)

4. P finds others who share the trait X and recognises her own experiences in those she encounters, either directly or indirectly, outside the local normative environment (“Oh there are other people who are X? I’m not so weird after all!”)

What emerges as a difference at (1) becomes a commonality at (4). As well as the application of this biographical model to other forms of experience, I’m interested in how processes of this sort can be understood at the macrosocial level. If I’m right that the underlying mechanisms at are at work in other spheres (i.e. the expanded pool of interlocutors offered by the internet allows what would otherwise be a proliferation of differences to instead becomes the emergence of new commonalities) then this is a really interesting route into debates about the internet, social change and social integration. It raises obvious empirical questions about the nature of these ‘new commonalities’ and the similarities and differences which in turn obtain between them. Do they provide a basis for the establishment of ‘new continuities’ as Archer would put it? Or simply represent a fragmentation that exists at the level of groups, self-defined in a particularist and experiential way, rather than of individuals? Is it even meaningful to talk about ‘groups’ in this sense? Subcultural social worlds is a concept I’ve been playing with recently to make sense of this, seeing them as emergent but heterogeneous spaces of meaning and practice which are constituted through biographical interweaving and amenable to the further emergence of networks acting in relation to values and ideas within this ‘social world’.

I keep writing this in inverted commas because I think it’s a conceptualisation of a difference and that its objective basis varies a lot. The category of ‘not experiencing sexual attraction’ emerges from the relation between particular constellations of norms about sexuality and an individual who, for whatever reason, does not meet the expectations implied by them. The ‘for whatever reason’ is the objective underpinning of that experience for any particular individual and it needs to be analytically distinguished from the biographical process of coming to understand oneself which it indirectly brings about. It’s a necessary but insufficient condition for the emergence of an asexual identity because the characteristics it is generative of need to be rendered problematic at the social level for them to be in any way significant. This is why I think studying the aetiology of asexuality is conceptually confused – ‘asexuality’ is a deeply socio-cultural phenomenon and it’s too broad a category upon which to base an investigation of what underpins it causally.

Why Slavoj Zizek is a Waste of Space for the Social Scientifically Literate Left (2013-09-04 11:27)

Slavoj Zizek may be great at beating up on grand old men of the anti-establishment such as Chomsky, but he is a total waste of space for a self-described ‘Left’ that wants to remain politically relevant in the 21st century. Whenever
I read him, I think to myself: This guy either just wants us to feel good about ourselves after performing some self-contained Occupy-ish rituals or he is calling for outright violence in a prophylactic bloodbath. Zizek can’t seem to imagine any other political alternatives, which may suit his vast legions of followers, who are ‘politically inert’ by most conventional understandings of the phrase. This was really made clear to me in his latest piece for the Guardian, which celebrates the importance of cyberspace whistleblowers, who if ultimately regarded as ‘progressive’, will be for reasons that we have not quite yet figured out. At the moment, they look like fleas on the arse of history. [1] Here is the original piece, which I have deconstructed below.

We all remember President Obama’s smiling face, full of hope and trust, in his first campaign: “Yes, we can!” – we can get rid of the cynicism of the Bush era and bring justice and welfare to the American people. Now that the US continues its covert operations and expands its intelligence network, spying even on its allies, we can imagine protesters shouting at Obama: “How can you use drones for killing? How can you spy even on our allies?” Obama murmurs with a mockingly evil smile: “Yes, we can.”

But simple personalisation misses the point: the threat to freedom disclosed by whistleblowers has deeper, systemic roots.

Classic immunisation strategy used by intellectuals to conjure up an image of the opponent that is then officially denounced as unfair, yet the image leaves the desired bad aftertaste that contaminates the rest of the argument.

Edward Snowden should be defended not only because his acts annoyed and embarrassed US secret services; what he revealed is something that not only the US but also all great (and not so great) powers – from China to Russia, Germany to Israel – are doing (to the extent they are technologically able to do it).

His acts provided a factual foundation to our suspicions of being monitored and controlled – their lesson is global, reaching far beyond the standard US-bashing. We didn’t really learn from Snowden (or Manning) anything we didn’t already presume to be true. But it is one thing to know it in general, another to get concrete data. It is a little like knowing that one’s sexual partner is playing around – one can accept the abstract knowledge, but pain arises when one gets the steamy details, pictures of what they were doing ...

This is more revealing of Zizek’s sexual history than anything else. Some people think about these matters in the exact opposite way: i.e. the abstract possibility of infidelity (if it matters) prepares you for when it happens, so that you end up being more understanding, regardless of whether you continue the relationship. In fact, this is probably the more rational route. After all, you might wonder what strange sort of political impotence would have people (1) entertain the prospect that they are under constant surveillance, (2) not do anything about that prospect, yet (3) get very upset once it is shown to have happened. Here it is worth recalling that representative democracy is not predicated on trust – but on suspicion! That’s why elections happen on a regular basis, even if nothing bad seems to be happening. That gives people an opportunity to voice those dark thoughts, which in turn can inject a level of uncertainty that might not have been expected. That people carry on voting in the Clintons, Blairs and Obamas back into office has nothing to do with lack of access to facts but a measured judgement of harms vis-à-vis benefits, all of which are assessed under conditions of uncertainty. It would be a slight exaggeration to say that a vivid imagination works much better in political reasoning than supposedly solid facts, but it’s close to a truth that Zizek fails to appreciate.
Back in 1843, the young Karl Marx claimed that the German ancien regime “only imagines that it believes in itself and demands that the world should imagine the same thing”. In such a situation, to put shame on those in power becomes a weapon. Or, as Marx goes on: "The actual pressure must be made more pressing by adding to it consciousness of pressure, the shame must be made more shameful by publicising it."

This, exactly, is our situation today: we are facing the shameless cynicism of the representatives of the existing global order, who only imagine that they believe in their ideas of democracy, human rights etc. What happens in WikiLeaks disclosures is that the shame – theirs, and ours for tolerating such power over us – is made more shameful by publicising it.

This is playing to the Left’s toy soldier gallery. The ancien regime could afford to be cynical because their right to succession didn’t involve popular approval. If democratically elected officials are keeping secrets from the public, then something else is involved. While ‘national security’ may be too sanguine an explanation for the secrecy, that is probably part of it – along with other things that might be teased out by the normal democratic means, and which in the end may or may not matter in the electorate’s judgement as to whether the politicians have done an adequate job.

What we should be ashamed of is the worldwide process of the gradual narrowing of the space for what Kant called the Immanuel “public use of reason”.

In his classic text, What Is Enlightenment?, Kant contrasts "public" and "private" use of reason – "private" is for Kant the communal-institutional order in which we dwell (our state, our nation ...), while "public" is the transnational universality of the exercise of one’s reason: "The public use of one’s reason must always be free, and it alone can bring about enlightenment among men. The private use of one’s reason, on the other hand, may often be very narrowly restricted without particularly hindering the progress of enlightenment. By public use of one’s reason I understand the use that a person makes of it as a scholar before the reading public. Private use I call that which one may make of it in a particular civil post or office which is entrusted to him."

We see where Kant parts with our liberal common sense: the domain of state is "private" constrained by particular interests, while individuals reflecting on general issues use reason in a "public" way. This Kantian distinction is especially pertinent with internet and other new media torn between their free "public use" and their growing "private" control. In our era of cloud computing, we no longer need strong individual computers: software and information are provided on demand; users can access web-based tools or applications through browsers.

This makes no sense whatsoever. Kant is really pulling a Leo Strauss here. He lived in a time of benevolent despotism. For the ‘public’ to retain its potency yet appear non-threatening, it had to be confined to the utopian realm of the literate (still a minority of Europe in the late 18th century). So ‘public’ = ‘perhaps actual in the future’. In that respect, the closest contemporary analogue to Kant’s sense of the public is ‘virtual’ in the sense of science fiction, which often presents very vivid challenges to the status quo but without providing any clear sense of how we might get from here to there. Kant is effectively reassuring the despot that these challenges are really paper tigers in the short term, so as to ensure that the ‘light’ of the Enlightenment is not simply blown out peremptorily, say, by abrogating freedom of the press.

As for Kant calling the exercise of official reasoning as ‘private’, he is imagining a world in which the state is dominant, its bureaucracy divides society into functional units, and each official exercises authority by virtue of
speaking from his proper unit. That sense of ‘propriety’ is what Kant means by ‘private’ (i.e. within well-defined borders). But of course, it is also somewhat ironic because it suggests that this sense of propriety is valid ONLY under the status quo.

To a certain extent, Marx still lived in Kant’s world but we certainly do not. Zizek fails to tell the difference.

This wonderful new world is, however, only one side of the story. Users are accessing programs and software files that are kept far away in climate-controlled rooms with thousands of computers – or, to quote a propaganda-text on cloud computing: "Details are abstracted from consumers, who no longer have need for expertise in, or control over, the technology infrastructure 'in the cloud' that supports them."

Here are two telltale words: abstraction and control. To manage a cloud there needs to be a monitoring system that controls its functioning, and this system is by definition hidden from users. The more the small item (smartphone) I hold in my hand is personalised, easy to use, "transparent" in its functioning, the more the entire setup has to rely on the work being done elsewhere, in a vast circuit of machines that co-ordinate the user’s experience. The more our experience is non-alienated, spontaneous, transparent, the more it is regulated by the invisible network controlled by state agencies and large private companies that follow their secret agendas.

These two paragraphs might conform to what I have described as Kant’s sense of ‘public reason’, which unfortunately is not Zizek’s own! Speaking of ‘secret agendas’ is an inflammatory irrelevance unless you think that government and big business have actually managed to achieve what you imagine them capable of. However, given the number of outright disasters – which are more impressive than whistleblowers – you might come to believe that Zizek is egging the pudding with regard to any straightforward sense of big data resulting in big control. Of course, this provides no grounds for complacency. But the real critical effort should be placed on revealing the fallibility of ‘big data’ as inputs to state action. If anything, the whistleblowers celebrated by Zizek are just as certain as the allegedly menacing states about the latter’s potential efficacy. Yet, this is the myth that really needs to be addressed – but which Zizek unfortunately occludes.

Once we choose to follow the path of state secrets, we sooner or later reach the fateful point at which the legal regulations prescribing what is secret become secret. Kant formulated the basic axiom of the public law: "All actions relating to the right of other men are unjust if their maxim is not consistent with publicity." A secret law, a law unknown to its subjects, legitimises the arbitrary despotism of those who exercise it, as indicated in the title of a recent report on China: "Even what’s secret is a secret in China."

China is not a representative democracy in the Western sense and has not claimed otherwise. There is no reason to expect China to live up to Zizek’s reading of Kantian maxims. If we truly wish them do so, then I suggest that mass propaganda is in order (which I might support). Otherwise this high dudgeon is simply presented to raise the political temperature.

Troublesome intellectuals who report on political oppression, ecological catastrophes, rural poverty etc, got years in prison for betraying a state secret, and the catch was that many of the laws and regulations that made up the state-secret regime were themselves classified, making it difficult for individuals to
know how and when they are in violation.

What makes the all-encompassing control of our lives so dangerous is not that we lose our privacy, that all our intimate secrets are exposed to Big Brother. There is no state agency able to exert such control – not because they don’t know enough, but because they know too much. The sheer size of data is too large, and in spite of all intricate programs for detecting suspicious messages, computers that register billions of data are too stupid to interpret and evaluate them properly, ridiculous mistakes where innocent bystanders are listed as potential terrorists occur necessarily – and this makes state control of communications even more dangerous. Without knowing why, without doing anything illegal, we can all be listed as potential terrorists. Recall the legendary answer of a Hearst newspaper editor to Hearst’s inquiry as to why he doesn’t want to take a long-deserved holiday: "I am afraid that if I go, there will be chaos, everything will fall apart – but I am even more afraid to discover that if I go, things will just go on as normal without me, a proof that I am not really needed!" Something similar can be said about the state control of our communications: we should fear that we have no secrets, that secret state agencies know everything, but we should fear even more that they fail in this endeavour.

Clearly the editor was on holiday. This is simply paranoia, and perhaps Zizek’s weird late Cold War closeness to the Stalinist mentality may be to blame for this particular outpouring. Again, the problem is not that the state may really know too much but that it may THINK it knows too much, such that the comprehensiveness of big data issues a more liberal license for action than the state would normally have. In contrast, a productive ‘left’ response must begin with recognition of this fundamental epistemic difference.

This is why whistleblowers play a crucial role in keeping the “public reason” alive. Assange, Manning, Snowden, these are our new heroes, exemplary cases of the new ethics that befits our era of digitalised control. They are no longer just whistleblowers who denounce the illegal practices of private companies to the public authorities; they denounce these public authorities themselves when they engage in "private use of reason".

We need Mannings and Snowdens in China, in Russia, everywhere. There are states much more oppressive than the US – just imagine what would have happened to someone like Manning in a Russian or Chinese court (in all probability no public trial). However, one should not exaggerate the softness of the US: true, the US doesn’t treat prisoners as brutally as China or Russia – because of its technological priority, it simply does not need the brutal approach (which it is more than ready to apply when needed). In this sense, the US is even more dangerous than China insofar as its measures of control are not perceived as such, while Chinese brutality is openly displayed.

It is therefore not enough to play one state against the other (like Snowden, who used Russia against the US): we need a new international network to organise the protection of whistleblowers and the dissemination of their message. Whistleblowers are our heroes because they prove that if those in power can do it, we can also do it.

These last three paragraphs show why Zizek has become a waste of space for the Left – especially for anyone trained in social science. He is surfing on the surfaces of recorded political action without considering the differences in the structures of accountability that are bringing them about and potentially limiting or extending them. Just as Zizek ignorantly fetishises the potential of ‘big data’ to bring about a ‘Big Brother’ style world, he equally ignorantly fetishises American ‘technological priority’ (a euphemism for military might), without realizing the potential for enormous unintended and unanticipated failure. To be sure, these failures could have even more disastrous consequences than
Zizek imagines, but for him to imagine them he would need to wake up from his Stalinist dystopian fantasy.

**Jazz and Sociology - a professional jazz musician responds (2013-09-04 12:28)**

Hi Graham, I am a professional jazz musician and as such feel qualified to respond to [1]your post in an engaging way based on my own experiences and knowledge of jazz.

The first thing I would say is that this idea of jazz as "black" or "white" music or even of jazz being divided into those respective camps is an idea that exists outside the jazz community a lot more than it does within it. Only a very small number of practising jazz musicians hold any views of this kind and in my experience are usually ostracised for these views. I think this has historically been the case too. Throughout history jazz musicians have always been pioneers in breaking racial barriers and there are countless examples of mixed race groups playing together despite the social environment of the time. People often cite bebop musicians as sort of "black warriors" who made their music too complicated so that white people couldn’t play it. I am perhaps missing your point but you did say:

"Not only were blues and jazz their music; but they consciously performed solos no white counterpart could cope with."

I think that these musicians did not have any kind of racial ideology behind their solos and the notion that no white counterpart could cope with them is in my opinion completely absurd. Throughout the history of jazz people like Parker are sometimes viewed as being against white people in their musical statements and any new developments in jazz are often mis-labelled as movements of black separation. But all of the black musicians cited in this way frequently collaborated with white musicians in these very endeavours and I have not really heard many statements from them about race being a factor. A few examples:

- Buddy rich (white) was one of Charlie Parker’s favourite drummers.
- The Ornette Coleman album “this is our music” (often wrongly cited as a statement about race) features white bassist Charlie Haden.
- free jazz pioneer Albert Ayler (another movement which is frequently falsely cited as being black-separatist) frequently performed and recorded with white bassist Gary Peacock
- Billie Holiday collaborated and toured with Artie Shaw

There are countless other examples of this. While I am not denying that jazz developed in an atmosphere of racial oppression or that jazz is capable of statements about race, to say that jazz is about race is I think incorrect and also takes away from the higher meaning of jazz which is often love and personal expression. I am also not saying at
all that black musicians haven’t been persecuted and that there has never been any racial tension around jazz. But this idea that musicians are in anyway racially divided is simply not true in my experience and I think you will find that actual jazz musicians have always been very open to all different racial and cultural backgrounds on the whole.

It’s easy to forget as a listener that when you listen to Charlie Parker or Billie Holiday or anyone who is playing jazz standards that a lot of the tunes they choose to play were written by white composers like Gershwin, Cole Porter, Hoagy Carmichael, and Rodgers and Hart. These composers are probably responsible for writing around 60-70% of what are now considered among musicians to be “jazz standards”. I think this shows pretty clearly that black jazz musicians haven’t generally been particularly interested in any kind of separation from white musicians and that the music they make isn’t a statement about that. I believe that it is instead about expressing themselves as individuals and also simply about playing something that communicates emotionally with the listener and makes them feel as though they relate, rather than any kind of political idea. Again in my experience with other musicians this is what we talk about much more than any kind of political message in the music. The political ideas are often attached to the music more by outsiders like critics and historians.

I would also challenge your statement about not enjoying white performances as much as black ones. I can 100% guarantee you that I could give you a “blindfold test”, where I play you recordings without telling you who the artist is, and that you would be unable to sort the white from the black performances.

I hope that didn’t sound too aggressive, but I really wanted to make it clear that this idea is not one that is prevalent within the jazz community itself!

R.E “Music Communicates” – I completely agree that music communicates! (well, good music anyway...) I think the beauty of music is that it communicates in an abstract way. Music cannot definitely be about something (lyrics are a different matter, but if we are just discussing music as sound – jazz is often instrumental music anyway). The intention of the artist can be to be about something and the idea behind a piece can definitely be a concrete thing, but music heard on its own without any context of why the composer has written it or what their message is can be interpreted differently by every listener. We all have particular pieces of music that are associated with a person or a place or a particular time in our lives, and that meaning is completely personal and has nothing to do with the artist’s original intention. There is a wonderful quote from John Coltrane relating to this:

“I never even thought about whether or not they understand what I’m doing . . . the emotional reaction is all that matters as long as there’s some feeling of communication, it isn’t necessary that it be understood.”

The idea that drugs disinhibit is an interesting one, but one that I think is misunderstood from the outside. Unless you really understand the mental process of improvisation it is quite confusing I think to see how it can happen. I personally never use drugs so I am also probably unqualified to talk about it completely clearly, but my thoughts are that when you learn to improvise to a high level, even just the act of improvising becomes something that doesn’t require as much concentration. To clarify, this is different to saying that the musician just uses muscle memory of patterns of hand movements to achieve something that sounds fairly improvised. I am describing a situation in which they are still actually improvising their musical ideas, not regurgitating memorised information.

For example, if you are highly intoxicated in some way you often still retain some basic faculties like speech, even if it is impaired slightly, you are still often able to speak and to maintain some sort of thought process of reacting to what people are saying around you, as well as muscular control of the vocal chords in order to speak. I think that musicians like Parker would have reached a similar relationship with music and their instrument through hours and hours of practice, where it gets to the point where improvising fluently is as easy as something like speaking and that there isn’t really much mental calculation that needs to happen consciously in order for him to play, in the same way that the complex movements of the voice box during speech don’t have to be consciously calculated as you talk. Maybe that is a bit far-fetched, but it is a thought that I had about the topic.

1948
Sam Watts is a professional jazz musician. This post is a response to Graham Scambler’s earlier post about jazz and sociology.

Reclaiming ‘impact’ and committing sociology (2013-09-04 14:25)

Earlier today I stumbled across this interesting post by David Mellor on the (now defunct) Sociology & the Cuts blog:

There is a great deal of talk about publics that very often fails to materialize into anything more substantial than well meaning sentiment. In my eyes this is simply due to a lack of solidarity and communal support within British sociology – a rather ironic situation really. This is not the fault of the BSA and nor should it be their job, I think, as a professional association. The BSA provides the spaces for us to be drawn together – what we do in and from these spaces is our own responsibility.

What I’m calling for doesn’t have a name yet, because as far as I know there isn’t a collective noun for a group of sociologists (jokes on a postcard to the usual address). I’d like to suggest ‘an insurrection’ of sociologists. What I’m calling for then, is an insurrection of sociologists for impact. This would entail us working collectively across institutions and beyond national borders to share our experiences, to encourage others, and to form new groupings for action. We don’t need to debate public sociology anymore; we need to get good at it. I’ve chosen the term insurrection because I think it captures the nature of what we can actually achieve. Even acting collectively with colleagues from sociology and other disciplines – and perhaps with other pressure groups and social movements – we are highly unlikely to have revolutionary impact. This doesn’t mean, however, that we will have none, or that we should just give up and lapse into disciplinary docility. On the contrary, we can use the context of impact-for-audit to create a platform for impact-for-justice, from where we can develop strategies for political and ethical struggle. Many individuals have worked hard in this area and their biographies illustrate the problems we continue to face as individual scholar-activists, particularly in the absence of a strong collective platform (see for example Max Farrar’s exemplary ‘Cracking the Ivory Tower’ in Burnett et al. (2010) New Social Connections). It’s time to make an opportunity out of a crisis and build a strong collective platform for impact-for-justice.

It’s hard to convey quite how emphatically I agree with his proposal that "we don’t need to debate public sociology anymore; we need to get good at it". Hopefully this is what the new BSA Activism group will do. I’m by no means hostile to Public Sociology as a concept (in fact we host this [1]great bibliography compiled by Albert Tzeng) but it’s hard not to be struck by the emergence of such a voluminous literature debating what must surely be a predominately practical endeavour. Perhaps problems arise because the process of building an infrastructure for ‘getting good at it’ isn’t glamorous and it isn’t an institutional priority.
I'm thinking of things like media training, digital literacy and online projects which serve to amplify the voices of individual sociologists who can only participate on an occasional basis. As a young sociologist who works hard at trying to communicate my research through the media I've increasingly become aware of the fact that I have never had a substantive discussion about working with the media with another sociologist. Nor have I encountered any support structures orientated specifically towards communicating sociological ideas (as opposed to generic media training my university has provided in the past). Obviously I realise that there's more to Public Sociology than working with the media and engaging online. I cite these activities only because they're the ones I've engaged in a lot over the last 5 years. Through doing so I've become aware of the glaring absence of any kind of apparatus to support those, particularly PhDs/ECRs, who want to engage in this kind of activity.

This didn’t put me off and I figured out what I was doing largely through trial and error. But surely if we’re committed to the principle of public sociology then the logical next step is ‘getting good at it’ and building support structures to this end? I’m very keen to do this with the BSA Digital Sociology group to the greatest extent I can and am in the process of planning a sociological blogging workshop for early next year. Perhaps it might be valuable to try and hold a workshop sharing experiences and exchanging insights into the specific challenges and opportunities posed by trying to communicate sociological knowledge in the media? These are the ideas that occur to me based on my own experiences of certain kinds of activities. But I’m sure there are others and I’d love to hear anyone’s suggestions. In short: if we accept that public sociology is worthwhile then how practically do we go about getting good at it?

Steve Fuller (2014-01-05 11:49:00)

Thanks for saying what has been needed to be said for a very long time. I believe that ‘public sociology’ tends to become just another discursive rabbit hole for sociologists rather than actual acts of public sociology because people feel they can’t be ‘public sociologists’ unless they’re speaking in the name of the discipline (or at least in terms of findings, etc. that have passed peer review within the discipline). This is an enormous liability. As a result, sociologists such as Frank Furedi (I could name others) are not credited as ‘always already’ public sociologists. People like Furedi – who I think of as among the true public sociologists in our time – act as professionals (imagine lawyers) who because of their accreditation in the field (both through education and employment) are licensed to practice the discipline as they see fit. Such people should not be automatically chastised for failing to represent ‘latest research’ in the field — especially when their pronouncements appear politically uncomfortable. This simply undermines the impact of sociology as a whole, both by leaving the external impression that we’re in disarray and the internal impression that no one should venture forth unless they’ve checked that they’ve name-checked all the right academic sources. Much more productive would be for those who don’t like de facto public sociologists like Furedi to develop exactly the sorts of interventionist skills that Mark suggests, and then practice some public sociology in the press, etc.against people like Furedi. In that case, sociology will be truly conducted in public — which is what I thought ‘public sociology’ was supposed to be about. (By the way, much of what Furedi says is spot on, but I raise him as an example for purposes of the likely audience for this message.)

» Making Sociology Public The Sociological Imagination (2015-03-29 08:01:21)

[... ] However while it’s obviously the case that social media is relevant for public sociology, I’ve found it harder to be clear about precisely what this relationship entails. The communicative affordances of social media obviously play an important part in this: these tools are ‘fast, cheap and out of control’ as the educational technologist Martin Weller has put it. But there are good sociological reasons to reject a view of the communication of sociological knowledge as intrinsically valuable, as well as important conceptual questions about what exactly we mean by ‘sociological knowledge’. The discipline’s identity is far from secure and ritualistic invocations of the sociological imagination (etc) need to be treated with
caution at a time of institutional instability. That said, I’m still convinced that Sociology has an important role to play in public life and I’m much more interested in getting good at public sociology than I am in adding to an already voluminous literature. [...] 

Life without Father or Ford: feminist perspectives on work, employment & society (2013-09-04 20:40)

In October 2012, British Sociological Association journal Work, employment and society hosted a one-day conference reflecting on key debates and looking forward to what the future might hold for the discipline and the journal. We are happy to have video footage of the stimulating presentations.

Feminist analysts of women’s labour market position used to assume that women’s domestic labour was essential for capitalism, just as urban sociologists assumed the provision of the goods and services of collective consumption had a similar role. The cold new world of neoliberalism, economic crisis and recession challenged what now look like overly optimistic claims. Linda McDowell looks backwards and forwards in this talk assessing the changing explanations of women’s labour market participation and the types of research published in WES to address the changing nature of research about gender relations over the last 25 years, as well as to suggest an agenda for the future.

Technology, Not Tenure: The Politics of the Digital Turn in #HigherEd (2013-09-05 08:00)

An absolute must read in the Chronicle of Higher Education for those interested in digital change within higher education:

Last year, a former Princeton University president, William G. Bowen, delivered the Tanner Lectures at Stanford, continuing a long tradition of college leaders' using the top floors of the ivory tower to speak difficult truths about academe.

When the dot-com craze was sweeping the nation, back in 2000, Bowen—an author in the 1960s of the original "cost disease" diagnosis of labor-intensive industries — kept his eyes on the evidence. He didn’t yet see reason to believe that colleges could use technology to save money. But another decade of progress changed his mind. "I am today a convert," he said. (The lectures were published this year by Princeton University Press as Higher Education in the Digital Age.) Bowen's random-trial-based research suggests that "online learning, in many of its manifestations, can lead to at least comparable learning outcomes relative to face-to-face instruction at a lower cost."

With MOOC mania showing no signs of abating, such strong conclusions from an esteemed scholar have drawn notice.

Less attention has been paid to what Bowen said next. Increasing labor productivity is one thing in theory, something else in practice. Less face-to-face instruction can mean fewer faces on the faculty side. It also means routinizing aspects of the student learning experience and thus reducing the day-to-day academic discretion of individual professors.

Bowen was a university president long enough to know how faculty are likely to respond, and what mechanisms of structural power and appeals to tradition will be employed to divert productivity gains to "gild the educational/research lily." "I wonder," he said, "if the particular models of what is often called 'shared governance' that have been developed over the last century are well suited to the digital world."

Nor does Bowen believe that this an issue of academic freedom: Freedom of expression "should not imply unilateral control over methods of teaching. There is nothing in the basic documents explaining academic freedom to suggest that such control is included. It is not."

These are the battle lines of early-21st-century higher education. Or at least they will be if the professoriate chooses to fight for traditional totems and privileges.

It’s an infuriating set of arguments being proffered by the "Director of Education Policy Program" at a think tank which has Eric Schmidt as the chairman of the board of directors. But I think he's correct about the 'battle lines of early-21st-century higher education':

1952
Total academic freedom in the classroom is just ridiculous. If an organization is focused on doing something, like education, it ought to have theories and standards and practices about that something. As the University of Chicago’s longtime president, Robert Maynard Hutchins, said in another lecture-series-turned-book-length provocation, the system of letting students choose among classes taught by wholly autonomous professors ‘denies there is content to education, so the organization of the modern university denies that there is rationality in the higher learning. The free elective system as applied to professors means that they can follow their own bents, gratify their own curiosity, and offer credits in the results.”

Hutchins was concerned with curriculum back in 1935, but the same laissez-faire approach is applied, then as now, to the practice of teaching. Student evaluations provide little useful information other than an inverse correlation to academic rigor. Teaching varies as professors see fit, which is widely, and so learning varies as well, and far too much.

Digital technology in contemporary higher education is janus faced. It risks being a means through which an unprecedented disciplining of academic labour can be enacted while simultaneously holding out unprecedented possibilities for expanding the autonomy of networks of academics vis-a-vis the institutions within which they operate. It’s for this reason that I think there is an incipiently political dimension to digital scholarship. The technology which is increasingly implicated in the politics of higher education is also reshaping the circulation of research, as Dave Beer has pointed out:

What I would like to suggest is that this blog post, like other social media content, will be subject to the politics of circulation that defines contemporary media. The data that is produced as a by-product of contemporary cultural life does not just stop when it is produced, rather data fold-back into our everyday lives in variegated and often unseen ways. Similarly the destiny of this blog post will be shaped by the material infrastructures that it has been placed within. In this sense, academic knowledge is being opened up to social media’s politics of circulation. As such, these transformations in the communication of research are likely to have profound implications for the way that we encounter and discover knowledge. All of which will then, in turn, implicate the knowledge that we go on to produce. There is the potential then for social media’s politics of circulation to influence both the communication and production of knowledge.

Using social media to communicate academic knowledge is not a problem in itself, it actually opens up vast new possibilities, but it forces us to ask what will happen as more and more researchers use social media and other open-access outlets for their work. How will we cope with the din? And, most importantly, who will get heard? If we don’t understand the politics of data circulations that define contemporary media cultures then we may also find that academic practice is reshaped without sufficient reflection and reaction.

The way in which digital technology is being deployed, in a partly rhetorical fashion, as part of a project to discipline academic labour is a distinct process from the politics of circulation described by Beer. But the unpredictability of this circulation potentially throws a spanner into the works. All the more so if digital scholarship is embraced with the aim of securing the agency of scholars in a rapidly changing knowledge environment. The available options are radically expanding. The only one that is untenable is passivity and a retreat into comfortable certainties:
We can no longer imagine that we are communicating research in an environment in which our ideas, or data, amble continually forward in a slow linear stroll. Rather our findings, even those published in old fashioned journals – which now have blogs and Twitter feeds attached and whose publishers are looking to increase impact factors through predictive recommendation and the like – are also being introduced to the chaotic maelstrom of contemporary media. The result is that our research will take on this vitality and will be caught in the currents, which might be simultaneously unnerving and invigorating. Some ideas will be washed away, unnoticed, others will find a significant audience, others may have a profound and surprising journey through networks. The outcomes will be unpredictable, but all will be a product of the politics of circulation that defines contemporary media forms.

**Nick Couldry - 'Voiceblind: On Some Paradoxes of the Neoliberal State' (2013-09-06 14:00)**

Nick Couldry (London School of Economics) speaking at the ‘Neoliberalism, Crisis and the World System’ conference organised by Nicholas Gane and Claire Westall at the University of York, UK, July 2nd, 2013. For a full conference programme, see http://www.york.ac.uk/sociology/about... Funding for this event came from the British Academy and the Centre for Modern Studies at York.

Do you have an experience of *inwardness*? Do you feel inner activity which is known to you in a way it is not to others? Margaret Archer suggests that most people would assent to some claim of this sort. Obviously, this would not entail we ought to accept the report of this experience but it does mean we should take it seriously. However, it is often not taken seriously and one reason for that, argues Archer, is an over-reaction to the metaphor through which ‘introspection’ has tended to be construed.

This metaphor of ‘looking inwards’ implies that we have a special sense, or even a sense organ, enabling us to inspect our inner conscious states, in a way which is modelled upon visual observation. This analogy between perception and introspection is what has borne the brunt of criticism. Etymologically it derived from the Latin *spicere* (‘to look’) and *intra* (‘within’). Those who insisted upon the dis-analogy between perceiving and introspecting were surely correct. In perception, there is a clear distinction between the object we see and our visual experiences of it, whereas with introspection there can be no such differentiation between the object and the spectator, since I am supposedly looking inward at myself. Over the last half century, the critical response to this misplaced perceptual metaphor has been overkill. It generically consists in turning our heads inside out, so that our inner doings are learned from our external behaviour, rather than vice versa, where behaviour traditionally betokened the workings of the mind. (Archer 2003: 21).

This involved a first-person account being replaced by a third-person one, entailing that we “thus learn about our own intentions, motives, feelings, commitments and so forth by watching what we do or listening to what we ourselves say out loud, which is identical with how we come to know other people” (Archer 2003: 21). This turns ‘introspection’ into ‘extrospection’: I observe what ‘I’ am doing by observing what ‘he’ is doing, in the same way I would observe any other person. However the obvious problem faced by such a move is how it can deal with the possibility of covert mental acts i.e. those which have no behavioural manifestations. Affirming the existence of this category does not entail a blanket denial of the possibility of ‘extrospection’: Archer fully acknowledges that many mental states do have behavioural manifestation but places great stress on the ones for which this is not true. Upholding this claim poses three philosophical tasks,

To sustain a successful defence against behaviourism entails upholding three arguments coherently: (a) that there is a domain of mental privacy within consciousness, (b) which is inaccessible to ‘extrospection’ and, (c) of which the person has awareness through means other than introspective observation. (Archer 2003: 24).
In seeking to make these arguments Archer opposes what she sees as a justified "critical onslaught upon Cartesian notions of how we obtain knowledge of our mental doings, what authority our subjective reports possess and whether our internal deliberations are causally efficacious" which, partly deflected by a focus on the unnecessary and inappropriate metaphor of the 'inner eye', has nonetheless gone too far and jettisoned notions of 'private knowledge', 'first-person authority' and 'subjective causation' which she argues are integral to an adequate understanding of the social functioning of human persons (Archer 2003: 20).

Tuesday, September 17, 2013 from 1:00 PM to 5:00 PM (BST)
Leeds, United Kingdom

At this inaugural event there will be presentations from researchers who have been exploring quantified self or self-tracking either empirically or theoretically which will stimulate discussion around the potential and implications for future developments. We hope that this event will stimulate discussion and collaboration among attendees and further afield. This is a great opportunity to be involved in the development of an emerging academic area and to connect with others. Below is a short summary of the proposed interests of the network. This is, however, intended to be an open forum in which a collective vision for the future of the network can be produced.

In the last few years there has been a significant increase in public and academic interest in the use of devices or techniques for the accumulation, aggregation and analysis of personal data. Apps for mobile phones such as Track My Run and body tracking devices such as Jawbone, Fitbit and Nike's Fuelband have perhaps garnered the widest attention with their ability to passively collect data on everyday activities which can then be analysed and shared with others. There is, however, more to quantified self than the mainstream media picture of obsessive "techies". Many people engaged in "life logging" collate data on mood and experiences often without a direct quantitative element. While a relatively formalised arm of the quantified self movement has formed, through the Quantified Self group based in San Francisco, not everyone involved in quantified self activities is affiliated with Quantified Self. This formalised movement, as well as the broader cluster of practices and orientations which are coalescing within and beyond it, point to commercial and political connections which have yet to be fully explored.

CfP: What are zombies and why are they now so prevalent across both pop culture and academia? (2013-09-07 21:45)

Does it suddenly seem like the living dead are everywhere? Lumbering past cyborgs, mutants, werewolves, and, yes, even vampires, zombies are the monsters du jour. Zombies have taken up residence in the pages of fiction (literary hits such as Colson Whitehead’s Zone One, The Walking Dead comic books, pulp zombie apocalypse narratives such as World War Z, and young adult fiction such as Warm Bodies) and inhabit our various screens, from television shows such as AMC’s ubiquitous The Walking Dead, to movies (from 1968’s Night of the Living Dead to the more recent 28 Days Later, I Am Legend, and Shaun of the Dead), and video games (Resident Evil, Left 4 Dead). We have zombie runs, zombie computers, Nazi zombies, and zombie banks. Even zombie strippers and zombie studies. They have come from space, from nature, from biotech labs, and the dark recesses of the globe. They even have their own CDC website and inhabit a growing area of scholarly debate over the status of philosophical zombies. We’re seemingly surrounded by the living dead.

What are zombies and why are they now so prevalent across both pop culture and academia? The Journal for Cultural and Religious Theory proposes a special issue to critically examine the resurgence of interest in the zombie as a cultural and political figure. We invite papers from across the disciplines that explore diverse aspects of this vibrant cultural phenomenon and address the current popularity of the living dead.

Completed papers must be submitted by September 30, 2013. Authors will be notified of acceptance by November 30, 2013. Projected publication: Spring, 2014. Please submit papers to dweiss@ycp.edu.

Submit electronic copies of completed papers (3000 – 6000 words). Abstracts cannot be considered. Papers will be subject to a double blind review by a selection committee. Include your name, paper title and contact information on a separate page. Include the paper title but not your name on a header or footer on each numbered page of the paper itself. The papers must be previously unpublished in any format.

The Journal for Cultural and Religious Theory is a peer-reviewed journal devoted to both disciplinary and interdisciplinary scholarship of a cutting-edge nature that deals broadly with the phenomenon of religious and cultural theory. Subfields include, but are not limited to, philosophical and cultural theory, theological studies, postcolonial and globalization theory, religious studies, literary theory, cultural studies, ethnic, area, and gender studies, communications, semiotics, and linguistics. No term papers, religious advocacy pieces, unsolicited book reviews or opinion pieces, etc. will be considered. The Journal is FREE of charge, is published three times a year (Winter, Spring and Fall).

All manuscripts submitted, or revised, for publication must be in Microsoft Word format. No hard copies of manuscripts will be accepted. The Journal for Cultural and Religious Theory uses the Chicago Manual of Style for all published reviews and articles.

CfP: Quantified Self and Self-Tracking (2013-09-08 08:00)

In the last few years there has been a significant increase in public and academic interest in the use of devices or techniques for the accumulation, aggregation and analysis of personal data. Apps for mobile phones such as Track My Run and body tracking devices such as Jawbone, Fitbit and Nike's Fuelband have perhaps garnered the widest attention with their ability to passively collect data on everyday activities which can then be analysed and shared with others. There is, however, more to quantified self than the mainstream media picture of obsessive "techies". Many people engaged in "life logging" collate data on mood and experiences often without a direct quantitative element. While a relatively formalised arm of the quantified self movement has formed, through the Quantified Self group based in San Francisco, not everyone involved in quantified self activities is affiliated with Quantified Self. This formalised movement, as well as the broader cluster of practices and orientations which are coalescing within and beyond it, point to commercial and political connections which have yet to be fully explored.

The new Quantified Self research network will explore the broad implications of this loose set of practical and ethical approaches to understanding bodies, psyches and everyday practices. While we are interested in exploring the practices and techniques of assessment we think it is equally important to understand the often novel ways in which the diverse types of analysis enable new forms of reflecting on the embodied self and relations with others. We hope to encourage interdisciplinary dialogue around this multitude of emerging issues, in the belief that historical, philosophical, cultural, sociological, psychology, economic, technological and political approaches all have a role to play in understanding this fascinating trend.

The network aims to:

- Build network of scholars interested in qs
- Explore possibilities for further research and collaborations
- Share ideas about substantive issues
- Support access and development of postgraduate and early career researchers
- Develop sociological approaches to understanding qs
- Identify potential for disciplinary collaborations
- Develop relations with interested parties beyond the academy
- Potentially developing some sort of web resources (perhaps as part of the BSA Digital Sociology Groups's website)

We've organised an initial seminar at the University of Leeds on September 17th. If you would like to do a short talk (20 mins max) about your research, intended research or simply to explain the intellectual basis for your interest in quantified self then please contact network organisers: Mark Carrigan ([1]mark@markcarrigan.net) and Christopher Till ([2]christophertill@hotmail.co.uk) with a short abstract and bio. Full details will be released soon for those who do not wish to present but would like to attend on the day. Furthermore, please get in touch if you would like to be
Manuacturing Consent in an Age of Austerity: Bashar al-Assad the “naughty child” (2013-09-08 08:48)

As anyone who follows me on Twitter will probably have noticed, in the last week I’ve been gripped by the march to war in Syria and what has seemed to be the new playbook, tentatively trialled with Libya, which the US and UK now draw upon in manufacturing consent for ‘military intervention’. For anyone with even the most minimal disposition towards critical reasoning, the ‘official’ case for action is weak: two years into a civil war which has led to the deaths of hundreds of thousands amidst a whole sequence of atrocities, we’re told that the use of chemical weapons represents a ‘red line’ which has been crossed and this qualitatively distinct act of cruelty ‘must be avenged’.

Any geopolitical considerations entering into the sanitised public discourse amount to little more than platitudes about inaction leading to the perception of weakness. In essence the official justification has vacillated between shrilly demanding to know “how would you feel if this was your children!?” and an oddly managerial line about reputation management. One case is invoked when the manifold weakness in the other risks becoming transparent. There’s something interestingly (and worryingly) new about the action that is being proposed here:

We’re nearing the end of the run-up: American officials are now telling the press that Syria strikes are inevitable “within days.” What’s confusing most people about the decision is why: what’s the point of strikes that US officials are describing as “just muscular enough not to get mocked” but not significant enough to actually change the balance of power between the Assad regime and the rebels?

The common answer to this conundrum is that the strikes are “symbolic,” punishment for the Assad regime’s use of chemical weapons. That’s true, but in a key sense misleading. The truth is that strikes are a kind of humanitarian intervention, albeit one with such a specific and narrow aim as to be essentially unprecedented in the history of humanitarian war.

Administration officials, as The Washington Post’s Max Fisher suggests, have left zero room for doubt that this intervention is about chemical weapons. Fisher argues that, instead of thinking of the strikes as an attempt to restore American “credibility” after Assad crossed the chemical weapons red line, the point of the strikes is to defend the international norm against chemical weapons use. We’re attacking Syria to make sure that chemical weapons are never used, particularly against civilians, again.

There’s two intended audiences for this message: other states with chemical weapons stockpiles, like North Korea, and the Assad dictatorship itself. The message being sent to the latter is much more interesting because the United States has explicitly ruled out regime change. We’re telling the Syrians that we’re staying out unless you return to en-masse gassing, in which case we’ll get involved with (by implication) escalating levels of force.

This is a form of humanitarian intervention, albeit a very specific one. The idea behind a humanitarian intervention is to end ongoing violence or prevent it from escalating; the idea behind the
norm against chemical weapons is that chemical weapons are uniquely hideous and well-suited for the mass murder of civilians. Intervening in Syria to deter Assad from using chemical weapons is intervening to prevent a very particular subset of the horrible violence going on in Syria from getting worse.

Intervening against a particular tactic that could be used to kill civilians, rather than the campaign of murdering civilians in general, is unprecedented. It would be as if the United States had intervened in Rwanda to stop Hutus from killing Tutsis with machetes, but not the systematic extermination of Tutsis writ large.

But is there also something new about how it’s being sold? There are many broader questions here which I hope to read more about in the next week or two – most pressingly the implications for the balance of power in the region and the significance of this renewed imperial shrillness (some of the invocations of ‘being disgusted’ at inaction seem genuine) in the context of long-term austerity and ever increasing signs of the ill-health of British democracy. Even more so than Iraq this seems to have been a post-democratic strategy for military invention in Colin Crouch’s sense of the term. It has been stage managed and structured around appealing simple tropes which reduce its geopolitical complexity to moral intuition: how would you feel if it was your children being gassed?

The other aspect to this only occurred when listening to Radio 4’s Any Questions (a usually atrocious phone in show which I can’t help but listen to despite it constantly winding me up) was the figurative presentation of Assad as a naughty child. One caller actually invoked this explicitly: talking about the need to give him a ‘short, sharp spank’ (!!!!) or words to that effect immediately after the chemical attack. He’s a naughty child who needs to be taught how to ‘play nice’. I thought this trope was apt and actually prefigured by the official rhetoric justifying military action – in fact I’m sure you could probably find it being invoked explicitly if you look hard enough. It reduces a complex issue to personal experience and complements the invocation of ‘your children’ effectively – the ‘case for action’ is an assemblage, a set of interconnected ideational components, intended to frame what is proposed cognitively and canalise affect in terms which render sustained discussion difficult.

In essence all I’m saying is that there seems to be a sophistication to the marketing here which intrigues me. What’s also interesting is the social media component to this – I’m not suggesting the US military will have been the only, or even a major, agency at work here (I’m thinking particularly of youtube) but it would be naive to assume that the well documented psychological operations capacity of the US military wouldn’t be deployed in this case and/or that it wouldn’t be deployed on social media.

The Libertarian Imaginary in an Age of Austerity (2013-09-09 11:42)

This fascinatingly weird essay by Peter Thiel, founder of PayPal and Facebook’s first outsider investor (not to mention founder of the most [1]sinister tech startup you’ve (n)ever heard of - let’s sidestep the ideological tension involved in being a leading libertarian making money from developing the infrastructure for a ’big data’ security state) offers interesting insights into the shifting fortunes of libertarian politics:

As one fast-forwards to 2009, the prospects for a libertarian politics appear grim indeed. Exhibit A is a financial crisis caused by too much debt and leverage, facilitated by a government that insured against all sorts of moral hazards — and we know that the response to this crisis involves way more debt and leverage, and way more government. Those who have argued for free markets have been screaming into a hurricane. The events of recent months shatter any remaining hopes of politically minded libertarians. For those of us who are libertarian in 2009, our education culminates with the knowledge that the broader education of the body politic has become a fool’s errand.

Indeed, even more pessimistically, the trend has been going the wrong way for a long time. To return to finance, the last economic depression in the United States that did not result in massive
government intervention was the collapse of 1920–21. It was sharp but short, and entailed the sort of Schumpeterian "creative destruction" that could lead to a real boom. The decade that followed — the roaring 1920s — was so strong that historians have forgotten the depression that started it. The 1920s were the last decade in American history during which one could be genuinely optimistic about politics. Since 1920, the vast increase in welfare beneficiaries and the extension of the franchise to women — two constituencies that are notoriously tough for libertarians — have rendered the notion of "capitalist democracy" into an oxymoron.

Given how ignorantly recalcitrant these 'constituencies' (i.e. most of the population) Thiel has become rather pessimistic about the prospect of his libertarian ideals finding social expression. So given his pessimism about a reversion to the class politics of the 1920s (presumably his ideal solution were it not for democracy and the fact that the vast majority of the populace would find his politics abhorrent) he’s looking elsewhere in his mission to “make the world safe for capitalism”:

(1) **Cyberspace.** As an entrepreneur and investor, I have focused my efforts on the Internet. In the late 1990s, the founding vision of PayPal centered on the creation of a new world currency, free from all government control and dilution — the end of monetary sovereignty, as it were. In the 2000s, companies like Facebook create the space for new modes of dissent and new ways to form communities not bounded by historical nation-states. By starting a new Internet business, an entrepreneur may create a new world. The hope of the Internet is that these new worlds will impact and force change on the existing social and political order. The limitation of the Internet is that these new worlds are virtual and that any escape may be more imaginary than real. The open question, which will not be resolved for many years, centers on which of these accounts of the Internet proves true.

(2) **Outer space.** Because the vast reaches of outer space represent a limitless frontier, they also represent a limitless possibility for escape from world politics. But the final frontier still has a barrier to entry: Rocket technologies have seen only modest advances since the 1960s, so that outer space still remains almost impossibly far away. We must redouble the efforts to commercialize space, but we also must be realistic about the time horizons involved. The libertarian future of classic science fiction, à la Heinlein, will not happen before the second half of the 21st century.

(3) **Seasteading.** Between cyberspace and outer space lies the possibility of settling the oceans. To my mind, the questions about whether people will live there (answer: enough will) are secondary to the questions about whether seasteading technology is imminent. From my vantage point, the technology involved is more tentative than the Internet, but much more realistic than space travel. We may have reached the stage at which it is economically feasible, or where it soon will be feasible. It is a realistic risk, and for this reason I eagerly support this initiative.

My fear is that for all his seemingly earnest belief in these sci-fi utopias (it’s hard not to imagine Thiel watching Elysium and siding with the space station’s elite) the likely implications of his politics and influence are much more terrestrial. He’s funding ‘security robots’ which, though fairly innocuous in their current incarnation, could certainly herald something more sinister if viewed with even a fraction of Theil’s undoubtedly imaginative futurism:
RoboteX was founded in 2007 and creates robots without the use of government funding. Its line of "Avatar" robots are meant to help with security, sometimes in situations that could be dangerous for humans. The website lists examples such as serving papers to a dangerous individual, entering hostage situation, patrolling, investigating suspicious packages, and more.

The company also has a line of robots for the home and office that offer its own form of roving security system. You attack an iOS device to the robot, which you can then remotely control to survey the house on your behalf.

The robots also come with a line of accessories, such as a command center, carrying case, manipulator arm, and stabilizers for rough terrain. With the manipulator arm, the Avatar II almost looks like a tiny NASA Curiosity rover.

[http://venturebeat.com/2013/03/22/robotex-funding/#abPQFg2xhF7oYSUQ.99](http://venturebeat.com/2013/03/22/robotex-funding/#abPQFg2xhF7oYSUQ.99)

Perhaps more worrying is the deployment of his security and technology firm. Given Thiel is on record enthusiastically opining that "I no longer believe that freedom and democracy are compatible" it’s hard to imagine that he had any qualms in principle about this operation, nor that he would about similar work in future. After all he seems truly committed to the mission of 'making the world safe for capitalism'.

It gets worse: the technologies and know-how acquired over years of spying on suspected foreign terrorists and threats were turned to private, political use against US citizens. In what became known last year as the "Chamber-Gate" scandal, Palantir was outed by Anonymous as the lead outfit in a private espionage consortium with security technology companies HBGary and Berico; the groups spent months “[creating electronic dossiers on political opponents of the Chamber through illicit means.”

According to [4]ThinkProgress, Palantir “may have used techniques and technologies developed under military contracts in their pro-Chamber campaign.”

Thiel's Palantir and its two intelligence contractor partners—collectively named [5]“Team Themis” after the Roman goddess of law and order—proposed to the Chamber’s lawyers a plan that involved illegal cyber-espionage against the Chamber’s enemies, including targeting activists’ families and children. Among those targeted: ThinkProgress, union leaders, MoveOn, Brad Friedman and [7]Glenn Greenwald, whose support for Wikileaks [8]reportedly rankled Chamber member Bank of America.

It has been quite a summer for antagonistic television in the UK. In July, Channel 4 broadcast How To Get A Council House, which chronicled the devastating shortage of affordable housing in one of London’s most overcrowded boroughs, and Why Don’t You Speak English?, which paired migrants with ‘host’ families for a week to improve their language skills. While the content of these programmes did occasionally veer into sympathy and even compassion, the programme’s deliberately titillating titles were enough to paper over much of this subsequent complexity – the former seemingly promising an expose of housing loopholes exploited by those savvy enough to play the system, the latter phrased as an accusation steeped in racism and linguistic/geographical propriety. In August, Channel 4 broadcast Benefits Britain 1949, a reality programme which set three benefit claimants the challenge of living by the benefit rules of 1949 (when the welfare state was first launched). I will be writing about Benefits Britain 1949 in more detail elsewhere, but for now it is worth pointing out how, like much current ‘austerity culture’ it romanticises post-war ‘resilience’ and ‘toughness’ with little socioeconomic context. In any case, UK viewers are surely by now familiar with the shock tactics of Channel 4, once an independent innovator and champion of the oppressed, now increasingly a peddler of emotional money-shots and clichéd horror-prompts at exotic Others (mostly ‘the poor’).

It was more surprising to see the BBC, the “voice of the nation”, stride into this territory, but stride they did, with We All Pay Your Benefits, a two-part July documentary in which four ‘taxpayers’ and four ‘claimants’ were paired up, ostensibly to learn from one another about work and worth.

The genre of ‘poverty porn’ is diffuse and covers a broad range of formats: from cookery and lifestyle programmes fronted by shrewd celebrities who have recognised the appetite for recession-focused culture ([2]Jamie Oliver and [3]Kirsty Allsopp, who both came to media prominence by inviting viewers to spend and consume, are now reinventing themselves as gurus of budget living), to reality incarnations which feature people living on low incomes undergoing financial ‘retraining’ or being set challenges to shop smarter. Abigail Scott Paul of The Joseph Rowntree Foundation [4]recently criticised the willingness of television producers to exploit the very real hardships experienced in the UK as a result of austerity measures and welfare ‘reforms’, stating that, as usual, “people in poverty are objectified on TV for the gratification of others”.

In the first episode, the camera follows the taxpayers as they are introduced to their claimant partner, are invited to cross the threshold and peer into their lives, homes and possessions.

We All Pay Your Benefits is fronted by Nick Hewer and Margaret Mountford, who first featured on our television screens as advisors to enterprise tsar Alan Sugar on the reality programme The Apprentice. Nick Couldry and Jo Littler (2011) have described The Apprentice as ‘ritualized play’ which dramatises the new precariousness of work culture and replaces social collegiality and collaboration with a highly individualised and even aggressive form of charismatic power. As they argue, The Apprentice requires that its contestants absolutely internalise the values of chaotic neoliberalism – and consequently position all subsequent ‘failures’ (“you’re fired!”) as part of a ‘natural’ order in the competitive workplace. Sugar himself has repeatedly [5]attacked maternity rights as “counterproductive”, boasted of his [6]sexist hiring policy and has had tempestuous working relationships with many of his Apprentice ‘winners’. We All Pay Your Benefits inherits this ideological history and works in a parallel way, symbolically dividing ‘workers’ from ‘shirkers’ as if such categories could be approached as solid – and more importantly as if belonging to either could
be understood as merely a matter of will. In the first few minutes, Nick and Margaret firmly position themselves in the ‘worker’ camp (their initial exchange in the back of a taxi proceeds: “the benefits world is not something I know anything about, do you”, “me neither, me neither, we’re the explorers”) and the final frame of the opening credit sequence leaves us in no doubt about who is being reprimanded (literally here, looked down on) by the programme’s title:

![Image of Nick & Margaret: We All Pay Your Benefits]

At the heart of the programme is the symbolic division between ‘worker’ and ‘shirker’, or in the current manifestation, ‘skiver’ and ‘striver’. These divisions are constructed through the very machinery of the programme: the ‘taxpayers’ clock up many minutes of the broadcast speaking to camera on their initial journeys to the ‘claimants’ homes, offering unchallenged caricatures of what they imagine ‘a life on benefits’ to be. It is impossible to know what proportion of this was elicited by producers and what was spontaneously offered, though in places, the prejudices of the taxpayers seem almost wilfully mocked in the edit. Taxpayer Debbie for example accompanies Kelly on her weekly supermarket shop, and comes across as cold-hearted and miserly in her determination to find fault with spending habits. She repeatedly questions why Kelly’s children should have two hot meals a day, before criticising her for buying a whole chicken rather than chicken fillets and for buying “high-salt, high-sugar” supermarket brand tinned food. Their exchange ends in Kelly’s tears and is a powerful reminder to the viewer that the ‘skiver/striver’ rhetoric so enthusiastically embraced by some of the participants has upsetting consequences for those that are stigmatised by it.

There are a set of foundational myths that accompany the programme as it unfolds: one is that the unemployed don’t want to work, another is that full employment is possible under neoliberalism. Tracy Shildrick et al. (2012) have powerfully challenged this narrative, pointing to the existence of a low-pay, no-pay cycle which affects many people in recurrent poverty. They describe the cycle as a “longitudinal pattern of employment instability and movement between low-paid jobs and employment, usually accompanied by claiming of welfare benefits” (2012: 18). Far from being ‘lazy’ or ‘workshy’, many people claiming unemployment benefits do so over short spells, in between periods of low-paid, poor quality, precarious, short-term or zero-hours work. This kind of work is increasing in neoliberal Britain [7]at a faster rate than permanent, full-time, living-wage work. Importantly, it is no longer confined to entry-level work (a stepping-stone, from which one might be promoted) but constitutes a ‘sticky state’ of work, a cycle of entrapment which has a powerful stigmatising effect in terms of future opportunities.

1968
Even within the programme itself, the cracks in these unemployment myths erupt at key moments. ‘Unemployed graduate Liam’, whose appearance on screen is repeatedly accompanied by a visual motif of his branded consumer goods, is revealed to be volunteering at a youth centre in order to gain experience. He is able to live rent-free at his grandfather’s house: without this and under current housing benefit law, Liam would qualify for Housing Benefit up to the level of Local Housing Allowance for a single room in a shared house, and would be required to make up any rent shortfall from his other benefits. The financial support he gets from his family is presented as a problem which fuels his consumer desires, rather than as cushioning his meagre unemployment benefits. We ought to ask, how far is Liam’s story representative and what does it disguise in terms of changes to Housing Benefit calculations and rising rates of youth homelessness? Luther, whose lung disorder limited the physical work he was able to do, described himself as a homemaker and described his ‘job’ as raising his children: a powerful challenge to the programme’s limited vision of work and worth, though one which is continually dismissed. ‘Single mum Kelly’ commented that while she could not commit to early morning cleaning shifts (leaving her house at 5.30am) for a lack of childcare, she would be happy to take on a later shift. This was promptly contrasted with her ‘taxpayer’ peer Debbie (also a single mum) for whom childcare (Nick and Margaret imagine) would “not get in her way”. We are not told what shifts Debbie works, or how she resolved her childcare needs: nor is any detailed consideration of patchy, inadequate and expensive childcare presented. After meeting with an employment analyst, the presenters Nick and Margaret themselves acknowledge (albeit briefly) that the inadequacy of job opportunities has a more important effect on prolonging unemployment than any individual’s desire to work or otherwise.

Despite these eruptive moments, the programme’s ideological message was clear; worth comes from paid work and not from childrearing or volunteering; unemployment is a problem of will or determination and not of structural obstacles; and social security itself generates the ‘problem’ of welfare dependence. The insights gleaned from experts were soon forgotten and Nick and Margaret want to know at the end of the process if the claimants’ “attitudes to work” have changed. From the first moments of footage, and throughout, the divisions between taxpayer/claimant ‘Skivers’ are symbolically and verbally reinforced as if they are different ‘types’ of people.

But the ideology presented on the screen in We All Pay Your Benefits does not necessarily translate into its acceptance by the viewer. As Beverly Skeggs and Helen Wood remind us in their recent book Reacting to Reality Television
programmes such as these work by inciting and generating feelings (disgust, anger, shame, pride); feelings which in turn activate broader circuits of value, systems of judgement, evaluations and assessments.

'Strivers'

These circuits of value depend upon the social and economic locations of viewers, and the judgements we make as viewers towards those on the screen might be to do with questions of taste, cultural or political critique, or associated with a moral objection. For Skeggs and Wood, it is precisely because reality TV operates at this level of sensation, of provoking and inciting feeling, that it should be recognised as a politicized site. Whatever the programme producers had hoped to incite, they could surely not have predicted the wave of sensation that erupted on social media during the broadcast. The hashtag #HappyToPayYourBenefits began to trend on Twitter during the broadcast of both episodes, used by viewers who were appalled by the divisive message of the programme who wanted to express their support of the welfare system. Scrolling through these tweets is instructive and energising and demonstrates the appetite for solidarity even in the face of ‘poverty porn’ television and the postwelfare consensus it seeks to establish. As sociologists we should seek to not only counter the unemployment myths which are presented, unchallenged, on such programming, but also to incubate and extend these kinds of popular resistances to neoliberal rhetoric.

The first episode of We All Pay Your Benefits featured (for me, its lowest point) one low-paid single mother peering disapprovingly into the shopping basket of another. However, through unexpected moments of camaraderie and compassion between the artificial categories of ‘claimant’ and ‘taxpayer’, the neoliberal myths of work and worklessness are challenged. At the end of the second episode, when asked if his experience of working has made him re-assess his life on benefits, Luther incisively turns the question round and states that his ‘taxpayer’ peers are underpaid: "both are worth more than what these jobs pay". Both Liam and Kelly recognise the strains placed on the family lives of their taxpayer peers through the demands of long hours, night shifts and low-paid work. Speaking back to austerity culture, and specifically to ‘poverty porn’ television, requires that we resist the symbolic and stigmatising divisions that it tries to impose, and seek instead the common costs we all face as a result of the excesses of global neoliberalism.

What the other social sciences can learn from economics (2013-09-09 13:00)

An interesting post by Diane Coyle on the LSE Impact Blog offers a useful counterweight to those who engage in economist-bashing as a matter of reflex. Though I’m sure I’ve probably lapsed into this on occasion, it’s something which increasingly bothers me. The idea that ‘economics’ does nothing more than embrace political orthodoxy and/or sell itself as an ideological force to the powerful is simply bad sociology and it obscures a much more complex picture which I think it’s crucial for us to understand. Coyle usefully summarises the recent public history of economics in the UK, which sociologists could learn a lot from:

In the UK, the strong presence economists have in public debate about policies ranging from public service reform to monetary policy, HS2 to the Euro crisis, arguably stems from a media initiative launched in 1997, prompted by a cover story in The Economist: “[2]The puzzling failure of economics.” Romesh Vaitilingam started the Royal Economic Society’s media initiative after that – I was then a journalist on The Independent, and was one of the economics writers he contacted. From then on, many economic researchers came to realise that there are some simple but essential lessons for disseminating research successfully – albeit still ignored by other academics.

For example, you have to use normal English, not professional jargon, to explain research. Statistical results require particularly careful explanation as not only the readers but also the journalists are often not statistically literate. You need to be aware of the constraints under which journalists operate, working to tight deadlines (especially in broadcasting), limited to at most a few hundred words, and above all pitching their story in competition with many other candidates. So there is a knack to explaining research in a straightforward, concise but not exaggerated manner, and this is why media training is one element of achieving impact.

The landscape of public debate has changed enormously since 1997, and blogs in particular have come to play a highly influential role in economics. Some of the best-known count as important media in their own right, including Paul Krugman’s [3]Conscience of a Liberal, or [4]Marginal Revolution run by Tyler Cowen and Alex Tabarrok. There are in addition now a number of blogs that publish columns by a range of economists presenting the findings of their academic research – as in the highly influential [5]VoxEU – or providing academics with a platform to provide informed comment on the issues of the day – such as [6]Project Syndicate. Many academic economists, financial market participants, practitioners and journalists now blog and tweet. The online public debate about economics is consequently extremely lively, albeit also manifesting some of the negative aspects of the online world, including a tendency to over-simplify (140 characters is not much) and polarise into opposing ‘camps’.

In the context of economics this discussion seems to lead inevitably to the question of influencing economic policy. In an important sense I think the scope of sociological engagement can and should be much wider than this. Not least of all because the concomitant complementarity (where significant amounts of research in economics logically entail certain conclusions about economic policy) is far more marginal for sociological research. But I think this is a strength rather than a weakness, in so far as that it leads quite naturally (in my mind at least) to a minimalistic criterion for public engagement – sheer interestingness or [8]‘making the familiar strange’ perhaps? Though I obviously think there’s more to public sociology than public engagement.

As I wrote about earlier in the week, I’m in complete agreement with David Mellor’s argument that [9]“we
don’t need to debate public sociology anymore; we need to get good at it”. Coyle’s blog post points towards how much more practically orientated the response of UK economists to a loosely homologous set of circumstances has been. One thing that particularly struck me was the alliance building she points to between academic economists and ‘economics writers’. Are there self-identified ‘sociological writers’? If not, why not? I’m certain there must be active writers with undergraduate or postgraduate degrees who for whatever reason no longer identify as sociologists despite having their sensibilities shaped by the discipline. If so then it’s important to build productive relationships with them but also to understand what patterning, if any, there is in the dissipative tendencies exhibited by the intellectual identities of those who have studied sociology but no longer do so within a university.

According to Mike Savage’s *Identities and Social Change in Britain Since 1940* there were 1,530 academic economists within the UK system in 2003-4 of which 57 % were research active. In contrast there were 1,400 sociologists of which 63.1 % were research active. Yet as Savage suggests, “if the ‘social’ disciplines of social anthropology, sociology, social policy, and social worker are grouped together, they become clearly the numerically dominant part of the social sciences, with over half of the core social science staffing” (Savage 2010: 131). The lack of ‘impact’ vis-a-vis economics here is puzzling and important to understand. My objection to facile invocations of the ideological role of economics to explain it stems largely from a belief that such ‘explanations’ are an obstacle to understanding what’s really going on here. There’s an element of truth to them but they simplify in such a way as to entirely obscure the practical differences of strategy and tactics which can be identified in how academic economics, in contrast to other social sciences, negotiates the public context within which it is embedded. I think there’s an awful lot that can be learnt here but that the response should not simply be to try and copy, say, the Royal Economic Society’s media initiative. I guess what interests me is that there seem to have been people outside academic economics working towards its popularisation in a way which does not seem to have been the case with other social science disciplines – I’d like to understand why this is the case, if I’m correct that it is, as well as how this ‘communicative gap’ can be bridged.

David Walker (2014-10-02 14:26:07)
As someone who has spent a good part of a career in journalism interested in disseminating social science, let me offer a partial answer to the question in the last paragraph. 1. it’s not ‘popularisation’ (which has a sniff of snobbery and/or epistemological absolutism about it), but application of the rule of thumb news writers apply (which of course is not ideology free) ...does this quicken the blood/interest the hard-bitten desk editors/ pass the ‘so what’ test. Economics stuff tends to have a higher ratio of passes because 2 (subject to empirical analysis) the kinds of things economists are interested in are the kinds of things that intermediaries (who would go out of business if they were too far off the public’s general interests) are excited by . . . tax, money, fairness, business, jobs etc. The ‘arena of interest’ also includes gender, family, power - the subject matter more often of the other social sciences - but their output doesn’t hit this spot often enough. Here’s a thought experiment. The Institute for Fiscal Studies is supremely successful at subjecting public conversation (especially initiated by politicians) to disciplined analysis and critique, usually economics led. Were there, say, an Institute for Social Policy, in what circumstances and over what output might it command the attention the IFS does. And, a question for social scientists, are there enough practitioners of sociology
and social policy to step up and do what Paul Johnson and colleagues do with such effect?

Sociological Imagination (2014-10-02 22:16:03)
That’s a VERY interesting question. I’ve just posed it on twitter.

Going through Overwhelming Experiences: Organizations in Times of Austerity - 29th November (2013-09-10 12:39)

Birkbeck Institute for Social Research

in collaboration with
BSA Sociology, Psychoanalysis and the Psychosocial Study Group & the Tavistock Institute for Human Relations

1974

Friday 29th November 1pm - 5 pm Room B04, 43 Gordon Square Speakers: Dr William Halton, independent consultant Dr David Bell, President of the British Psychoanalytic Society We are living in turbulent times, and organisations of all kinds are being buffeted from many sides as funding is cut, income streams dry up and internal pressure builds. Working in such organizations can be an overwhelming experience for people at all levels and undertaking kinds of roles. Call for contributions and participation From academics and practitioners working with psychoanalytic approaches to organizations, we are inviting Case Presentations for inclusion in the Study Day. The Case Presentations might take different forms, depending on the research questions/ consultancy project, the original audience envisaged for the work, and the role of the enquirer: for instance, a collaborative enquirer engaged by the organization under study, a (formal or informal) participative enquirer where the enquirer is a member of the organisation, or an external researcher. The intention is to provide a learning space for reflection on the range of methods and approaches that can incorporate psychoanalysis in sociological enquiry. Please submit your proposed case presentation in no more than 300 words to the event organizer, [2]Dr Milena Stateva by 14th October 2013. Outstanding case presentations which cannot be accommodated in the Study Day will be published as a blog on a dedicated website. The cases will be presented and discussed in small groups with keynote speeches following. All are welcome, whether or not a case study is submitted. [3]Please register and pay: £25 - Standard £15 - BSA members; Birkbeck staff; Tavistock Institute staff & associates; non-Birkbeck students & unwaged £10 - BSA member students; BSA member unwaged; Birkbeck students For further information contact: [4]Dr Milena Stateva

ISA 2014, Yokohama (2013-09-10 12:40)

Dear Colleagues,

As you may already know, September 30, 2013 is the deadline for submitting abstracts to the XVIII ISA World Congress of Sociology that will take place in Yokohama, Japan, on July 13-19, 2014.

I am extremely pleased that approximately 1,000 sessions covering a range of topics have been proposed by the Research Committees, Working and Thematic Groups. Please consult their Call for Papers and submit your abstract

1975
on-line through a centralized website by the submission deadline.

For more details on abstract submission, please see Guidelines for Presenters

Hope to see you at this ISA World Congress of Sociology in beautiful and historic Yokohama, a bay suburb of Tokyo, Japan.

Best,

Maggie

Margaret Abraham

ISA Vice-President, Research Council

International Sociological Association

Call for Articles and Open Space Pieces for this Themed Issue of Feminist Review, Issue 109, March 2015

CALL FOR PAPERS

The financial and economic crises of the last four years, together with an ascendance of conservative politics, have had far-reaching material and discursive consequences in regards to deepening social and economic inequalities. As capitalism seeks to reinvent itself in order to survive a crisis of its own making, austerity politics exacerbate divides of class, gender, race, ethnicity and disability at local, regional and global levels. In this special themed issue, we invite contributions that will provide new feminist analyses of the origins, modalities and effects of this contemporary economic, political and social crisis.

We are interested in exploring what feminism can bring to an analysis of the political economy of austerity. What macro- and micro-level changes are occurring in contemporary forms of capitalism and how are they gendered? What might a feminist analysis of the origins and impact of the financial crisis look like? How are we to understand the power of the financial services sector to set the parameters of economic policy and public debate? How do attacks on the state and the public sector fit into this overall emerging political economy? What is the nature and form of the cultural responses this crisis generates?

Equally, we are concerned with the differential impacts of austerity. While work has begun to emerge in terms of the disproportionate effects of austerity in relation to gender, race, class and disability, we welcome additional contributions to this field, including considerations of how austerity might be reconfiguring intersectional relations of privilege and subordination. We are also interested in new feminist research that considers specific sectors of the economy, or that focuses on the uneven effects of austerity within regional (eg. the Eurozone) and global spaces.

In a time of shrinking states and public services, how is social policy being transformed and what are the intersectional effects of these transformations? What legitimating discourses are emerging for austerity policies and what are their effects in relation to reconfiguring gender, race, disability and class relations and identities?

Finally, we invite feminist analyses of emerging forms of resistance to the politics of austerity, whether in the form of new social and political movements or of creative and cultural practices. What and who are the subjects and objects of these forms of resistance, and what are their limits?

Possible topics include, but are not limited to:

- Country, region or sector-specific feminist analyses of the origins and/or impacts of the financial crisis;
- Differential austerity;
- In relation to gender, race, ethnicity, sexuality, disability, class, generation and their intersections;
- In relation to specific sectors;
- At local, regional or global levels;
- Social policy in a time of austerity – how are social welfare and equality/diversity agendas changing and what are their effects;
- Discourses of austerity and their implications for social relations and identities;
• Attacks on the public sector, their discursive legitimations and effects;

• The austere state and feminist alternatives;

• Politics of protest in times of austerity – new social movements and political strategies;

• Cultural politics of resistance – emerging forms of creative practice as resistance.

Issue Editors: Avtar Brah, Ioana Szeman and Irene Gedalof

Deadline for first drafts of papers marked clearly ‘AUSTERITY’ submitted online and following Feminist Review guidelines (http://www.palgrave-journals.com/fr/author_instructions.html) by 15th December 2013

The editors are happy to discuss possible papers informally with potential contributors. Please contact: a.brah@bbk.ac.uk; I.Szeman@roehampton.ac.uk; i.gedalof@londonmet.ac.uk

Conference Bingo! (2013-09-10 14:56)

[1]Kat Gupta and [2]Heather Froehlich have put together a Conference Bingo card which it’ll be hard to resisting printing out for next time I attend a conference. Are there any items you think they've missed....?

Call for Papers - Moral Panics and the State, 22nd November, Cardiff University (2013-09-10 17:00)

Call for Papers is now open and closes on Friday 27th September 2013

*******Delegate Fee will be complimentary for those delegates whose paper is accepted***********

[1]http://moralpanicseminars.wordpress.com/programme-seminar-3/call-for-papers/ Papers will address a series of key questions: • What is this social issue or anxiety about? • What is held up as evidence of this social concern? • Who are its subjects? • Who are the claims-makers/moral entrepreneurs who are leading on this issue? • How does this issue connect to wider social concerns and tensions? • What is significant about the historical moment at which the panic develops? • What are the consequences of these moral panics? • What lessons are to be learned Selected papers will be allocated 15 minutes for their presentation. Successful papers will be notified by early October 2013. Presenters will be expected to provide copies of their papers in advance of the conference to be distributed to the delegates. Practicalities All paper presentations will have access to PowerPoint. Any additional equipment needs should be discussed.

Academic freedom and 'unpublishing' your thoughts (2013-09-10 20:20)

This disturbing case in America raises questions about the implications of the NSA's activities for academic freedom (HT [1]Gurminder Bhambra):

A [2]professor in the computer science department at Johns Hopkins, a leading American university, had written a post on his blog, hosted on the university’s servers, focused on his area of expertise, which is cryptography. The [3]post was highly critical of the government, specifically the National Security Agency, whose reckless behavior in attacking online security astonished him.

Professor Matthew Green wrote on 5 September:

I was totally unprepared for today's bombshell revelations [4]describing the NSA's efforts to defeat encryption. Not only does the worst possible hypothetical I discussed appear to be true, but it's true on a scale I couldn't even imagine.

The post was widely circulated online because it is about the sense of betrayal within a community of technical people who had often collaborated with the government. (I linked to it myself.)

On Monday, he gets a note from the acting dean of the engineering school [5]asking him to take the post down and stop using the [6]NSA logo as clip art in his posts. The email also informs him that if he resists he will need a lawyer. The professor runs two versions of the same site: one hosted on the university’s servers, one on Google's blogger.com service. He tells the dean that he will take down the site mirrored on the university’s system but not the one on blogger.com.

1980
The analysis in the article is pretty incisive, making a convincing case that this censorship is entirely preemptive and perhaps even more worrying for it:

Dennis O'Shea told me the original concern was that Matthew Green's post might be "illegally linking to classified information". I asked him what law he was referring to. "I'm not saying that there was a great deal of legal analysis done," he replied. Obviously. But again: given the severity of the remedy – unpublishing an expert's post critical of the NSA – careful legal analysis was called for. Why was it missing?

In commenting critically on a subject he is expert in, and taking an independent stance that asks hard questions and puts the responsibility where it belongs, Matthew Green is doing exactly what a university faculty member is supposed to be doing. By putting his thoughts in a blog post that anyone can read and link to, he is contributing to a vital public debate, which is exactly what universities need to be doing more often. Instead of trying to get Matthew Green's blog off their servers, the deans should be trying to get more faculty into blogging and into the public arena. Who at Johns Hopkins is speaking up for these priorities? And why isn't the Johns Hopkins faculty roaring about this issue? (I teach at New York University, and I'm furious.)

Notice: Matthew Green didn't get any takedown request from Google. Only from Johns Hopkins. Think about what that means for the school. He's "their" professor, yet his work is safer on the servers of a private company than his own university. The institution failed in the clutch. That it rectified it later in the day is welcome news, but I won't be cheering until we have answers that befit a great institution like Johns Hopkins, where graduate education was founded on these shores.

And another thing: America's system of research universities is the best in the world. No one argues with that. It's one of biggest advantages this nation has. If it becomes captive to government and handmaiden to the surveillance state, that would be an economic and cultural crime of monstrous proportions. What happened to Matthew Green's blog post yesterday is no small matter.

It raises an important sociological point about how institutions might mediate (and perhaps amplify) the operations of the NSA through a potent combination of risk aversion and idiocy. This case is extremely worrying.
Changing the subject: **Occupy Wall Street’s Achievements and Prospects** by Ruth Milkman

In October 2012, British Sociological Association journal Work, employment and society hosted a one-day conference reflecting on key debates and looking forward to what the future might hold for the discipline and the journal. We are happy to have video footage of the stimulating presentations.

Occupy Wall Street burst onto the scene in New York City September 2011. Inspired in part by social movement in the Middle East and Southern Europe, its critique of inequality rapidly gained traction with the broader U.S. public with the slogan “We Are The 99 %,” cloning similar occupations worldwide. This presentation explores the sociological roots of OWS, with particular attention to the changing US labour market, and reports on the results of a unique representative survey of New York City OWS participants. In addition, the presentation analyzes the movement’s achievements to date and speculates about its future.

The British Social Attitudes Survey (2013-09-11 10:00)

The British Social Attitudes Survey is a large annual survey run by the National Centre for Social Research. It’s now in its 30th year and NatCen have put a lot of effort into promoting this year’s iteration. As they describe the survey,

Each year NatCen’s British Social Attitudes survey asks over 3,000 people what it’s like to live in Britain and what they think about how Britain is run.

Since 1983 we’ve been measuring and tracking changes in people’s social, political and moral attitudes.

The survey is a critical gauge of public opinion, and is used by the Government, journalists, opinion formers and academics.

Celebrating 30 years of British Social Attitudes

This is a special year for British Social Attitudes; 2013 marks the publication of our 30th annual report.

To celebrate 30 years of NatCen’s British Social Attitudes we’ve launched a brand new interactive data tool, which lets you explore 30 years of data on attitudes to welfare, morality, politics, NHS and the environment.

Helping the nation

We’re a charity and we want our research to reach as many organisations trying to improve life in the UK as possible.

That’s why NatCen’s British Social Attitudes is freely available online and available as an ePUB.
The ‘gold standard’ of survey series

Every year, we ask people to take part in British Social Attitudes on the basis of random probability sampling.

This technique ensures that everyone has an equal chance of being picked to take part, so the results are representative of the British population.

And because we repeat many of the same questions over time, we’re able to identify real changes in people’s social attitudes.

In this video Alison Park, Co-Director of British Social Attitudes, gives a quick overview of some of the highlights of 30 years of NatCen’s British Social Attitudes survey.

IFrame: [3]//www.youtube.com/embed/1i-CF0fmqRE

However the reason we’re posting this is not simply to sign post the fact this survey exists but instead as a preamble to the simple act of posting the URL for the wonderful site NatCen have put together where you can play around with 30 years of British Social Attitudes data. Apologies in advance for the time you’re likely to waste with this: [4]http://www.bsa-30-data.natcen.ac.uk/
Any thoughts on the data? As always comments very welcome, leave them in the box below.

3. file://www.youtube.com/embed/1i-C0fmqRE

Blogging for #PhD Students: Risks and Opportunities (2013-09-11 18:34)

The panel responds to a question from the audience in this podcast from the BSA Digital Sociology group’s seminar on July 16th 2013. These were the speakers on the day:

Kim Allen, Manchester Metropolitan University
Les Back, Goldsmiths, University of London
Ben Baumberg, University of Kent
Laura Harvey, Brunel University
Noortje Marres, Goldsmiths, University of London
Heather Mendick, Brunel University
Mark Murphy, University of Glasgow
Evelyn Ruppert, Goldsmiths, University of London
Helene Snee, University of Manchester
An interesting article on Savage Minds recently discussed public engagement within anthropology and its recent history. The author argues for the potential contribution which anthropologists are able to make within public debate and discusses her own experiences of seeking to do this:

"Anthropology," James Peacock said in a 1995 address at the annual meetings of the American Anthropological Association, "boasts brilliant observers, cultural critics, writers, and creators, yet few if any of us have produced books that we (not to mention others) crave to read, films that we crave to see, or music that we crave to hear." Thirteen years have passed since Peacock spoke these words. So, have anthropologists today heeded his call? Are the crucial issues of our time receiving public reflection from anthropologists, if not in books, then in popular media? What are some of the obstacles that prevent us from doing so more often?

With every passing year, I see more anthropologists using their regional and topical expertise to weigh in on social issues in the media. In this post, I'd like to address two possible ways that we as anthropologists can communicate with a lay public—media appearances and Op-Eds—and the positives and negatives of both.

What particularly stood out was the parallel here:

To me, this issue of communicating with wider audiences is becoming increasingly crucial, particularly as anthropologists are constantly forced to defend the value of an anthropology degree in an environment that insists on quantifying knowledge. To write for the public is to demonstrate that anthropologists have knowledge, expertise, and thoughts worth considering, and that we value civic engagement. In a future post, I'll offer some tips for writing Op-Eds, and also discuss how graduate programs and other entities, like the Center for Public Anthropology, are encouraging students to learn to engage with the public this way.

I've tried to make the corresponding point about sociology a lot, though have never done so in a way that left me feeling satisfied that I've managed to articulate my underlying belief adequately. As sceptical as I am about 'Impact' and 'Public Engagement' in their institutionalising and top-down manifestations, it seems blindingly obvious to me that sociology needs to actively and creatively represent itself through interventions outside the academy if it is to have any hope of securing its wider esteem and legitimacy in an increasingly inhospitable climate.

1986
In theory much of this falls within the remit of ‘public sociology’ but, to be utterly frank, my defining experience of public sociology was a failed attempt to setup a public sociology group which led to countless hours of tedious arguments about what ‘public sociology’ is. It did lead to the production of this wonderful resource (the [2]public sociology bibliography) but the experience was otherwise an extremely frustrating one.

I may be generalising wildly from an extremely particular set of circumstances but the intuition this left me with was that debates about ‘public sociology’ unfold at too high a level of abstraction. However I think the converse obtains with ‘public engagement’: I’ve been at the fringes of this for some time (e.g. I’m a Public Engagement Ambassador at the NCCPE) but the lack of any abstract vantage point, such as would consider purpose or politics, leaves me unwilling to jump any further into it. Though it’s worth noting that the reason the terminology of Public Engagement (with a capital ‘P’ and a capital ‘E’) seems so sterile to me might be that it’s purged of disciplinary specificity.

But as it stands I’m not sure where to get support in pursuing public engagement activities. I took a media skills session my university communications office offered a few years ago but other than that, it’s unclear to me what assistance is on offer. I’m lucky in that there’s a few people who are more established in their careers than I am who are happy to talk to me about issues related to working with the media. But on occasions where things have gone wrong or where I’ve struggled to make a decision about what to do (this happened very recently) some sort of organised support, perhaps at a disciplinary level, would have been really useful. I’m not sure what form this could take but even to have more online conversations about the practicalities of doing public sociology than currently take place (I do go looking for them) would be beneficial.

At present my experience is of there being no institutional support (or institutional recognition) for many of the things I do – in fact I’ve sometimes felt faintly embarrassed by it and kept it to myself. My assumption that this was an irrational reaction was challenged recently by hearing someone be described as a ‘media whore’ as a genuine term of abuse. But I like talking to print and broadcast journalists. I like producing websites and podcasts. I like trying to get media projects going (though I’ve yet to succeed). I like talking at non-academic events. I like organising exhibitions (hopefully coming soon after 3 years + of intermittent work). I like the idea of communicating my own work as widely as possible. I like the idea of writing books that popularise the work other people have done.

It’s this affective dimension which I find so utterly missing in institutionalised conversations about public engagement i.e. why this activity matters to people. But for me at least, it leads naturally to practical questions about discussing projects and comparing experiences – it’s this space of discussion, affectively laden but orientated towards practical activity, which seems stuck in the middle between public sociology and public engagement. Occupying this ground was actually my initial idea for what [3]The Sociological Imagination would be but it soon transmuted into something quite different. It’s also something I’m keen to incorporate into the remit of the [4]BSA Digital Sociology group but it remains to be seen whether the broader set of questions gets squeezed out so only the digitally orientated ones are left. Writing this post has also reminded me that I started creating this Bundlr ([5]Getting Started: Public Engagement for Social Scientists) some time ago but never got round to finishing it – any suggestions for inclusion are much appreciated.

In short I don’t think sociology in general (and digital sociology in particular) has a [6]demand problem – at least not in the way that some might assume. However I think an apparatus for supporting public sociology is crucial if we accept it as axiomatic that greater public engagement by sociologists is a good thing.

Cluster hire in Transgender Studies at the University of Arizona (2013-09-12 15:48)

Faculty Cluster Hire in Transgender Studies The University of Arizona is pleased to announce a cluster hire of 4 tenure-track faculty positions in transgender studies over the next two years. Two positions are being offered this year in the College of Social and Behavioral Sciences (SBS), with a start date of fall 2014. Two positions to be based elsewhere in the university will be advertised next year, with a start date of fall 2015. This cluster hire is one element of the University of Arizona’s unprecedented investment in the field of transgender studies. Other elements include support for a new peer-reviewed journal, TSQ: Transgender Studies Quarterly, which will be published by Duke University Press starting in 2014, with the editorial office housed at the University of Arizona’s Institute for LGBT Studies; a new interdisciplinary Center for Critical Studies of the Body; and an anticipated graduate degree program in transgender studies.

Transgender studies concerns itself with the variability and contingency of gender, sexuality, identity, and embodiment across time, space, languages, and cultures. It pays particular attention to the socio-political, legal, and economic consequences of noncompliance with gender norms; to the histories and social organization of minoritized transgender lives and communities; to forms of cultural production that represent or express gender variance; to the medicalization of identity and the depathologization of bodily difference; and to the emergence of novel forms of embodied subjectivity within contemporary techno-cultural environments. Because we seek to hire the most innovative scholars in this rapidly evolving field, we are open to considering any area of specialization, research agenda, and inter/disciplinary training compatible with faculty service in the College of Social and Behavioral Sciences.

We invite applications for two assistant professor positions, one of which will be based in the Department of Gender and Women’s Studies, and the other of which will be based in another suitable department within SBS (see[1]sbs.arizona.edu). In addition to possessing requisite expertise in transgender studies, applicants must be qualified to teach core courses in their home department, and ideally will fulfill strategic priorities set by SBS in the following areas, broadly defined: health, the environment, technology, and global impact/regional roots. Our goal is to hire interdisciplinary scholars who can contribute to a new program in transgender studies while also meeting the needs of their home department.

To apply, please send a cover letter, CV, and the names of three references by October 14, 2013 to [2]uacareertrack.com, job number 53456. Shortlisted candidates will be asked to supply additional materials.

Quantified Self Research Network – Inaugural Event (2013-09-12 15:54)

Tuesday, September 17, 2013 from 1:00 PM to 5:00 PM (BST)
Leeds, United Kingdom

At this inaugural event there will be presentations from researchers who have been exploring quantified self or self-tracking either empirically or theoretically which will stimulate discussion around the potential and implications for future developments. We hope that this event will stimulate discussion and collaboration among attendees and further afield. This is a great opportunity to be involved in the development of an emerging academic area and to connect with others. Below is a short summary of the proposed interests of the network. This is, however, intended to be an open forum in which a collective vision for the future of the network can be produced.

In the last few years there has been a significant increase in public and academic interest in the use of devices or techniques for the accumulation, aggregation and analysis of personal data. Apps for mobile phones such as Track My Run and body tracking devices such as Jawbone, Fitbit and Nike’s Fuelband have perhaps garnered the widest attention with their ability to passively collect data on everyday activities which can then be analysed and shared with others. There is, however, more to quantified self than the mainstream media picture of obsessive "techies". Many people engaged in "life logging" collate data on mood and experiences often without a direct quantitative element. While a relatively formalised arm of the quantified self movement has formed, through the Quantified Self group based in San Francisco, not everyone involved in quantified self activities is affiliated with Quantified Self. This formalised movement, as well as the broader cluster of practices and orientations which are coalescing within and beyond it, point to commercial and political connections which have yet to be fully explored.

“What was Visual Sociology?”: specialisation and fragmentation within disciplines (2013-09-13 08:00)

There's an interesting [1]post on the CSIP blog by Michael Guggenheim. Along with Nina Wakeford, he’s convening Goldsmith's new MA Visual Sociology. The strange formulation in the blog’s title stems from his desire to overcome the visual epithet, such that the terminology of ‘visual sociology’ could be confined to the past. There's an interesting question here about how terminology can work to codify the stratifications within disciplinary knowledge systems:

Why then does this blog post speak of visual sociology in the past tense? Why not ask: [2]What is visual sociology? (to follow up Noortje Marres' [3]"what is digital sociology" post?).
Short answer: Because we need to get rid of the "visual" as a denominator of the subdiscipline. By starting an MA in visual sociology I am guilty in perpetuating this unfortunate situation, but, I hope, we may also produce a new generation of students, who can then leave the visual behind.

As in the case of women's studies, the denominator does not simply announce a subfield that stands next to any other subfield. There is not visual sociology and textual sociology. There is not men's studies and women's studies. Women's studies emerged because disciplines such as history and sociology were men's studies without saying so in the title. For the same reason, we have sociology, and a special subfield called visual sociology, because for whatever reason, sociology is assumed to be a purely textual discipline (the same situation applies to visual anthropology). "Visual" is considered to be strange, not really sociology, not really scientific, or it is simply forgotten.

In many other disciplines the same situation does not apply. There is no visual astronomy or biology or chemistry. A non-visual astronomy simply does not exist. What would astronomers do without producing visual traces of other stars, planets and galaxies?

It seems important to me that we distinguish the terminology of Visual Sociology (or Digital Sociology) from that of X studies. In each case, we can see an underlying tendency towards the diversification of the knowledge system, driven in part by the ideational arms race within which professional rewards go to those who can combine ideas in novel ways and disseminate them widely through frequent and well-placed publications. But the terminology of 'Visual Sociology' will tend to allow this diversification to be reincorporated into disciplinary knowledge systems whereas the terminology of X Studies will tend not to.

By this I simply mean that the work being done under the rubric of 'visual sociology' can more easily be related back to sociological work as such. The propositional content of Visual Sociology and, to invent a parallel for sake of argument, Visual Studies might be indistinguishable but the nomenclature of the former entails an orientation towards the beliefs, theories and practices which constitute the 'parent' discipline. This makes it more likely that the implications of Visual Sociology (the contradictions and complementarities which obtain at the level of ideas) for Sociology more broadly will actually be recognised, drawn out and argued for by the cultural agents whose activity is required for the reproduction or elaboration of the knowledge system.

In short there are three points which interest me here: (1) the ‘ideational arms race’ driving diversification, (2) the emergence of sub disciplinary specialisms and (3) the emergence of substantive areas of interdisciplinary inquiry. There’s an underlying structural process driving (1) which results largely from the incentive systems operating within the modern academy, as well as the technological reduction of friction which used to impinge upon the navigation of the knowledge system i.e. it’s easier to put elements together in novel ways if you can instantly find them through Google Scholar etc. So I’m proposing that (2) and (3) are socio-cultural trends which enable this diversity to be reincorporated into the knowledge system in different ways: one allows for disciplinary reincorporation whereas the other engenders disciplinary fragmentation.

If we accept that the ‘Eternal Sunshine of the Spotless Sociologist’ (see the letter to Laurie Taylor by Stephen Mugford reproduced below) and continually reinventing the wheel is a bad thing then these issues of how areas of inquiry are named become much more important than they might initially seem. Yet another recent addition to my list of post-PhD writing projects is to apply Margaret Archer’s often overlooked work on culture to the (re)formation of disciplines in the contemporary academy. In this post and a few others I’ve started to sketch the initial outlines for what this project will entail and I think it offers a powerful set of tools for untangling the complex interaction of structure, culture and agency in the reproduction and transformation of academic knowledge.
Laurie,

I listen to TA as a podcast, so timing and order can be a bit scrambled. So it was that only recently I heard one on 'intoxication' from 2012.

I’m writing to you because it provoked in me a serious concern about sociology today which I raise with you below, I hope collegially. (I trust not in some curmudgeonly way).

Brief background: You and I are pretty well age and disciplinary peers—I did my London Sociology Hons in 1968 and then went to Bristol with Michael Banton, Theo Nichols, et al, finishing writing my PhD while teaching sociology in NZ. In late 1974 I went on to the ANU where I stayed until late '96. In the period '79-'96 I was fairly heavily involved in crime and deviance studies, authoring and co-authoring a range of papers on drug use and policy and also some on restorative justice. This took me into the American Society of Criminology where I met, or re-met in some cases both UK sociologists (Ian Taylor, Jock Young, Mike Presdee*, etc.) as well as US ones (Bill Chambliss, Jack Katz, etc.) Great fun and good times. Pat O'Malley and I organised a ripper session at one ASC on crime, excitement and modernity with Mike Presdee, Jack Katz, ourselves, etc. which was packed to the rafters....

[*I say re-met because Mike and I not only met in Australia, we also, I discovered, went to school together in Gloucester. A sad loss is Mike.]

So if I say that the material in the program was pretty familiar, you won't be surprised. And of course, if you did not know the area well, it would be a good episode because it covered a lot of ground effectively, the speakers were nicely integrated, etc. I’ve done a fair bit of media work (professional video work, etc.) and I know TA is a well created series.

But what DID worry me, which is implicit in my title, is that I learned almost nothing. It is 20+ years since, for example, I co-wrote papers like:

- 1993 Social change and the control of psychotropic drugs—risk management, harm reduction and 'postmodernity', Drug and Alcohol Review, 12: 369-375

My point is not that these folks did not cite, or seem to know, these works. Rather, these pieces were part of a much larger corpus written by people like Presdee and Katz and others, which explored all the conceptual and theoretical issues that were raised in much the same way but the corpus as a whole seems to be completely missed.

And so all the (to me) familiar themes came out. Yes, antidrug use campaigners miss the pleasurable side of drug use. Yes, Bakhtin and carnival are relevant ideas. Yes, drug abuse is best described as the “the use of drugs I don’t use by people I don’t like”. Yes, getting written off is an ambiguous
thing—fun but dangerous. Et cetera. And all presented as if somehow this was new or surprising, when it had all been said before (and very likely before I and my mates said it too—we may equally be guilty of exactly the same problem.)

I would hope that after 20 odd years out of the game, I would hear something new, something that made me think, "Oh, wow" and not "Uh, huh." In other fields of enquiry things are moving apace. Leave aside the natural sciences with myriad breakthroughs (from Homo Floriensis to the Higgs Boson), cognitive science and psychology and their cognates are all rocketing along. Every time I listen to a podcast in one of these fields (and in some of them I am quite well read so this is not just a naïve effect) I hear new and intriguing stuff. And there is some new stuff in sociology, especially around network research, where I DO get the wow effect.

It worries me, however, to hear people rediscovering things for the nth time and solemnly discussing them as if they are new. And I think that maybe what we see here is a real warning about the discipline. What do you think?

Maybe I am just suffering from 'nostalgia aint what it used to be"? But I don’t think so.

Collegially yours,

Stephen

[7]Making the familiar strange
Although the British Prime Minister David Cameron popularised the renowned axiom ‘the age of austerity’ in a speech of 2009, political discourse has long given shape to popular rhetoric on the subject. The sentiments of ‘make do and mend’ and ‘boom and bust’ offers two such examples that have filtered into popular and national conscious. Indeed, there have been memorable occasions when political parties have sought to appropriate the vehicle of popular culture to articulate their agendas; who can forget Tony Blair’s use of the D:Ream dance anthem ‘Things Can Only Get Better’ as part of the Labour Party’s Manifesto in the 1996 General Election, for example?

However, political idiom is not the sole medium to express the effects of austerity, recession and the global economic crisis in contemporary society. From Jarvis Cocker’s glamorisation of the sexual tension between the ‘haves’ and have nots’ in Pulp’s ‘Common People’, to Morrissey’s cynical yet dulcet tones espousing what today’s Government might describe as the scourge of benefit culture in The Smith’s 'Still Ill', popular culture has sought continually to explore and engage with the social and cultural manifestations of recession and austerity. John Self, the protagonist of Martin Amis’s Money learned hard lessons about ‘maxed out’ credit cards in the Thatcherite Yuppies culture of the 1980s, but the summer of 2013 will see Kirstie Allsopp share her austerity-inspired know-how with prime-time audiences in the Channel 4 television series Fill Your House For Free.

Our edited book collection, Hard Times: Austerity and Popular Culture seeks to map the diverse ways in which austerity is—and has been—reflected in and by popular culture. We solicit submissions on any aspect of austerity in popular culture that can offer new and innovative insights into its representation and ideologies.

In what ways have literature, film and television, and music (amongst other cultural modes) given expression to austerity? How are its effects conveyed? What commentaries does popular culture offer on, about or towards the age of austerity? How has the expression of austerity in popular culture changed over time, and what lessons about representations of austerity in popular culture from the past can be learnt in the present? Can popular culture have a significant influence in shifting our attitudes towards political discourses of austerity? In soliciting submissions from across the arts and humanities, the editors welcome submissions that could consider the following themes:
- Representing recession
- Credit and spending culture
- Boom and bust – individual and cultural
- The Gendering of austerity
- Thrift chic
- Self-sufficiency vs. spending cuts
- The austere family
- Race, disability, and/or class and austerity
- Benefits culture(s)
- Nostalgia and austerity
- Representing contemporary austerity through the past
- Unemployment and/or poverty
- Youth and austerity
- Revolution, revolt and protest against austere times

Please submit abstracts of 600 words and a short biographical note to both editors, Dr Helen Davies (Helen.Davies@tees.ac.uk) and Dr Claire O’Callaghan (cfo3@le.ac.uk) by 31st January 2014. If accepted, completed chapters of 6000 words will be expected by 1st September 2014. A proposal will be submitted to I.B. Tauris from whom we have a received an expression of interest.

---

**Does Žižek take himself as seriously as other people do? Idolatry, activism and the academic left**

(2013-09-15 08:00)

So as most people reading this will probably realise, Žižek bashing and boosting has been somewhat in vogue within certain sections of the academic blogosphere in recent months. The Sociological Imagination was an enthusiastic part of this recently, through an ever-so-slightly polemic blog post penned by Steve Fuller,

Slavoj Zizek may be great at beating up on grand old men of the anti-establishment such as Chomsky, but he is a total waste of space for a self-described ‘Left’ that wants to remain politically relevant in the 21st century. Whenever I read him, I think to myself: This guy either just wants us to feel good about ourselves after performing some self-contained Occupy-ish rituals or he is calling for outright violence in a prophylactic bloodbath. Zizek can’t seem to imagine any other political alternatives, which may suit his vast legions of followers, who are ‘politically inert’ by most conventional understandings of the phrase. This was really made clear to me in his latest piece for the Guardian, which celebrates

1995
the importance of cyberspace whistleblowers, who if ultimately regarded as ‘progressive’, will be for reasons that we have not quite yet figured out. At the moment, they look like fleas on the arse of history.

This prompted a spate of obnoxious comments which I saw no point in posting. Previous articles I'd posted myself, which were far from dismissive of Žižek, had prompted people to post abuse at the @soc _imagination – it was initially amusing to be told I was a reactionary and have my scientism denounced before it eventually just got tedious. But then I’ve always been mildly contemptuous of academic cultural politics in a way that I tend to keep to myself, lest I wander round the academy inadvertently insulting people. My intention in writing isn’t to be vituperative, in fact I’m trying very hard to avoid this, but simply to observe that the ratio of rhetoric to action among the academic left can often be distressingly low. As a biographically orientated sociologist I have a pretty clear understanding of the reasons why this is so and, as someone whose activism has often been squeezed out while grappling with a far from ideal work/life balance over the last five years, this understanding is informed by self-reflection as much as social observation. However I nonetheless think this is a problem and, oddly enough, some of Žižek’s ideas have been important in elaborating my understanding of how this is so.

Particularly his account of **cynicism**, which at least as I understand it*, argues that post-ideological culture tends towards an over-estimation of subjective belief: people congratulate themselves on not being ‘taken in’ by ideology while nonetheless construing their circumstances in a way which engenders objective complicity. My political problem with Žižek is the peculiarly post-ideological form of idolatry his work seems to engender – what difference does Žižek make? What’s the point of Žižek? I’ve never heard an answer to this question which isn’t irredeemably subjective, construing him as a diagnostician of late capitalism in a way which implicitly invokes some objective and proactive correlate, the specification of which is indefinitely deferred. Or in slightly plainer language: Žižek fans always talk about him as if his work is deeply practical in its implications and yet never seem to say what these are exactly. My accusation is that his work often engenders a subjective sense of one’s political outlook as being intellectually sophisticated while contributing nothing, in fact often detracting from, objective action. This is what prompted me to write this post, which I’ll finish soon lest it become overly rambling, which I cite to illustrate my point in a way which will hopefully be conducive to friendly debate:

Subsequently, this is also why I argue that Žižek provides us with the only space for the left. Any other leftist project (“social scientifically literate” or otherwise) is by definition fundamentally apolitical if they only remain within the possible, but Žižek allows us to revive the ‘politics proper’ which is central to some of the most radical sociologists and social theorists (including, I would argue, [2]C. Wright-Mills whose criticism of abstract empiricism in describing the sociological imagination embodied the Marxian dictum that “philosophers have only interpreted the world, the point however is to change it”). Žižek shows us a way to break from contemporary ‘social sciences’ which spends its time and resources describing society in an age where it is needed more than ever to change society for the better.

On the contrary I think Žižek provides us with an intoxicating rhetoric to describe this **aim** but offers little to nothing which helps do it and in fact muddies the waters and makes ‘resistance’ seem much more theoretically complicated than it often is. I write in the paragraph above the quote that his work ‘seems’ to engender this tendency because I’m completely open to changing my mind about this. Plus it’s probably useful to reiterate the point that I read a lot of Žižek and, more so, I don’t do it in a ‘know thine enemy’ kind of way. I read him because I enjoy his work. I have more of a problem with how his work is taken up and deployed than I do with the man himself. Žižek clearly likes reading,
writing and speaking. He lives the pampered life of the international academic superstar. He is a brand. He is also idolised. I'm not dismissing him on this basis – in fact I'm not dismissing him at all – not least of all because Chomsky, one of my life long heroes, is just as much of a brand and is equally idolised. In fact it was this meeting of the two most high profile brands on the academic left which meant their public spat, contrived in large part by academic web editors such as myself, attracted the attention which it did. Nonetheless I do think the Žižek and Chomsky brands tend to dominate the intellectual attention space of the left, simply taking up room that would be occupied by other scholars and activists – thought this bothers me much more in the case of the latter than the former.

And I hasten to add that if I haven't understood his meaning correctly then I couldn't care less. I read Žižek because I find him enjoyable and often thought-provoking, approaching him in an exegetical way is like reading the Daily Mail. I understand why people might do it, I'm sure I'm intellectually capable of it but left to my own devices it's the last thing in the world I'm ever going to choose to do.

Žižek is a jester in the pay of capital to promote harmless subversions. Those who really would like think about transformation of capitalism (revolution really is an obsolete idea) should read [1] The Gramscian Moment by Peter D. Thomas

honneth (2014-05-17 20:59:22)
'Does Zizek take himself as seriously as other people do' => i unequivocally think not. Part of the problem, I think, with the fanaticism of some Zizek fans is that that a lot of his fanbase are undergrads who don't really have the theoretical rigour to properly understand what he's on about - an encounter with Zizek because of his fun anecdotes, without some understanding of the theory that informs his work, can be very confusing. But the problem as I've experienced it is that because (in my experience at Warwick, at least), there's not really any academic staff I've encountered at undergrad level who seem interested in discussing Zizek, or in critiquing him - he's simply ignored. So there's no-one to help clarify things. And within the social sciences Hegel and Lacan aren't really taught. For me at least, I discovered them (and read them) because of Zizek, which I think is great. And for those bored with the orthodox paradigms it is easy to become uncritically enamoured with Zizek's radical brand of critical theory. But I agree in that I enjoy Zizek's work because it really makes me think. As with all theory, its utility in practice is questionable. But that is an issue which goes well beyond Zizek in particular.

very thought provoking comment! shame it seems like that at warwick - perhaps the theory centre should open up the reading groups to undergraduates next year?

‘Theory’ is what happens when common starting-points can no longer be taken for granted (2013-09-15 11:51)

'theory' is what happens when common starting-points can no longer be taken for granted. For example, literary critics in the English-speaking world in the 1950s and 1960s disagreed about many things - about the authorship of certain Jacobean plays or about the influence of Keats on Tennyson or about whether D. H. Lawrence was a great writer - but for the most part they did not disagree about whether the evaluation of literary worth was legitimate or even possible, or indeed about whether there was such a category as 'literature'. When all these concepts and procedures are defamiliarized, made to seem culturally contingent rather than logically necessary, debate has to move to a more theoretical or abstract level. But once again, this is not a form of pathology, not something that happens because there is nothing more to say about the established canon or because literary scholars have lost interest in literature (though some may have). It may, rather, be an index of health, or at least a sign that scholars cannot and should not be immune to the intellectual changes consequent upon living in a more diverse society in which the assumptions shared by certain traditional elites no longer command general assent

- [1] What are Universities For? by Stefan Collini (1176)

1. https://kindle.amazon.com/work/what-are-universities-for-ebook/B00SVFV7HE/B006UCVPJM

It seems a safe assumption that most people who read this blog will be familiar with the [1]Great British Class Survey. For anyone who managed to miss it, this is how the LSE’s Mike Savage described the project in a post on the [2]LSE Politics Blog:

In April 2013, the first results of the BBC’s Great British Class Survey (GBCS) will be launched, in a simultaneous publication in the British Sociological Association’s (BSA) journal Sociology, and in a plenary address at the BSA’s annual Conference. The BBC are anticipating that the results will be a very important social science story and plan to feature them on their news channels, including radio, television and the web.

The Great British Class Survey is one of the most exciting ventures in digital social science which has yet been attempted. Launched in January 26th 2011, more than 161,000 people have completed a 20 minute web survey, which makes this the largest ever study of class in the UK, with unusually detailed information on how social class maps onto specific occupations, geographical locations, and even the particular university which respondents went to. In a period when there is an intensifying interest in the accentuation of social inequality, this project promises to deliver the most sophisticated and detailed understanding of ‘the state of the nation’ that we might posses.

http://blogs.lse.ac.uk/politicsandpolicy/archives/31179

Lots of people didn’t like the Great British Class Survey. Personally I loved the fact that for an entire week millions of people up and down the UK were debating sociological conceptions of class. Furthermore, a lot of the objections I personally encountered seemed to amount to little more than "I think I’m X and the GBCS said that I was Y". Nonetheless there clearly were a lot of criticisms that could be made of the GBCS and as the full time editor of a politics blog at the time I was in the privileged position of being able to sit round all day drinking coffee and reading the many online responses while getting paid for it.

As someone in the presumably quite unusual position of reading what I’m sure was a substantial proportion of the online debate about this while having pretty much zero intellectual investment in debates about class (I’m a class struggle vulgarian when it comes to political issues and pretty satisfied with Margaret Archer’s work in the 80s+90s when it comes to treating these questions in my own research) it was easy for me to remain detached and see the whole episode as a pleasing reflection of the academic blogosophere’s growing maturity. But it was obvious to me throughout that this debate was going to run on beyond the confines of academic blogs and furthermore that it was an important one given a range of underlying tensions reflected in it, particularly the influence of Bourdieusian theory in British sociology. Leaving aside the vituperativeness of some on Twitter there are really interesting broader issues tangled up in the criticisms of the GBCS as a specific project. For instance the LSE Politics Blog hosted a thought provoking interview with [3]John Goldthorpe:

The first thing to say about the recent paper by Savage and colleagues on social class is that the analyses they report are only marginally dependent on the BBC Great British Class Survey. This was a – quite predictable – flop because of the self-selection bias of respondents. To try to save the show, Savage et al. resorted to asking the same questions of a small quota sample, from which their results essentially derive – with the link then made to the GBCS data being of only a quite tenuous and largely inconsequential kind.
Second, their presentation of their data and analyses is disturbingly unprofessional – as must also have been the reviewing of their paper. No details are given of the quota sampling (let alone any explanation of why this largely discredited method was accepted) nor of the crucial ‘latent class’ modelling from which their seven classes derive. Third, this attempt to define class boundaries ‘inductively’ from data on various forms of ‘capital’ à la Bourdieu amounts to little more than a data-dredging exercise – resulting in much conceptual confusion. For example, in one of the seven classes the average age is 34, in another 66! The dredging is simply picking up variance that has nothing whatever to do with class inequality or differentiation on any coherent understanding.

NS-SEC provides a sound basis, conceptually and methodologically, for analysing class inequalities in Britain – in mobility chances and likewise in life-chances in education, health etc – and one from which the unduly narrow approach of economists, focussing on income inequality, can be questioned. The Savage model is an unfortunate distraction, bringing quantitative sociology down to the level of market research. But it will, I believe, find little use outside the circle of Bourdieusian true believers.

http://blogs.lse.ac.uk/politicsandpolicy/archives/35681

Given all this it was very interesting to see a recent post by Mike Savage on the Culture and Stratification network’s blog explaining the [4]future agenda for the GBCS team:

The publication of our paper ‘A new model of class? Findings from the BBC’s Great British Class Survey experiment’ in Sociology in April 2013, allied with a simultaneous press campaign led initially by the BBC has led to unprecedented interest in the nature and significance of social class in Britain. This reception of our work has been remarkably wide ranging, straddling academic disciplines, and a great variety of non-academic groups. We would like to thank the numerous people who have contacted us with their thoughts, written blogs, and more generally commented on our study. Some of the reception has been critical and has posed challenging questions about our purpose, methodology and data. We are pleased to have inspired such an engaged reception, and are aware that we need to respond to the criticisms and comments made. Furthermore, given the extent of public interest in this project, we feel responsible for explaining how we will be developing our research in the coming period. This note briefly spells out our plans.

http://stratificationandculture.wordpress.com/2013/09/15/a-statement-on-future-research-from-the-great-british-class-survey/

Anyone even vaguely interested in the GBCS should definitely read the above post and find out more about what they’re planning. I’m particularly interested in the "popular and accessible - though also serious and critical" book they are under contract with Penguin to write on social class. I find it really exciting how much of this debate has
been playing out in the academic blogosphere and hope this continues.

David Rose (2014-09-21 19:31:43)
That all sounds a bit 'never mind the quality, feel the width'. And folk have short memories. I know I’m parti pris, but the announcement of the NS-SEC received similar publicity in the media and public involvement via BBC. But that’s no more to the point with NS-SEC than it is to the GBCS. The fundamental questions about the GBCS can’t be answered till we all have access to the data it was induced from.

Floating Cities, Class War and Matt Damon: what more could you want? (2013-09-16 08:00)

I like Matt Damon. I like Science Fiction. I loved Neil Blomkamp’s first film District 9. So it was pretty inevitable that I would be excited about Elysium. As if that wasn’t enough, there was the added benefit of the film’s heavily trailed politics, as described by Gavin Mueller from the Jacobin:

Trailers for Elysium were like catnip for the left-leaning viewer: a near future where the masses, stranded in crumbling cities, outfit Matt Damon with a robot suit and send him to fight the bourgeoisie, who
have Galted off the planet to Space Station Elysium, taking their shrubbery, Spanish-style mansions and cancer cures with them. It promised to be an allegory about class struggle as transparent as director Neill Blomkamp’s first movie, District 9, was about racial apartheid. The 99-vs-1 narrative would finally get the sci-fi blockbuster treatment it richly deserved.

Mueller makes a number of fair criticisms of the film. Not least of all taking issue with the film’s gender politics (with the exception of Jodie Foster’s defence secretary, it is hard to imagine how this film could have rendered women any more marginal or passive) and its oddly dichotomous treatment of race – on the one hand, the film depicts a dystopian future where “the oppressed classes stuck on polluted and undeveloped Earth are almost entirely brown and black while Elysium is full of WASPs” but on the other the weird casting of Matt Damon in the lead role transforms “pointed commentary on race, citizenship, and gentrification into a white saviour narrative”. However Mueller also picks up on what I loved so much about this film:

The space station concept nicely dramatizes the spatialization of class that geographers like David Harvey and the late Neil Smith have written about for years. Elysium collapses the gated city and the militarized border into one potent metaphor, and Blomkamp’s not afraid to show the privileged defending their picturesque suburbs against crippled children with deadly force. Perhaps the most novel idea is to collapse citizenship with health care. A ticket to Elysium grants you citizenship and access to miraculous life-preserving technologies, a powerful point as citizenship is one of the biggest holes in the Swiss cheese that is Obamacare. Blomkamp’s able to see how the overt authoritarianism of apartheid biopolitics (where blacks were denied citizenship, had their movement strictly controlled and had a life expectancy at least a decade shorter than whites) hasn’t been abolished. Instead, it’s been globalized, covered with a thin neoliberal veneer of market and meritocracy. In Elysium the struggle is not for the means of production, but the means of reproduction, as the vast majority of Earth is treated as a surplus population left to die lest they waste precious resources.

It depicts a future where the ruling class have withdrawn nearly entirely from contact with the vast majority of the world’s population. The robotic workforce securing and serving the ruling class renders the population largely surplus to requirements. The neoliberal condition diagnosed by [3]Loic Wacquant and others finds itself generalised to the planet as a whole – the poor are rendered surplus and punished for behaviours arising from this marginalisation. But in the world depicted by Elysium the entire planet is poor. All who are not are now ensconced in the safety of Elsyium, the floating utopia (eerily identical to my mental image of the orbital platforms from the Culture books) looking down upon the earth. It’s a direct descendent of the floating cities which occupy the contemporary libertarian imagination:

Since 2003, a colossal barge called the Freedom Ship, of debatable tax status, should have been chugging with majestic aimlessness from port to port, a leviathan rover with more than 40,000 wealthy full-time residents living, working and playing on deck. That was the aim eight years ago when the project first made headlines, confidently claiming that construction would start in 2000.

A visit to the “news” section of freedomship.com reveals a more sluggish pace. The most recent messages date from more than two years ago, forlornly explaining how “scam operations” are slowing things down but that “[t]hings are happening, and they are moving fast.” Meanwhile, the ship is not yet finished. Indeed, it is not yet started. Despite this, Freedom Ship International Inc. has been startlingly successful in raising publicity for this “floating city.” Much credulous journalistic cooing over “the biggest
vessel in history,” with its “hospitals, banks, sports centres, parks, theaters and nightclubs,” not to mention its airport, has ignored the vessel’s stubborn nonexistence.

Freedom Ship’s website claims that the vessel has not been conceived as a locus for tax avoidance, pointing out that as it will sail under a flag of convenience, residents may still be liable for taxes in their home countries. Nonetheless, whatever the ultimate tax status of those whom we willcharitably presume might one day set sail, much of the interest in Freedom Ship has revolved precisely around its perceived status as a tax haven.

And despite the apparent corrective on the website, the project’s officials have not been shy in purveying that impression. They have pushed promotional literature that, in the words of one journalist, “paints the picture of a luminous tax haven,” and stressed that the ship will levy “[n]o income tax, no real estate tax, no sales tax, no business duties, no import duties.” Of course, as no cruise ship could ever levy income tax, to trumpet that fact is preposterous, except as a propaganda strategy.

Freedom Ship’s board of directors are canny enough to recognize tax hatred as a defining characteristic of the tradition of fantasies in which it sits. It is one of countless recent dreams of a tax-free life on the ocean wave: advocates of “seasteading” are disproportionately adherents of “libertarianism,” that peculiarly American philosophy of venal petty-bourgeois dissidence.

But their pesky reliance on a human crew has been technologically negated by the time of Elysium. No more awkward interactions with social inferiors, as the robotic workforce serve all the needs once met by the working classes. It’s a world where the problem of the mass, the inconvenience of their sheer numbers, has been overcome. The few details we are given about the onset of this dystopic world point to problems arising from overpopulation. The mass have doomed the planet so the ruling class have sensibly absconded and moved beyond what little reliance they had on a small fraction of the population.

There are certainly problems with this film’s script. It seemed as if it had been a much longer film cut down to size, with much having been lost in the process. But Mueller’s critique of its underlying politics, as resolved in the final scene of the film, seems grossly unfair. My reading was of the film grasping at accelerationism, making a much more interesting point about the role technology played in formulating this dystopia but also the role it can play in moving beyond it:

Given the enslavement of technoscience to capitalist objectives (especially since the late 1970s) we surely do not yet know what a modern technosocial body can do. Who amongst us fully recognizes what untapped potentials await in the technology which has already been developed? Our wager is that the true transformative potentials of much of our technological and scientific research remain unexploited, filled with presently redundant features (or pre-adaptations) that, following a shift beyond the short-sighted capital- ist socius, can become decisive.

[...]

We need to revive the argument that was traditionally made for post-capitalism: not only is capitalism an unjust and perverted system, but it is also a system that holds back progress. Our technological development is being suppressed by capitalism, as much as it has been unleashed. Acceleration- ism is the basic belief that these capacities can and should be let loose by moving beyond the limitations...
imposed by capitalist society. The movement towards a surpassing of our current constraints must include more than simply a struggle for a more rational global society. We believe it must also include recovering the dreams which transfixed many from the middle of the Nineteenth Century until the dawn of the neoliberal era, of the quest of Homo Sapiens towards expansion beyond the limitations of the earth and our immediate bodily forms. These visions are today viewed as relics of a more innocent moment. Yet they both diagnose the staggering lack of imagination in our own time, and offer the promise of a future that is affectively invigorating, as well as intellectually energising.

"How do I start an open access journal?" (and will anyone read it...?) (2013-09-16 11:14)

One of the most exciting innovations in scholarly publishing in recent years has been the emergence of open source software (such as [1]open journal systems) which radically democratises the process of starting a new journal. It’s still a difficult project which requires some funding and much effort but it has been opened up as a possibility in a way it simply wasn’t previously. There’s an interesting post on the [2]Thesis Whisperer which discusses how to do precisely this and offers some great advice:

For the Managing Editors and Editorial Committee of the peer reviewed, interdisciplinary Gender, Sexuality and Diversity Studies (GSDS) journal [3]Writing from Below it's been a learn on the job affair, with attendant highs and lows. This is a list. It’s not an exhaustive list, but I’m writing it in the hope that if you have some niggling desire to found an [4]open access journal you don’t know where to start, this might give you a platform to leap from.

I’m not going to go into the reasons why we founded Writing from Below here, but if you want to know more, our editorial, [5]GSDS Takes Sidesgives a pretty good run down. I'm also not going to go into the politics of OA, but there's [6]lots of great stuff out there if you'd like to read more.

http://thesiswhisperer.com/2013/09/04/how-to-start-an-open-access-journal/

But my excitement at this possibility goes hand-in-hand with a caution about academic over production. Should we be worried that ever more papers are being published in ever more journals and being read ever less? I think it’s obvious that we should be. So what are the long term implications of an innovation like Open Journal Systems? Given it radically lowers the start up costs for a new journal then, other things being equal, it seems likely to contribute to a proliferation of new journals. But is this a good thing? In terms of individual projects I find this technology incredibly
exciting but from a more detached perspective I worry that it risks intensifying an already problematic tendency towards overproduction of papers and journals.

I’m not for a second blaming this problem on OJS - it seems clear to me that this over-publishing and under-reading has its roots in an institutional structures of incentives which rewards the former and implicitly treats the latter as ‘efficiency’. But it does seem as if OJS, though fantastic in and of itself, risks entrenching this problem by removing obstacles to participation. On this level it’s clearly equitable, in so far as it that it opens up the possibility for those who would have previously lacked the resources to do so. It’s also individually rational to found an innovative journal as a career advancement strategy. But where is this all going in the long term?

One aspect I find particularly interesting is the role that the proliferation of open access journals would play in restructuring academic networks. For instance as the Thesis Whisperer article describes:

GET AN AWESOME [7]ADVISORY COMMITTEE.

We really do have an awesome advisory committee. This mostly came about because of bravery. If there’s an academic in your field whose work you admire, approach them. I think we were only turned down by three or four people–everyone else came back immediately with an “Of course! I’d be honoured.”

NETWORK, NETWORK, NETWORK.

Once our [8]first issue was ready to go, we built a [9]FaceBook page and set up a [10]Twitter profile. We have four admins on our FB page because a multiplicity of voices is always good, and it spreads the load. Likewise the tweeters amongst us login and tweet, and add followers, and follow back. We share our [11]Call for Papers, great quotes, and news about what’s happening with the journal, but we also like to spread the social networking love. This means sharing or tweeting other cool journal pages or calls for papers, as well as news or information that we think our followers will like.

Conceptualising biographical events (2013-09-17 08:00)

One of the arguments I’ve tried to make with my PhD is that any approach which seeks to use the individual life course as a unit of analysis needs to be extremely careful about how biographical events are conceptualised. This issue can seem strikingly unproblematic when considered in the context of our lives – stuff happens to us, we make decisions and the choices we make often come to define us. This sense of plausibility which is rooted in first person experience can perhaps be invoked to explain why concepts like ‘turning points’ and ‘fateful moments’ circulate as readily as they do within research fields. It seems obvious that there are turning points in our lives, events which led us in one direction or the other, or nodal points where events conspired to force us to take consequential decisions.

However the problem with the self-interpretation of our biographies is our tendency to rely on a perceptual criterion i.e. we are natural empiricists about our own lives. We experience events under our own descriptions, mediated through our own dispositions and as people to whom their potential implications matter. We tend to interpret events in our own lives in a ‘flat’ way, focusing on what has happened rather than why and how it has occurred (in the precise way that it did). Conversely, we tend to over-estimate our own autonomy in responding to events, focusing on what we did rather than why and how we responded the way we did and what enabled or constrained us in doing this. This is all because we tend to rely on our perceptions of events rather than discursive reflection upon the underlying causes of those events.

That we do so in everyday life is unproblematic. But it does mean that approaches to social research which want to understanding the unfolding of individual biographies need to be very careful about how events are understood to operate and how qualitative data is conditioned by the subject being embedded within the event itself. From a realist perspective, the level of events (the actual) must be distinguished from the experience of those events (the empirical) or the real mechanisms underlying them (the real). In our everyday lives we will tend towards empiricism about events, construing them in terms of our own experience of them. This is far from universally true though, as we often ‘step back’ and theorise about why and how something happened in the way that it did e.g. “why did she act like that? was there something she wasn’t telling me?” or “this has turned out so much better than I thought, how did it happen? why was I so convinced it was going to go badly?”.

But any adequate treatment of events within social research needs to encompass the real, the actual and the empirical. The properties and powers of individuals cannot be dropped out or replaced with generalisations about action tendencies because they too are part of the event:

There is more to the world, then, than patterns of events. It has ontological depth: events arise from the workings of mechanisms which derive from the structures of objects, and they take place within geo-historical contexts. This contrasts with approaches which treat the world as if it were no more than patterns of events, to be registered by recording punctiform data regarding ‘variables’ and looking for regularities among them.

We noted earlier that the same mechanism can produce different outcomes according to context, or more precisely, according to spatio-temporal relations with other objects, having their own causal powers and liabilities, which may trigger, block or modify its action. Given the variety and changeability of the contexts of social life, this absence of regular associations between ‘causes’ and ‘effects’ should
be expected. The causes and conditions of any particular social change tend to spread out geographically and back in time from the point at which it happened. (Sayer 2000: 15-16)

The notion of an event which impinges upon an individual cannot be comprehensively understood in a way which abstracts from the particularity of the individual concerned. To be clear: I'm not for a moment suggesting this as a critique of non-biographical social research – that would be an absurd claim because the vast majority of ‘biographical events’ are of no concern for the vast majority of social researchers. My suggestion is rather that if the substantive area of inquiry invokes the individual as a unit of analysis then it’s essential to theorise biographical events in a way which understands the causal contribution of an individual’s properties and powers to that event. So in other words: all research that deals with individuals must in some sense, even tacitly, deal with individual biography. If the history of a specific individual drops out then so too will the role their own causal powers and liabilities play in triggering, blocking or modifying the action of other causal mechanisms at work within the event. My claim is that human beings must be understood as spatio-temporally situated objects contributing to the event. Not all of the causal contribution arising from their specificity (normally subsumed under generalisations about human causal powers) need be considered but we need to be aware of its independent role to determine what aspects of this contribution should be pursued:

A good explanation will seek to focus selectively on the most relevant causal factors and there are at least two important criteria of relevance: first, the aspect of the event that we are seeking to explain, and secondly, which powers make the most significant contribution to this aspect of the event. In practice, we do not seek to explain all aspects of an event, even as simple an event as selling something in a shop. Instead, there are specific things we want to know – why did the salesperson not try to sell a more expensive television to the customer, for example, or why did she speak to him in a particular accent and what effect did this have on the outcome? Whichever aspect we focus on there will be causal factors we can decide to ignore because they have little explanatory significance for it, though we cannot necessarily prejudge which factors these will be.

Of course, this leaves open a whole range of further methodological considerations. In particular, how can we tell which were the most significant causal factors for any given outcome? This is not a question to which we can give a general answer on ontological grounds; the answer will always depend on the nature of the processes at work and how they interact with each other.

Explaining individual events, then, is challenging in the social sciences, and always involves some subjective decisions about how far to follow the causal chains and which ones to prioritise. But this does not mean that we can never do it: there may be occasions when one or a few causal factors predominate so strongly that we can reasonably treat them as the primary cause(s). Perhaps the salesperson decided not try and sell a more expensive television because she knew the customer and knew he could not really afford one. Perhaps she decided not to do it because of a recent conversation in which someone she respected criticised the practice. In such cases we may not be able to give quite definite answers to the causal question; but it is always a contingent empirical question whether this will be the case. (Elder-Vass 2010: 178)
Asexuality, Identity and ‘Scratching an Itch’ (2013-09-17 14:00)

It’s pretty great when you stumble across people discussing your work on the internet. All the more so when they ask thought-provoking questions which make you reconsider arguments you’ve made in the past and encourage you to explore their limitations:

Asexual elitism is an elitist attitude where some asexuals don’t consider other people to be asexual because they participate in an activity that the asexual elitist thinks falls outside of the realm of asexuality. What the activity is, be it masturbation, kissing, or sex, varies between asexual elitists (gbrd143). AVEN rejects asexual elitism by defining asexuality on its website homepage as ‘A person who does not experience sexual attraction’ (The Asexual Visibility and Education Network). This definition allows an asexual to engage in any type or amount of sexual behaviour; their identity only relies on the fact that they are not sexually attracted.

I think it’s important to qualify what the article says about me only describing sex-aversion and sex-neutrality. In the paper I published before this I actually list four terms: sex-positive, sex-neutral, sex-averse and anti-sex (Carrigan 2011: 468). I discuss sex-aversion and sex-neutrality in more detail in this paper but that’s because almost everyone who took part in the research (with the qualifier that the open-response format of the questionnaires meant I couldn’t tell in some cases) seemed to fit clearly into one of those two categories. I hadn’t realised the categories I was talking about had narrowed in this way between the two pieces of work and retrospectively I certainly regret this. The broader point made in this article still stands though and it’s an important one:

Carrigan claims that asexuals exist who specifically want to have sex, but the explanation for this is that they have sex for the intimacy it offers. In all these articulations, the asexual who wants to have sex because it feels good is absent.

A person who wants to have sex, but is not sexually attracted to anyone, is a type of asexual that is largely ignored or, as shown in Carrigan’s explanation, written away as wanting to have sex for a reason other than the act itself. This kind of asexual is so absent from conversations about asexuality that we might be led to believe that they don’t exist or are impossible.

- Talia in AVENues issue #25 http://www.asexuality.org/home/avenues.html

I guess there’s been a case of theoretical blindness on my part here. I’ve made the argument that what leads someone to come to identify as asexual is that certain attribute(s) of themselves are rendered problematic by the implicit and explicit judgements they encounter from significant others. Exactly what these attribute(s) are is a complex question and, in many ways, one which I think can’t be answered sociologically. But given the diversity within the asexual community, the heterogeneity underneath the umbrella definition, it seems obvious to me that this is not one attribute that all people who come to identify as asexual share. In an important sense I’m a constructivist about ‘asexuality’ but a realist about the processes which lead concrete individuals to come to identify as asexual. I think ‘asexuality’ is a cultural label, with its own history and a shifting politics attached to it, which has been the focal point for the elaboration of a rich web of terms and concepts. But just because the network of individuals who are both elaborating this terminology and using it to navigate their everyday lives (the two cannot ultimately be separated) are converging on the same label doesn’t mean they’re doing so for the same reasons or that they’re applying it to the same attributes.

2008
In this sense, the model I’m offering has no difficulty in accepting the existence of “asexuals that have sex because they orgasm, it feels good, and they actually want to”. But it’s never occurred to me because (a) there was no sign of them in my data (b) I didn’t knowingly encounter any when I did the internet phase of my research which was almost five years ago now (c) my model does struggle to make sense of why people like this come to identify asexual because I’ve understood this biographical process in terms of the individual coming to recognise certain attribute(s) of themselves as amounting in practice to ‘not being sexual enough’ or ‘not being sexual in the right way’ as a result of the stigmatising and/or pathologising judgements of significant others. In other words, I’ve been arguing that people come to identify as asexual because ‘not experiencing sexual attraction’ is rendered problematic by those around them. Just to be clear, I’m saying the problem here is with my model - I’m writing this post because I found the article in AVENues very thought provoking and I want to understand this issue better than I do at present:

I have often described sex-favourable asexuals as having an itch they want to scratch. They cannot find the right tools for the job, but they’ll use whatever is available because it really itches and they don't mind the tools at their disposal. They've accepted that there is no 'right tool' and they will never get the job done the typical way [...] the sex is of a different kind, but not ruined. Another type of sex-favourable asexuals could have no metaphorical itch or sexual libido. They might enjoy sex simply because, like jogging, it feels good. If something feels good, why not do it?

The conceptual difficulty emerges because I’d imagine either of these conditions (having sex because of an ‘itch’ that needs to be ‘scratched’ or simply because ‘it feels good’ in the way that sport or exercise does) is true for the majority of sexual people at least some of the time. People have sex with those they’re not sexually attracted to. People have sex when they’re ‘not in the mood’. People have sex because of intrinsic physical pleasures in a way which renders the specificity of the sexual partner wholly or partly redundant. So from my point of view, as someone who researches asexuality, there are two questions which stand out for me here. Firstly, how should ‘sex-favourable asexuals’ be conceptually distinguished from Gray-A’s* on the one hand and the variable centrality of sexual attraction to the sexual experience of non-asexuals on the other? Secondly, how do ‘sex-favourable asexuals’ come to identify as asexual and what ‘work’ does this identification do biographically? Is it just a convenient label for them? Does the label help ‘solve’ any problems they face in everyday life as a result of not experiencing sexual attraction? Are there particular difficulties they face (over and above the politics of ‘asexual elitism’ which sparked the AVENues article) specifically in virtue of not experiencing sexual attraction yet still having sex? How frequently do people in this category have sex? Does the absence of sexual attraction actually play a positive role in shaping sexual behaviour?

Which I guess is where I would have ‘placed’ these experiences if I’d thought more directly about it. This post has already taken me longer than I expected to write but I might come back to this point at a later date.

"Oh ‘INTP’. So that’s what I am": Identity and Alterity in a Digital Age (2013-09-18 08:00)

A couple of years ago I did a conference presentation called “The Difficulty of Working Out Who You are: Sexual Culture, Sexual Categories and Asexuality”. Or at least I gave a presentation this title. In reality it didn’t actually do what it said on the tin because I’d rather jumped the gun and given a definitive title to something which was then (and still is really) a loose amalgamation of thoughts in the progress. I started working on asexuality around 5 years ago now and my immediate interest was in asexuality as something approximating a sexual orientation (sparked
largely by how extraordinarily overlooked the conceptual possibility, let alone the empirical reality, had been in the academic sexualities literature I’d engaged with for the MA I’d just completed). Two further interests emerged from this as I got more into it:

1. The fascinatingly idiosyncratic frame of reference which asexuality (and [1]asexuality studies) offers for engaging with well rehearsed questions about contemporary sexual culture and its history of emergence

2. The broader issues of identity and alterity in late modernity which manifest themselves in the emergence of the asexual community (as well as the question of in what sense, if any, it’s meaningful to use the term ‘community’ here).

It’s the second question which has been on my mind recently. I’m talking about this at the Royal Geographical Society conference next week as part of a panel on the politics of anti-normativity and at a conference in Nottingham the following week on ‘normality in an uncertain world’. I like the second event theme in particular because it nicely captures the aspects of Archer’s account of late modernity which she’s only begun to draw out in her final book on reflexivity. This involves a situation where, as Archer (2012: 302-3) puts it, “the differences characterising each agent so overwhelm communalities with others that they increasingly engage in transactions with the system ‘as a whole’ (meaning raiding it for the detection of ‘contingent complemantarities’ and exploiting these novelities)”. What she’s suggesting is that increasingly atomised individuals, confronted with little to no socio-demographic possibilities for collective identification, look towards the cultural system for resources to help make sense of self and circumstances, which might furnish them with an ideal (which later provides a basis for value orientated collective action) but more immediately serves to increase the heterogeneity of their environment. What I think Archer misses is both how the cultural system can provide an immediate basis for social (re)integration and how socio-cultural relations can be digitally mediated. So the individual whose experience of not experiencing sexual attraction has been rendered problematic within their local environment, comes to recognise their commonality with (distant) others through direct and indirect accounts of experience which are encountered online. This in turn leads to an experienced difference (“I'm so weird! Everyone else is so interested in sex”) being transvaluated into commonality (“oh there are other people just like me!”) and provides a starting point through which many, though by no means all, come to pursue ‘offline’ relations on the basis of ‘online’ connections.

However I don’t think people who don’t experience sexual attraction are the only ones who follow this sort of biographical arc. To be clear: I’m talking about homologies at the level of individual biography and suggesting the existence of analogous structural and cultural factor which condition, though do not determine, the shape of that biography. I’m not subsuming a whole range of disparate phenomenon under one notion of biography (e.g. the existentially crisis prone individual in late modernity) though it occurred recently I sometimes talk as if this is what I’m doing. My point is to draw out a typological connection between disparate phenomenon which because of their particularity often have their connections overlooked (or are even ignored in and of themselves altogether). In terms of Archer’s approach, I’m gesturing towards a few things: a cultural account of contextual incongruity to supplement her structural account, a theory of how cultural systemic properties can provide an immediate basis for social re(integration) and a contribution to her thinking on reflexivity and collective action. After years of doing ‘my asexuality research’ and my PhD side-by-side, it’s really satisfying to have actually incorporated them into the same frame of reference at last... but I digress. What prompted me to write this post, which I’m stunned to realise is now close to 1000 words long without me having yet got to my main point, is the Myers-Briggs typology as another example of the weirdly specific cultural bases for social (re)integration which I’m convinced have come to circulate all around us without us having grasped their full implications yet. To those who don’t know, the Myers-Briggs is a taxonomic theory of ‘personality type’ designed for psychometric testing. It was ‘extrapolated’ from the work of Jung by two people with no psychological credentials or training (note: I’m not being a snob here, only stressing the important point that there the MB has, as far as I’m aware, zero empirical
basis and little or no credentialised authority for its putative conceptual roots in Jung's work). In effect it divides people up into 16 personality types through psychometric testing and there's a massive industry attached to the development, promotion and application of the MB. I first did it long ago (I love this stuff in spite of my chronic cynicism) and have tended to be ‘scored’ as an INTP. This is the attached personality profile from the Wikipedia page:

Architects are introspective, pragmatic, informative, and attentive. The scientific systematization of all knowledge, or [2]Architectonics, is highly developed in Architects, who are intensely curious and see the world as something to be understood. Their primary interest is to determine how things are structured, built, or configured. Architects are designers of theoretical systems and new technologies. Rearranging the environment to fit their design is a distant goal of Architects.

Architects are logically and verbally precise. In casual conversations, they may be tempted to point out errors the other speaker makes, with the simple goal of maintaining clarity within the exchange. In serious discussions, Architects’ abilities to detect distinctions, inconsistencies, contradictions, and frame arguments gives them an enormous advantage. In debates, Architects can be devastating, even to the point of alienation from the group with detailed logical arguments, which may be characterized as “hair-splitting” or “[3]logic-chopping”.

Architects tend to analyze the world in depth. They prefer to quietly work alone and they may shut other people out if they are focused on analysis. This, coupled with the fact that Architects are often quiet, makes it difficult for other individuals to get to know them. In social exchanges, Architects’ interest in informing others about what they have learned is greater than their interest in directing the actions of others.

Credentials or other forms of traditional authority do not impress Architects. Instead, logically coherent statements are the only things that seem to persuade them. Architects value intelligence highly and are often impatient with people with less ability than they have. An architect often perceives himself as being one of the few individuals capable of defining the ends a society must achieve and will often strive to find the most efficient means to accomplish their ends. This perspective can make Architects seem arrogant to others.

[...]

According to Rational Role Variants, by David Keirsey:

“Architects take their mating relationship seriously and are faithful and devoted – albeit preoccupied at times, and somewhat forgetful of appointments, anniversaries, and other common social rituals. They are not likely to welcome much social activity at home, nor will they arrange it, content to leave scheduling of social interactions to their mate. If left to their own devices, INTPs will retreat into the world of books and emerge only when physical needs become imperative. Architects are, however, even-tempered, compliant, and easy to live with - that is, until one of their principles are violated, in which case their adaptability ceases altogether. They prefer to keep their desires and emotions to themselves, and may seem insensitive to the desires and emotions of others, an insensitivity that can puzzle and frustrate their mates. But if what their mates are feeling is a mystery to them, Architects are keenly aware of what their mates actually say and do, and will often ask their mates to give a rationale for their statements and actions.” The INTP’s long-term mate is the ENFJ.

I find it hard not to recognise myself in this. Turns out others have the same experience: this is why websites, web forums and twitter feeds seem to have begun to emerge for those whose response to this subjective recognition has been to seek interlocutors who share this commonality: see [5]here, [6]here and [7]here. What’s going on here seems to be very similar to some of the relational dynamics driving the biographical trajectories of people who identify as asexual. However unlike asexuality, where my outsider status as a social researcher imposes certain constraints, something important seems obvious to me when focusing on the INTP: it’s an identity based on an exclusion. The experience of identification depends upon the accentuation of certain points which in turn distract from others. The INTP profiles seem so unerringly to capture certain aspects of my character (“They prefer to quietly work alone and they may shut other people out if they are focused on analysis. This, coupled with the fact that Architects are often quiet, makes it difficult for other individuals to get to know them”) that it distracts from those which aren’t incorporated within it descriptively or even run contrary to it (e.g. it’s hard to see a basis for political activism or shared engagement with live music in the NTP profile – both of which have been integral parts of my life since I was a teenager). In other words: the transvaluation of difference into commonality rests on confirmation bias. This is a strong and hypothetical suggestion about something which is ultimately an empirical question but it’s an important point: to what extent do the emergence of these ‘new commonalities’ presupposes the individual actively seeking them? What implications does this have for the putative social (re)integration I’m arguing emerges from these new collective identifications? This is why the asexual community fascinates me: the commonality becomes a basis for the emergence of new differences as dialogue unfolds i.e. behind the ‘umbrella term’ (asexuality as someone who does not experience sexual attraction) a diverse terminology for recognising and expressing (a)sexual difference emergences. I wonder if this is true elsewhere?

Why academic podcasts are much more valuable than people realise (2013-09-19 08:00)

There’s a great post on Savage Minds [1]here which discusses a new anthropology podcast series. It makes some important points about the potential value of academic podcasts:

Its fascinating to listen to the interview version of an article (in fact, its much more convenient than reading the article!) but its even more fascinating to have a chance to get to know the authors behind the articles. This, to me, is the real value of the podcast: it gets you to the backstage of elite anthropology, to see what the people at the center of the discipline are like. Its an incredibly important experience denied to the vast majority of anthropologists who didn’t go to Top Schools, and the SCA’s willingness to share this with us is really fantastic.

Michael Fisch, for instance, is one of the many new hires that have recently been made at Chicago, where I earned my Ph.D. So, you know, my question was: now that he’s someone is he good enough
for Chicago? The written work was less important to me than the character and the quality and vitality of the responses he made in his interview. For me, the most interesting part of the podcast came as he discussed his broader theoretical interest, and particularly the importance of moving past Latour to the thinkers that influenced him in order to dig out the genealogy (and thus possible future) of a realist, network-based ontology to ground future research. As someone who studies mining and petroleum, Fisch's frustration that we hadn't completed the seemingly effortless task of developing cheap sources of infinitely renewable energy was, maybe, not so insightful. But whatever — it was a great interview with a young and successful scholar. Surely other young scholars will want to see what success sounds like, eh?

The Handler interview was very different. Handler is a senior scholar (I mean that in a nice way) talking mostly about the kind of issues that comes at the height of one's career, rather than at the beginning. It deals with administrative matters and big-picture issues in the organization of our discipline (and others). I've not always been interested in the topics that Handler studies (except Quebec, which I <3 ) but I've always been blown away by his tremendous analytic ability. Its remarkable to me to have the opportunity to listen to someone who has spent a lifetime in the academy tell us what he has figured out about the professionalization of the discipline and how it related to the intellectual endeavors that it scaffolds. There's a certain clarity that only experience can provide. Its valuable for anyone thinking about being involved in anthropology long-term.

This powerfully captures what I've always seen as the promise of academic podcasting. However I've recently felt that I'm in a bit of a rut with my podcasting. Having seen the difference which quality editing makes to the finished product while working at the LSE I'm finding it difficult to be satisfied with what could be politely described as my 'minimalistic' approach to editing. I'm wondering if I should begin to approach the podcasts in a much more planned and episodic way, structured around particular themes and edited properly rather than simply topped and tailed in Audacity before being thrown online. It's so much work though. But I think the promise of academic podcasts, as described so well in the extract above, can’t be realised without it. The direction in which Cheryl Brumley is taking the LSE's podcasts is also a great guide to how this can be done:

Audio is important to the LSE Public Policy Group. Our blogs, funded by HEIF 5 – an innovation fund focusing on knowledge exchange – have continued to push the boundaries of academic dissemination. One of our highest aims is to bring academia online, and in turn, broaden access to the social sciences. Audio is integral to this process. By giving narrative to the full breadth of academic research, we hope to stretch the understanding and impact of research beyond the confines of universities. You can find all four of our podcasts series across these online platforms: [3]LSE’s podcast channel, [4]Soundcloud, iTunes and iTunes U. 

Not only is the diversification of online output important for us, but the quality of output is integral to what we do. We want to challenge the idea that an academic podcast is merely a speaker at a microphone. We experiment with different podcasts formats and take many lessons from the tried and tested world of radio storytelling.

I blog about issues related to sound and how it can be used to enhance social science dissemination. You can read my [5]Simple Guide to Academic Podcast series, for practical and technical advice on how to begin your own project. If you have any audio-related questions, you can also find me at [6]c.k.brumley@lse.ac.uk and on Twitter [7]@cherylbrumley.
My initial scepticism when confronted by Cheryl's attention to detail (and the weird fear provoked in me by using microphones and headphones when interviewing) pretty quickly subsided once I heard how good podcasts sound when someone who knows what they're doing works on them properly. Here are the podcasts I did with Cheryl when I was managing the LSE Politics Blog:

1. [9]2 January 2013: A conversation with Tim Newburn: Combining journalism with academia: How to read a riot
2. [10]LSE British Politicast Episode 1: Reflecting On The Riots
3. [11]The ‘jobs for generals’ scandal highlighted important issues about UK defence procurement

I'm unlikely to produce anything quite this good on my own (I lack the skill, time and motivation) but I definitely want to start a podcast series which is much closer to this than the stuff I've done previously. I own the domain [12]http://www.outflankingplatitudes.com which at present simply hosts a Rebel Mouse site. I'm not sure how to integrate the podcasts into the Rebelmouse page or if starting the former would mean abandoning the latter. But an idea is definitely taking shape in my mind about how the podcasts themselves could work.

I'd particularly like to do more social theory podcasts - these are probably the ones I've enjoyed most from the individual interviews that I've done but they've always been limited by being with one person on one topic. Instead I could choose a particular theme (e.g. relational sociology) and interview people who take contrasting approaches to it. I suppose it would also be possible to gradually incorporate some of the existing interviews that I've done (there's about 60 or so) into thematic episodes. I definitely intend to use Soundcloud in future, as the habit I fell into of just uploading the MP3s to WordPress is quite limiting. Not least of all because it's not possible to get stats on how many people actually listen to the podcasts.

"Stop living off the state" demands The King of the Netherlands (2013-09-19 19:12)

King Willem-Alexander, alongside his wife, Queen Maxima, told the Dutch people that they must create their own social and financial safety nets, and that looking to the state for help was a thing of the 20th century.

The speech was part of the monarch's annual address on the day the government presents its budget.

It was not immediately clear if the 100 million euros spent by the government on maintaining the Royal House, with its castles and parades, would be included in the austerity cuts.
Recent polls show confidence in the government at a record low and that most Dutch people believe the cabinet’s austerity policies are at least partially to blame

This is rather blunt to say the least. Are there instances elsewhere in Europe of this degree of honesty? For instance a similar sentiment clearly animates the Coalition government in the UK but they’d never be this explicit about it because of the electoral oblivion which would likely ensue.

nomen nescio (2013-09-24 09:56:54)
just to inform that the speech the king gives on 'prinsjesdag' ('princes' days', the 3rd tuesday in september when the government presents it's plans for the coming year) literally comes from the government. he does not have any say in this. only the christmas speech has personal touches

When journalists strike back - towards a sociology of the scam call (2013-09-20 00:15)

In recent years increasing numbers of people have been plagued by 'Microsoft support' scam calls. These callers claim to have identified a fault with the individual’s computer and to be calling on behalf of Microsoft in order to help solve the problem. But suffice to say this is not their real intention:

The phone rings and there’s a voice on the line telling you they’re aware you’re having computer problems, but not to worry – they’re with Microsoft, and they’re here to help. It’s a complete lie, and the opening gambit of an [1]all-too-successful scam.

The person on the end of the line has no idea how your PC has been behaving lately. And they’re certainly nothing to do with Microsoft. They’re just after your cash.

These ‘tech support’ scammers will typically ask for remote access to your PC. They may then infect it with malware that could lift credit card details from your computer. Or they could simply charge you through the nose for PC 'support' that you never even needed.

In this wonderful podcast the BBC’s technology correspondent Rory Cellan-Jones records his interaction with one of these callers. The first 16 minutes or so involve a fascinatingly absurd series of technical claims made by the caller in pursuit of their prize before Cellan-Jones eventually reveals his true identity around the 17th minute.
Yet again I’ve received a call about a "problem with my Windows computer". From a company in Yorkshire, apparently...
I was quickly passed on to the senior supervisor David, and managed to keep him on the phone for twenty minutes before revealing that the computer "under attack" was actually a Mac.
When I told him I was a journalist and thought he was involved in a disreputable scam, he said "you don’t sound like a journalist." Now I’m trying to work out whether that’s a good or bad thing.

The audio clip as a whole was interesting and funny. But did anyone else find the interaction from the 17th minute onwards as fascinating as I did? It’s crying out for someone more knowledgeable about ethnomethodology than I am to analyse the weird exchange where the scam caller starts attacking Cellan-Jones and his purported credentials. It reminded me of the strange exchange I had with a ‘chugger’ (charity mugger) who turned up at my front door asking me to sign up to Save the Children. I told him I wasn’t interested and he instantly retorted: "so you’re not interested in helping children?".

1. http://www.which.co.uk/consumer-rights/action/how-to-spot-a-scam/

Corrie (2013-09-23 16:36:09)
I may not be savvy with computers but the first time I read complaints about calls purportedly coming from Microsoft at Callercenter.com, I knew it was a scam already. It’s just too obvious.

Howard Becker, Blogging and Phenomenology (2013-09-20 08:00)
There’s a really nice [1]post on Jon Rainford's blog which talks about Howard Becker’s [2]Writing for Social Scientists and its potential lessons for bloggers:

This second edition examines some of the changes in technology in the twenty years since it was first published, especially in terms of ways in which computers have enhanced the ability for drafting and rearranging ideas and the reduced permanence of the text that is churned out, allowing for writers to take more risks with what they put into being. This, combined with some of his lines of argument about the value of sharing and discussing writing lead me to thinking how the rise of blogs have changed the game even further since 2007.

Becker uses a lovely phrase in chapter three. He says 'A thought written down is stubborn, doesn't change its shape and can be compared to thoughts that come after it' (p.56). For me, this forms the crux of why I am finding blogging so valuable for my writing, it allows me to commit those ideas
to writing and to share them with other people, not only my close academic network, but more widely. It allows me to ask questions, to float partially formed thoughts and to help develop the thinking by continuing to write about them. This is what many academics have done for years in letters and through discussions so why, in some cases is there a resistance to blogging still by some people?

Becker poses a possible reason why, he says ‘There’s something that I think many of us believe: talking about work is less of a risk than writing about it. In part it’s because no one remembers the ideas you speak.’ (p.118). I wonder if it is an extension of this argument that keeps the discussions in private opposed to in the open on a blog. Maybe if you do not make public your partially formed ideas, people won’t remember all the wrong turns you took, after all, your audiences only want to hear the perfectly formed ideas, not those provisional ones, right?

I love the description of a thought that “doesn’t change its shape” once written down. I’ve become aware of myself in the last few months as someone who thinks-through-writing and this is integral to it. Thoughts in my mind feel formless and inchoate until I’ve externalised them in speech or, better yet, writing. When discussing things I find interesting or writing about them, it’s sometimes a surprise to me what comes out – it’s obviously not something which emerges ex nihilo but until I’ve externalised the thoughts in my head they’re only really potential thoughts. Or something like that... in my more pretentious moments I think that I’d like to write a phenomenology of blogging at some point. I recently encountered a great passage by Nick Crossley talking about the phenomenology of typing and it seems a logical next step to extend this into a phenomenology of writing with a keyboard. In fact the discussion of the physical process of typing seems oddly lopsided without it (not a criticism of him given that this makes perfect sense in the context of the article) – the emphasis in the extract was added by me:

It is not only my own body that I "know" in this way, moreover. I have a pre-reflective sense or grasp on my environment, relative to my body, as is evidenced by my capacity to move around in and utilize that space without first having to think how to do so. Our relation to technological objects, such as word processors, provides an interesting illustration of this. I can type and to that extent "I know" where the various letters are on the keyboard. I do not have to find the letters one by one, as when I first bought the thing. My fingers just move in the direction of the correct keys. Indeed, when I am in full flow, I seem actually to be thinking with my fingers in the respect that I do not know in advance of typing exactly what I will say. It is not just that I do not need to think about where the keys are, however. The break with reflective thought is more severe than this. I could not give a reflective, discursive account of the keyboard layout. I do not "know" where the keys are in a reflective sense and to make any half decent attempt at guessing I have to imagine I am typing and watch where my fingers head for when I come to the appropriate letter. The type of knowledge I have of the keyboard is a practical, embodied knowledge, quite remote and distinct from discursive knowledge. It is “know-how,” in Gilbert Ryle’s sense, not propositional knowledge-that.

- Nick Crossley, The Phenomenological Habitus

Underlying this interest is my conviction that an understanding of the practice of writing cannot be divorced from an understanding of the tools with which one writes. This is a point well made by Evan Selinger in a short essay on
Nietzsche’s adoption of the typewriter later in life:

In [5] *Gramophone, Film, Typewriter*, Kittler contends that in order to understand how Nietzsche coped with myopia, it is crucial to grasp the import of him by buying a[6] typewriter: a Danish model invented by Hans Rasmus Johann Malling Hanson. Given the lack of philosophical precedent, Kittler characterizes Nietzsche as the “first mechanized philosopher,” and argues that integrating the typewriter into the writing process facilitated several changes to the act of writing itself, profoundly impacting Nietzsche’s thought and style.

Kittler stresses how typewriters alter the physical connection between writer and text. Unlike the visual attention that writing by hand requires, the typewriter made it possible to create texts by exploiting a blind, tactile power that can harness "a historically new proficiency: écriture automatique." Given the report of a Frankfurt eye doctor, which stated that Nietzsche’s "right eye could only perceive mistaken and distorted images,” and Nietzsche’s own claim to find reading and writing painful after twenty minutes, we can appreciate why he would turn to a writing device that could be operated simply by pressing briefly on a key—a key that doesn’t even need to be looked at. Indeed, the Malling Hanson was specifically designed to "compensate for physical deficiencies" by having the capacity to "be guided solely by one’s sense of touch."

[...]

Kittler cites a poem that Nietzsche wrote about the Malling Hansen in 1882. Translated, it states:

THE WRITING BALL IS A THING LIKE ME: MADE OF /IRON/ YET EASILY TWISTED ON JOURNEYS./ PATIENCE AND TACT ARE REQUIRED IN ADBUNDANCE,/ AS WELL AS FINE FINGERS, TO USE US.

By comparing "the equipment, the thing, and the agent," Nietzsche appears to demonstrate his awareness that "authors" do not generate thoughts that transcend their material culture.

The last line seems like something of an overstatement but it nonetheless expresses something quite profound about the role of ‘tools’ in the creative process.

Think Progress [1] reports that the Republican campaign against Obamacare has reached a new low, with an advertising campaign encouraging students not to sign up for medical insurance which surely has to rank amongst the most offensive (and weirdest) political advertisements in history:

Republican efforts to block Obamacare have taken shape in several different forms. On the federal level, lawmakers [2] repeatedly threaten to cast votes to defund and delay the health law. On the state level, lawmakers are doing their best to [3] impede the law’s new insurance marketplaces, which are set to roll out next month. And as a “grassroots” strategy, Obamacare opponents hope they can simply convince Americans to forgo signing up for health insurance altogether.

A new campaign by [4] Generation Opportunity, a conservative group that Yahoo News [5] reports has “financial ties to billionaire businessmen and political activists Charles and David Koch,” is taking this third approach. Generation Opportunity wants to specifically target college students this fall, spending up to $750,000 on a campaign to convince young people they don’t need health insurance.

“What we’re trying to communicate is, ‘No, you’re actually not required to buy health insurance,’” Generation Opportunity’s president, Evan Feinberg, [6] explained in an interview with Yahoo News. “You might have to pay a fine, but that’s going to be cheaper for you and better for you.”

How does Generation Opportunity want to get that message across to college students? They’re planning a [7] college tour, bringing anti-Obamacare literature and beer coozies emblazoned with the words “opt out” to 20 different campuses. And they’re also unveiling an ad campaign that features an unsettling image of “Uncle Sam” appearing in the doctor’s office to subject young adults to invasive exams.

The Sociology of Hipsters (2013-09-20 14:00)

An interesting post on Sociology Lens yesterday made a useful contribution to the online debate about the sociology of hipsterdom which I briefly became completely obsessed with last summer:

This week in a local Massachusetts newspaper a columnist made a list of demands to the influx of hipsters into his neighborhood. In the [1]article the author attempts to reconcile with how his city is gentrifying and seems to be making something of a plea to the newcomers' humanity. The article sparked my interest and had me asking, what is a hipster?

The author himself admits that the term hipster is a generalization. To clarify his definition he writes, “If you would like a more precise definition, then I am addressing you if you identify with rebellious subculture(s), but you enjoy privileges associated with the dominant class; if your rebellion is more about recondite consumption choices than humane institutional changes.”

The author goes on to convey the aspects of community that he finds important, like participation in local clubs and politics, and asks that these newcomers join in. The author seems to define hipsters as a cultural subculture and an economic class with distinct consumption choices.

I actually quite like this understanding because it includes, albeit slightly crudely, the classed element which is often present in the anti-hipster discourse. I think this is sometimes overlooked by those seeking to oppose the anti-hipster discourse (is the idea of an outright pro-hipster discourse (oxy)moronic?).

This blog post then offers a neo-Weberian analysis of the figure of the 'hipster' which I find quite compelling:
Weber helps us to understand hipsters because while the instinct is to see cultural differences, the economic and political context of a hipster is extremely important. As the comments section illustrates, people are not convinced or comfortable with a simple definition of hipster. This is because hipsters are a recognition that something larger is happening – change is happening; neighborhoods and cities are looking different and are being inhabited by different people. The need to understand what is happening seems to drive much of the hipster debate. The logic seems to be – if we can figure out who is changing the neighborhood then we can stop them or make pleas to their humanity to join our way of doing things.

While Weber agrees that it is real people in real places making the world move – they do not make change in a vacuum. People make change in and with the help of social institutions: economic, political, and cultural. So what is a hipster? Seems to me a hipster is the newest cultural spotlight that takes our attention away from the politics and economics of change and instead turns debates into a witch-hunt – looking for who is to blame.

1. mailto:http://www.thesomervilletimes.com/archives/42150

Louie Ludwig (2013-09-20 15:18:36)
My own response to the anti-hipster discourse: http://youtu.be/0zu0jVVZSOU

Benjamin Geer (2013-09-30 09:45:48)
Here’s a recent analysis based on the idea that the conflict over the definition of hipster reflects a struggle to preserve the value of cultural capital in the “indie” cultural field: “For our participants, the hipster myth is the trivializing stereotype that threatens the value of their identity investments in the indie field of consumption.... By gleaning aesthetically meritorious forms of indie culture from the mainstream marketplace, these consumers leverage their field-dependent cultural capital in ways that distinguish them from stereotypical hipsters and also from indie consumers who have less status in the consumption field and hence lack the cultural license to flaunt the symbolic boundary between legitimate and illegitimate expressions of indie culture.... Owing to their high status position in the field, these consumers have a cultural authority to dismiss any resemblances between their consumption practices and the hipster icon as irrelevant trivialities or as an ironic comment on its corporate contrivances.... Once vested in the indie field, these consumers become reflexively aware of the hipster marketplace myth that has been culturally (and commercially) imposed on their identity practices. Rather than functioning as a source of attraction, indie consumers view this marketplace myth as a caricature of their aesthetic tastes, which threatens the value of their field-dependent capital. They employ demythologizing practices to insulate the field of indie consumption from the stigmatizing encroachments of the hipster myth and, in so doing, protect their field-dependent capital from cultural devaluation.” Zeynep Arsel and Craig J. Thompson, “Demythologizing Consumption Practices: How Consumers Protect Their Field-Dependent Identity Investments from Devaluing Marketplace Myths,” Journal of Consumer Research 37, no. 5 (February 1, 2011): 791–806, doi:10.1086/656389.

2023
Combining towards effective research design in digital sociology (2013-09-21 08:00)

I am currently trying to devise a workable research design for a two and a half year [1]project. Its absence, needless to say, isn’t stopping me jumping into the field for what I call the ‘landscape mapping’ phase of the project – which I half suspect will last longer than the part that’s directed by a robust and clear research design.

The project is at once a sociology of a profession (journalism), an organisation (a media group) and a distributed practice (blogging and online discussion). It is my ambition to take an action research approach and allow the agenda to be influenced by the needs and interests of respondents / organisational members, hopefully without sacrificing either scientific robustness or theoretical relevance. To put this another way, at the end of the journey I want to be able to write a book for an academic audience, but I also want to find time for plenty of detours and stop-offs along the road to enable me to engage very intensively with actors in the field about the emerging findings, and to interpret them collaboratively.

That in itself is a difficult combination to achieve. However, the combinations that are now giving me most pause for thought are more of a technical, methodological, interpretive and analytical nature than about subjects, objects and audiences. Like Ruppert, Law & Savage (2013), I am becoming aware of how "social knowledge is more visibly non-coherent than it was in the recent past": that digital data is increasingly ‘self-generated’, ubiquitous and lively, generated outside the academy and less dependent on the capacity of actors to learn to behave as the kinds of publics experts like us construct them as in the design of our research instruments. It follows, they argue, that "we will need to vary the magnification as we explore the chains of relations and practices enrolled in the social science apparatus" and "explore fields of devices as relational spaces where some devices survive and dominate in particular locations while others are eclipsed, at least for the moment" (Ruppert, Law & Savage 2013: 19-20). Never has it been more relevant to strive for ways of combining views of the social from above and from below. Or, better perhaps, to configure the social successively and iteratively from different angles of attack, equipped with devices that afford different conceptual and technical preconceptions.

But what, exactly, am I trying to combine in my own project? I’m going to have a mixture of data and metadata: interview transcripts, samples of text from blogs and online discussion, detailed fieldwork observation notes and a range of pseudo-constitutional documents on the one hand; user databases and various forms of scraped online social data (Marres & Weltevrede 2013) on the other. I’m taken by the idea that such a heterogeneous corpus of texts can be analysed as … a corpus as long as you find a way of opening up an intermediate space for its active and iterative interpretation, as Chateauraynaud argues: “one can re-equip the social scientific laboratory by installing an intermediate workspace between the Web and the confined universe of sociological research … What we need is a mediator or an intermediary placed between the traditional world of knowledge and the digital world, without being configured entirely by one or the other, and which carries sufficient autonomy to be able to produce cognitive events of a new genre.” (2007: 3) The point is really to use that space to construct an intelligent corpus by continually interpreting the dossier you’re amassing – describing it, indexing it, annotating it, calibrating it, testing its coherence. To find new ways to responsibilise the datasets we construct that are as good as the techniques used by qualitative researchers to understand and mark the transformations unavoidably set in train when working with traditional documentary sources (Hakim 1993). One purpose of techniques like framework analysis, for example, is to format a dataset for one’s own study purposes, marking it as different from ‘raw’ data sources so that one is forced to take ownership of it by acknowledging that one’s own purposes are different from those of the authors of the documents.

So I’m looking for a digital methods equivalent of framework that can help me construct and analyse a corpus combining all of the following elements.
Technical level

Big data approaches

Mass observation techniques

Metadata and self-generated online social data

Ethnographic approaches

Following the actors

Rich textual discursive data

Methodological level

Disintermediated and collaborative data-gathering

Theory-based and expert data-gathering
Interpretive level

Interpretation through action research where knowledge is framed pragmatically by its use and relevance to a media organisation and journalists

Interpretation that engages with the academic literature on professions, organisations and the Internet / eParticipation in order to generate knowledge

Analytical level

Field analysis at the macro-level of an organisation and a profession

Discourse analysis at the micro-level of speech acts and communicative interaction, intermediary objects and their translation, localised regimes of justification

Some of these combinations are very difficult to do: field theory is generally held to be so bequeathed to structural explanation as to be incompatible with pragmatic and ethnomethodological sensibilities I insist on practising as a researcher in the terrain. Nevertheless, my hunch is that my research will be the better if I can pull them off. More than that, my hunch is that I need to pull them off to do this particular research properly. To be sure that the results are worth something.

What I am less sure about at the moment is precisely what leverage I get from each of the perspectives I introduce. How to weigh their importance (not least for practical purposes of time allocation)? And then, how do the combinations work – how do I make them perform work, i.e. make them stick together, as the actor network theorists would say? One idea is to think of the different views as different phases of the same process. For example, Aguiton and Cardon (2008) have suggested that you glimpse a socialising dynamic at work when your focus is on the small-scale or the physical, and an amplifying dynamic at work when your focus is on the large-scale or the virtual. They use this insight to understand processes of open innovation, but we could easily extend it to any case of emerging social practice that makes use of online communication. Another idea would be to take Pentland and Feldman’s proposal (2005) about the dialectical relationship between change and routine in organisations. Does one perspective make
you more likely to notice the ostensive scripts that actors follow when they try to emulate an ideal, while another sensitises you to a submerged but active repertoire of performative scripts that actors invoke when they subvert (or repair) organisational routines?

Accordingly, I sense that the research design needs to be as iterative as possible in terms of chronology: zooming in and zooming back out as often as possible to alternate between perspectives that will contradict and interrogate as much as they complement one another.

Cooren and Fairhurst (2004) ask us to consider how the programmes of action of the groups we study intersect around mutual interests. If the aim of research is to attain an omniscient version of a story, this might therefore have a network shape centred around a key helper or co-orientation object. Once we then recognise ourselves as actors in that network, it is incumbent on us to go one step further and ask where and how their programmes of action coincide with our programme of action as researchers so as to identify potential boundary objects around which a joint action domain for ‘research in the open air’ might productively coalesce.

So my quest for a good study design is, I hope, not just another tilt at structure-agency windmills. It’s the necessary step to preventively screen or ‘proof’ my data collection techniques by truly appropriating the data and to recognise the parallels (which represent possibilities for collaboration) with the indigenous acts of recording, comparing, combining and interpreting that intelligent and interested members of the organisations I am studying perform on distinct but overlapping knowledge corpuses. And hence to open Chateauraynaud’s intermediary space.

Are most countries in Europe democratic? Post-politics, technocracy and populism (2013-09-21 10:38)

The LSE EUROPP blog has a great[1] interview with the political theorist [2]Chantal Mouffe in which she discusses her understanding of European politics as being in a post-political situation. Her understanding of ‘post-political’
is similar to what the political sociologist Colin Crouch means by [3] post-democratic: the formal institutions of democratic politics are still in place but their substantive content is absent. I was quite taken with Mouffe’s account of right-wing populist parties when I first encountered it around 2006/2007 and it seems particularly pertinent now. Mouffe argues that the politics of ‘beyond left and right’ in actuality represents a hegemonic neoliberal consensus which precludes a widespread affective identification with political parties and leaves an opening for populist parties to fill the gap and offer the electorate a choice:

Of course some people have been arguing that it is good for democracy, this blurring of the line between left and right, because democracy is supposedly more ‘mature’. I disagree with this. For instance in my book, [4] On the Political, I’ve tried to explain the development of right-wing populist parties as a reaction to the lack of choice which is given to citizens. Right-wing populist parties are, in many countries, the only parties who argue that there is a real alternative. Now the alternative that they propose is unacceptable, would not work economically, and on top of that often reflects some form of xenophobia, but they give the possibility of mobilising passion toward change.

Politics is, of course, to do with interests and moral concern, but there is also a dimension related to ‘passion’: the need for people to identify with a project. And what I call post-political is precisely the lack of this passion and identification.

[...]

One theory I have developed is that political identity is based on the idea of ‘we’ as opposed to ‘them’. If you are to construct a people then it is necessary to determine who ‘they’ are. In the case of right-wing populism this is usually immigrants, or Muslims, or foreigners. But this is not the only way to construct a people. If we consider the [5] Front de Gauche in France, for instance, they are clearly a left-wing movement, but they have also been accused of being populist. In a sense this is absolutely correct, because they want to oppose the discourse of the Front National by constructing another people. This is a people where Muslims and immigrants are not excluded, but instead the chief adversaries are the forces of neo-liberal globalisation. So while both the Front de Gauche and the Front National are populist movements, there is a very big difference between the types of people they have attempted to construct.

It’s a really interesting interview which is worth [7] reading in full. If you like her ideas I’d recommend The Democratic Paradox or On The Political. Both are short, engaging and provocative books. I’m certainly planning to go back and reread them some point soon after having not thought about Mouffe’s work in years. Her work offers some useful theoretical tools for making sense of the rise of Greece’s neo-fascist Golden Dawn party but also suggests that the attempt to ban it is unlikely to succeed:
Europe seems to be caught between two opposing trends which on the surface could not be more different: radical populism on the streets and sterile technocracy in the parliaments. However Mouffe would argue the two go hand-in-hand as populist movements arise to fill the affective vacuum left by the evisceration of substantive democracy. As she observes at the end of the LSE interview:

Certainly I agree with the ideas of people such as Colin Crouch, who argue that we are living in a ‘post-democratic’ situation. Our societies still call themselves democratic, but what does democracy mean in the present circumstances? The most obvious case is of course when they decide to completely overrule democratic processes through parliament and put in place a technocratic government. What does it mean to call this kind of society democratic?

This is definitely a real trend, but it’s a trend that will undermine democracy even further. We seem to believe that it’s now possible to do away with democracy altogether. It leads to the idea that we might be able to run things better if we simply removed any democratic constraints and implemented some form of bureaucracy. The name ‘democratic’ might remain in these cases, but we cannot genuinely see these countries as democracies any more.

These are worrying times for Europe. Caught between what Daniel Cohn-Bendit has called the “neoliberal Taliban” which dominates the European commission and a resurgent neo-fascism on the streets:

The Identity Crisis in Cybernetics (2013-09-21 16:19)

This post-conference reflection on [1]Mark Johnson’s blog raises a really interesting issue for traditions of intellectual inquiry which fall beyond or between disciplinary boundaries:

At my University over the summer, we hosted the annual conference of the American Society for Cybernetics. It was really good - despite some worries I had beforehand. It seems that Cybernetics provides a space for people to play with and break the ordinary rules of disciplinary discourse. That’s refreshing and good fun. Cybernetics has an identity crisis. This can be boiled down to a question: "Can something which sees itself as transdisciplinary establish itself within the disciplinary context of the academy?"

There are a number of responses one might have to this. But judging from a rather fierce online argument currently underway, I would say the answer is "no". At our conference, there was an implicit anti-academic thread which presented cybernetics as in some way divorced from conventional discourse. This caused many of the problems that blew up before the event started. The difficulty is that the provenance of cybernetics is clearly academic: it came from physics, biology, psychology, philosophy, education, economics, mathematics, computer science and management studies. It would seem reasonable that any advances in the discipline would emerge from those discourses. And indeed they do, but (the problem for the 'subject' of cybernetics) is that as cybernetic ideas are advanced in each area, nobody refers to them as cybernetic ideas! They are now ideas in computer science, mathematics, physics, etc. Which leaves the cyberneticians sulking in a corner, feeling unloved and (frankly) short of funding.

(I give it six months before someone has the idea of rebranding cybernetics as 'cybernetics studies')

Is virtual ethnography an oxymoron? (2013-09-22 08:00)

Attempts to conceptualise the sociological study of behaviour on the Web often involve juxtaposing the words 'virtual' or 'digital' to 'ethnography' or blend 'ethnography' with 'Internet' to create 'netnography'.

Rightly or wrongly ethnography for me connotes old school anthropology - Malinowski and Mead - and deep, long term immersion in communities. In my research I am considering how young people engage with information online. I visited a college, I interviewed my subjects (and their teachers) and let them loose on the Web during which time I wanted to capture everything both on and offline that influenced the data. As well taking traditional field notes I audio and video recorded what went on in the room, used a proxy server to capture all the client-server traffic, set-up a dialogue feed to capture what the subjects were saying to each other online and downloaded the browser history files. The result is a lot of data. I am, however, reluctant to call this research ethnography. I use ethnographic
methods but I think the picture is still too superficial to call it ethnography.

I have a rich snapshot but it's still only a snapshot. I asked young people about immigration and climate change and used the data to contextualise what they did online. But without further ethnographic research I can’t account for the influence of other social domains or fields beyond the boundaries of my visits. I don’t know for example the extent to which the students were rehearsing the views and practices of people within their households.

The data I got from the Web and social networks told only a fraction of the story. I couldn't know what some data meant until I cross-referenced it with what happened offline. During one session, for example, someone was reading a newspaper, discussed what he’d read with a peer then altered his stance online as a result. This is why I’m reluctant to use terms such as digital ethnography and netnography; its methods are too superficial to justify the word ethnography. Please let me know if you think I’m mistaken!

Huw Davies is a 2nd year, interdisciplinary, PhD student at the University of Southampton attempting to synthesize the best of sociology and computer science under the banner of Web Science. More info on his Twitter profile @huwcdavies

Craig (2013-10-20 10:53:36)
Not sure this is an issue you should get too bogged down in. Maybe you are not though. Anyway ... as you say, you are certainly using ethnographic methods. Whether it is ethnography, well, that depends on how you see what ethnography is. You admit to a somewhat traditional view. No doubt you are also familiar with the view that there are ethnographies ... a pluralistic view, that does not elevate the old school work in some kind of hierarchy. Is part of your struggle to see your work as ethnography something to do with idealising residential communities and as a school is not one, this troubles you on some level? Just a thought. Mc75@gre.ac.uk

RS Slack (2013-10-20 11:11:06)
I don’t see the need to make ‘traditional’ Malinowskian ethnography a model against which to measure, but at the same time the idea of an ethnography of the virtual has conceptual issues (it is ethnography of this or that wether it takes place on line or elsewhere). What you’re doing is, to my mind, ethnographic but more importantly it is producing what sounds like interesting data - so why worry about terminology that is either ideal-typical or conceptually problematic? My sense is that the production of ‘thick descriptions’ such as those you describe could be ethnography but do you need the label ‘an ethnographic study’ to hang these worldly things on? Others may disagree but just now getting the kind of data you are getting, however you label it, is where the action is. There's always the allegedly pragmatic catch all fallback of ‘multi-methods’ in any event.

Public Sociology and Writing For The Media (2013-09-23 08:00)

We've posted a few times this month about what public sociology means in practice. If we agree that it’s a worthwhile thing then how should we set about doing it? One obvious way to do this is to try and get opinion pieces published in the media. There’s some great tips on [1]Get a Life PhD about how to go about doing this:

It can be hard for an academic to respond with lightning speed to the daily news and formulate a well-crafted 800-word article in less than 24 hours. I know. Luckily, you don’t have to.
The other strategy is to predict the future. Think about an OpEd you would like to write. Write it. Then, wait for something to happen in the news that relates directly to your OpEd.

For example, if you work on immigration policy, write an OpEd now. Then, wait for Congress to debate the next big bill. Or, if you work on climate change, write your OpEd and wait for an international forum to happen to submit the OpEd. In many cases, you can write an OpEd which can have many possible ledes.

The good thing about this strategy is that you can recycle your OpEd if it is not accepted. If the New York Times doesn't publish it, you can revise it, wait for the next major event to happen and send it to the Washington Post.

Over the past few years, I have realized that I am not alone among academics who want to reach a broader audience. As I have had some success in this area, I have realized that strategy can be crucial for success here. Thus, I share these tips with you.

Between Two Worlds: The story of a first-year sociology student (2013-09-24 08:00)

Between Two Worlds. A challenging student life and a demanding degree: could we bring those two universes together?

'Reality? What is that?
Is it an idea or just a convention?
It's how we define that particular threat,
which pushes our dreams right into detention.

Is my love for you part of the real?, I ask.
I do not know, but I can say
every single person wears a mask;
we use it in this reality, if not, we have to pay…'

This is an excerpt from a longer poem I wrote before starting University. It reflects my perspective about life at that 'pre-sociological' moment. This view started to change slightly on 17th September 2012 when I began my degree in Sociology with a specialism in Media Studies at Sussex University.

As I was studying something new for me, one of the first things of which I gradually became aware during the
first lectures and seminars was that so many taken-for-granted ideas, beliefs and customs are, in fact, socially constructed. I had more or less realized this before, but when I started studying Sociology I really thought it through. If we think about the dominant factors that effectively run our society as discourses for example, family, marriage, religion, power, education, sexuality, assumptions of what is 'good' and 'bad', 'acceptable' or 'unacceptable' - the list goes on), and pause to think how our own beliefs relate to those concepts, we shall start noticing where the 'socially constructed factor' intervenes, posing insistent questions to 'normality' of all kinds...

Having received this revelation or wake-up call to sociology, I am happy to say that I had a very enjoyable first year. With a little (and sometimes a lot) help from my lovely friends on campus and from my gorgeous boyfriend whom I had met at University, I managed to escape the stress of studying in a foreign country, getting used to the academic language, and the many other challenges of university life. I succeeded in striking a healthy balance between late-night parties and the hours spent in the library: an equilibrium that somehow materialised into good (and sometimes very good!) grades throughout the year. ‘Healthy balance’ is not just one secret: it is the most important secret of becoming a successful Sociology undergraduate. All you need is passion, good time-management skills and, more often than not, a creative spirit.

Passion is a key word. I think you have to be passionate about what you do in order to be satisfied and to feel good in your field of activity – and in this respect studying sociology is no different from any other pursuit. But involvement is equally important, especially when the time comes to choose a career which will effectively influence your entire life. During my first year of studying sociology, one of the biggest challenges was choosing which topics to write about, which books and articles to read for my essays, and which presentation topics to address. Compared to my previous experience of secondary education, university gave me more freedom which I enjoyed and that’s what has shaped my passion for Sociology. The best thing about university is feeling free to focus on what genuinely interests me (though, obviously, I do not completely ignore topics I do not like). My long first-year trip through many themes, perspectives and ideas in Sociology has helped me develop an idea as to what to do, and on what to focus, during the next couple of years.

Once the first year has accomplished its mission – to make you discover your areas of interest – what comes next?

Well, it is not enough to simply be captivated by your studies. You have to deal with managing your time, which becomes increasingly more important in later years of study. Even when you are tempted to read all the books that interest you, go to many parties and do sports, you must simultaneously meet deadlines and attend seminars and lectures. What helped me was the simplest thing possible: keeping lists. Each weekend I would plan the following week in as much detail as I could, arranging ‘to do’s according to priority. I had lists and lists: daily lists, shopping lists, weekly lists... Here is an example of a weekly list:

1. Finish the readings for the essay

2. Get plane tickets for vacation

3. Don’t forget to text Doriana for her birthday

4. Don’t miss the beach party of Thursday

...the list could go on and on. This simple approach allows you to have an overview of the immediate future. You can imagine what activities need to take place during the coming week and be sure not to miss anything (though of course you have the freedom to amend the list if needed). And let’s not forget that satisfying feeling when you’ve finished your assignments and you delete, cut, put a X or a V in front of every ‘thing to do’, or just throw the list in the bin. After that, because you have completed the long and stressful list, you deserve to go out and relax with your
friends.

Lists and planning are not all. In order to be academically successful, you must also be creative. This was my main problem during the first year. At first, I was confused about how to be creative in something that did not appear creative, such as an academic essay. I came to University with what I thought was a very good understanding of the word 'creative': my hobbies are poetry, painting, drawing and fashion design. But my first assignments gave me a new challenge: what does the criterion of ‘originality’ in the mark mean, if the essay is supposed to be a serious and rigorous piece of written work? So here is another thing that I learned (and still continue learning) during the first year of studying Sociology: originality is not only about my 'outré art', it can also exist between the lines of a well-structured academic essay.

A lot more could be written about my first year experience in studying Sociology and Media Studies, but I hope that these few reflections about my experiences, what I have learned so far, what worked and what didn't, would be useful to you. If I had to sum up the main ingredients of a successful start at university, I would say that you need, above all, passion, time management and creativity. But how does all this answer the question posed in the title of this short essay? In my experience, the two apparently different worlds, the life of a fresher and their busy timetable, can work very well together, as long as you keep a good balance and enjoy what you are doing.

During the university induction, one of the speakers advised us to ‘work hard, be good and have fun’. At the time, a quiet inner voice, the voice inside my head, objected: ‘Sure, sure, this is another welcoming cliché.’ Now, a year later, I speak with my consciousness alert:

‘Well, that man was right, completely right.’

---

Alexandra Bulat is a second year Sociology and Media Studies student at the University of Sussex.

This stream welcomes abstracts on any aspect of theory as well as abstracts for the following Study Groups:

- Bourdieu
- Historical and Comparative Sociology
- History of Sociology
- Realism and Social Research
- Weber

The Realism and Social Research group would also like to invite abstracts under the theme "What is Realism for?". The group is particularly interested in papers that consider any of the following issues:

- Consider the relevance of realist theory to substantive social, economic and political issues.
- The practical implications of methodologically operationalising different forms of realist thought.
· Those from other schools of thought who wish to engage critically in a dialogue with realist theory.

**How to submit**

All paper abstracts and proposals for other events can be submitted online at: http://www.britsoc.co.uk/events/bsannualconference/submissions.aspx

**The deadline for submission of abstracts is 18 October 2013.**

For further information contact the Theory stream coordinators

Gurminder K Bhambra E: g.k.bhambra@warwick.ac.uk

Tom Brock E: T.Brock@mmu.ac.uk

Alternatively, contact the BSA Events Team E: events@britsoc.org.uk

**Steve Fuller on The Proactionary Imperative (2013-09-24 13:28)**

While I’m a bit sceptical about the 'beyond left and right' terms in which this is being framed, it's nonetheless an extremely interesting idea:
As a sociologist-in-training and a grad student it is my job to eat, breath, and live sociology, the study of human interaction and social institutions. I spend most of my week either reading sociological pieces, listening to lectures and talks, or participating in class discussions with faculty and fellow students. Through all this we are supposed to be thoroughly indoctrinated in the sociological imagination which is the ability to see the connections between the macro and the micro, the individual and society. We assume that this imagination is universal and abiding and that terms such as society, institutions, the state, and others are also universal. What I have come to realize over time is that what I am really learning in graduate school is a European sociology and an European sociological imagination. As a person of African descent this sociology is stifling and at time hostile to my mind and humanity.
There are some authors who have highlighted how sociology and other social sciences are rooted in the experiences of European people. This rootedness is problematic on its own but becomes deadly when we add in the experience of Europeans included eradicating Native Americans, enslaving Africans, dominating and colonizing Africa, Asia, and South America. These experiences of oppression have defined how we today understand the social world around us, which sadly is still dominated by white privilege and supremacy. Examples of work that shows us this picture of an oppressive European sociology is *Thicker Than Blood* by Tukufu Zuberi which highlights how social statistics are based on racist ideologies and *White Logic, White Methods* joining Zuberi with Eduardo Bonilla- Silva which takes a broader view of racist sociological methods. An old favorite written right when African-Americans were being first let into the university, *The Death of White Sociology* edited by Joyce Lander, shows how white supremacy entrenched itself not only in the structure of discipline but also the research and teaching of sociology. Through these works and a number of others we see how sociology is not neutral and privileges the perspectives of European people.

Above is the type of speech that you may hear from anyone that calls themselves a "critical" scholar of any kind. They fully understand that the social sciences are very much a colonized space and they all have racism aplenty. Their prescription is for scholars to undertake the process of decolonizing sociology and other social sciences. Anthropology, being in the past one of the worse perpetrators of Eurocentric science, is today at the forefront of decolonization through journals such as the Association of Black Anthropologists’ *Transforming Anthropology* and *Decolonizing Anthropology: An Anthropology for Liberation* edited by Faye Harrison. This decolonization is supposed to rid the social sciences of ideologies, practices, and biases that hinder an honest and objective understanding of any and all things that involve people of color and at the same time open up the work of the social sciences more fully to people of color. Although these goals are good, they are also only a partial solution to the problems of Eurocentric sociology.

In order to see how much deeper the problems created by Eurocentric sociology go we have to think back to the roots of social sciences. Most of the social sciences we know of today were born out of the European Enlightenment with the goal of understand human social behavior to quell social conflict. Later with the rising importance of the scientific method as a basis of doing all science the idea of doing science for social change was repressed and positivist perspectives on understanding social science took over. Because many of these disciplines were founded with this goal in mind there are themes and assumptions about human behavior that have become embedded in how we study the social world that are wholly alien to anyone that is not European. A list of these ideas could include:

- Positivism
- Materialism
- A concept of “society” as a distinct entity from nature
• Humans are inherently hedonistic or self-interested

• The social contract

All of the above sociological/social science concepts are concepts that are of European origin and are embedded in the European worldview. As an African who is seeking to understand the social world I have been born into as well as make it more hospitable for my people knowing that how I do my science is rooted in an exclusively European experience is very disturbing. It reminds me that all the perspectives and imaginations created by countless other societies, including my people’s, are systematically ignored and/or destroyed by the hegemony of European science. This is where decolonization often fails. It rids us of the racism of the European perspective but not of its basic worldview which is hidden in a cloud of objectivity. We need to move beyond a decolonization focused on grafting oppressed stories, ideas, and authors onto the dominate form of science and towards a decolonization that constructs alternate forms of science and inquiry, all coexisting, that draw on the worldviews of other peoples. In other words for my people we need an Africana Sociology.

What would an Africana Sociology look like? I have not had the time to do a ton of groundwork on this particular question but I give you an example of how valid sociological inquiry can be done without being anchored to the terms and worldview of European sociology. Let’s say we are doing a study where we would like to understand why race riots or race rebellions happen in general. For most of the mainstream sociological community any theory of race riots will be rooted in conflict theory or Marxist sociological thought. The theory will likely organize a narrative of white capitalist oppression through the police of poor black and brown neighborhoods which eventually reached a breaking point resulting in riots/rebellions. Inherent in this narrative are ideas such as society and history being the story of conflict for resources and power among classes and that society then is always unbalanced with the dominate class trying to create a balance that secures their supremacy over society.

How would Africana Sociology approach this same question differently? If we draw on the philosophical and what can be understood as social theories of ancient Africans we will see a very different picture of race riots from what we see in the European context. African philosophies such as those of Egypt understood society as inseparable from nature and spiritual world/world of ideas. The concept of Maat represented the connectedness of everything to everything (this idea is referenced in Lauryn Hill’s “Everything is Everything” a saying that sums up the Egyptian conception of creation) and how the natural state of the universe is balance. Isfet is the counterpart of Maat, which is imbalance, chaos, and evil. Racial domination in urban cities in the United States represents an immense destruction of Maat, creating inequality and Isfet. When this oppression and inequality reaches a tipping point where there is a severe lack of Maat people revolt and social change happens to restore Maat. Human history is here seen as the balancing and unbalancing of the world with balance being the natural state. Racial stratification which citing Douglass Massey’s Categorically Unequal entails the extraction of resources of an oppressed people and the hording of opportunities from those same people inevitably leads to contradictions and a rise in Isfet.

What we see here is that one can still collect data on social phenomenon, analyze it, and come to conclusions that are valid and useful to us as observers/participants of human society without being anchored to Eurocentric worldviews. If you think about it, sociology if it were born out of an ancient Egyptian/African worldview would likely be called Maat/Isfet Studies versus Sociology which has its roots in Latin and Greek linguistics. It begs the question of how other social problems or processes would look though this African lens.

To conclude there are many more discussion to be had on this topic. We are seeing today coming out of Feminist, Black Feminist, Native American/First Nations, and other spaces forms of science not anchored to the Eurocentric, Patriarchal, Capitalist social sciences most of us have rooted ourselves in. Know this means that there can be a dialogue about how to create an more pluralistic scientific community free from both oppression and full of diversity of human imagination. For African social scientists in particular, one of the few peoples of the Earth almost
completely stripped of all agency, history, and sense of self, we must do our part to contribute to this pluralistic social science world by reaching back into our legacy and reconnect to our African worldviews and bring them with us as we build a new understanding of our social world rooted in our rich perspectives and realities.

Is there space for non-European theories/practices of science? What can we do concretely to create spaces for these to emerge? What concepts would be included in an Africana Sociological Methodology or Imagination?

William Richardson is a 2nd year MA student in Sociology at the University at Buffalo (Department of Sociology. He is currently writing his Master’s thesis on how communities racially essencialize space and its contributes to continued residential segregation. Outside that he has interests in race/racism, intersectional stratification systems, and the integration of language into systems of domination.

Crystal Eddins (2013-10-23 17:16:51)
There is a long tradition of black sociologists whose work implicitly and explicitly take up the issues you’ve outlined; W.E.B. DuBois, Anna Julia Cooper, Oliver Cromwell Cox, and Charles S. Johnson are just a few. If you’re interested in readings that provide context for the relationship between scholars of African descent and the social sciences, try Black Scholars on the Line (Holloway & Keppel 2007) and African American Pioneers of Sociology (Saint Arnaud 2009). Also, several works in African Diaspora studies have developed a strong line for understanding cultural and social processes among African descendants.

Chung Bakst (2019-09-04 00:22:00)
Hi you have a cool website It was very easy to post easy to understand

Friday 25 October 2013, 09:30-16:45

British Library Conference Centre, London

Speakers include: Evelyn Ruppert (Goldsmiths), Ken Benoit (LSE), Emma Uprichard (University of Warwick), Alan Warde (University of Manchester), Abby Day (Goldsmiths), Emer Coleman (dsrptn), Peter Elias (University of Warwick), Paul Martin (University of Sheffield), Paul Taylor (UCL), Andrew Goffey (University of Nottingham).

Following the success of last year’s Presidential Event, BSA President, Professor John Holmwood has announced a one-day seminar/workshop this October on ’The Challenge of Big Data’. This event will take place at the British Library Conference Centre, London on Friday, 25 October 2013 between 09:30-16:45.

Organised in collaboration with Dr Emma Uprichard (Centre for Interdisciplinary Methodologies, University of Warwick) and Dr Abby Day (Department of Sociology, Goldsmiths), this joint event of the BSA and the British Library will use a workshop format to address issues around administrative data, its linkage to other large data sets, and the increased proprietorial interest in large data - all of which pose a fundamental challenge for the social sciences to confront big data with big questions.
BSA members can attend this event for only £10 (Non BSA Members £30) and due to expected high demand, places will be allocated on a first come, first served basis.

>>>>> BOOK YOUR PLACE TODAY - [2] http://www.britsoc.co.uk/events/bsa-presidential-event.aspx <<<<< If you have any queries or would like to speak with a member of our events team, please call us on [3]+44 (0)191 383 0839 or email [4] events@britsoc.org.uk

An Invitation to Digital Public Sociology? Some initial thoughts (2013-09-25 20:01)

What does ‘public sociology’ entail in a world of facebook, twitter, youtube, slideshare, soundcloud, pinterest and wordpress? What affordances and constraints do these tools entail for the task of “taking knowledge back to those from whom it came, making public issues out of private troubles, and thus regenerating sociology’s moral fibre”? What implications do these tools have for the relationship between the public and private in the occupational biographies of individual sociologists and, through aggregation and collective organisation, the discipline as a whole? There’s an interesting passage in Burawoy’s [1]2004 ASA Presidential Address which I managed to miss the first time I read it:

The original passion for social justice, economic equality, human rights, sustainable environment, political freedom or simply a better world, that drew so many of us to sociology, is channeled into the pursuit of academic credentials. Progress becomes a battery of disciplinary techniques—standardized courses, validated reading lists, bureaucratic ranking intensive examinations, literature reviews, tailored dissertations, refereed publications, the all-mighty CV, the job search, the tenure file, and then policing one’s colleagues and successors to make sure we all march in step. Still, despite the normalizing pressures of careers, the originating moral impetus is rarely vanquished, the sociological spirit cannot be extinguished so easily.

It’s in this sense that I think digitalisation within and beyond the academy has to be seen as integral to public sociology in the contemporary climate. It is reshaping what is ‘public’ and ‘private’ in complex ways, some positive but many not, conditioning the propensity of sociologists towards ‘public sociology’ but also the institutional context in which certain forms of activity are recognized and others ignored. It also complicates Burawoy’s distinction between ‘organic’ and ‘traditional’ public sociology:

Public sociology brings sociology into a conversation with publics, understood as people who are themselves involved in conversation. It entails, therefore, a double conversation. Obvious candidates are W. E. B. Du Bois (1903), The Souls of Black Folk, Gunnar Myrdal (1944), An American Dilemma, David Riesman (1950), The Lonely Crowd, and Robert Bellah et al. (1985), Habits of the Heart. What do all these books
have in common? They are written by sociologists, they are read beyond the academy, and they become
the vehicle of a public discussion about the nature of U.S. society—the nature of its values, the gap be-
tween its promise and its reality, its malaise, its tendencies. In the same genre of what I call traditional
public sociology we can locate sociologists who write in the opinion pages of our national newspapers
where they comment on matters of public importance.

There is, however, another type of public sociology—organic public sociology in which the sociologist
works in close connection with a visible, thick, active, local and often counterpublic. The bulk of public
sociology is indeed of an organic kind—sociologists working with a labor movement, neighborhood
associations, communities of faith, immigrant rights groups, human rights organizations. Between the
organic public sociologist and a public is a dialogue, a process of mutual education. The recognition
of public sociology must extend to the organic kind which often remains invisible, private, and is often
considered to be apart from our professional lives. The project of such public sociologies is to make
visible the invisible, to make the private public, to validate these organic connections as part of our
sociological life.

Digitalisation disrupts ‘traditional public sociology’ because it fragments the media field in a way which renders
a broadcasting model of public intellectualism untenable while also creating many new opportunities for
nar-
rowcasted public intellectualism of various sorts. It also disrupts ‘organic public sociology’ because it engenders a
tendency towards an increasing awareness of the ‘private’ activity of others within the academy (e.g. you follow
someone on Twitter and you’re much more likely to find out about the activism they’re involved in) and it’s also
changing the organisational dynamics of the publics with whom one is working in an organic way. My claim is that if
we take Burawoy’s call to develop a ‘sociology of publics’ seriously then it’s impossible to ignore the important role
digitalisation is playing in reshaping the processes through which publics come to be constituted. Though we should of
course resist naïve tech-boosterism which would seek to reduce the constitution of publics to digital communications.

Another aspect of Burawoy’s address which I managed to miss last time I read it was his emphasis on sociol-
ogy students as a public:

There is one public that will not disappear before we do—our students. Every year we create approx-
imately 25,000 new BAs, who have majored in sociology. What does it mean to think of them as a
potential public? It surely does not mean we should treat them as empty vessels into which we pour our
mature wine, nor blank slates upon which we inscribe our profound knowledge. Rather we must think
of them as carriers of a rich lived experience that we elaborate into a deeper self-understanding of the
historical and social contexts that have made them who they are. With the aid of our grand traditions
of sociology, we turn their private troubles into public issues. We do this by engaging their lives not
suspending them; starting from where they are, not from where we are. Education becomes a series
of dialogues on the terrain of sociology that we foster—a dialogue between ourselves and students,
between students and their own experiences, among students themselves, and finally a dialogue of
students with publics beyond the university. Service learning is the prototype: as they learn students
become ambassadors of sociology to the wider world just as they bring back to the classroom their
engagement with diverse publics. As teachers we are all potentially public sociologists.
This is an idea I’ve had in mind with sociologicalimagination.org for some time: what role can social media play in facilitating an active engagement with sociology outside the confines of the university? One thing which irritates me about the Open Access debate is the persistent tendency to overestimate both the degree of external interest in gaining access to academic journals and the likely ramifications of people doing so. I think there’s often an entirely unrealistic view of how many people would, could or should read academic papers which is coupled with a distressingly common view that an increasing circulation of expert knowledge will inevitably lead to the amelioration of social problems. It’s underpinned by a potent mix of bad sociology (what Margaret Archer would describe as ‘social hydraulics’) and professional hubris. Instead I think engaging outside the academy has to be seen in more quotidian terms which, at least in my own mind, lend themselves easily to a dichotomy: seeing the amelioration of social problems through the communication of sociological knowledge in an agential way (i.e. working with others to deploy this knowledge in collective action rather than simply ‘making public’ and assuming that’s enough) and attempting to communicate sociological knowledge in a much broader and open-ended way to simply to facilitate engagement by those who are interested or might become so if circumstances lead them to encounter it. The importance of seeing sociology students as a public encompasses both categories but the latter, such as can be achieved through blogging and podcasting for a wider audience, seems obviously numerically larger to me.

Another aspect of ‘digital public sociology’ (I really dislike this phrase but I dislike it less than ‘digital engagement’ which I’ve tended to use for the last year) that seems important to me is the collective negotiation of what Dave Beer calls the politics of circulation:

What I would like to suggest is that this blog post, like other social media content, will be subject to the politics of circulation that defines contemporary media. The data that is produced as a by-product of contemporary cultural life does not just stop when it is produced, rather data fold-back into our everyday lives in variegated and often unseen ways. Similarly the destiny of this blog post will be shaped by the material infrastructures that it has been placed within. In this sense, academic knowledge is being opened up to social media’s politics of circulation. As such, these transformations in the communication of research are likely to have profound implications for the way that we encounter and discover knowledge. All of which will then, in turn, implicate the knowledge that we go on to produce. There is the potential then for social media’s politics of circulation to influence both the communication and production of knowledge.

Using social media to communicate academic knowledge is not a problem in itself, it actually opens up vast new possibilities, but it forces us to ask what will happen as more and more researchers use social media and other open-access outlets for their work. How will we cope with the din? And, most importantly, who will get heard? If we don’t understand the politics of data circulations that define contemporary media cultures then we may also find that academic practice is reshaped without sufficient reflection and reaction. Social media is likely to lead to uneven patterns of influence, amplification, visibility and, to borrow the discourse of contemporary web cultures, Klout. It is important that we are alert to this, particularly as social media come to define the circulation of our ideas.

It is becoming increasingly apparent that various academic disciplines, right across the spectrum of the social sciences and humanities, are trying quite hard to develop a more public profile. These
struggles take many forms, as do the drivers and pressures that instigate them. Some are based upon
governmental imperatives for research ‘impact’ – which is actually shorthand for having measurable
impact (Burrows, 2012). Others are a result of cultural changes and the general feeling that public
engagement is worthwhile. Alongside these, there are also some broader transformations in the media
landscape that mean that researchers are forced to ask: what is stopping me from having a public face?

[...]

The outcomes and findings of social research have always circulated back into the social world in
variegated and often untraceable forms (Savage, 2010). But the changing media through which research
is being communicated opens this research up to a new range of possibilities for circulation and
re-appropriation. If it gets any attention, it will be commented upon and rated (or ‘liked’) and, crucially,
it will be re-appropriated through sharing, re-tweeting, re-blogging and as sections of the content
(particularly visualizations) are cut-and-pasted into other posts for use by other ‘authors’.

[9]http://dhg.sagepub.com/content/3/1/92.abstract

It’s in this sense that I think digital skills can be understood in terms of the extension of academic agency. I did
wonder recently if I’ve misunderstood Dave’s point about the ‘politics of circulation’ having only read a couple
of short papers and blog posts but not yet read his book. However at least in how I understand the concept, as
conveyed in the extracts above, the question of how socio-technical structures shape the circulation of sociological
knowledge seems unavoidably intertwined with the more ‘traditional’ question of how social structures more broadly
shape this circulation. So at least in my own mind seemingly narrow and technical issues pertaining to the capacity
of sociologists to use digital tools effectively are unavoidably entangled with larger political questions concerning
the marketization of higher education, the assault on the public university and the restructuring of the broader
knowledge system within which academics as intellectual workers are embedded. This is brilliantly diagnosed by
Tom Medvetz in one of my favourite books I’ve read in the last couple of years:

While social scientists with little left to prove in the academy can afford to reinvest their academic capital
in public debate – and often do - rank-and-file scholars have little incentive to follow this route [...] the
growth of think tanks over the past forty years has played a pivotal role in undermining the relevance
of autonomously produced social scientific knowledge in the United States by fortifying a system of
social relations that relegates its producers to the margins of public debate. To the degree that think
tanks arrogate for themselves a central role in the policy-making process, they effectively limit the range
of options available to more autonomous intellectuals, or those less willing to tailor their work to the
demands of moneyed sponsors and politicians [...] The rise of think tanks must therefore be set analyti-
cally against the backdrop of a series of processes that have contributed to the growing subordination
of knowledge to political and economic demand – including the reassertion of control over the economy
by holders of economic capital, the development of specialised forms of political expertise, the growth
of the mass media as a conduit for the imposition of market forces into politics, the corportization of
the university, and the withdrawal of the state from the financing of public education. The question
posed acutely by the rise of think tanks in America concerns the social value of social scientific knowl-
edge itself: Put simply, should money and political power direct ideas, or should ideas direct themselves?

Tom Medvetz, Think Tanks In America 225-226

But think tanks tend not to be very good at social media (a claim I should probably substantiate at some point
given that I keep coming out with it) whereas academics often do turn out to be very good at social media once they acquire a familiarity with its ecology. So the politics of digital literacy (crap term – any suggestions for a better one would be much appreciated!) could be seen as simultaneously inwards and outwards facing - negotiating the politics of circulation within the academy increasingly goes hand-in-hand with negotiating it outside the academy. This is because the distinction between ‘within’ and ‘without’ becomes, at least in terms of digital communications, a solely analytic one and arguably not even a coherent one at that and is perhaps a zombie category.

» Sociological Images: Blogging as Public Sociology The Sociological Imagination (2013-10-11 08:00:30)
[…] reflect on blogging as public sociology. I’ve recently posted some initial thoughts on Digital Public Sociology and this paper is an important contribution to what seems likely to become an increasingly […]

Ben Straughair (2014-04-27 12:18:30)
Great article.

thanks! the podcasts from the conference session this gave rise to are online here -> http://markcarrigan.net/2014/04/29/digital-public-sociology-at-britsoc14/

The first meeting of the Quantified Self Research Network took place last week at the University Leeds. This was established by myself and Chris Till in order to help encourage interdisciplinary dialogue amongst people working on different aspects of Quantified Self. Our assumption was that there were a lot of people who intended to work on this topic in the near future and that it’s a topic of the sort that would produce some really rewarding and interesting discussions if people assembled in a shared space. Both seemed to be the case, with the event attracting a lot of interest despite being organised at short notice at a fairly inopportune time of year and, perhaps more importantly, turning out to be a really interesting and productive day which all present seemed to enjoy. Here’s our description of the context and aims of the network:

In the last few years there has been a significant increase in public and academic interest in the use of devices or techniques for the accumulation, aggregation and analysis of personal data. Apps for mobile phones such as Track My Run and body tracking devices such as Jawbone, Fitbit and Nike’s Fuelband have perhaps garnered the widest attention with their ability to passively collect data on everyday activities
which can then be analysed and shared with others. There is, however, more to quantified self than the mainstream media picture of obsessive “techies”. Many people engaged in “life logging” collate data on mood and experiences often without a direct quantitative element. While a relatively formalised arm of the quantified self movement has formed, through the Quantified Self group based in San Francisco, not everyone involved in quantified self activities is affiliated with Quantified Self. This formalised movement, as well as the broader cluster of practices and orientations which are coalescing within and beyond it, point to commercial and political connections which have yet to be fully explored.

The Quantified Self research network will explore the broad implications of this loose set of practical and ethical approaches to understanding bodies, psyches and everyday practices. While we are interested in exploring the practices and techniques of assessment we think it is equally important to understand the often novel ways in which the diverse types of analysis enable new forms of reflecting on the embodied self and relations with others. We hope to encourage interdisciplinary dialogue around this multitude of emerging issues, in the belief that historical, philosophical, cultural, sociological, psychology, economic, technological and political approaches all have a role to play in understanding this fascinating trend.

The network aims to:

- Build network of scholars interested in qs
- Explore possibilities for further research and collaborations
- Share ideas about substantive issues
- Support access and development of postgraduate and early career researchers
- Develop sociological approaches to understanding qs
- Identify potential for disciplinary collaborations
- Develop relations with interested parties beyond the academy
- Developing quantifiedselfresearch.org as an online resource

We’re planning some more activities in the not too distant future: another work in progress seminar early in 2014 and a proposed session at the British Sociological Association’s 2014 conference in Leeds. If you’d like to keep in touch with what we’re doing, our new website is now online at [1]quantifiedselfresearch.org - we’re still not 100% sure what this will turn out to be yet. It would be great if it can perhaps be a place for discussion (which requires people to submit guest blogs and anyone working in this area who wants an account to post themselves is welcome to one) but even if not it will hopefully be a useful online resources where we can curate announcements, videocasts/podcasts and other resources.

If you’d like to join the network the best thing to do at this stage is to subscribe to the blog via e-mail - the form to do so is at the bottom of the website at [2]quantifiedselfresearch.org - we won’t be posting particularly frequently at this stage and it will mean you’re informed about everything we’re doing.

The Books I’m Currently Reading (2013-09-26 08:00)

It’s fun to read about books. So in this new feature we’re hoping to feature lots of books on the site. If you’d like to share your ‘to read’ pile and a short discussion of the books you’re reading then please send a JPG (smallest file size possible please!) and 1000 words or less to Mark AT MarkCarrigan.net

I’ve been ‘currently reading’ The Constitution of Society and Modernity and Self-Identity for a couple of months now. The first chapter of my PhD thesis is an extended critique of Giddens and the latent structurationism which lurk beneath the surface of his late modernity books. In essence I argue that he ties himself in knots partly because the deficiencies of structurationist theory become much more pronounced when an attempt is made to conceptualise reflexive responses to social change – too much of agency is incorporated into structure and it leaves Giddens vacillating wildly between depth psychology and a view of subjectivity (at ‘fateful moments’) which comes weirdly close to rational choice theory in its view of risk calculation and life-planning. I’ve read Modernity and Self-Identity twice before and I’ve engaged quite a lot with the Constitution of Society but had never read it cover to cover. Having become rather infuriated with Will Atkinson’s facile and lazy reading of Margaret Archer in his last book I suddenly
found myself wondering if I might have inadvertently done the same thing with Giddens. I’m fairly confident I haven’t but still feel I must finish the two books before I submit my thesis. Plus perhaps finish off Central Problems in Social Theory which I was actually quite enjoying but keep giving up on simply because it’s simultaneously much less relevant and much more difficult a read.

I’m reading The Formation of Critical Realism out of sheer curiosity about Roy Bhaskar as a person. It’s a book of interviews conducted by Mervyn Hertwig (editor of the Journal for Critical Realism) and it’s definitely worth looking at for anyone interested in critical realism. I’m finding it hard not to draw connections between the ‘spiritual turn’, ageing and his theosophist parents but whatever you think about his later work (I am, putting it mildly, sceptical) it’s hard to deny his stature as a thinker if you’ve engaged even marginally with his work. He’s also one of those writers who seems to have become progressively less lucid over time so this book can provide an accessible introduction to his ideas, given that he’s able to speak about them with a refreshing clarity. There’s much more to dialectical critical realism than I’d realised but also, I’m finding it difficult to avoid concluding, much less to the spiritual turn (written as somehow who was far from complementary at the outset).

Using Social Media in the Classroom is a book I’m reading as a spur to a proposal I’m currently in the process of putting together. It’s very good! But I don’t feel able to explain how and why I think this is the case without inadvertently talking about my planned book.

Approaches to the Individual is an extremely interesting book written by a former PhD student of Margaret Archer which explores the interface between internal conversation and external speech. It’s framed in terms of ‘approaches to the individual’ within sociological theory but I’ve seen much less of this in any substantive sense than I expected given the book’s title. I disagree with large aspects of her approach (Tom Brock and I are in the process of writing a paper critiquing its application to the empirical analysis of political resistance) but it’s certainly worth reading for anyone with an interest in internal conversation. I’ve found the sections on Goffman particularly illuminating and they point to an aspect of his work which I had no idea existed.

Lowry and the Painting of Modern Life is the book attached to the current Tate exhibition. I was bought it as a birthday present but I’m going to avoid reading it until I go to the Tate show next week. I saw the exhibition of unseen work at the Lowry Centre in Manchester last week and I can’t wait for the Tate. I’ve got some other stuff on Lowry which I’ve yet to fully read (including a really fascinating biography). I’ve had the idea rattling around in my head for ages that it’s possible to identify a sophisticated sociological sensibility incipient within Lowry’s work which (usefully) seems to be periodised – thus allowing its emergence in his work to be framed by his biography (and its historical context). After I’ve been to the Tate I’m going to start trying to write this up as a paper or perhaps a series of blog posts if I don’t think there’s enough to the idea once I started trying to develop it.

Militant Modernism is the Zero Book I was astonished to realise recently that I’ve had on my shelf for years and haven’t read. I love Owen Hatherly – I’ve read his other books, much of what he’s written online and I’m bemused that it’s taken me this long to get round to reading his first book. He’s transformed my experience of the built environment, helped me articulate what had felt like a weird and irrational fascination with brutalist architecture which emerged while I lived near the Brunswick Centre (before they ruined it) and has amongst my favourite prose styles of any living writer. The other person who’s transformed my experience of the built environment is David Harvey whose Rebel Cities is, unsurprisingly, fantastic. I’m pretty sure I’ve heard him discuss the contents of the first two chapters on a number of occasions but it doesn’t really bother me. Typically lucid, insightful and provocative – casually and softly polemic in the most enticing way possible, with an unerring capacity to make radical judgements sound like common sense reactions to the social world.
Does Facebook make people more polite? (2013-09-26 11:03)

For those of us who are cheerily hostile to Facebook, it might seem counter-intuitive to associate the platform with people being relatively civil to each other. However this research being conducted at the University of Kent, reported on the [1]Democratic Audit blog, suggests that the identification and accountability which are intrinsic to the platform tend to engender civil interaction between users of the site.

One notable platform which makes its users accountable for the comments they make and the content they produce, presumably making them less likely to behave in an uncivil manner, is Facebook. The biggest online social network site with over 1.15 billion active monthly users, Facebook requires users to construct a public or semi-public (restricted) personality profile – using their real-name – through which they can traverse the site, engage in its many social functions, and connect with other users to form social networks. Users are encouraged to maintain relatively open and identifiable profiles that include photos, educational affiliations, religious and political preferences, birthdays, and hobbies. Profiles also contain a public space where other users have the chance to leave messages, post links, and connect with one another. Moreover, Facebook users are automatically notified via the news-feed function when other members of their network produce content. Thus, Facebook users are both identified with and accountable for their behaviour. Research currently underway at the University of Kent suggests that the increased sense of accountability that Facebook users experience may go some way towards improving the quality of online discussion by reducing the occurrence of uncivil communicative behaviour. Having analysed the content of comments left by readers of the Washington Post online, the study compared the occurrence of uncivil and impolite remarks in comments left on the Washington Post website, with comments left in response to the same articles posted on the Washington Post Facebook page. Uncivil remarks – that is, those which threatened the traditions of democracy and the rights of others, as well as those which included the use of stereotypical language, were significantly more likely to occur in comments left on the website version of the Washington Post where users were able to remain anonymous and unaccountable for their comments. [2]http://www.democraticaudit.com/?p=1455

The question of how the particular characteristics of specific platforms encourage some forms of behaviour and discourage others is a fascinating one. Have you ever made the mistake of browsing Youtube comments?

BSA Activism in Sociology Forum Inaugural Meeting (2013-09-26 11:09)

Saturday 9 November 2013, 10:30am-4pm
BSA Meeting Room, London
Invitation and Call for Papers
The BSA Activism in Sociology (ASF) has been established to increase the contribution of sociology and sociologists to challenging injustice and inequality by connecting those already working in this area, building solidarity, and helping people who want to start combining sociology with activism to find the support they need. We feel this is urgently needed in a context of the neoliberal offensive that is increasing inequalities, deepening the poverty and oppression of some of the poorest sections of the working classes, and at the same time marketising higher education and restricting the space for radical critique within universities.

We recognise and seek to learn from existing initiatives across disciplines that in different ways share some of our values or aims (those we are aware of are listed below, please let us know if we have missed any). We also recognise and seek to build on what has already been achieved by sociologists, and hope to document, promote and support the work that sociologists are already doing to challenge injustice. Join us at the inaugural meeting and help to shape the activities of the ASF in its first year.

The inaugural meeting will include:

- A roundtable bringing together sociologists, activists and activist-academics from other disciplines, to debate the current state of society and the contribution of sociology to challenging inequality and injustice.
- Three concurrent workshops dedicated to: working with and through the media; engaging communities; working across disciplines to challenge injustice (see call for presentations below).
- A plenary to draw discussions together and decide on next steps. By the end of the meeting we aim to have produced:
  - A founding charter setting out the agreed aims of the forum
  - An initial plan of action to advance the aims of the forum (see call for proposals)
  - A UK-wide database of individuals who are practising sociology within their community, especially but not exclusively those working with oppressed and vulnerable people, connected by a dedicated JISCMAIL list and social media
  - A public report on the meeting showing examples of activism in sociology that were represented on the day
  - A bank of activists who will be available to speak to the media, supported through blogging on the BSA website

Registration

Attendance is free but due to limited places it is essential you register if you plan to attend.

Call for workshop presentations and posters

We are seeking short (up to 10 minutes) presentations for one of three workshops at the inaugural event, posing questions on the following themes:

- Working with and through the media: How can sociology contribute to public debates? How can sociologists help to include oppressed and marginalised voices within the media? How can we build effective relationships between sociologists, activists and journalists, or should we become sociologist-activist-journalists?
- Engaging publics: How can sociologists play a role in the community, and communities in the university? What alliances should sociologists build to challenge injustice? How do we put sociological tools in the hands of oppressed people struggling for liberation?
- Working across disciplines to challenge injustice: What can sociology learn from other disciplines’ efforts to fight for social and economic justice? What is sociology’s distinct contribution? How can we collaborate?

Presentations and posters should include one or more examples of work that has already been done in this area. We recognise the importance of a diversity of forms of expression, and welcome non-traditional presentations such as poetry or stories as well as academic papers. We had hoped to have a space for posters and other visual
Network analytic approaches to the production and propagation of literary and artistic value (2013-09-26 14:00)

Daniel Allington, The Open University

Centre for e-Research
Anatomy Museum Space
King’s Building (6th Floor)
King’s College London
The Strand
London

According to Bourdieu, the value of art, literature, etc is a form of belief that is produced within the cultural field and then propagated outwards into wider society through public-facing cultural institutions – as in the case of the ‘writer’s writer’ who is initially read only by his or her peers, but who becomes ‘consecrated’ (i.e. canonised) thanks to peer esteem and eventually finds a mass readership through school or university syllabi. In this talk, I shall lay out two innovative methodologies for studying these processes through social network analysis. This is potentially controversial because of Bourdieu’s much-discussed preference for Multiple Correspondence Analysis. However, I shall argue that, just as the abstract mathematical space of Multiple Correspondence Analysis forms a useful analogue for Bourdieu’s conception of field, the no-less abstract structure of a directed graph forms a useful analogue for his understanding of the production of value within a field, and of its subsequent propagation beyond that field.

The first of the methodologies I shall present focuses on the production of value. It has already been trialled through a case study of interactive fiction, with results of this investigation to appear in my monograph, Literature in the Digital Economy (forthcoming from Palgrave, 2014), and elsewhere. As I will argue by reference to ongoing research, the same methodology can potentially yield important insights when applied to other cultural forms.
The second of these methodologies focuses on the propagation of value, and thus provides a possible approach to the study of the impact of the arts on wider society, as well as a bridge between the two major strands of research in the sociology of culture, i.e. study of cultural producers and study of cultural consumers. It builds on the first methodology but presents arguably greater difficulties with regard to data collection and the interpretation of findings. However, these difficulties are instructive because they raise deep questions about the use of social network analysis in cultural research, both in the humanities and in the social sciences.

---

**Evelyn Ruppert on Digital Sociology (2013-09-27 08:00)**

In this podcast from the [1]BSA Digital Sociology Group's July 16 seminar [2]Evelyn Ruppert (Goldsmiths) talks about Digital Sociology.

Social Movements Network at the Council for European Studies Conference

Call for Abstracts: Social Movements Network at the Council for European Studies Conference

Washington, March 2014

The Council for European Studies' research network on social movements, now two years old, comprises 180 scholars in over 20 different countries and as many disciplines. The network is dedicated to research on social movements in Europe, whether in individual countries or transnationally. It has been very active at the prestigious CES conference, the world's premier location for European Studies, with panels, workshops, symposia and semi-plenaries at the 2012 Boston and 2013 Amsterdam conferences and joint symposia with Harvard's Berkman Center and Amsterdam's Transnational Institute, in collaboration with its sister networks in the European Sociological Association and the European Consortium for Political Research. In May the network's first book, Understanding European Movements, edited by the network’s co-chairs Cristina Flesher Fominaya and Laurence Cox, was published by Routledge.

We are now encouraging submissions for the 2014 conference (March 14 – 16) in Washington DC. The conference call can be found at [1]https://councilforeuropeanstudies.org/conferences/2014-ces-conference/2014-conference-call and important information together with the submissions portal can be found at [2]https://councilforeuropeanstudies.org/conferences/2014-ces-conference. The submission portal is now open and CLOSES on October 1st. We encourage the submission of individual papers and paper panels, on any theme related to European social movements; discussion of how movements are responding to the European crisis is particularly welcome. Such papers and abstracts should be flagged as linked to the social movements research network.

Members of the research network are more likely to have their proposals accepted and we also have the ability to pull together panels from papers which share a common theme. Membership of the network is free; for details see [3]http://councilforeuropeanstudies.org/research/research-networks/social-movements. Members have access to networking via our website and are listed in a directory available online to other members for joint proposals, networking purposes etc.

What Does It Mean to be an Intellectual Today? (2013-09-27 10:24)

The Social Epistemology Review and Reply Collective has an interesting interview with Steve Fuller about what it means to be an ‘intellectual’ in contemporary circumstances. There’s a range of important points in this interview but these really caught my attention:

Yes, I see myself as an intellectual, although it is not what I get paid to do. Being an intellectual is not part of the job description of an academic (of course, some major intellectuals have been academics). Academics are typically — perhaps even increasingly — trained and encouraged to transmit ideas within a restricted range of media, such that the medium becomes the message. For example, academics tend to believe that ideas cannot be properly developed in a radio program or a newspaper column. This attitude at once establishes the academic’s expert authority (since publishing an academic article is not a trivial skill) and implicitly sets up the intellectual as an anti-academic figure who assumes that any complex conception worth conveying can be done effectively in the popular media. Sometimes the intellectual is cast as degrading academic knowledge. This underestimates the threat that intellectuals pose to academic knowledge, which is to de-skill it and ultimately render it redundant. Thus, if you can understand evolutionary theory after reading a 750-word column by Richard Dawkins, why read Darwin’s voluminous tomes, let alone the even more verbose academic commentaries that have followed in their wake?

[...]

If by ‘real intellectuals’, you mean people who speak their own minds and not function as ideological mouthpieces, then the minimum requirement is that their income is not dependent on the popularity or validity of what they say. Academic tenure historically supplied this requirement — what I have called ‘the right to be wrong’ — but it was mainly to encourage researchers to stake risky hypotheses and venture into terra incognita. Some academics, quite legitimately I think, have also used tenure to become public intellectuals because they know that even if they say very unpopular things, they still keep their jobs. In the other great breeding ground for intellectuals, journalism, the situation has been always more precarious. Typically journalists have had to turn their world-view, or style of approaching issues, into a ‘brand’ that attracts followers who then buy the newspapers and magazines where those journalists appear, simply because they want to learn what the journalists have to say. Just as serious challenges have been lodged against academic tenure in recent years, so too it is no longer clear that the market for readers in today’s cyber-inflected media environment allows for the effective branding of intellectuals. But I don’t think that these larger structural transformations have anything to do with the quality of the individuals capable of becoming intellectuals — if anything, their ranks have swelled. My advice to a young aspiring intellectual is to read very widely and critically but take a multi-media course in university so that you are equipped to transmit your ideas in variety of literary and audio-visual media.

What really interests me is how the tension between academic activity and intellectual activity is being reshaped
by the changing politics of circulation within which it plays itself out. Academic expertise is consolidated by making contributions to an extremely specialised body of knowledge through a relatively limited range of media. So there’s an investment in these media as legitimising forms which often engenders a scepticism about satisfactorily communicating expert knowledge outside of them. However this academic habitus will, when left to its own devices, tend to engender public marginality. Hence the need for the ‘intellectual’ or, from my point of view, popularisers of social science.

This is a job which has tended to be carried out by self-branded journalists (Malcolm Gladwell, David Brooks etc) who are clearly intellectuals in the sense expressed by Steve in the second paragraph. But why aren’t they coming from within the academy? I wonder if digital technology can begin to square the circle of academic activity vs intellectual activity by making the latter feasible, in a way which builds on research but extends beyond an individual’s specialisation, without it constituting a whole different career path. In the way that for instance Gladwell and Brooks continue to work as journalists while constituting themselves as public intellectuals through the talks that they give and the books that they write? I find it fascinatingly weird that books about social science are frequently in worldwide best seller lists and yet, with a few notable exceptions, it’s rarely social scientists who are writing them.

“I’m a cyborg? I thought I was just wearing glasses”: technology, agency and ontology (2013-09-28 08:00)

This is a quick attempt to elaborate on a thought which kept coming back to me during the Quantified Self seminar on Tuesday. It seems obvious to me that one of the key conceptual questions encountered in studying technology which augments human capacities (and this category is obviously much wider than digital self-tracking) is the nature of the interface between the human and the technological. One common response to this seems to be to conceptualise it in terms of co-constitution or co-evolution where the properties of the human become indistinguishable from the properties of the technological because both are changing in relation to each other. As I understand it the point being made is that the entwinement of the human and the technological has reached such a degree of complexity that it makes more sense to think in terms of hybridity rather than interaction between entities.

Is this a fair summary? If not input would be much appreciated. It’s one of those arguments I’ve encountered in conversations and listening to talks rather than having read about in any serious way (one of many things on my post-phd to do list). But what appears to me (perhaps wrongly) to be a case of collapsing the conceptual distinction in the face of empirically observable interplay worries me. From my point of view the interaction between myself and my iPhone involves two distinct sets of properties and powers – my own as a reflexive embodied human being and those of the iPhone as a technological artefact. During the two weeks I’ve had my new iPhone I’ve changed its properties through modalities (e.g. apps, settings) encoded into the artefact by other reflexive embodied human beings whom I will never meet nor know. I’ve also changed its properties in ways which were not designed into it as an artefact: I dropped it and scratched it*, a change in its properties reliant on the material constitution of itself and the floor onto which it fell.

Has it changed me? I don’t think so. But my old iPhone changed me in all sorts of ways. Some of them are superficially dispositional, such as the oft cited tendency to rely on wikipedia rather than remembering information,
though perhaps with long term neurophysiological correlates. Others are entirely deliberate, such as my experience of navigation using digital maps – I couldn’t navigate to begin with so I’ve not lost a capacity through failing to exercise it because of a technical substitute. It’s an affordance the phone provides which I deliberately draw on in specific situations rather than something that has changed me in a more substantive sense.

My point is that I’m not convinced it’s necessary to think in terms of hybridity to understand these trajectories of human <-> technological change. As far as I can tell I basically agree about what these processes are but I disagree about how these should be conceptualised. Input would be very appreciated on this, as would suggestions on where to start reading about the concepts I’m expressing suspicion of so I can stop predicing blog posts on conversations I’ve had & talks I’ve heard.

I didn’t actually do this. I love my shiny new iPhone too much to be so careless. But the theoretical point stands.

Ailsa Haxell (2013-09-29 23:08:45)
In what ways has your phone altered you? Have you begun outsourcing your memory yet? No more remembered ph numbers, they are on the iphone...you are part of it, and it part of you. Cyborg. Have a look at Donna Haraway’s cyborg manifesto http://www.egs.edu/faculty/donna-haraway/articles/donna-haraway-a-cyborg-manifesto/ Or in Science, technology and society (STS) studies, but with an ANT lens; interrogating human and nonhuman actors in the same way. We are not so much separate from these other beings as we might like to believe...we too are made of minerals etc. They are in us/ and us in them. The cyborg manifesto and ANT allows a provocation to explore what seems outlandish. But actually isn’t all that outlandish once the surface of socialised ways of being get cleared away.

Sociological Imagination (2013-09-29 23:11:36)
"you are part of it, and it part of you." but I’m really not. my point is that i understand the theoretical impulse behind this argument but find it methodologically problematic. it doesn’t offer explanatory purchase on how specific humans engage with specific technologies and in fact actually detracts from this endeavour by blurring the boundaries between the former and the latter.

Claire Preston (2013-10-12 09:13:31)
Yes I have also grappled with this issue though not sure I identified as succinctly as you what troubles me about it. I found Ian Hacking’s The Social Construction of What quite insightful, in particular, his point about 'interactive kinds' eg women refugees, as opposed to 'non-interactive' kinds eg quarks. His key point is, as you say, that you are reflexive and embodied and the phone isn’t. But he adds to this by reference to the idea of a matrix. I won’t embark on more explanation and oversimplification of Hacking’s ideas here but I would be interested to hear your views if you take a look.

oh excellent thanks, I'll take a look, I've loved the small amount of Hacking that I've read.

This was retweeted on twitter, and I just wrote a reply and noticed this post is a bit old. I’ll reply anyway! There’s a pretty vast literature on these topics. David Chalmers has written a lot on "the extended mind" (a youtube video here https://www.youtube.com/watch?v=ksasPjrYFTg), Bruno Latour has written a paper called "on interobjectivity" which presents some of these thoughts, Ingunn Moser has written some good papers on disability, technology and subjectivity as well. Of course you are right that your phone is not “in you” in a literal sense, but you do enter into a relation with it, which enables you to do things which you did not do before. The point, at least for me, is the acknowledgement that people do not live in vacuums. You might be a reflexive and embodied person now, but lock you up in a vast, white room with nothing to interact
with, and I think you'll feel different! Further, people develop their cognitive skills as reflexive beings through interactions with, amongst others, things! The psychologist Lev Vygotsky wrote on this in the 1930s. Anyway, I think you should expand on what you mean by the fact that this type of theory doesn't allow "explanatory purchase". Also, it should be considered that not all the scholars writing about these issues are especially interested in (causal) "explanation".

"The point, at least for me, is the acknowledgement that people do not live in vacuums. You might be a reflexive and embodied person now, but lock you up in a vast, white room with nothing to interact with, and I think you'll feel different!"
I couldn't agree more! My question is what we do with that relationality in concrete cases of trying to explain things as social scientists. I have no disagreement with the point on a philosophical level, my question is a methodological one. I'd be genuinely interested in seeing studies that have applied the cyborg concept (etc) to case studies of specific people interacting with technology over time.

ayashaaban (2015-09-20 13:39:36)
You could complement the topic by adding stories of first encounters with technology (especially in the case of people who have not had much contact with technology but all of a sudden found themselves in the midst of a digital age). Also you can write about the onset of this "hybridity" (or when you believe it started).

I like this idea!

The Sociology of Daydreaming (2013-09-28 08:00)

People who build castles in the air do not, for the most part accomplish much, it is true; but every man who does accomplish great things is given to building elaborate castles in the air and then playfully copying them on solid ground ... Mere imagination would be indeed be mere trifling; only no imagination is mere. 'More than all that is in thy custody, watch over thy fantasy,' said Solomon. 'For out of it are the issues of life.'

- Charles Sanders Peirce

One of the most interesting aspects of Margaret Archer's work on internal conversation is the role it assigns to daydreaming as a modality through which people change. Drawing on a reading of Peirce that is far from uncontroversial (the key influences here are Vincent Colapietro and Norbert Wiley) she understands this "imaginative anticipation" as a mechanism through which "we review and rehearse how we would act under novel circumstances and these action plans prepare the future self to execute them when a similar real conjuncture arises" (Archer 2003: 77). The point is not that this is the goal of daydreaming but rather that the activity indirectly prepares us through our experience of entertaining hypothetical novelty within the imaginative confines of our first-person experience.
This has important implications for the common pragmatist notion that reflexivity only emerges as a response to situational novelty i.e. we’re thrown back upon reflection when habitual responses fail in confrontation with novel circumstances. Instead there is a relative independence of the mind because of our capacity to ‘confront’ novelty internally - it’s not a repudiation of the traditional pragmatist conception of how reflexivity and habit relate but rather an extension of it. Crucially, our daydreams rely on the “social variation and cultural variety available to ponder upon reflexively” (Archer 2012: 59-61). Our daydreams are furnished by the ‘raw materials’ which our social and cultural environment provides for us. But the fact we are able to furnish our inner lives with these ideational materials leaves interiority as an independent source of novelty over-and-above that which is situationally demanded by the circumstances we encounter. Peirce talked about this as ‘musement’:

Our musings can range far and wide to include daydreams or fantasies. Some persons, situation, or idea that has been encountered may prompt them, or they may be triggered by the task in hand. Musings are exploratory; they are ways of clarifying our aspirations and ambitions, our hopes and our fears, our orientations and intentions. Increased self-understanding is their product. These explorations are very much part of our private lives because they are unobservable, have no necessary behavioural outcomes and the understanding we achieve many be of precisely the kind that we do not wish to communicate to others. Nevertheless, through our musings, certain goals can be privately scratched form our personal agendas or they can internally reinforce our determination to see something through. (Archer 2003 100-101)

To give a sense of the implications of this for research, in my own PhD work which involved longitudinal interviews over two years, I made a great effort to get people to elaborate upon their ‘musements’. So if they made occasional remarks (e.g. "if money weren’t an issue I’d love to do X") I’d just try and talk it through rather than let it drop out of the conversation. It’s a far from radical strategy in an interview but it’s something you become very sensitive to if you accept Archer’s argument about ‘musement’. The point is that “the uninhibited use of imagination is one way in which many people extend their horizons beyond their quotidian contexts and initiate a process of discernment about endorsing much bolder projects” (Archer 2007: 271). Much as with deliberation in general, it’s a faculty which is straightforwardly misrepresented if construed in entirely psychological terms* because its causes and consequences are intrinsically social. I think there’s more to be said about this but Archer’s account of musement’s significance focuses particularly on those 'bolder projects' which would,

alter their life courses if they could discount the costs and risks by bringing themselves to the point of commitment. Instead, there are very strong reasons why sharing one’s flights of fancy or inmost
urges with a familiar interlocutor will invariably curtail them. Clearly, if the castle in the air is outside the shared context of the interlocutor, then the dialogical partner has nothing positive to contribute because it is beyond his or her experience. However, they can have plenty that is negative to say, ranging from the 'Don't be daft – get real', to perfunctorily entertaining the attractions of being a famous footballer or pop star, yet quickly concluding, 'It'd be great, but it's not on is it?' The problem of offering up one's dreams (or nightmares) for outside commentary is that they are regularly cut down to size – the size that the shared context can accommodate, which thus serves to reinforce 'contextual continuity'.

Cutting down to size also entails reminders of normative conventionality. Share your desire for savage revenge on an unfaithful partner and the likely response would be something like, 'Sure, he's a bastard but he's not worth swinging for!' Just as importantly, the internal, highly vitriolic outpouring of our recriminations in an imaginary conversation literally knows no bounds and we can derive considerable satisfaction from honing our insults into the most hurtful prose. Such mental activities may simply prove cathartic or constitute the stocking of one's verbal armoury for possible future use; we can harden ourselves to the shocking nature of vituperation by internal repetition. But to share these phrases and formulae with a third party is to introduce an independent 'ear' which has the same effect as 'the gaze' of inducing shame. People find themselves climbing down, engaging in self-editing or adding modifications to withdraw the public sting." (Archer 2007: 272)

Though this is not to advocate a sociological imperialism which would deny the role of psychology in understanding such faculties. One of the (many) things I want to work on post-PhD is to try and flesh out this account of 'internal conversation' through an engagement with the social psych and cognitive psych literatures. Particularly the literature on 'system 1' and 'system 2' which, from my cursory engagements with it, make the equivalent sociological debate about reflexivity and habitus seem embarrassingly sterile.

The Dangers of Academic Blogging (2013-09-28 10:03)

As you might have noticed, we're quite keen on academic blogging here. So it was interesting to stumble across [1]this thoughtful post (HT [2]Alistair's Adversaria) reflecting on some of the dangers associated with academic blogging. This point in particular stood out and left me wondering if such a disclaimer should be common practice:

As I have learned as a blogger it is almost impossible to avoid writing something that will offend someone. It may be that you espouse a view on a matter that others reject, or you may get into a "debate" in the comments section that can be perceived as somewhere between uncomfortable and ugly. Inevitably, someone will come across your blog and you will be judged by your online persona. In a recent email correspondence with [3]Marc Cortez of Wheaton College (formerly my Th.M. advisor at Western Seminary and a mentor and friend now) he shared this insight (shared with permission):

...many academics, and particularly those in academic administration do not understand blogs. As you know, blogs are their own genre and need to be read/interpreted in the right way. People who spend most of their time with academic journals come to blogs with the wrong set of interpretive criteria and walk away with the wrong conclusions. That potentially means that you're putting up a lot
of material with your name on it that is likely to be misread by the people who control your future.

Then he went on to say that many people don’t understand the "exploratory" element of blogs. That is why this blog has the following disclaimer on the side:

Disclaimer: The views and opinions presented on this blog may not represent the groups or organizations with which the authors are affiliated. Also, please consider the date of each blog entry. The author's opinion may have changed since its composition.

Thank you!

I use my blog to “think aloud,” to have conversations with people interested in the same subjects that interest me. I don’t think I’ve ever blogged a personal credo of any sort and if someone cared to do the research it would be quite apparent that many of the things I write may not reflect my opinion several weeks from now! If the genre of blogging is not taken into consideration than blog posts will be misunderstood. For the most part, blogs should be understood as a written form of a classroom discussion, not as a position paper, not as a journal article, not as a proposal for publication, not as the answer to application questions. It is a place for discussion. Sadly, many people do not know this and their unfamiliarity with the genre of the blog may result in their misunderstanding of what you’ve written.

There was a discussion at the recent BSA Digital Sociology seminar which touched on this, framing it around risks and opportunities attached to different career stages for academic blogging. I was interested to find someone in the audience who had the exact same sense of academic blogging that I did - as constituting a public record of your intellectual development - but was horrified at this prospect whereas I think it’s really cool:

[soundcloud url="http://api.soundcloud.com/tracks/109866414" params="" width=" 100 %" height="166" iframe="true" /]

The rest of the aforementioned series of posts is really worth reading for anyone interested in academic blogging. Here are the links:

- [6]Introduction
- [7] #1, ruining your public reputation
- [8] #2, offending potential educators/employers
- [9] #3, irrelevant topics
- [10] #4, Time Management
2060
It was refreshing to come across an extended reflection about some of the dangers which can be associated with academic blogging that was written by someone who is nonetheless enthusiastic about it. I’ve regularly encountered so much pontification about blogging that comes from a position of ignorance (though less so these days, which is probably more a function of self & social selection than it is any real cultural change) that it can be quite easy to ignore things people say about the practice. Though I think it’s important that those who believe academic blogging is a valuable activity, capable of enriching individual craft and academic life as a whole, should not be dismissive of the anxieties which can surround it for those who have yet to start.

Thank you for sharing my series of posts and for the thoughtful interaction!

Sociological Imagination (2013-09-28 14:15:45)
thanks for writing them!

have you published your paper btw? would love to read if so

Brian LePort (2013-09-28 21:32:00)
I haven’t yet because it is still developing. I am scheduled to present it on November 24th and soon after that I will post it on my blog and probably on my academia.edu account as well.

Deborah Lupton (2013-09-29 11:49:32)
As you now, I am a great supporter of academic blogging. But let’s not forget that not all bloggers are the same: some are more vulnerable to potential threats and risks more than others, and this needs to be acknowledged. Women and people from marginalised social groups for example, tend to be subjected to greater harassment than white male bloggers, while early career researchers may need to be more cautious than established academics. I talk a bit about this in my recent blog post ‘Academics online: what are the risks?’ http://simplysociology.wordpress.com/2013/09/16/academics-online-what-are-the-risks/.

Deborah
for sure - that’s what the soundcloud micro podcast was pointing to, this important point can be easily overlooked.

Are you a fox or a hedgehog? (2013-09-28 10:25)

There’s a wonderful section of [1]one of the posts we just linked to about the [2]dangers of academic blogging which discusses the way different intellectual personalities approach academic blogging. The post makes an important (and personally quite sobering given how clearly I’m not a hedgehog) point about how intellectual hedgehogs might perceive the online activity of blogging foxes. 

There is a saying attributed to the Greek poet Archilochus that goes, “The Fox knows many things, but the Hedgehog knows one great thing.” The philosopher Isaiah Berlin was inspired by this pithy observation so he wrote an essay titled [3]“The Hedgehog and the Fox” wherein he presented the idea that there are two types of thinkers: (1) those who understand the world around them through the lens of one big idea and (2) those who understand the world by drawing from a variety of ideas. Since then, people have used this model to describe their own approach to the life of the mind. 

Personally, I’m a Fox—not an attractive person, but one who wants to know a little bit about everything. While most of my reading time is spent with books related to biblical studies and/or Christian theology there is no denying that I am almost as interested in other topics like contemporary religions, international politics, various sorts of philosophy, ethics, neuroscience, and professional sports. That is why this blog has failed to be strictly a biblioblog. I am not apt to isolate and compartmentalize my thought life. I understand the big picture when I factor all the smaller pieces and I understand the smaller pieces in light of the big picture. 

[5]
In this video from TEDxVancouver Elaine Lui, writer of a popular celebrity gossip blog, talks about what exactly ‘gossip’ is and why people care. She makes an interesting case about the complexity of the ecosystem surrounding modern celebrity. What's perhaps more contentious is her claim that as a 'professional gossip' she studies the celebrity ecosystem in the same way a natural scientist studies a particular environment. However if we put to one side the overstatement which is practically demanded by TED events, is it really such a silly claim? Perhaps there’s some degree of applied sociological knowledge which can be seen in the crafting of a gossip site which is now read by a million people a month? Her argument that celebrity gossip, construed as a form of story telling, is significant in understanding contemporary culture certainly seems plausible when considered in terms of the sheer amount of human attention that is occupied by it each year.

Gabriel Tarde and Anthropology (2013-09-30 08:00)

In recent years the work of [1]Gabriel Tarde has attracted renewed attention. This individualistic rival of Durkheim, long marginalised in the recent history of sociological thought, owes much of his newfound popularity to the promotional efforts of Bruno Latour and his followers. In fact Latour seems to be a huge fan and actually played Tarde in an odd [2]reenactment of a 1903 social science debate. Perhaps there’s a context here which makes it seem slightly less strange. If you’d like to find out more about Tarde and his legacy, it’s worth reading this interesting post on [3]Savage Minds which discusses Tarde’s often overlooked influence on anthropology:
In the last decade or so (earlier, if you speak French) there has been a 'neo-Tardian revival' as people organize conferences, write books, and otherwise advocate for Gabriel Tarde, an otherwise-forgotten thinker of France's Third Republic. Most anthropologists think of Tarde, if they think of him at all, as one of the many guys that Durkheim defeated on his climb to the top of France's academic heap. Today, people are interested in Tarde because he is part of the intellectual genealogy of people like Deleuze and Latour. This work is interesting and important because it moves beyond a vision of society as composed of static, coherent, superorganic social wholes to one which more adequately theorizes human conduct as a dynamic, emergent system with multiple determinants and outcomes. Except I will say one thing:

Some of the earliest anthropologists to take up Tarde's work were American anthropologists. The first English translation (afaik) of Tarde's Laws of Imitation was by Elsie Clews Parsons, who was (among other things) the first female president of the American Anthropological Association.

I don't bring this up to dismiss current work on Tarde, which is very interesting. Nor do I bring it up because there was a tremendous up-take of Tarde’s thought in Boasian anthropology (there wasn’t). However, I do want to insist that Parson’s translation of Tarde is as emblematic of anthropology’s future as the more recent work I cited above.

Reification: A New Look at an Old Idea (2013-09-30 10:42)

In this interview from the [1]Platypus Axel Honneth talks about his book [2]Reification: A New Look at an Old Idea. His discussion of the history of reification as a concept and the politics surrounding it was particularly interesting:

Axel Honneth: This is a surprising question, one I would not have thought to ask, so my answer comes very much ad hoc. I do not believe that concepts belong to any specific political community or group. The degree to which concepts help us explore something or see something new, they should be taken as an instrument potentially available for everyone in society. So, in that sense, I do not believe that reification is an automatically leftist concept. Moreover, in terms of the history of ideas, I am not even sure that reification is necessarily a concept developed only by leftists. For instance, the French Marxist thinker Lucien Goldmann sought to demonstrate the similarities between the approaches of Lukács and Heidegger. You can find in Heidegger an idea of reification, which already indicates that reification was a concept also utilized by the right, or on the right. There are many problems with Lukács's analysis. The almost mystical role he assigns the proletariat is only one of them. Even if we grant that his was one of the most fruitful periods in the Left tradition, in the history of Western Marxism, I think that today we can see much more clearly the limits of that analysis and the mistakes bound up with those limits.
And, surely, the biggest mistake is not only the emphasis on the world-historical role of the proletariat, but also how this is emphasized, namely by way of a very peculiar set of background ideas, let’s say, about the social structure of reality. Lukács relies on a kind of Fichtean-Hegelian metaphysical concept by which all human society is thought to be grounded in a certain kind of world-constituting activity, and so Lukács thinks that the only class that can overcome reification, which is seen as the destruction of that world-constituting activity, is the class which is representing—even under alienated or distorted conditions—that kind of praxis. Therefore, we have this almost fantastic piece within the whole study, wherein Lukács wants to reveal this one moment of the overcoming of these distorted conditions. For Lukács, this moment looks almost like this one revolutionary act; I mean, you almost get the sense that in one second all these destructive conditions are overcome. It’s a very peculiar analysis—enormously inspiring, but also very strange.

Sergio (2014-04-05 03:18:31)
It would be a good idea if philosophy itself was taught in schools. This has been neglected in Britain for a long time, probably for a over century (I haven’t the figures to hand). Every subject has a philosophy which both informs the subject and challenges its assumptions. The problem with the ID vs evolution debate is that the debate is not about science per se, but about what counts as science. This is not a question answerable within science at all: it is a question answerable when thinking about the philosophy of science. Many people are unaware of this. This is mainly due to almost all schooling to age 18 in Britain providing a readymade philosophical framework for each subject, without ever asking the child to justify that framework, or even telling them what the framework is. Our young adults are therefore philosophically ignorant: they do not know what philosophy is, or what it is for. Were philosophy taught properly in schools then it is likely that both sides of the argument would fear the other side less. They would all know that philosophically aware pupils were able to challenge the presuppositions of each subject for themselves, and were provided with a safety net against nonsensical thinking and indoctrination. Also, what I like here is that I have not needed to state my own view on ID vs evolution! And I don’t need to, that’s not the point. I can guarantee though, that having thought about the question of origins in depth, I don’t believe the world rests on tortoises, who may or may not be partially responsible for creation/nature (does anyone?!) That third option has too great philosophical problems. Both ID and evolution have less problems than tortoises. So I believe my philosophy is, to this extent, informed. I would love young adults to have a similar philosophical benefit of informed thinking, having considered carefully all sides of a debate within their own philosophical framework, and having considered their own framework too.

Invitation to Agency Theory Reading Group 2013/2014 (2013-09-30 10:44)

Dear All,

Following the success of the Summer Clinic on the sociological theory of agency we are offering the opportunity to further develop our investigation and review of the concept over the coming academic year.
We propose monthly sessions on the last Wednesday of each month from November 27th 2013 through to June 25th 2014 from 2-5pm at London South Bank University. This would give 8 sessions in all.

Whereas the Summer Clinic was pre-cast we would welcome a more peer led reading group for these months. To this end, we are inviting those who would like to participate to suggest any agency related topic and reading. This is a great opportunity to use our network to expand all our understandings of the field of sociological agency, and to connect the group to the specific research interests of its participants.

We would also invite those who suggest topics (or anyone who feels enthused) to be the facilitator of the group for that month, and perhaps to raise some initial thoughts and questions for the discussion.

If there is enough interest we would like also like to propose that the reading group ends with a symposium in July in which we could present short papers for further discussion, perhaps with a view to a joint publication, special edition etc.

If you are interested in participating/proposing please contact Sadiya and myself at[1]agencytheorylondon@gmail.com< mailto:[2]agencytheorylondon@gmail.com>. Looking forward to seeing you all again, and possibly taking this further. Please do forward this invitation to any relevant lists. Best wishes, Julien Morton (London South Bank University) Sadiya Akram (University of Canberra)

How would Marx cope with the neoliberal university? (2013-10-01 08:00)

This TED talk raises important issues about the intensification in the growth of inequality which can be seen throughout the world, particularly in terms of the the super-rich at the very top of the income distribution. It’s a good talk but is there not something slightly strange about the way this is discussed in a TED context? If Marx was around in 2013 would he be giving TED talks? After all, Marx would not have coped well in the 2013 university so perhaps he would have been forced to hit the international conference circuit in order to ensure a demonstrable ‘impact’:
BSA Annual Conference 2014: Changing Society - Call for Papers (2013-10-01 09:38)

Wednesday 23 – Friday 25 April 2014 (Postgraduate Workshop: Tuesday 22 April 2014)

University of Leeds, UK

The theme of the BSA Annual Conference 2014 will be 'Changing Society'. This follows on nicely from the theme of engagement at this year’s conference in London, where BSA President, John Holmwood, Guardian Columnist, Polly Toynbee and BBC Radio 4's Laurie Taylor all championed the need for sociologists to engage in public debate and prove their contribution. The theme of changing society will therefore focus on how sociologists are affecting that change, both individually and as a collective discipline.

With this in mind, the BSA is inviting submissions for the 2014 Conference on any sociological research topic, with individual members and BSA study groups all encouraged to contribute posters/papers and other activities.
Suggestions for grouped sessions within the new *Frontiers* stream are also welcomed, while there will also be an opportunity for study groups to meet independently over the three days.

If you wish to submit an abstract, please visit the [BSA Annual Conference 2014 page on our website](http://www.britsoc.co.uk/events/bsa-annual-conference/submissions.aspx) and follow the online instructions. Alternatively you can speak with a member of the events team on 0191 383 0839 or by email at [events@britsoc.org.uk](mailto:events@britsoc.org.uk). The final deadline for abstract submissions is **Friday 18 October 2013**.

**SUBMIT NOW >>**

**Important Dates:**

Friday 18 October 2013 - Final deadline for abstract submission

Friday 17 January 2014 - Last date for presenters to register

The Daily Mail Song (2013-10-01 21:10)

Apologies to our many non-UK readers for whom this will be baffling but [1]recent political events in Britain make this song deeply relevant:

Royals on the first page,
Swine flu and road rage.
Find maddie, foreign baddie, put him in a big cage.
Bureaucratic red tape, facebook gang rape.
Gordon out, David in before the country caves in.
Ian Huntley gets his own jacuzzi and a gym in jail.
It's absolutely true because I read it in the Daily Mail.
Bring back capital punishment for paedophiles,
Photo feature on schoolgirl skirt styles,
Binge Britain. Single mums.
Pensioners. Hoodie scum.
Oversexed and underage, (Foreign stories half a page)
Criminals get Marks and Spencer vouchers when released on bail.
It’s absolutely true because I read it in the Daily Mail.

Ban this gay smut,
I’m not racist but...
Car crime, knife crime.
Hang the cheating wife time.
Pop stars take drugs.
Teen boys wear hoods.
Sports stars have sex.
Bears shit in woods.
Brussels politicians want to stop us drinking English ale.
It’s absolutely true because I read it in the Daily Mail.

Climategate. Petrol prices.
Pot-holes. Credit crisis.
Gypsies. Russell Brand.
Time we all took a stand.
Modern art where to start? Trash the lot of it.
Apart from statuette of puppy.
£50 plus p+p.
Muslim women hiding stolen goods behind their veil.
It’s absolutely true because I read it in the Daily Mail.

Poles paid to give blood.
Immigration 'like a flood'.
Soft touch british isles,
Cancer from your mobiles,
Cancer from your laptop,
Cancer from your root crop,
Cancer from your shoes,
From your dog,
From your pen top,
Immigrants arriving on an unprecedented scale..

It’s got to be the case if it’s written in the Daily Mail.
They never mix their words in the good old Daily Mail.
It’s absolutely true, because I gather all my views,
From the Daily Mail.

CfP: From Queer/Nature to Queer Ecologies (2013-10-01 21:21)

The new deadline is October 15, 2013. Please share widely and submit your work!

+++====+++

This issue of *UnderCurrents* celebrates the 20\textsuperscript{th} anniversary of ‘Queer/Nature’ by inviting creative and scholarly contributions to the heterogenous field of Queer Ecologies. We envision this issue as both a retrospective moment and timely opportunity to highlight the continued ethical and political creativity that springs from thinking about the queer and the ecological together. In May 1994, *UnderCurrents* released what was very likely the first ever publication wholly devoted to the intersection of queerness and nature. In the editorial essay framing that issue, Shauna M. O’Donnell and the Editorial Collective of *UnderCurrents* wrote, “Difficult though it may be, trying to map out a space for Queer/Nature within a politics of the environment demands the charting of courses through a discursive terrain of perils and possibilities” (2). That landmark issue explored topics as diverse as the intersection of geography and queer theory (Gordon Brent Ingram), sexual morphology and medicalization of the queer body (Morgan Holmes), ecologies of life and death (J. Michael Clark), and the nascent queer ecology (Catriona Sandilands). It also included myriad creative work that touched themes of queer memory (Ailsa Craig), alternative kinship and communities constituted in passion (Caffyn Kelly), and small town life (Deanna Bickford). The exploratory openness, breadth, and diversity of the issue signaled both the significance of ‘queer’ as a conceptual and political transformation of sexual politics and the sense that environmental politics could “no longer be an articulation of white, male, heterosexual prescriptive or descriptive privilege” (2). Two recent edited volumes represent the breadth of queer ecological scholarship. The first, *Queering the Non/Human* (Giffney and Hird) explores of the theoretical, ethical, and political possibilities of an encounter between queer theory and posthumanism. The volume’s editors offer a breathless introduction to the complex diversity of work presented in the book. Most broadly, the contributors to *Queering the Non/Human* challenge both the meaning and uses of queer theories and the porous and contested boundary between the human and the non human. The second, *Queer Ecologies: Sex, Nature, Politics, Desire* (Mortimer-Sandilands and Erickson) traces intersecting lines of queerness and nature, mapping a field with implications not only for environmental politics, but also for the theorization of the boundary between human and animal, considerations of nation, nature, and colonialism, and imaginations of the ecologization of desire, to name just a few. In addition to these two substantial volumes, recent articles by geographer Matthew Gandy and ecocritic Timothy Morton gesture toward the continued expansion and diversification of queer ecological thinking and research. We invite both creative and scholarly submissions that contribute to Queer Ecologies. Possible perspectives, themes, and intersections include, but are by no means limited to:

- Evolving queer theories and activisms, especially perspectives from:
  - Trans Studies
  - Disability Studies
  - Queer of Color scholarship
  - Transnational Sexuality Studies
Submission Guidelines UnderCurrents welcomes both creative and scholarly work for the printed issue as well as the online version. These include essays, poetry, photographs, visual submissions, video, audio, mixed formats, and more. The extended deadline for submissions is October 15, 2013. The subject line of your email should read: Submission // Queer Ecologies. Submissions are made through the UnderCurrents website [1]http://pi.library.yorku.ca/ojs/index.php/currents/index Images should be at least 1600X1200 pixels, 300dpi. All text should be in .doc or .docx format, and not exceed 6,000 words. Detailed guidelines and requirements can be found on the website. Submissions that do not meet the requirements will not be considered. For any questions please write to [2]currents@yorku.ca. The Editorial Collective will work closely with authors whose work has been selected. UnderCurrents encourages authors to engage in anti-discriminatory discourse. Visit our website for more details: [3]http://pi.library.yorku.ca/ojs/index.php/currents/index

Dear Group members,

I have had this idea for a long time, but just got around to trying to implement it.

I propose to set up a 'CLASSICS READING GROUP'. We can meet up, perhaps, once a semester/term and read/discuss/critique 'classics' - the likes of Marx, Weber, Braverman, Pateman, Oakley and so on. Anything that we deem classic (and interesting!) but still relevant to the sociology of work, employment and economic life. The formal discussion can, of course, be followed by an informal discussion and a pint in a local pub.

This would probably be mostly relevant for early career WEEL researchers but senior members are especially welcome and can participate as discussants or lead a workshop - if you are expert on the particular 'classic' that we are reading.

We could meet at the BSA room (the room is free). But perhaps for the purposes of inclusivity we could do an odd meeting in the 'North' of the country (if someone would organize a space at their university).

Now, to get this going I would need to know how many would be interested to participate. SO - IF YOU ARE INTERESTED - please e-mail me at [1]M.Karepova@uel.ac.uk or through our WEEL Facebook page. And once we know the numbers we could chose the book and the date.

I'm sure this will be an opportunity to read something that many of us 'always wanted to read' - but also an opportunity and occasion to meet new colleagues and make new friends.

I'm looking forward to hearing from you!

Maria

DISCOVER SOCIETY

Measured-Factual-Critical

We publish short (1500 word) research-based articles on social topics. We also publish: ‘Viewpoints’ (on current social issues); ‘Policy Briefings’; ‘On the Frontline’, and a longer, ‘Focus’ article in each issue.

We welcome contributions that are research-based and meet our guidance for contributors (available online: [2] http://bit.ly/18LEZMg)

Potential contributions can be discussed in advance with the editors via a short ‘pitch’ sent to: [3] discoversociety@outlook.com

Managing Editors: John Holmwood (University of Nottingham) and Sue Scott (University of York)

Editorial Board: Kehinde Andrews (Newman University); Lorenza Antonucci (University of West of Scotland); Les Back (Goldsmiths); Ben Baumberg (University of Kent); Gurminder K. Bhambra (University of Warwick); Mark Carrigan (University of Warwick); Emma Uprichard (University of Warwick); David Mellor (University of Oxford); Katherine Smith (University of Edinburgh).

Impostor Syndrome and Academic Writing (2013-10-02 08:00)

There’s an interesting post on the (excellent) [1]Explorations of Style blog which discusses the relationship between 'imposter syndrome' and academic writing. The author acknowledges that the description of imposter syndrome rings true for many - feeling like you’re a fake, worrying that you will be 'found out' etc. However she raises a really interesting note of caution about how frequently and widely the term is applied, particularly as pertaining to academic writing:

I worry that treating *dis-comfort* as exceptional contributes to the notion that we ought to feel comfortable. In particular, I am troubled by the notion that we ought to feel comfortable about academic writing. Writers must learn to live with a great deal of uncertainty and vulnerability. Exposing our ideas to public scrutiny is uncomfortable, and recognizing that discomfort as inevitable can actually help make us more comfortable. The recognition of discomfort acknowledges the inherent and ongoing challenges of academic expression. It helps keep us humble, which matters if we are going to produce interesting and honest work. It makes us work harder than we might otherwise do. Academic writing is a struggle and not a realm in which confidence and complacency are ever likely to predominate. It’s not my intention to valorize any notion of suffering for art, but rather to accept the likelihood that producing good academic prose that we are willing to present to the public will be a struggle. Students often seek out writing instruction so that the writing process will become easier. However, in many cases, it’s more realistic to focus on writing *better* than to focus on lessening the emotional costs of writing. This acceptance of writing as an intrinsically challenging act seems particularly important for novice writers who often assume that the challenges come from their inexperience rather than from the very nature of academic writing.

Podcasts: Contemporary Realist Theory (2013-10-03 08:00)

These podcasts were recorded at an event in September run by the British Sociological Association's Realism Study Group. A range of speakers working in the critical realist tradition were asked to address the theme of *contemporary issues in realist theory*. The intention was to link this tradition of social theory to the pressing issues, theoretical and empirical, which those working within it have addressed.

Call for papers- Sociological Studies of Children & Youth: Soul of Society (2013-10-03 19:34)

Call for papers- Sociological Studies of Children & Youth: Soul of Society

"There can be no keener revelation of a society’s soul than the way in which it treats its children." Nelson Mandela

Guest Editor: M. Nicole Warehime, Ph.D., Oklahoma City University

[1]Sociological Studies of Children and Youth (SSCY) will feature an edited volume on discussing children and youth as “the soul of society”. This volume will provide insight into the modern lives of children and youth.

The guest editor is considering a broad knowledge of current empirical research that focuses on children and
youth in today's society. Manuscripts featuring qualitative and quantitative methods, mixed methods, program evaluation and outcome studies are particularly invited.

Manuscripts should be a maximum of 30 pages (14,500 words) in length including references and should be prepared according to the series [2]author guidelines and using APA 6th Edition reference style.

Please contact the Guest Editor for any inquiries: [3]mnwarehime@okcu.edu

Deadline for submissions: Friday, 13 December 2013.

Manuscripts should be submitted electronically to [4]mnwarehime@okcu.edu with a subject line of "SSCY Volume 17".

All submissions will be reviewed by the SSCY editorial board with notifications made by Friday 31 January 2014.

The deadline for submissions of revised, final drafts will be Friday 28 February 2014.

Publication of the volume will be in 2014.

For more information about SSCY visit the series [5]homepage

Podcast: What is Digital Sociology? (2013-10-04 08:00)

In these podcasts from the [1]BSA Digital Sociology group's July seminar, a range of speakers address the question of what is Digital Sociology? The day was divided into two panels: digital methods and digital engagement. The first panel deals with a broad range of issues pertaining to digital sociology while the second looks more specifically at issues attached to sociological engagement using digital tools. Further podcasts include responses to audience questions and the plenary talk given by Les Back.

The New Socialism

What is valuable, visible & knowable in the emerging social economy?

A one-day conference hosted by Centre for Interdisciplinary Methodologies

10am-6pm, 11th December 2013

Room MS.03, University of Warwick

Appeals to the ‘social’ today are everywhere: ‘social enterprise’, ‘social media’, ‘social neuroscience’, ‘social prescribing’, ‘social marketing’, ‘social analytics’, ‘social innovation’. This is thanks partly to the affordances of new techniques of accounting, network visualization and behavioural analysis, many of which take advantage of the ubiquitous digitization of market and non-market activity. The social world can be seen, quantified and influenced via new forms of expertise and data analytics. Managers, marketers and policy-makers make explicit appeals to the ‘social’, in order to sustain brands, rational decision-making, mental health and public goods.

How do we make sense of this? What is the ontology of the ‘social’ that is being appealed to, and how does it differ from the ‘social’ of 20th century statistics, society and sociology? What methodologies are at work in rendering this form of sociality visible, measurable and governable? Is social network analysis now performative, as neo-classical economics has been described in the past? What power relations are latent in this new notion of the social, and to what extent is it in fact reducible to the economic after all - or, perhaps, the biological?

This conference brings together scholars working in economic sociology, science and technology studies, social studies of finance, social studies of Big Data and other fields, to address these questions. Confirmed speakers include:

2095
The conference is free to attend, but registration is essential. You can register for this conference [9]here. All queries should be sent to Will Davies – [10]William.j.davies@warwick.ac.uk

The event takes place in Room MS.03, which is in the Mathematics and Statistics building. A campus map is available[11]here (the building is number 38 on the map). Information on how to get to Warwick University is available [12]here.

Another conversation this morning about [1]casualisation in UK higher education left me feeling I should probably try and articulate my convoluted and perhaps contradictory views on this issue. It keeps cropping up in conversations, usually in the pub, which inevitably leave me feeling afterwards that I’ve given people who I 99% agree with the impression that I’m somehow hostile to anti-casualisation arguments. I’m truly not. I organised an anti-casualisation session at the BSA postgraduate pre-conference a few years ago (with a speaker from UCU’s committee and another who had been heavily involved in disputes over [2]grad student unionization in the US) which I was a bit pissed off that only a single person attended, despite lots of people being at the event. This issue has been relegated to the back of my mind in recent years, partly because I’m an avoidant person and responded to being pissed off that no one attended my session by not thinking about it and partly because I’ve been busy with a lot of other stuff, some of which has been higher education related activism of other forms. It’s an issue I care about deeply but one which, with three years of freelancing behind me, I seem to have slightly more complex views on than I did initially.

In the case from this morning Durham’s department of theology had posted an advert inviting PhD students to apply for the ‘opportunity’ to design and run extracurricular seminars with a target audience drawn from anywhere across the undergraduate student body. The advert implicitly acknowledged that there might be some expectation of payment for such an activity by making clear that the role would not be paid but there would be a ‘photocopying allowance’ (I’m not making this up) as well as familiar platitudes about the instrumental and personal value attached to such a wonderful opportunity. I hope it’s not hard to see why myself and others would find this objectionable and I suspect if you’re reading this blog then you probably more or less share that reaction. But I do
find it harder to articulate precisely why I object and, as someone who would probably be a political philosopher right now if I hadn’t stumbled across sociology, this bothers me.

To explain why this is so, let me cite the example I had in mind while pondering this earlier. The Sociology Department at the University of Warwick has a long running Centre for Women and Gender Seminar Series which I’ve participated in twice and whose convenors have pretty much entirely been friends or acquaintances of mine over the past few years. The department often actively recruits these convenors because inevitably there is an end point to people’s willing involvement. I’m not sure how much work is involved but it’s probably not insignificant given that, as I recall, it’s a monthly seminar series over two academic terms with speakers organised into thematic sessions. Basically, I find it nigh on impossible to object to something like this yet many of the arguments cited against schemes such as that found in Durham’s theology department surely apply with (near) equal weight to the CWGS seminar series? In fact anything which contributes to the research culture of a department can be seen as contributing to the attractiveness of the department and its capacity to win funding – in which case does this not constitute work on behalf of the department which should be paid?

My slightly facile response to my own worry is to invoke the spectre of administration. My fear basically amounts to the possibility that anti-casualisation discourse could contribute to the already rampant commodification of higher education, collapsing the category of voluntary activity undertaken for its own intrinsic rewards into labour that is either paid or unpaid. So my response to this fear from an anti-casualisation standpoint is to say that what makes the difference is the administrative involvement of the university – at which point it ceases to be ‘voluntary activity undertaken for its own intrinsic rewards’ and begins to become part of the formal life of the institution and should be remunerated as such. But the abstraction of this distinction bothers me and this issue is still far from clear in my own head. Outside of this specific issue I’m still 100% supportive of the anti-casualisation campaign and hope this comes across (hence the long and defensive preamble about my activism in the first paragraph) – my abstract pontification also doesn’t detract from my acceptance of the well rehearsed moral arguments about the inequities attached to ‘opportunities’ to work for free given the obvious variability in people’s capacity to take them and the implications they can hold for future advancement.

Benjamin Geer (2013-10-18 03:48:54)

Why can’t we do something that has intrinsic rewards and still get paid for it, because, after all, we also have to pay rent? Why should work that has intrinsic rewards be volunteer work? That would mean that the only people who could afford to do intrinsically rewarding work would be those with a large inheritance.

I’m not saying we can’t! I think they co-exist rather than being mutually exclusive & it’s the actually existing tensions between them that I find interesting.
When Lacan got trolled (2013-10-05 08:00)

43 years ago today, on October 13, 1972, the charismatic and controversial French theorist and psycho-analyst [1]Jacques Lacan is giving a lecture at the Catholic University of Louvain, Belgium, when a young man with long hair and a chip on his shoulder walks up to the front of the lecture hall and begins making trouble. He spills water and what appears to be flour all over Lacan’s lecture notes and then stammers his way into a strange speech that sounds as if it were taken straight out of [2]Guy Debord’s *The Society of the Spectacle* (HT Open Culture and Critical-Theory.com)

http://www.openculture.com/2011/03/jacques_lacan_speaks_zizek_provides_free_cliffs_notes.html

Though we feel obliged to point out that a number of people on Twitter claimed that this ‘confrontation’ had been staged.

Noam Chomsky: Totalitarian Culture in a Free Society (2013-10-05 14:00)

This Chomsky lecture from a couple of decades ago is fascinating (though the initial introductory speaker is a little devoid of charisma).

The Thirteen Commandments of Neoliberalism (2013-10-06 08:00)

In the Utopian [1]Philip Mirowski discusses [2]neoliberal thought and takes issue with the increasingly common dismissals of neoliberalism as 'market fundamentalism', arguing that such a label entirely misrepresents neoliberal doctrine in a way which 'dulls serious thought'. Instead he argues that it is a body of ideas which has always been on the move.

Throughout the second half of the twentieth century, the neoliberal project stood out from other strains of right-wing thought in that it was self-consciously constituted as an entity dedicated to the development, promulgation, and popularization of doctrines intended to mutate over time. It was a moveable feast, and not a catechism fixed at the Council of Trent. It is very important to have some familiarity with neoliberal
ideas, if only to resist simple-minded characterizations of the neoliberal approach to the financial crisis as some form of evangelical "market fundamentalism."

However the recognition of this heterogeneity in neoliberal thought does not entail that it represents 'gormless empiricism or random pragmatism'. Instead Philip Mirowski argues that there is a logic underlying this flux, one which both shapes and explains neoliberalism's response to the contemporary financial crisis. He offers his Thirteen Commandments of Neoliberalism as a way of getting an explanatory handle on what this means politically. We've reproduced them below but it's worth reading this fantastic article in full to understand what he means by each of these pithy formulations.

[1] THOU SHALT REVIVE AUTHORITY IN A NEW GUISE

**Some critical thoughts on psychosocial research (2013-10-07 08:00)**

One writer who made a huge impact on me during my transition from philosophy to sociology was Ken Plummer. There are many aspects of his work which I now have problems with but I think my engagement with his work (particularly Sexual Stigma, Telling Sexual Stories and Documents of Life) had a big impact on how I approach sociological inquiry. It’s on the question of the *individual* where we part ways and I think this can make me seem a lot less interactionist than I seem:

Certainly the concrete human must always be located within this historically specific culture – for ‘the individual’ becomes a very different animal under different social orders. This is not a book that champions looking at the wonderful solitary human being: my conception of the human subjects and their experiences is one that cannot divorce them from the social, collective, cultural, historical moment. But in the face of the inherent society-individual dualism of sociology, I argue that there must surely always remain a strand of work that highlights the active human subject? And in the face of a constant tendency towards the abstract and the linear in modern thought, surely there is also always a need for the creative, imaginative and concrete? (Plummer 2000: 7).

This seemed radical and provocative to me when I first read it. Now it simply seems mistaken. I don't think the society/individual dualism represents some intractable problem and my enthusiasm for Margaret Archer’s work stems largely from my conviction that she has largely solved this problem (in so far as one really does ‘solve’ theoretical ‘problems’) in a way conducive to empirical research. Lots of substantive theoretical and empirical work remains to be done but there’s an astonishingly expansive research programme incipient in the work she’s done, particularly in the last fifteen years. My point in writing this isn’t to sing the praises of her approach but simply to explain how, from my point of view, her work offers a much more powerful way to approach the exact same things I was interested in when I was a symbolic interactionist.

If I’d encountered psychosocial approaches at the time I was entering sociology, I doubtless would have been attracted to them too, given that they work from an understanding of “research subjects whose inner worlds cannot be understood without knowledge of their experiences in the world, and whose experiences of the world cannot be understood without knowledge of the way in which the inner worlds allow them to experience the outer world (Hollway and Jefferson 2000: 4). However the difficulty with these approaches arises because of their construal of the subject as *psychic* and *social* such that the underlying gap between ‘individual’ and ‘society’ which Plummer sees as intrinsic is not *bridged* in any meaningful way. The general trajectory of psychosocial approaches is animated by a critique of ‘naïve’ models of subjectivity which is simultaneously methodological and ontological:

*Taking a research subject’s account as a faithful reflection of ‘reality’ similarly assumes that a person is one who:*

- shares meanings with the researcher;
- is knowledgable about him or herself (his or her actions, feelings and relations);
- can access the relevant knowledge accurately and comprehensively (that is, has accurate memory);
- can convey that knowledge to a stranger listener;
- is motivated to tell the truth” (Hollway and Jefferson 2000: 11-12)
Some of the methodological aspects to this are perfectly acceptable from a realist perspective. There is a sense in which the resolution of the ‘individual-social paradox’ (described by Hollway and Jefferson (2000: 13) as “how individuals come to have experiences supposedly at odds with the norm for their social position, the fearless woman, the fearful man etc”) is precisely Archer’s point when she contends that reflexivity should feature in our explanations because,

> without it we can have no explanatory purchase upon what exactly agents do. Deprived of such explanations, sociology has to settle for empirical generalisation about ‘what most of the people do most of the time’. Indeed, without a real explanatory handle, sociologists often settle for much less: ‘under circumstances x, a statistically significant number of agents do y’. These, of course, are not real explanations at all. (Archer 2007: 133).

The correct recognition that “once methods allow for individuals to express what they mean, theories not only have to address the status of these meanings for that person and their understanding by the researcher, but they must also take into account the uniqueness of individuals” licenses a deeply problematic ‘drilling down’ into the (supposed) psychic life of the subject. The plausibility of this move rests largely on the (false) assumption that the only available alternatives are to treat the subject as ‘self-transparent’ or collapse their particularity into their socio-demographic placement.

Instead the strategy offered is essentially one of psychoanalytically ‘reading’ the subject in a *socially situated* fashion, such that psychic phenomena are understood as a “feature of individuals” but without being “reducible to psychology”. For instance ‘anxiety’ is construed in a way that is “psychic because it is a product of a unique biography of anxiety-provoking life-events and the manner in which they have been unconsciously defended again” and it is social because "such defensive activities affect and are affected by discourse (systems of meaning which are a product of the social world)”, "the unconscious defences that we describe are intersubjective processes (that is, they affect and are affected by others)” and involves “real events in the external, social world which are discursively and defensively appropriated” (Hollway and Jefferson 2000: 24).

Leaving aside the many questions which can be asked about the application of these conceptual frameworks outside of a clinical context, the difficulty here is the lack of space between the *social world* ‘out there’ and *psychic life* ‘in here’. It is an attempt to solve the ‘individual-social’ paradox by peering into the inner depths of particular individuals, armed with a toolkit cobbled together from items borrowed from psychoanalysts based on meta-theoretical criteria which are vague at best, rather than Archer’s work which systematically bridges the two sides of the dichotomy in a way orientated towards empirical inquiry at the micro, meso and macro levels.

Any thoughts on this much appreciated. It’s intended as a friendly engagement – until starting the Hollway and Jefferson book recently my interaction with psychosocial approaches had come predominately through conferences and online videos. I often feel I have more in common with people who work in this way in terms of my *interests* than I do with anyone else I meet in sociology. I also think I get the general trajectory of it as an intellectual current and am largely in agreement. My problem is with its response to this problem – plus I find the appropriation of psychoanalytical concepts very problematic over and above my broader theoretical disagreement.
Introducing a Blog: The Geek Anthropologist (2013-10-07 08:00)

I was surfing the web over breakfast (as one does) and found a fellow anthropology site bearing the cute name The Geek Anthropologist that I thought many of our readers would like. It is a community blog run by anthropology student Marie-Pierre Renaud of Laval University (Quebec city, Canada) which deals with "geekiness, online communities and science-fiction" through the lens of socio-cultural anthropology. The posts explore issues such as geek identity, the representation of ethnic groups in science-fiction and the importance of video games in people's lives.

So, once you've made that second Monday morning coffee, [1]Stop Wasting Time Online: Read an Anthropology Blog instead!

BSA Annual Conference 2014: Changing Society

Call for Papers

Theory Stream Submissions

This stream welcomes abstracts on any aspect of theory as well as abstracts for the following Study Groups: · Bourdieu · Historical and Comparative Sociology · Realism and Social Research · Weber The Realism and Social Research group would also like to invite abstracts under the theme "What is Realism for?" The group is particularly interested in papers that consider any of the following issues:

- The relevance of realist theory to substantive social, economic and political issues.
• The practical implications of methodologically operationalising different forms of realist thought.

• Those from other schools of thought who wish to engage critically in a dialogue with realist theory.

How to submit  All abstracts and proposals for other events can be submitted online at: [1]http://www.britsoc.co.uk/events/bsa-annual-conference/submissions.aspx  The deadline for submission of abstracts is 18th October 2013. For further information contact the Theory stream coordinators: Gurminder K Bhambra E: [2]g.k.bhambra@warwick.ac.uk Tom Brock E: [3]t.brock@mmu.ac.uk Alternatively, contact the BSA Events Team E: [4]events@britsoc.org.uk

The Sociological Imagination Revisited (2013-10-07 14:06)
Let me confess a sin. The opening chapter from C Wright Mills' *The Sociological Imagination* was the very first piece of required reading handed to me as an undergraduate. It also holds the distinction of beginning a chain of photocopied chapters and essays that were filed away in my waste paper bin. Like many first years, scholarly activity initially came second to binge drinking and intimate trysts with the toilet bowl. And so this classic statement of introductory sociology got the body swerve treatment, and *Imagination* remained one of the many canonical works I hadn't got round to reading. Two decades on and I'm beginning university afresh, albeit now as a lecturer. So, belatedly, I was quite pleased that Monday morning's introduction to social theory tutorial required I read the self-same chapter I unceremoniously dumped all those years ago.

What then is this thing, the 'sociological imagination'? Using the state of 50s America as his jumping off point, Mills argued that the popular sense, the popular mood was suffused with a strange sense of unease. It was a condition in which people were told by their papers, their screens, their politicians and ideologues that they lived in a state of freedom. An American could be whoever they wanted to be and follow their own inclinations and desires. But the scope of this freedom was very much limited to every American's private life. Hence the popular feeling, the hard-to-place sensation that all wasn't safe and well was an outcome of the friction between the boxed-in character of private/familial social relations inside the home, and the uncertain, potentially terrifying buffeting of large, invisible, unknowable and impersonal social forces outside it.

For Mills, to make sense of this, people required

> ... a quality of mind that will help them to use information and to develop reason in order to achieve lucid summations of what is going on in the world and of what may be happening within themselves. It is this quality ... that journalists and scholars, artists and publics, scientists and editors are coming to expect of what may be called the sociological imagination. (1959, p.5)

What the sociological imagination does is provide a way of thinking through and understanding social life, of how the inner lives of each of us as individuals are conditioned by social forces, and - borrowing terminology from [Pierre Bourdieu] - to understand our trajectories through social space. For Mills, the imagination is also a 'terrible' realisation as it shows that our fate is largely something that is done to us, regardless of our choices.

The sociological imagination asks certain sets of questions. These are taken up and formulated in particular ways by the main theoretical perspectives that have come to dominate sociology. The three sets are:

1. How is society structured? What are its components? How are they interrelated and mutually conditioning? How do they contribute to social persistence and social change? How does one society differ from another?

2. Where does a society stand in relation to the historical development of human societies? How are present societies stamped with the marks of the past? What are the essential features of modern times?

3. What social groups hold sway? What groups are rising and declining? What are the kinds of human natures that have contemporary currency? And what are their meanings in relation to discrete features of society?

The sociological imagination may well ask these sorts of questions, but how do you begin the business of unravelling the complex tapestry of social relations to make sense of them? Mills begins with distinguishing between 'personal troubles' and 'public issues'. The former denotes the so-called private sphere, and concerns personal, intimate, milieu-specific settings. The latter refers to a higher social scale, or a greater degree of abstraction. i.e.
Questions around the integration of milieux into social structures, of how social collectivities mesh, relate with, and constitute one another. Hence problems occurring at this level of societies; dysfunctions, conflicts - pick a category from the social theory of your choice - cannot be anything other than public issues. Therefore how these structure and intertwine with individual experiences, this is the province of the sociologist.

Using this understanding, if we return to Mills' thesis that unease and anxiety underlined the American (modern) condition, he asks if this is the lot of just one or very small groups of disparate people, then it is a matter of individual biographies. But if insecurity, fatalism, fear for the future is a mass experience we are witnessing a social phenomenon that is the expression of how certain social relations are structured. And, of course, this angst might be the spur for further pathological social developments. If this is the modern condition, it falls to the sociologist to investigate, analyse and explain.

What particularly interests me about Mills' argument is the following observation. He argues that every age has a common intellectual denominator, a shared zeitgeist that figures time and again in the cultural tropes, in the stories we tell ourselves, in the senses we use to interpret the social world. For example, in the late 19th and early 20th century one widely-held habit of mind, particularly among the privileged and educated elites, was Social Darwinism. Consciously and unconsciously, social policy, sociology, emerging nationalisms, encouraged the view that relations between human beings were essentially an extension of the evolutionary struggle each and every species wages in the natural world. However, by the time Mills was writing the denominator, the structuring principle of social thought had greatly changed. The social had come to predominate - the sociological imagination was the mindset of the modern world. He held that as the old certainties were melted by the friction of rapid social change, popular perceptions of social problems focus on the routines, behaviours, conflicts and crises that lie at their root. Of this, Mills writes:

It is the quality of mind that seems most dramatically to promise an understanding of the intimate realities of ourselves in connection with larger social realities. It is not merely one quality of mind among the contemporary range of cultural sensibilities - it is the quality whose wider and more adroit use offers the promise that all such sensibilities - and, in fact, human reason itself - will come to play a greater role in human affairs. (ibid. p.15)

For 1959, this was a very sharp observation. We're not all Sociologists. But we are all sociologists. Whatever you think of them, politicians put forward sociological explanations of varying complexity and accuracy to makes sense of society's ills. Economists are forced to acknowledge the social dimension outside of their equations to explain the crash of 2008. Celebrities lay bare the travails of overcoming obstacles thrown by their humble backgrounds as they gaped their way toward fame. Our mass media and social media, from frivolous muckraking to "hard news" obsesses incessantly over the character and quality of social relationships. Will Dave sack IDS? Is Simon Cowell going to marry Lauren Silverman? Does Deidre Barlow still pine for Ken? Ours is a 'social age' where even your worth is measured by relationships, crudely denoted by numbers of Facebook friends or Twitter followers.

Curiously, at the moment the sociological imagination is the habit of mind par excellence sociology as a discipline is stuck on the doldrums. It's perceived as a breeding ground for axe-grinding lefties and abstruse waffle few outside of seldom-read specialist journals care about. And it's not controversial to state that the sociological imagination has allowed other disciplines and lay actors to park their tanks on sociology's lawn. New mass killing outrage? Call a psychologist. Youth delinquency? Get a criminologist. Parenting? Katie Hopkins. Class? Paul O'Grady.

Yet fads in the broader social sciences come and go but sociology stubbornly remains. Women's Studies, Industrial Relations, Cultural Studies; these are all cognate disciplines that after a brief life have largely disappeared and find themselves folded into sociology departments. Why and how sociology soldiers on despite being derided
and ignored is probably a lifetime's work in and of itself. Perhaps the materiality of the sociological imagination consistently generates a mass education market out of the minds it captivates as a subject of fascination in its own right.

The sociological imagination shows absolutely no sign of ebbing. As dictatorships dissolve and civil societies open up across the globe, not only are the disciplinary futures of sociology secured but more importantly the questions of our times - the environmental crisis, the relations between the genders, nationalism and hate, the balance of inequality, the chaos of the global economy - are also increasingly treated as social, not natural problems. And that realisation may just be the beginning of doing something about them.

claudia vallve (2013-10-11 14:53:41)
Hi! I was also one of these students that discovered sociology by reading Wright Mills book... something like... well.. many, many years ago. In my case, however, it had a very positive impact and I recall it - together with Berger and Luckman's social construction of reality - as one of those books I could not stop reading. In my favour I have to say that - though I was also highly interested in parties, drinking, bars and fiesta- sociology was my second career... being law the first one. And after four years of civil codes and similar tortures, reading about sociological imagination was a veritable pleasure. Casually, I'm also revisiting Wright Mills book these days. I've been asked to write a divulgative book on social sciences, and I've decided to start by speaking of sociological imagination as a quality needed for everybody. I totally agree in the conclusions re-visitation has brought to you. I think most sociologists (fortunately not all) have lost this capacity of being curious about absolutely everything, and enjoying discovering and understanding our society. And, yes, it would be wise to do something about it. Maybe if we are able to transmit all this to the younger generation of sociologists, raising enthusiasm on the reading of Wright Mills books, we can start doing something...

[...] The Sociological Imagination Revisited [...]
growth. Shifting emphasis away from the established Lacanian paradigms of voyeurism, lack and desiring identification, growing numbers of scholars are turning to the work of object-relations analysts in order to provide an account of the filmic encounter and the internalized moving image as a living source of subjective and relational metamorphosis. This one-day workshop aims to bring together established and postgraduate scholars, therapists and practitioners working on media, psychoanalysis and cultural transformation from a broadly object-relations theoretical perspective. We would like to go beyond Winnicott (while at the same time retaining the crucial concepts of play and transitional phenomena so usefully analysed by Annette Kuhn et al. in *Little Madnesses: Winnicott, Transitional Phenomena and Cultural Experience*, I.B. Tauris, 2013) in order to consider what an awareness of object-relations in general may bring to the discussion of film, the moving image, and the changing spectator, especially with regard to the possibility of politicized and post-traumatic healing. Subjects for consideration might include (but are not limited to):

- Filmic form/structures and object-relations
- The film and the spectator as relational partners
- Genre, affect and psychic growth
- Spectatorship, splitting and projective identification
- Gender, film and object-relations
- Multi-racial moving objects
- Class, hate, envy and film
- Kleinian approaches to film-watching
- Fairbairn, Guntrip and the schizoid spectator
- Milner, film and ‘butterfly thoughts’
- Bion, cinematic alpha-function and the container-contained
- André Green and the filmic dead mother
- Christopher Bollas and the transformational object
- Cinema, object-relations and resistance/revolution
- Digital activism and psychosocial agencies

Proposals of no more than 300 words should be sent to Andrew Asibong ([1]a.asibong@bbk.ac.uk) and Amber Jacobs ([2]a.jacobs@bbk.ac.uk) by 31 October 2013.

The virtue of selfishness in austerity times (2013-10-08 12:00)

Who are the really selfish people in our society? Why should I pay to support you and yours? Why can’t I keep what I earn? Surely charity begins at home? In this guest blog [1]Anita Biressi and [2]Heather Nunn explore the vexed issue of self-interest and how selfishness can be a virtue in austerity times.

Austerity measures have re-charged long-term public disputes about the selfishness of various social groups and individuals. These disputes are taking place in the context of a fierce battle for resources. We see political drives for the state to roll back (or ‘reform’) what used to be called ‘social security’ in the UK and ‘public assistance’ in the US but what is now frequently called ‘welfare’. American and British opinion formers have helped frame a public conversation in which the ‘selfish society’ is the outcome of an ‘entitlement state’ that teaches people to want instead of work. Trades union members, ‘stay at home’ mothers, lone parents, public sector workers, the disabled and so on have all, on occasion and sometimes relentlessly, found themselves labelled as selfish and socially damaging. Websites sell bumper stickers which wryly declare: ‘work harder, those on benefits rely on you!’ and ‘welfare is not a career opportunity.’

But while selfishness is most often regarded as a trait to be condemned, in the Unites States austerity measures have also given rise to fresh calls for selfishness to be reinstated as a civic virtue, as the spur to responsible individualism, entrepreneurial action and economic growth. This is a very different brand of selfishness to that spied in the needy and workshy who draw on national resources. Virtuous selfishness is rooted in an outspoken rejection of the state in all of its forms. The embrace of ‘selfish individualism’ is quite explicit in the US where the green shoots of selfishness are springing up all around. Grassroots signs include the appearance of lone tweeters such as Selfish American and Selfish Virtues, the wider appeal of Facebook sites such as ‘Majority Against ObamaCare’ , the many college Chapters of Young Americans for Liberty and recent popular protests against ‘big government’ which have featured a vigorous defence of what’s mine is mine. As one protester against ObamaCare declared, “I should get the [3]fruits of my labor and I shouldn’t have to divvy it up with other people.”. Also worth mentioning is the continuing influence of the Ayn Rand Institute (AYI, of which more below) and the growing vocalisation of Randian philosophy by fellow travellers whose numbers include notable Tea Party activists, 2012 vice-presidential nominee Paul Ryan, business leaders, the opinion writers of Fox News and talkshow hosts such as Rush Limbaugh, Dennis Prager and Glen Beck.

So where did these validations of selfishness come from and where are they heading?

It’s not selfish to keep your money in your own pocket

The well-known neoliberal arguments for self-interest as the motor of the successful (and the good) society put forward by Friedrich Hayek, Milton Friedman and others famously gained traction during the 1980s. These arguments included a vigorous rejection of public altruism and the collective notions of social progress and civil society which are embodied in state-supported social security. [4]Hayek summarised the values at stake for the taxpayer in an oddly convoluted statement, loaded with negatives, designed, perhaps, to avoid the more positive but despised term ‘altruism.’

Only where we ourselves are responsible for our own interests and are free to sacrifice them, has our decision moral value. We are neither entitled to be unselfish at someone else’s expense, nor is there any merit in being unselfish if we have no choice.
Critically, Hayek underlined the sense of unfairness that some feel at being legally required to support the subsistence and well-being of their fellows. Current media commentary articulates and, we believe, actually fosters a simmering resentment that some are living rather too well from resources that others have worked hard to earn. Hard-pressed citizens are apparently demanding to know why ‘strivers’ must pay for the ‘shirkers’, why the childless must pay for universal child benefit, why the young should support the old and so on.

The work of Hayek’s close contemporary Ayn Rand was also embraced in the 1980s and her views are once again being promoted by the American right. She developed a philosophy of anti-altruism and anti-government which included her own re-conceptualisation of selfishness as a quality of the highest merit. More radical than Hayek, she saw no place at all for the state. Rand’s influential novels and political journalism stressed individual will and the pursuit of personal goals as the only life worth living. Her heroes, as characterised in the best-sellers The Fountainhead (1943) and Atlas Shrugged (1957), were antisocial, anti-altruistic, deeply self-interested industrialists and artists. Her most famous protagonist, the [5]social rebel John Galt pledged: “I swear by my life and my love of it that I will never live for the sake of another man, nor ask another man to live for mine.”. Numbered among Rand’s admirers were the future Chairman of the American Federal Reserve Alan Greenspan and Ronald Reagan. In Rand’s view, it’s those who make money and who are successful in the world who risk being exploited by the needy masses and by weak, centralising government. The recent deployment of the defiant historical American slogan [6]‘Don’t tread on me’ by anti-Obama conservatives highlights this perception of big government as the real jackboot of history.

Tellingly, perhaps, Rand and Hayek’s work has been embraced by business people, self-consciously ambitious students and hard-pressed individuals. This is due in part, we argue, to the ways in which they depicted particular social types and character traits as ones to be emulated or despised. Hayek, for example, condemned socialist intellectuals (by which he meant teachers, journalists and other progressive, but ‘badly-informed’, professionals) as '[7]second hand dealers in ideas'. This chimed with Rand’s own description of ‘second handers’ : individuals who can’t think for themselves, who value the good opinions of their peers and who lack the will to pursue a selfishly creative and independent life A current ARI [8]lesson plan for High School students summarises second handers in the baldest terms: ‘those dependent persons who, in one form or another, are not productive, do not survive by means of their own mind or effort, but who, rather, survive second-hand by leeching off of others. There are many types of second-handers—criminals, family bums, welfare recipients, military conquerors, political dictators, social climbers…’ In addition, Rand’s novels cite social workers and do-gooders of every hue.

It was thinkers such as Hayek and Rand who ultimately formulated and then crucially, from our perspective, popularised the neoliberal ethos of self-interest among business people, entrepreneurs and, later during the 1980s, among politicians. Rand's contention, made in her 1964 book [9]The Virtue of Selfishness, that 'there is no such entity as "society", since society is only a number of individual men' remains perhaps one of the most infamous declarations of confident individualism, even though very few people seem to know its source. [10]

Among Rand’s other legacies she helped furnish a lexicon which re-positioned self-interest as a virtue and selfishness as a positive character trait. In the neoliberal myth, dealers in second hand ideas and second raters of all kinds stand in the way of the pioneers of capitalist enterprise; the latter struggling against the growing bureaucratic state and the turbulence of the marketplace together.

**Young Conservatives pave the way**
In his book Ill Fares the Land Tony Judt observes that ‘Selfishness is uncomfortable even for the selfish’. If this is so, then this discomfort seems well-hidden. Indeed, we report here that the right to be selfish is the renewed battle cry of American neoliberalism as its foot soldiers, leaders, advisors and supporters in the media seek to recoup the ideological ground lost during the financial crisis. Most worryingly, successful incursions are being made by the young and energetic through an astute use of new media and social networking sites, via blogs, talkshows and subscription web TV. The growing confidence of conservative youth is nicely encapsulated in the astonishing 2009 Youtube video ‘Young Con Anthem’. This featured two sharply-dressed Ivy Leaguers rapping out their political philosophy to an audience whose numbers ultimately reached half a million. The video featured in many news outlets including the Huffington Post and the performers Joshua Riddell and David Ruffull appeared on nationally syndicated radio stations, major web outlets and national television. Riddell and Ruffull rapped: ‘three things taught me conservative love/ Jesus, Ronald Reagan plus Atlas Shrugged.’ Conservative news outlets, young American conservative sites, Tea Party activists and grass roots anti-government protestors insist that the moral, as well as economic, tenets of self-interested individualism have never been more economically necessary or ethically defensible. We think that their message is once again gaining traction.

Anita Biressi and Heather Nunn are the authors of Class and Contemporary British Culture (2013). They are currently researching a new book called Politics Interrupted: Gender, Citizenship and Disruptive Voices (2015) for Rowman and Littlefield International.

Of course there is the darker side to Hayek also, the side that the neo-liberals tend to try and hide....namely that where their policies have been implemented in full...it has been done at the end of the barrel of a gun! This little letter that I came across...from Thatcher to Hayek probably gives us an idea to that darker side http://gfmurphy101.wordpress.com/2013/08-14/hayek-and-thatcher/

Why the British public should be worried about GCHQ (2013-10-08 20:44)

The novelist [1]John Lanchester was invited by the Guardian to read through the GCHQ files which have been at the heart of recent revelations about the security agency’s activity. He offers a [2]thought provoking summary (with wonderful illustrations) of the significance of what we’ve learnt from these files and why the British public should be worried:

What this adds up to is a new thing in human history: with a couple of clicks of a mouse, an agent of the state can target your home phone, or your mobile, or your email, or your passport number, or any of your credit card numbers, or your address, or any of your log-ins to a web service.

Using that "selector", the state can get access to all the content of your communications, via any of those channels; can gather information about anyone you communicate with, can get a full picture of all your internet use, can track your location online and offline. It can, in essence, know everything about you, including – thanks to the ability to look at your internet searches – what’s on your mind.

To get a rough version of this knowledge, a state once had to bug phones manually, break into houses and intercept letters, and deploy teams of trained watchers to follow your whereabouts. Even then it was a rough and approximate process, vulnerable to all sorts of human error and countermeasures. It can now have something much better than that, a historically unprecedented panoply of surveillance, which it can deploy in a matter of seconds.
This process is not without supervision, of course. In order to target you via one of these "selectors" – that's the technical term – the agent of the state will have to type into a box on his or her computer screen a Miranda number, to show that the process is taking place in response to a specific request for information, and will also need to select a justification under the Human Rights Act. That last isn't too arduous, because the agent can choose the justification from a drop-down menu. This is the way we live now.

Care vs control: how do girls see healthy relationships? (2013-10-09 08:00)

Here is a good example of recent action research: Women's Aid ([1]www.womensaid.co.uk) and Girlguiding ([2]www.girlguiding.co.uk) have collaborated to produce this [3]very interesting (and at times mortifying) report about the ways in which girls today understand relationships. The report explores issues of well-being, happiness, fulfillment, safety, security, personal space (offline and online), and others.

You can read the full report [4]here, and here are some of the findings:

Two-fifths of girls believe it is acceptable for a partner to make you tell them where you are all the time.

Girls are ready to accept controlling behaviour and see it as a normal part of a 'caring' relationship.

Our research exposed a generation suffering from a role model deficit, with a narrow range of positive examples to look up to.

21 % said that telling you what you can and can't wear was acceptable.

21 % said that shouting at you or calling you names because of what you may have done could sometimes be OK.

Girls [...] told us that if they were concerned about their own relationships, most would be very reluctant to involve parents, teachers or their authority figures unless they felt the situation had become extreme. For the majority this means physical violence – leaving huge leeway for harmful controlling behaviour to go unchecked and establishing very damaging expectations for future relationships.

94 % said that it was never acceptable to pressure a girl to have sex. (but 6 % didn't!)
39% said that making you tell them where you are all the time is acceptable.

Key notions discussed in the focus-groups

2. www.girlguiding.co.uk
It's become almost platitudinous to observe how little the political underpinnings of the neoliberal economic settlement were impacted upon by the financial crisis. The Kilburn Manifesto brings together some leading lights of the British left to offer a systematic response to the strange historical conjuncture in which we now find ourselves embedded:

_The old world is dying away, and the new world struggles to come forth: now is the time of monsters - Antonio Gramsci_
Chapter 2: [2] Vocabularies of the Economy

CfP: Digital Sociology PhD/ECR Workshop (2013-10-10 12:00)

Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from peers and established academics in a supportive environment.

The event will take place between 11am to 4pm on February 19th at Goldsmiths College in South London. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.

If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn’t been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.

Sociological Images: Blogging as Public Sociology (2013-10-11 08:00)

In this paper the team behind the continually fantastic Sociological Images reflect on blogging as public sociology. I’ve recently posted some initial thoughts on Digital Public Sociology and this paper is an important contribution to what seems likely to become an increasingly prominent debate over time.

Sociological Images is a website aimed at a broad public audience that encourages readers to develop and apply a sociological imagination. The site includes short, accessible posts published daily. Each includes one or more images and accompanying commentary. Reaching approximately 20,000 readers per day, Sociological Images illustrates the potential for using websites as a platform for public engagement in the social sciences. This report provides an overview of the site’s history, approach, reach, and impact. The authors also discuss some challenges facing academics interested in blogging for a general audience and some of the features that contribute to the popularity of the site.

Seminar Series on the History of Sexuality (2013-10-11 12:02)

Seminar Launch Event: What is the History of Sexuality?

6 p.m. Tuesday 7th January 2014, The Court Room, Senate House London.

The Institute of Historical Research, London, launches its new and exciting research seminar series, History of Sexuality, with a round table discussion of ‘What is the History of Sexuality?’

The founding of the History of Sexuality seminar at the Institute of Historical Research, London, marks a recognition that the field has grown enormously during recent years. The new seminar reverses the lacuna in sustained seminar provision in London in this field. While the history of sexuality is a diverse area of study that refuses straightforward categorisation, it nonetheless focuses broadly on men and women as sexual beings in the past, on the categories of heterosexuality and homosexuality through which sexual selfhood has been experienced, and, moving beyond this binary, on other historical expressions of gender identity and sexual experience. The History of Sexuality seminar at the Institute explores historical perspectives on themes as varied as sexual reform and identity-based movements, sexuality and urban space, medical and criminological discourses on sexuality, and representations of sexuality. It also explores the historiography of the field, along with those varied methodological and theoretical

2120
approaches to the study of the sexual past that have shaped the history of sexuality as a sub-discipline. Finally, the seminar provides a forum for an exploration of the intersections between the history of sexuality and other related academic practices – including those of gender, feminism, psychoanalysis, and the study of the emotions.

Conveners: Heike Bauer (Birkbeck); Chiara Beccalossi (Oxford Brookes); Justin Bengry (Birkbeck/McGill); Sean Brady (Birkbeck); Matt Cook (Birkbeck); Jana Funke (Exeter); Graig Griffiths (Queen Mary); Claire Hayward (Kingston); Julia Laite (Birkbeck); Jane Mackelworth (Queen Mary); Alison Oram (Leeds Metropolitan); Anna Katharina Schaffner (Kent); Sarah Toulalan (Exeter); Chris Waters (Williams).

If you have questions about the History of Sexuality seminar at the IHR, or would like to propose a paper, please contact Craig Griffiths at [c.griffiths@QMUL.AC.UK](mailto:c.griffiths@QMUL.AC.UK)

This infographic from [1]Neal Hudson (HT [2]Liberal Conspiracy) shows the dramatic rise in English House Prices relative to earnings since 1997. Of course there are important methodological questions which can be asked about an infographic like this and, though I think these are fantastic communicative aids, it worries me that I find myself less inclined to ask these questions than I would be with a set of claims presented through text - is there a risk of positivism by default with infographics?

Another pressure point is the falling applications from indebted English graduates to study for master’s degrees and doctorates, especially in the humanities, and this is before the first cohort incur the full debt. Soon, the only graduates carrying on their studies will be the sons and daughters of the very rich or those poorer students who can secure one of the inadequate number of bursaries, scholarships and grants.

Yet graduate education is not just the university’s lifeblood, supplying the next generation of academics, it is one of the core elements in any innovation ecosystem. It constitutes the principal pool from which the scientists, technologists, doctors, lawyers and intellectuals of tomorrow will be recruited. A key societal function is under threat.

Universities across the board are in a quandary. The real wages of academics have fallen by 13% since 2008, one of the largest sustained wage cuts any profession has suffered since the Second World War. Yet, unsurprisingly, students incurring the debt want to see some value for their money. Research has to be sustained. What to do?

Unless there is some bold political leadership, the future is becoming clearer. Oxford, Cambridge and a handful of other top English universities will want to charge more than £9,000 to support their expensive teaching, while trying not to deter applicants by offering even more generous fee rebates and scholarships to undergraduates and graduates from disadvantaged backgrounds.

They would preserve themselves in the short term as premier academic institutions. But they would have caused an interdependent university system to fragment, leaving less strong universities in an impossible position, and further entrenching the noxious class stratifications in English society.

The rest of the university sector would increasingly be devastated: it would have to reconstitute itself around a limited range of digital courses and online learning in order to slash fees as students became more and more aware that the debt could not be justified by any job they are likely to get. The very idea of an interdisciplinary university, across the gamut of expensive disciplines, would become impossible. Our economy and society would be immeasurably weaker.

What is needed is a mixed economy of student finance. Universities create the public good of knowledge and thus more wealth; they should be paid for in part by general taxation and in part from moderate student fees on which negligible interest is charged. Fees in moderation are a good financing principle.

But loading the entire burden for university financing on to the shoulders of the innocent young, who are so inspiring to meet, with their ambitions to change the world, while their elders are washing their hands of responsibility, is a disgrace. England will pay a high price for such arrant selfishness.

Gone and busted, done and dusted? Notes towards a moral and political grammar of ‘civil dawn’
(2013-10-14 18:34)

What happened?

While preparing the fourth instalment of the [2]Sociologists of Crisis on the issue of suicide, life via death took over and in the face of a tragic event, I had to get my editorial, moral, political and sociological priorities right. The event was no other than the murder of Pavlos Fyssas, the 34 year old Greek anti-fascist hip-hop artist (Killah P) by supporters of Greece's far right Golden Dawn party. But as is the habit of shocking events, it was promptly followed by another; the arrest of circa 20 Golden Dawn delegates charged as 'participants in a criminal organisation'. More on both stories can be found [3]here and [4]here. As a witness to both events, albeit from afar, I was juggling the temptation to comment and the discipline of letting some time pass for my thoughts and emotions to settle. The first seemed too premature, the second oozed of the dangers of making oneself irrelevant and allowing the flood of questions to wreak havoc in one's own mind. What follows is my attempt to give this flood-stream a certain direction so that it can acquire meaning as it flows. You will not find anything a priori right, conclusive, or
expertly in it so if that’s what you’re after you can simply stop reading immediately. All I am endeavoung to ‘do’ in the space of this article is to provide a few cautious and cautionary remarks, dictated by my civil conscience and offered out in the open as an invitation to think together, but differently, with more humanism, compassion and understanding. Failing that, we all risk becoming irrelevant and inaccessible to each other if not entirely helpless.

What and whose was 'it'?

Having briefly sketched out ‘what happened’ (not our usual type of arrest), and ‘what brought it forth’ (another violent act as befits Golden Dawn’s ‘marauding militia’ tactics), it is timely to consider the implications of both but mostly emphasising on the aftermath of the arrests and the public discussion that ensued. Anyone who attuned themselves to the public outcry following the arrests will have identified a series of recurring arguments over what the event actually was; was it a victory of polity, law, democracy and civil society? Was it a masterful intervention of the Greek justice system, the, government, the state and the police? Could it be interpreted as a decisive move by the ruling party? Do we owe such arrests to the Right? Or perhaps to the Left? In other words, what was ‘it’ all about and whose was ‘it’ anyway?

Replaying such possibilities in mind, I think it is fair to say that it would be foolish to allow anyone to claim stewardship over such an event, be it the Right or the Left whose political reflexes in Greece historically exhaust themselves in nepotism, polarity, populism and sloganeering, and whose civic loyalty and democratic sympathies are articulated solely by reference to ‘the party’; that minute segment of society they participate and are interested in, while of course issuing grand promises to liberate ‘the people’, ‘the nation’ if not the whole world over. Neither the Left, nor the Right did anything to effectively allow themselves to claim this as a victory of their own, though they certainly can, will and have use(d) it to their advantage; the right will claim that ‘it is we who put these men behind bars’, to which the left will respond ‘Yes, but you owe that to our antifascist struggle and protests’. The reality betrays both of course, as it always should. [5]Golden Dawn’s criminal activities are no surprise to anyone in the know, let alone to the Greek political elites on either side; over two-hundred racist attacks, mostly attributed to Golden Dawn members, have been recorded the past two years making any statement of response from any political party unacceptable if not entirely laughable. Neither wing of the political spectrum won anything, nor should they as they both wavered in their commitment to civil society and its institutional satellites that they could have mobilised earlier to such effect. The process of gathering evidence to make a convincing case in order to press charges against Golden Dawn took a week, but that week could have well been any week in year 2012. Perhaps the protests were not loud enough, the blood spilled then was ‘not our own’, ‘we’ didn’t know what to do, how to deal with it, but now?

‘Now’ was what changed it all! This of course is a long string of excuses and soothing lullabies we sing to ourselves to avoid watching ourselves snore and, as Erving Goffman (1974: 14) wrote, ‘the sleep is deep’. A fleeting awakening however did happen, but it was the reflex of another, more subtle political impulse brought forward by the most ‘gelatinous and primordial’ of political entities/institutions, as Gramsci (1971 [1929]: 238) called it, namely; civil society. Am I then suggesting that all this was the defeat of the political system and a victory of civil society? Simplistically put, yes, that’s what I’m saying, but it’s not all I’m saying! What I am saying is that it might be helpful and productive to interpret this event as a hinge-moment where a lot of things were in fact unhinged and where the abstract realm we call ‘civil society’ mobilised the ‘optimism of the will’ that was hitherto lacking in the political mainstream and perhaps the public too, who contented themselves instead with the ‘pessimism of the intellect’, to use a famous aphorism of Romain Rolland which Gramsci popularised through the masthead of L’Ordine Nuovo. But that’s a point that needs qualifying and that’s exactly what I intend to do in turn.

Why now?

That is a question that has puzzled [6] many and quite rightly so. But unlike Douzinas and Co. I don’t think it is useful to attribute it to an act of political calculation by the government, simply because it was not a response from the government per se and sensu stricto but an initiative borne out of the powers of civil society itself,
this case meaning its democratic institutions such as the courts of justice. This separation of ‘government’ from ‘civil society’ in my analysis may appear strange on its own but in the Greek case, I don’t think the two can be conflated or treated as ‘one and the same’. It wasn’t the government and/or its assemblies that took the issue on but rather, the polity at broad, especially facilitated by law and the justice system. And, this is not the first time the government is caught unawares in similar circumstances, but before dwelling on that let me just clarify that ‘the state’ and its institutional branches are not the same as or reducible to ‘the government’, but an organised political community living under ‘a’ government. In other words, the concept of the state is here provisionally distinguished from the concept of government to show how the latter was, in fact, caught by surprise as it was in 1963, following the murder of independent Greek MP, Grigoris Lambrakis (immortalised later through the film Z, directed by Costa Gavras). The Greek PM at the time, Costas Karamanlis the Elder, famously asked ‘But, alas! Who rules this country?’ and this question remains open to interpretation to this day, or rather especially today. When a PM does not know who runs the state and does not recognise that, last time we checked, it was himself and his political appointees, in collaboration of course with the undercurrent mafias that are inevitably attached, we can suggest two things; either that he should be held accountable (but not responsible) for the murder or that the state is run without him, in which case whatever response to the crime does not come from him. Or, in a more conspiratorial scenario the murder was staged by him, and so was the response from the law but as it would be absurd to charge him with the crime, others had to be brought in as a sacrificial offering in the name of justice and peace. This remark of course is satirical, but it does invite a certain conundrum or a paradox even. If the head of the state does not govern it, might this mean that s/he is exempt from accountability for such an event and should therefore mobilise all powers to restore justice through law? Or does it mean that s/he is complicit in some way or another? The former is virtually impossible and the latter amounts to a grave accusation. If it is the latter however, that means that the (right-wing) government cannot possibly claim any success over the persecution of Golden Dawn unless it plans to celebrate its downfall. That leads us to suggest that we owe the trial of Golden Dawn elsewhere; to the Left, to civil society, to ‘the people’ or to the democratic/institutional powers of the state, to name a few possible places where we might locate that change in the speed of political thinking and decision-making. Let us retrace my main argument however for the purposes of clarification; neither the right-wing government, nor the oppositional Left can claim the Golden Dawn trials as a success of their own because they’ve both been complicit in, accountable to and responsible for doing virtually nothing for a very long time in order to build a case and/or persecute the party in question as a criminal organisation; both parties mobilised no processes whatsoever to that effect, so they cannot possibly claim any credit for these trials. The simple implication then is that the decision to bring Golden Dawn members to trial flows from a combination of (a) public indignation via protest and (b) the response of democratic institutional powers, such as the judiciary, towards the criminalisation and trials of Golden Dawn delegates who are now, all of the sudden, unanimously referred to as ‘members of a criminal organisation’. If that is the case, and we can pride ourselves on the agility of our civil reflexes and the robustness of our democratic institutions why weren’t we appalled before and why were the institutional powers of democracy not intervene before? Was the murder of [7]Shehzad Luqman in January 2013 not enough to spark off such a response? Were the numerous other attacks on immigrant by Golden Dawn vigilantes not enough to cause our indignation, anger and disgust? I will stray away from suggesting that it was the spilling of ‘Greek blood’ that brought that reaction forward, but I will stress the hypocrisy and bigotry that logically accompanies it in the next section of this article.

The Shock Vitrine

Paraphrasing the title of Naomi Klein’s (2007) best-selling book, The Shock Doctrine, I propose the term ‘shock vitrine’ as the way in which the reaction to Pavlos Fyssas’ murder was framed. The shock vitrine works like a smokescreen that allows us to appear utterly surprised and indeed shocked in the face of such tragic incidents. This however is a reaction which smacks of extreme naïvety on the one hand and extreme hypocrisy on the other therefore betraying important civic values such as honesty and responsibility. We cannot possibly claim, like [8]Captain Renault in Casablanca, to be shocked when faced with the news of such a murder because it has happened before and we did close to nothing about it. There is nothing more shocking/appalling about this murder than there was in the Shehzad
Luqman case and we must not allow amnesia, negligence, double-standards, regret, guilt and remorse cloud our view, our thinking or our civic response to such incidents, but we must make a resource out of them promising that we shall not allow this to happen again, not in our conscience and not in our name. The shock vitrine must therefore be dismantled at once or we must admit that we like to hide beneath its shiny glass surface as if it were a veil; but it is not a veil, it is transparent and our nakedness shows.

An important ingredient in the shock vitrine’s success as a barrier to our (re)thinking and (re)action is of course our unwillingness to accept a number of uncomfortable truths about the ideological extremisms that have a long pedigree in Greece and not without a reason. In a country that has been ravaged by a brutal civil war and a malignant military junta, remnants of ideological extremism will be found and they are bound to be periodically re-animated, prompted by a number of circumstances, ‘the crisis’ being just one of them. But instead of shying away from that realisation by denying it or cursing it away with oppositional slogans, we have to understand that such ideas do circulate freely and they have been supported by many a people in our country, not to mention the complicity of many during the reign of the Colonels’ junta; aided and abetted by co-operation with and nostalgia for such ‘good times’ in the history of modern Greece. Anyone who has taken a cab, gone to a bar, dined with a distant relative, anyone who has lived in this country knows and will have heard such statements often enough to be robbed of the right to act surprised and/or shocked. Anyone who knows that history, either by researching it directly or through testimonies of the people who survived it, will also know that our very society did very little, or close to nothing towards successfully deciding how and/or whether to ‘deal with’ the actively involved sympathisers of and accomplices to the junta or the collaborationists during the Nazi occupation of Greece. An event, by the way, that did not simply coincide with, but effectively prepared the ground for the country’s blood-stained civil war; for most countries World War II lasted for five or six years, in Greece it lasted for another four. No one can pretend that this is ‘news’, or that these ideas are now extinct and when they re-emerge we need to be shocked; whoever does so, must do so at her own peril and by accepting her responsibility for being hypocritical, ignorant and therefore irrelevant.

What now?

Having so far attempted to outline the complexities, contradictions and tensions inherent in the Golden Dawn trials as well as in their interpretation, it seems particularly urgent to open up a discussion on what I propose, not as a sociologist and definitely not as an expert of any kind, but as someone involved in an emotional relationship with the pleasures and frustrations of political life, armed with an aspiration to use civic principles of associational life as a potent mould with which to (re)fashion a political reaction/response to such events. By means of a disclaimer, let me just say that I use ‘civic principles’ and ‘the powers of associational life’ to refer to a political realm outside party politics and ideological confines but one that aspires to and encourages participation in one’s polity for the sake of it, rather than to gain honorary badges, serve particular interests or act out politics from a pedestal or from the margins. My faith is neither in the ‘elites’, nor in the ‘masses’ but in the agora as an open public space that can assume many forms and invites us all to speak to each other candidly and with civility, thus affirming our humanity and recognising speech and action as ‘the modes in which human beings appear to each other, not indeed as physical objects, but qua men. This appearance, as distinguished from mere bodily existence, rests on initiative, but it is an initiative from which no human being can refrain and still be human’. Thus spoke Hannah Arendt (1998 [1958]: 176) who saw in political deliberation and action the powers of making a life in common as human beings that are accountable, responsible and, by necessity, reducible to each other. If I were Gramsci (1929), I would call this agora ‘civil society’, and if I were Habermas (1962) I would refer to it as ‘public sphere’. What the three terms have in common is their intent to find communicational, dialogic solutions to political problems, contending that it is through ‘communicative action’ that any ‘structural transformation of the public sphere’ may be(come) possible, and that open public spaces can be found(ed) anywhere insofar as they are imbued with a willingness [9] to speak and to listen.

This process of articulating politics as a medium for making sense of each other together through dialogue, is likened here to a moral and political grammar in order to suggest a shift not just in the mood but also in the mode in which politics is spoken and heard in debates that surround such events in Greece. Like Arendt (1998 [1958]: 176) I
am inclined to believe that ‘[a] life without speech and without action is literally dead to the world’ so lacking a moral and political grammar to articulate speech and action with, is bound to lead us to our own extinction as political animals. This is an admittedly dark interpretation made even more sombre by my fear that the Golden Dawn trials have provided us with a hinge-moment, an affective point in which we find ourselves at the intersection of more light or more darkness as illustrated visually by the astronomical phenomenon of civil dawn where some fascinating glimmer of light is still visible before the sky casts its darker curtain on us. Less poetically put, we can either continue to behave politically as we have been so far, therefore admitting that we are not at all perturbed by the possibility of similar events resurfacing, or we need to prepare ourselves for a different kind of politics; one of many being what I here call the politics of civil dawn, articulated as a moral and political grammar with which to participate in the public agora.

Towards a politics of civil dawn

In keeping with the idea and the metaphor of civil dawn, as outlined above, it seems important to stress that my reason for insisting upon it is to dramatise what I see as a pivotal moment, one that needs to be grasped and seized, and this discursive politics of civil dawn seems to me to offer a great opportunity for such politics of prehension, of grasping who ‘we’ are, who ‘the others’ are and why we find ourselves in each other’s arms. ‘We’ and ‘others’ are staged figures; ‘we’ are not Golden Dawn supporters, ‘others’ can indeed be, so (how) do we come to learn to talk to each other and what for? Is there something to be gained from such a process of talking to ‘the enemy within’? My answer is a disconcerting ‘yes’. But first we need to recognise that others exist, will keep on existing and trying to exterminate them symbolically (through language) or physically (through violence) will yield no results, other than the intensification of hatred and violent collision, a state of ‘being’ that is closer to ‘nothingness’ and to a wasteland, than it is to a democratic polity. And, to make matters worse, we will know that we have all failed in our efforts to establish what we think is right, appropriate, good and true to our humanity because we failed to make room for ‘the other’ however repulsive she may be.

What I am therefore proposing in the remainder of this article is that we establish a different way of being ‘us’ which can then also alter what and who the ‘others’ are. In my conception of politics, the very gamble of social life is to understand, recognise and find ways to deal with the reality that we need to learn how to live with people who are unlike us therefore relying on our skill as political animals to remind ourselves not just that ‘nothing that is human can be foreign to us’ but also that ‘nothing that is foreign to us can be real’ to paraphrase Sennett (2011: 87). Reality is our common humanity, the rest we need to negotiate peaceably (with words) rather than barbarically (with violence). Besides, as Richard Sennett (2011: 87) recalls, was the Japanese President Nakasone not right to assert that ‘[o]nly those who understand one another can make decisions together’? Failing that, everything else is destined to failure too. This of course points to something extremely difficult to achieve and it requires immense imaginative and progressive powers for making sense of politics as a peacable agreement to recognise ourselves and others by finding a way to live together with tension and conflict, but without recourse to the dehumanising effects or violence or the mobilisation of emotions that run high but don’t run deep if they intend to cancel out what we have in common (a lot) than what divides us (very little). Hopefully my reflections on some recurring responses to the process and the outcome of the trials (still pending), might make all this just a little bit clearer.

Just as it is paradoxical, if not entirely farcical, to celebrate with a feeling of elation the powers of democracy in a country where we have historically invested very little in it, unless by democracy we mean its very splintering into a myriad of political factions that then and only then we can identify with the idea of democracy somehow, it is equally laughable to feel a sense of relief following the arrest of Golden Dawn members. The reason is that locking ‘them’ up becomes synonymous to denying that ‘they’ exist, that ‘they’ were democratically elected by 400,000 of our compatriots, and that ‘they’ have supporters who don’t feel the way ‘we’ do about these arrests. Denying that ‘they’ exist makes ‘us’ forget that ‘they’ actually do exist and repentance hardly ever happens, and hardly should ever happen by being confined to a cell. If anything, imprisonment, humiliation and torture may weaken someone’s body, sense of pride and amour propre but it will hardly weaken one’s resolve if that someone is determined to ‘do things’ with her ideas (experiences of political prisoners during the Greek junta demonstrate both points rather vividly).
Am I suggesting then that ‘they’ should be left free to roam the streets of Athens with burning torches and the intention to attack anyone who is ‘unlike them’? Definitely not! But what I am pointing out is that locking anyone up amounts to a decorative gesture, not a substantial one as the story of Pandora’s casket teaches. Keeping a lid on things we dislike hardly means that the cabinet of evils that resides in the box won’t spill out again sometime, sooner or later. Instead of celebrating the capture of people that we don’t like, might we not have faith in our civil powers as citizens to face, discuss and deal with the problem of far-right extremism uncuffed? To rely on the prison cell as a solution means we can’t and it also means that we fail to envision alternatives. Abominable though ‘their’ acts of violence may be to ‘us’, what are ‘we’ actually doing to eliminate them? Leaving the answer in suspension, here’s what I think we haven’t been doing, and what I propose we should be doing instead.

I

Above all, I wish to let out a plaintive cry against ex cathedra denunciations of evil that only succeed in making us feel comfortable in our display of self-righteous indignation towards ‘their’ evil acts and invite us instead to (a) develop political skills that go beyond waving flags, shouting slogans and sounding out clichés, (b) resist ideology in favour of taking ownership of our polity, ourselves, our situation and our relationship with and towards ‘others’ and (c) recognise our role in the making of democratic processes expecting them to happen through the mobilisation of our own political will, rather than rely on our elected representatives who can and will do only as much.

II

This requires an ability to understand that nothing will be ‘done and dusted’ or ‘gone and busted’ just because we keep it locked up in some safe place or simply because it is being cursed away voodoo-style as if it is an evil spirit. Such thinking confuses politics with sorcery and is of use only in superstitious rituals, not in deliberative politics.

III

A fair degree of maturity and wisdom is also desperately needed to conceive of political ideas as verbal, symbolic, cultural agreements that we need to forge as ends in themselves rather than instrumentally as ‘he who seeks liberty in anything more than liberty itself is destined for servitude’ to use a phrase from Tocqueville that hardly ever stales (see Lerner, 1969: 71).

IV

Ideological posturing, ontological constraints, fanaticism and prejudice are of very little help in such a process as they fail to recognise politics as an ongoing process, treating it as either a lost realm or as something to be conquered like a war trophy. Such sentiments atrophy political thought and debase political action in a way that using our communicative powers to negotiate our polity doesn’t.

One way of doing so is to apply such powers and discursive political skills to re-think our relationship with our recent historical traumas by finding ways to heal them, not through anguished revenge or violent retaliation but through making a restorative political resource out of opening those issues up for discussion properly as a historical first in Greek history. In the following and final section of this article I will dwell precisely on those concerns, drawing on examples where such attitudes to healing and traumas have been mobilised and discussed in relation to political violence, atrocities and shocking, evil, irreparable harms committed on a relatively mass scale on four different occasions, namely the tribunals of ‘collaborationists’ in post-Occupation France, the scars left from the bitter animosities between the two sides of the Berlin Wall, post-apartheid South Africa and September 11, 2001. Suffice to say that these events are not just randomly selected but specifically alluded to because they have been surrounded by truly awesome scholarship that sought to look deeper into those events and their aftermath.
Towards a ‘new’ emotional education for politics?

‘I want to write the moral history of the men of my generation or, more accurately, the history of their feelings. It’s a book about love, about passion; but passion such as can exist nowadays—that is to say, inactive’.

This is how Gustave Flaubert (1982: 80) describes the theme of his seminal oeuvre, Sentimental Education, in 1864 to fellow author Marie-Sophie Leroyer de Chantepie. The quote is telling, not as a piece of biographical trivia in the history of French realism but for what we might make of it as an observation on the instability and complexity of human emotions, especially in turbulent times. Flaubert sets the scene in the revolution of 1848, an event that upset not just the self-centred psyche of Frédéric Moreau but the whole of Europe which found itself negotiating its place in the emergence and crisis of modernity. To liken the backdrop of the Golden Dawn trials to ‘the year of revolutions’ in (most of) Europe, would of course be fanciful and this is not what I am attempting. What I am keen to explore however is the interweaving of emotions in political reflection and political reaction suspecting that there is a fine line between where the one realm ends and the other begins. The main emphasis of this final part of the current article is to interpret the emotional reactions to the Golden Dawn trials through the lens of one emotion (revenge), four historic events (see above) and a suggestion towards healing past and present traumas through a politics of discursive reconciliation.

Hannah Arendt (1958: 241), who spent most of her scholarly life dissecting the human condition, described revenge as ‘the natural, automatic reaction to transgression’, a remark echoed in more graphic terms by Ellis Cose (2004: 65) who referred to the same emotion as a ‘fiend who cackles wickedly, uncontrollably’, while political theorist Judith Shklar (1990: 93) calls it ‘an insatiable urge of the human heart’. Against such descriptions of revenge as an instinct, an appetite, an impulse, or an insatiable desire, Simone de Beauvoir cautioned against avenging injury with injury showing revenge to be ‘a complex social emotion and one that is almost always doomed to failure’ (see Kruks 2012: 154). Beauvoir was writing about revenge at the backdrop of a period of tribunals (formal and informal) following the end of World War II where collaborationists of the Vichy regime of Marshal Philippe Pétain were called to testify for their wartime activity. In response to those trials, and particularly that of Robert Brasillach, de Beauvoir wrote the 1946 essay An Eye for An Eye and developed her theory on The Ethics of Ambiguity in 1948 where she sought to delve at length on the emotional responses to the whole process problematizing, among other things, the distinction between épuration légale (legal purge) and épuration sauvage (inofficial ad hoc purges). For Beauvoir ‘revenge as a response to atrocity is almost always a failure on its own terms. For it cannot actually restore the prior situation or cancel out the prior suffering. Nor can it provide full moral satisfaction by establishing actual reciprocity’ (Kruks 2012: 160). To make matters worse, revenge as punishment ‘does not seek to prevent [the perpetrator] from committing new crimes, for if one is able to punish him, this means he is already beyond the condition where he could do further wrong. Nor is it a matter of making an example...Thus, vengeance is not justified by realistic considerations’ concludes Beauvoir (in: Kruks, 2012: 160). If then, à la Beauvoir, vengeful retribution is an existential, legal and political failure mobilised as it were on behalf of oneself, on behalf of others and/or in the context of legal persecution, could there be an alternative in sight?

Taking a lead from Sonia Kruks’ (2012) excellent chapter on the question of revenge, and attempting a chronological leap forward into post-apartheid South Africa, the notion of restorative justice emerges as a plausible alternative emerging through the setting up of truth and reconciliation commissions that urged surviving victims of and other affected individuals by atrocity to be ‘healed through reconciliation and forgiveness’ (Kruks, 2012: 176). Although such have been established after mass atrocities in many countries, from Peru to East Timor, the best and perhaps most influential example comes from the South African Commission chaired by Archbishop Desmond Tutu who described the commission as engaging in ‘restorative justice which is concerned not so much with punishment as with correcting imbalances, restoring broken relationships-with healing, harmony and reconciliation’ (Kruks, 2012: 176).

The third example returns us to the Old Continent and a few years back from apartheid South Africa to the
reunification of Berlin in 1989 and the efforts made to restore the building of the city's archaeological museum, what is now known as the Neues Museum, as a place of and for the collective memory of the Berliners. Richard Sennett (2012: 216-8) describes how its restoration by British architect David Chipperfield raised 'deeply unsettling' questions about 'how much did Berliners want to remember, how much did they want to forget?' and about the extent to which restoration should 'somehow register, preserve [and] narrate the trauma' through which both the building and Berlin's citizens had passed. Instead of blotting out the trauma, Chipperfield and his associates chose a revealing through healing approach by deciding not to hide but to show and restore war damage in some of the rooms of the museum so that it becomes possible to see the effects of the bombing.

Our last example in this short exploration of trauma and how it can be managed culturally and socio-politically, comes from the aftermath of 9/11 and Judith Butler's (2006) passionate book-length essay on 'the powers of mourning and violence' as viable resources with which to do politics, following violent attacks. In a similar vein to Beauvoir, Butler (2006: xix) cautions against mourning as 'resolved through violence, it seems clear that violence only brings on more loss and the failure to heed the claim of precarious life only leads, again and again, to the dry grief of an endless political rage'. Instead, she makes a case for using loss and vulnerability as potent raw materials to make use of in the post-violence period maintaining that both loss and vulnerability are essential human emotions which 'seem to follow from our being socially constituted bodies, attached to others, at risk of losing some attachments, exposed to others, at risk of violence by virtue of that exposure' (Butler, 2006: 20). This is a complicated statement, reflecting perhaps the complicated nature of social emotions in the face of tragic events, but Butler's (2006: 49) point is articulated with more clarity when she explores the basis of our common, human interdependence; 'I am confounded by you, then you are already of me, and I am nowhere without you'. This could well be mistaken for a love poem were it not a passage from a political treatise on violence, loss and mourning. What Butler aims to problematize and insists on is the importance of and for a politics of 'living together', which she illustrates with reference to the word Ta'ayush in Arabic, asking 'what do we make' of it as a political resource (Butler, 2006: 116). Ta'ayush as a word that stresses 'living together' appears to Butler (2006: 118) as 'an amazing learning experience' for democracy and for responding to 'times of crisis'. Though it has 'no office, no official positions, it is democracy at work' asking that we 'maintain dialogue and work together' towards creating a 'real community' thus dislodging pervasive assumptions that keep us apart.

Drawing on such ideas that counsel against the immediacy of emotion and rather advise calm, political reflection in association with developing dialogic, communicational responses in the face of adversity, I suspect that there is indeed something very extraordinary in the four examples here considered, at least as a call to and an open invitation for a process of healing deep historical, existential, cultural and socio-political traumas that have been haunting the political landscape of my native Greece for the most part of its recent history. Those bitter animosities are exactly the stuff that fills the proverbial Pandora's casket, and each time those 'wicked' political 'fiends' are liberated, chaos ensues and amidst such chaos we lose the capacity to think of each other as interdependent and or human and lose sight of the implicit agreement we have made or have yet to make for living together differently, with less or no misery, a plea that (coincidentally) applies both to [10]society and sociology by equal measure (see Bauman, 2000: 79-90). 'Vengeance', de Beauvoir (in Kruks, 2012: 160) reminds us, has no place in such a process as anything either than 'a luxury' while restoration and repair appear as an urgent necessity; 'since the evils of atrocity cannot be allowed to sink silently, unacknowledged, into historical oblivion we must continue to seek repair', not through revenge but through forgiveness. 'But as we do so we must recognise, with Beauvoir, the element of wager that is present in all action and that "failure is a condition of life itself"' (Kruks, 2012: 180).

Lambros Fatsis is a final year DPhil student at the School of Law, Politics and Sociology at the University of Sussex. His doctoral thesis concentrates on discussions of public sociology, the role of the University and intellectuals, while other research interests include black music, urban culture and the history and sociology of the Jamaican soundsystem. He also performs as a reggae selector/radio presenter under the name Boulevard Soundsystem and is a contributor of Billboard magazine on reggae music. Recent publications are featured on the British Sociological Association's Postgraduate Theory Forum and on The Sociological Imagination blog on a
variety of issues ranging from the English riots, the idea of sociological imagination and the Eurozone crisis. In the spring of 2013 he achieved Associate Fellow status of the Higher Education Academy.

Crafting a postgraduate module: Digital by-product data and the social sciences (2013-10-15 08:00)  

Over the last two or three weeks I’ve been working on my postgraduate module ‘Digital by-product data and the social sciences’. The module ran for the first time last year and I’ve been trying to develop the content a bit for this year (it runs in the spring term). It’s actually been much easier to flesh out the reading lists this year. There have been quite a few relevant publications in the last twelve months. The module focuses upon the conceptual and methodological challenges and opportunities of digital by-product data and what these mean for the social sciences. So the material on digital culture and web cultures is useful for background reading, but I’ve tried to focus on readings that fit directly with the aims. It has become clear that this is a rapidly expanding area with more social scientists thinking about what they might do with digital data, and what the limitations might be. We are even now beginning to see this type of data being used to perform social science and to investigate substantive topics.  

Given that the students are seeing this development unfold, this is quite an experimental module. As well as getting the students to do readings, I also get them to imagine projects and to find and use bits of data. We then reflect on what this reveals and the problems and issues we might identify. We try to use more conceptual and critical accounts if these developments to frame the use of digital data. We also think about how these new data and methods might interface with more traditional approaches.
As well as adding a series of new readings, I’ve also been gathering podcasts, audio interviews and studios of talks. Many of these have been posted on this blog. Because of the connected and tech savvy nature of those interested in 'digital sociology', there is a variety of material available. So this year I’ve been able to add audio and audio/visual materials to sit alongside the readings and inform the seminar discussion (thanks in particular go to [1]Mark Carrigan for the work he has done producing podcasts that I’ve been able to link to). These podcasts really give a different dimension and have really helped in building up the depth of content.

This is the running order for the module:

1. Introduction: Data accumulation and the crises of social science
2. Software infrastructures and data harvesting
3. Researching a confessional society
4. The culture of visualisation
5. Drawing upon digital by-product data and networks
6. The new melodramatic imagination: an example of the sociology of mediated objects
7. Social media data aggregators and scraping
8. Data recursivity, the social life of methods and the social life of data

This post by Dave Beer was originally posted on [2]Thinking Culture - we’ve reposted it with his permission as part of our Sociological Craft Project. Find out more [3]here. If there’s an aspect of academic life you’d be willing to reflect upon for the project then please do get in touch!

Money, Power and Opportunity in the Late Modern City, or, isn’t it a shame J G Ballard isn’t around to see this? (2013-10-16 08:00)

[youtube=http://www.youtube.com/watch?v=6niWzomA__So &w=640 &h=360]

This documentary by [1]Alex Gibney, director of [2]the Corporation amongst others, takes as its starting point the disjuncture between Park Avenue Manhattan and the other Park Avenue over the river in the Bronx. The former is home to some of the wealthiest people in the country whereas the latter is a site of endemic deprivation:
40 Park Ave, New York City, is home to some of the wealthiest Americans. Across the Harlem River, 10 minutes to the north, is the other Park Avenue in South Bronx, where more than half the population needs food stamps and children are 20 times more likely to be killed. In the last 30 years, inequality has rocketed in the US – the American Dream only applies to those with money to lobby politicians for friendly bills on Capitol Hill.

It’s a startling and provocative documentary. However I would have enjoyed more reflection both upon how such affluence and poverty can co-exist within the context of the city and the everyday lives of the super-rich. This co-existence has always fascinated me about London, as the only world city I’ve ever lived in or really know to any meaningful extent. It’s also something which is increasingly under threat, as ‘reforms’ of housing benefit look likely to create a situation which even prominent conservatives have described as a [3] ‘social cleansing’ within the city. Given the absence of rent controls (and their continual failure to even enter into debate as a possibility) and soaring house prices, as the global elite desperately seek relatively safe investments, housing benefit paid to those on low incomes has led to far higher payments in London then elsewhere in the country. These effective subsidies to private landlords are now being capped, with the likely implication being a large demographic restructuring of the population of London. But obviously the wealthy denizens who remain still need people to serve them... this perhaps is where the lives of the rich and the poor intersect most in an otherwise divided city. But what are these everyday lives really like? We don’t actually know. But a fascinating project being undertaken by a team from Goldsmiths, KCL, LSE and York is investigating precisely this, as described by Roger Burrows in a post for the [4]LSE Politics Blog:

With few exceptions, the very wealthy have not been examined in any detail; this despite the signal increase in their numbers globally, including in Britain, and widespread popular interest in their (mis)fortunes. There is also the suggestion that the super wealthy are ‘moving away’ from the larger ranks of the professional middle classes, and our project is designed to take forward these concerns in a developed, systematic and substantial way.

The number of individuals who might be considered as ‘super-rich’ can be operationalized in any number of different ways and as part of this project we will examine a range of these. One sensitizing conceptualisation is that offered in a 15-year series of reports by Capgemini and Merrill Lynch. These analyses distinguish between High Net Worth Individuals (HNWIs) and Ultra-HNWIs (UHNWIs). HNWIs are defined as people who hold financial assets in excess of $1 million – so this excludes residences, collectables, consumer durables and consumables. In 2010 there were estimated to be some 10.8 million HNWIs globally with wealth totalling $42.7 trillion. UHNWIs – a subset of this group – are defined as those who have financial assets of $30 million or more. In 2009 it was estimated that there were just 78,000 such people across the globe (but holding over one-third of total HNWI wealth). The geographical spread of HNWIs is much as might be expected: 31 per cent in North America; 31 per cent in the Asia-Pacific; 29 per cent in Europe; with the residue located in Latin America, the Middle East and Africa.

The few empirical social scientific studies of the super-rich that do exist tend to be nested within the long tradition of studies of elites. This is an important literature, which informs our work, but the existing conceptual tool kit that this tradition provides, focused on corporate interlocks and social network closure, needs to be radically re-worked to allow an analysis of the dynamism and complexity of the materially rich metropolitan and globally-oriented class now inhabiting significant sections of global cities like London – home to a disproportionate number of the world’s billionaires.

[...]
In addition to exploring the extent of proactive socio-spatial dis/engagement by the affluent we will also set out to explore the extent and forms of attachment (if any) that wealthy individuals and households have to specific neighbourhoods and urban centres. Do they, for example, develop similar forms of ‘elective belonging’ as spatially mobile members of the middle classes? While the degree to which genuinely super-rich households are ‘footloose’ has often been cited in political debates about inequality and the taxation system, there is little in the way of empirical evidence to help adjudicate on the matter. How important is attachment to neighbourhood in ‘holding’ the rich ‘in place’? This is a significant question if we are to better understand the degree to which the super-rich feel that lifestyle and urban services are substitutable at urban and international levels. Linked to this concern we note the somewhat scant knowledge we currently possess about the links that the contemporary urban rich have with the arts; to galleries and other distinctive service infrastructures – the kind of ‘soft’ attributes of place often identified as influential in attracting a creative and innovative milieu.

Nothing is as emblematic to me of the long term trajectory of London than One Hyde Park. This once-in-a-life-time investment opportunity offered to the world by [6]Christian and Nick Candy quickly smashed records when its incomprehensibly expensive and gaudily decorated apartments went on the market after years of hype.

But the ownership of the apartments is shrouded in a veil of secrecy. Plus the owners are not actually there:

Designed by the architect Lord Richard Rogers, who also designed London’s iconic Lloyd’s building, One Hyde Park has divided Britain. Gary Hersham, managing director of the high-end real-estate agency Beauchamp Estates, says it is “the finest building in England, whether you like the style or you don’t,” while investment banker David Charters, who works in Mayfair, says, “One Hyde Park is a symbol of the times, a symbol of the disconnect. There is almost a sense of ‘the Martians have landed.’ Who are they? Where are they from? What are they doing?” Professor Gavin Stamp, of Cambridge University, an architectural historian, called it “a vulgar symbol of the hegemony of excessive wealth, an over-sized gated community for people with more money than sense, arrogantly plonked down in the heart of London.”

The really curious aspect of One Hyde Park can be appreciated only at night. Walk past the complex then and you notice nearly every window is dark. As John Arlidge wrote in The Sunday Times, “It’s dark. Not just a bit dark—darker, say, than the surrounding buildings—but black dark. Only the odd light is on. . . . Seems like nobody’s home.”

That’s not because the apartments haven’t sold. London land-registry records say that 76 had been by January 2013 for a total of $2.7 billion—but, of these, only 12 were registered in the names of warm-blooded humans, including Christian Candy, in a sixth-floor penthouse. The remaining 64 are held in the names of unfamiliar corporations: three based in London; one, called One Unique L.L.C., in California; and one, Smooth E Co., in Thailand. The other 59—with such names as Giant Bloom International Limited, Rose of Sharon 7 Limited, and Stag Holdings Limited—belong to corporations registered in well-known offshore tax havens, such as the Cayman Islands, the British Virgin Islands, Liechtenstein, and the Isle of Man.
From this we can conclude at least two things with certainty about the tenants of One Hyde Park: they are extremely wealthy, and most of them don't want you to know who they are and how they got their money.

Is this the future of the city? Luxurious developments owned by absentee landlords who have purchased them as investments, tended to by an army of service staff bussed in from the periphery of the metropolis. There's something about the vacated nature of One Hyde Park which grips me (and not in a good way) given this vacuity - in more than one sense - goes hand-in-hand with all the staff on call. As a metaphor for the economic structure of neoliberal capitalism, it's a grim one which, unless something changes, could become ever more accurate.

<b>Narrowly escaping the academic life</b> (2013-10-17 08:00)

This really struck a chord with me given my continued ambivalence about a career in academia:

With my new eyes I re-survey the life around me. Most particularly I become frightened to realize how close I came to letting myself slide into the academic life. It would have been effortless ... just keep on making good grades—(I probably would have stayed in English—I just don't have the math ability for Philosophy)—stayed for a master's and a teaching assistantship, wrote a couple of papers on obscure subjects that nobody cares about, and, at the age of sixty, be ugly and respected and a full professor. Why, I was looking through the English Dept. publications in the library today—long (hundreds of pages) monographs on such subjects as: The Use of "Tú" and "Vous" in Voltaire; The Social Criticism of Fenimore Cooper; A Bibliography of the Writings of Bret Harte in the Magazines + Newspapers of California (1859–1891) ... Jesus Christ! What did I almost submit to?!?

Deadline TOMORROW - CfP BSA 2014 (2013-10-17 12:00)

BSA Annual Conference 2014: Changing Society

Call for Papers
Theory Stream Submissions
This stream welcomes abstracts on any aspect of theory as well as abstracts for the following Study Groups:

- Bourdieu
- Historical and Comparative Sociology
- Realism and Social Research
- Weber

The Realism and Social Research group would also like to invite abstracts under the theme "What is Realism for?"

The group is particularly interested in papers that consider any of the following issues:

- The relevance of realist theory to substantive social, economic and political issues.
- The practical implications of methodologically operationalising different forms of realist thought.
- Those from other schools of thought who wish to engage critically in a dialogue with realist theory.

How to submit
All abstracts and proposals for other events can be submitted online at:

The deadline for submission of abstracts is 18th October 2013.

For further information contact the Theory stream coordinators:
Gurminder K Bhambra E: [2]g.k.bhambra@warwick.ac.uk
Tom Brock E: [3]T.Brock@mmu.ac.uk
Alternatively, contact the BSA Events Team E: [4]events@britsoc.org.uk

**Why Sociologists and Technologists Should Talk (2013-10-18 08:00)**

An interesting article from ZDNet (HT [1]Jean-Loup Richet) made a case for why all technologists should become technology sociologists. It contends that the question of how and why technology will be used tends to be occluded by the continual focus of technologists on the properties of the artefact itself:

> We've looked at the technology. But, no one is asking this vital question: "Why?"

Technologists never ask this question, and really we need to start.

> Or, maybe we do ask this question, but yet we still roll up our sleeves and get to work the moment our brain provides the answer "because it's cool!"

A non-technologist responds to many ideas that technologists posit with a simple phrase: "So what?"

I'm not sure if this means technologists should become technology sociologists. However I do think it illustrates the opportunities for productive collaboration which are increasingly open to sociologists. Hopefully this is something which the growth of digital sociology can help encourage and normalise, though I know these collaborations already happen nonetheless. I think it's also important to hear from sociologists working in industry whose experience can often be marginalised or entirely overlooked from within the academy.

Every one of us at some point has sat down with a significant other, or a colleague, and fallen into the mire of assumed technical knowledge, and a "solution first" mindset. This is what technologists do because our desire is to build not use.

The scenario above, all that user wanted to do was take a picture of their kids and share it on Instagram. And everything we did got in the way of that. The sociological side — the sharing, the recording of memories, the social connection — that's the important bit. *The actual technology is never important.*

A technology sociologist sits at the crossroads between technology and sociology, much like a CTO sits at the crossroads between technology and the business's commercial needs.

To do good product design, all we have to do is strip away the stuff that seems cool and that we want to build, and that doesn't make our family and friends look at us with that quizzical look when we tell them about it.

They're the ones that need to say “that's cool”, not us.

---

1. https://twitter.com/JeanLoupRichet
There are some excellent sociologists working in Microsoft, Xerox, Google, HP and other places - there are also some excellent sociologists working with these companies from, for example, Lancaster, Nottingham, Kings London and others. This is one area where ethnomethodologically informed ethnography has made a major contribution - the aim is to bridge the divide between the artefact and its context, explicating artefacts in context as used by society members. Forgive me, but my work with colleagues then at Edinburgh and Lancaster on co-realisation is an example of developing artefacts that aren't simply neat design ideas or explorations of the why of technology at work and play but situated at the edge of ethnography and design give what can be seen as work (or play) affording artefacts. So what? Technologists and sociologists are talking and have been for over two decades. We need to look at the links between social and computer science in higher education. How come few computer scientists know a great deal about the work of doing this or that and how come social scientists are often so marginal that synergies never arise? Talking with one senior member of faculty some years ago I was surprised to find that they formulated computer supported cooperative work as “like second life, that sort of thing. What’s the use?” There’s a long way to go but in commercial contexts these links are already in place.

Carrigan, Mark. Why sociologists and technologists should talk. Unos apuntes de porqué los profesionales de la creación de tecnologías deberían no sólo tener conceptos claros sobre sociología, sino lo enriquecedor que es contar con investigadores sociales para el desarrollo tecnológico y comprender mucho más que el usuario. http://sociologicalimagination.org/archives/14326 [...]

How is wealth distributed in Britain today? (2013-10-19 08:00)

Guardian’s [1]animated infographic reveals the extent of monetary inequality in Britain in 2013. See it and compare your own ideals, perceptions and the reality.

Why Things Matter to People (2013-10-20 08:00)

Underlying this book is a simple proposition: things matter to people. As well as the thought and interaction which have been traditional objects of the human sciences, we also evaluate our relation to the world is one of concern. Andrew Sayer’s book is concerned with drawing out the theoretical and methodological implications for social science of recognising this irreducible dimension of lay normativity:

The most important questions people tend to face in their everyday lives are normative ones of what is good or bad about what is happening, including how others are treating them, and of how to act, and what to do for the best. The presence of this concern may be evident in fleeting encounters and mundane conversations, in feelings about how things are going, as well as in momentous decisions such as whether to have children, change job, or what to do about a relationship which has gone bad. These are things people care deeply about. They are matters of ‘practical reason’, about how to act, and quite different from the empirical and theoretical questions asked by social science. If we ignore them or reduce them to an effect of norms, discourse or socialisation, or to ‘affect’, we produce an anodyne account of living that renders our evident concern about what we do and what happens to us incomprehensible. (Sayer 2011: 2)

Sayer contends that the pervasive misdescription of lay normativity has contributed to the production of a social science which is both alienated and alienating. The tendency to treat concern “as if it were merely an incidental, subjective accompaniment to what happens” manifests itself in the hegemony of external description and the marginalisation of internal description. In doing so we “miss people’s first person evaluative relation to the world and the force of their evaluation”. However this is not a plea for the reintroduction of subjectivity and, in understanding why Sayer opposes this, we begin to apprehend the sophistication of the arguments which run through the book. His positive account has its roots in a meta-theoretical critique of the “whole series of flawed conceptual distinctions that obstruct our understanding of the evaluative character of everyday life”:

- Fact and value
- Is and ought
- Reason and emotion
- Science and ethics
For instance the conceptual distinction between is and ought obscures their interpenetration in the evaluative aspect of everyday life. We are, as he puts it, "needy, vulnerable beings, suspended between things as they are and as they might become, for better or worse, and as we need or want them to become" (Sayer 2011: 4). We might say that our subjective evaluative responses are objectively part of any state of affairs that can be studied and they are subjectively meaningful responses to objective circumstances. But in doing so the limitations of these concepts becomes clear, with clarity of expression rapidly lost as we strain against the tendency of these distinctions to foreclose certain ways of thinking and speaking. Another related example is the distinction between facts and values. Some try to avoid value judgements because they are understood to preclude objective assessment of facts. Others critique the ambition of an 'objective assessment of facts' because such an endeavour is seen to be impossible because unavoidably value-laden. Both these positions start from the assumption that objectivity and values are incompatible. Thus Sayer seeks to shed the conceptual structure which generates the problems rather than engaging in what he has elsewhere terms a 'PoMo flip' where a reaction to a problematic position involves a simple inversion and retains the conceptual structure which generated the problem in the first place.

One aspect of the book I found particularly thought provoking was Sayer's account of value. On his view values should be understood as past evaluations sedimented as present dispositions which we believe to be justified. This view sees value as "based on repeated particular experiences and valuations of actions" while also tending "recursively, to shape subsequent particular valuations of people and their actions, and guide that person's own actions". They are "habits of thinking to which we become committed or emotionally attached" (Sayer 2011: 26-27). This goes hand-in-hand with a broader argument that "we should think of normativity more in terms of the ongoing flow of continual concrete evaluation, and less in terms of norms, rules, procedures, or indeed decisions and injunctions about what one ought to do" (Sayer 2011: 97). This puts Sayer in conflict with someone like Elder-Vass who, despite a somewhat similar theoretical starting point, offers an account of normativity in terms of the causal power of social groups. As a number of people have pointed out, his concept of norm circles lacks a diachronic account. It might offer useful insight into whose action contributes to which social injunction at a particular point in time but it struggles to explain how this propensity to enforce norms comes about over time. To adequately explain the endorsing of norms requires an account of value. Without this it becomes difficult to comprehend what motivates normative behaviour unless we wish to argue that the norm circle effectively brings itself into being.

That said I’m still not sure precisely where I stand in relation to Sayer’s account but I find it interesting that three competing theories of normativity (Archer, Elder-Vass, Sayer) have emerged from within critical realism in the last decade. I find Sayer’s contribution extremely thought-provoking, partly because of the nuanced hostility to disciplinariness which pervades it. Early in the book he contrasts the often over-socialised view of individual action within social science to the under-socialised view of the individual which tends to dominate within philosophy. His intention in the book is to move beyond the conceptual frameworks which produce such methodological tendencies and to avoid the temptation to deal with the explanatory symptom rather than address the underlying theoretical malaise. But he does so through a careful unweaving of the meta-theoretical thread, rather than seeking to ‘philosophize with a hammer’. This becomes possible because of his sensitivity to the lay normativity of social scientists as persons i.e. he seeks to understand how and why, for instance, actual social scientists are moved to invest themselves in problematic notions of ‘objectivity’. In doing so the ‘carving up’ of the social world in terms of different disciplines comes to seem deeply problematic:
We need a ‘postdisciplinary’ perspective (Sayer, 200a). The conceptual problems that make it difficult to understand evaluative being are partly a product of the emergence of a division of academic labour in which each discipline imperialistically seeks to extend its parochial concerns to the exclusion of others, and each imagines that it is the most fundamental and insightful social science. The mutual hostilities between sociology (and anthropology), psychology, politics and economics serve to support various kinds of disciplinary reductionism that prevent us understanding the social world. The polarisation between oversocialized and undersocialized conceptions of individuals is the most obvious example. The divorce of normative from positive thought about society, through the separation of philosophy from the rest of social science, is another. A plague on all disciplinary imperialism and parochialism! If ‘postdisciplinary’ sounds a bit pretentious, it’s actually little different from the familiar pre-disciplinary social science of the eighteenth – and nineteenth century founders (Sayer, 200b). Although a social scientist myself, this research is based on a lengthy search within philosophy, particularly moral philosophy, for ways of overcoming social science’s difficulty with lay normativity in general, and ethical being in particular. I ask readers to be open to ideas and orientations from outside their own disciplines. (Sayer 2011: 14)

Why Things Matter to People is a rich and complex book. It is unavoidably filled with abstract terminology and at times Sayer’s frustration with the constraints of theoretical discourse is almost palpable – he deserves eternal credit for acknowledging early in the book that ‘lay normativity’ is a rather alienated way of describing its object. Nonetheless the entire project is animated by his concern to understand this everyday yet so frequently overlooked dimension of human life. For something so intrinsically abstract it’s also weirdly readable. I find the sensitivity with which Sayer does theory deeply admirable, as well as the clarity with which he writes about what it is he has done. The book is a pleasure to read and that’s something I have rarely found to be true of social theory, regardless of how accomplished the works in question might be. In short I can’t praise this book enough. Now I need to resist the urge to reread the whole thing when I only picked it up again to check a reference and ended up writing this post.

[...] There’s a review I wrote of the book here: sociologicalimagination.org/archives/14330 [...]  

SheriO (2015-05-18 15:54:06)
Thanks for writing this review. I’ll have to try to read it. If thus social theory were applied to doctoral training how would doctoral study change? How could a doctoral program not produce disciples and universities function without them? I think that study would become multi-perspective and real world whereby instead of studying a discipline some real world phenomena could be studied...although it already is...Your thoughts on doctoral training without disciplines....There is a school of doctoral study in England that is not organized into disciplines but around 'pods'...so some reorganization against the disciplinary silo is happening..it is a training school for 'the sciences', not the social sciences...

Social Science and the Politics of Public Engagement (2013-10-20 16:32)

Social Science and the Politics of Public Engagement
Tuesday, January 28, 2014 from 6:00 PM to 8:00 PM
Open University Camden Centre, 1 - 11 Hawley Crescent, Camden Town, London
In recent years new technology has begun to facilitate ever more novel forms of research practice across the social sciences. New opportunities for collaboration exist in an information environment that is being radically and rapidly restructured by digital communications. An increasingly digitalised culture increasingly produces 'by-product data' as an unintended secretion of everyday social practices while also dramatically reshaping the circulation of academic research within the wider world. Universities themselves are undergoing profound changes, some by deliberate design and others as unintended consequences of broader social changes originating elsewhere. Given such changes, it seems untenable to conceive of or enact 'public engagement' in a way which fails to account of the shifting grounds upon which those seeking to support particular versions of the public find themselves standing. The constitution of contemporary publics cannot be taken for granted nor can the stability of the context within which 'engagers' seek to act.

This event seeks to explore this unstable landscape through exploring a number of innovative projects which pursued novel forms of research practice while also being orientated towards those beyond the academy. Through a discussion of these projects, their methodological innovations and the publics that formed around them, the seminar will seek to shed light on emerging questions about the future(s) of social science, its contested politics and of its relations to emerging ideas and practices of public engagement. The event will address, amongst others, the following questions:

- In a post REF 2014 environment, what could and should a social science informed public engagement agenda be?
- How, specifically, might the social sciences intervene in and help shape the PE agenda in the next couple of years?
- How could social scientists collaborate, both with each other and with those innovating forms of PE in other domains, to re-make what PE means?
- How can a critique of institutionalized approaches to PE and impact be articulated with commitments to public activism, social justice, relevance and responsibility?

Speakers:

Keri Facer, Professor of Educational & Social Futures and AHRC Leadership Fellow for the Connected Communities Programme, based at the Graduate School of Education, University of Bristol.

Tim Newburn, Professor of Criminology and Social Policy at the London School of Economics.

Shamser Sinha, Senior Lecturer in Sociology and Youth Studies at University Campus Suffolk.

More speakers TBC

Organisers:

Nick Mahony is Research Fellow and Co-Director Publics Research Programme, Centre for Citizenship, Identities and Governance, Faculty of Social Sciences, The Open University. Nick leads the Creating Publics project which aims to 're-conceptualise public engagement with social science research in an age of emergent publics'. He is co-investigator on the RCUK-funded 'Catalyst' project and the ESRC-funded project 'Making publics across time and space'. With Dr. Hilde Stephansen, he is also currently building a new OpenLearn website called 'Participation Now'. At the heart of Participation Now is an evolving archive of contemporary participatory public engagement initiatives. The aim of this project is to support practitioners, researchers, students and citizens interested in new - participatory public engagement related - thinking, practice and innovation.

Mark Carrigan is a sociologist and academic technologist based at the University of Warwick. He edits the Sociological Imagination and co-convenes the BSA Digital Sociology and BSA Realism and Social Research groups. He is
a research associate at the LSE’s Public Policy Group and was formerly managing editor of the LSE’s British Politics and Policy Blog. His research interests include sociological theory, methodology, biographical methods, longitudinal qualitative research, asexuality, sexual culture and digital sociology.

Paul Krugman, Niall Ferguson and the norms of public intellectualism in a digital age (2013-10-21 08:00)

The academic blogosphere had been getting a bit boring ever since the [1]Chomsky and Zizek spat came to an end. Fortunately, Niall Ferguson decided a couple of days ago that it was time to take his longstanding feud with Paul Krugman to the next level in an [2]earnest essay, syndicated on the Huffington Post weirdly enough, which largely amounts to an extend accusation that Krugman is a bully who hides his frequent errors through the ferocity with which he is alleged to attack advocates of austerity.

Much of it is remarkably dull, with the end result of the countless hours Ferguson has clearly spent reading through the archives of Krugman’s blog looking remarkably like the sort of thing you find on pg 50 of a bad tempered debate thread on a bulletin board that takes itself far too seriously. In essence Ferguson is self-consciously pursuing this as a clash of public intellectuals concerning the norms of public intellectualism. But what’s remarkable is the banality of much of the discussion and I found it difficult not to wonder if the internet might have been spared this diatribe were Ferguson only to have become acquainted at the right moment with the xkcd cartoon on the left (which has personally saved me from becoming embroiled in pointless internet disputes on more occasions than I can count).

But while I utterly failed to engage with the body of Ferguson’s essay, it was hard not to be interested in the final section where he effectively got to his point after the long preamble:

So we public intellectuals should not brag too loudly when we get things right. Nor should we condemn too harshly the predictions of others that are subsequently falsified by events. The most that we can do in this unpredictable world is read as widely and deeply as we can, think seriously, and then exchange ideas in a humble and respectful manner. Nobody ever seems to have explained this to Paul Krugman. There is a reason that his hero John Maynard Keynes did not go around calling his great rival Friedrich Hayek a [3]”mendacious idiot” or a “dope”.

I assume he’s correct about this. Though that might be because they were friends rather than any inherent reticence
to name call on the part of Keynes. But nonetheless I’m interested to see how Krugman responds to this:

When Paul Krugman first began his attacks against me, he made it clear – as if almost proud of the fact – that he had read none of my books. (Quote: “I’m told that some of his [5]straight historical work is very good.”) This was a mistake on his part. I have read his books. If he had read mine, he would perhaps have thought twice about seeking to discredit me on the basis of a few articles and interviews.

Krugman’s unabashed ignorance of my academic work raises the question of what, in fact, he does read, apart from posts by the other liberal bloggers who are his zealous followers. There is a ratio that really would be good to have as a metric of the seriousness of a public intellectual. It is the ratio of words read to words written. Ideally, I would say, that ratio should be between 100 and 1000 to 1. But in the case of the Invincible Krugtron, I begin to suspect it has now fallen below unity. (When he does read a book, he mentions it in his blog as if it’s a special holiday [6]treat.)

In the past few days, I have pointed out that he has no right at all to castigate me or anyone else for real or imagined mistakes of prognostication. But the fact that Paul Krugman is often wrong is not the most important thing. It is his utter disregard for the norms of civility that is crucial here. I am not alone in being dismayed by Krugman’s [7]“spectacularly uncivil behavior”. It is “my duty, as I see it, is to make my case as best I honestly can,” Krugman has written, “not [to] put on a decorous show of [8]civilized discussion.” Well, I am here to tell him that “civilized discussion” matters. It matters because vitriolic language of the sort he uses is a key part of what is wrong with America today. As an eminent economist said to me last week, people are afraid of Krugman. More “decorous” but perhaps equally intelligent academics simply elect not to enter a public sphere that he and his parasitical online pals are intent on poisoning. I agree with Raghuram Rajan, one of the few economists who authentically anticipated the financial crisis: Krugman’s is [9]“the paranoid style in economics”:

All too often, the path to easy influence is to impugn the other side’s motives and methods ... Instead of fostering public dialogue and educating the public, the public is often left in the dark. And it discourages younger, less credentialed economists from entering the public discourse.

Where I come from, however, we do not fear bullies. We despise them. And we do so because we understand that what motivates their bullying is a deep sense of insecurity. Unfortunately for Krugtron the Invincible, his ultimate nightmare has just become a reality. By applying the methods of the historian – by quoting and contextualizing his own published words – I believe I have now made him what he richly deserves to be: a figure of fun, whose predictions (and proscriptions) no one should ever again take seriously.

And I’m finding it hard not to wonder about the read:written ratio of many authors now! Mine has diminished over the last couple of years but is still probably relatively healthy. The disturbing thought this provoked was that with the rise of eReaders, increasingly sophisticated reference managers and the move away from paper, the only practical obstacle to consistently measuring this is a lack of standardisation about what and how different people are reading. How long before the F(erguson) index comes to supplement the H index et al on Google Scholar profiles.....?
Inside the Mind of the Republican Party (2013-10-22 08:00)

For those such as myself who have been increasingly baffled by events in the US in recent weeks, this analysis of findings from six focus groups with political partisans within the Republican party makes for interesting reading. The full report is available online [1]here.

Understand that the base thinks they are losing politically and losing control of the country – and their starting reaction is “worried,” “discouraged,” “scared,” and “concerned” about the direction of the country – and a little powerless to change course. They think Obama has imposed his agenda, while Republicans in DC let him get away with it.

We know that Evangelicals are the largest bloc in the base, with the Tea Party very strong as well. For them, President Obama is a “liar” and “manipulator” who has fooled the country. It is hard to miss the deep disdain—they say the president is a socialist, the “worst president in history,” and “anti-American.” [..]

These are strong common currents in the Republican base, but the thinking and passions are very distinct and telling among the key blocs – and those have consequences for those who seek to lead.[2][2]

- **Evangelicals.** Social issues are central for Evangelicals and they feel a deep sense of cultural and political loss. They believe their towns, communities, and schools are suffering from a deep "culture rot" that has invaded from the outside. The central focus here is homosexuality, but also the decline of homogenous small towns. They like the Tea Party because they stand up to the Democrats.

- **Tea Party.** Big government, Obama, the loss of liberty, and decline of responsibility are central to the Tea Party worldview. Obama's America is an unmitigated evil based on big government, regulations, and dependency. They are not focused on social issues at all. They like the Tea Party because it is getting "back to basics" and believe it has the potential to reshape the GOP.

- **Moderates.** Moderates are deeply concerned with the direction of the country and believe Obama has taken it down the wrong path economically. They are centrally focused on market-based economics,
small government, and eliminating waste and inefficiency. They are largely open to progressive social policies, including on gay marriage and immigration. They disdain the Tea Party and have a hard time taking Fox News seriously.

**The Dangers of Academic Digital Media Use (2013-10-23 08:00)**

One of our most popular posts last month was the [1]Dangers of Academic Blogging. Though we're hugely enthusiastic about academic blogging, it's clear that this is an important conversation for the emerging academic blogosphere. However the dangers are not restricted to academic blogging or to the unexpected career impact which it might have, as this article from [2]Savage Minds about the abuse faced by those engaging online makes clear:

I live a lot of my professional life online. I’ve been running a [3]personal research blog for over 5 years now, where I often post quite frank discussions of my experiences as a new academic. I have active scholarly [4]Twitter, [5]YouTube and [6]Google Plus accounts. I teach my students to use Twitter, YouTube, Blogger, Google Hangouts (among other social media) in class, and I run workshops where I teach my colleagues and other professionals to use these same tools effectively in their working lives.

So not only is my own professional identity quite exposed, but I’m also engaged in training others to make their identities equally—if not more—exposed. I do this because I am very familiar with the productivity of digitally-mediated communication. These media make possible relationships, idea sharing, knowledge making and forms of epistemological change that are exceptional. And yet they can also be deeply dangerous—something that I’ve become intimately familiar with over the last two years.

In 2011, just as I was finishing my PhD, I began to receive a series of private messages focused on my sexuality and appearance sent to my email and other personal online accounts direct from professional acquaintances of mine based at various institutions around the world. These tended to be detailed, fantasy-like descriptions, sometimes accompanied by photographs. There was no debate about the inappropriateness of such messages: they were explicit, sometimes verging on the perverted, often concerned with my physique and dress, or with asking me for certain favours which ranged from ‘cuddling’ with them to baking them cakes in recompense for their paid professional contribution to my academic projects.

I was so embarrassed about these communications and so confused about how to reply that I ignored them for nearly two years. However, when the fifth professional acquaintance of mine began to do the same to me in 2012, but this time on a more aggressive and persistent level, I responded by doing what I know best: investing in research on the topic.
I began to study other women who had been subjected to harassment via digital media. Some of these women will be familiar – [7] Anita Sarkeesian, [8] Mary Beard, [9] Caroline Criado-Perez – because their harassment has been incredibly public and often quite faceless. But I, in contrast, had virtually no public visibility, and I knew all of my harassers. More than this, all of my experiences had happened privately – through direct messaging – so the content was witnessable only to me.

The Pervert’s Guide to Ideology renews the collaboration between Sophie Fiennes and Slavoj Žižek in a film examining ideology in contemporary capitalism. It articulates itself through engagements with a whole sequence of films, interspersing original clips with striking recreations starring Žižek so as to create the bizarre but attention-grabbing effect of Žižek leading the viewer through the cinematic archive.

There are some fabulous moments. I found Žižek's analysis of Ramstein entertaining and insightful, with the gnawing worry I’ve had over years of going to punk gigs (“er wait isn’t there something a little bit fascist about the way this crowd operates?”) suddenly resolved through his account of the social psychology of a metal gig. His sudden appearance in an [3]aircraft boneyard was a jarring and effective way of making a point about trash as the real of capitalism which I’d never understood when I'd encountered it in his books. Plus I love his reading of Titanic and it was visually staged to wonderful effect in the film.

But this also gets to what frustrated me about the film: I’d encountered this reading many times before. I’m certain many seeing this film will have read more Žižek than I have and yet the great majority of the film’s arguments were familiar to me from his books and articles. This isn’t necessarily a criticism, not least of all because so much value could be found in the innovative presentation of the ideas, but what seemed to be a total lack of new intellectual material did nonetheless bother me a bit.

Paul Krugman recently published an insightful post on his blog reflecting on the conditions in which intellectuals operate in a digital age. In what seems to be an oblique response to his recent spat with Niall Ferguson, he suggests that academics shouldn't overestimate the normative weight of their credentials in the eyes of readers:

What a lot of people — academics, I'm sorry to say, in particular — don't seem to understand are the limits to what credentials get you, in principle and in practice.

Basically, having a fancy named chair and maybe some prizes entitles you to a hearing — no more. It’s a great buzzing hive of commentary out there, so nobody can read everything that someone says; but if a famous intellectual makes a pronouncement, he both should and does get a listen much more easily than someone without the preexisting reputation.

But academic credentials are neither a necessary nor a sufficient condition for having your ideas taken seriously. If a famous professor repeatedly says stupid things, then tries to claim he never said them, there's no rule against calling him a mendacious idiot — and no special qualifications required to make that pronouncement other than doing your own homework.

Conversely, if someone without formal credentials consistently makes trenchant, insightful observations, he or she has earned the right to be taken seriously, regardless of background.

One of the great things about the blogosphere is that it has made it possible for a number of people meeting that second condition to gain an audience. I don’t care whether they’re PhDs, professors, or just some guy with a blog — it's the work that matters.

Meanwhile, we didn’t need blogs to know that many great and famous intellectuals are, in fact, fools. Some of them may always have been fools; some of them are hedgehogs, who know a lot about a narrow area but are ignorant elsewhere (and are, in many cases, so ignorant that they don't know they're ignorant — a variant on Dunning-Kruger.) And some of them have, for whatever reason, lost it — I can think offhand of several economists, not all of them all that old, of whom it is common to say, "I can't believe that guy wrote those papers."

And let me add that believing that you can pull rank in this wide-open modern age is itself a demonstration of incompetence. Who, exactly, do you think cares? Not the readers, that's for sure.

What is valuable, visible & knowable in the emerging social economy?

10am-6pm, 11\textsuperscript{th} December 2013

Room MS.03, University of Warwick

Appeals to the ‘social’ today are everywhere: ‘social enterprise’, ‘social media’, ‘social neuroscience’, ‘social prescribing’, ‘social marketing’, ‘social analytics’, ‘social innovation’. This is thanks partly to the affordances of new techniques of accounting, network visualization and behavioural analysis, many of which take advantage of the ubiquitous digitization of market and non-market activity. The social world can be seen, quantified and influenced via new forms of expertise and data analytics. Managers, marketers and policy-makers make explicit appeals to the ‘social’, in order to sustain brands, rational decision-making, mental health and public goods.

How do we make sense of this? What is the ontology of the ‘social’ that is being appealed to, and how does it differ from the ‘social’ of 20\textsuperscript{th} century statistics, society and sociology? What methodologies are at work in rendering this form of sociality visible, measurable and governable? Is social network analysis now performative, as neo-classical economics has been described in the past? What power relations are latent in this new notion of the social, and to what extent is it in fact reducible to the economic after all – or, perhaps, the biological?

This conference brings together scholars working in economic sociology, science and technology studies, social studies of finance, social studies of Big Data and other fields, to address these questions. Confirmed speakers include:

• [3]Profesor Nikolas Rose - Kings College, University of London
Craftsmanship names an enduring, basic human impulse, the desire to do a job well for its own sake. Craftsmanship cuts a far wider swath than skilled manual labour; it serves the computer programmer, the doctor, and the artist; parenting improves when it is practiced as a skilled craft, as does citizenship. In all these domains, craftsmanship focuses on objective standards, on the thing in itself. Social and economic conditions, however, often stand in the way of the craftsman's discipline and commitment; schools may fail to provide the tools to do good work, and workplaces may not truly value the aspiration for quality. And though craftsmanship can reward an individual with a sense of pride in work, this reward is not simple. The craftsman often faces conflicting objective standards of excellence; the desire to do...
something well for its own sake can be impaired by competitive pressures, by frustration, or by obsession. (Sennett, 2008, pp. 9)

In craftsmanship there is no ulterior motive for work other than the product being made and the processes of its creation ... the details of the craftsman's daily work are meaningful because they are not detached in his mind from the product of the work. The satisfaction he has in the results infuses the means of achieving it. (Mills, 2008, p.181)

1. Craft presupposes a connection between an individual's concerns, projects and practices. The meaningfulness of craft emerges from the relation between everyday activity and broader projects which matter to us. Craft necessitates a sense of 'ownership' of the overarching project. The project to which daily practice contributes must be one which matters to each given individual, regardless of how it was initially formulated.

2. Craft can be constrained by the ossification of practice, as habitual orientations towards the same old tools narrow the possible relations between projects and practices. Similarly new tools are amenable to craft because of the practical opportunities they entail for novel forms of activity.

3. Hierarchy is inevitably corrosive of this sense of ownership because of the fragility which characterises the relations between concerns, projects and practices.

4. Craft is usually suspended uneasily between internal and external goods. Standards internal to the activity at hand often co-exist with external motivations of requirement, recognition and renumeration. This is why the sociology of craft must take reflexivity as its starting point: craft cannot be reliably 'read back' from objective conditions or assumed to be an inevitable corollary to a particular sort of activity.

5. Taking the reflexive individual as a unit of analysis allows us to explore the tension between craft and labour (whether paid or unpaid) in terms of the interplay over time between structure and agency.

6. The concept of 'craft' provides a normative vantage point in terms of which we can critique actually existing organisations and the working conditions which they tend to foster.

Please keep up, Sociology (2013-10-27 12:29)

How can we have a real 'global dialogue' in a sociological discipline that is becoming increasingly censorious and elitist? In each major publication or event we wheel out the same theorists to regurgitate the same ideas. Textbooks and monographs are becoming repetitive, predictable and dull. The research and publication apparatus operates to railroad younger sociologists into using their research projects as default reproductive vehicles for the disciplinary elite's rather inadequate and in some cases obsolete theoretical frameworks. There are many good young thinkers
in our discipline, and there are certainly many good thinkers outside it. Continental philosophy is especially lively at
the moment; Žižek, Badiou, and Stiegler – along with political theorists such as Dean, psychoanalysts such as Bollas
and economists such as Keen – and numerous others across the globe are generating penetrative ideas we could use
to rethink core concepts such as ideology, subjectivity, desire, economic forces and the sociosymbolic order. Why
don’t we hear more discussions about ways in which we might incorporate some of these sparklingly brilliant ideas
into our discipline? The answer is that the elite theorists who guard the discipline’s ailing domain assumptions run a
tight ship. Access to the discipline's ethical and philosophical inner sanctum is heavily guarded. Anyone who thinks
otherwise should try getting a full-blooded critique of the discipline’s long-standing domain assumptions published
in a core journal.

In the absence of any real dialectical momentum in social theory we struggle to construct convincing explanations of
the advanced capitalist world as it is. For instance, at a time when we are coerced into suffering austerity to prop
up a 600-year-old banking system that we allegedly can't do without, and female billionaire Gina Rinehart recently
accused Australian workers of ruining the economy by refusing to work for $2 a day, why does sociology continue to
reproduce flawed and obsolete concepts such as ‘reflexive modernity’ and ‘hegemonic masculinity’? Should it not
strike us as odd that the vast majority of leftist sociologists in fact argue for nothing more radical than a slightly more
regulated and socially inclusive market economy, a genuflection to the ‘end of history’ rather than a move forward
towards something new and genuinely progressive? In the cultural realm, do these same sociologists not simply
enjoin us to be a little more tolerant towards each other in a socioeconomic system that is functionally dependent
upon competitive individualism and its hostile psychosocial forms? Is there no better and fairer form of economic
organisation and no higher social plane on which our class, ethnic and gender differences can be transcended? Can
there be no more movement in the World Spirit? Is this really the best we can do?

In sociology’s current liberal-empiricist paradigm, which limits us to the investigation of possible modes of inclusion in
an incorrigibly exclusive and hierarchal system, our deep fear of ideology and real politics ensures that our discipline
falls yet further behind in its attempts to make sense of the current conjuncture. Recently, British journalist Aditya
Chakraborty (2012) asked why sociologists had been largely silent in the aftermath of the Credit Crunch, and what
suggestions they might have for new ways of organising the socioeconomic order as neoliberalism crumbles. The
terrible truth is that our heavily policed, negativistic, economically illiterate and philosophically moribund discipline
had very little to say. It is sclerotic, languishing in the shadow of the past’s political failures while occasionally offering
attenuated critiques of neoliberalism’s most destructive excesses.

If we ever reach a stage where we are inclined to begin a process of paradigmatic renewal, how would we begin?
Firstly, we must stop dreaming that supposedly organic cultural forces are leading us to a fairer social order just
around the corner. We need to develop an ultra-realist ethnographic method that unsentimentally addresses the
world as it is, not as we would like it to be. The wave of protests that followed the economic crash is already dying
out, and we suspect that the key reason for this is that most people can see no coherent alternative way of organizing
the economy. In the absence of something different and compelling, populations remain mired in post-political
cynicism and depressive hedonia. Only when we grasp just how apolitical and consumer-fixated many individuals
have become can we begin the process of identifying a path forwards.

The dominant sociological paradigm cannot bring itself to admit that resistance to the system simply no longer exists
in an organic cultural form, and that divisive identity politics and the current concatenation of social movements
cannot generate the oppositional momentum once generated by universalist politics, even in its milder social
democratic forms underpinned economically by Keynesian capital controls. Simultaneously, we need to audit
current core theoretical concepts – especially those dealing with ideology and subjectivity – and begin to import and
construct anew. Our core journals, however, are resistant to such fundamental revision. We need to ramp up the
pressure in the current debate on the publishing system; do we go for open access or some sort of hybrid, and how
do we maintain quality whilst promoting greater freedom of thought?

In short, we must see the post-war intellectual period as a spent force, take from it what might be useful – probably considerably less than we once thought – and become a true intellectual community busy in the task of generating and circulating honest empirical data and truly reflexive theory. None of this is possible unless we extricate ourselves from our current position of servitor to failed left-liberal politics, a failure brought home by the current capitulation to austerity and the potential return of the very extremist politics that the liberal left fear. Until a new paradigm-shifting debate is up and running, we have little of worth to take to the public other than an endless procession of complaints about spatially bound instances of social inequality.

At the moment we are floundering in a catastrophist continuum dominated by frightened liberals. We have explained this at length elsewhere (see Hall, 2012; Winlow and Hall 2013), but, put very simply, we became so frozen with fear of the totalitarian power that blighted the mid-20th Century that we voluntarily dismantled the intellectual and political infrastructure that opposed, or even sought to regulate, liberal capitalism’s destructive dynamism. Now we face the return of the real conditions in which totalitarian reaction is more likely: geopolitical tensions, austerity, bankruptcy, humiliation, chronic insecurity and social hostility. If we are to have a ‘global dialogue’, let’s have one, but we must reorganise the sociological discipline in order that we can transcend its subtle and insidious mode of censorship.

Professor Steve Hall and Professor Simon Winlow are Co-Directors of the [1]Teesside Centre for Realist Criminology. They address these issues in greater depth in their book [2]Rethinking Social Exclusion: The End of the Social?

Vibrant Matter: A Feeling for Things (2013-10-28 08:00)

One of the most thought-provoking books I’ve read in recent months was [1]Vibrant Matter by Jane Bennett. While I’m still a little sceptical about some of the claims made in the book, it nonetheless had what I assumed was one of its desired effects by quite dramatically shaking me out of my intellectual habit of marginalising the non-human. This is the publisher’s blurb from the book and it effectively conveys the sophisticated eclecticism which was my defining impression of it:
In *Vibrant Matter* the political theorist Jane Bennett, renowned for her work on nature, ethics, and affect, shifts her focus from the human experience of things to things themselves. Bennett argues that political theory needs to do a better job of recognizing the active participation of nonhuman forces in events. Toward that end, she theorizes a "vital materiality" that runs through and across bodies, both human and nonhuman. Bennett explores how political analyses of public events might change were we to acknowledge that agency always emerges as the effect of ad hoc configurations of human and nonhuman forces. She suggests that recognizing that agency is distributed this way, and is not solely the province of humans, might spur the cultivation of a more responsible, ecologically sound politics: a politics less devoted to blaming and condemning individuals than to discerning the web of forces affecting situations and events.

Bennett examines the political and theoretical implications of vital materialism through extended discussions of commonplace things and physical phenomena including stem cells, fish oils, electricity, metal, and trash. She reflects on the vital power of material formations such as landfills, which generate lively streams of chemicals, and omega-3 fatty acids, which can transform brain chemistry and mood. Along the way, she engages with the concepts and claims of Spinoza, Nietzsche, Thoreau, Darwin, Adorno, and Deleuze, disclosing a long history of thinking about vibrant matter in Western philosophy, including attempts by Kant, Bergson, and the embryologist Hans Driesch to name the "vital force" inherent in material forms. Bennett concludes by sketching the contours of a "green materialist" ecophilosophy.

There was a recent seminar at Birkbeck exploring Bennett’s work and I was pleased to learn that the event was recorded (HT [2]David Beer) and the podcasts are now [3]available online. Here’s the description of the event:

The work of the political theorist Jane Bennett (Johns Hopkins University, Baltimore) over the last decade has consistently drawn attention to and had a feeling for things, for the inorganic, and for the agency or quasi-agency of nonhuman actants. Her project of developing a new political ecology and renewed vitalist thought beginning with Thoreau's *Nature: Ethics, Politics and the Wild*, *Modernity and Political Thought* (1994) was further developed in *The Enchantment of Modernity: Crossings, Energetics and Ethics* (2001)and found its fullest expression in *Vibrant Matter: A Political Ecology of Things* (2010) a book which has thoroughly reshaped the way in which we think about landscape, ecology, matter, vitality and the terrain of continental philosophy in a time of critical climate change.

This event makes the writing of Jane Bennett a vibrant matter for discussion across the fields of philosophy, psychosocial studies, political theory, cultural studies, literary theory, visual theory and performance studies among others. In particular, the focus will be on how Bennett’s explorations of vitalism, anthropocentrism, agency, biopolitics and new materialisms contribute to the emerging and fraught conversations between feminist and queer theory, Object Oriented Ontology and Speculative Realism.

This workshop will discuss the intersections between Bennett’s political thought, OOO and feminist/queer theory featuring responses from Eileen Joy, João Florêncio, Nigel Clark, Eszter Timár, Lisa Baraitser and Michael O’Rourke.

In this podcast Les Back talks to Charlynne Bryan about her experience of taking part in the project Les undertook with Shamser Sinha which explored the possibility of a more 'sociable sociology'. This project experimented with treating participants as co-authors and Charlynne reflects on her experiences of engaging with the opportunities and risks attached to participating in a project of this sort.

You can read more about the project [here](http://backdoorbroadcasting.net/2013/10/a-feeling-for-things-a-conversation-around-the-work-of-jane-benne/):
Combining insights from Stuart Hall’s recent writings and Franz Fanon’s lesser-known essays, the article argues that new hierarchies of belonging are established that replay aspects of colonial racism but in a form suited to London’s postcolonial situation.

How Twitter is Ruining America (2013-10-29 08:00)

It’s far from an original sentiment to claim that social media is having a corrosive effect on the fabric of social life. But [1]this article from the Atlantic makes an intriguing argument about the impact of Twitter on the social psychology of electoral politics and the ramifications this has for social cohesion:

Political candidates and politicians have always surrounded themselves with fans, of course. They’ve often, as The Washington Post’s [2]Ezra Klein lamented, put on blinkers when it comes to the feedback they want to receive and the media they use to receive it. But there’s something about social media — the clustering of opinion, the immediacy, the sense of hearing directly from people — that seems qualitatively different. Klein’s point in the article linked above is that the proliferation of partisan news outlets allows an elected official (or [3]a member of the Supreme Court) to easily seek out only affirmative information. But Klein neglects to notice that every Facebook account and tweet and retweet is itself a news outlet, as that social media company employee at The Baffler’s bar points out. The filter provided by journalism is an accident that became essential, a way of providing information and perspective that people once couldn’t otherwise get. It is and has always been word-of-mouth brought to scale. The difference between you saying what you saw in Dallas on November 22, 1963, and what the Associated Press reporter saying what he saw was that the number of people that heard the reporter was much, much larger. Journalism has always said, "You may not have known this." You may not have known that the restaurant you gave five stars on Yelp just failed its health department inspection. Or: You may not have known that the NSA is collecting information about every phone call you make. The official media outlets that existed when, say, Thomas Jefferson was president were more partisan than those today. But Jefferson had to work with his political opponents, had to spend time with them, had to hear their opinions in a way that Ted Cruz does not. Collins’ point isn’t just that the media is bifurcated. It’s that we can all, any of us, live in a world in which the majority of what we hear is what we want to hear.

The Future of Scholarly Publishing (2013-10-30 08:00)

What does the future hold for scholarly publishing? Most would agree that the present system is unsustainable yet there remains little consensus on what could and should replace it. Patrick Dunleavy at the LSE Impact Blog makes a [1]compelling case as to the widening scope for disintermediation. Or in other words: what’s the point of scholarly publishers when universities are increasingly able to perform these functions themselves?

Yet now journal articles are all online, most serious or major books will move into electronic format, and scholarly work will become a fully digital product (Weller, [2]2011). Add in open access and the possible scope for disintermediation widens dramatically. Many large publishers are still charging around $2700 for an open access paper in a good journal, while the sustainable future rate will probably be around $600. This is a huge premium, and it is not going to do academic publishers’ already battered reputations any good at all to try to defend it. Serious, big universities will be thinking, are already thinking – why don’t we publish digitally and open access ourselves? All that academics at (for instance) Stanford, Harvard, Imperial or LSE get from being published in prestigious journals is the certification of peer review, itself an increasingly battered and replaceable currency. Yet top universities could organize their own conventional peer review processes economically and effectively, much as they do for PhD examining in the UK, using a system of mutual service and support. All the rest of the piece – getting articles publicized by twitter and blogs, providing a well-edited product, delivering the article to any PC, phablet or colour printer in the world – can be done easily and cheaply by universities themselves. Online communities are already doing the work of developing more and more research, so for universities to directly organize and publish their own peer reviewed journals, monographs and books is a natural next step. In my view only a dramatic fall in journal OA prices can prevent this transition in the next ten years.

And it’s not just in publishing. With the rise of podcasting, universities are already substantial broadcasters – for instance, LSE podcasts have been downloaded many millions of times in 2012-13. Whatever eventually transpires around MOOCs, TV and videocast outputs from universities are already mushrooming. So universities increasingly broadcast their own work across the whole field of the cultural outputs, and they will do so far more in the next decade – partly responding to the also substantial impacts agenda ([3]Bastow et al, 2014).

The Case Against Open Access (2013-10-30 16:49)

I think the argument made [1] here by John Holmwood is very important. My instinct is to support open access, though I think the scale of its ramifications are sometimes overestimated, however there has often seemed to be a degree of inattentiveness to economic and political context within which these arguments are being made:

For many commentators, open access to data and academic publications will bring clear public benefits, facilitating better public debate and allowing different kinds of elites to be held to account, whether they be political elites, policy makers or other kinds of experts. The case for open access appears overwhelming where the research is publicly-funded. Why should the public be denied access to that research by the high subscription pay-wall of journals? And, indeed, aren’t most academics interested in the widest dissemination of their work?

This argument confronts a paradox. The push to open access occurs in the context of dramatic reforms to universities that stress that higher education should not be seen as a public benefit, but a private investment in human capital for which the beneficiary should pay (and should pay above its costs once fees are allowed to rise above the current fee cap). Indeed, the Minister for Universities and Science seeks a more efficient and diverse system in which [2] for-profit providers will play a larger part, and even envisages a change in the corporate form of the university to facilitate greater engagement with [3] private equity investors. It seems that a paywall is to be removed, at the same time as new paywalls are under construction.

Once the common factor of commercialisation is teased out the paradox disappears. One of the main drivers of open access is to make academic research more easily available for commercial exploitation, especially by small and medium enterprises. In this context, it is significant that the licence under which open access should function is CC BY which enables commercial exploitation and reuse in any form. The consequence, for the natural sciences, or any other research with a directly exploitable commercial idea, is to bring the underlying research under the protection of Intellectual Property Rights.

All of this is part and parcel of the impact agenda whose primary economic purpose is to shorten the time from idea to income. Here we are witnesses to an inversion of previous science policy inaugurated by Lord Rothschild in the 1970s that was concerned with publicly funded research and advanced the idea that, where there was a private beneficiary, the beneficiary should pay. Now it seems that there should be no research undertaken without a beneficiary, but that beneficiary does not pay.

But what of the humanities and social sciences? Surely, here the situation is different? First, let it be noted that the very commercialisation of the university itself will have the consequence of dividing the higher education system between a small number of elite universities and others subject to the
pressures from for-profit providers. This will include the ‘unbundling’ of their functions (also involving the separation of research from teaching), as described by Sir Michael Barber, Chief Education Advisor of Pearson (and former member of the Browne Review), in a recent publication for IPPR. In this context, open access – especially MOOCs (and the online curriculum of Pearson) – provided by ‘elite’ universities is the means of undermining the conditions at other institutions and providing a tiered educational system that reinforces social selection to elite positions. This is the context in which Mike Boxall of PA Consulting Group speaks of a sector divided among ‘oligarchs, innovators and zombies’.

Equally significant, is that the argument for unbundling (some) universities is the claim that research is increasingly taking place outside universities. In the case of the social sciences, this is research undertaken by ‘think tanks’ and commercial organisations. It is here that access to ‘big data’ provides commercial opportunities. Open access is an opportunity to amalgamate data from different sources, develop techniques of analysis under patent, and re-present data, and the means of checking any analysis using it, behind a new paywall. Significantly, the recent ESRC call for a What Works Partnership in Crime Reduction specifies that the products of the research need not be under CC BY, but under IPR arrangements.

The Politics of Zombies (2013-10-31 08:00)

A few months ago I wrote about the use of zombies to represent crowds in films like World War Z. My basic point being that zombies are a shorthand for portraying the irrationalism of mass assemblies which threaten the social order.

Leaving aside the sheer socio-political weirdness of this bit of the film, it also left me thinking about the aesthetics of the crowd which characterised the film as a whole. The film portrays, in its own terms, the beginning of a world war – an established global order, represented throughout by the United Nations, suddenly finds itself under siege by an internal threat and, I’m sad to say, all looks lost, at least until some heroic figures are able to leverage scientific knowledge and military resources into temporary survival and the onset of total war. Who are the enemy? The sheer mass of the human population, those who formerly contributed to the reproduction of the social order each and every day but are now gripped by an inexplicable destructive urge, constituting an existential threat to the established order through their sheer numbers and violent reaction to the remaining organs of power. How terrifying a spectacle, to see a crowd so blood thirsty, plagued by such malevolent demons that too much contact with soldiers can leave the security forces equally consumed by the nihilism of the mob! Who are the
heroes? Special forces, the World Health Organization, the United Nations, the IDF and the US Military.
The thought that kept returning to me through the film was the extent to which it portrayed the mirror image of what China Mieville describes as ‘floating utopias’ - in a kinder and gentler age of pre-austerity neoliberalism, the libertarian imaginary found its expression in fantasies of liberation from the state in floating paradises of consumption and free enterprise. In an age of austerity, this utopian impulse finds it counter-image in nightmares of being eaten alive by a feral crowd, with dark hopes of malthusian salvation necessitating a militarization of social life and total war against the mass of humanity. Only through embracing death and destruction (by literally internalising it in the form of the viruses which render one oblivious to the teeming destructive hoards) can the forces of social order stand a chance against the nihilistic fever which has gripped the mass of humanity and eviscerated the capitalist world system.

It seems that the Department of Homeland Security agree with me:

Justice, Genes & Welfare:
Are Intergenerational Relationships Toxic?

A joint BSA Families and Relationship Study Group and Youth Study Group Event

Keyworth Centre, London South Bank University
Thursday 28 November 2013

Intergenerational relations increasingly seem to be called into question in contemporary society, highlighted as centrally implicated in some of its key ills. The topic of intergenerational justice has been the focus of a slew of popular and political publications,
contending that the „baby boomer“ generation has skewed the allocation of economic, social and cultural resources in its own favour and left younger generations immersed in debt and facing a perilous future. Early years policy reports pose parenting as formative in babies“ brain architecture, hard wiring future (anti)social behaviour and empathetic (in)abilities, as well as shaping the genetic inheritance that passes down through the generations. Ideas about cycles of deprivation, transmitted disadvantage and intergenerational cultures of poverty and worklessness are a recurrent feature of political pronouncements, where low aspirations and benefit dependency are alleged to be passed down in families and communities.

This day seminar will ask, "Are intergenerational relationships toxic?"

Contributors will appraise:
JUSTICE: Jonathan White (LSE), and Susie Weller (LSBU) and Ros Edwards (University of Southampton);

GENES: Val Gillies, Nicola Horsley (LSBU) and Ros Edwards (University of Southampton); and

WELFARE: Tracey Shildrick (University of Leeds), and Eldin Fahmy (University of Bristol).

A concluding review of the state of intergenerational relationships will be given by the Chair for the day: Jane Pilcher (University of Leicester).

Registration
BSA Members £45
Non-Members £55

4.11 November

Sports got political on Sunday. NBC sportscaster Bob Costas utilized a halftime moment to talk about a longstanding issue: The use of Washington’s Football team name, the R*dskins. I noticed a reaction on my Facebook- from someone who was not a person of color: "I don't want to hear Bob Costas inject his politically correct b*tch ass opinion."
Now why does it matter if such opinions come from a person of color or not? Ideally, it shouldn’t, but issues of identity tend to be more prone in communities of color and there’s a reason for it. The debate reminded me of a contentious argument I saw at Occupy Los Angeles. The Los Angeles camp had an extremely diverse crowd: ethnically, ideologically, and generationally. Tensions were inevitable.

A man from an indigenous group made a declaration to the 100-person crowd: “Do not use the word Hispanic.” Better yet, he said, all of us should refer to those in the camp from a Latino background with a more respectful term: “Indigenous.” Immediately afterward, a light-skinned man approached the platform and insinuatingly asked, “Would you accept the term ‘human’?” It was a well-intended and seemingly simple question; maybe a heartened effort to bridge all our humanity together. But the reality is that such questions are mired in historical ignorance.

Here’s how: Issues of self-identification are difficult to understand by groups in society who always had the right to self-identify. It’s relatively recent that communities of color, on the other hand, can say how they want to be identified without facing jail time or death. This comes after centuries of suffering, violence, and peaceful resistance on our part. Now we, as communities of color organizing for peaceful equality for all people, finally have the right to say this is who we are, yet today we still face resistance. It is a right that is taken for granted, just like Americans take many other rights for granted. Those who came before us died for our right to say we are not web*cks, we are not ni*gers, we are not r*dskins. The right to say this is who I am and this is who I’m not is an American struggle that, given the R*dskin team name debate, is still ongoing.

I am not a nationalist; I believe the core of issues in the United States and globally are economic. However, I recognize the lack of understanding that is prevalent when someone asks “why not just be human?” Of course we are human, but humans are not naked of culture or history. Such a being would be hardly considered human at all. Such questions try to minimize the dynamics of Chicano and Indigenous culture, by branding us naked of identity and culture altogether (trust me, our people have been there before and aren’t interested in going back).

So when a person of color makes a stand for his/her identity, remember it’s a historically rare occasion to be that free to do so. It’s also threatening when a person tries to attack our display of self-identification.

I personally do not identify myself as Chicano or anything similar, but I respect people’s right do so. This may seem like a contradiction, but my fundamental point is this: We all have the right to identify ourselves how we’d like. This is a relatively new right we’ve gained over the years.

During his halftime segment, sportscaster Costas also said that “a majority of Native Americans say they are not offended” by the term R*dskin. Though I am not sure if valid studies exist to support the claim, I am certain there is some truth in it. America remembers a time when African-Americans themselves performed blackface (similarly, R*dskin fans today apply red to their face at games). It’s believable that many Native Americans may find r*dskin acceptable, or even find pride in a blackface-like caricature, Cleveland Indian mascot Chief Wahoo. This may represent a historical phenomenon from marginalized persons to find delight in the slightest hint of inclusion, whether positive or negative, into mainstream society. Many comedians of color, for example, perpetuate stereotypes of their own community in order to penetrate the mainstream. That being said, there are many Native Americans who choose not to accept such terms of integration ([1]Why not hear it from a Native person’s perspective?).

We’ve also noticed in the social media sphere how us lefties are being considered “politically correct” or too sensitive. Actually, I’d argue the term politically correct has become negatively charged; it is a more emotional than logical argument. It has become an effectively curt term to deny validity to a valid question. It is a tool of propaganda. It seeks to quickly end key discussions by labeling dissenting opinions as “sensitive,” “weak,” or “vibe-killing.” Movements should either struggle to make the term more positive or do away with it completely.

Now with the question on if we are being too sensitive. Life’s too short to take things on a personal level.
But then there’s the political. It’s hard to accept the claim that American society treats all as equals when there’s no sports team called the California Cr*ckers, Nebraska N*ggers, or New York Ch*nks (rightly so, of course), but its 2013 and we surely have the R*dskins.

But here’s a last curveball. We do have the power to turn some derogatory words into acceptable words. This includes words like queer and chicano, the latter of which used to be an insulting slur in Texas. Both words are now celebrated in their respective communities. Notably, the N-word hasn’t gotten there due to resistance. Changing the social meaning of a term in an either positive or negative direction, clearly, takes collective effort from the group whose identity is in question. Seemingly, it is in the right of any group to define itself as it’d like.

But can this happen to a term like r*dskin? Can Native Americans rally enough support to make the term acceptable, like queer or chicano? Or is the term too loaded with pertinence to skin color to garner wide acceptance? The direction of that answer may be determined by the Native collective itself.

Michael Lozano is a contributing writer. His articles have been published nationally across New American Media, ImpreMedia (the nation’s largest Spanish language news publishers), and various campus papers. He graduated from CSULB in 2011 with Honors in Sociology and a minor in Journalism.

[...] Challenging Words [...]

Why have young people in Japan stopped having sex? (2013-11-02 08:00)

As you’ve probably noticed if you follow this site at all closely, we sometimes post about [1] asexuality. For those who don’t know, asexuality is usually defined as ‘not experiencing sexual attraction’ and is a cultural identity which largely emerged online and has grown in prominence over the last decade. But from a sociological standpoint it seems clear that we can’t reduce not experiencing sexual attraction (as a characteristic or set thereof) to asexuality (as the cultural discourse which has grown out of online asexual spaces). To argue otherwise would imply that asexual people suddenly appeared at the same time as the asexual idea began to circulate online. In other words: our current notion of ‘asexuality’ is relatively recent but there is no prima facie reason to think this is true of not experiencing sexual attraction.

Approaching the topic in this way immediately opens up fascinating issues for comparative analysis, as accepting the premise that not experiencing sexual attraction is likely to be partly or wholly transcultural raises the obvious question of the alternative forms of cultural expression this experience has found in other times and places. This is why I was so fascinated by the [2] following article exploring a radical transformation in Japanese sexual culture:

Japan’s under-40s appear to be losing interest in conventional relationships. Millions aren’t even dating, and increasing numbers can’t be bothered with sex. For their government, “celibacy syndrome” is part of a looming national catastrophe. Japan already has one of the world’s lowest birth rates. [3] Its population of 126 million, which has been shrinking for the past decade, is projected to plunge a [4] further one-third by 2060. Aoyama believes the country is experiencing “a flight from human intimacy” – and it’s partly the government’s fault.
The number of single people has reached a record high. A survey in 2011 found that 61% of unmarried men and 49% of women aged 18-34 were not in any kind of romantic relationship, a rise of almost 10% from five years earlier. Another study found that a third of people under 30 had never dated at all. (There are no figures for same-sex relationships.) Although there has long been a pragmatic separation of love and sex in Japan - a country mostly free of religious morals - sex fares no better. A survey earlier this year by the Japan Family Planning Association (JFPA) found that 45% of women aged 16-24 "were not interested in or despised sexual contact". More than a quarter of men felt the same way.

Japan's under-40s won't go forth and multiply out of duty, as postwar generations did. The country is undergoing major social transition after 20 years of economic stagnation. It is also battling against the effects on its already nuclear-destruction-scarred psyche of 2011's earthquake, tsunami and radioactive meltdown. There is no going back. "Both men and women say to me they don't see the point of love. They don't believe it can lead anywhere," says Aoyama. "Relationships have become too hard."

Marriage has become a minefield of unattractive choices. Japanese men have become less career-driven, and less solvent, as lifetime job security has waned. Japanese women have become more independent and ambitious. Yet conservative attitudes in the home and workplace persist. Japan's punishing corporate world makes it almost impossible for women to combine a career and family, while children are unaffordable unless both parents work. Cohabiting or unmarried parenthood is still unusual, dogged by bureaucratic disapproval.

Are similar trends happening elsewhere in the world? According to Google Analytics we have an astonishingly diverse international audience so it would be great to hear from people outside the Anglo-American world which is unfortunately still the horizon of the vast majority of research into asexuality.

Horrifying. And it could happen here. We are loosing our humanity! It's like we think what makes us human needs to be expelled. This is so, so scary.
In the case of Iran, as my country, due to everlasting increasing of living cost, and skyrocketing of girls share in higher education which disseminate to highest degrees as PhD, and so much more opportunity for women to get involved in labour market (generally meaning), we (Iranian) at least have a semi - similar experience. In this scheme both young male and female are not interested in marriage due to its burden responsibility, required commitments!, sharp economic demands which simply overwhelm the desire for FORMAL dating and marriage; but it doesn't mean necessary to giving up sexual desire, it just work on marriage issue, which will result in more decreasing rate of child-birth rate and diminishing of country’s population in longterm period. A trend which is strengthen by changing values while it let people to take a single - lifestyle and have a non - marriage affair with opposite sex without any fear of punishment or stigmatization!.

Good, if the world follows this trend overpopulation will stop! Imagine a world with less people - more resources for each, less contamination, more quite places to go on vacations, more wild life, less animals in farms suffering to be eaten by us, maybe it even stops clima change? education and care of fewer kids easier, more focused, etc. In short, the rise of quality over quantity, great! We don’t live in times were we depend on natural selection anymore. This would also go well along with the raise of technology, global connectivity, and robots/tasks automation. It has a few temporary issues like the payments of rents of the older generations, but this is neglactable from a long term, global perspective.

CfP: Digital Sociology PhD/ECR Workshop (2013-11-02 12:26)
Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from peers and established academics in a supportive environment.

The event will take place between 11am to 4pm on February 19th at Goldsmiths College in South London. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.

If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn't been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.

Ray Pahl, friendship and the emergence of Discover Society magazine (2013-11-03 08:00)
Following this month’s launch of [1]Discover Society, one of its managing editors, John Holmwood, talks about the genesis of the idea for the online magazine in a conversation with the late Ray Pahl. You can read the full post on the [2]Policy Press Blog.

[3]

DISCOVER SOCIETY
MEASURED - FACTUAL - CRITICAL
Earlier this month a new online magazine, [4]Discover Society, was launched. The magazine features articles on social research, policy analysis and commentary, and is supported by the British Sociological Association, the Social Policy Association and Policy Press.

The seed of the project was planted when some of us who went on to set up Discover Society met with [5]Ray Pahl, the eminent sociologist best known for his studies of social interaction, polarisation, work and friendship in suburban and post-industrial communities, shortly before he died in June 2011. We talked about a range of topics, including the fate of universities in the face of marketisation, the financial crisis, and the increasing hardship on the front-line of austerity Britain. We also talked about the future of social research – in truth, the future of sociology and the special character of the sociological imagination and its public relevance.

Ray researched and wrote about communities, but he also wrote for communities. As part of our visits to Ray, we also helped arrange his papers. In a dusty attic space, old copies of New Society were piled up and he pointed to them and said, “That’s what we need today. Without a magazine to disseminate sociology and social policy, there will be no real engagement.” Ray had written for New Society and, like many others – as the response to [6]Mike Savage’s article on the magazine in our first issue shows – had felt its demise in 1988 keenly. He associated its closure with the changing tenor of the times and the claim that there was no such thing as society associated with the promotion of neo-liberal policies designed to make the claim a reality.

__________________________

The Phenomenology of Obsessiveness (2013-11-04 08:00)

To talk about ‘modes of reflexivity’ can sometimes seem to suggest types of person or personality. Understanding reflexivity in this way misleads because its suggestion of divergent individual traits can too easily obscure the commonalities shared between all reflexive individuals. To postulate a mode of reflexivity entails a claim about an identifiable tendency in how some set of individuals deliberate about objective circumstances in light of their subjective concerns. What makes the difference is how this practical tendency manifests itself over time as the individual makes their way through the world. The variable life of the mind Archer’s account claims should not be
understood as a claim about different types of mind but rather as an account of how individual differences in the exercise of a particular mental faculty (reflexivity) are both shaped by our circumstances and, in turn, work to shape those circumstances through the differing modalities of being-in-the-world and ensuing biographical trajectories which they engender.

It’s in this sense that I’ve been thinking a lot recently about the capacity to bring deliberations to a close. Communicative reflexivity constitutes a tendency to rely on others to complete and confirm deliberations: the individual will often draw some initial conclusions but relies on trusted interlocutors to validate these provisional thoughts in conversation before they feel comfortable acting upon them. Autonomous reflexivity constitutes a tendency to complete one’s own deliberations, not in the sense of precluding the input of others but simply that this is seen as a potentially more or less informative contribution to what is a fundamentally individualised process of working out what to do. Meta-reflexivity constitutes a tendency for deliberations to spiral because both self and circumstances are susceptible to further interrogation e.g. “is this really what I want to do?” or “why do I always react this way when this happens?”. Fractured reflexivity constitutes a tendency for deliberation to amplify affect without bringing the individual any closure to an action-orientation.

What seems crucial here is the phenomenology of obsessiveness. For instance we often consider something such as ‘indecisiveness’ to be a personal characteristic. Whereas considered in terms of reflexivity, this can be better understood as a difficulty with concluding internal conversations. In this sense I want to distinguish between someone who doesn’t know how to start making a decision and someone who doesn’t know how to stop. The former might designate an inability to begin, an absence of criteria and/or of motivation, which lead to a straightforward inability to know how to approach the question in a practical way – perhaps leading to tossing a coin, rolling a dice or simply choosing arbitrarily. In contrast the latter might be understood as a lack of confidence in concluding a decision – “how do I know this is the right choice?”. Though I’ve gotten better with it over time, I still sometimes struggle hugely with decisions simply because I experience myself as very persuasive… I run through arguments in my head to do A and am persuaded, I run through arguments in my head to do B and am equally persuaded, I run through arguments in my head to do C and yet again I’m persuaded it’s a good idea. One of the striking things about my PhD data was how this seemed to be true of almost every meta-reflexive who took part in my research.

There’s an interesting section in Margaret Archer’s Being Human, written before her work on reflexivity had properly begun, which has provided a useful starting point for thinking through this issue in greater depth. It’s one I want to return to post-PhD to ponder this more at the level of phenomenology:

Why does the dialogue finish here: after all the subject may be making an unwarranted judgement about the worth of her concerns or a mistaken one about her emotional ability to live with them. She may indeed, for this is always possible with any judgement, but there is still no arbitrariness in deciding to end a sequence of potentially endless evaluations which could never conclude with certainty. ‘Terminating the sequence at that point – the point at which there is no conflict or doubt – is not arbitrary. For the only reason to continue the sequence would be to cope with an actual conflict or with the possibility that a conflict might occur. Given that the person does have this reason to continue, it is hardly arbitrary for him to stop.’

Archer (2000: 241) (italicised section quotes from Harry Frankfurt’s The Importance of What we Care About)

The important point here is that there is no necessary conclusion to deliberation. Particularly when it comes to momentous life decisions, there is a possibility for continual deliberation which is intensified because neither self...
nor circumstances remain static while the individual deliberates. Once we free our understanding of ‘inner life’ from Cartesian metaphysics and see it as a process always in movement, one which cuts across and threads through the embodied engagements of day-to-day social life, it becomes easy to see how obsessiveness can so frequently go hand-in-hand with inertia. At some point we have to decide. The deliberation itself can never engender certainty and, with the exception of more extreme instances of fractured reflexivity, we learn to act without it. But we do have proxies. For the communicative reflexive, the confirmation of significant others acts as a proxy for the certainty which is a phenomenological impossibility. For the autonomous reflexive, their confidence in their own reflexive capacities acts as a such a proxy. Whereas for the meta-reflexive and fractured reflexive there is, for different reasons, no such proxy and this is why decisiveness remains such a struggle.

Jessica Foley (2013-11-20 11:49:00)
Mark, many thanks for this insightful post - I wonder could you recommend any further texts or discussions in relation to the 'meta-reflexive' and 'fractured reflexive'. It's of growing relevance to me in my own PhD research and I could do with finding out more about this! Thanks.

What does it mean to be a public intellectual in an age of austerity? (2013-11-05 08:00)
The higher education system is going through a period of profound change, with newfound opportunities opening up for the [1]superstar professors to develop their brand through MOOCs, TV and cinema. Where will it all lead? Fortunately the renowned anthropologist [2]Robin Dunbar has opted to show us the way through this minefield. In this series of videos produced by Guinness (HT [3]Charles Knight) he has teamed up with the comedian Danny Wallace to… do something slightly depressing. It’s probably best I let Guinness explain the project themselves:

Friendships are a beautiful thing… but not if they’re left to wither away to nothingness.

Is sending your mates the odd tweet or giving them a call once in while enough? Science says not.

Getting together is what’s needed, seeing each other, doing stuff together…why is this? Well, because science says so.

A bold claim, yes, but Guinness have teamed up with Professor [4]Robin Dunbar of Oxford University who’s research in this area has proven that men need to meet up physically and frequently to maintain their friendships.

Not only will this lead to stronger friendships but it will lead to a better, richer life. Again, this is science saying this.

So, to explain more and to help Robin put his science to the test Guinness enlisted the help of social commentator [5]Danny Wallace and the effervescent Jonathan Ross.
Isn't it great that academics have the chance to make an impact through an integrated marketing campaign? If only C Wright Mills were still alive so he could team up with Harley-Davidson! What well loved brand will you be seeking research sponsorship from?

Economists are horrible people (2013-11-06 08:00)

I don’t think this is a particularly meaningful statement. But it’s certainly an attention grabbing one. I encountered it earlier when [1]Salon picked up on a post by Adam Grant on Psychology Today:

Why does the invisible hand want to slap you across the face?

Because it belongs to a douchebag.

That’s the conclusion, anyway, of a provocative blog post in Psychology Today by Wharton professor Adam Grant [4]making the rounds across planet internet.
But before all you econ majors get your demand curves in a twist, hear what the good professor has to say.

Citing research by Cornell professor Robert Frank, Grant makes the compelling case that economists are neither generous, nor cooperative. And that’s because they’ve swallowed one of Adam Smith’s main tenets: people act out of rational self-interest.

Emphasis here on the self.

In short: economists don’t feel bad about acting in their self-interest because — well — the economic theories tell them that they should be selfish.

This is the same Adam Grant who’s achieved an impressive degree of visibility at a relatively young age, not least of all because of the snappily counter-intuitive thesis propounded in [6]his last book that ‘giving’ is a route to career success. As befitting the youngest tenured professor at the Wharton Business School*, his claim about economists is one grounded in empirical research:

Robert Frank, an economist at Cornell, believes that his profession is squashing cooperation and generosity. And he believes he has the evidence to prove it. Consider these data points:

**Less charitable giving:** In the US, economics professors gave less money to charity than professors in other fields—including history, philosophy, education, psychology, sociology, anthropology, literature, physics, chemistry, and biology. More than twice as many economics professors gave zero dollars to charity than professors from the other fields.

**More deception for personal gain:** Economics students in Germany were more likely than students from other majors to recommend an overpriced plumber when they were paid to do it.

**Greater acceptance of greed:** Economics majors and students who had taken at least three economics courses were more likely than their peers to rate greed as “generally good,” “correct,” and “moral.”

**Less concern for fairness:** Students were given $10 and had to make a proposal about how to divide the money with a peer. If the peer accepted, they had a deal, but if the peer declined, both sides got nothing. On average, economics students proposed to keep 13% more money for themselves than students from other majors.

In another experiment, students received money, and could either keep it or donate it to the common pool, where it would be multiplied and divided equally between all participants. On average, students contributed 49% of their money, but economics students contributed only 20%. When asked what a “fair” contribution was, the non-economists were clear: 100% of them said “half or more” (a full 25% said “all”). The economists struggled with this question. Over a third of them refused to answer it
or gave unintelligible responses. The researchers wrote that the “meaning of ‘fairness’... was somewhat alien for this group.

This raises the obvious question of causation: does economics make people horrible or are horrible people drawn to economics? Obviously, it’s likely to be a little of both. It seems glaringly self-evident to me that self-selection is at work in shaping the characteristics of people within different disciplines (not least of all because I have a few hundred surveys from my PhD that demonstrate precisely this). There is a sense in which it is meaningful to talk about ‘physics people’ and ‘english literature people’, though these are of course fuzzy folk typologies which barely meet the status of being an empirical generalisation. Where I think they become more plausible though, is in making sense of the mentalities likely to be found amongst professionalised members of disciplines i.e. though who keep on self-selecting all the way through to grad school and beyond. So could we assume on this basis that the processes identified amongst economics students are likely to apply with a greater intensity amongst professional economists? Here’s what Grant suggests with regard to the former:

To figure out whether economics education can shift people in the selfish direction, we need to track beliefs and behaviors over time—or randomly assign them to economics exposure. Here’s what the evidence shows:

1. **Altruistic Values Drop Among Economics Majors**

At the very beginning of their freshman year, Israeli college students who planned to study economics [18] rated helpfulness, honesty, loyalty, and responsibility as just as important as students who were studying communications, political science, and sociology. But third-year economics students rated these values as significantly less important than first-year economics students.

2. **Economics Students Stay Selfish, Even Though Their Peers Become More Cooperative**

When faced with [19] choices between cooperating and defecting, overall, 60 % of economics majors defected, compared with only 39 % of non-economics majors. For non-economists, 54 % of freshmen and sophomores defected, while only 40 % of juniors and seniors did. The economists, on the other hand, did not decrease in defection significantly over time. Roughly 70 % defected across the board. Non-economists became less selfish as they matured; economists didn’t.

3. **After Taking Economics, Students Become More Selfish and Expect Worse of Others**

Frank and his colleagues [20] studied college students in astronomy, economic game theory, and economic development classes. Self-interest was a fundamental assumption in the game theory class, but had little role in the economic development class. In all three classes, students answered questions about benefiting from a billing error where they received ten computers but only paid for nine and finding a lost envelope with $100. They reported how likely they would be to report the billing error and return the envelope, and predicted the odds that other people would do the same.

When the students answered these questions in September at the start of the semester, the esti-
mates were similar across the three classes. When they answered the questions again in December at the end of the semester, Frank’s team tracked how many students decreased their estimates. After taking the game theory course, students came to expect more selfish behavior from others, and they became less willing to report the error and return the envelope themselves.

“The pernicious effects of the self-interest theory have been most disturbing,” Frank writes in [21]Passions Within Reason. “By encouraging us to expect the worst in others it brings out the worst in us: dreading the role of the chump, we are often loath to heed our nobler instincts.”

4. Just Thinking about Economics Can Make Us Less Caring

Exposure to economic words might be enough to inhibit compassion and concern for others, even among experienced executives. In [22]one experiment, Andy Molinsky, Joshua Margolis, and I recruited presidents, CEOs, partners, VPs, directors, and managers who supervised an average of 140 employees. We randomly assigned them to unscramble 30 sentences, with either neutral phrases like [green tree was a] or economic words like [continues economy growing our].

Then, the executives wrote letters conveying bad news to an employee who was transferred to an undesirable city and disciplining a highly competent employee for being late to meetings because she lacked a car. Independent coders rated their letters for compassion.

Executives who unscrambled sentences with economic words expressed significantly less compassion. There were two factors at play: [23]empathy and unprofessionalism. After thinking about economics, executives felt less empathy—and even when they did empathize, they worried that expressing concern and offering help would be inappropriate.

I recall encountering more work exploring this issue in the past and I really wish I’d saved the references. It also leads me to wonder if economists have a unusual proclivity for empirically studying themselves and, if so, what this says about the discipline in general and these findings in particular? As naval gazing as sociologists tend to be, they also seem to spend little time studying themselves, at least in a systematic way.

An important analysis on LSE Politics Blog looks at what the British Social Attitudes survey says about public attitudes towards higher education:

In an era of rising tuition fees, deepening student debt and the global commodification of learning, any remaining notion of Higher Education as a ‘public good’ may seem improbable. However, evidence from the British Social Attitudes survey shows that the broader, society-wide benefits of Higher Education are still prized, albeit not always by those you might expect.
Together with colleagues from Oxford and London University, we examined surveys from the last thirty years to chart how public attitudes towards participation have reflected changes in policy. Despite questions being framed in ways that increasingly constructed university as a public expense, we identified a persistent belief in the core values of Higher Education. For example, 43% of those surveyed in 2010 thought that over half of young people should go on to university, a finding at odds with popular perceptions of a labour market saturated by graduates of ‘Mickey Mouse’ degree programmes.

More surprising, Higher Education was cherished most highly by those from lower social classes. Only 10% of working class respondents thought opportunities should be reduced, compared to 26% among the professional and managerial classes. We also found gender and school type to be key predictors of attitude. Men were more likely than women to say that university isn't worth the time and money, as were those educated privately. But the strongest predictor was whether respondents had themselves participated, with graduates more than twice as likely to favour a reduction as non-graduates. Those who profit most from Higher Education, it would seem, are those most inclined to pull up the ladder behind them.

The Future of Scholarship (2013-11-08 08:00)

The LSE Impact Blog co-hosted a conference about Open Access recently which I’m now wishing I’d gone to. I really liked [1]the talk given by Jonathan Gray, director of policy at the Open Knowledge Foundation, which offered an adept diagnosis of the present crisis in scholarly publishing and its implications for the future of scholarship:

If sheer quantity is a measure of success then things aren’t going too badly. The amount of research being published is growing at an astonishing rate. Recent studies estimate that around [2]50 million journal articles have been published since their first appearance in the mid 17th century (Jinha). This colossus is estimated to be expanding at around 1.5 to 2 million articles per year, which is roughly 3 to 4 % annually. (Scopus lists about 1.6 million in 2012. The UK Publishers Association suggested global output is [3]around 2 million per year, quoting 120,000 articles as around 6 % in evidence to UK parliament. This is up from an [4]estimated 1.3 million in 2006.)

But more people publishing more words does not necessarily mean that our system of scholarly communication is serving us well. Scholarship is not just about publication, but about interaction, interpretation, exchange, deliberation, discourse, debate, and controversy. Plato writes of understanding as being a kind of flash that occurs between two people trying to come to terms with something from different viewpoints, a flash that arises from the friction of discussion and momentarily floods everything with light.

Scholarship is, of course, not just about the production of text – text which has been processed, reviewed, and packaged up in the right way, in accordance with the dictates of style manuals and in keeping with the appropriate theoretical or methodological genre. Scholarship is about the way in which constellations of people and objects produce meaning, understanding and insight, through interaction, acts of interpretation. The value of a journal article is not the stated impact factor of the journal, any more than the value of a scholar is the aggregate of his or her publishing record. The value of a piece of scholarly text is in the interaction it has with its readers, in the sparks it generates, the friction and light that it produces – whether tomorrow, or in a hundred years time.

Unfortunately our current system of scholarly communication has often developed with other priorities in mind. For a start it echoes our broader cultural and social attitudes towards sharing the fruits of our creative and intellectual labour more generally: our disproportionate focus on protection and compensation, commodification and control. The default is still that our creations cannot be shared without payment or explicit permission. Even though they are unlikely to receive a penny for it, scholars are often inclined to be more guarded than generous about sharing their published work. This social and cultural hostility to sharing in turn reflects the state of the law, which is profoundly imbalanced towards protecting and rewarding rights-holders rather than recognising that copyright is an instrument which should strike a balance between protecting private interests and providing the public with access to the fruits of our collective intellectual labour.

Furthermore, the academic career structures in many disciplines are heavily focused around and driven by publication. Not even on scholarly output, but very specific forms and genres of publication, with a strong focus on certain journals and publishers. Journal articles and monographs have become the de facto currency of scholarship, and certain venues are worth more than others. Other forms of engagement – from collaborative projects to conferences – are often not recognised, or only recognised insofar as they result in publication.

If publishing operations such as journal titles and monograph series are the stars which structure
the orbits of scholarly communication, then we may forget that what gives them their gravitational force is ultimately the scholars and scholarly communities associated with them. Hence we may conflate the trust, reputation and authority that derives from the scrutiny, energy and attention of a particular group of scholars, with the avenue through which this is manifested: namely the title of a particular publication or series. So entangled are the reputations of scholars and publishing operations that sometimes we may find it hard to wrench them apart and to recall that ultimately it is publications which are dependent on scholars, and not the other way around.

The result of all of these things is the lamentable situation we find ourselves in today, whereby a huge amount of the intellectual energy and attention of researchers is funnelled into the creation of products for the publishing industry which are then locked up and sold back to the institutions which employ them: the very same institutions which effectively subsidise the creation, editorial and peer review of said products. In 1999 [5] a scholar and a librarian wrote a report unpacking the implications of this situation, which they called the 'crisis in scholarly publishing', which they described as: "a vicious cycle of increasing prices and decreasing distribution, straining (or breaking) library budgets, and leading to cancellations of journals and cuts in other acquisitions, as well as dangerous erosion in confidence in the integrity of peer review". "Ultimately", they concluded, "the flow of scholarly communication is at stake, eroding the academic mission."

In a recent edition of the LA Review of Books Christopher Newfield, renowned commentator on US higher education, reviewed Andrew McGettigan’s The Great University Gamble. He offers a helpful and lucid summary of the book’s (equally lucid) arguments and it’s extremely interesting to encounter the changes in UK higher education being analysed from the perspective of the US higher education system. However what makes this essay a must read is the conclusion, depressing though it is, where he makes an intensely compelling case as to the broader political significance of the coalition’s higher education ‘reforms’:

What are the practical outcomes for this counterreformation in higher education? A first is a reduction of professional authority, now subordinate to financial management in decisions on what has value in the institution. Treasury, budget, and finance will decide the value of higher education, which is, in effect, to decide what level of development society shall afford. This means a loss of legitimacy for any educator who speaks for the social value of egalitarian intellectual development.

The second effect is that the steady expansion of higher education enrollments will stop. UK enrollments fell just after the Tory changes began — applications from England to UK schools declined 8.6 percent between 2011 and 2012. They have recovered this year, but the government keeps a lid on fundable enrollments and shows no interest in further expansion.

The third effect is decreased equality of conditions for the students who do attend. The large number of newish middling UK universities that McGettigan calls "the mass of mass higher education" will face new financial difficulties. While these institutions struggle to maintain some reasonably small courses or to find part-time graders for lecture courses, the government continues to offer public funding for Oxbridge’s tutorial system. If a slogan for the higher education reformation might have been "tutorials for all," the unspoken slogan of the counterreformation is "tutorials for the few — and standardization for the rest."

This may seem odd to most readers: isn’t this the very moment in world history in which mass standardization is of little value in the economies of the West? Aren’t we supposed to be upgrading everyone’s abilities to compete in a global economy? This is where we arrive at a final layer of Tory...
strategizing, conscious or not. It is strategizing about the future of British capitalism as such. If fewer middling students get their higher learning at a smaller number of middling universities, what is the loss? These non-students will receive lower wages, cost society less money, learn to make fewer demands, and be less trouble to Britain’s leading economic sectors. They are downgrading British society to new lower status in the "global auction," a competition at all skill levels that puts downward pressure on everyone's wages. Rather than receive high wages for their high skills, graduates will, in this late-capitalist framework, receive low wages for them. Tories appear simply to have conceded the point, accepted that the "high-skill/low wage" bargain is the best Britain can do, and decided to limit current taxpayer outlays for a losing university bargain. Of course this means accepting a Britain that is both less qualified and less affluent, that is in fact post-middle class. This defeatism is at the heart of the government’s higher education plan: there is and shall be no collective betterment, and thus no need for collective investment.

I don't want to come to an overly simplistic conclusion that distracts attention from the richness of detail in McGettigan's book or from the complexity of these Tory changes' effects. I am not clairvoyant about where they will lead. But I have spent years watching the public university systems of the United States and the United Kingdom — and of France and Germany — struggle to tread water without a buoyant definition of their value as public goods. The result has been the status quo for some, floundering for most, and a general sinking of public confidence that universities are on the public's side.

The inconvenient truth is that a public-good higher education would mean and will mean increasing enrollments, rising quality, and increasing development for a country’s economy and society. The Tory's instituted private system will mean lower enrollments, rationed quality, and reduced overall development. Unless the university sector can define its mission as "a quality commitment to the population defined as whoever can benefit," unless it can make clear the connection between its public good status and democratic economic hope, Tory-like counterreformations will prevail throughout the West. McGettigan’s book shows that this outcome would be contrived, imposed, artificial, and devastating.

As well as reactivating the past through our use of language, a more mundane danger that most of us are trying to avoid is what Roland Barthes, a grand master of semiotics, called ‘the disease of thinking in essences’. Essentialism traps a person/group into a cage of unchanging characterisations from which they cannot escape – if you like opera you are not really black or Indian Muslim women can’t have enjoyable, playful sex lives. Racism and other isms work by slotting us into preconceptions where we must stay put, pinned down and unable to move like one of those poor lifeless insects suspended in amber. The paradox is that while we are immobilised, racisms are constantly morphing.

Race used to be thought of as connoting immutable biological difference, but in what has been called ‘neo’, ‘cultural’ or ‘second degree’ racisms, identities such as those related to immigration or religion, are the fodder of contemporary race thinking. In these cases it is a fundamental incomensurability of lifestyles that substitutes for, or perhaps augments, notions of biological difference. This is ‘race without race’ as the writers Etienne Balibar and Immanuel Wallerstein have put it. Like an inventive but fickle Casting Director, racism is always open to new lead characters and plotlines. It could be religion today, who knows what will be centre stage next? But whatever is mobilised in race thinking, be it biology, culture or immigration status, what we lose sight of is our common humanity. One of the most powerful descriptions of racism comes from the British novelist Doris Lessing. For Lessing, racism is ‘atrophy of the imagination’.

So how do we negotiate the risks of essentialism and this withering away of the imagination? I used to get het up about this in my writing and teaching. I have tried various strategies in the past such as herding terms into scare quotation marks when I write or using language that is deliberating jarring such as ‘minoritised’ – to problematize the word ‘minority’ and to show it as an active racialisation (I didn’t want the term to roll off the tongue without thought in the way that the facile ‘BME’ does).

The excruciating bind is that without race terms and categories it is difficult, if not impossible, to challenge racism or to name and share experiences. I still remember the knot of anxiety and confusion in my stomach as a child when I heard or witnessed banal racism in the playground or on TV and I didn’t have the words to decode and to name what was happening. Regardless of the political and academic debates about language, whether we are talking to each other or writing, racial signifiers continue to have currency and traction. And good people do amazing things with bad language. A couple of weeks ago I listened to doctors and nurses talking about an initiative to increase access to hospice care for ‘BAME’ groups. I may have been wincing inwardly throughout, but it was a wonderful project, skilling local people and demystifying illness, disease and death. It will make more of a meaningful difference to lives than I ever will.

Over the course of this year Sheryl Sandberg, the 44 year old Chief Operating Officer of Facebook, has enjoyed ever greater media attention since launching her book *Lean In: Women, Work and the Will to Lead*. It has sold over a million copies, dominating best seller lists and leading many commentators in the mainstream media to present her as the most influential feminist voice of her era. Though her ‘co-writer’ has received much less attention. Unsurprisingly, she has done a TED talk on the themes of the book:

[IFRAME: //www.youtube.com/embed/18uDutylDa4]

It would be inaccurate to describe Sandberg’s rise as anything other than meteoric. She’s reported to be worth almost half a billion dollars. She’s a corporate high flyer, best-selling author and is widely presumed to have future political ambitions. Yet she’s also been the subject of much criticism. In a thoughtful yet polemic essay discussing Sandberg, bell hooks distances herself from some of the more vitriolic attacks on the Facebook COO, while nonetheless sustaining a powerful critique:

Certainly, her vision of individual women leaning in at the corporate table does not include any clear statements of which group of women she is speaking to and about, and the "lean in" woman is never given a racial identity. If Sandberg had acknowledged that she was primarily addressing privileged white women like herself (a small group working at the top of the corporate hierarchy), then she could not have portrayed herself as sharing a message, indeed a life lesson, for all women. Her basic insistence that gender equality should be important to all women and men is an insight that all folks involved in feminist movement agree is a central agenda. And yes, who can dispute the facts Sandberg offers as evidence: despite the many gains in female freedom, implicit gender bias remains the norm throughout
our society. Patriarchy supports and affirms that bias. But Sandberg offers readers no understanding of what men must do to unlearn sexist thinking. At no point in *Lean In* does she let readers know what would motivate patriarchal white males in a corporate environment to change their belief system or the structures that support gender inequality [...]

Unfortunately her voice is powerful, yet Sandberg is for the most part not voicing any new ideas. She is simply taking old ideas and giving them a new twist. When the book *Lean In* began its meteoric rise, which continues to bring fame and notoriety to Sandberg, many prominent feminists and/or progressive women denounced the work, vehemently castigating Sandberg. However, there was just one problematic issue at the core of the anti-Sandberg movement; very few folks attacking the work had actually read the book. Some of them had heard sound bites on television or had listened to her Ted Talk presentation. Still others had seen her interviewed. Many of these older female feminist advocates blatantly denounced the work and boldly announced their refusal to read the book.

As a feminist cultural critic, I found the eagerness with which Sandberg was viciously attacked disheartening. These critiques seem to emerge from misplaced rage not based solely on contempt for her ideas, but a rage bordering on envy. The powerful white male-dominated mass media was giving her and those ideas so much attention. There was no in-depth discussion of why this was the case. In the book Sandberg reminds readers that, "men still run the world." However, she does not discuss white male supremacy. Or the extent to which globalization has changed the makeup of corporate elites. In Mark Mizruchi’s book *The Fracturing of the American Corporate Elite*, he describes a corporate world that is made up of a "more diverse crowd," one that is no longer white and male "blue chip dudes." He highlights several examples: "The CEO of Coca-Cola is Muhtar Kent, who was born in the United States but raised in Turkey; PepsiCo is run by Indra Nooyi, an Indian woman who came to America in her twenties. Burger King’s CEO is Brazilian, Chryslers’s CEO is Italian, and Morgan Stanley’s CEO is Australian. Forget about influencing policy; many of today’s leading US CEO’s can’t even vote here." Perhaps, even in the corporate world, imperialist white supremacist capitalist patriarchy is ready to accept as many white women as necessary to ensure white dominance. Race is certainly an invisible category in Sandberg’s corporate fantasy world.

She makes light of her ambivalence towards feminism. Even though Sandberg can humorously poke fun at herself and her relationship to feminism, she tells readers that her book "is not a feminist manifesto." Adding as though she is in a friendly conversation with herself, "okay, it is sort of a feminist manifesto." This is just one of the “funny” folksy moments in the book, which represent her plain and ordinary approach – she is just one of the girls. Maybe doing the book and talking about it with co-writer Nell Scovell provides the basis for the conversational tone. Good humor aside, cute quips and all, it is when she is taking about feminism that many readers would have liked her to go deeper. How about just explaining what she means by “feminist manifesto,” since the word implies “a full public declaration of intentions, opinions or purposes.” Of course, historically the best feminist manifestos emerged from collective consciousness raising and discussion. They were not the voice of one individual. Instead of creating a space of female solidarity, Sandberg exists as the lone queen amid millions of admires. And no one in her group dares to question how she could be heralded as the "voice of revolutionary feminism."

How feminist, how revolutionary can a powerful rich woman be when she playfully admits that she concedes all money management and bill paying to her husband? As Sandberg confesses, she would rather not think about money matters when she could be planning little Dora parties for her kids. This anecdote, like many others in the book, works to create the personal image of Sandberg. It is this "just plain folks" image that has been instrumental in her success, for it shows her as vulnerable.

This is not her only strategy. When giving filmed lectures, she wears clothes with sexy deep V-
necks and stiletto heels and this image creates the aura of vulnerable femininity. It reminds one of the popular television advertisement from years ago wherein a sexy white woman comes home and dances around singing: "I can bring home the bacon, fry it up in the pan and never let you forget you're a man...cause I'm a w-o-m-a-n!" Sandberg's constructed image is not your usual sexist misogynist media portrayal of a feminist. She is never depicted as a man-hating ball-busting feminist nag.

Instead, she comes across both in her book and when performing on stages as a lovable younger sister who just wants to play on the big brother's team. It would be more in keeping with this image to call her brand of women's liberation faux feminism. A billionaire, one of the richest women in the world, Sandberg deflects attention from this reality. To personify it might raise critical questions. It might even have created the conditions for other women to feel threatened by her success. She solves that little problem by never speaking of money in Lean In; she uses the word once.

This thoughtful (though depressing) post on the[1] LSE Impact Blog dissects the politics of the precarious future faced by grad students in the United Kingdom. How does the future look elsewhere? Better? Worse? The Idle Ethnographer and I have a chapter coming out in the [2]Para Academics Handbook in which we explore some of these issues through the lens of our experience running this website:

A ‘job’ posting circulated on Twitter and Facebook in July 2013, provoking a mix of shock, anger, and hopelessness among [3]academics, particularly young aspiring academics. The posting was for a ‘non-stipendiary’ junior research fellowship in philosophy at Essex. The position has [4]since been withdrawn, although the statement issued by the university did little to assuage initial concerns. The university expressed alarm that, in the current funding climate, the intentions for the scheme were “at risk of being misunderstood and misrepresented.” Although the position is not paid, the statement continues, fellows may take on other work in addition, apply for funding, or take other measures to “manage a period without paid employment”. It’s difficult to identify at what point the misunderstanding occurred: the position was indeed an unpaid year-long posting for a post-doctoral researcher.

More recently, the Theology and Religion department at Durham [5]came under fire for soliciting
postgraduate volunteers to do unpaid teaching on its modules; rather than being paid, teachers on
the course would benefit in terms of the "valuable experience" of this "career development oppor-
tunity." It seems that the culture of unpaid internships, already so pervasive across all sectors, has
now extended into doctoral and post-doctoral life. How can it be that in the higher education sector
work is now severed from the guarantee of pay? Paid work would be great, but it's no longer guaranteed.

By no means is this limited to the few 'non-stipendiary' positions that have been posted recently.
This trend is evident in the proliferation of 'adjunct' positions, the disappearance of permanent jobs
and the tenure track, and the increasing use of underpaid PhD students to provide cheaper teaching
about the increasing precariousness of academic employment is that it overturns my previously held
assumption that academics would be resistant to such practices, eager as we are to critique neoliberal
capitalist exploitation. Why, then, the seemingly complete disconnect between theory and practice
here?

Enacting Methods: working with creative research methods (2013-11-12 18:33)

Enacting Methods: working with creative research methods

3 December, 10:30 – 16:30, The Open University, Milton Keynes, Michael Young 1 &2

What is the relationship between acts, performance and social science methods? This CCIG forum (co-developed
and hosted by CCIG Families, Relationships and Communities and Enactments Research Programmes) will explore
this question. It will provide a valuable practical opportunity for researchers interested in both using creative research to engage participants and also in developing methods which can dynamically work with people’s own, often political, actions. All Welcome!

Programme:

10.30-13.15: First Session

Introductions: Janet Fink, Jacqui Gabb and Kesi Mahendran (CCIG)

Brett Lashua (Leeds Metropolitan University): *Sound practice? Making music in creative research/as creative research with young people*

E-J Milne (University of Edinburgh): *Using creative methods to research identities, transitions and (non)belonging with young people*

Les Back (Goldsmiths, University of London): ‘*Go Home’ Texting, E Bordering and the New Politics Research*

13:15-14:00: Lunch & Showcasing of speakers’ methods and projects

14:00-16.00: Second Session

Engin Isin (Open University): *Acts Archive and method as politics*

Andrea Calsamiglia (Autonomous University, Barcelona): *Forum Theatre as a research methodology. Opportunities and challenges*

Elizabeth Sharp (Durham University/Texas Tech): *Methodologies of discomfort: Troubling data in a Dance/Social Science collaboration*

16.00-16.30: Questions and reflections

Further details and registrations on [1]CCIG website.

1. [http://ccig.newsweaver.co.uk/dcarv55hwlo2680f1niig?email=true&a=6&p=42372425&t=20101045](http://ccig.newsweaver.co.uk/dcarv55hwlo2680f1niig?email=true&a=6&p=42372425&t=20101045)

Sociology and Jazz (part 3) (2013-11-13 08:00)

I read the post by [1]Graham Scambler and the reply by [2]Sam Watts with interest. When I did my sociology A Level at college I was studying piano with a jazz teacher at the same time. All a long time ago now, but these posts stirred 2196
up some lost connections. I think that Scambler’s description of the place that jazz holds in the dominant view of cultural history resonates, and I can see where those perceptions come from. But I see Watts is quite right to point out the extent that jazz musicianship is colourblind within itself.

Watts makes the point that many of the jazz standards are by white composers, and I'd like to riff on that theme for a moment because there is an interesting story to tell there that I think draws on both posts.

One of the first steps that many take into jazz improvisation is by experimenting with a well known tune, such as "oh when the saints come marching in", or "sweet georgia brown". Imagine just a singer, unaccompanied: there is a creativity in the way that the familiar tune can be performed, played with, stretched, sung straight or with a turn into the blues. Now imagine them singing alongside a piano. The accompanist could play it straight or could also bring creativity. Then imagine them with a double bass, a sax, a clarinet, each finely tuned into each other’s take on the core tune. It is this collective creativity that is so characteristic of jazz improvisations.

I think there is something very poignant in the way the jazz standards have been reinterpreted, over and over, each time unique. Each performance is an assertion of entitlement: I can play this tune, I can play it in my own way, I can do something new with this. I think it is powerful to look back at the 20th century and see the great black american musicians claiming that right. So I think there is something politically progressive about jazz: it invites us to take ownership of a song and to make it our own. Punk before punk. It correlates with the progress of black america, it’s like sitting on the front of the bus. I have every right to play this.

It's even more interesting given the collective creativity: this is a group of people, black/white/yellow/brown, reinterpreting the score, each time. Just the fact that humans are able to do this is testament to our sociality as well as our technical musicality. We have every right to play this, and we trust each other enough to be creative together.

I suspect that the joy of listening and watching jazz improv is easily surpassed by the joy of playing. This probably isn't unique to jazz: the music we in the west now call "folk" was for most of human history more about playing than listening. The professionalisation of music over the last 200 years or so has alienated some of us from one of the real joys of music, which is participating. Lets compare a jazz improvisation to an classical orchestra. Yes, each performance is technically unique, and under the conductor, the interpretation of the score might be exciting. But it’s rehearsed. And most importantly to my point, audiences at orchestral classical participate in their head, perhaps they might tap their foot, or rock, or weep, or even clap along at the proms, but they are audiences, not players. Jazz improvisations, on the other hand, highlight the fluid collective creativity, watching it you see the eye contact, you see them subtly reading each other, you are acutely aware of them as individual players. But for the audience, the faces are too far away to see them as individuals. I’m sure there are books written about the orchestra as a symbol of industrial production. Perhaps chamber ensembles, who predate orchestras, have a little more of the individualism, and obviously contemporary classical, which borrows some of the characteristics of jazz, sometimes including improvisation. And, composers like Dvorak, Copeland and Gershwin fused jazz into classical and the same way people like Vaughn Williams did with folk into classical. I’m not saying jazz is isolated, it is clearly intertwined with other musical tradition.

Lastly, some jazz musicians are deliberately political. Nina Simone comes to mind, and her tear-inducing "the King is Dead" about the death of Martin Luther King, and her amazing renditions of "I wish I knew how it feels to be free".

Even if the individual musicians are not consciously political, their ability to do what they do is illustrative of a sort of freedom within a culture. My trips around Eastern Europe in 90s/00s suggested many ex-Soviet states have strong jazz traditions aligned to its political counter-cultural movements. The best jazz improvisation I ever saw was in a run-down underground club in Berlin in c2002.
So, Graham Scambler hypothesises: AGENCY IS STRUCTURED, AND JAZZ PERFORMANCE TRACKS THE INDIVIDUAL 'SOUL' AS IT EMERGES, EVEN OCCASIONALLY ESCAPES, FROM ITS SOCIAL HINTERLAND.
I would recast this as: Agency is enacted within a social structure, with each agent negotiating the freedoms and responsibilities of collective creativity.

Scambler: JAZZ IS A POLITICAL STATEMENT AGAINST RACISM.
Thomas: Jazz is an assertion of entitlement to be part of a culture.

Scambler: MUSIC COMMUNICATES, BUT MOSTLY VIA CONVENTION AND IN CONTEXT.
Thomas: Jazz improvisation is collective creativity impossible without an agreed structure

Scambler: DRUGS DISINHIBIT.
Thomas: no comment. probably yes, but I'm not sure disinhibition is required to be a jazz musician.

Scambler: THE CAPACITY OF JAZZ TO MOTIVATE ‘COLLECTIVE ACTION’ IS DEPENDANT ON STRUCTURE, STRUCTURED CULTURE AND AGENCY AND THE MOMENT.
Thomas: The collective creativity within jazz improvisation is only possible through collective recognition of the expected structure. A shared awareness of expected structures / conventions is a pre-condition for creativity. It is also a pre-condition for political and social change and may therefore correlate within social movements

Amber Thomas is a philosophy & literature graduate with an A level in sociology, and a rusty jazz pianist. Her day job is heading up the Academic Technology Team at the University of Warwick.

That’s the rather provocative issue addressed in [1]this Guardian article which explores the present malaise of liberal democracy in terms of the historical persistence of scepticism about its long term viability:

It has been a bad few months for western democracy. Over the summer we discovered that while democratic citizens and their elected politicians were going about their everyday business, the secret services were routinely eavesdropping on everything they did. It was bad enough to suppose that the politicians were conniving in this. More disturbing was the thought that even the politicians were being kept in the dark about what was going on. Then, in September, we had the spectacle of western leaders trying to take a lead on Syria, only to be stymied by their legislatures, which wouldn’t let them do anything (the British parliament didn’t express a decisive view, not even against the use of force; it simply rejected all the options put to it, like a sulky child). Principled positions on both sides of the argument got lost in the fog of partisan politicking. As Obama, Cameron and Hollande floundered around looking for a workable policy on Assad’s chemical arsenal, Putin stepped in at the last moment to save the day. It was a humiliation he compounded with [2]a crowing article in the New York Times that highlighted the advantages of mature statesmanship over democratic skittishness. Then things got worse. For 17 days in October the US
government ceased to function altogether, while bitter infighting in Washington took the country to the brink of a disastrous default. The sight of American politicians playing their absurd game of chicken with the global economy left the rest of the world with conflicted emotions, ranging from despair to barely concealed glee. Putin smirked. The Chinese tut-tutted. Bureaucrats in Brussels gave a world-weary sigh. Politicians who do not have to worry about getting re-elected or who face only docile and compliant parliaments found themselves looking on with a mixture of pity and contempt. Imagine trying to do serious politics under the relentless pressure of eternal democratic squabbling, with barely enough time to breathe, let alone to think straight. Is it any way to run a government?

This pattern has repeated itself throughout the following century. In the early 1930s, at the height of the great depression, dictator envy was rife. It was widely assumed that western democracy would only survive if it took a leaf out of the dictators’ book. Stalin, Mussolini and Hitler looked like the men of action who could take the tough decisions needed to stave off disaster (Mussolini was particularly admired in this period for his hackneyed ability to get the trains to run on time). Elected politicians looked like miserable pygmies by comparison; too frightened of their electorates to take charge and too hamstrung by their parliaments to change course. But Franklin Roosevelt showed that this analysis was wrong. He was a notoriously changeable politician, never quite sure what he was doing or what he believed in but willing to try most things on the off chance they might work. Throughout his long presidency there were regular predictions of impending disaster: either the country would be ruined or Roosevelt would turn out to be a dictator after all. Neither came to pass: under Roosevelt’s chaotic but resourceful leadership the country muddled through. It was the dictatorships that fell apart in the end. Barack Obama is no FDR, but the criticism he faces takes the same form. Some accuse him of being a dictator; others of being an inveterate ditherer. The truth is that he is neither. He is just a democratic politician doing his best to improvise a way out. During the cold war there was barely a moment when commentators in the west didn’t worry that the fight was being lost because the Russians were so much more ruthless than we were. Elected politicians were too busy fretting about getting re-elected to devise a coherent strategy for ultimate victory. They kept missing their chance. This fear persisted through the 1980s, even as the cold war was finally being won. In the Reagan White House, full of gung-ho cold warriors, the book everyone read (according to speechwriter Peggy Noonan) was How Democracies Perish, by a gloomy, pretentious French intellectual called Jean-François Revel. Like everyone else, Revel had spotted that the Soviet system was in deep trouble: communism didn’t work. Still he argued that it would drag western democracy down into the grave with it because the democracies were too indecisive for the brutal politics of the endgame. When the Soviet Union fell apart, the west would not know how to take advantage. The endless distractions of democratic politics would get in the way. So the hard-headed tyrants in the Kremlin, with nothing to lose, would run rings round us. Once it came to the crunch, democracy would fail to rise to the occasion.
In a nutshell Burns’ entire argument revolves around the equivalency of gold and money, and furthermore points out that if the Fed does not control this core relationship, it would “easily frustrate our efforts to control world liquidity” but also “dangerously prejudge the shape of the future monetary system.” Furthermore, the memo goes on to highlight the extensive level of gold price manipulation by central banks even after the gold standard has been formally abolished. Some thoughts on how to use NVivo effectively (2013-11-14 08:00)

Kelle (1997) sounds a useful note of caution in an insightful discussion of the history of CAQDAS software:
The newly developed software programs for computer-aided textual analysis became tools for data storage and retrieval rather than tools for 'data analysis'. Nevertheless, terms used quite frequently in the ongoing debate like 'computer-aided qualitative data analysis' or 'software program for theory building' carry implicit connotations of computer programs as tools for the analysis of textual data which could be compared to software packages that perform statistical analyses.

While the boundary between data retrieval and data analysis has blurred somewhat as subsequent generations of CAQDAS software have become ever more sophisticated, it is helpful to recognise the important distinction between organising and analysing data at the outset. As with most software packages, many researchers only use a small selection of the tools offered within NVivo and many use it solely for the former function of organising the data which accumulates within any qualitative research project. On this level the software can be extremely useful: it is simply quicker, easier and cheaper to organise and manage large collections of qualitative sources using specialist software than is the case with any analogue alternative (Welsh 2002).

In the same way that a word-processing package does not dictate whether you write a novel or a sermon, QSR software does not determine nor constitute a method despite some literature that links the software to grounded theory. (Crowley, Harré and Tagg 2002: 195)

This is an important point though one which does risk overstatement. Using NVivo can predispose researchers towards certain techniques or approaches to analysis but, if and when this happens, it is a consequence of how the software is being used rather the software itself. As noted earlier, many researchers only use a small fraction of the functionality offered by the software. There is nothing ‘wrong’ with doing this. Indeed it would be difficult to understand what such a statement would mean, though a vague sense that one is using the tool in the ‘wrong’ way can be a common experience involved in working with complex software packages, particularly when getting started. It is helpful to confront this at the outset and proceed from an understanding of what the software can do and what use you want to make of these functions. Reflecting in the way helps us avoid what is a surprisingly common misconception about the role such software plays in research practice:

The misconception that the software does something (a notion of some automated process of analysis) is not uncommon. The question of who is in charge, the software or the researcher, is tellingly reflected in enquiries such as ‘Will it let me. . . ?’ It is sometimes forgotten by those new to qualitative software that any lack in its ability to do something in particular certainly does not preclude them from including such strategies in their research. It is always possible to leave the software to one side and use other
means as well—to get out of the car and perhaps walk, cycle or a take a boat for parts of the journey, as it were. It must be emphasized that, although the limitations it imposes continue to decrease, the researcher is not a hostage to qualitative software (Crowley, Harré and Tagg 2002: 195)

One of the most important things to remember about NVivo is that it is a collection of tools. While it might be difficult to make an informed decision about which of these to apply without some prior knowledge of the software, it is nonetheless a choice to be made by yourself and/or your research team. In my experience, it often doesn't occur to people that NVivo can be used in some entirely mundane ways tied to the practical demands of the project you're working on e.g. using a node or collection of nodes to collate material intended for a particular journal article you will be working on.

*So much to read, so little time* (2013-11-15 08:00)
If you read one book a week, starting at the age of 5, and live to be 80, you will have read a grand total of 3,900 books, a little over one-tenth of 1 percent of the books currently in print.

#Keeponreading

I came across this post on the [1]CISG tumblr recently and it stuck in my head. I actually found it quite a distressing thought in a subdued sort of way. There's an inevitable upper limit on the number of books you can read in a lifetime and, once you begin to think it through, that upper limit constitutes a tiny fraction of the books in print. But I'm also fairly sure it's a tiny fraction of the books I would like to read. When I think about this it makes me want to be incredibly selective about the books I choose to read. But that kind of selectivity would feel like it was contrary to the enthusiasm for reading which generates the problem in the first place.

Social Science and the Politics of Public Engagement (2013-11-16 08:00)

Social Science and the Politics of Public Engagement
Tuesday, January 28, 2014 from 6:00 PM to 8:00 PM
Open University Camden Centre, 1 – 11 Hawley Crescent, Camden Town, London

In recent years new technology has begun to facilitate ever more novel forms of research practice across the social sciences. New opportunities for collaboration exist in an information environment that is being radically and rapidly restructured by digital communications. An increasingly digitalised culture increasingly produces 'by-product data' as an unintended secretion of everyday social practices while also dramatically reshaping the circulation of academic research within the wider world. Universities themselves are undergoing profound changes, some by deliberate design and others as unintended consequences of broader social changes originating elsewhere. Given such changes, it seems untenable to conceive of or enact ‘public engagement’ in a way which fails to account of the shifting grounds upon which those seeking to support particular versions of the public find themselves standing. The constitution of contemporary publics cannot be taken for granted nor can the stability of the context within which ‘engagers’ seek to act.

This event seeks to explore this unstable landscape through exploring a number of innovative projects which pursued novel forms of research practice while also being orientated towards those beyond the academy. Through a discussion of these projects, their methodological innovations and the publics that formed around them, the seminar will seek to shed light on emerging questions about the future(s) of social science, its contested politics and of its relations to emerging ideas and practices of public engagement. The event will address, amongst others, the following questions:

- In a post REF 2014 environment, what could and should a social science informed public engagement agenda be?
- How, specifically, might the social sciences intervene in and help shape the PE agenda in the next couple of years?
- How could social scientists collaborate, both with each other and with those innovating forms of PE in other domains, to re-make what PE means?
- How can a critique of institutionalized approaches to PE and impact be articulated with commitments to public
activism, social justice, relevance and responsibility?

**Speakers:**

Keri Facer, Professor of Educational & Social Futures and AHRC Leadership Fellow for the Connected Communities Programme, based at the Graduate School of Education, University of Bristol.

Tim Newburn, Professor of Criminology and Social Policy at the London School of Economics.

Shamser Sinha, Senior Lecturer in Sociology and Youth Studies at University Campus Suffolk.

More speakers TBC

**Organisers:**

Nick Mahony is Research Fellow and Co-Director Publics Research Programme, Centre for Citizenship, Identities and Governance, Faculty of Social Sciences, The Open University. Nick leads the Creating Publics project which aims to ‘re-conceptualise public engagement with social science research in an age of emergent publics’. He is co-investigator on the RCUK-funded ‘Catalyst’ project and the ESRC-funded project ‘Making publics across time and space’. With Dr. Hilde Stephansen, he is also currently building a new OpenLearn website called ‘Participation Now’. At the heart of Participation Now is an evolving archive of contemporary participatory public engagement initiatives. The aim of this project is to support practitioners, researchers, students and citizens interested in new – participatory public engagement related – thinking, practice and innovation.

Mark Carrigan is a sociologist and academic technologist based at the University of Warwick. He edits the Sociological Imagination and co-convenes the BSA Digital Sociology and BSA Realism and Social Research groups. He is a research associate at the LSE’s Public Policy Group and was formerly managing editor of the LSE’s British Politics and Policy Blog. His research interests include sociological theory, methodology, biographical methods, longitudinal qualitative research, asexuality, sexual culture and digital sociology.

[...] or coupled “human-natural’ nature” that underpinn them. In recent years, where new technologies and digital media have begun to shape almost all aspects of research practice across both the social and natural [...] 

CfP: Digital Sociology PhD/ECR Workshop (2013-11-17 08:00)

Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from peers and established academics in a supportive environment.

The event will take place between 11am to 4pm on February 19th at Goldsmiths College in South London. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.
If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn’t been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.

Enduring Love? Couple Relationships in the 21st Century

The Enduring Love? project is a major ESRC-funded study (2011-2013) that has been exploring how couples experience, understand and sustain their long-term relationships.

To celebrate the end of the project we are hosting an event to launch the study findings and, with our dynamic array of speakers, to provoke wider discussion on making research count, why relationship research matters and dialogic research practice. The project has been designed, developed and implemented in collaboration with policy makers, relationship support organisations, media commentators and academic colleagues so the event promises to be a highly stimulating and critically engaged forum. There are also canapés and a glass or two of wine to take us into the evening.

We would be delighted if you could join us on:

Tuesday 14th January 2014, 12.30 – 6pm at The British Library, Euston Road, London

Full programme details are included below and are attached in poster format. Please feel free to circulate widely.

To register online please go to:

or contact CCIG Research Secretary Sarah Batt at:

The myriad of diverse groups from various social and cultural backgrounds within a multicultural society such as the U.K means it is essential to find ways to promote an atmosphere of acceptance and understanding to ensure community cohesion. It is commonly accepted that schools address this through the compulsory curriculum in lessons such as Citizenship and Personal Social Education (PSE); however, recent reports by Ofsted in England and Estyn in Wales note that many schools are lacking when it comes to teaching citizenship; for example, Estyn (2006 p.3) states that schools “are generally more confident about, and focus more on, sustainable development than global citizenship.” One way of addressing this issue is to encourage the sociological imagination of high school pupils by incorporating psychosocial aspects into the school curricula. This can facilitate “the capacity to shift from one perspective to another- from the political to the psychological” (Wright Mills 1959 p.7). The education system should, and often does, attempt to expand individuals’ critical thinking skills, and this can be improved and taken further by increasing pupils’ capacity to empathise in order to address key issues within diverse societies, particularly the need for toleration.

Western societies have changed considerably since C Wright Mills first introduced the concept of the sociological imagination, particularly with regard to communications technology and globalisation. Yet counter to the view that globalisation and the homogenisation of cultures would reduce ethnic tensions, Williams (1999 cited in Mendus p.94) describes how as traditional forms of identity and expression are becoming lost through the system of modernisation, nationalism is an attempt to instil a sense of community. Furthermore, Leighton (2012 p.64-65) warns that “The increasing uniformity, predictability, homogeneity and standardization of everyday life- the mcdonaldization of existence- is creating false differences to fill the vacuum left by real choice.” Such ‘false differences’ can be seen dangerously manifesting themselves in the form of the BNP, and more recently, the English Defence League. As the sociological imagination essentially includes an attempt to walk in the shoes of others, in addition to recognising historical social factors and how we form our attitudes and feelings towards others, it may provide a useful focal point in the attempt to combat extremist views from all angles of the political spectrum.

One way of encouraging empathising with others, or at least creating an understanding of the dangers of the far right and other extremist groups, is to teach about poignant empirical experiments carried out at crucial points in history. By studying this type of research, it should be possible to create an all round awareness of the intricacies of human interaction and attitudes towards race and ethnicity. My recommendation for the curriculum in this area is to focus on basic psychological knowledge intertwined into the field of sociology, thereby placing a greater emphasis on socio-psychological outcomes. One example of the research that may be included is the renowned experiment conducted by Milgram who aimed to find out whether “Germans are different” with reference to the holocaust. The electric shock punishments administered by the participants during the course of the study revealed that no, in fact, Germans are not different, and many people are capable of blindly following those in authority. The experiment goes some way towards explaining the occurrence of genocide and can be related to more recent events such as Bosnia or the situation in Rwanda; whilst on another level, it may encourage a greater sense of personal awareness.

Furthermore, there is a wide range of socio-psychological studies which focus on issues such as in-groups and out-groups, and how membership of a particular group can cause unreasonable attitudes and responses towards others. Also, learning about the effects of labelling in relation to education and crime, and the impact of the media, with an emphasis on the current and past situation of ethnic minorities, should aid pupils in gaining a better understanding of societal developments. The point here is not to carry out a deep critical study of such research, but to take the basic lessons that have been learnt from the research and incorporate them into the compulsory school curriculum- not just for pupils studying specific subjects, but across the board. This may make it possible for students to imagine themselves in certain situations, including evaluating their perceived responses.

Ignatieff (1999 p.83) explains how the individuality of the person within a group that is despised is usually completely overlooked, with only membership of the group taken into consideration. The new forms of social
media provide a vehicle for the promotion of such views, with succinct comments and eye catching images having a major impact. A poignant example of this is the content of the English Defence League’s Facebook page, which also provided an interesting response to a question posed on the page following the horrific murder of soldier Lee Rigby. The question concerned whether one of the EDL’s aims is to encourage its members to attack Muslim women in the street. The reply was that only a minority of its members would do such a thing, to which the reply was “the same as in the Muslim community then”; following which the whole post was promptly removed by the administrators. Clearly then, sweeping generalisations about any group are offensive as well as dangerous, therefore the “essential task in teaching ‘toleration’ is to help people see themselves as individuals, and then to see others as such” (Ignatieff 1999 p.83); this may go some way towards mitigating the negative aspects of social media and the use of sound bites of information.

Tolerance should be a two way process, and pupils from minority groups would of course also be required to learn the curriculum, which is essential because toleration is not purely an issue for the majority culture. As Williams (1999 cited in Mendus p.75) points out, “the people that the liberal is particularly required to tolerate are unlikely to share the liberal’s view of the good of autonomy, which is the basis of his toleration.” Thus, perhaps an important aspect here is that an element of reciprocity may be developed, as feeling respected is likely to generate reciprocal respect, creating a mutually beneficial situation.

Another key factor in implementing a curriculum such as this, which is based on promoting certain values whilst suppressing others, is whether it is morally acceptable to do so- diversity in society suggests it is not only moral but essential.

Here in the U.K, as in most other Western countries, society has been facing continuing change in its demographic make up for centuries, and there is no going back from this. For society to maintain stability and flourish, it is of paramount importance that communities are able to live and work side by side cohesively. The alternative to this is the situation that manifests itself from time to time, particularly in northern mill towns, with people from one side of the cultural divide pitted against those from the other side. Therefore it is entirely reasonable to educate to limit such situations, which are often infectious, and their resultant harm. Moreover, Guttmann (1999 p.14) explains how “A democratic theory of education focuses on what might be called ‘conscious social reproduction’- the ways in which citizens are or should be empowered to influence the education that in turn shapes the political values, attitudes, and modes of behaviour of future citizens.” Developing the sociological imagination allows for this ‘conscious social reproduction’ and can assist in developing critical thinking skills which may be put to use throughout life, whether during further study or while making decisions in the workplace or social settings- not only during compulsory schooling.

Since reading this [1] astonishing book by Neil Gross earlier in the year I have been increasingly aware of the latent influence of pragmatism on my thought. I used to [2] really like Richard Rorty but came to think it was just a phase, explicable in terms of the resources his work gave me to [3] articulate my gnawing dissatisfaction with the philosophy I was studying at the time. However since the Neil Gross book sparked this particularly intensive bout of theoretical naval gazing, it’s become obvious to me that I was slightly too hasty in declaring pragmatism a phase. There’s a significant (Peircean) pragmatist influence in Margaret Archer’s work on reflexivity which has in turn shaped how I do sociology, as well as how I understand what it is I do, more than anything else. There’s also a significant pragmatist impulse within the work of Nicos Mouzelis was has, in the last couple of years, strongly shaped my understanding of the means and ends of sociological theory.

However there’s also the neo-pragmatist sensibility which, in retrospect, was what attracted me to Rorty in the first place. I’m currently in the process of occasionally going back to his work to consider what this sensibility is and the extent to which it’s compatible with the kind of social realism I’m now entirely persuaded by (i.e. ontological realism, epistemic relativism, judgemental rationality, the social as open system, fallibilism, a relational & emergentist ontology). One of the things Mouzelis has helped me to realise is that my interest in these questions is predominately practical, which conversely explains my frustration with the sort of philosophy I used to study. I want to understand how these debates do or do not have practical implications for how people study the social world. I want to understand how theoretical discourse is embedded with conflicting or collaborative networks of practitioners framed by intellectual traditions and how these interactions in turn reproduce or transform those traditions and shape the environment in which future practitioners will do their work.

It’s in thinking about what people actually do with theory that I’ve come back to Rorty’s notion of strong mis-reading, which appropriately enough seems to have been derived from a wilful misreading of Harold Bloom’s concept of the same name. This is an approach to reading which comes quite naturally to me:

The critic asks neither the author nor the text about their intentions but simply beats the text into a shape which will serve his own purpose. He makes the text refer to whatever is relevant to that purpose. He does this by imposing a vocabulary – a “grid,” in Foucault’s terminology – on the text which may have nothing to do with any vocabulary used in the text or by its author, and seeing what happens. The model here is not the curious collector of clever gadgets taking them apart to see what makes them work and carefully ignoring any extrinsic end they may have, but the psychoanalyst blithely interpreting a dream or a joke as a symptom of homicidal mania …. The strong misreader, like Foucault or Bloom, prides himself on the same thing, on being able to get more out of the text than its author or its intended audience could possibly have found there … The strong misreader doesn’t care about the distinction...
between discovery and creation, finding and making. He doesn’t think this is a useful distinction, any more than Nietzsche or James did. He is in it for what he can get out of it, not for the satisfaction of getting something right.

- Richard Rorty, The Rorty Reader, Pg 131

I find this notion much more challenging now than I did when I first encountered it seven years ago as a masters student. I take Rorty’s point to be that a preoccupation with uncovering the truth of the text, finding the key which will allow us to unlock the code concealed within, distracts from the real business of intellectual discourse: *keeping the conversation going*. So while his advocacy of this could be seen as violently deconstructive, it seems much more helpful to me to foreground the constructive notion incipient within it – if we move beyond the register of correct and incorrect interpretation then we begin to have much more fruitful (and interesting) conversations which build on a text and move beyond it.

This is where I see a compatibility between the neo-pragmatist sensibility and social realism. A sociologically self-aware and methodologically sensitive social realism offers us standards of *utility* in relation to potential (mis)readings of texts which Rorty’s aestheticism tends to shut down. So the social realist strong misreader wants theoretical texts to provoke interesting and useful conversations about how the conceptual insights of the text can be *practically* applied to the study of the social world. The point is not to say that theoretical discourse should be subjugated to the demands of methodologists and practitioners, as a ‘standing reserve’ of intellectual resources waiting to be mined, but simply to say that talking about theory doesn’t necessitate that we adopt the conceptual and normative standards endorsed and enforced by the theoreticians.

Though having said all this, I delayed my PhD by a month earlier this summer when I was consumed by the sudden anxiety, prompted by encountering a pathetically facile misreading, that the critique of Giddens in the first chapter of my thesis was predicated on a comparable misconstrual. So I diligently returned to his books in order to reassure myself that I had indeed discovered the *truth of the text*. I’m not sure how to square either this concern or my response to it with what I’ve written above. I can think of other examples, which I’m not going to write about lest this post become far too long. But there does seem to be a theory-practice inconsistency here which intrigues me.

I’m also concerned that ‘strong misreading’ licenses my eclecticism in a negative way and that, on some level, it appeals to me because I’m someone who tends to read widely but shallowly. So making a virtue of productive misinterpretation, ‘getting more from the texts than the authors intended’, in fact only serves to free me from the nagging feeling that I’ve not read deeply enough into an area to justifiably make the claims that I want to make. Given the general direction of travel within intellectual life, in which professional rewards goes to those who can generate novelty by combining existing ideational material in new and attention-grabbing ways, there’s also something potentially subversive about *slow reading*. Having spent the summer blogging my way through Margaret Archer’s recent books I can certainly see the appeal of doing this. But is this necessarily driven by the impulse to find the ‘truth of the text’ or could it simply be a particular sort of intellectual conversation which can only take place when it is grounded on a *concerned* and *attentive* reading? So rather than accurate or inaccurate could we usefully think about *attentiveness* or *inattentiveness*?

This post is an example of sitting down to write one thing and in fact writing another. I intended to write something quick about Rorty’s notion of ‘strong misreading’ and instead ended up writing something much more exploratory, in which I raised a number of questions which had been inchoately rattling around in my head for the last few months. If you accept my understanding of how I use blogging (often as an externalisation of an internal conversation) then this post could be seen as an example of what I’m interested in with the ‘neo-pragmatist sensibility’. I had a particular object (a specific concept articulated by a specific philosopher) which i intended to write about and, through doing so, I found myself writing about many other things as well. This is a peculiarly monological
example of what interests me about ‘productive’ conversations. The intellectual standards we endorse and enforce have implications for kinds of conversations, external or otherwise, which they give rise to.

Even though I reject Rorty’s aestheticism, in which he judges the value of these conversations in entirely aesthetic terms*, I think his sensitivity to the dialogical consequences of intellectual norms is very important. I guess a long term project of mine, albeit one that’s a million miles away from crystallising into any sort of concrete form, would be to try and recover this impulse so as to rearticulate it within a generic framework of social theory working at a level of generality which encompasses everything that shares the belief in the possibility of social knowledge to be produced through social scientific inquiry. Theoretical schism bores the hell out of me (though I think some of the issues at stake are sometimes important in a practical sense) and, as divisive a figure as Rorty is philosophically, it increasingly seems to me that there are elements of his work which could be recovered and reconstituted as a productive resource for social scientific practice.

How could he do otherwise given that he has collapsed the distinction between what is rhetoric and what isn't? This move has always baffled me given that, as far as I can see, it reduces theoretical discourse to the status of crap poetry.

What is Capitalist Realism? (2013-11-19 08:00)

Assuming I haven't completely misunderstood Mark Fisher’s point then I'd argue this is one of the most striking examples of [1]capitalist realism I’ve ever encountered. It was posted as a comment on [2]this Glenn Greenwald article. Note how an assertion of the obviousness of this state of affairs goes hand-in-hand with a dismissal of the ‘rubes’ who are assumed to have uncritically assented to the enormously powerful ideological forces from which the commentator has long been immune. Self-congratulation at being ‘smart enough’ to see through manufactured illusion and contempt for those who failed to do this substitute for moral condemnation of something which is nonetheless regarded as a social problem. The post-ideological stance of ‘seeing through’ the lies in fact engenders objective passivity coupled with a reactionary orientation to those who seek to engage in proactive opposition:

I just don't understand why people hadn't assumed this kind of surveillance was going on already. Has no one seen the Enemy of the State? In all seriousness, I wondered about it after figuring out how communications satellites work and realizing that all of those satellites are launched by the government.

Is it such revelation that a country on a planet as nationalistic as Earth had the opportunity to spy on most of the world and took that opportunity? If you are a student of history you would know that spying on other nations/groups is human reality.

I don't necessarily think its a great idea to have one country doing a lot of this under the guise of "the greater good" because they will end up using it to benefit themselves in any way they feel they can. I just don't think any of the Snowden revelations should have been so inflammatory. How could you not
see the writing on the wall? How could you assume this wasn’t happening?

I just don’t like the Greenwald tone of “I can’t believe this, can you? We don’t live in a perfect world as our politicians had told us!!” He comes across as a rube if he is truly shocked by all of these spying "revelations."

And I defy you to find a country on this planet who doesn’t conduct all of the surveillance that they possibly can. Its an aspect of national defense and economic survival that causes this espionage all over the planet. The US just possess a crazy ability to spy on mostly everyone because of the system of communications the US gov’t help set up for the world.

All I’m saying is, you missed the window to complain about this by about 15-20 years. The groundwork for this type of communications monitoring has been in front of your face since the 80’s & 90s and you weren’t smart enough to see it. There is no going back.

Call for papers: Historical Perspectives on ‘Antisocial Personality Disorder’ (2013-11-19 14:00)

Call for papers: Historical Perspectives on 'Antisocial Personality Disorder'

We are organising a conference with the title ‘Historical Perspectives on ‘Antisocial Personality Disorder”. This will be held in London on Monday 12th May 2014, at Queen Mary, University of London.

We are interested in work that takes historical perspectives on the various diagnostic categories typified by those of ‘moral insanity’, ‘psychopathy’, and ‘personality disorder’. We are particularly interested in work that helps to put 19th-century developments of ‘psychiatric’ thought in this area into social and cultural contexts.

The keynote speaker will be Professor Nicole Rafter, School of Criminology and Criminal Justice, Northeastern University.

The conference will be funded as part of an ESRC seminar series called ‘Cross Disciplinary Perspectives on ‘Antisocial Personality Disorder” and is being jointly organised with the Centre for the History of the Emotions (QMUL).

We will have some funds available for transport costs for a number of speakers.

If you are interesting in contributing to this event please send a 200-300 word abstract to Dr David W Jones by Friday 29th November:[1]d.jones@uel.ac.uk<mailto:d.jones@uel.ac.uk>.

As the AVEN website describes, "in a world where sexuality is promoted as the norm, many asexuals grow up thinking that they're somehow sick, broken or deficient". This raises the question of the nature of this norm, as well as how it is formed and propagated. Why would individuals who do not experience sexual attraction be so pervasively prone to considering that this might be a function of some underlying pathology? Seemingly the association between sexual desire and 'normal' physical and psychological functioning is sufficiently pervasive that it goes largely unrecognized and unquestioned. Kim suggests that reaction to asexuality can be understood in terms of the "pathological framework for asexuality" which results from a "larger trend in which sexuality is tied up with the image of 'normal bodies'". On her account stigmatizing reactions to asexuality should not be assumed to be particularistic prejudicial responses to a newly emerging minority identity but rather stem from culturally pervasive and near hegemonic ideas about health and the body. She suggests that "the absence of sexual desire, feelings and activities is seen as abnormal and reflective of poor health because of the explicit connection made between sexual activeness and healthiness". This association is echoed in the everyday experiences of many asexual individuals.

Kim places much stress on contemporary attitudes towards health and the body as an explanation of the marginalization and stigmatization which the asexual community is widely subject to. She suggests that "health information and interpretations about sex are grounded too much in belief in universal sexual desire and given too much authority to health professionals to produce 'cures' marketed by sex therapy and pharmaceutical industries". This stands as a plausible claim given the high visibility which such 'lifestyle and health' discourses are afforded in a world saturated by information television, lifestyle magazines and health websites. The aggregative effect of such phenomena is to propagate a sense of normalcy which equates bodily health with sexual satisfaction. Within disability studies, much attention has been paid to the 'myth of asexuality', identifying the role which outward markers of disability are equated with an underlying lack of sexual function.

This pervasive tendency within contemporary culture to equate health with sexual activity expresses itself in the trend, discussed earlier, for asexual individuals to initially consider that the difference they recognize in themselves (i.e. their lack of interest in sex) is the result of some underlying pathology. Though the vocabulary used and the stress placed varies from person to person, the notion in play is the same: 'if I don't have a desire for sexual activity does this mean there's something wrong with my health?'

However while this prevalent discourse of the healthy sexual body clearly plays some role in the sexual assumption, it does not explain it in its entirety. To suggest that it does would assume firstly that individuals in contemporary society are 'cultural dupes', with attitudes entirely determined by medical discourses propagated in the media and secondly that the emergence of the sexual assumption correlates directly with the increasing proliferation of lifestyle advice about sex and the body. While an empirical investigation of this latter claim is beyond the purview of the present chapter, it seems implausible that this could be so, not least of all because the bringing into being of such an idea through massive exposure in the media would surely prompt a degree of reflection upon it which has heretofore been lacking. Therefore I will argue that other factors play a crucial role in explaining the genesis and trajectory of the sexual assumption within contemporary society.
There’s a great post on [1]Deborah Lupton’s blog in which she discusses the academic quantified self. It builds on a recent paper by Roger Burrows, [2]Living with the h-index, in which he explores the implications of the increasing quantification of academic labour for the structures of feeling prevalent amongst academics. I’ve attached a talk Roger gave on the topic underneath the extract from Deborah’s post.

Engaging as a public sociologist using digital media invariably involves some form of quantifying the self. Roger Burrows has employed the term ‘metric assemblage’ to describe the ways in which academics have become monitored and measured in the contemporary audit culture of the modern academy. As part of configuring our metric assemblages, we are quantifying our professional selves.

Academics have been counting elements of their work for a long time as part of their professional practice and presentation of the self, even before the advent of digital technologies. The ‘publish or perish’ maxim refers to the imperative for a successful academic to constantly produce materials such as books, book chapters and peer-reviewed journal articles in order to maintain their reputation and place in the academic hierarchy. Academic curricula vitae invariably involve lists of these outputs under the appropriate headings, as do university webpages for academics. They are required for applications for promotions, new positions and research funding.

These quantified measures of output are our ‘small data’: the detailed data that we collect on ourselves. Universities too engage in regular monitoring and measuring practices of the work of their academics and their own prestige in academic rankings and assessment of the quality and quantity of the research output of their departments. They therefore participate in the aggregation of data, producing ‘big data’ sets. The advent of digital media, including the use of these media as part of engaging in public sociology, has resulted in more detailed and varied forms of data being created and collected. Sociologists using digital media have ever greater opportunities to quantify their output and impact in the form of likes, retweets, views of their blogs, followers and so on. We now have Google Scholar, Scopus or Web of Science to monitor and display how often our publications have been cited, where and by whom, and to automatically calculate our h-indices. Academic journals, now all online, show how often researchers’ articles have been read and downloaded, and provide lists of the most cited and most downloaded articles they have published.

I’m curious as to how attitudes towards metrics differ between career stages. In my own case, it often confuses me that my hostility towards audit culture can co-exist with a strange affection for google scholar. I still find it exciting to discover that my work has been cited. It confirms people have read it and that it made a sufficient impact for them to choose to reference it. Google Scholar automatically indexes these citations for me, thereby avoiding what would feel like a depressingly narcissistic exercise of searching for them myself. It's a service that has existed for longer than I have been publishing academic papers. So what did you do before google scholar? Simply wait until you stumbled across references to yourself or an acquaintance noticed them and pointed them out to you? The idea seems incredibly strange to me. Has a PhD in the current climate already shaped my professional self to cohere with what [5]Burrows calls *the moment of the metrics*?

At what point can we begin to date the emergence of the significant metricisation of the UK academy? It is the contention of this paper that the marked change in academic sensibilities invoked by new forms of measure only really begun to take hold in a significant manner within the last decade or so. There has been a slow accumulation of layer upon layer of data at various levels, scales and granularities since the mid-1980s, until there came a point of bifurcation; a point at which structures of feeling in the academy were irretrievably altered by the power of these numbers. The ‘bygone world’ identified by Lock and Martin (2011) was the academy of the 1950s through to the early or perhaps even the mid-1990s. As De Angelis and Harvie (2009: 10) have observed, academic accounts of the life-world of the post-war University, as contained within studies such Halsey’s (1992) Decline of Donnish Dominion and even Slaughter and Leslie’s (1997) Academic Capitalism, concur that ‘measure in any systematic form, with accompanying material consequences…[is]… new. Measure, as we would now recognise it, simply did not exist in the post-war university’.

So the ‘moment of the metrics’ – the point of bifurcation – could be thought of as the beginning...
this century; the point at which academics could no longer avoid the consequences of the developing systems of measure to which they were becoming increasingly subject.Crudely, at some point between the Research Assessment Exercise (RAE) carried out in 1996 and the one conducted in 2001 (Hicks, 2009; Kelly and Burrows, 2012) the moment of the metrics occurred and the structures of feeling that have now come to dominate so much of academic culture began to take hold.

As discussed elsewhere (De Angelis and Harvie, 2009; Kelly and Burrows, 2012) the life-world of the university is now increasingly enacted through ever more complex data assemblages drawing upon all manner of emissions emanating from routine academic practices such as recruiting students, teaching, marking, giving feedback, applying for research funding, publishing and citing the work of others. Some of these emissions are digital by-products of routine transactions (such as journal citations), others have to be collected by means of surveys or other formal data capture techniques (such as the National Student Survey (NSS)) and others still require the formation of a whole expensive bureaucratic edifice designed to assess the ‘quality’ of research (Kelly and Burrows, 2012).

As Angelis and Harvie (2009:17-24) note, different metrics operate at different scales: some at the level of the individual; some at departmental, school or faculty level; some at institutional level; some at national level; and some at international level. However, all are nested or folded into each other to form a complex data assemblage that confronts the individual academic. One could, for example: have an individual h-index (see below) of X; publish in journals with an average ‘impact factor’ (see below) of Y; have an undergraduate teaching load below the institutional norm; have a PhD supervision load that is about average; have an annual grant income in the top quartile for the social sciences; work within an academic agglomeration with a 2008 RAE result that places it within the ‘top 5’ nationally; receive module student evaluation scores in the top quartile of a distribution; work within a school with ‘poor’ NSS results, placing it in the bottom quartile for the subject nationally; teach a subject where only Z per cent of graduates are in ‘graduate’ employment 6 months after they graduate, earning an average of just £18,500; work within a higher education institute that is ranked in the ‘top 10’ nationally in various commercially driven ‘league tables’, and within the ’top 80’ globally, according to others.

It would be quite easy to generate a list of over 100 different (nested) measures to which each individual academic in the UK is now (potentially) subject. However, for our purposes here, we will consider just six domains: citations; workload models; transparent costing data; research assessments; teaching quality assessments; and university league tables. Through the discussion of these we will be concerned to begin to decipher common themes and points of difference in the origins, functioning, effect and affect of these different measures. To be sure, all of our examples were developed at different points in time, by different organisations and for different purposes: citation measures and league tables have been developed by private companies, publishers and newspapers to promote sales and revenue streams; the transparent costing system was developed by Treasury in order to ensure no cross-subsidisation between teaching and research; research assessment exercises were initiated by civil servants but then ‘domesticated’ by funding agencies and scholarly bodies and associations; and the measurement of student satisfaction was prompted by politicians concerned to promote a greater level of consumerism amongst students (and their parents) in the higher education system. However, there are commonalities in that all give an emphasis to numeric representation, order and rank, all focus on the ‘measurable’, and all appear to have an interest in promoting competitive changes that alter numbers and ranks over time. The crucial thing though is that together they are all now experienced ‘on the ground’ as a more or less ubiquitous melange of measures – full of legacy tensions and contradictions to be sure – that increasingly function as a overarching data assemblage orientated to myriad forms of quantified control; an assemblage that the enactment of which invokes the sorts of affective reactions enumerated at the outset of this paper.
This does suggest a possible generational divide between those who made the transition into the moment of the metrics and those who entered an already metricated academy. Does the nature of resistance to quantified control vary in each case? I hope I never take these metrics too seriously but I realise that I struggle to imagine ever ignoring them all together. The depressing thought is that I struggle to imagine not being interested in them. Deborah asks some important questions which relate to this at the end of her post:

Should the practices of quantifying the academic self be considered repressive of academic freedom and autonomy? Do they place undue stress on academics to perform, and perhaps to produce work that is sub-standard but greater in number? However it is also important to consider the undeniable positive dimensions of participating in digital public engagement and thereby reaching a wider audience. Academics do not write for themselves alone: being able to present their work to more readers has its own rewards. Quantified selfers can find great satisfaction in using data to take control over elements of their lives and also as a performative aspect. So too, for academics, collecting and presenting data on their professional selves can engender feelings of achievement, satisfaction and pride at their accomplishments. Such data are important to the academic professional sense of self.

Deborah Lupton (2013-11-21 08:15:00)
Hi Mark Thanks for this. I recently received a comment by an Australian colleague on the blog post you cite above, asking how any 'pleasure' could be engendered by the quantified academia. This is my response to him that I posted on the blog:

"Most people, including academics, find satisfaction from positive feedback about their work. This may include the number of citations our work has received, the assessments our students give us, the number of followers we have on Twitter or readers of our blogs, for example. In this sense, there is pleasure to be gained from measures of self-quantification. I would also argue that some of these measures can be important for academics who have had an interrupted career trajectory or who are from marginalised social groups to demonstrate their 'worth' when applying for jobs and so on in ways that are viewed as objective by those who assess them. They thus can be powerful bargaining chips in cases where discrimination may otherwise occur." I am discussing this further in my Digital Sociology book. There are many interesting issues here to explore about the ambivalences of quantifying the academic self. As for your question about how one measured one's impact in pre-digitised days, well there were paper equivalents of Web of Science that were kept in university libraries as large annual volumes, and one could look up one's citations in these. But of course they took ages to appear and excluded most humanities and social sciences journals. As far as I am concerned, Google Scholar is a marvel, and I have used my citations (and yes, my h-index) to my advantage as much as I have been able! Deborah
We academics are terrible cynics (and quite often hypocrites too ...). It’s true we are embroiled in a moment of metrics, but academics have been metricised for a long time, even if it just meant displaying how many articles and books etc they had published on their CVs as a measure of worth. Not sure where Bourdieu’s work on power could be used here, as I have tended to draw principally on his habitus stuff (although that is relevant to notions of the academic habitus as a metricised assemblage!).

With a UK population of 3.3% it is clear that black Britons are faced with a very problematic situation, there is an overrepresentation of black students and a massive under representation of Black professors. These students end up overwhelmingly as recipients and not participants of knowledge creation in this country.

There are 4,450 black UK national academic staff members, and 2,690 black non-UK national staff member – this means over a third of the academics that work within UK institutions are not born and possibly not educated in the UK. There is a very particular type of subtle social injustice that takes place when institutions overlook local populations and point to black non-UK academics and professors when searching for proof that they are in fact actively employing black people. Through no fault of their own these black academics come from a different environment, often without the connection or knowledge necessary to become assets to black populations in the UK.

The Quantified Self and Taylorization 2.0 (2013-11-23 08:00)

There’s a provocative post on [1]Nick Carr’s blog in which he discusses the potential expansion of self-tracking technology as a mechanism of quantified control:

But, as management researcher H. James Wilson [2]reports in the Wall Street Journal, there is one area where self-tracking is beginning to be pursued with vigor: business operations. Some companies are outfitting employees with wearable computers and other self-tracking gadgets in order to “gather subtle data about how they move and act — and then use that information to help them do their jobs better.” There is, for example, the [3]Hitachi Business Microscope, which office workers wear on a lanyard around their neck. “The device is packed with sensors that monitor things like how workers move and speak, as well as environmental factors like light and temperature. So, it can track where workers travel in an office, and recognize whom they’re talking to by communicating with other people’s badges. It can also measure how well they’re talking to them — by recording things like how often they make hand gestures and nod, and the energy level in their voice.” Other companies are developing Google Glass-style “smart glasses” to accomplish similar things.

A little more than a century ago, Frederick Winslow Taylor introduced “scientific management” to
By meticulously tracking and measuring the physical movements of manufacturing workers as they went through their tasks, Taylor counseled, companies could determine the "one best way" to do any job and then enforce that protocol on all other workers. Through the systematic collection of data, industry could be optimized, operated as a perfectly calibrated machine. "In the past the man has been first," declared Taylor; "in the future the system must be first."

The goals and mechanics of the Quantified Self movement, when applied in business settings, not only bring back the ethic of Taylorism, but extend Taylorism’s reach into the white-collar workforce. The dream of perfect optimization reaches into the intimate realm of personal affiliation and conversation among colleagues. One thing that Taylor’s system aided was the mechanization of factory work. Once you had turned the jobs of human workers into numbers, it turned out, you also had a good template for replacing those workers with machines. It seems that the new Taylorism might accomplish something similar for knowledge work. It provides the specs for software applications that can take over the jobs of even highly educated professional

There’s a sense in which I agree with Carr here and I’ve [5]written about this in the past. However he glosses over the issue that interests me the most when he talks about the “transformation of QS from tool of liberation to tool of control”. It’s this dichotomy which so fascinates me about self-tracking. On the one hand, I can see how it can function as a quasi-emancipatory technology which augments the human capacity for reflexivity, potentially freeing the individual from the blind force of (socially inculcated) habit. On the other hand, I can just as easily see how this expansion of portable technology for quantification can, particularly when coupled with amenable patterns of affective response from the ‘users’, constitute a potentially terrifying expansion of disciplinary control within the workplace. I could see how, stealing a phrase from Mark Fisher, this results in the ever more effective design of electro-libidinal parasites deployed to manage motivation at a time of intensifying deskilling. Carr usefully draws out a parallel tension which can be found in in the advent of ‘personal’ computing, usefully hinting at the dialectical interconnection between the consumerisation of IT and the centralization of control in cloud services and data centres:

The transformation of QS from tool of liberation to tool of control follows a well-established pattern in the recent history of networked computers. Back in the mainframe age, computers were essentially control mechanisms, aimed at monitoring and enforcing rules on people and processes. In the PC era, computers also came to be used to liberate people, freeing them from corporate oversight and control. The tension between central control and personal liberation continues to define the application of computer power. We originally thought that the internet would tilt the balance further away from control and toward liberation. That now seems to be a misjudgment. By extending the collection of data to intimate spheres of personal activity and then centralizing the storage and processing of that data, the net actually seems to be shifting the balance back toward the control function. The system takes precedence.

Self-tracking and 'techorexia' The Sociological Imagination (2014-01-17 08:00:57)

[...](many) things which fascinates me about self-quantification tools is their seeming capacity to both increase individual autonomy and extend control over the individual. However my instinctive personal reactions to this tend to be a matter of seeing the former as [...]

BSA Early Career Theorists’ Symposium (2013-11-24 08:00)

Early Career Theorists' Symposium
6th June, 2014, held at the London School of Economics

Call for Abstracts
The Early Career Theorists’ Symposium is a special one-day symposium for up-and-coming theorists, organized on behalf of the British Sociological Association’s Theory Study Group. This symposium aims to bring together sociologists at a relatively early stage in their career, who work on theory or are engaged in original theoretical work as part of their on-going research. We invite early-career sociologists, across all research areas, to submit abstracts. Submissions from advanced PhD students are also welcome.

Prof. Claire Alexander (Manchester), Prof. Patrick Baert (Cambridge), and Dr Fran Tonkiss (LSE)—covering theorisations of Race & Ethnicity, Philosophy of the Social Sciences and the Sociology of Intellectuals, and Urban and Spatial Theory and Economies, respectively—will comment on the papers. Complete information for submitting the abstract will consist of:
(1) name and contact information of the author (including career stage, e.g. PhD student, post-doc, early career academic);
(2) title of your presentation;
(3) a 500-word abstract of the presentation;
(4) five keywords descriptive of the presentation.

Please send submissions to the organizers: Dr Marcus Morgan, University of Cambridge ([1]mm2014@cam.ac.uk) and Dr Suzi Hall, London School of Economics ([2]s.m.hall@lse.ac.uk). The deadline for submission of abstracts is 6th January, 2013.

Please plan to share a full paper of no more than 5000 words by 28th April, 2013.
In his book, [2]Zombie Politics and Culture in the Age of Casino Capitalism, author and scholar Henry Giroux connects the dots to prove his theory that our current system is informed by a "machinery of social and civil death" that chills "any vestige of a robust democracy."

This week on Moyers & Company, Giroux explains that such a machine turns "people who are basically so caught up with surviving that they become like the walking dead – they lose their sense of agency, they lose their homes, they lose their jobs."

What's more, Giroux points out, the system that creates this vacuum has little to do with expanding the meaning and the substance of democracy itself. Under "casino capitalism," the goal is to get a quick return, taking advantage of a kind of logic in which the only thing that drives us is to put as much money as we can into a slot machine and hope we walk out with our wallets overflowing.

A cultural and social critic of tireless energy and vast interests, Giroux holds the Global TV Network Chair in the English and Cultural Studies Department at McMaster University and is a distinguished visiting professor at Reyerson University, both schools in Canada.

"No one is born gay (or straight)"? (2013-11-25 08:00)

[1]

(CC BY 2.0 [2]Guillaume Paumier)

[3]Here is a great post by [4]ejaneward at the [5]Social (In)Queery blog discussing the social origins of sexuality and the complexity of notions, such as "choice", which we are too often keen to simplify. What do you think?

Social (In)Queery is a collective project to enhance public access to good social data on sexuality and gender. Begun in 2011 by sociologists Tey Meadow, C.J. Pascoe and Jane Ward, Social (In)Queery promotes collaborative dialogue, interdisciplinary investigation and feminist and queer analysis of topics relevant to public debate.

The Perils of Passion: Videogames, Higher Education and Precarious Labour (2013-11-26 08:00)

[1] The Jacobin Magazine has a [3]fascinating article exploring the role played by a passion for gaming in facilitating the expansion and intensification of precarious labour within the video game industry. With seemingly endless cohorts of eager young gamers desperate to break into the industry, the employment practices encountered by the article’s author are increasingly the norm amongst design studios:

I was a QA engineer, and a QA’s job is to break things in-game, record how the things were broken, and then pass the information to the content creation team, who would hopefully fix them. It’s a common entry-level gig in the industry, one which gives you a broad knowledge of how things work to eventually launch something more specialized.

Most of my coworkers viewed their gigs at Funcom as having “arrived.” Almost all of them had come through Red Storm, one of the most respected studios in the country and an industry linchpin in North Carolina. The stories they told were galling: gross underpayment, severe overworking, and middle management treating the cubicle farm as a little fiefdom all their own.

Red Storm at the time employed the bulk of their QAs as temps. Lured in by promises of working their way up the ladder, scores of college kids and young workers would come in, ready to make it in the new Hollywood of the video game industry. The pay was minimum wage. The hours were long, with one of my immediate supervisors casually stating that he regularly worked at least 60 hours a week during his time there. Being temps, there were no benefits.

This would go on for the duration of a project, usually the final four months or so. When the temps weren’t needed anymore, it was common for groups of them to be rounded up, summarily let go
without notice, and told that a call would be forthcoming if their services were needed again.

There were other stories – strange and mean ones, like the producer who waltzed into the QA office and asked if anyone was heading for the dumpster. When no one answered, she dropped a big bag of garbage in the middle of the floor, snarled, "I guess I’ll just leave this here, then," and stalked off; the QA lead chewed them out since the woman was a producer, a project manager.

Everyone who came through related the same story of QA's complete sequestration from the development team; nobody was allowed to speak to a "dev" directly, only through intermediaries, nor to enter the dev side of the building. The QA temps were a clear underclass on one floor, while full-time "real" video game workers occupied the other.

At the time, I didn’t understand why someone wouldn't leave such a situation. The pay was awful, the hours too long, and it sounded like a rotten place to work if even a fraction of the stories I’d hear over lunch breaks were true.

But everyone kept returning to some variation of the same theme: it was their dream to work in the video game industry.

http://jacobinmag.com/2013/11/video-game-industry/

What makes the difference is **passion**. When people are dreaming of a career spent working on what they love, it becomes much easier to convince them to accept working conditions which are ungenerous at best and nakedly exploitative at worst. It becomes easier still when a limited number of positions within the industry are immensely oversubscribed, often by younger (and lesser experienced) hopefuls willing to work for less than established staff.

Again and again, when you read interviews or watch industry trade shows like E3, "passion" is used as a word to describe the ideal employee. Translated, “passion” means someone willing to buy into the dream of becoming a video game developer so much that sane hours and adequate compensation are willingly turned away. Constant harping on video game workers' passion becomes the means by which management implicitly justifies extreme worker abuse.

And it works because that sense of passion is very real. The first time that you walk through the door at an industry job, you’re taken with it. You enter knowing that every single person in the building shares a common interest with you and an appreciation for the art of crafting a game. Friendships can be built immediately – to this day, many of my best friends arose from that immediate commonality we all had on the job.

This is an incredibly enticing proposition; no one who goes in is completely immune to it, no matter how far down the totem pole of life’s interests gaming is. And there are few other jobs quite like it.

Geek culture takes such strongly held commonalities of interest and consumption far more seriously than most other subcultures. I recently wrote a [4]piece for this publication which was, in part,
about the replacement of traditional class, gender, and racial solidarity with a culture of consumption. Here, in the video game creation business, is the way capital harnesses geek culture to actively harm workers. The exchange is simple: you will work 60-hour weeks for a quarter less than other software fields; in exchange, you have a seat at the table of your primary identifying culture’s ruling class.

http://jacobinmag.com/2013/11/video-game-industry/

The parallels to higher education struck me early in this article, so it was oddly satisfying (though also rather depressing) to read about the role that private higher education is coming to play in the perpetuation of this deeply problematic state of affairs:

In addition to gaming’s notoriously manipulative management, one of the true villains of modern America decided to hitch itself to the burgeoning and increasingly chic industry in the 1990s. Just in time to latch onto the boom years of the Sony Playstation, for-profit universities began marketing sham programs to people hoping for a career in video game creation.

They’re still at it in 2013. The commercials come on late at night or, more rarely, the middle of the day. The times chosen aren’t an accident – they’re aimed at the jobless and underemployed. A wailing guitar or dubstep kicks in. Sometimes there’s an attractive woman or a fast car. The (almost always) male student recalls how [5]nobody ever thought video games would make him money; they, he smirks, were wrong.

For-profit colleges sell a [6]vision of a career which doesn’t exist. Moreover, they use a weird, sexy, completely untrue version of a video game career as bait for their other programs, showing a school where even the screenwriting students can hobnob with these cool slackers.

As with so much other hard data regarding the industry, figures from education are obfuscated and hard to come by. When I spoke with the National Center for Education Statistics, we had to set parameters on our searches that left out programs which I know exist, simply because many are filed under general computer science. Coupled with total enrollment figures being available only once every other year, and this data only being available from schools accepting federal student aid, makes the numbers on video game design programs nearly impossible to accurately assess.

Cracking what numbers are available reveals an unflattering portrait of for-profit video game programs. Such institutions do not, as a general rule, graduate many students as a percentage of their enrollment. But of the total degrees given in 2012 at schools with video game/interactive media programs, a significant percentage were in those programs – in the 20 to 30 percent range. A significant number of graduates of the higher-profile for-profit schools hovered around 50 percent.

These degrees are largely worthless. I personally know several developers who, as a rule, summarily pass over applicants for anything but entry level QA positions if they hold a degree from such schools. Even prospective video game workers know these degrees aren’t going to get them in above the ground floor. Yet the figures prove that people keep signing up at for-profit colleges for a shot at their dreams – and the for-profits have no interest in dissuading them from doing so.

Enduring Love? Couple Relationships in the 21st Century

The Enduring Love? project is a major ESRC-funded study (2011-2013) that has been exploring how couples experience, understand and sustain their long-term relationships.

To celebrate the end of the project we are hosting an event to launch the study findings and, with our dynamic array of speakers, to provoke wider discussion on making research count, why relationship research matters and dialogic research practice. The project has been designed, developed and implemented in collaboration with policy makers, relationship support organisations, media commentators and academic colleagues so the event promises to be a highly stimulating and critically engaged forum. There are also canapés and a glass or two of wine to take us into the evening.

We would be delighted if you could join us on:

Tuesday 14th January 2014, 12.30 – 6pm at The British Library, Euston Road, London

Full programme details are included below and are attached in poster format. Please feel free to circulate widely.

To register online please go to:

The Sociology of Soldiers Reuniting With Their Dogs (no, really) (2013-11-27 08:00)

I’m someone who likes animals. I’m also someone who spends a lot of time procrastinating on youtube. These two facts converged some time ago when I noticed an interesting trend for youtube videos, usually filmed by female partners, capturing usually male soldiers being reunited with their dogs. Turns out Buzzfeed noticed it too:

[1]

18 Tear-Jerking Moments Of Soldiers Reuniting With Their Dogs

Grab some tissues, because we’re about to turn on the feels. Every soldier deserves this kind of welcome home.

posted on November 11, 2013 at 10:00am EDT

Chelsea Marshall

Follow

I love these videos as someone mildly obsessed by animals. But I also find them really interesting as a sociologist. There’s a very specific pattern recurring in countless videos I’ve watched in which the female partner narrates the soldier’s return to the animals (“right guys, you ready?”) before filming the inexpressible enthusiasm with which the animals greet him, as well as his (usually) equally effusive response. The affectivity of the shared pet seems to act as a communicative mediator, as if the anxieties and ambiguities inherent to human relationships can be temporarily dissolved through the reciprocal embrace of a mutually loved animal who can feel and react much more simply than we are able to. The last video of these is the most interesting, at least with my pseudo-psychoanalytical hat on, not least of all because of the moment when the woman filming the reunion feels the need to exclaim “I’m not drunk”. Towards the end they exchange statements of “I love you” in a way which seems oddly ambiguous as to whether they are talking to each other or to their dog. In fact the soldier is looking at the dog as he begins to say this, before
he looks towards the camera.

I feel the need to add that I’m someone who was once engaged to a woman with whom I owned a dog, a cat and a large number of rodents. I’m writing this in a somewhat self-interrogative manner, as opposed to trying to say something about the military. I think the very specific situations depicted in these videos of military homecomings reveal something much broader about the role that pets in general, as well as dogs in particular, play in grounding and reproducing domesticity.

Free One Day Conference at Leicester
Postgraduate Travel Bursaries available – please email [1]hso1@le.ac.uk
Paradata, marginalia, fieldnotes and letters are all by-products of the process of social research which can add considerable depth to our understanding of the research process. It is only recently, however, that researchers have begun to recognise the value of such data. In the field of large-scale survey data paradata analysis has become more widespread with researchers increasingly turning their attention to the context in which questionnaires are completed, observations made during the interview and the impact of such factors on the recruitment and retention of participants. For those researchers undertaking secondary analysis of datasets the benefits of paradata and marginalia in the form of fieldnotes and fieldworker comments in the margins of questionnaires are invaluable and can cast light on the otherwise hidden aspects of field research.

This free one-day conference offers academics and postgraduate students the opportunity to learn more about recent research that addresses the issue of how to make use of the by-products of social research. The day represents a unique chance for a dialogue across disciplines and research paradigms: across social sciences and humanities, historical and contemporary data, primary and secondary sources, quantitative and qualitative approaches – each highly important with the increasing emphasis of research councils on interdisciplinary and secondary research.

This is a free conference with lunch included but pre-registration is required as places are limited.

Doing Social Network Analysis using Qualitative Methods (2013-11-27 17:37)

This interesting lecture by Nick Crossley and Gemma Edwards offers a helpful introduction to social network analysis before discussing purely qualitative approaches to analysing social networks. We interviewed Nick about his work on relational sociology a couple of years ago and it's great to hear him talk more about the methodological implications of this theoretical approach.
Holy Crap! Intersections of the Popular and the Sacred in Youth Cultures (2013-11-28 08:00)

Holy Crap!
Intersections of the Popular and the Sacred in Youth Cultures
28–29 August 2014, Helsinki, Finland

Call for Papers and Sessions

Holy Crap! is an international conference organised by the Finnish Youth Research Society and Network, focusing on the interrelations between popular culture, youth and the sacred. The conference aims at interrogating understandings of popular and youth cultures in relation to the contested phenomena of (post)secularisation, re-enchantment and the emergence of alternative spiritualities.

Seeking to analyse the social and cultural changes accompanying these phenomena, the conference will facilitate interdisciplinary dialogue between youth studies, cultural studies, religious studies and the broader social sciences.
Recent years have seen a growing interest in "re-scripting the sacred" through popular culture. Although "youth" as an age-based category has lost its privileged status within such studies of popular culture, young people remain vital (sub)cultural agents. There has also been renewed interest in the ubiquitous contestations and ambiguities around the notion of the "popular" in light of the increasing commodification and standardisation of culture, the opposition this engender, and the cultural drift into virtual worlds.

Holy Crap! locates itself at the intersection of these three contested concepts, seeking to re-examine and re-evaluate the dynamics within and between cultural phenomena prefixed with "popular", "sacred" and "youth".

The conference organisers invite proposals for either complete 90 minute sessions or individual 30 minute presentations. The general theme of the conference may be approached from within any discipline or methodology. Suitable topics include, but are not limited to:

- Discourses: the mythologies of popular and youth cultures, histories and invented traditions, freedom of speech and expression, contesting authenticity, transcendence and transgression, consolation and affect;
- Identities: the intersections of the popular/sacred/youth dynamics with class, (dis)ability, ethnicity, gender and sexuality, subcultural belonging and community, nationalism and the sanctification of race;
- Ideologies: questioning religious tenets, political doctrines, consumerism and economies of pleasure, value and moral judgments, the (post)modern and the (post)secular;
- Institutions: families, congregations, denominations, corporations, educational institutions, gangs, (neo)tribes, subcultures, municipalities and the state;
- Materials and technologies: ecologies, media, art, symbols, shrines, memorials, actions, practices, rituals, pilgrimage, stardom, fandom and authorship, web 2.0 and 3.0, virtual religions and virtual worlds;
- Theories and methodologies: evidence and authority, interdisciplinary methodologies, theology and secular scholarship, critical theories of religion, reconceptualising key concepts.

The proposals should be submitted via email, preferably as an attachment in doc/pdf/rtf format, to Research Coordinator Antti-Ville Kärjä ([1]antti-ville.karja@nuorisotutkimus.fi) no later than 15 January 2014. Notifications of acceptance will be sent by Friday 31 January 2014.

Proposals should include the following information:

- name(s) and affiliation(s) of the presenter(s);
- the title of the presentation/session;
- an abstract of no more than 200 words for a 30 minute presentation or 500 words for a 90 minute session.

For further information, please visit [http://www.nuorisotutkimusseura.fi/en/holy-crap](http://www.nuorisotutkimusseura.fi/en/holy-crap) or contact Antti-Ville Kärjä ([3]antti-ville.karja@nuorisotutkimus.fi).

CfP: Digital Sociology PhD/ECR Workshop (2013-11-28 14:00)

Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from peers and established academics in a supportive environment.

The event will take place between 11am to 4pm on February 19th at Goldsmiths College in South London. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.

If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn’t been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.

Getting Started: Public Engagement for Social Scientists (2013-11-29 08:00)

[1] "Getting Started: Public Engagement for Social Scientists" on Bundlr

How to be a progressive thinker in the 21st century (2013-11-29 13:23)

Suppose we live in an ideologically polarised world – let’s call it ‘left’ v. ‘right’ – where free speech is the norm. The ‘left’ people are basically about humans changing their default ways of being. The ‘right’ people are basically about humans sticking to their default ways of being. Which scenario do you think will result in a better world? (a) Let the right make outrageous claims that the left corrects, or (b) Let the left make outrageous claims that the right corrects? The answer based on my reading on history is pretty clear: (b).

Let me put the point more bluntly: The value-added for the left from the free expression of ideological differences comes precisely from the right spontaneously doing the left’s copy-editing and fact-checking. But it doesn’t work the other way round. Whenever people on the left attack right-wing ideas and policies, they all too often fall back on opprobrium – bad faith, bad motives, etc. This is pretty useless to the right and its supporters, and so not surprisingly most left-wing criticism falls on deaf ears. As long as people continue tolerate how things have been, that by itself provides support for the right. In contrast, whenever people on the right attack left-wing ideas and policies, they usually bring up so-called ‘facts’—which, of course, may be incorrect or misleading – but nevertheless serve as an incentive for leftists to smarten up their act.

We on the left need to learn that the right serves a very useful function, namely, to keep us ‘honest’ in the sense required by politics. That is, it forces us to take seriously that people may disagree with us for reasons other
than their not having heard the message sufficiently often (or, worse, are simply too stupid or self-interested to understand it).

From this standpoint, the larger background fact that the left-right divide is dissolving as the main points on the political compass should be a source of significant concern to those interested in a future rational politics. Who will be checking whom?

gosheffo (2013-12-13 16:34:00)
There’s lots of good fact-checking that goes on by left-wing academics. And the old left-right dissolving stuff is a bit old no? Even Ed Miliband’s soft populism with continued neoliberal economics has opened up a slight gap between the two main parties even if it will have little effect on the general economic direction of the country. Sorry but I don’t really understand the point of this article...

CfP: An Invitation to Digital Public Sociology (2013-11-29 14:00)

What does ‘public sociology’ entail in a world of facebook, twitter, youtube, slideshare, soundcloud, pinterest and wordpress? What affordances and constraints do these tools entail for the task of “taking knowledge back to those from whom it came, making public issues out of private troubles, and thus regenerating sociology’s moral fibre”? What implications do these tools have for the relationship between the public and private in the occupational biographies of individual sociologists and, through aggregation and collective organisation, the discipline as a whole?

Short articles (1000 to 4000 words) are sought for an open access edited book which explores conceptual, methodological or practical aspects of Digital Public Sociology. If you would be interested in contributing then please send an abstract of 200 words or less by December 31st 2013. The final articles would be needed by March 31st 2014, with the intention of launching the collection in the summer of 2014. Please send abstracts (or questions) to mark@markcarrigan.net.

Social and Political Critique in the Age of Austerity
A one day workshop at Keele University
10.30am-6pm, Wednesday 12th February, 2014

This one day workshop is devoted to the discussion of critical politics in the contemporary age of austerity. Following the 2007 global economic crash, which led to a raft of government bank bail outs and nationalisations across America and Europe, a cunning ideological reversal took place – the crash was no longer the result of the hubris of the neoliberal financial sector, which had developed the idea of ‘riskless risk’ where reckless stock market speculation
and the creation of value ex nihilo could produce endless profit, but rather the immoral wastefulness of the people and society. According to this ideological position, which was advanced by governments across Europe, the welfare state, and in many respects society itself, was transformed into an ‘exorbitant privilege’ that was simply unaffordable. In fact, in order to pay for their wastefulness the people were not only expected to give up their public services, but also required to accept ever lower wages, and a general state of social and economic precariousness.

This is the current state of play across America and Europe, where the neoliberal state has exploited the crash in order to retrofit society for violent competition with Asian capitalism. In the face of this race to the bottom, key thinkers such as David Graeber, Antonio Negri, Slavoj Zizek, Alain Badiou, and Costas Douzinas have spoken out against the new form Naomi Klein calls neoliberal disaster capitalism and given voice to the protest, rebellion, and revolt taking place across the world.

The objective of this workshop is to build upon the works of these key thinkers and explore the possibility for resistance in the age of austerity. We invite contributions from a range of disciplines focused on diverse social and political contexts and a variety of theoretical perspectives. Contributors may choose to focus on austerity and resistance across Europe, including the UK, Greece, Spain, and Italy; the Occupy movement; the media construction of austerity, including the idea of the undeserving poor who are seen to be living off public funds; methods for the organisation of resistance; the concept of the multitude and the digital commons; anti-capitalist thought; or transformative social and political theory and practice more generally. Most importantly, we are keen to emphasise that this list is not exhaustive – the key principle behind the workshop is that debate should open up a space for social and political creativity. In this way we are keen to encourage potential contributors to be creative and explore new possibilities for political change in a historical period where change seems absolutely necessary, but also impossible to envisage. In this respect, we encourage contributions from a variety of participants – academics, post-graduate students, activists, and others engaged in thinking through the possibilities of change under conditions of crisis and austerity.

The workshop will close with a lecture from Professor Costas Douzinas (Birkbeck), author of Philosophy and Resistance in the Crisis: Greece and the Future of Europe.

In order to take part in the event please send a 250 word abstract to Emma Head ([mailto:e.l.head@keele.ac.uk](mailto:e.l.head@keele.ac.uk)), by Monday 23rd December. This event is being organised jointly by Mark Featherstone (Keele Sociology) and Emma Head (Keele Sociology and the BSA Digital Sociology study group). Registration will open in early January. Confirmed speakers will be notified by 7th January.

1. [mailto:e.l.head@keele.ac.uk](mailto:e.l.head@keele.ac.uk)
How long till we have Open Access books? (2013-11-30 08:00)
There’s an extremely informative article on the LSE Impact Blog giving a useful overview of the still uncertain future of open access monographs. There are a variety of potential models which could be adopted for publishing open access monographs and it’s still unclear as to which is the most viable:

This means that there are some extremely interesting experiments happening at the moment. Some borrow from the dominant OA journal publishing business model, which asks authors to pay a fee (or APC) to cover the costs of producing and disseminating their work. In some cases, they may seek to lower the initial fee that they charge by continuing to make profits on the print or formatted e-book versions of the book. Of course, the challenge for the author in this model is finding the money for that initial fee; although some funders (notably the Wellcome Trust) have indicated that they’re happy to pay, much research in HSS is not grant-based and the author may not have access to the levels of money that publishers charge.

Another model builds on a more traditional source of funding for monographs: library budgets. Knowledge Unlatched is currently operating a pilot to establish the feasibility of a library consortium which underwrites the first copy costs of books in order to make them open access on publication. The project’s organisers hope to be able to show that for as little as $60 per title, libraries can pay to ‘unlatch’ a book and make it open access for everyone. Of course, there’s an altruistic element to this activity: the project acknowledges this explicitly, but also offers participating libraries a chance to shape the future of the work.
One of the key questions from a commercial standpoint is the implications of open access for usage and sales. Perhaps even more challenging is the important role monographs play in credentialization. This impedes experimentation because people’s careers are built, in part, through following established norms within their disciplines:

One of the big challenges of open access for monographs is that in many HSS disciplines, books have taken on a significance which goes beyond their core purpose of communicating a researcher’s ideas. Publishing a book can have a significant positive effect upon a researcher’s career, particularly when they have been picked up by a publisher considered prestigious within their discipline. This makes it very difficult for researchers to do anything that differs from disciplinary norms, particularly those at the start of their careers and looking for secure employment. It’s encouraging, therefore, that well-established publishers such as Oxford University Press are joining the OAPEN-UK project (with the full support of their authors), while others are engaging with similar projects to explore how they might develop an open access offer.

These remarks point obliquely to another possibility: open access edited books. Unlike monographs these have a minimal credentializing function. My own experience of editing has been one of intense enthusiasm from a curatorial standpoint which rapidly diminishes once I’ve been confronted with the realities of the market. Or in other words: I love the idea of edited collections as a vehicle for weaving diverse strands of scholarship into a useful whole but I find it incredibly frustrating how expensive these are. The commercial imperative of scholarly publishers undermines the communicative intent behind these collections. So why aren’t these being self-published? What does a commercial publisher add to the typical edited book beyond impeding its circulation by slapping a massive price tag onto it?

The Phenomenology of Inertia (2013-12-01 08:00)

I wrote a few weeks ago about obsessiveness and how I understand it in terms of internal conversation. I'm particularly interested in the role that differing forms of obsessiveness, as a generic term for difficulty with drawing
deliberations to a close, plays in making decision making difficult. There’s no logically necessary end point to our
rumination about a potential course of action. There’s always other possibilities we could consider. There’s always
other ways of looking at the issue. There’s always other people whose advice we could seek. The divergent tendencies
of individuals with respect to these possibilities could be conceptualised in a range of ways. I’d argue that they’re
more significant than they may seem. Not necessarily because of their implications for action at one point in time
but because of their cumulative implications for the trajectories of social action which an individual will tend towards.

It’s from this standpoint that I’m also interested in inertia. The capacity of people to go months, years or
decades pondering a decision without making it is one which fascinates me (albeit slightly morbidly). I’m currently
reading John Lanchester’s novel Capital and there’s a wonderful passage which made me come back to these issues,
which I’ve been thinking about less since I (finally) finished the data analysis for my PhD. In the chapter introducing
an Oxford educated classicist who entered the police force on a graduate fast track, Lanchester has a lovely couple of
pages in which he paints a vivid picture of the ambivalence which characterises the relationship of this middle-class
teetotal Christian to his career in the police. Having “wanted to scratch an itch to do with authority, his need for
it, his desire to have it, his liking of hierarchy and order” he found the social politics deeply challenging. While
he felt he was doing some good, this nonetheless went hand-in-hand with a perpetual consideration of a possible exit:

That didn’t mean he didn’t think about giving it up and doing something else. He did, almost every day.
The thought was a safety valve; the idea that he could quit whenever he liked was one of the things which
kept him in the job. The exit was always in his line of sight. The idea of it helped him to stay put and to
cope with the rough parts of his job and his day.

This is what I mean about obsessiveness and inertia. This fictional character deliberated almost everyday about a
potential exit (“could I leave? should I leave? is this right for me?”) but far from deliberation leading functionally
towards action, the obsessiveness which characterises this consideration actually engenders inertia. Reminding
himself of the possibility of exit offers fleeting protection against the facets of the job, as well as his feelings about
them, which engender his desire to do something else. But if this continues then with the passing weeks and months
the cost of exit (and entry elsewhere) become higher and the inertia becomes ever more entrenched. How much
of life is lived this way? How different would the world be if inertia of this form didn’t exist? Is such inertia simply a
product of the tyranny of choice which privilege allows? Is inertia always negative? Is it possible to investigate inertia
in an empirical way? Or will the stories people tell themselves and others to make sense of their inertia prove too
much of a problem?

» Intellectual Trajectory and the Pleasures of Disciplinarity The Sociological Imagination (2014-06-25 08:02:30)
[...] characteristics (though this is far from universally true). However it can also reflect social inertia, as people continue
making choices which increase the opportunity costs of future exit while [...]

Sociologists Outside Academia: My days in the telecoms industry (2013-12-01 15:31)

The Swedish Ministry of Education proposed in a recent memorandum that universities should be transformed
into private foundations in order to increase their autonomy and facilitate greater collaboration with industry. The
proposed legislation follows more than two decades of political discussion on the issue of **decoupling universities from the state**. In response to this debate, an array of applied research centres, innovation offices and research companies have been created in order to cultivate collaborations between the academy and industry. This story is about my experiences during a three year post-doctoral position as an 'in-house researcher' at the consumer research department of an international telecoms company. The collaboration was initiated and largely financed by Riksbankens Jubileumsfond ([www.rj.se](http://www.rj.se)) – a foundation with the aim of strengthening social sciences and the humanities.

When I applied for the position I had formulated an ambitious three-year research plan encompassing previous research, theory, method, and the lot. This was all according to the usual academic application procedure. After having been approved by the academic referees, I was summoned to a job interview at the company. Stepping into the head office that day I felt a bit out-of-place among all the well-tailored suits and big TV screens broadcasting company commercials.

I was interviewed by several people. I remember that they did not ask much about my research, instead they were more interested in my personal history, background, and interests. This was a surprise to me since I was under the impression that they would interrogate me about my research plans. I now understand that the interviewers were interested in assessing not my scientific skills but my social skills, to judge whether or not I would be able to fit in at the company.

However, one question regarding my research plan was brought up by all the interviewers: "Are you going to do one single project during the whole time?". This idea of a single three year long project obviously aroused some suspicions. I learned that day that the company's research projects usually ran between three to six months. That was the first challenge: how to work as a social scientist, doing research, in collaboration with short term company projects? I came up with a quick fix – I redefined my project as a program. By doing so I could participate in a range of different company projects, as long as I could fit them within the framework of the research 'program' that had been formulated in the application and accepted by my scientific patrons.

Furthermore, to ensure an effective use of my time, my way of working was structured as linear processes with definite steps towards delivery of results: a) Scoping: start up meetings with stakeholders and clients to specify the project; b) Data gathering; c) Analysis: analytical workshops with stakeholders and clients; d) Delivery: Communication to stakeholders and clients; f) Evaluation: assessment from stakeholders and clients. Even though this way of working proved quite helpful in setting up projects and performing empirical studies, it also proved difficult to find time to engage in theoretical or methodological work. My pragmatic solution was to maximize the empirical research and save the scientific analysis and publications till after the collaboration had ended.

After a while I started to get the hang of the practical ways of working and was participating in several company projects and activities. A more difficult lesson to learn, however, was the organizational culture – the informal rules, norms, language and attitude that govern the behaviour of the company colleagues. It was like I never really knew if my company colleagues understood what I said or if they just did not agree with me. One example of cultural clashes between academia and industry involved another social scientist who was invited to present his research. When doing this he brought forth his PhD thesis (as per good academic manners) and circulated it among the audience while talking about his research. I noticed that no-one in the crowd opened his book; the others simply passed it around, quickly. The situation irritated me and when the book came to me I went through it thoroughly to acknowledge the invited researcher. Afterwards, I asked my colleagues about the situation. And apparently they too had felt disturbed, but for different reasons than myself. They thought it rude not to give the speaker their full attention. In academic culture, passing around one's thesis is a way to present oneself as scientist. My company colleagues did not know this and acted according to their internalized cultural script, which was to pay respect to what the speaker said, not to his book which they perceived as a distraction.
I see my days in the telecoms industry as a personal exploration of what an academic researcher can do and be in contemporary society by paying respect to different ways of working and thinking. I have learned to negotiate deals and manage international research projects, but what I value the most is probably my improved pedagogical skills. Participating in other cultures challenge you to express yourself differently in order to make yourself understood. Such experience enhance your communicative repertoire, involving verbal and body language but also presentation and visualization techniques, and can help you communicate research in ways that attract a wider community. Having said this, my days in the telecoms industry have also made me more appreciative of academic research. Universities can do well by learning a few tricks from the industry, but they should also be protective and nurturing of its own unique culture and qualities. I am not only talking about the methodological and theoretical skills of individual researchers but also of the organizational and environmental requirements that cultivates scientific creativity and serendipity.

Today, I am back in the academy doing three year projects again. And as manager for my university’s new collaboration arena I am building bridges between the academy and industry rather than burning bridges by trying to transform universities into companies.

Marcus Persson, PhD, received his doctoral degree in sociology from Lund University in 2007. Since then he has worked in educational media production and the telecoms industry; today he holds a position as post doctoral fellow at Mälardalen University doing research about ICT in health care and education, as well as managing the university’s new arena of collaboration.

**The Second Cybernetics (2013-12-02 08:00)**

I’ve recently been reading Magoroh Maruyama’s writing on the *second cybernetics* and I’m quite taken with it. There’s a context to his work which I only dimly understand, given my lack of grounding in the first cybernetics, though I’m still finding his writing extremely thought-provoking. One of the key themes seems to be the critique of an exclusive focus within the first cybernetics on *deviation-counteracting processes* and the self-equilibrating systems which they engender. In contrast Maruyama is interested in the role of deviation-amplifying causal relationships in shaping systems over time. This is the example which has really caught my imagination:

Development of a city in an agricultural plain may be understood with the same principle. At the beginning, a large plain is entirely homogeneous as to its potentiality for agriculture. By some chance an ambitious farmer opens a farm at a spot on it. This is the initial kick. Several farmers follow the example and several farms are established. One of the farmers opens a tool shop. Then this tool shop becomes a meeting place of farmers. A food stand is established next to the tool shop. Gradually a village grows. The village facilitates the marketing of the agricultural products, and more farms flourish around the village. Increased agricultural activity necessitates development of industry in the village, and the village grows into a city.

This is a very familiar process. But there are a few important theoretical implications in such a process. On what part of the entire plain the city starts growing depends on where accidentally the initial kick occurred – The first farmer could have chosen any spot on the plain, since the plain was
homogeneous. But once he has chosen a spot, a city grows from that spot, and the plain becomes inhomogeneous. If a historian should try to find a geographical “cause” which made this spot a city rather than some other spots, he will fail to find it in the initial homogeneity of the plain. Nor can the first farmer be credited with the establishment of the city. The secret of the growth of the city is in the process of deviation-amplifying mutual positive feedback networks rather than in the initial condition or in the initial kick. This process, rather than the initial condition, has generated the complexly structured city. It is in this sense that the deviation-amplifying mutual causal process is called “morphogenesis.

Are you a productivity ninja or a turtle-walking flâneur? (2013-12-03 08:00)

That was the question (sort of) posed by [3]this article on the LSE Impact Blog. With the intensification of workloads throughout the academy, as the ‘efficiency agenda’ leads to spiralling demands to do more with less, the resulting time squeeze seems inevitable. Far from being resisted, this is embraced in some quarters, with the rise of things like ‘academic speed dating’ (eugh). The author deftly summarises two prevailing responses to these conditions: reclaiming academic slowness and becoming a productivity ninja. The deliberate embrace of ‘slow scholarship’ can be an attractive antidote to the growing fetishisation of speed and efficiency. In embracing it, some have actively developed the notion in relation to the ‘slow food movement’.
You have likely heard of the “Slow Food Movement” – the momentum of diners, chefs, gardeners, vintners, farmers and restaurateurs who have taken a critical look at how our society has shifted to a position where for most, food is something to be consumed, rather than savoured, to be served up and eaten “fast” on the way to doing something else. “Slow Food,” by contrast, is something to be carefully prepared, with fresh ingredients, local when possible, and enjoyed leisurely over conversation around a table with friends and family.

“Slow Scholarship” is a similar response to hasty scholarship. Slow scholarship, is thoughtful, reflective, and the product of rumination – a kind of field testing against other ideas. It is carefully prepared, with fresh ideas, local when possible, and is best enjoyed leisurely, on one’s own or as part of a dialogue around a table with friends, family and colleagues. Like food, it often goes better with wine.

In the desire to publish instead of perish, many scholars at some point in their careers, send a conference paper off to a journal which may still be half-baked, may only have a spark of originality, may be a slight variation on something they or others have published, may rely on data that is still preliminary. This is hasty scholarship.

http://web.uvic.ca/ hist66/slowScholarship/

But as Filip Vostal argues in the LSE Impact post, "Slowness appears somewhat remote from the disciplined and path-dependent organizational tactic postulated by modernist speed-up". It might function as a cultural palliative which ameliorates some of the more deleterious effects of the worship of speed but it’s perhaps difficult to imagine slowness as an “organizational principle of academic life". Furthermore, it will always encounter resistance given the longstanding equation of slowness with that which is “regressive, idle and reactionary". In the abstract I can see the appeal of ‘slow scholarship’ but in a practical and affective sense it is not for me. Perhaps my dispositions have been too thoroughly moulded by the world of blogging. Heather Mendick from the CelebYouth project talked about her experience of how blogging was changing her academic practice at the BSA Digital Sociology event last July. Then appropriately enough she blogged about it afterwards:

I love this website that Kim, Laura and I have created. I enjoy doing online communication – the immediacy and supportive feedback are more to my taste than the long timescales and anonymity associated with publishing via peer-reviewed journals. Yet I am disturbed by the alignment between fast academia and going digital.

Writing a blogpost rather than an entry in an research diary generates fast responses and produces a useful and measurable output. By using google analytics I can track how many people accessed which parts of our website, how long they spent there and whether or not they stayed on the site. I can find out how many people each of our posts reached through Facebook and how many people are talking about them. Twitter and YouTube too provide multiple ways of measuring the ‘impact’ of our work – which tweets get favorited, which retweeted and which disappear without trace? This all fits remarkably well with the insistence on accountability, and with the growing impact agenda. Moreover, documenting a project online aligns with the contemporary compulsion to tell (what Michel Foucault called confession).

Of course there are choices about how we engage, and [4]as Laura discusses we’ve done it collectively – I really like the way that no-one knows for sure which of us is behind the Twitter (though it is usually Kim). It seems to subvert the emphasis on the individual, entrepreneurial academic, that the internet might otherwise fuel. I feel we need to be continuing to ask: How is it changing research? What are the alternatives?
I end with one way that I feel this aspect of digital sociology is changing my practice as an academic. While, there’s no clear distinction between the descriptive and the analytic, the need to formulate my ideas into something that can be blogged or even tweeted is moving me more quickly from a more descriptive to a more analytic register. My favourite example of this is from an Amy Hempel short story [5]The Harvest cited by [6]Chuck Palahniuk in Non-Fiction. Here, instead of being offered the pre-analysed formulation that ‘the boyfriend is an asshole’, Hempel describes how, after a car crash, ‘we see him holding a sweater soaked with his girlfriend’s blood and telling her, “You’ll be okay, but this sweater is ruined”’. While the second account is far from innocent, it is very different and it allows one’s thoughts to follow different lines of flight. Which lines of flight does the internet open up and which close down?

http://www.celebyouth.org/the_internet_and_fast_academia/

The approach to blogging I’ve gravitated towards in recent years is one which shares the work in progress. I treat blogging as a public notebook in which to develop ideas and iteratively work them up into more coherent wholes. So on this level the dichotomy between ‘slow scholarship’ and ‘fast scholarship’ doesn’t quite make sense to me: the extremely fast bits of it slowly lead towards more fully worked out publications. Nonetheless I sometimes feel frustrated by my own tendency, which I don’t entirely understand, to rush... to constantly be looking towards the next idea, the next project and the next paper. My ambivalent inclination towards being a productivity ninja comes in part from this rushing. There are so many things to do, to read and to write that I experience inefficient habits as internal constraints on action. So while ‘productivity’ culture can be disciplinary, particularly when it’s imposed from the ‘top down’, I would also insist that it can be empowering. I think the problem is that much of productivity culture is bullshit. The LSE Impact post does a good job of summarising this tendency and the problems with it:

University senior managers seem to understand the busy academic and offer the typical managerial solution: attention and time management training. However, rather than questioning the very causes that lead to and co-produce the conditions of hurry sickness, academics are advised to adapt by keeping up, going faster, press ahead, be resilient and agile, boost productivity. Using the uncanny #HigherEdBiz Newspeak, staff development departments encourage academics to clench their teeth and become undestroyable time warriors. Training sessions such as [7]How to be a productivity ninja’ and courses offering time management techniques to enable regular academic writing, effective reading and to help handle information overload emerge. Not only that: these initiatives present themselves as cures for hurry sickness – as newage-ish zen-like [8]’time therapies’ for ever-busier academics: ‘A "Productivity Ninja" is calm and prepared, but also skilled and ruthless in how he or she deals with the enemy that is information overload’ we can read in the ad for this training. The key problem with such programs is that, next to producing a group of fast-moving response-able ‘speed winners’, they also render the increasing academic workload and associated time-shortage, alienation, burnout and demotivation (experienced diversely at different institutions; variables such as gender and academic rank dramatically affect this experience) as a personal and individual issue – rather than stressing their origin in the structural transformation of the academic environment.

Democratic decision-making, deliberation, will-formation and policy implementation need to be underpinned, as Robert Hassan says, by natural unforced rhythms (which do not have to be slow). This principle seems entirely salutary – if not straightforwardly necessary – in the academic environment. However, if academics and universities are not taking the lead in such a program, one wonders whether anyone at all can resist oppressive nature of late modern fast time. In order to resist academic hurry sickness, it would perhaps have to be those academics holding senior administrative positions who need
to legislate the principle of scholarly time autonomy as an explicit political demand – and perhaps as an ethical principle integral to the education and science governance.

http://blogs.lse.ac.uk/impactofsocialsciences/2013/11/20/in-search-of-scholarly-time/

I’m not sure what I think about the politics of this but on a personal level I find it extremely plausible. The problem with productivity culture is not the productivity per se but rather the lack of autonomy implicit in its valorisation. When productivity goes hand-in-hand with autonomy then much of my objection vanishes. The genuine productivity ninja cannot be anything other than autonomous.

CfP: Digital Sociology PhD/ECR Workshop (2013-12-04 08:00)

Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from peers and established academics in a supportive environment.

The event will take place between 11am to 4pm on February 19th at Goldsmiths College in South London. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.

If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn’t been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.

The Politics of Hip Hop (2013-12-05 08:00)

There’s a [1]great article on Media Diversity exploring the implications of “Hip Hop’s successful [2]crossover from an underground culture to a commercially viable pop-commodity” for its politics. It argues that cultural shifts in Hip Hop cannot be understood in isolation from the radically transformed structure of ownership that has ensued from
its corporate mainstreaming:

Why have images of hypermasculine black males and objectified black females become the norm on our televisions and radios? Many point to the fact that only a handful of conglomerates control the vast majority of mainstream music, and that the core audience for stereotypical rappers is undoubtedly young white males. Furthermore, the predominantly white executives of these media giants are believed to assume that their primarily ‘white male’ audience would all rather listen to 50 Cent than Arrested Development. Former Def Jam President Carmen Ashhurst is unequivocal about her experience of this shift, she says:

The time when we switched to gangsta music is the same time that the majors bought up all the labels. I don’t think that’s a coincidence…. We went to Columbia, then the next thing I know... we’re pushing a group called Bitches with Problems.”

Needless to add, allegations like these are not isolated. Recently, Hip Hop legend and former Def Jam South President Scarface argued that white executives controlled the negative depiction of black people:

...these old-ass punks that’s running these record labels that’s in the powerful positions to dictate what the black community hears and listens to... There’s no fucking way that you can tell me that it’s not a conspiracy against the blacks in hip hop... [white executives who have] never tried to embrace this culture try to dictate whats hot and what’s not... In 25 years... Elvis will be the face of Hip Hop…”

Although blunt, an objective glance at the facts reveals that Scarface has raised an important point. In 2010, U.S. Senator Robert Menendez – the only Hispanic in the Senate – compiled a report into corporate diversity among the Fortune 500, including the six media conglomerates that control 90 % of everything consumed in America. Menendez found that 70 % of all board members and CEOs of these companies were white men, while black Americans were under-represented by over 50 %.

The full article is essential reading for anyone interested in Hip Hop. It connects nicely to some of the themes discussed by Akala and Lowkey in this video we posted last year:
Hi, this is my article (Twitter: @IAmAkwesi) Glad you enjoyed it! This is the debate we need to be having in Hip Hop. UK artists like Akala, Lowkey (& many more) need greater exposure as an alternative to the inconsequential, exploitative mainstream.
CfP: An Invitation to Digital Public Sociology (2013-12-05 12:00)

What does ‘public sociology’ entail in a world of facebook, twitter, youtube, slideshare, soundcloud, pinteret and wordpress? What affordances and constraints do these tools entail for the task of “taking knowledge back to those from whom it came, making public issues out of private troubles, and thus regenerating sociology’s moral fibre”? What implications do these tools have for the relationship between the public and private in the occupational biographies of individual sociologists and, through aggregation and collective organisation, the discipline as a whole?

Short articles (1000 to 4000 words) are sought for an open access edited book which explores conceptual, methodological or practical aspects of Digital Public Sociology. If you would be interested in contributing then please send an abstract of 200 words or less by December 31st 2013. The final articles would be needed by March 31st 2014, with the intention of launching the collection in the summer of 2014. Please send abstracts (or questions) to mark@markcarrigan.net.

Research Priorities... or Research Bubbles? (2013-12-06 08:00)

Ever been baffled by what research gets funded and what doesn’t? Ever suspect that the whole process is fundamentally irrational? There’s a summary here of an interesting paper which argues that the increasingly dominant incentive structures of research funding are prone to producing research bubbles:

“In finance, the first condition for a bubble occurs when too much liquidity is concentrated on too few assets. The second is the presence of speculators. In science, similarly, if too much research funding is focused on too few research topics, and all researchers speculate in the same fashionable scientific templates to attract funding, a potential science bubble may be forming," [1]professor of Formal Philosophy Vincent F. Hendricks from University of Copenhagen explains.

[2]

Number of papers published annually in the neurosciences 1958-2008. Source: Web of Science

In the article [3]"Science Bubbles" just published in Philosophy and Technology, professor Vincent F. Hendricks and postdoc David Budtz Pedersen trace the mechanisms that can result in science bubbles. They point to the past decade’s massive investments in cognitive neuroscience as a potential bubble – culminating with President Obama’s recent endorsement of the one billion dollar Brain Activity Map Project and the European Commission’s 500 million euro Human Brain Project.

“These investments have been preceded by a dramatic rise in fields that attach ‘neuro’ to some human behaviour or trait with promises that the techniques of neuroscience will explain it – and into
game-changing explanations of the human mind," Budtz Pedersen says and adds that studies have shown that peer reviewers and lay citizens are more likely to find explanations of e.g. psychological phenomena more convincing when they contain neuroscientific information, even when it is not relevant to the explanation.

---

**Detaching ‘agency’ and ‘choice’ from voluntarism (2013-12-07 08:00)**

I read an [1]interesting paper by Ros Gill earlier which nicely frames one of my main theoretical interests. It’s a reflection on shifting fashions in how the relationship between culture and subjectivity has been conceptualised within cultural studies. This bit in particular caught my attention and the clarity with which it diagnoses this common explanatory tendency is commendable:

A recent article by Duits and van Zoonen (2006) is in many ways typical of this latter trend. It examined the moral panics in Dutch society occasioned by two articles of clothing – the Islamic headscarf and the "hypersexualized" (their term) g-string. Duits and van Zoonen assert that public reaction to these garments denies girls and young women “their agency and autonomy”, and they argue that the proper response from feminists and other critical intellectuals is that all girls’ sartorial decisions should be understood as autonomous choices. Such a position, they argue, is respectful of girls’ own agency. Their call for empirical research that listens to and respects young women’s voices is clearly important. But I am sceptical of the terms “agency”, “autonomy” and “choice” that are mobilized so frequently in their argument. To what extent do these terms offer analytical purchase on the complex lived experience of girls and young women’s lives in postfeminist, neoliberal societies? Moreover, what kind of feminist politics follows from a position in which all behaviour (even following fashion) is understood within discourse or free choice and autonomy? The girls in Duits and van Zoonen’s argument seem strangely socially and culturally dislocated. They neither seem to operate in a world in which there are authoritarian parents or teachers, or in which organized religion or fashion exert any influence. Indeed, in the desire to “respect” girls’ choices, any notion of cultural influence seems to have been evacuated entirely. Yet how can we account for the dominance of a fashion item such as a g-string without any reference to culture? Why the emphasis on young women pleasing themselves when the look that they achieve – or seek to achieve – is so similar?

On one level I don’t think this is a particularly difficult problem. We make choices but we do so in circumstances
not of our own choosing. But to actually put this theoretical postulate into practice is much trickier. Nonetheless it frustrates me how frequently people seem to assume that voluntarism follows inevitably from an attentiveness to individual agency. This is a methodological problem not a theoretical one.

2. [http://www.palgrave-journals.com/sub/journal/v25/n1/abs/sub200828a.html](http://www.palgrave-journals.com/sub/journal/v25/n1/abs/sub200828a.html)

YYYYYYYYYES. I'm encountering this so much with my dissertation right now. I think the problem comes because of the hegemony of rational choice theory. The cultural and social payoffs (including an avoidance of stigma) women would hope to gain from wearing g-strings are impossible to quantify. Because we can’t explain why—with objective numbers—why someone would dress that way, we have to just assume it’s voluntarism. The conflation makes it simple and easy, but dramatically diffuses any conflict inherent in the study.

The Sociological Imagination Today: The Need for Biology (2013-12-07 08:42)

C.W. Mills' (1959) call for a 'Sociological Imagination', the suggestion that social, historical and biographical dimensions be considered as integral in the analysis of social life, is important. By highlighting the interplay between individual and society, between private ‘troubles’ and public ‘issues’, Mill forces the reader to examine the contextual and situated nature of their existence. This consciousness-raising manoeuvre is important as a greater contextual awareness of the numerous forces which shape and constrain social actors provides the potential to better inform policy and reconceptualise practice. Explanations as to how and why various institutions, discourses, norms and values have emerged become possible and the imagining of alternatives feasible. As such, the Sociological Imagination offers tremendous emancipatory potential. For you can’t escape the quicksand if you don’t know you’re in it. Or, if you can, it will be more by luck than judgement. But Mill’s conception of the Sociological Imagination is arguably insufficient. It does not go far enough and is missing an essential piece of the puzzle: biology. To offer a fuller, more complete picture, it is important to consider the role of biology and remove the anthropocentric bias still so prevalent in social research.

The attempt to apply biological explanations to understanding social phenomena is not a new enterprise but in recent times has been popularised by E.O. Wilson (1975). The ideas he suggested have been fiercely debated, with objections often raised to the notion that genetic traits have a significant role in the explanation of human social phenomena. This is particularly controversial when suggesting that various anti-social or criminal behaviours have a genetic origin or influence, as; 1) such theories can potentially be misappropriated by certain groups or individuals in order to discriminate against others and, 2) it arguably either completely or partially removes moral culpability from an actor regarding said act. After all, it might be said, to what extent can it be considered ‘fair’ to punish someone for behaviour(s) not entirely of their choosing? This is a point that shall be returned to shortly. Such objections, however, arguably have at their root a form of anthropocentric bias and thought that elevates humans above the natural world - separate, special and distinct from all other creatures. But such an approach ironically serves to obscure our own self-understandings. By elevating humans in such a manner, we neglect our own biological roots and thus fail to appreciate an essential feature of our existence. Let us take, for example, a man who is depressed as a result of a recent divorce, and who is now sitting alone in his bedroom, intermittently letting out exacerbated sighs and crying. For his actions to be fully intelligible, it is necessary to understand concepts and social institutions such as love, marriage and divorce, as well as the potential physiological responses to, and interactions with, said concepts. Tears and sighs, in this instance, are, at least in part, physiological responses to emotional stimuli, responses which have emerged and are only possible as a result of the evolutionary process.
Appreciating the finite plasticity of the human body and the external physical environments humans inhabit has practical implications for our understanding of forms of social behaviours. As Guang (2006) suggests, ‘Taking genetic heritage or other biological factors into account promises a fuller understanding of social outcomes and a more precise understanding of the roles of social context’ (Guang: 2006: p. 148). There have been recent studies, for example, which suggest that, ‘...genes with social effects have now been identified...’ (Foster et al: 2007: p. 79). Much of this research has been concerned with the possibility of discovering genes that influence the ability of individuals to recognize the differences between cheating and cooperative behaviors. The ability to recognize and distinguish such behaviors would seem an integral and practical prerequisite for social existence. It would also seem, however, as Rosenberg (2008) suggests, to necessitate some manner of, ‘... free-rider detection device...’ (Rosenberg: 2008: p. 183 - italics in original). And, indeed, studies suggest that, ‘...mutations that affect cheating and recognition behaviors have been discovered’ (Foster et al: 2007: p. 74). Brembs (2010) drawing upon developments in Neurobiology, has argued that there is a genetic basis for ‘free will’ and suggests that, in this regard, humans are not unlike other animals in that we are constrained by our biology regarding the perception of choices open to us. Additional research also suggests that fears and phobias can be genetically transmitted across generations, potentially providing an explanation for seemingly phobic attitudes and behaviours as a response to innately perceived threats (Dias and Ressler: 2013). If the biochemistry of the body and the brain influence the ability of humans to receive, store, process and transmit information, then an understanding of culture and its impact on human behaviours is incomplete without a greater appreciation of corporeality. There appears to be growing evidence, then, to support the idea that our biology plays a significant role in influencing social behaviors.

This is not meant to suggest, however, that we should all uncritically ascribe to the tenets of Sociobiology but, rather, that an honest appreciation of the influence of biology on behavior and culture is necessary for more fully understanding social life. Even if we are influenced by our biology, this is by no means the end of the story. Studies on other species have suggested that the issue is far from clear-cut and that, ‘...the trait a gene codes for will have to be understood as specified only relative to an environment’ (Rosenberg: 2008: p. 192). From this perspective, it is essential to consider environmental factors that can influence the degree to which particular genes may exert themselves. We need to recognize though, that the potential varieties of genetic expressions within any particular environment are finite. There is not an infinite amount of plasticity and thus potential social features and behaviours are limited. The potential for a tree or a human to grow, to feed, or to mate is, for examples, limited by the combination of inherent genetic potential and specific environmental factors present at any particular time. An appreciation of the delicate interplay between biology and culture is necessary, then, in order to more fully comprehend social life.

True freedom, empowerment and emancipation will only come when humans come to understand and appreciate the biological constraints on their existence. So, whilst Mill states,

‘Seldom aware of the intricate connection between the patterns of their own lives and the course of world history, ordinary men do not usually know what this connection means for the kinds of men they are becoming and for the kinds of history-making in which they might take part. They do not possess the quality of mind essential to grasp the interplay of individuals and society, of biography and history, of self and world.’ (Mill: 1959: p. 2),

the use of biology in the buttressing of Mill’s Sociological Imagination arguably provides the missing piece of the puzzle through which to examine afresh human behaviour. When mainstream sociology comes to appreciate this, greater insights and impact are likely to be achieved. If Mill’s cry for a sociological imagination is to be realised, if it is to reach its logical conclusion and genuinely offer explanatory and potentially emancipatory potential, then its adherents must begin to take corporeality and its ramifications more seriously. Until then, the Sociological Imagination remains incomplete.

Richie Nimmo (2014-01-24 01:00:53)
Good article. I’m generally sympathetic. Ted Benton made the case well in an old article in Sociology called ’Beyond BioPhobia’, I forget the year. Vital to tread carefully though as there is a lot of terribly reductionist and ideologically suspect stuff out there in the name of biological explanations of social phenomena. Also, isn’t the real point to question the conceptual separation of the ’biological’ and ’social’, which is different from viewing them as interrelated? The question is also interestingly related to how the human/animal divide is inscribed and policed. A last point - important to be critical of how ’biology’ is constructed and mobilised in knowledge-practices, as it’s not simply a real domain; worth considering for example that biology is not reducible to genetics, which is only the current dominant paradigm - equally viable to prioritise the level of the organism, group, or even eco-system, in visions of ’the biological’.

Thank you. Absolutely, you’re right. There is a lot of quite crude, reductionist and ideologically driven work out there appropriating biology for suspect reasons that we need to be careful of. I just feel we need to address what I believe to be the anthropocentric bias still so prevalent in social research and the artificial divide between the ’biological’ and the ’social’. I think you’re right that the conceptual separation needs questioning and much more detailed scrutiny if we are to more fully comprehend social life. I’ve come across so many sociologists that downplay the role of biology and dismiss it as of little influence, I just feel that as a community we’ve gone too far in that direction. We need to strike a balance and this brief piece was intended to contribute to that rebalancing.

Cuteness has a global reach: it is an affective response; an aesthetic category; a performative act of self-expression; and an immensely popular form of consumption. This themed issue of the East Asian Journal of Popular Culture is intended to launch the new, interdisciplinary, transnational academic field of Cute Studies.

Cute culture, a nineteenth century development in Europe and the US, with an earlier expression in Edo-era Japan, has flourished in East Asia since the 1970s, and around the world from the turn of the new millennium. This special issue seeks papers that engage with a wide variety of both the forms that express cute culture, and the platforms upon which its articulation depends. Thus, the field of Cute Studies casts a wide net, analyzing not only consumers of cute commodities, but also those who seek to enact, represent, or reference cuteness through personal presentation or behavior. Since these groups intermingle, cute culture may be seen as a type of fan community, in which the line between consumers and producers is continually renegotiated. Cute Studies also encompasses critical analyses of the creative works produced by practitioners such as artists, designers, and performers, as well as the circumstances that determine the production and dissemination of these works.

Defined as juvenile features that cause an affective reaction, somatic cuteness follows the Kindchenschema set down by Konrad Lorenz (1943), and supported by later research: namely, large head and small, round body; short extremities; big eyes; small nose and mouth. Whether genetic, or activated by learned signals, the cuteness response is also associated with a range of behavioral aspects, including: childlike, dependent, gentle, intimate, clumsy, and nonthreatening. Such physical and behavioral features trigger an attachment based on the desire to protect and take care of the cute object. This deterministic nature of the cute affective register is highly pertinent to humanities scholars in the way it is expressed through categories of difference such as gender, race, or class. Furthermore, the difference in status between the subject affected by cuteness, and the harmless cute object, denotes a power differential with important political and ideological implications. The appeal contained within cuteness seeks to establish a reciprocal relationship of nurturing/being nurtured, and the subject who responds to this appeal faces very different ethical obligations depending on whether the cute object is a thing, an animal, or a human being.

Possible topics for papers include the following (Note: a specific focus on the geographical region of East Asia is not required of submissions):

Cute Cultures of East Asia
Cute Commodities and Consumers of Cute: Structure vs. Agency
Cuteness and Gender
The Science of Cute
Cute Histories
Practitioners of Cute
Cuteness and Race
Queering Cute
Cuteness and Disability
The Cuteness of Animals/Zoomorphic Cute
The Dark Side of Cute (the grotesque, violence, pedophilia, etc.)
Digital Cute (social media, memes, etc.)

The deadline for submissions to this special issue of EAJPC is: 15 April, 2014

Please submit papers to: [1]CuteStudies@gmail.com
A dialogue between phenomenology and realism in pedagogical and educational research (2013-12-08 14:00)

The workshop forms part of the activity to support our [1]Social Sciences strategic priorities for 2013-14 and falls under the Teaching research methods stream. The workshop is free to attend for delegates from both subscribing and non-subscribing institutions but booking is essential to secure your place as numbers are limited.

The workshop aims to stimulate debate around the philosophical underpinnings of different research methodologies, whose shared terminology is often interpreted in radically contrasting ways, and in particular, to encourage dialogue between realist and phenomenological research traditions. It is intended for pedagogical and educational researchers looking to expand their methodological repertoire and to explore new ways of teaching research methods.

The seminar uses the example of education research, itself an interdisciplinary subject, to explore connections between social scientific research and enquiry in the humanities. The inter-disciplinary focus of the seminar is addressed by exploring how education research (usually housed within the social sciences) is transformed by being considered as a humanistic (philosophical and artistic) endeavour. The event will develop participants’

(a) methodological expertise – through exploration and discussion of philosophical terminology understood differently in different research traditions i.e. ontology, truth, phenomena
(b) self-understanding of research and teaching identity – through responding to the theme of education researcher as artist/poet and identifying new pedagogical approaches to research training

(c) inter-disciplinary competence in research methods teaching – through engaging in dialogue with researchers with a range of different educational research perspectives and reflecting on different pedagogical practices in research methods teaching

The workshop will have a strong capacity building element, furthered by encouraging participation by early career researchers and advanced doctoral students.

It is widely acknowledged that the positivist/interpretivist distinction in social and educational research has proven inadequate as a description of methodological approaches in these fields and as a heuristic for interpreting their historical development. However, among the descriptions of how this dichotomy can be resolved, transcended or sublated, two new ‘worlds’ have emerged, centring around a phenomenological perspective on the one hand, which claims that research into the educational experience has more in common with a literary or artistic endeavour than a ‘methodology’, and a perspective on the other hand that seeks to reconceive a social science in a ‘critical realist’ or ‘post-positivist’ light.

This event will provide opportunities for researchers at different career stages to engage in philosophical exploration of the points of departure or convergence between the two traditions. In particular, discussion will centre on the different ways in which each has appropriated key terms – ontology, epistemology, reality, truth and the phenomenon. It will also explore the spectrum of ‘phenomenologies’, which range from a technically developed empirical methodology to a poetic note of caution about the place of ‘method’ in educational research, and the range of realist proposals, with their associated debates. Questions to be addressed include: Can the two approaches find common ground through a hermeneutic exploration of their vocabulary? Does each play a different role within the research community, such that, for example, phenomenology might provide for an examination of the ‘questions’
to which the critical realist method can be applied? Is there the possibility, as some scholars have suggested, of the emergence of a 'phenomenological realism'? What are the implications for research methods teaching in education?

Proposed programme

9:30-10:00 Registration

10:00-10:45 *Phenomenological Inquiry and Phenomenological Pedagogy*

10:45-11:30 *Exploring Education Through Phenomenology*

11:30-12:00 Coffee

12:00-12:45 *Realist Social Theory: The Morphogenetic Approach*

12:45-13:30 *Education, Epistemology and Critical Realism*

13:30-14:15 Lunch

14:15- 3:00 Exploring key theoretical terminology in relation to phenomenological and critical realist inquiry (two parallel workshops)

3:00-3:45 Emerging understandings of the relationships between philosophical traditions, their methodological implications, and associated research methods pedagogies (panel discussion with the four key presenters)

3:45 – 4:00 Future collaboration and activity (plenary discussion)
The Militarization of America's Police Forces (2013-12-09 08:00)

SWAT teams are familiar figures from films and TV shows. But where did they come from? I’ve been fascinated for years by the militarization of policing and it stems, in part, from wanting to understand how this basically sinister trend was so rapidly normalised through popular culture. It’s one of those topics I occasionally find myself losing a few hours to reading about online, in this case prompting the present post.

Surprised as I am to find myself reading, let alone posting, something from a right wing libertarian think tank, this analysis from CATO of the paramilitarization of US policing is excellent. It offers an incisive summary of how a number of trends (e.g. the ‘war on drugs’, the rise of ‘knock raids’, the building of links between police and the defence department, the reutilisation program which transfer military hardware to police forces) have converged to drive a heretofore unprecedented degree of militarization in US policing. Police departments are now imposing quotas for drug arrests in order to win federal funding, which they’re pursuing through raids which utilise ‘donated’ military hardware:

A little-known Pentagon program has been quietly militarizing American police forces for years. A total of $4.2bn worth of equipment has been distributed by the Defense Department to municipal law enforcement agencies, with a record $546m in 2012 alone.

In the fine print of the National Defense Authorization Act for fiscal year 1997, the "1033 program" was born. It allows the Defense Department to donate surplus military equipment to local police forces.

Though the program’s existed since the 1990s, it has expanded greatly in recent years, due, in part, to post-9/11 fears and sequestration budget cuts. The expanse, however, seems unnecessary given that the Department of Homeland Security has already handed out $34bn in "terrorism grants" to local polices forces – without oversight mind you – to fund counter-terrorism efforts.

Additional militarization, then, deserves congressional attention as the program is harmful and must be scaled back for a number of reasons.

First, the program is transforming our police into a military. The results of such over-militarized law enforcement are apparent from the dispersion of Occupy protesters in Oakland to the city-wide
lockdown in Boston.

http://www.theguardian.com/commentisfree/2013/oct/07/militarization-local-police-america

This is what these teams look like in action:

IFRAME: [7]//www.youtube.com/embed/05gLm6mSZ5M

Note: I use the qualifier 'basically' here in a deliberate fashion. I completely accept that there may be some situations which render something like a SWAT team a good idea. But the rapid expansion of this model is deeply disturbing.

The Pathology of the Rich (2013-12-09 21:47)

Chris Hedges on the nature and significance of the oligarchic class. His polemic take ties in nicely with what seems to be a recent resurgence in British sociology of research into elites. See the [1]recent issue of Discover Society for instance.

Preparing for life post-PhD (2013-12-10 08:00)

One thing I’ve gradually noticed in life is how easily advice can slide into being a performative justification of the choices the individual giving the advice has made in the past. Never does this seem to be more true than with academia, perhaps unsurprisingly given the potent combination of a preponderance of intensely ruminative people alongside career structures which have changed radically in a relatively short space of time. I don’t think this means academic career advice is worthless (far from it*) but it does mean everything should be taken with a pinch of salt. Receiving advice and thinking about what people are suggesting to you can be just as useful in helping you work out what your priorities are as it can be in helping you expand your understanding of objectively felicitous strategies.
This is all an elaborate preamble to highlighting this interview about preparing for a post-PhD career. It raises some important issues and is full of interesting thoughts but it really should be treated with caution. Though perhaps that went without saying. Does anyone have suggestions about preparing for post-PhD life or thoughts on the sociology of advice? We’d love to hear from you if so.

During my post-doc I was interviewed for a number of permanent academic posts around the UK. After my fifth interview rejection the third and final year of my funding was coming to an end. So I decided to leave academia and get a job in business instead. The main driver for me quitting academia was my unwillingness to accept part-time teaching and associated pay just to ‘stay in the game’ for a permanent academic post. My choice of sector, e-learning and web-based training, left the door open to a return to academia, but once I started in business I knew there was no going back.

[...]

As I said in my introduction, life after the PhD is very different and you need to be mentally prepared for this difference. One major change I believe you need to make in the final six months is to gradually switch off a powerful force that has sustained you for so long: deferred gratification. Delaying gratification is the ability to make do with less now, in the anticipation of future gains. It’s great when you’re in a structured environment like education, as it keeps you focussed on the end goal of achieving your qualification. It gives you the power to knuckle down and write that chapter, read that book, rather than give in to distractions and interruptions. But it’s not such a great capability when it comes to the next major priority after completing your PhD: finding a secure job that will pay you a decent salary and has benefits like a pension and health insurance.

So after having spent more than two decades of your life in school deferring gratification, you are suddenly in the position towards at the end of your PhD where you need to start to embrace it! All those things that we as PhDs have had to put off: having a family, buying and furnishing a home, going on holiday, paying off debt, suddenly become a real possibility. In fact you have to transition quite rapidly from the approach of just getting by, into someone who can really start to ‘make a living’. You have to quickly learn how to present yourself to a hiring committee (i.e. no longer act like a grad student), negotiate yourself a good salary and benefits package, and start work in an unfamiliar place with sufficient professionalism to get you through your probation. [2]The Professor Is In website has lots of great advice in this area by the way, relevant to both academic and non-academic careers.

The true cost of adjuncting

Already I can hear people yelling ‘Yeah great in principle Chris we would wholeheartedly love to embrace gratification like you say, but where are all the well-paid jobs in academia?!’ True enough, the academic job market is currently terrible. Many of our peers are toiling away in under-employment as a result: working as adjuncts, or employed in the university bookshop, as a lab assistant or as a local tour guides, waiting for things to improve. However, what started as a few months of ‘staying in the game’ can easily extend into a few years and then into a whole adjunct or under-employed way of life. As many of our peers have found to their cost, especially in the US, temporary and part-time work is now entrenched in the higher education system. In the US there is the now infamous statistic that 75 % of faculty work part-time on temporary contracts, while in the UK, more than a third of academics are now on fixed-term contracts, according to a recent story in [3]The Guardian. The dream job that so many aspire to may turn out to be just that: a dream that will never materialize. Ironically the academy, that last bastion of tenure, is today fronted by an army of casual workers on short-term and temporary contracts.
What does frustrate me about this is how important advice about not getting stuck in a rut waiting for the 'next' career stage which might never come co-exists with an enthusiastic reiteration of a similarly linear normative trajectory (after you've done X, your next priority is Y and you can no longer do that within the academy). An increasing awareness of ‘alternative’ careers for PhDs is a hugely important goal but it’s one which really shouldn’t be framed in such dichotomous terms. It’s interesting to encounter the perspective offered in the interview but I have a lot more time and sympathy for ‘alt-academic’ and ‘para-academic’ conceptions, to name but two, than I do for the kind of understanding offered here. If you’re interested in these issues then please do get in touch (mark AT markcarrigan.net) as we have a project planned in the not too distant future which will be exploring the changing experience of career structure within the academy, perhaps as a prelude to a substantive research project in the longer term.

I’ve found it’s much more useful to seek advice about how a particular procedure or practice works than what someone should do under some given circumstances. But pursuing this thought risks slipping into writing an entirely different blog post.

Enhancing the learner experience in HE (2013-12-10 19:33)

The latest edition of the journal Enhancing the Learner Experience in Higher Education (ELEHE) is out. So now we are looking for papers for the next or following issues. Personally, it was be interesting to see a greater number of papers around how public engagement has a positive experience on learner’s experience (or possibly collaborating on one). The bit below hopefully answers some of the questions you might have. If you have any questions please get in contact on scott.turner@northampton.ac.uk

What is ELEHE?

ELEHE is an open-access (with no page fees!), interdisciplinary, international, peer-reviewed online journal published twice yearly, enthusiastically addressing the challenge of enhancing learning in Higher Education. Papers are welcome which embrace the student voice to help improve the learner experience in ways which have been shown to impact positively on students. As well as learner experience in the teaching environment it also includes all aspects (including students and student voice within public engagement activities) that improve the learner’s experience in Higher Education.

The journal is interdisciplinary in scope. It welcomes a diverse range of articles, drawing on a variety of critical, comparative and reflective approaches responding to key agendas in Higher Education. Committed to evidence-informed practice, it will also encourage the setting of new agendas where the student experience can be enhanced.
When does my paper need to be submitted by?

We run an open call and are happy receive papers through out the year.

How is the paper reviewed?

At least two referees will review the paper.

What type of papers can I submit?

The journal welcomes:

- research articles (3000-6000 words);
- critical case studies (3000-4000 words);
- short reports (up to 2000 words);
- book reviews (up to 1000 words).

Details of the journal focus and scope, along with author guidelines can be found at [1]http://journals.northampton.ac.uk/index.php/elehe/about

What is it going to cost me to publish?

It is currently a free, open access, peer-reviewed journal. There are no page charges, etc. The University of Northampton supports the journal, including infrastructure, paying for DOIs, etc.

If you want to discuss ideas about possible articles, or want guidance on preparing your submission, please contact the Editors

Dr Rachel Maunder (Chair of Editorial Team) Rachel.Maunder@northampton.ac.uk

Dr Simon Sneddon (Editor; and Book Reviews Editor) Simon.Sneddon@northampton.ac.uk

Anna Crouch (Editor) Anna.Crouch@northampton.ac.uk

Dr Scott Turner (Editor) Scott.Turner@northampton.ac.uk

The Journal Enhancing the Learner Experience in Higher Education can be found at:[2]http://www.northampton.ac.uk/elehe

1. [http://journals.northampton.ac.uk/index.php/elehe/about](http://journals.northampton.ac.uk/index.php/elehe/about)

CfP: An Invitation to Digital Public Sociology (2013-12-10 19:34)

What does 'public sociology' entail in a world of facebook, twitter, youtube, slideshare, soundcloud, pinterest and wordpress? What affordances and constraints do these tools entail for the task of "taking knowledge back to those from whom it came, making public issues out of private troubles, and thus regenerating sociology's moral fibre"? What implications do these tools have for the relationship between the public and private in the occupational biographies of individual sociologists and, through aggregation and collective organisation, the discipline as a whole?

Short articles (1000 to 4000 words) are sought for an open access edited book which explores conceptual, methodological or practical aspects of Digital Public Sociology. If you would be interested in contributing then please send an abstract of 200 words or less by December 31st 2013. The final articles would be needed by March 31st 2014, with the intention of launching the collection in the summer of 2014. Please send abstracts (or questions) to mark@markcarrigan.net.

Launch of ‘SexGen Northern Network’ in the UK (2013-12-10 19:37)

Dear Colleagues,

We are delighted to announce the launch of the 'sexgen Northern Network'.

'sexgen' is a collaborative interdisciplinary network bringing together gender and sexuality based research centres around the North of England. We aim to bring academic research, writing and thinking on gender and sexuality into conversation with the ideas, cultural expressions and knowledges of community groups, cultural sites and activist organisations. Series organising contacts are: Sally Hines, Centre for Interdisciplinary Gender Studies, University of Leeds: [1]s.hines@leeds.ac.uk and Surya Monro, Centre for Research in Social Sciences, University of Huddersfield: [2]s.monro@hud.ac.uk.

In 2014-2015 sexgen will hold a series of free seminars, details of which will be forthcoming. Seminars will be themed to reflect current and emerging themes within gender and sexuality studies.

Please find attached the Network flyer and the flyer for the first seminar: Seminar 1: February 28th 2014, The Centre for Research in Social Sciences, University of Huddersfield: 'Compulsory Sexualities'.

We would be grateful if you could publicize 'sexgen' among your networks.

We look forward to seeing you at future events.

With best wishes,

Surya Monro and Sally Hines.

[3]
sexgen is a collaborative interdisciplinary network bringing together gender and sexuality based research centres around the North of England. We aim to bring academic research, writing and thinking on gender and sexuality into conversation with the ideas, cultural expressions and knowledges of community groups, cultural sites and activist organisations. Series organising contacts are: Sally Hines, Centre for Interdisciplinary Gender Studies, University of Leeds: s.hines@leeds.ac.uk and Surya Mono, Centre for Research in Social Sciences, University of Huddersfield: s.mono@hud.ac.uk. The other Universities belonging to the Network are Durham, Lancaster, Manchester, Newcastle, Sheffield and York.

In 2014-2015 sexgen will hold a series of free seminars, details of which will be forthcoming:

Seminar 1: February 28th 2014, 2.00-6.00pm: Centre for Research in Social Sciences, University of Huddersfield:

Compulsory Sexualities

This seminar provides a space for us to explore different forms of erotic imperative and their effects. It links debates about the commodification of sexuality with analysis of the ways in which compulsory sexualities are embraced, celebrated, avoided and resisted. Why is active, partnered sexual expression so valorised in Anglophone societies? In what ways are we, as subjects, influenced by dominant discourses about healthy sexualities? How do these discourses impact on different social groups, in terms of gender, ethnicity, ability, age, and sexual identities, as well as other social characteristics? What alternative sexual identities (for example asexuality) are emerging in marginal social spaces, and are marginal social spaces imbued with non-normative compulsory sexualities?

Speakers:
Mark Carrigan (University of Warwick): Asexuality
Surya Mono (University of Huddersfield): Biphobia and the hypersexualisation of bisexuality
Christina Richards (Notts and Nottinghamshire Healthcare NHS Trust Gender Clinic and at West London Mental Health NHS Trust (Charing Cross Gender Clinic): Trans sexualities/trans sexualities
Eleanor Wilkinson (University of Leeds): Compulsory coupledom
Jo Woodhouse (University of Huddersfield): Compulsory sexuality and therapeutic discourse
Sharon Wray (University of Huddersfield): Ageing, ethnicity and compulsory sexualities

To register please email A.Holmes@hud.ac.uk. For enquiries please contact s.mono@hud.ac.uk
The Old New Politics of Class (2013-12-11 08:00)

In his inaugural lecture at the LSE, Mike Savage reflects on the Great British Class Survey and the key issues surrounding class in contemporary society. Bev Skeggs is the respondent. It's a really interesting talk on a number of levels. I was particularly intrigued by his argument about how the GBCS dataset, which was criticised for being non-representative, could nonetheless be a rich source of insights if treated in a quasi-ethnographic fashion. There are some related thoughts by Mike Savage on the LSE Sociology Department’s new blog.

Collisions, Coalitions and Riotous Subjects: Reflections, Repercussions and Reverberations (2013-12-11 19:35)

Another sociological resource to add to our collection:

1. Sociological Imagination and UK Riots:

Continuous Publishing and Being an Open-Source Academic (2013-12-12 08:00)

One of my favourite academic blogs is [1]Understanding Society. Written by Daniel Little, Chancellor for the University of Michigan-Dearborn, it covers an extraordinarily broad range of theoretical topics and sustains the rigour of serious academic writing while nonetheless being written in a relatively accessible way. I think it’s the best theory blog on the internet (by quite some way) and I’m always stunned by quite how much interesting stuff there is in the archives. The author, who has also done some excellent [2]video interviews with leading social scientists, describes the blog as a ‘hypertext book’ and you can find an index of topics [3]here.

My blog, UnderstandingSociety, addresses a series of topics in the philosophy of social science. What is involved in "understanding society"? The blog is an experiment in writing a book, one idea at a time. In order to provide a bit more coherence for the series of postings, I’ve organized a series of threads that link together the postings relevant to a particular topic. These can be looked at as virtual "chapters". This list of topics and readings can serve as the core of a semester-long discussion of the difficult philosophical issues that arise in the human sciences. It roughly parallels the topics I cover in the course I teach in the philosophy of social science at the University of Michigan.

I’d be interested to know if Little still sees it as a book. The sheer size of the blog’s archives suggest that it’s now something approximating a whole series of books. Clearly, it’s been a success. What I have always been curious about is the author’s institutional role (which I assume is the equivalent of a UK vice-chancellor) and the role which the blog perhaps serves as an outlet for his continued scholarship when he presumably has many other commitments competing for his time. I was pleased to see this [5]addressed recently in a really thoughtful and thought-provoking post. The blog recently had its sixth birthday and the author reflected on the evolution of the blog and his understanding of the role that it serves:

This week celebrates six years of Understanding Society. This effort represents over 850 posts, on topics ranging from current debates in philosophy about causal powers to China’s urban transformation to the conservative war on the poor, leading to nearly three million page views since the first post in 2007. I’m grateful to the communities of interested readers who have followed Understanding Society on [6]Twitter, [7]Facebook, and [8]Google Plus. There are almost 4,000 readers in these groups, and I’m grateful to everyone who has read, followed, tweeted, commented, and Googled the blog — thanks!

What I found particularly interesting was the author’s description of himself as an ‘open-source philosopher’. The integration of the blog into his working practices, such that it constitutes the starting point for traditional scholarship rather than something in opposition to it, is something which deeply resonates with me from the opposite end of the career spectrum. When I’ve written about [10]continuous publishing in the past, this is exactly what I’ve been trying to say:

Virtually all the new academic publishing I’ve done in these six years began as a couple of posts on Understanding Society. You might say I’ve become an “open-source” philosopher — as I get new ideas about a topic I develop them through the blog. This means that readers can observe ideas in motion. A
good example is the efforts I've made in the past year to clarify my thinking about microfoundations and meso-level causation. Another example is the topic of “character,” which I started thinking about after receiving an invitation to contribute to a volume on character and morality; through a handful of posts I arrived at a few new ideas I felt I could offer on the topic. This “design and build” strategy means that there is the possibility of a degree of inconsistency over time, as earlier formulations are challenged by newer versions of the idea. But I think it makes the process of writing a more dynamic one, with lots of room for self-correction and feedback from others.

The blog has also given me a chance to write about topics I've long cared about, but haven't had a professional venue for writing about. These include things like the reality of race in the United States; the lineaments of power that determine so many of the features of contemporary life; and the nuts and bolts of education and equality in our country. And along the way of researching and writing about some of these topics, I've come to have a better and more detailed understanding of them. Not many philosophers have such a wide opportunity to write on a variety of topics beyond the confines of their sub-disciplines.

It's really interesting to read about the blogging experiences of someone who has been a philosophy professor for decades. I was struck by the homology between his experiences and my own in spite of our very different positions within the higher education system. I wonder if there's something interesting about freedom here. As someone who has blogged throughout my PhD, I've experienced it as an intellectual outlet which has no real implications for my academic position (though retrospectively that's not really true). Perhaps Daniel Little feels similarly free about his blog, for entirely different reasons, as a result of his institutional position leaving scholarship via his blog being something he does for its own rewards rather than any need to make a living out of it. Reading his post has increased my confidence in the notion of 'continuous publishing' and strengthened my conviction that, with time, this is a way of working that will become ever more common. Both the short-term and long-term gains available to those who begin to work in this way are such that it seems inexorable, barring a trend towards heavy-handed institutional regulation or something along those lines. I think the implications of this are hugely significant. Here's how Pat Lockley and I described it in a blog post we wrote quite some time ago:

Perhaps it’s time to move from [12]'the Cathedral to the Bazaar'. These metaphors from the open-source software movement refer to contrasting models of software development. In academic terms we might see them as referring to distinct orientations towards publishing: one which works towards the intermittent, largely private, production of one-off works (papers and monographs → cathedrals) and the other which proceeds in an iterative and dialogical fashion, with a range of shorter-term outputs (blog posts, tweets, online articles, podcasts, [13]storified conversations etc) standing in a dynamic and productive relationship with larger-scale traditional publishing projects: the ‘cathedrals’ can be something we build through dialogues, within communities of practice, structured around reciprocal engagement with publications on social media platforms.

The idea which is still insufficiently clear in my own mind is how my advocacy of this relates to my belief in academic over-production. I've had a vague intuition for a long time about the potential ‘rebalancing’ away from ever more journal articles which ever fewer people read and towards a continuous making public of provisional work which ultimately leads to fewer though better journal articles. In a future post I'll try and elaborate my
understanding of the institutional constraints and enablements upon such as process, as well as what I imagine the landscape of scholarly publishing might look like when it is filled with a preponderance of open-source academics.

CfP: Troubling Narratives: Identity Matters (2013-12-12 14:02)

First Call for Papers

'Troubling Narratives: Identity Matters'

The Institute for Research in Citizenship and Applied Human Sciences,
University of Huddersfield, Thursday 19th and Friday 20th of June 2014.

Confirmed keynote speakers for the conference are:

Ann Phoenix, University of London

Ken Plummer, University of Essex
This conference builds on the University of Huddersfield's long held tradition of hosting a bi-annual conference on narrative research. It seeks to provide a fresh context for the development and dissemination of new research, ideas, perspectives and methodologies in the field of narrative research and enquiry and aims to bring together scholars working in a range of disciplinary fields. ‘Narrative’ is well known for its looseness of definition, its multiplicity of approaches and its interdisciplinarity, which over the years has led to a richness and diversity of narrative work. Identities, both private and public and individual and collective, have long been a focus for narrative researchers, where the content, form and effects of identity story-telling have been explored in a range of areas and contexts. The focus of 'Troubling Narratives: Identity Matters' is to address the ‘troubles’ that now surround contemporary narratives of identity, and the ways in which previous work may simultaneously inform but also trouble and be ‘troubled’ by new narrative work in the broad area of ‘identities’.

We invite contributions from researchers interested in using narratives across a range of disciplines including, sociology, gender studies, psychology, law, politics, criminology, philosophy, history, anthropology, social work, education, and business and management. Topics of interest to this conference include (though are not restricted to) the following areas:

Abstracts should be no longer than 250 words. We invite papers in the form of 20 minute oral presentations, and also workshop sessions and poster presentations (the format should be clearly stated in the abstract). All submissions must include the author/speaker(s) name, title of paper, university or organizational affiliation, and contact information.

The deadline for submission of abstract is Monday 3rd February 2014. Please email your abstract to the conference organisers at: troublingnarratives@hud.ac.uk with ‘conference abstract’ in the subject line. You will be notified about whether your paper has been accepted soon after Monday 10th March 2014.

1. mailto:troublingnarratives@hud.ac.uk
CfP: Sociologies of Everyday Life (2013-12-13 20:29)

Deadline for submissions: 31 August 2014

We are pleased to invite papers for consideration in the Sociology Editor’s Special Issue in 2015. The theme will be the Sociologies of Everyday Life.

Everyday life sociology is a well-established tradition in the discipline and interest in ways of understanding day-to-day worlds continues to be significant. These engagements are becoming increasingly interdisciplinary, across the social sciences as well as outside them. It is in this context that the 2015 Special Issue aims to provide a timely opportunity to take stock. This is intended to be a reflective moment – where has sociology arrived at in its attempts to think through the everyday? It is also intended to be an anticipative moment – what are the new logics, foci, approaches, uses, limits of sociologies of the everyday?

two big hassles in editing a book, and what you can do about them (2013-12-13 20:32)

My first post last week suggested that there were three good reasons to consider editing a book. This post focuses on the necessities of book editing. I’m writing about two big problems, not because I think that they should be enough to put you off, but because it’s better to go into the book editing process forewarned. So here they are.

Problem One: You got it wrong.

It’s easy to be convinced, when you’re doing the book proposal, that you’ve got a fantastic and original idea for an edited collection. You’ve got a novel focus and a new structure for putting the chapters together. You convinced the publisher it would work. You invited people to contribute. But now you’ve got the chapters in hand you can see that the grand idea isn’t actually quite what you thought it would be. In fact, it seems to have all kinds of problems – and the result is a not very good collection. It’s clear that this has nothing to do with the quality of what’s been submitted – it’s caused by the actual guiding framework, your creation, your fault, your problem. Now what?

Think that doesn’t happen? Well, I’ve been in just that situation. My co-editors and I had a great idea, we thought. We asked people to write, and they did. But when we put the chapters all together it looked like two books, not one. We sweated for weeks about what to do and finally decided that we had no choice but to restructure the book. That meant we had to renegotiate with the publisher, ask some new contributors and then work out what to do with the chapters left over. In our case, because the chapters were (thankfully) all focused on the same topic, we were able to secure a special issue of a journal. All of the authors gracefully agreed to rewrite their piece a bit so it could be refereed for that particular publication. We solved the problem. As we needed to – after all, we created it!

Solution: Be prepared.

If you have an idea for a collection that is a bit off piste, then make some kind of back up plan. You have an obligation to the authors to make sure that work they have produced in good faith is published.

Problem Two: The authors didn’t deliver as expected.

This is the issue that most editors face. There are multiple ways in which authors become a problem and here’s some of the most common.

(1) Authors write off topic. You’ve asked them to write about a particular thing, they submitted an abstract that you used in the book proposal and it looked good. However, when the chapter turned up, it’s nothing like what you imagined.

(2) Authors write badly. The published work you’ve seen from the author has all been fantastic. But what they’ve sent you is clearly hurried, muddled and generally sloppy. In fact it’s not publishable in its present state.

(3) All the chapters are too long. You’ve given the authors a word length, and you’d allowed a bit of slack but they’ve all gone over by a significant amount ... now the entire book is well over the word limit that is specified in the contract.
(4) Authors miss the deadline. (Blush, this is my major writing sin.) They have good excuses and you can see why they’re late. It’s a case of blood and stones, you have no choice but to wait on them.

(5) Authors don’t submit anything at all. For whatever reason, authors promise to write a chapter and then they don’t. Life gets in the way, they get ill, they get an unexpected grant which is all consuming, they are just overloaded with work... they meant well but in the end they just couldn’t get it together. For whatever reason, the chapter doesn’t happen. This is generally not because they are lazy so and sos, but is more about the nature of academic life. What to do? You’ll still probably need to talk to people who haven’t managed to get their chapters in on time – you’ll generally find that they are embarrassed and very, very apologetic.

**Solution: Anticipate that all of these issues will happen.**

*Set up expectations.* Tell authors beforehand that there is a review process and they will get feedback on their chapters. This can even be from peer reviewers that you enlist to help out. (You can thank them in the acknowledgements). Design a review form to use for feedback which looks at (a) the content and argument and the fit with the collection and (b) secretarial issues such as citations, referencing style and word length. Show the contributors this beforehand.

*Build a review process into the timeline* for getting the book to press. Be realistic about the deadline. In fact, be generous. Better to be finished ahead of time than fall behind. But also be prepared to go back to the publisher and ask for more time, ahead of the deadline. Publishers schedule printing and advertising as soon as they issue contracts so it’s really important to keep them in the loop.

*Don’t make it more stressful than it has to be.* You do need to have enough flex in the timetable to be able to offer people a bit more time if they really need it. If you are reviewing chapters for example, you can always start with those in hand, and cut a few people a bit of slack (especially if its me 😞).

*Be firm.* If authors can’t get down to the required length, but you want their chapter in the collection, insist. You might offer to edit it for them if you think they genuinely can’t do it. I’ve found that people are often grateful for some suggestions about where to cut, and/or an empathetically conducted edit. Conversely, you can go to the publisher to ask if there is any possibility of increasing the word count – sometimes there is.

*Be prepared to make hard decisions.* You may have to tell someone that their chapter isn’t up to the mark even after several revisions. This is just part of the editing process. After all it’s your book with your name on it – you’re the one who will be seen to be a crappy editor if some of the contributions are weak. If you feel uncomfortable about refusing to include something, ask your publisher for help. They have a vested interest in your book being a strong collection too and are sometimes prepared to be the ‘bad cop’.

*Have a back up plan.* Some people like to invite one or two more contributions than they expect to have in the book (but what to do if they all turn up?). Others have a couple of colleagues ready to step in, or have a chapter of their own that they can insert if the anticipated contributions don’t arrive.

**Some final important advice**

Be prepared for the emotional labour involved in dealing with these problems. Many book editors – and I’m one of them – swear immediately after finishing an edited collection that they’ll/we’ll never do another one. Like childbirth, we forget quickly, and many of us find ourselves lining up for another one – or even more – rather more quickly then we anticipated.

Finally, you’ll see that I’ve mentioned “your publisher” several times in this post. As with any book, it’s really
important to establish a good working relationship with your publisher. They can be particularly important for edited collections and the various dealings that you have with authors over contracts, copyright – and most of all, quality.

This was originally published on Pat Thomson’s personal blog, [2]Patter, and is reposted here with permission

CfP: Social and Political Critique in the Age of Austerity (2013-12-13 20:34)

Social and Political Critique in the Age of Austerity
A one day workshop at Keele University
10.30am-6pm, Wednesday 12th February, 2014

This one day workshop is devoted to the discussion of critical politics in the contemporary age of austerity. Following the 2007 global economic crash, which led to a raft of government bank bail outs and nationalisations across America and Europe, a cunning ideological reversal took place – the crash was no longer the result of the hubris of the neoliberal financial sector, which had developed the idea of ‘riskless risk’ where reckless stock market speculation and the creation of value ex nihilo could produce endless profit, but rather the immoral wastefulness of the people and society. According to this ideological position, which was advanced by governments across Europe, the welfare state, and in many respects society itself, was transformed into an ‘exorbitant privilege’ that was simply unaffordable. In fact, in order to pay for their wastefulness the people were not only expected to give up their public services, but also required to accept ever lower wages, and a general state of social and economic precariousness.

This is the current state of play across America and Europe, where the neoliberal state has exploited the crash in order to retrofit society for violent competition with Asian capitalism. In the face of this race to the bottom, key thinkers such as David Graeber, Antonio Negri, Slavoj Zizek, Alain Badiou, and Costas Douzinas have spoken out against the new form Naomi Klein calls neoliberal disaster capitalism and given voice to the protest, rebellion, and revolt taking place across the world.

The objective of this workshop is to build upon the works of these key thinkers and explore the possibility for resistance in the age of austerity. We invite contributions from a range of disciplines focused on diverse social and political contexts and a variety of theoretical perspectives. Contributors may choose to focus on austerity and resistance across Europe, including the UK, Greece, Spain, and Italy; the Occupy movement; the media construction of austerity, including the idea of the undeserving poor who are seen to be living off public funds; methods for the organisation of resistance; the concept of the multitude and the digital commons; anti-capitalist thought; or transformative social and political theory and practice more generally. Most importantly, we are keen to emphasise that this list is not exhaustive – the key principle behind the workshop is that debate should open up a space for social and political creativity. In this way we are keen to encourage potential contributors to be creative and explore new possibilities for political change in a historical period where change seems absolutely necessary, but also impossible to envisage. In this respect, we encourage contributions from a variety of participants – academics, post-graduate students, activists, and others engaged in thinking through the possibilities of change under conditions of crisis and
austerity.

The workshop will close with a lecture from Professor Costas Douzinas (Birkbeck), author of Philosophy and Resistance in the Crisis: Greece and the Future of Europe.

In order to take part in the event please send a 250 word abstract to Emma Head ([1]e.l.head@keele.ac.uk), by Monday 23rd December. This event is being organised jointly by Mark Featherstone (Keele Sociology) and Emma Head (Keele Sociology and the BSA Digital Sociology study group). Registration will open in early January. Confirmed speakers will be notified by 7th January.

Judith Butler and Cornel West, Honoring Edward Said (2013-12-14 08:00)

On the Tenth Anniversary of Edward Said's passing, renowned scholars Judith Butler and Cornel West discuss what it means to be a public intellectual and Edward Said's impact on the academic discourse of Palestine.

IFRAME: [1]//www.youtube.com/embed/jF5mYvjDp3U
CfP: An Invitation to Digital Public Sociology (2013-12-15 08:00)

What does ‘public sociology’ entail in a world of Facebook, Twitter, YouTube, Slideshare, Soundcloud, Pinterest and Wordpress? What affordances and constraints do these tools entail for the task of “taking knowledge back to those from whom it came, making public issues out of private troubles, and thus regenerating sociology’s moral fibre”? What implications do these tools have for the relationship between the public and private in the occupational biographies of individual sociologists and, through aggregation and collective organisation, the discipline as a whole?

Short articles (1000 to 4000 words) are sought for an open access edited book which explores conceptual, methodological or practical aspects of Digital Public Sociology. If you would be interested in contributing then please send an abstract of 200 words or less by December 31st 2013. The final articles would be needed by March 31st 2014, with the intention of launching the collection in the summer of 2014. Please send abstracts (or questions) to mark@markcarrigan.net.

CfP: Digital Sociology PhD/ECR Workshop (2013-12-15 20:36)

Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from peers and established academics in a supportive environment.

The event will take place between 11am to 4pm on February 19th at Goldsmiths College in South London. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.

If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn’t been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.
A Necessary Disenchantment: myth, agency and injustice in the digital age (2013-12-16 08:00)

This lecture by Nick Couldry, who we [1]interviewed here about neoliberalism, offers a really plausible contextualisation of 'big data' in terms of a shifting history of 'media myths'.

Professor Couldry challenges some 'digital age' myths about how we gather on social media platforms and the value of 'big data', and considers the new forms of agency and injustice emerging alongside them.

“Wait, what? You have a PhD and you work where?!” (2013-12-17 08:00)

I always find it interesting to find out about people who pursue careers outside the academy after completing a PhD. Org Theory has a new guest blogger who has done precisely this and whose [1]first post describes the kind of work that he does:
We have two units within our branch here at DMV Research and Development (R &D). I work in the Driver Competency and Safety Projects Unit; there is also the Alcohol and Impaired Driving Unit. The distinction between the units is not substantial – many projects involve collaboration between researchers, and in many cases we use very similar types of data and methods to conduct our projects.

In general, I've worked on projects that involve the screening, testing, and assessment of physical, visual, and mental functions that may affect driving. If you've ever read a newspaper article about some tragic incident where someone pressed on the accelerator instead of the brake, and drove into a fast-food restaurant, you may have wondered “gee, I wonder if anyone's doing research on this problem?” The answer is “yes,” and I'm one of the people that works on that type of question (if you’re curious, such incidents often involve some element of cognitive impairment – such as occurs in early-stage dementia). The kinds of projects that I've worked on as a researcher include: (1) evaluating the results of a pilot project that used novel screening and education tools to identify drivers that may be at risk of unsafe driving due to a physical, visual, or cognitive impairment; (2) calculating projections about the number of cases DMV may see in the next few years of drivers who are referred for evaluation due to a medical problem of one type or another; (3) developing a method by which we can determine the reliability and validity of a drive test that we use (rarely) for persons who drive in extremely limited circumstances, on defined routes or in bounded areas.

I seem to recall dreaming up the notion of punk sociology at some point during my PhD, I think it was around 10 years ago. When I think back I imagine, rather melodramatically, that it came to me whilst I was trying to write one of the middle chapters of my PhD thesis as I listened to The Clash playing ‘Clampdown’. I hadn't intended to write anything explicitly about it. The punk sociology approach was simply something that I tried to tacitly develop in my work over that decade – I often asked myself, what would a punk do here? At the beginning of 2013 it suddenly seemed like the right moment to flesh-out the idea in a more direct and rigorous form. The conditions just seemed right. A number of things were coming together at this time – student fee structures and quotas had altered, research assessment was in full flow, key information sets were operational, league tables were circulating, research funding was eroding, the impact agenda was taking hold, the list goes on. The result was the book *Punk Sociology*.

One obvious starting point for the book was the discussion of a disciplinary crisis in sociology. Debates about a ‘coming crisis’ have been very prominent over the last 6 years or so, but they stretch throughout large parts of sociology’s history. I find the discussion of crises within sociology to be very productive and engaging, but only if handled carefully. The problem with talk of a crisis is that it can be inhibiting and potentially disenchanting for those in the early stages of their careers, when people first encounter sociology, or when we are trying to find a sense of purpose in their work. Crisis talk can actually perpetuate a sense of uncertainty unless it is used carefully. We shouldn’t hide from or try to conceal our problems, but I wanted to make a positive statement about the way I thought the discipline might be re-energised and how it might find a vibrant and sustainable future. I’m sure that lots of sociologists will disagree with my vision, but it seemed necessary to say something definite about the way we might protect and foster sociology in its current conditions.

*Punk Sociology* is intended as a response to any lack of confidence in the discipline. It suggests that we should tackle such uncertainty head-on. Punk sociology also taps into a number of debates about the future of sociology. There
have been some excellent recent edited collections on *Live Methods* (edited by Les Back and Nirmal Puwar) and *Inventive Methods* (Celia Lury and Nina Wakeford), along with a range of other articles, that claim that sociologists need to be ‘inventive’, ‘crafty’, ‘lively’ and ‘imaginative’. Many of us would agree with this type of sentiment, but I was left wondering how we might achieve this imagined future for the discipline. It’s actually quite scary to think that we are faced with the responsibility of making-up a more imaginative sociology. So, although these edited collections and articles are excellent and inspiring, I still felt there was space for a model to emerge that might help us to be imaginative and creative in rethinking sociology. This is where I suggest that we turn outside of the discipline to use cultural resources to help us. I turn to punk, largely because I think it gives us the means to think creatively about sociology, as well as allowing us to consider what sociology might be and how it might be done. In other words, the punk ethos might give us inspiration for thinking about the challenge to be ‘inventive’, ‘lively’ and ‘creative’ sociologists. It might seem odd to look back nearly 40 years in order to inspire the future of our discipline, but it is in the sensibility of punk that we can find viable ways for ensuring sociology’s vitality.

Alongside this, sociology is, of course, performed and produced in a changing environment. The words ‘neoliberal’ and ‘audit’ are often imported to describe these conditions, and often with good reason. In the book I suggest that the risk is that the pressures placed on us in this environment are likely to push us towards *playing it safe*. If we follow the lead of these systems of measurement and the way that they place value in certain types of work then, I argue, we are likely to find that our efforts and focus are counterproductive. Playing it safe will lead us to slip into the background of the social world. Instead, we need to resist the temptation to play it safe. My suggestion is that we use the punk ethos to do this. We can use the punk ethos to find ways of re-imagining how sociology is done and to help us to navigate the disciplinary and structural pressures that we are faced with. Punk shows us how to be creative and resourceful. It also shows us the value of being bold and fearless in our work whilst embracing raw ideas and a DIY ethic. Overall though, *Punk Sociology* is a call to think about how sociology might respond to its changing environment. *Punk Sociology* is intended to be a call to people who might want to explore the promise of sociology away from the inhibiting pressures we face and the shackles of convention. Hey Ho Let’s Go!

**David Beer** is Senior Lecturer in Sociology at the University of York, UK. His book *Punk Sociology* will be published by Palgrave Macmillan in January 2013. You can read the introduction to the book open access [2]here. He also blogs at [3]thinkingculture.wordpress.com

3. thinkingculture.wordpress.com

James Allen-Robertson (2013-12-21 15:15:00)
Looks good Dave. I’m certainly feeling a lot of uncertainty right now! I’ll be sure to pick up the book and hope punk will throw me a line.

Is there space for a rave sociology then?

Nam Tran (2014-05-06 19:14:20)
It’s always great to have new and creative ways of doing sociology.
Modern-Day Hermits: The Story Hikkomori in Japan and Beyond (2013-12-17 17:18)

Japan struggles with young people who have retreated into their bedrooms. Known as "hikikomori," they are modern-day hermits who disdain social contact and are unable to work or go to school. Dr. Alan Teo reviews this epidemic of social isolation.

CfP: Quantified Self Research Network, March 25th @SocioWarwick (2013-12-17 20:32)

The next meeting of the [1]Quantified Self Research Network will take place on the 25th March at the University of Warwick from 1pm to 6pm. It’s an informal seminar to present work in progress and is open to all.

If you would like to contribute then please send a short abstract and bio to mark@markcarrigan.net by February 1st. We use ‘quantified self’ in a broad sense inclusive of self-tracking, wearable computing and digital augmentation.

We’re also keen to build on the last seminar and move the discussion forward. Here are some of the key questions which emerged during the last meeting:

What is distinctive about qs?

People have tracked their health data for a long time such as keeping food diaries or measuring their weight. Is qs conceptually different to this or is it merely an automisation and intensification? Does the quantity of the data produced equate to more of the same or a qualitatively distinct phenomenon?

Are there inequalities in qs and self-tracking?

The technologies required for qs are usually quite expensive even for a basic device and would certainly be out of the range of disposable income for many people and...

Are we creating inequalities with the focus of research?

If qser are a relatively privileged group while it may be interesting to understand their practices and development of individual and group identities there are other people who cannot afford these practices, are uninterested or simply unaware of them.

What about gender?

The QS community seems to have more men than women as active participants. What are the reasons for this? If we take the broader notion of qs suggested by some of the presenters then often the more “mundane” or “domestic” approaches to self-tracking are more associated with women? Is there something fundamentally different about these?

How do we identify a ‘non-user’?

Although some of the methods of tracking have been used for a long time some of them are very new and it is currently unclear what kind of uptake they will have. We fairly easily identify a user (agreeing on a definition may be more complex) it is more difficult to identify a non-user. Are they people who do not practice qs or use the devices because they do not have access to them, they are not aware of them or they simply do not care? Is it right to define people as non-users of a fairly niche activity often engaged in by relatively privileged people? But with the amount of data which is generated about us (often without us knowing) are we not all quantified whether we like it or not?
Richard Swedberg begins his paper on "Thinking and Sociology" by recognizing that there may be "good reasons" why these two things are rarely discussed together. Though "all of us think" and "we all know the intensely private character of our thoughts", these thoughts are fleeting and ephemeral when considered next to things that we say and things that we know. These phenomena have been the closest sociology has tended to come towards looking at thinking itself and the reasons for this are both epistemic (they relate to things that are more or less open to others and tend, by their nature, to use terms that are understandable to others) and genealogical (Durkheim was the founding father most interested in thought yet also the most strongly committed to studying it through its objectification in social facts). Given that social facts are a product of collectivities, "the individual plays a very subordinate role in Durkheim's work, and most of what goes on in his or her mind belongs to the science of psychology, not sociology". He understood the categories of thought, collective representations, as gifts of society which should be analysed as social facts. So while sociologists have often looked at the products of thinking, the process itself has tended to be ignored or even dismissed in principle as a possible object of study.

For reasons that are intuitively obvious but nonetheless rewarding to explicate, this has not been true of philosophy. Swedberg considers Kant, Kierkegaard and Heidegger as three philosophers, amongst many, whose work could provide insights for a nascent sociology of thinking. Kant's essay "What is the Enlightenment?" can be understood as a short and purposefully accessible treatise on thinking: "what it means to think, why we should think, and what the consequences of thinking are". It also discussed how people avoid thinking through falling back upon established authorities, directly or through their cultural products, as a substitute for addressing their own questions. Kant also offered practical guidance on thinking, for instance suggesting that one should avoid thinking deeply

---

while eating and that thinking while walking should be a matter of letting the imagination wander. Kierkegaard was concerned with the relationship of thinking to existence as a *particular individual*. For him thinking is part of existence: “a human being thinks and exist”. Thinking does not dominate existence but can fit harmoniously with it. This however is an achievement and one not enjoyed by the ‘objective thinker’ whose generalising and systematising thought ignores his own particularity in spite of it being bound up with this thinking. Instead, we ought to think *inwardly* and thus avoid the ‘stuntedness’ of the objective thinker who is not interested in his or her own existence. For Heidegger all human beings *can* think but many do not. He distinguishes between the thinking we all have the capacity to engage in and the thinking which we *usually* engage in: the ‘one-track thinking’ and ‘thoughtless chatter’ which our everyday lives in a technological society provoke. Instead of thinking, for Heidegger, we too often have opinions. But we can also learn how to think. For Heidegger this is a practical competency which is learned through doing:

We are not simply born with a certain capacity to think. But how can one learn to think? Heidegger’s answer is that it is a bit like swimming: you learn it by doing it. You cannot ‘read a treatise on swimming’: you have to open yourself up to the ‘adventure’ and ‘leap into the river’.

If you read a book by a philosopher, you can learn thinking by studying the way that the author asks questions. Summarizing and repeating the ideas in a book does not represent thinking. One should also try to locate and work with what the author does not say – what has been left ‘unthought’. And once this exercise is over, and you have ‘found’ the thinking of the author, you have also to ‘lose’ it. Freeing oneself from somebody’s thinking, Heidegger says, is harder than to find it.

Associated with this notion of thinking as a practical competency which can be learned is an understanding of thinking as *action* rather than being opposed to it. Heidegger was concerned that "action has often replaced thinking" and sought to overcome the "common notion that thinking is simply what comes before action and that it lacks value unless it is followed by action". Instead he sought to cultivate an understanding of thinking as a craft:

> The carpenter cannot learn his craft in some abstract manner; he must develop his skill by working on wood and by sensing what he can make of this material. The wood contains shapes, Heidegger says, and it is the carpenter’s task to sense these and bring them out in the wood. The idea of hidden forms means that the person should use thinking to understand Being.

However Swedberg is well aware that these arguments lack a sociological dimension. The first two authors lived before there was a sociology, while the latter was explicitly critical of sociology (as a science). But his suggestion that philosophy can be a potent source for a *sociology of thinking* is surely plausible and his impulse to turn their thought in a ‘sociological direction’ is one which I find deeply appealing. Other potential sources are the sociology of knowledge, the economics of information, cognitive psychology and neuroscience. But Swedberg’s most pressing concern is with the contribution of philosophy:

Kant, Kierkegaard and Heidegger all agree that thinking represents its own special activity or, to phrase it different, that one should focus the analysis directly on thinking. This is an approach that sociology may want to follow. It would also appear that sociology should try to study *thinking* which is a process, rather than *thought* which is a product. Heidegger’s argument that thinking should be independent of knowing as well as of action raises further interesting questions for sociologists.

One shared concern of all three philosophers he discussed were the “forces that prevent the individual from thinking...”
on his or her own”. Kant looked towards a reliance on established authorities, Kierkegaard towards the force of routine while Heidegger blamed technological society. These concerns naturally provoke sociological questions given the empirical referents of such claims. However these thinkers also raise important practical questions about the activity of thinking. Given that “it is easier to think in certain places, just as it is easier to think in certain postures” we might ponder the existence of “an architecture of thinking as well as a body technique”. Such ruminations naturally connect the sociology of thinking to the existential concerns of sociologists of thinking:

My own way for how to think is to spend one hour early in the day sitting still and focusing on some topic that needs to be thought through. I do not write, and I do not try to empty my mind so much as to focus it. It is an exercise in thinking, not in meditation. I usually find that my thinking proceeds step by step, and it comes natural to memorize each step.

For a long time I was puzzled by Kierkegaard’s insistence that thinking has an existential dimension. I first began to understand what he meant by this when I started to set aside some time for thinking also at the end of the day. It was impossible to engage in thinking when the day was over, I found, without directly connecting broader issues to personal ones. The link between thinking and subjectivity was in this way established in a very natural fashion. A day that has passed in your life – what does this mean?

My “own way for how to think” is to blog. I like the notion of a sociology of thinking in part because it gives me a novel frame of reference within which to ponder my own use of blogging. I like it for many other reasons as well though. What do other people think?

‘Patent Trolls’, Intellectual Property and Technological Innovation (2013-12-19 08:00)

Over the summer the BBC website had an [1]interesting feature looking at the ‘patent trolls’ who proactively buy patents with the sole intention of suing people for their infringement. The introduction of these ‘non-practicing entities’ into the patent system is something novel, with an influx of ‘entrepreneurs’ and ‘finance people’ having transformed the system into one in which the “majority of patent lawsuits today are filed by entities that don’t make any products”. Some ‘patent trolls’ develop their own patentable inventions in-house but most rely on buying second-hand technologies, which current owners were willing to sell for an influx of capital in exchange for potentially deployable ideas which nonetheless remain unactualised. Perhaps the financial crisis represents a supply-side cause of this willingness, given the apparent chronology of the growth of the ‘patent trolls’, though this is purely speculative on my part.
I find this interesting because the ‘patent trolls’ seem to rely on digital technology, in so far as that they use ‘virtual offices’ to minimise legal constraints and presumably rely upon internet research to assemble their ‘patent war chest’ and to identify their targets. Their methods rely upon digital innovation and abundant data but so too do the basis of their claims. What intrigues me is how an obscure potential technology for which they have acquired a patent can be linked to actually existing technologies which are claimed to infringe upon that patent. Their activities represent a weird inversion of the innovation process: linking ideas with their practical deployment in technological artefacts. How open-ended could this potentially be and what are its implications for innovation itself? Furthermore, what are the long-term effects of this likely to be for the viability of systems for registering and enforcing intellectual property? If we accept Margaret Archer’s (2012: 36) argument that the growth of the patent system “served to ‘freeze’ uncertainty and, in guaranteeing profitability ceteris paribus, thus freed up internal resources to make the next innovative development which, if successful, would then be protected in the same manner” then the long term viability of this growth, which underwrote the calculability upon which corporations have tended to depend, becomes something of enormous sociological significance. The enterprise of ‘patent trolling’ is “totally legal, and very lucrative, and absolutely shady”. Perhaps unsurprisingly then, it seems likely to take centre stage as a political issue in coming years:

Innovation is the foundation of America, and since 1790, entrepreneurs have been able to claim patents on their inventions so that copycats can’t profit off their work. But some companies have found a controversial use of the American patent system, derisively referred to as “patent trolling.” The practice refers to when a company buys broad patents for technology that it doesn't make—or partners with inventors who don’t actively use their patents—and brings legal claims against other companies that use the technology. The price of stealing someone’s work in the United States is mind-blowingly expensive—in the [3]millions of dollars—and even if the accused company wins, it still faces high legal costs. Often, a company violating a patent will pony up a few thousand dollars for licensing fees rather than face off in court.
“There are hundreds of thousands of crappy, vague, overly broad patents out there, and all you have to do is scoop up one of these patents and threaten to sue. No one is going to defend themselves, because it makes no financial sense,” says Julie Samuels, a senior staff attorney for the Electronic Frontier Foundation (EFF), which is running a database[4] of patent troll claims. “It’s totally legal, and very lucrative, and absolutely shady.”

Bryan Farney, an attorney for a MPHJ, a company that has accused multiple businesses of using its patented office-scanner technology without permission, takes issue with the characterization of companies that sue others over patents they don’t use. “Obviously, patent trolling is a pejorative term...” he tells Mother Jones. “A more accurate term is Non-Practicing Entity.”

Earlier this month, Senator Claire McCaskill (D-Mo.) [5]called these kinds of companies “scam artists” and “bottom feeders” who “work in the shadows.” Senate Judiciary Committee Chairman Patrick Leahy (D-Vt.) and Senator Mike Lee (R-Utah) introduced a bill this month that specifically takes aim at them by making it harder and more expensive to make these claims and allowing targeted companies to get their legal fees back. The bill has [6]support from the White House. This week, a group of inventors—including Facebook and Twitter’s co-founders—sent a [7]letter to the House and Senate Judiciary Committees arguing that “broad, vague patents covering software-type inventions—some of which we ourselves are listed as inventors on—are a malfunctioning component of America’s inventive machinery.”

But companies that oppose the legislation say that it shouldn't matter whether or not they use their own patented technology because big tech companies are taking advantage of their inventions. "Almost all inventions seem obvious after they have been invented,” wrote Katharine Wolanyk, president of Soverain Software, in a November 18 letter to the House Committee on the Judiciary. (Wolanyk’s company owns patents that governs online shopping cart technology and [8]lost one of its claims in the US Court of Appeals for the Federal Circuit. Soverain is now trying to [9]bring the case to the Supreme Court.) “The current system forces patent owners to defend, over and over again, the validity of their patents.”

If anyone can suggest useful places to begin reading further about this I'd be very grateful. There's something extremely interesting happening here and I'd like to understand it in much greater depth than I do at present. I'm particularly interested in the potential scope of the activity: is it possible that the range of ‘broad patents’ which can be linked to particular products is basically infinite? Will it be possible to legislatively counteract this tendency? Or is it perhaps more likely that we’ll see an ever growing influx of financial and human capital into ‘patent trolling’ and, if so, what are the long-term consequences? Would it even be possible to have an intellectual property system which prevents ‘patent trolling’?
One further thought is that [12]The Mark Cuban Chair to Eliminate Stupid Patents must surely be the best name ever chosen for an endowment. It’s also an instance of systemic consequences leading to the grouping of new agents seeking to transform their shared context. I wonder if it is a sign of more to come. The difficulty seems to be whether the interests vested in the patent system itself preclude the reforms that would render 'patent trolling' untenable.

The sociology of the quiet zone: norms and public transport (2013-12-20 08:00)

An interesting story went viral earlier this month which has left me thinking about the issue of normativity for the first time in a while. I have no way to know the accuracy of the reports but that’s irrelevant. If it turns out not to have happened in this way then this account can function equally well as a thought experiment. The extract below is from the Telegraph’s account of what happened. Kudos to whoever chose this title for the post: “A hipster humiliates a ‘dying’ middle-aged woman on a flight. Twitter applauds”.

Elan, like lots of Americans, caught a plane at Thanksgiving, and the plane was delayed. A few rows behind him, a middle-aged woman overshared about her fear of missing her family time with the passing staff. Now, we’ve all come across these people. There’s one on every flight. They’re a pain in the neck, but anyone with a modicum of maturity might have reminded themselves that people who are behaving like this are usually compensating for something else – fear of flying, for instance, or distress of another sort – and quietly tutted to themselves.

But not our hero. No, he was made of sterner stuff. Elan took it personally, and shared his disdain with his Twitter followers.

“Her family is very important to her, she says. Her family has a special recipe for stuffing. She needs to be there to help. It is crucial.”

“She had to sit down because we took off. She has been muttering ‘about DAMN time’ and I can hear her breathing from 5 rows back.”

After a while, sharing his disgruntlement with Twitter was not enough and he decided that punishment was the way forward. So Elan enlisted the help of a male staff member and sent her a glass of wine with a note. “[This] is a gift from me to you,” it read. “Hopefully if you drink it you won’t be able to use your mouth to talk.” Oh Elan! Your rapier wit!

Emboldened – or perhaps frustrated; it must be awful when such an act of naked courage goes unacknowledged – by his fellow passengers’ failure to respond, Elan set forth, armed only with two miniature bottles of vodka, to slay the dragon.

“Oh my God I did it I walked as if I was going to the bathroom and I leaned over and put them on her tray table and walked away Oh my God.”

“She just stared at me like REALLY hard. I’m not going to lie I am shaking.” You betcha, Elan! We’d all be shaking if we’d just taken on a woman in "mom jeans and a studded belt". You’re, like, Maximus in the Colosseum!

But then things got scary. Diane (for such was her name) had the temerity to call him "an awful person with no compassion", on a page torn from a lined notebook. No compassion! The cheek of it.

So he responded the way that only a true man can. He composed another note. “I hate you very much. Eat my d***.”
Wow, Elan! Touché! High five! Though presumably, as you were in the air, you might have had to ignore the seatbelt signs for her to do this.

Anyway, the upshot was that, after a bit more penis-related badinage, Diane gave Elan a slap in the face and he ran away, crying.

What interests me here is the role played by norms in the unfolding of these events. The story’s virality likely flows from the dramatically conflicting norms concerning behaviour on a plane which are being acted upon here. It’s compelling because we recognise on some level that this normative dissensus exists in society, particularly when it comes to conventions, but rarely does it manifest itself behaviourally in quite so dramatic a fashion. Elan clearly sees the woman in question as contravening apparently obvious norms of comportment when flying. The woman’s ‘oversharing’ and breathing (!) were impinging upon his experience of the flight and, in her failure to restrict her audial impact on those around her, she was acting contrary to Elan’s understanding of how people should conduct themselves when crammed into an overcrowded plane with many fellow passengers.

Though I’m generally critical about the concept of norm circle put forward by Dave Elder-Vass, it’s often struck me as a useful tool to make sense of behaviour like this. In essence he talks about the role played by an awareness of others being committed to a norm in engendering our own tendency to act in accordance with that norm. He sees this as a matter of endorsing and enforcing a given norm – we learn from past experience that acting in a way that contravenes X will tend to provoke sanctions and, through doing so, we come to endorse X and habitually act in accordance with it.

I’m not keen on this as an account of the genesis of normative behaviour. However I do think Elder-Vass captures something important about the social psychology of interactional norms when he further distinguishes between proximal, imagined and actual norm circles. The proximal norm circle are those people endorsing and enforcing a norm whom we have directly encountered. Though limited in number, we take them to be representative of a wider group: the imagined norm circle is the dispersed group who we imagine to endorse and enforce a given norm. The actual norm circle is the objective extension of endorsement and enforcement of a norm. There are a lot of problems with this account. But what I find useful about it is the distinction between the imagined and the actual in making sense of the social psychology at work in a public transport situation. Whenever we act to enforce a norm we do so on an understanding, implicit or explicit, as to the existence of a wider circle who share the endorsement which motivates our action. We also often choose not to enforce norms which we nonetheless endorse. My point here, which I’m not sure is the same as EV’s, is a claim about the phenomenology of norm enforcement – acting because we think X is wrong is unavoidably tied up in (potential) questions about the agreement or disagreement of others with our stance.

My examples for this always come back to the quiet zone on trains – the spaces where mobile phone use is prohibited. There’s a variability in the extent to which train staff seek to display their endorsement of this rule (by announcing it) or to enforce it (by actually intervening when people use mobiles). There’s also variability in the extent to which people recognise the norm in question (some clearly don’t), the extent to which they feel bound by it (for example if they were forced into the carriage by overcrowding) and the extent to which other passengers feel willing or able to enforce a norm. Next time you’re in this situation, watch other people’s behaviour when someone starts talking loudly on a mobile: there’s all manner of performative expressions of endorsement of the quiet zone norm which are entirely distinct from actually seeking to enforce it. I have no way to prove this empirically but I’d suggest, on the basis of observation and theoretical reasoning, that someone is much more likely to seek to enforce the no mobiles rule if other passengers are noticeably performing their endorsement of the norm e.g. rolling their eyes, irritated coughing noises etc.
My point is that the endorsement/enforcement and proximal/imagined/actual distinctions are useful for making sense of these kinds of interpersonal disputes. I've suggested that Elan's behaviour was at root a matter of enforcing a norm which he endorsed and saw Diane as contravening. He clearly felt empowered to act in ways which, from other perspectives, seem to contravene far more important norms of interpersonal behaviour. It's this swagger (real or fictitious) which I want to understand and I suspect twitter plays a role. The intuition I had this morning when reading this story is that twitter expands the imagined norm circle. When we complain on Twitter about someone we physically share space with, we'll often receive what can seem like tacit endorsements of our complaints (responses, retweets, favourites). Perhaps more importantly I suspect that silence is seen as, at best, indifference to what we're saying and, at worst, tacit endorsement of our irritation: we imagine that our twitter followers agree with us. As a proposal about twitter etiquette I'd therefore suggest: if someone is live tweeting their travel frustration and they're being out of order then say so! As this dynamic becomes much more common I wonder if twitter could have a real effect on people's tendency towards intolerance on public transport.

Call for Guest Editors: Developments In Teaching Social Research Methods (2013-12-20 11:52)

INTERNATIONAL JOURNAL OF SOCIAL RESEARCH METHODOLOGY

CALL FOR GUEST EDITOR/S PROPOSAL FOR SPECIAL ISSUE ON DEVELOPMENTS IN TEACHING SOCIAL RESEARCH METHODS

There have been a number of recent initiatives in teaching social research methods, both quantitative and qualitative. In part these are fueled by efforts to address skills shortages, but there are also developments in epistemological and pedagogic knowledge that are helping to shape the what, why and how of teaching data gathering, handling and analysis. The International Journal of Social Research Methodology is looking to publish a guest-edited Special Issue that addresses this theme.

Guest editors should submit proposals to the Journal editors by 30th April 2014. Proposals should be submitted via email to

[1]tsrm-editor@tandf.co.uk

Potential guest editors should submit a proposal of no longer than 3 pages covering:

- **Rationale**. An overview of the coverage of the special issue, highlighting the key areas and issues to be addressed.

- **Indicative contents**. Titles, authors and abstracts should be provided, including an editorial. Contents should demonstrate an international orientation, including through the range of contributors. If this is not the case, then a rationale should be provided.

- **Reviews**. Indication of whether or not the guest editor/s will take responsibility for relevant book, software or other reviews, or whether they would like the IJSRM reviews editors to provide them
Each Special Issue should amount to 45,000 words in total, which includes the editorial, abstracts, papers, references and reviews. The editorial should provide a ‘state of play’ introduction to methodological issues and methods addressed. Responsibilities of guest editors:

- ensure manuscripts are in keeping with IJSRM guidelines (see website)
- ensure articles are peer refereed (such as by setting up a refereeing panel), with a list of reviewers either provided to the Journal editors or thanked in the editors’ introduction
- deal with all correspondence with the contributors, Journal editors and Routledge production editor
- provide a ‘state of play’ editorial
- liaise with the editors and, if required, the reviews editors
- ensure delivery of the final manuscript to the editor

Responsibilities of Journal editors:

- facilitate the preparation of the Special Issue
- provide final quality control for the Issue
- forward the Special Issue to the Journal’s production editor

Rosalind Edwards, Christina Hughes and Malcolm Williams Co-editors International Journal of Social Research Methodology

Re-thinking research repertoires: foregrounding sound (2013-12-20 13:22)

On the final afternoon of an intense, three day sociology conference for the NYLON research network (PhD students and faculty from New York, Berlin and London), the two authors ran a workshop on sound and listening. This was something of an experiment on our part – we are both interested in sound in our research and are part of the sound reading group at Goldsmiths. But, as Ari Kelman noted recently, the ‘indeterminacy of the field’ of sound studies (2010:229) means that experimentation is an inevitable part of using sound in research. In this blog post we use the notion of foregrounding sound as a way of intervening into some of the complexities of working with and thinking about sound. We use moments from the sound and listening workshop to explore different understandings of foregrounding sound as variously, a mode of attentiveness or a way of tuning in; as a thing of sociological consequence in itself; and as an embodied and relational experience. We also draw on our experiences of encountering sonic resonance in our own work, and ask how we might think about how to recognise, convey and analyse sound.

Recent interest in sound as methodology and object in the social sciences echoes the ‘discovery’ of visual methods in sociology. As Michael Guggenheim noted recently on the CSISP blog (2013), the aim of visual sociology is to become obsolete; for sociology as a discipline to incorporate visual methodologies as a part of its normal practice. The same could be said for sound studies (or ‘auditory cultures’ as Bull and Back (2003) describe it) – except that we have no equivalent ‘sonic sociology’ as a starting point. Indeed, as Anahid Kassabian notes (2013), comparison
with another visual medium, film, is illuminating; film studies is often located in 'visual cultures' departments, institutionalising the assumption that in film, the sonic is always subordinate to the visual. This is not by way of arguing that one aspect of sensory sociology is more important than another – quite the opposite: to suggest that the senses work in concert (so to speak).

This is something that became clear from the responses of the participants in our workshop. We began the workshop with a short meditation led by Anna, which shifted our attention more towards the sonic, drawing on Les Back's concern with 'modes of attentiveness' in sociological enquiry (2009). We then asked the group to go outside in threes, and listen for three minutes to the sounds they heard, facing in different directions (thanks to Les for this exercise). We audio-recorded the discussion of this activity that followed. Participants had gone outside in the middle of an early spring rain shower – some had stood outside, some had taken refuge in the student bookshop and café. In attempting to describe what they had heard, members of the group came up with evocative, even beautiful descriptions, carefully trying to portray their experiences:

For me it was incredible how the water and the rain dominated the soundscape, like I feel with everything I heard, the water was involved, like it was people stepping, you know, [off] the stones, stepping into water, into puddles; the cars, you know, with wet tyres – really, I was amazed by this dominance of the water.

This quote makes vivid the experiential intensity of sound, which is inevitably embodied, and conveys one interpretation of 'foregrounding sound', that is, paying close attention to it, and perhaps making 'hearable' that which is heard but not really listened to. This is foregrounding sound as a form of close attentiveness.

The discussion touched on the wholeness/interconnectedness of sound – the way you never get 'just sound' but that sound is connected with vision, experience, knowledge, memory and in powerfully associative ways:

When we were outside listening, I was thinking a lot about the radio. Because I had my eyes closed, and it was, you know, sometimes, you get these sound snippets, like, when they’re doing an interview in a café, and before, they want to get something to put on, like 'doing an interview in a café', so you get, you know, the cups – [...] and it was exactly like that, so, I was thinking of the radio. So it seems to me it’s so much intertwined with experience. So it’s not – I was not thinking about the little raindrops, I was thinking about the radio.

[...]

When we started this exercise, same ambulances passed by, police, or whatever, and so, and then it faded out during these three minutes, but at the beginning I was quite aware of that, and thinking of that, and this reinforcement, this hearing of the traffic, that formed this interesting - and I think it was attention catching, this ambulance sound -

And then your mind catches onto it, hangs on to it –

Yes, exactly, and then this visualising process kicked in, and I saw the ambulance pass by, so to speak.

Foregrounding the interconnectedness or the mediative qualities of sound brought us to a discussion of how to work with sound. We started to talk about what to do with sounds; or what the inclusion of sonic awareness does for our
work. Participants were quite clear that they did not want to simply reproduce the sounds they had heard but that sound was about a kind of ‘tuning in’ to another kind of awareness, another resource. However, how to represent this material was at issue. Simply including sound recordings without any analysis we agreed to be problematic, in that it assumes a naturalism to sound; this is instead always a process of abstraction or of translation, so it is important to avoid thinking of sound as ‘pure’ or natural.

Here Michael Guggenheim’s ideas are also useful. In discussing the necessity for the foundation of a new Visual Sociology course at Goldsmiths, Guggenheim suggests that visual sociology is part of a broader project of approaching the sensory in a way which is ‘not documentary but manipulative’ (2013a). The sensory is not brought out as illustrative, reinforcing the assumption of ‘authentic’ reality, but rather attentiveness to analysis of sensory objects and experiences is itself of sociological consequence. Work with sensory foci thus becomes an interrogative, perhaps even disruptive process of transposing sensory experiences (see Guggenheim, 2013b).

One participant seemed to sum up what we were grasping towards in this part of our discussion, describing it as ‘sonic intervention’ that is then ‘brought into the more analytically tractable medium of writing’. Perhaps this can be a good starting point for thinking about putting these ideas into practice. We could ask: is sound without words, therefore, not an analytically tractable medium? What provides the traction?

Another interesting way of foregrounding sound in social research came from a paper by Alexandra Baixinho at the Goldsmiths’ Graduate Festival this May, where she played audio clips from her fieldwork on cruise ship tourism (see audio below). A recording of the creaking of the gangway as the ship moved while docked in port had a haunting, powerful quality to it, seeming to Anna (as a musician) as one of the most expressive sounds she’d ever heard. How can we include these kinds of non-human (and indeed human) sounds in our work? What do they add, other than being hugely evocative? Or is that enough?

Other examples of foregrounding sound in social research show how this can make audible aspects of our research that we might overlook. Take, for example, the pervasive practice of analysing interview transcripts to generate sociological knowledge. This method makes the data easy to get at, less complex, but loses attention to voice and sound in the process. By contrast, Walkerdine et al (2001) took a different methodological approach, listening together several times to their interview recordings, and comparing their responses. This was in the context of a broader approach, drawing on psychoanalytic theory as a methodology, but retaining the focus on the sound of the voice, and their responses as researchers to their participants’ voices.

Foregrounding sound can also draw attention to forms of social complexity which may be more clearly audible than visible. Katherine, in her research on public libraries in Berlin and London, has found experiences of sound highly significant. It is not that public libraries are necessarily quiet places, for frequently they are not, but rather that the shifting sonic atmosphere of the library becomes an indicator of different conceptions of the public good that library spaces represent. Here, people’s inevitably subjective responses to the sounds of others sometimes generate disputes or require mediation by librarians, while at the same time, the busy hum and rumble of a popular local library, housing multiple activities and events, is often used by librarians as a sign of its success. In the public library, levels of sound and quiet are differently understood and valued, and must be constantly negotiated.

Finally, and perhaps most generatively, foregrounding sound can provide a way of analysing affective transmissions and engagements. This might be through the voice, or through the materiality of sound, as Julian Henriques memorably explores in his article on the material, affective and socio-cultural qualities of sound in the dancehall scene in Kingston, Jamaica (2010). Anna’s participants in youth orchestras often talk about the sonic experience of being in the middle of such an awe-inspiring sound; what does this powerful affective-sonic dimension add to the socio-cultural experience of being in these groups? And how does affective transmission occur through sound?

The discussion in our workshop concluded with a call for a more critical attentiveness when discussing sound.
Making a link to Raymond Williams’ ‘structures of feeling’ one participant felt that the term ‘structure of the senses’ could be useful, to ask how ‘our sensual experience is structured and enmeshed and entangled with power and subjectivity’. As Kassabian notes (2013:23), sound doesn’t have vision’s ‘complicated’ association since the Enlightenment ‘with science, knowledge, distance and objectivity’ – sound is experienced as embodied, so the illusion of objectivity is much harder to uphold in relation to sound than vision. Using sound in social research therefore inevitably includes ourselves, the researchers, and our bodies as the ‘resonating chamber’ (Jean-Luc Nancy, 2007). Selves and bodies do not provide a neutral space of resonance, however - the sonic is always experienced socially and culturally.

By foregrounding sound, then, we can explore the ways sonic experience is always structured, mediated, influenced, and translated.

Thanks to the participants in our workshop at the NYLON conference in March 2013.

Katherine Robinson is a PhD candidate in sociology at LSE and Anna Bull is a PhD candidate in sociology at Goldsmiths College.

The Gangway Song

(2013, Alexandra Baixinho)

This piece departs from a found field sound, recorded last April in the port of Lisbon, by the Rocha do Conde d’Óbidos Cruise Terminal.

Through the use of sound and image my intent is to better convey the specific urban atmosphere and material context in which this sound is generated. Here, the gangway acts as an oscillating interface between the aquatic environment, the ship, and the quay.

The technical equipment used was the following: Zoom H4n digital sound recorder, together with a HTDZ HT-81 Uni-Directional Microphone + Nikon D3100 (for the video).

BSA Early Career Theorists Symposium – Call for Abstracts (2013-12-21 08:00)

BSA: Early Career Theorists’ Symposium

6th June, 2014, held at the London School of Economics

Call for Abstracts

The Early Career Theorists’ Symposium is a special one-day symposium for up-and-coming theorists, organized on behalf of the British Sociological Association’s Theory Study Group. This symposium aims to bring together sociologists at a relatively early stage in their career who work on theory or are engaged in original theoretical work as part of their on-going research. We invite early-career sociologists, across all research areas, to submit abstracts. Submissions from advanced PhD students are also welcome.

Prof. Claire Alexander (Manchester), Prof. Patrick Baert (Cambridge), and Dr Fran Tonkiss (LSE)—covering theorisations of Race & Ethnicity, Philosophy of the Social Sciences and the Sociology of Intellectuals, and Urban and Spatial Theory and Economies, respectively—will comment on the papers. Complete information for submitting the

2298
abstract will consist of:

1. name and contact information of the author (including career stage, e.g. PhD student, post-doc, early career academic);

2. title of your presentation;

3. a 500-word abstract of the presentation;

4. five keywords descriptive of the presentation.

Please send submissions to the organizers: Dr Marcus Morgan, University of Cambridge ([1]mm2014@cam.ac.uk) and Dr Suzi Hall, London School of Economics ([2]s.m.hall@lse.ac.uk). The deadline for submission of abstracts is 6th January, 2014.

Please plan to share a full paper of no more than 5000 words by 28th April, 2014. Registration for the event is free.

Please do forward/share as appropriate.

Racial Pornographics: A Special Issue of Porn Studies (2013-12-22 08:00)

Racial Pornographics: A Special Issue of Porn Studies
Edited by Mireille Miller-Young, PhD
Associate Professor of Feminist Studies, UC Santa Barbara
Contact: [1]mmilleryoung@femst.ucsb.edu

This special issue of Porn Studies will promote a discussion about race in the study of pornography. Race remains an underdeveloped area of research in porn studies, and employing racial analytics to the study of pornography’s historical, representational, market, labor, industrial, and technological production is imperative for the field. Race is crucial for the field because it allows us to think through power relations that function in concert with gender, sexuality, and class, to uncover the historical importance of unequal looking relations, labor relations, and access to media authorship, and to reveal the ways in which desire, sexual and otherwise, is inextricably bound to processes of racialization.

A critical racial optic, moreover, illuminates the interests, desires, and experiences of racialized minorities as they are portrayed in, mobilize, or labor within pornographic fields. This mode of analysis may draw on the theoretical scholarship of critical race scholars, women of color feminists, and queer of color critique as well as on the emerging field of porn studies scholarship to think through the fantasies, energies, connectivities, pleasures, and power relations embedded in racial pornographies. Another function of a racial optics is to expose the rise of colorblindness or postracial ideologies in popular media discourses and academic theories about pornography, even as race is ever more salient to labor, economic, political, and looking relations within adult industries in a neoliberal era.

In addition, this special issue of Porn Studies will highlight research that launches pornographics as a framework for
examining cultural productions and social relations outside of the genre and industry of pornography. Increasingly, scholars have drawn on pornography as a lens to problematize racial, gender, and sexual discourses, structures, and relations in ways that reveal the utility of pornographics as a mode of cultural inquiry that exceeds the formal confines of adult entertainment industries and networks of particular erotic communities. The goal of this special issue is to read the labor of race in pornography or pornographics, and the labor of pornography or pornographics in race.

Finally, although this is a scholarly journal we welcome essays, interviews, and creative pieces from academics, artists, activists, and adult industry practitioners.

About Porn Studies
New in 2014, Porn Studies is an international, peer-reviewed journal, which publishes original research examining specifically sexual and explicit media forms, their connections to wider media landscapes and their links to the broader spheres of (sex) work across historical periods and national contexts.

Topics
Race or racial minorities in pornographic images
Race or racial minorities in adult entertainment labor, racialized sex work
Deployments of racialized discourses in porn or discussions of porn
Colorblindness and postracial ideologies in porn or discussions of porn
Race in the production, distribution, or consumption of porn media technologies
Race or racial minorities in pornographic aesthetics or art
Racial discourses in antiporn or sex positive feminist approaches to pornography
Histories of race or racial minorities in pornography or pornographic cultural production
Ethnopornography and race
Racial or interracial communities in pornography
Race in global, transnational, or diasporic pornographies
Racial fetishism
Race and disability politics in pornography
Race and BDSM in pornography
Queer and feminist approaches to race and racism in pornography
Racial politics in porn activism, health issues, and legal concerns
Race and obscenity law, censorship, or free speech issues
Race and class in access to pornography, circulations of explicit media
Race in pornographic pop culture, sex tapes, viral videos, animation, and gaming
Race in feminist pornography, queer pornography, trans pornography, and gay porn
Race pleasure, racial pain, racial disgust, racial desire and other affective domains
Radical approaches to race or the methodology of racial studies in pornography

Format
The journal special issue will consist of original articles, book and/or film reviews, conference proceedings, photo essays, and a forum or dialogue based interview essay.

Submission formats:
Original articles, approximately 6,000-7,000 words in length (including notes)
Book or film reviews, approximately 1000-2000 words in length (including notes)
Conference proceedings or Photo Essay, approximately 1200 to 2000 words in length (including notes)
Forum pieces, Interviews, or Dialogue/Debate essays, approximately 3,000 to 5,000 words in length (including notes)

Style Guidelines:
Manuscripts are accepted in English, OED spelling and punctuation preferred, including use of single quotation marks. Authors should include 1-5 keywords, 150 word abstract, and a short biographical note.

Timeline
Deadline to Receive Notice of Intent to Submit a Manuscript, 150-200 word Abstract: January 8, 2014
Deadline to Receive Full Submissions: April 11, 2014
Expected Publication Date: September 2015

Address questions and submissions to:
Dr. Mireille Miller-Young
Department of Feminist Studies
4631 South Hall
University of California
Santa Barbara, CA 93106 USA

A four-year research project at Bournemouth University, “Gay and Pleasant Land?—a study about positioning, ageing and gay life in rural South West England and Wales”, took place as part of the Research Councils UK-funded New Dynamics of Ageing Programme on ageing in 21st Century Britain. The key output of this effort was the short professionally made, award-winning film RUFUS STONE 1

I acted as Project Lead and Author and Executive Producer for the film.

The research project’s methods included narrated biography, visual ethnography, auto-ethnography, focus group work and theatrical improvisation of interview data.

In the process of refining the treatment for the film, the Director ([2]Josh Appignanesi) and I faced several obstacles revolving around plot. If the premise was that Rufus would return to his boyhood village after 50 years in exile, there needed to be a reason for that journey back up by research to support it.

Subsequently, I returned to the interview data for more detail (‘evidence’) to support the reasons (‘theory’) for the return of Rufus Stone. I further explored and elaborated both Rufus’ story as a lad and his decision-making as an adult, always constructing these ‘facts’ from stories which were told to us whilst carrying out the research.

Both the film and this short story are fiction, or what I prefer to call ‘fictive reality’.

2301
Fictive reality is conceived as the ability to engage in imaginative and creative invention while remaining true to the remembered realities as told through the narrations of others.

Several, in fact, may recount a similar incident

. When these reports are combined into one person’s story or a “composite” character, a “fiction” is born ([3]Jones, 2013).

By returning to this material to write “The Return of Rufus Stone”, I am creating a ‘prequel’ to the film RUFUS STONE. It is a reworking and refinement of those early writings. By becoming a short story, it fine-tunes the detail by focusing on the reasons for Rufus’ return as literature. Rufus Stone’s reappearance in his boyhood village after 50 years of exile sets up the possibilities for the characters to remember, reassess and even potentially change. This short story explains how that journey became possible.

“The Return of Rufus Stone”

This was probably the bravest risk of his entire life, or the most foolish one. This is the way in which Rufus Stone decided to return to his village.

London 2010

‘Tall, dark and handsome’ was everyone’s first description of Rufus Stone. It was the intensity of his electric blue eyes, however, on which most strangers then commented enviously.

Rufus arrived in London at 18—six feet two inches tall with thick, dark blonde curly forelocks cascading on a tanned brow. His youth and good looks could have been his meal ticket. Nonetheless, Rufus concentrated on his love of photography and eventually got a post as assistant to a Notting Hill photographer. He consequently went on to take his own pictures of some of the most famous celebrities of the Sixties. From those connections, he later moved into advertising then television production—first as a cameraman, then an editor and later a director of some important documentaries made for the BBC.

Rufus never had problems attracting women or men equally. His looks, talent and career were the calling cards that engrossed his admirers. He is one of the lucky ones, because as he aged he held on to his good looks too. In fact, some compare him to stars such as Terrence Stamp or Sean Connery. His hair is now silver grey, but he hates the nickname, ‘Silver Fox’, with a passion. He still possesses those chiselled cheekbones, a slim build and his famous blue eyes. At 70, Rufus frequently turns the heads of both sexes.
His English country upbringing produced a quiet boy who turned into a soft-spoken man. In the hustle and bustle of London, this actually became another asset. A man of few words suggested that he meant what he said. This was a welcomed relief from the insincerity familiar amongst some Londoners, particularly amid the glitterati of television and film. When asked by the luvvies of the film industry if he enjoyed evenings at the Groucho Club, Rufus replied, ‘Never been’.

Somerset 1958

It is a typical January day—the frost-hardened ground, brown and grey, mimicking the sky above. Rufus and Ellie Stone take the trail to the rail junction through the bushes, littered with the rubbish that is now frozen into the mosaic of the landscape. The junction holds a special meaning for Rufus.

A six-foot post sunk into a gravel mound between the two rail lines at the junction is topped with a small greyish box. This sheet metal container has a small, hinged door on it. Rufus imagines that the box was used for some signal wiring at one time, but now is empty.

Rufus is seventeen, his sister Ellie just ten. She loves walks with her brother because he usually brings his camera and gets excited when he talks about taking pictures. Rufus is her protector—tall, strong and permanently tanned from working their parents’ farm.

The rail line splits in two at the junction, one part going to the north through a small village. The other line swings east along the ridge to the nearby market town. (Five years later, the infamous ‘Beeching Axe’ would close this rail line along with many others, but no one knew that then.)

Ellie and Rufus sometimes spend their Saturdays in the town selling vegetables at their parents’ market stall. Ellie likes going to town because she gets to dress up. Rufus hates its and just sees it as more hard graft with no pay.

Rufus’ mate, Flip, is olive skinned, dark-haired and shorter than Rufus. He is two years younger and lives along the rail line in the nearby village. The boys met two summers ago when Rufus was walking in the hills collecting berries. They have been best mates ever since.

Flip’s real name is Philippe. His younger brother is Antoine. Their mother comes from the nearby town and married a local villager. Being from the town and having ‘airs and graces’, she insisted on giving her children French-sounding names. Philippe quickly became Flip after a few rounds of bullying at school and Antoine’s father almost immediately shortened his younger son’s name to Tony.
One afternoon, Flip and Rufus discovered the metal box at the junction about halfway between their houses. The lads agreed to use it as their furtive hiding place. From time to time, Rufus and Flip secrete found treasures, photos and notes in the signal box for each other. Ellie is the only other person who knows about this clandestine niche, or at least Rufus hopes so.

Flip has also become engrossed in photography. The lads have spent many days walking the Somerset landscape together, taking photographs with Rufus’ camera and, on hot summer days, swimming in a nearby stream.

Rufus finished school at sixteen and has worked on his family’s farm full-time for the past year. He hates it and wants to get away from this harsh country life. Flip is now in his final year at school.

The two lads love to lie in the deep grass on a hillside next to each another and stare at the clouds in the sky, making up animals, characters and adventures for them out of the billowy white shapes. When Rufus happens to brush up against Flip or touch him almost by accident, electricity courses through his whole body. This delights him, but almost immediately causes him shame too.

You have probably surmised by now that Flip and Rufus love each other. At first, Rufus didn’t know what these feelings were. Both have always known, however, that being together matters more than anything else in their young lives. They will use any excuse to spend time together, particularly in the summer when school is out of term.

One particularly hot day when they are swimming, Flip doesn’t bother to put his T-shirt back on. Rufus conceals the worn, white shirt in his canvas army rucksack. He takes it home and sleeps with it next to his pillow that night.

Rufus can smell Flip on the shirt. At night in his single bed under the farmhouse's eaves, lying next to this piece of worn cotton clothing, Rufus dreams of Flip's unpolluted perfect being. The shininess of his young dark skin, his naturally sun licked hair, his smile's innocence, his warm arm around Rufus’ neck, and laughing—always laughing.

These feelings make Rufus both happy and frightened. Because Rufus is the older of the two, he senses that he is particularly responsible for his growing feelings about Flip. He knows innately that these stirrings could lead to something dangerous or forbidden in his small English country village.

Rufus decides to declare his feelings about Flip to him. Rufus wants to convince Flip that they could quit the village all together when Flip finishes school and find jobs in town, or even move to a city together where Rufus can try his luck at becoming a photographer. Rufus is resolved to tell Flip that he loves him and share his plan with him. So, a few days ago, he wrote a short but passionate note and left it with photos of the two of them frolicking in the woods at the junction box.
Today, Rufus is hoping that Flip’s answer will be waiting for him at the junction.

**At Sea 2010**

It happens at sea. I remember more clearly then, what those flashes of innocent intimacy were like. The lapping waves and the water’s surface with its shiny viscosity created by the light prompt me to recall the fluidity of those moments.

Memory is not text, not even remembered action, really. The past is recreated by recollections of an atmosphere, a sound or a temperature. Recalling the arrangement of the furniture often reveals more about a moment than the people sitting on it. Reminiscence is simply dreaming awake.

Images such as dappled sunlight are not a routine physical reality. They are as much a precise instance in the lifecourse as a particular sixteenth birthday. Our first experience of mottled sunlight is a rite of passage, a singularly unique occurrence in our young lives.

So is the nature of key moments in our story of young Rufus and Flip.

Roll the film. Capture them.

**Somerset 1958**

Close your eyes and recollect this patterned lightness on the patchwork English country landscape and you will see young Flip—dark, tan, laughing—happy to be with you. There has been no other instance in your life like it. You wish that this moment will go on forever but, even in your youth, you know it will not be so. You have been taught this in songs and they are sad ones.

Your soul has always been an old man’s, your cautious, fearful, doubting heart. We are forged as we will be in youth and spend the rest of our lives unravelling that fact. The child somehow knows that as a man you will seek to recreate this moment over and over again and so you prepare yourself for such reminiscence, even in your youth. Play the Adagio from the Mahler 5th. You understand it profoundly.

You and Flip walk over hills towards a wood. This is not a memorised landscape, however. It is a recollection of a three-dimensional physicality consisting of the soil under foot, the sound of the swish of tall grass, and the crunchiness of pebbles mixed with earth. The intensity of the English sky's summer blueness creates a light pressure against your skin. The warm country air is more uncontaminated than any you will ever breathe again. His arm around your neck as you walk is the last uncorrupted act of commitment that you will ever experience. This is the
You are in the stream at a point where the water, the great purifier, creates a deep pool. The chilly water laps against his body, and so you do too. The surface of the water makes a fluid partition that allows grazing against his body beneath it seem easier, less obvious, but still dangerous. The pretence plays out above the surface, the risk and the release beneath. If he ever objects ... but he never did. The physicality of your relationship remains in its purist state.

Flip’s mother rings your mother. Her shrill screaming coming from the telephone reverberates around the farmhouse kitchen. Your father is uncomfortable situating himself so intimately next to your mother who listens with the receiver away from her ear. She turns her back on you as you stand in the doorway, bracing yourself for what your unfounded guilt convinces you will be the earthquake to come.

Flip’s mother says that she found the dirty letter that you wrote to her son. She screams down the phone line that you are a filthy unclean pervert and she is coming to your parents’ farm with a kitchen knife to sort out the whole family. Then she is going to make certain that the entire village knows about their evil son and your wicked intentions. She is going to report you to the police for the criminal that you are.

Your mother is crying. Your father slams the kitchen door and storms outside. You can hear him near the barn shouting and swearing. The tall case clock in the hall ticks away its heavy unrelenting passage of time. It seems more strident than ever tonight—even louder than your father’s shouting or your mother’s crying. Somehow it’s ticking sooths you.

You know that tonight is the end of innocent intimacy. It is probably the beginning of something else, but you are unsure of what that is.

The next morning, very early, your father tells you that you will need to leave the village. He will drive you to the railway station in the nearby town, past the junction where you and Flip met up so many times. He tells you to go pack you things. He will give you the train fare to get to London, but then you are on your own.

He then mutters bitterly, ‘That’s where your kind go, don’t they?’

The surface is broken. Rufus never sees Flip again.

London 2010
Rufus prepares the motor for the long drive. It reminds him of those Saturday journeys to the market as a child when they neatly packed his father’s motor with wooden boxes of vegetables. There were so many boxes that there was hardly room in the back seat of his parent’s saloon for Rufus and his sister Ellie. Today, Rufus is stuffing the back seat of his prized 1965 racing green Rolls-Royce Silver Cloud III with cameras, equipment and boxes of photographs. After years of searching auctions, Rufus located the very same motor used in Antonioni’s classic 1966 film *Blow-Up*. His proudest possession.

"Packing a few bits and bobs that wouldn’t matter to naught but me for the long trip back to my small village in Somerset. I am returning to my birthplace after 50 years of London life and its adventures. The removal van went down to Somerset day ahead of me with my furniture, clothing and the rest of my bric-a-brac.

"London is now just routine to me, nothing to get excited about these days. After years of fighting the Tube, the crime and grime, the congestion charge and getting around London, I am ready to leave it all behind. The rushing, pushing and shoving—'Sorry, sorry, sorry!'—that hollow apology ringing out from every pub, shop and road crossing—I’ve had enough. I think I am now ready to finally try to a quiet life in the countryside.

"When my parents sold their Somerset farm quite a few years back now, they bought a small cottage in the nearby village to live out their retirement. My father died not long after. My mother recently passed away, but not before she had one last go at me over the telephone about what a disappointment I had been to her and my father. How their life in the village was made a misery after that ‘fuss’ around the ‘filthy’ business that I stirred up just before I left for good. She said that she has never absolved me for that. I suppose I was still 18 years old in her mind, even though I was by then near 70. Perhaps if she had forgiven me all those years ago, she would have died more peacefully and I might not be making this journey now.

"The money that remained from the sale of the farm went to my sister who emigrated to Australia. She married out there and has three children. My parent’s small worker’s cottage was deeded to me along with my grandfather’s tall case clock that I am particularly fond of. That generosity took me by surprise, actually. I don’t think it had anything to do with their forgiveness though, more to do with family duty and doing what was expected of them—doing the ‘right thing’.

"Fed up with London, I decided to finally retire to Somerset and their cottage. Most of my friends say that I am mad and will regret it. Still, they promise to come down for long weekends if I will entertain them properly. Most are involved in television production or the theatre. They would create quite a stir invading conservative Somerset! At least I think they would, since I haven’t lived in the village for nearly half a century".

*On the Road 2010*

As Rufus prepares to head out of Islington and make his way to the A-4, he wonders if he *can* go back. Can we ever go back and expect things to turn out differently?

"Of course, I am not the same person today. I have a lifetime of experiences, working as a photographer and making films for television, and the relationships that I have had certainly changed me. I am no longer that young lad who was cast out by the villagers because of their ignorance, shunned by my own family, and coerced into self-exile by my own doubts all those years back, that’s for sure!"
Rufus turns on the Rolls’ Sat-Nav, happy to rely on a posh but strict recorded woman’s voice giving directions. He named her "Sadie" after his deceased mother. Such nomenclature is a kind of cheekiness that would provide Freud with a field day in this case. For Rufus, the decision to leave is finally no longer in his hands; a programmed voice takes over. "Sadie" knows what’s best for him, what to do and where his next move should be.

As he careens off early morning Upper Street—it’s café workers cleaning up the pavement real estate occupied by drunken revellers the night before—he turns on BBC Radio 3. The Adagio from Ravel’s Piano Concerto in G is playing. Rufus makes a mental note to himself that this piece of music would provide a perfect soundtrack for the more rural segments of today’s journey. His mind is never far from the editing room. Rufus sinks into the Rolls-Royce’s leather upholstery and deeper into his thoughts. His driving becomes routine.

Who is it that impatiently awaits the conclusion to our story of Rufus Stone? Is it us, eagerly willing a happy ending? Is it young innocent Rufus who wants to finally go back and change the outcome of his tale of first love? Does he believe that by making this return in time and place that he can reignite the love, passion and intimacy of his youth? Or is it wiser and older Rufus who has realised that what matters most to him is to come to terms with the past at the end of his days? Can he even, perhaps, finally find a way to forgive in this tiny pastoral corner of the land? Can we ever go home? Or is it our memories, with all of their twists, turns and imaginings that propel us into a deep abyss created by our re-imagined pasts?

Rufus reconsiders the countryside of his youth as he drives.

It is a memory of a five-year old boy sitting on his grandfather’s lap. Granddad’s hand, rough and worn from working the land, his thumbnail somehow permanently split, reaches into the pocket of his tattered woollen trousers and magically produces a cellophane-wrapped peppermint sweet for the boy. The tall case clock ticks in the background, the same clock that ended up in his parent’s farmhouse hallway. The sound of this clock has always provided Rufus with comfort in times of crisis. It is recollections of his grandfather that most warmly represent the countryside to Rufus.

Rufus recalls pushing his sister’s pram up dirt paths on the hillside, away from the family farm and the village—as far away as he could get the two of them. He remembers the feeling of searching for his own private landscape where his thoughts could finally be free and be his own.

Later, he remembers walks along the railway tracks with his sister. It’s the majesty of the sky and the smell of wild grasses mixed with the scent of oil on the railway sleepers, more than a revisitualisation of their footsteps, which provoke his recall. It is the sounds of the train approaching, spewing and hissing steam—these sounds as much an invasion of their privacy as they portend the thrill of travel to unknown, yet-to-be-seen places.
He remembers getting to know the workers on that independent rail line and one of them taking him into the signal
box that day. This is when he learned about the physical stirrings that his body provoked in others and acts that are
prohibited between a boy and a man. Pleasure, guilt and the forbidden become central to his sense of self from that
day forward.

But then there is Flip. Beautiful Flip. Years of searching have never produced such innocent attractiveness again. If
Rufus could only experience it again, to be in his presence, to walk with him arm in arm!

Rufus makes stops at several lay-bys and overlooks along his route to take in scenic views. At each of these breaks in
the journey, he gets out a camera and takes some photos of the bucolic English countryside with its well-represented
patchwork of hedgerows and fields. Particularly noteworthy for Rufus are the points along the narrower roads where
they suddenly turn and reveal sweeping vistas. He laughs to himself when he sees cows in a field lying down and
remembers that this means that it is going to rain. Once a country boy... Except for the improved condition of the
roads, nothing much has changed.

His journey makes it way, first, through the less familiar Thomas Hardy country of Dorset and then on to Henry
Fielding’s Somerset. It is as though he is seeing his birthplace for the first time. After almost 50 years, he may as well
be.

Indeed, Rufus envisions one last attempt at resolving his youthful crisis somehow. He knows that he still must seek
acceptance in order to love openly and freely amongst his peers in rural England. The law may have changed in
his lifetime, but acceptance is still not a legacy for him and his kind and particularly not for his generation in the
countryside. This is the kind of tolerance that is fundamentally socially constructed by one’s peers. Life has taught
him this hard truth. In his imaginings, Rufus hopes, at least in his case, to make this finally possible.

This is the way our story now twists and turns. Consulting his memories, our Rufus drives confidently onward, willing
to gamble on his imagined past. This is probably the bravest risk of his entire life, or the most foolish one.

This is the way in which he decided to return to his village.

∞

A screening of RUFUS STONE will be featured as a Special Event in the Frontiers Stream of the BSA Annual Conference
at Leeds University, 24 April 2014 at 12:30 p.m.
With regard to self-concept, my claim in the Rorty book is certainly not that, as sociologists of ideas, we should somehow let intellectuals tell their own stories. As I've noted above, the accounts intellectuals give of their own lives are often highly problematic from the standpoint of sociological realism. That does not mean, however, that their self-narratives are irrelevant for explaining their actions. Beyond the point about grievances, the specific way in which I think they are relevant is that such narratives tend to be built around categories of intellectual selfhood into which thinkers understand themselves to fall. My argument is that thinkers labor under social-psychological pressure to do work they see as consistent with these categorical self-concepts. As to the methodological question of how one goes about reconstructing self-concepts, the answer I proposed in the book is to look for as many instances of self-talk as one can find - in interviews, autobiographies, correspondence, diaries, speeches, and so on - and attempt to discern from these the most salient and least evanescent categories of personhood a thinker places himself in at any given juncture. This reconstruction will have been carried out with maximum objectivity if most observers of that self-talk - including, where possible, the intellectual himself - will agree that those in fact seem to have been the most salient identity categories.

- Neil Gross

CfP: An Invitation to Digital Public Sociology (2013-12-24 08:00)

What does ‘public sociology’ entail in a world of facebook, twitter, youtube, slideshare, soundcloud, pinterest and wordpress? What affordances and constraints do these tools entail for the task of “taking knowledge back to those from whom it came, making public issues out of private troubles, and thus regenerating sociology’s moral fibre”? What implications do these tools have for the relationship between the public and private in the occupational biographies of individual sociologists and, through aggregation and collective organisation, the discipline as a whole?

Short articles (1000 to 4000 words) are sought for an open access edited book which explores conceptual, methodological or practical aspects of Digital Public Sociology. If you would be interested in contributing then please send an abstract of 200 words or less by December 31st 2013. The final articles would be needed by March 31st 2014, with the intention of launching the collection in the summer of 2014. Please send abstracts (or questions) to mark@markcarrigan.net.

CfP: Digital Sociology PhD/ECR Workshop (2013-12-24 14:00)

Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from peers and established academics in a supportive environment.

The event will take place between 11am to 4pm on February 19th at Goldsmiths College in South London. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.

If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn’t been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.

Digital Sociology at #BritSoc14 (2013-12-26 08:00)

Plenary: The Social Life of Digital Methods

Deborah Lupton, Evelyn Ruppert, Noortje Marres, Mike Savage and Emma Uprichard

Friday 25 April 2014. 13:30-15:00

As an inaugural conference session for the BSA Digital Sociology study group, we propose a round table discussion exploring digital methods and their implications for sociological research. Our theme would follow a recent special issue of Theory, Culture & Society discussing the ‘social life of methods’ which has attracted much attention
We expect the proposed roundtable would cover a diverse range of topics under the broad theme of the ‘social life of methods’ including the ‘crisis of empirical sociology’, the significance of ‘big data’, the history of sociological methods, the digital turn in social life and the problems and prospects for a critical social science under contemporary circumstances. In doing so, our proposed session would not only address the conference theme of ‘changing society’ but do so in a way which explores how the repertoires of social research are both shaping and being shaped by these broader changes within social life.

An Invitation to Digital Public Sociology

Sarah Burton, Mark Carrigan, Jessie Daniels and Deborah Lupton

Date/Time TBC (there was a clash)

This session asks what ‘public sociology’ entails in a world of facebook, twitter, youtube, slideshare, soundcloud, pinterest and wordpress. What affordances and constraints do these tools entail for the task described by Michael Burawoy of “taking knowledge back to those from whom it came, making public issues out of private troubles, and thus regenerating sociology’s moral fibre”? What implications do these tools have for the relationship between the public and private in the occupational biographies of individual sociologists and, through aggregation and collective organisation, the discipline as a whole? In addressing such questions it seeks to draw out the continuities between the emerging field of digital sociology and the longer-standing concerns of public sociology. In doing so it addresses the claim made by John Holmwood at the previous year’s conference that the task of sociology in an age of austerity is to “occupy debate and make inequality matter” and argues that the digitalisation of social life entails profound challenges and opportunities for sociological inquiry.

Quantified Self and Self-Tracking: Data, self and health

Farzana Dudhwala, Deborah Lupton, and Karen Throsby

Date/Time TBC (there was a clash)
This panel has been arranged by the newly formed Quantified Self Research Network which was established in September 2013 in order to bring together scholars who are interested in understanding the development of self-tracking devices and techniques. This event will comprise of a panel of three speakers who will offer empirical or theoretical insights which will help to set the agenda for this new area of sociological study.

Although individuals and populations have been subject to statistical measures for more than a century the potential for quantification has increased dramatically in recent times. Perhaps the most distinctive characteristic of the contemporary quantification of the self is the extent to which individuals are encouraged, and often willing, to quantify themselves and engage with the analytical potential this enables.

We take quantified self in a broad sense to refer to the (semi-)formalised movement and community which has built up around the use of, and sharing of ideas on, commercial self-tracking devices and technologies. In addition we are also interested in those techniques and practices which are used by clinicians and patients to monitor health and the myriad ways in which our bodies and activities are monitored without our direct participation.

The impacts of quantification of bodies and practices on individuals will be explored from a number of different perspectives in order to unpick the social and ethical consequences of quantification as well as explore the professional and personal practices which enable it.

---

**Digital Sociology Down Under (2013-12-27 08:00)**

In November, the 2013 annual conference of The Australian Sociological Association (TASA) was the first conference in Australia to host streams on digital sociology. It was the Associations’ 50 year anniversary and simultaneously the inauguration of digital sociology down under. After circulating an expression of interest for papers aligned with digital sociology through the Cultural Sociology thematic group, enough papers to fill two sessions rolled in, although an engagement with the digital sparked up throughout the conference.

Both digital sociology sessions were held on Wednesday, November 27, and were extremely well-attended. The popularity of the sessions and the engaged discussion they generated clearly showed that digital sociology is on the rise in Australia. It was an honour to have both keynote speakers Prof. Celia Lury and Prof. John Holmwood present in the digital sociology sessions. Lury, who works at Goldsmiths, where of course the first [1]MA/MSc in Digital Sociology has been set up, also delivered an intriguing address at the conference which raised issues about the need for sociologists to engage in new theories and methods to capture the culture of the digital.

Deborah Lupton opened up the first digital sociology session with her paper ‘Digital Sociology: Beyond the digital to the sociological’. Deborah has been instrumental in developing ideas around digital sociology in Australia, including numerous posts on her [2]blog, a [3]Facebook page and a first [4]introductory resource. In her presentation, Deborah outlined her definition of digital sociology and its relevance in the discipline. She argued that digital sociology encompasses all things digital, not just the cyber, and is a new way to enliven sociology. She outlined four key dimensions of digital sociology, including (1) professional digital practice, (2) sociological analyses of digital media use, (3) digital data analysis and (4) critical digital sociology.

Deborah’s paper was followed by several interesting case studies that exemplified what ‘doing’ digital sociology might look like. In a joint paper, Timothy Graham and I considered the ontological provocations of imminent
wearable computing technologies through the example of Google Glass. Carefully avoiding dualisms and technologically deterministic judgements of the new technology, we showed how Google Glass can be understood as a technique of self though which people relate to themselves and others and in this way navigate their day-to-day lives. Alerted by Latour to Gabriel Tarde’s concept of the monad we postulated that Google Glass provides an example through which to trace and make visible entities in a digital network.

Continuing the Google-theme, David Collis next conceptualised the Google PageRank algorithm as an autistoid technology that institutes a 'hyperlink ethic', which transforms the way information is organised online. Drawing on psychoanalytically-informed social theory his presentation exemplified how to account for the unique structure and agency of digital life.

Erin Carlisle concluded the first session with a paper on the Australian political panel TV programme Q &A. She questioned the applicability of traditional public sphere theory to despatialised, mediatised communication. Erin’s paper provided an excellent example of how digital sociology can be useful in reconceptualising publics in light of digital developments.

After recharging over lunch, the second session had even more to offer. In my paper ‘The Culture of the Digital: From Digital Methods to Digital Sociology’ I developed a critical perspective on the label ‘digital sociology’. While a keen proponent of the emergence of the sub-discipline or interest area, I cautioned about the use of the label. Arguing that it is great to see sociology reaffirming its contribution to the digitisation of social life, showing its willingness to adapt its craft, and declaring its relevance in the context of a proliferation of interest areas that are taking claim to the ability to access and analyse the social, I outlined the danger of reinforcing binaries between the humanities/qualitative studies and the sciences/quantitative/big data work. I suggested that good digital sociology needs to be open to interdisciplinarity and to acknowledge the unique culture, architecture and affordances of the digital, as well as to consider the emergence of new political and ethical power relations in the realm of the digital.

As if following my call, the rest of the session provided some stellar examples of critical digital sociology. Tristan Kennedy used his research on online heavy metal subcultures to reflect on ethical and methodological considerations surrounding privacy and consent when studying digital communities. Tim Jordan (also on behalf of Kim Humphery) conceptualised ethical consumption apps. He considered how new moralities emerge in the context of digital interaction, which reconfigure the ideological and material complicity of consumers and disturb the notion of the consumer as agent. Finally, Ashlin Lee presented his theoretical framework for understanding ‘convergent’ mobile technology. He showed how a shift in the materiality and sociality of digital communication and consumption necessitates new ways of conceptualising the entangled reciprocal relationships between humans and technologies.

The breadth and depth of the critical engagement in all of these presentations truly shows the unique perspective sociology has to offer to the study of the digital. And the lively buzz that surrounded the sessions indicates the keenness of sociologists to have their say. Numerous other papers that engaged with the digital were sprinkled throughout the conference and eager conference-goers tapped me on the shoulder left, right and centre, expressing their excitement about the sessions and their interest in getting involved.

The digital is certainly on the agenda in Australian sociology and we would like to foster this interest by establishing an Australian Digital Sociology research network. Researchers located in Australia who are interested in getting involved can contact me (t.sauter@qut.edu.au), Deborah Lupton (deborah.lupton@sydney.edu.au) or Alexia Maddox (alexia.maddox@curtin.edu.au).

Dr Theresa Sauter is a Research Associate in the ARC Centre of Excellence in Creative Industries and Innovation at the Queensland University of Technology.
Nikolas Rose: What is Mental Illness Today? Five Hard Questions (2013-12-28 08:00)

Professor Rose is one of our leading contemporary social scientists. Currently he is Professor of Sociology and Head of the Department of Social Science, Health and Medicine at King’s College, London. In the talk, Professor Rose characterises the ‘territory’ of mental illness today by posing five hard questions that seem to represent genuine empirical, conceptual, professional and ethical dilemmas.

The questions are:

1. Is there an ‘epidemic’ of mental disorder?
2. Does the path to understanding mental disorder lie through the brain?
3. What is the role of diagnosis and of diagnostic manuals?
4. Should we seek early identification of those at risk of future mental pathology?

5. What is the place of patients, users, survivors, consumers in the mental health system?

Is there really an ‘epidemic’ of mental disorder? Or are psychiatrists simply too willing to diagnose and, if so, why? Rose cautions against construing this as simple psychiatric imperialism. Instead we need to look at what he calls the ‘new engines of psychiatrization’ which are driving these increasing figures. What are the implications of incorporating all ‘mental illnesses’ into the category of ‘brain disorders’? If so many have ‘abnormal’ brains then what does ‘normality’ actually mean?

I’m always amazed by how much ground Nikolas Rose is able to cover during one lecture. There a [2]list of his lectures on his (new?) website, many of which are available to watch online.

There are no Digital Humanities (2013-12-29 08:00)

Thanks to [1]Daniel Allington for linking to this fascinating piece by Gary Hall:

While ideas of this kind appear just that little bit too neat and symmetrical to be entirely convincing, this so-called ‘scientific turn’ in the humanities has been attributed by some to a crisis of confidence. It is a crisis regarded as having been brought about, if not by the lack of credibility of the humanities’ metanarratives of legitimation exactly, then at least in part by the ‘imperious attitude’ of the sciences. This attitude has led the latter to colonize the humanists’ space in the form of biomedicine, neuroscience, theories of cognition and so on. Is the turn toward computing just the latest manifestation of, and response to, this crisis of confidence in the humanities?

Can we go even further and ask: is it evidence that certain parts of the humanities are attempting to increase their connection to society; and to the instrumentality and functionality of society especially? Can it merely be a coincidence that such a turn toward computing is gaining momentum at a time when the likes of the UK government is emphasizing the importance of the STMs and withdrawing support and funding for the humanities? Or is one of the reasons all this is happening now because the humanities, like the sciences themselves, are under pressure from government, business, management, industry and increasingly the media to prove they provide value for money in instrumental, functional, performative terms? (Is the interest in computing a strategic decision on the part of some of those in the humanities? As the project of [3]Cohen and Gibb shows, one can get funding from the likes of [4]Google. In fact, ‘last summer Google awarded $1 million to professors doing digital humanities research’.)

To what extent, then, is the take up of practical techniques and approaches from computing science providing some areas of the humanities with a means of defending themselves in an era of global economic crisis and severe cuts to higher education, through the transformation of their knowledge
and learning into quantities of information – deliverables? Following [6] Federica Frabetti, can we even position the computational turn as an event created precisely to justify such a move on the part of certain elements within the humanities? And does this mean that, if we don't simply want to go along with the current movement away from what remains resistant to a general culture of measurement and calculation, and toward a concern to legitimate power and control by optimizing the system's efficiency, we would be better off using a different term other than 'digital humanities'? After all, as [7] Frabetti points out, the idea of a computational turn implies that the humanities, thanks to the development of a new generation of powerful computers and digital tools, have somehow become digital, or are in the process of becoming digital, or at least coming to terms with the digital and computing. Yet what I am attempting to show here by drawing on the philosophy of Lyotard and others, is that the digital is not something that can now be added to the humanities – for the simple reason that the (supposedly pre-digital) humanities can be seen to have had an understanding of, and engagement with, computing and the digital for some time now.

Benjamin Geer (2013-12-29 09:53:00)
It’s certainly plausible that some people are attracted to the Digital Humanities label because there’s money in it, or because it makes their work look more like science. However, software can help make a lot of things less tedious in humanities research, especially tasks like finding relevant primary sources, comparing them, identifying interesting portions of them, annotating them, publishing them, and so on. To a large extent, software that’s really suited to helping scholars do these things has yet to be developed. Many attempts by humanities scholars to use software for these kinds of purposes have been isolated efforts, unmaintained after the end of the project, and their results have often been lost when the technology they rely on becomes outdated. There’s a real need for a collective, long-term, well-funded effort to develop good software for the humanities. This effort needs a name. Maybe Digital Humanities isn’t the best name, but I think it’ll do.

Benjamin Geer (2013-12-29 12:09:00)
That sounds like a good idea for a seminar. One thing that’s struck me, very subjectively, is that some humanities scholars (definitely not all) have a sort of visceral opposition to science. This often seems to go along with a surprising lack of awareness of the overwhelming success of the natural sciences and of the huge role they play in our everyday lives. (I often have to tell such people that GPS depends on Einstein’s theory of relativity, that MRI scanners depend on quantum mechanics, and so on.) And it sometimes also goes along with a mistaken belief that Continental philosophy has deconstructed science and shown it to be just another discourse based on nothing more than power relations. I tend to see these attitudes as
defensive postures on the part of individuals who, feeling that the value of their training is implicitly threatened, are inclined to discredit the scientific training that they don’t possess. I thought I detected some of this in the above post, which seems to romanticise resistance “to a general culture of measurement and calculation”, as if measurement and calculation were somehow inherently dehumanising forces turning us into soulless automatons, rather than powerful tools for improving our understanding of the world. I think a critical discussion of these attitudes would be an interesting topic in a seminar.

Sociological Imagination (2013-12-29 16:07:40)
Oh I see where you’re coming from, I read it sightly differently though. I thought the author was arguing that there had been a failure of nerve (for lack of a better expression) and a longstanding opposition to ‘scientific discourse’ had given way to an enthusiastic embrace, in a manner driven by (probably quite realistic) fears about the future of the humanities in the neoliberal academy. I’m 100 % in agreement with the thrust of what you’re saying - I’m always astonished and baffled when I encounter this axiomatic pomo textualism, in some spheres it seems to still be hegemonic, despite (arguably) poststructuralism beginning to die out within the social sciences.

Sorry, just came across this discussion. As a quick way of trying to convey the idea that there is something a little more subtle and interesting behind the above post than a ‘visceral opposition to science’ - and still thinking in the context of the digital humanities, and how software can help scholars in the humanities do interesting things - perhaps I can suggest taking a look at the Living Books About Life series Joanna Zylinska, Clare Birchall and I put together with Open Humanities Press for Jisc. http://www.livingbooksaboutlife.org/ This is a series of open access books that endeavour to provide multiple points of interrogation and (to avoid the trap of ‘scientism’) contestation, as well as connection and translation, between the humanities and the sciences. And just in case that is not enough to convince you the above post is not coming from a position in which science is somehow seen as threatening the value of a humanities training, might the Critical Climate Change series (http://openhumanitiespress.org/critical-climate-change.html) Tom Cohen and Claire Colebrook have put together for us at Open Humanities Press be another example of scholars working in Continental philosophy and theory who have an approach to the sciences that is far from seeing it as ‘just another discourse based on nothing more than power relations’? I hope this helps.

Sociological Imagination (2014-02-13 23:42:00)
I agree - I’ve always made that argument to him...

The Sociology of Awkwardness (2013-12-30 08:00)
What is awkwardness? It’s something we recognise. It’s something which is everywhere. Yet when we do think about it, it’s often seen as something trivial and mundane, representing an interruption of decorum or a warp in the texture of micro-social interaction. It’s something that can be intensely felt but is soon forgotten and, where it is not, we see this inability to forget as something pathological. In this sense awkwardness tends to be relegated to the periphery of social life when in fact it is something constitutive of it. There could be no social interaction without awkwardness because its possibility is inherent in the coming together of individuals in social situations. As Goffman describes this:

whatever his other concerns, then, whatever his merely-situated interests, the individual is obliged to ‘come into play’ upon entering the situation and to stay ‘in play’ while in the situation, sustaining this diffuse orientation at least until he can officially take himself beyond range of the situation. (Goffman 1963: 25)

The potential for awkwardness is inherent in ‘coming into play’ and sustaining an expected orientation while ‘in play’
before exiting in a manner equally congruent with the expectations within a situation. What’s important to grasp though is that awkwardness is not just a subjective response to an objective situation. As Adam Kotsko argues,

First there is what I will call *everyday awkwardness*, which seems to originate with particular individuals. It combines aspects of my gracelessness and the singer’s uncomfortable performance. It’s difficult to deny that there are people for whom awkwardness is a kind of perverse skill, who bring it with them wherever they go. We are only able to identify someone as awkward, however, because the person does something that is inappropriate for a given context. Most often, these violations do not involve an official written law – instead, the grace that’s in question is the skillful navigation of the mostly unspoken norms of a community ... Even when personal deficits make certain individuals seem extremely awkward by nature, however, awkwardness remains a social phenomenon, and therefore the analysis of awkwardness should focus not on awkward individuals but on the entire social situation in which awkwardness makes itself felt. (Kotsko 2010: 7)

His point is that awkwardness *emerges relationally*. It arises situationally in relation to norms concerning ‘coming into play’ and ‘staying in play’ which are endorsed and enforced by others within the situation. However what I really like about Kotsko’s analysis is his attentiveness to the way in which “awkwardness moves through social network, it *spreads*” because “you can’t observe an awkward situation without being drawn in: you are made to feel awkward as well, even if it is probably to a lesser degree than the people directly involved” (Kotsko 2010: 8). One claim he makes on the basis of this is that comedy relies on this ‘drawing on’. Another more counter-intuitive claim is that awkwardness “actually creates a weird kind of social bond” through “in the moment of awkwardness” being “forced to share to varying degrees in the experience of awkwardness” (Kotsko 2010: 9). He seeks to place this intrinsically social character of awkwardness in historical perspective:

Following the pattern, one could say that the tension of awkwardness indicates that no social order is self-evident and no social order accounts for every possibility. Awkwardness shows us that humans are fundamentally social, but that they have no built-in norms: the norms that we develop help us to ‘get by,’ with some proving more helpful than others. We might say, then, that awkwardness is what prompts us to set up social norms in the first place – and what prompts us to transform them. (Kotsko 2010: 16)

This seems an implausibly strong claim but it’s one rooted in a interesting Heideggerian analysis of awkwardness. He suggests it as a counterpart to Heidegger’s understanding of anxiety and boredom. But unlike these experiences which isolate the individual, awkwardness unites them, albeit through the creation of a peculiar and perverse sort of social bond. His claim is that awkwardness drives the structuring of sociality through its perpetual tendency to emerge, as well as to *spread*, in the absence of such structure. Awkwardness (stemming from the provisionality of social normativity) in interaction is analogous to anxiety (stemming from the finitude of existence) in individuals. But Kotsko argues that we live in an inherently awkward age:

Everyday awkwardness happens in a context where the social order seems more or less adequate and comfortable, but the provisional nature of every social order indicates that it’s not an all-or-nothing question of either having a social order or none, as in the opposition between everyday and radical awkwardness, between awkwardness in violation of a social norm and awkwardness in the absence of a social norm. I propose that there is a particularly awkward kind of awkwardness in between the two, which I will *cultural awkwardness*. It arises when there seems to be a set of norms in force, but it feels somehow
impossible to follow them or even fully know them. Just as it is easier to criticize than to create something, a social order in decline maintain its ability to tell you what you're doing wrong even as it is losing its ability to provide a convincing account of what it would look like to do things right ... Contemporary mainstream middle-class social norms are not remotely up to the task of minimizing awkwardness, but at the same time, there seems to be no real possibility of developing a convincing positive alternative. (Kotsko 2010: 16-17).

He makes a convincing case that the role of awkwardness in comedy is not simply a matter of playing upon the familiarity of everyday awkwardness. Instead there is an elaboration within some recognisable genres of the broader cultural malaise and its attendant anxieties. He takes Judd Apatow films as representative of a sense that “the order of adulthood somehow doesn't work, that it needs the awkward supplement of the male bonding it supposedly overcomes”. In the absence of new traditions, which is the only cultural condition in which the phrase 'new traditions' could be coherent, we are left with a “pervasive sense that despite the fact that we can never fully embrace the traditional norms, we are somehow hardwired to head in that direction and will do so immediately once our attempts to do something else fail” (Kotsko 2010: 65). These films not only represent friendships which are 'structurally awkward', in that they are grounded in opposition to cultural conventions, but they are ones which are eventually cast off in an unreflexive embrace of a circumscribed normativity. In contrast to this resist and then do it anyway approach to negotiating cultural awkwardness, Kotsko finds inspiration in the writings of St. Paul's on the possibility of cultural assimilation, imagining communities where,

Awkwardness is no longer a way of escaping social norms, and social norms are no longer a way of escaping awkwardness: instead, people simply meet each other, without the mediation of a defined cultural order, and figure out how to live together on a case by case basis. (Kotsko 2010: 80).

From this perspective the problem of cultural awkwardness becomes one of our response to it. Rather than "trying to come up with some permanent way of overcoming awkwardness, one should go with it" (Kotsko 2010: 79). In this way he inverts the notion of awkwardness, leading us “beyond the common sense notion of awkwardness as a disturbance in the social fabric and toward something like utopia” (Kotsko 2010: 86). Far from being something to be overcome, awkwardness in fact represents an opening towards a more fully human mode of being-with each other. It is a possibility we are forced to confront, however inchoately, because “opportunities to enjoy the community of awkwardness are always there, always available, always ready to erupt, because awkwardness is undefeatable”. Under such conditions it becomes imperative for us to cultivate “the peculiar kind of grace that allows us to break down and admit that we are finally nothing more or less than human beings who will always be stuck with each other and, more importantly, to admit that we are glad of it" (Kotsko 2010: 89).

The academic ethics of strikebreaking (2013-12-31 08:00)

This [1]insightful reflection on academic strikebreaking captures something very important about the contemporary politics of higher education:
The disavowal at work here is stunning in its mundanity, the fact that it went unremarked as it was stated. ‘The union should adopt different tactics – but I will not join the union’; ‘I support the strike – but I am not going to strike myself’; ‘the cause of the strike is just – but I renounce the basic means of resisting injustice’.

There is no reason why academics should be any more logical about these matters than anyone else. But I wonder if the gaping holes in these responses are, at least in part, a result of the shaping of academic subjectivity by the capitalist university. We are engaged in a profession which claims to promote something above instrumentalism – and it is precisely this which is our instrumental role. We have to play the games of preparing students for employment, and raising money for research, but we keep an internal distance from these things. We cynically despise them (and often despise the students who do not measure up to our ideals), whilst committing ourselves to a system which believes in these things on our behalf (cf. the Zizekian analysis of contemporary belief).

However, it is this internal displacement which produces the figure of the contemporary academic. This person is invested in an ethic of scholarship, which actually leaves them without a language or imagination for addressing the material conditions of higher education, beyond that of an ultimately ineffective idealism. The melancholy of the modern scholar over the marketization of education is therefore neither a form of resistance nor mere nostalgia, but a fabricated affect essential to the mediating role we play.

Of course, I generalise hugely, and we can all think of many exceptions. I am not suggesting that our bureaucratised unions or existing left groups offer any panacea. Nevertheless, higher education has been, and will continue to be, marketised and instrumentalised, and the vast majority of academics will (grudgingly, cynically) put up with it. And our ethic of scholarship is of no use. It is the same ethic which is able to abide such logical inconsistencies and lack of solidarity when it comes to strikebreaking.

5. 2014

5.1 January

1,000 months in which you can read 4,000 books (2014-01-01 08:00)

If you read one book a week, starting at the age of 5, and live to be 80, you will have read a grand total of 3,900 books, a little over one-tenth of 1 percent of the books currently in print.

#Keeponreading

As a shake-up, the philosopher AC Grayling is fond of reminding people that the average span of human life is less than 1,000 months. “If a third of them you are asleep and a third you’re in Tesco’s,” he says, “the other third, about 25 years, is left to you to live well.”

But how to respond to such a realisation...? Becoming overly discerning about the books you choose to read (“my god I’m one bad novel closer to death”) risks eroding the joys of reading. While thinking in terms of your 1,000 months risks becoming A C Grayling. It’s enough to make me want to embrace a perpetual present. Or perhaps it’s a spur to think about how to approach 2014?

CfP: Death Online Research Symposium (2014-01-02 08:00)

CALL FOR PAPERS

Death Online Research Symposium
Wednesday April 9th – Thursday April 10th, 2014

Durham University Centre for Death and Life Studies, Durham University, UK.
Keynote speaker: Professor Tony Walters, Director of the Centre for Death and Society, University of Bath, UK.

As digital media have become an integral part of our everyday life, so have also death and our afterlife become inextricably interwoven with technology. Marking the formation of the international research network Death Online Research, this first Death Online Research Symposium will focus on current research into the digital mediation of dying, death, mourning and personal legacy, in order to explore and discuss how online connectivity is changing how, when and where we engage with death. We invite presentations within the following areas: online memorial sites; grief and social media; mobile technologies in graveyards; the digital afterlife; and digital inheritance. We welcome other relevant perspectives on the impacts digital technology has on the context of death in the 21st century.

Paper abstracts of 400 words should be submitted to [1]deathonline@itu.dk by January 5th, 2014.

For further information, please visit [2]www.deathonlineresearch.net.

1. mailto:deathonline@itu.dk

The Shoes and Lives of Refugees (2014-01-03 08:00)

Since 2011, about 30,000 refugees have fled Sudan after the country started a campaign against immigrants (here is a [1]detailed article about the Sudanese situation by Eric Reeves). The refugees fled across the border from Sudan’s Blue Nile state to South Sudan - on foot. Photographer [2]Shannon Jensen made a visual museum of refugee lives in her photographic series entitled “The Long Walk” which documents the shoes belonging to adults and children refugees. The materiality, the documentary approach and the unusual subject make for compelling photography which conveys in a striking, almost ethnographic way some of the reality faced by war refugees in Sub-Saharan Africa.

Why Medium might be pretty great for academics (2014-01-04 08:00)

I just tried using Medium for the [1]first time and I loved it. I suspect I won’t be alone in this. Here’s a few reasons why I think it’s a good fit for academic blogging:

1. The interface is lovely. It does exactly what it claims to do and adopts an aesthetic which foregrounds what you’re writing. I’ve always seen the appeal in minimalistic interfaces for writing but never quite got to grips with them. There’s something about the Medium interface which really works for me (see screenshot below). It feels like writing in a really nice notebook using an ornate pen, with all the attentiveness this can engender. As opposed to WordPress which, in contrast, feels to me like scribbling for predominately practical purposes. These may be idiosyncratic reactions but I suspect they’re not entirely so.

2. The content ecosystem of Medium is setup to preclude the need for regular posting in order to build an audience. Not unlike a multi-author blog, the aggregation of content in one place brings the audience to Medium and users find your article through its submission to a range of curated thematic feeds or through it being ‘recommended’. In other words, articles circulate on their own merits. It’s possible to write very occasionally and yet gain an audience for what you’re written presuming the article itself is interesting and clear.

3. It has the advantage of guest blogging, in that it avoids the need to build your own audience and blog regularly. But it’s more immediate and I suspect this will really appeal. You don’t have to discuss the idea with the editor. You don’t have to wait for a slot to come up in the posting schedules which most bigger blogs will have. You can self-publish instantaneously but without the need to collate an audience that other platforms impose.

4. It has interesting metrics, offering stats in terms of views, reads, read ratio and recommendations. I need to look up how it calculates the reads. I suspect it works from time on page (given it automatically generates a ‘read time’ depending on length of the article) but it doesn’t say.

The plastic bag: a mocumentary (2014-01-05 08:00)

[EMBED]
Lauren Sardi: You are a proponent of arts-based research. What is arts-based research (ABR)?

Patricia Leavy: Arts-based research is when researchers in any discipline adapt the tenets of the creative arts in their social research. The arts can be used as a method of inquiry and/or representational strategy. As a sociologist I was trained that there are two major paradigms, quantitative and qualitative, and then mixed methods where you combine quantitative and qualitative. But an alternative paradigm has emerged: Arts-based research. ABR can make social research accessible to diverse audiences and I believe in public sociology. I think there are ethical and practical mandates for doing work that is of value beyond the academy. The products of traditional social research rarely reach the public domain. Research findings are jargon-laden and circulate in highly specialized, hard-to-get journals read by only a handful of academic "experts". ABR can help us bridge the academy and the public as we bridge science and art.

Lauren Sardi: You turned to fiction in your own research. Can you talk about that?

Patricia Leavy: My turn to fiction as a research practice came from my desire to reach public audiences with my scholarship and to engage academic and student readers on a deeper level. I was frustrated with the limitations of traditional academic articles and monographs which are only read by a handful of people with highly specialized education. They simply never reach broad audiences. I think people generally enter the field of sociology with a desire to make a positive contribution to society but the constraints of academia can be disenchanting. I wanted to do research that had the hope of being of some value and specifically, useful for girls and women. For nearly a decade I collected in-depth interviews with women of varying backgrounds about their relationships, identities and body images. I wanted to take what I had learned, cumulatively, and share it. My first novel, *Low-Fat Love*, is loosely based on that interview research and explores the psychology of negative relationships, women's identity and self-concept development and the social construction of femininity. After writing that book I wanted to explore other themes from my interview research as well as autoethnographic data. So I wrote another novel, *American Circumstance*, which explores appearance versus reality; how our lives and relationships look versus how we experience them, how social class shapes identity and the codes of female friendship including the things we do and do not say to each other. Both books are deeply embedded with sociology and as one colleague suggested, they offer a sociology of everyday life.

Lauren Sardi: What has fiction afforded you that traditional academic writing did not?

Patricia Leavy: Through fiction I have been able to reach both academic and general audiences. I've had the chance to speak with college classes as well as women's book clubs. It's wonderful to share work more broadly. It isn't just who you reach though, it is also how you reach them. People generally enjoy reading fiction. I believe learning can be joyful and must be engaged and fiction is well-suited towards those ends. Through fiction we can also try to promote empathy, disrupt stereotypes and grand narratives, make micro-macro links by showing instead of telling, tap into emotional complexity, construct believable realities for readers to enter, cultivate resonance and open up a multiplicity of meanings. From a writer's perspective, fiction also allows greater freedom than traditional academic writing. You don't need to censor yourself which is liberating and I think benefits readers as well. I've actually written a book called *Fiction as Research Practice* which details this methodology.

Lauren Sardi: What does the novel format in particular offer you?

The novel format allows me to weave stories together, build gaps into the narrative and develop characters in ways that I hope promote empathy towards them. Because I play with assumptions and stereotypes, sort of laying them out and then challenging them, I need some time to introduce characters, giving readers an impression of a character and then subtly suggesting things are not always as they seem. Novels, even when short like mine, give
you the space to do that. With that said, I have read social science written as novellas, short stories and poems that are quite powerful.

Lauren Sardi: Both of your novels are a part of the Social Fictions book series that you edit. This is the first academic book series of its kind. How did it come to be?

Patricia Leavy: When I finished writing Low-Fat Love I had to figure out how to publish it. I very much saw the novel as research. I am also deeply committed to advancing arts-based research and hoped to use my novel as a vehicle for doing so. I came up with the idea for the Social Fictions series in order to create a space to publish the products of ABR and so that my book would be a part of something larger. The series publishes books written entirely in literary forms, including plays, novels and short story collections, but all of the books are written by scholars and are informed by social research and it is published by an academic press.

Lauren Sardi: You’ve said in conference presentations that it was difficult to get a publisher to take a chance on the idea of “social fictions” but the reaction to your novels and the series as a whole has been astounding with your publisher announcing Low-Fat Love is their top-selling title of all time. What does this mean to you and what is your hope for the series?

Patricia Leavy: The first publisher I approached turned me down saying that we couldn’t sell enough copies to earn back his investment. I believe he predicted we couldn’t sell more than 200 copies. Actually this points to an ethical issue. Many publishers, that one included, will publish books about how to do arts-based research but then they won’t take a chance on publishing the products of arts-based research. But in terms of the Social Fictions series it all worked out extremely well. Sense Publishers is committed to social justice and creativity and they have been the ideal partner for the series. I hope the success we’ve achieved paves the way for others so that we see more of this genre blurring work and more people have access to scholarly works. Our goal has always been to advance arts-based research and public scholarship and I think we’re doing just that.

Patricia Leavy, PhD is an independent scholar and novelist, formerly Associate Professor of Sociology, Founding Director of Gender Studies and Chairperson of Sociology & Criminology at Stonehill College. She has published a dozen non-fiction books including Method Meets Art: Arts-Based Research Practice, Essentials of Transdisciplinary Research: Using Problem-Centered Methodologies and Fiction as Research Practice and the novels American Circumstance Low-Fat Love. She is the editor for four book series with Oxford University Press and Sense Publishers. Routinely called on by the media, she has appeared on national television, radio, is regularly quoted by the news media, publishes op-eds and is a blogger for The Huffington Post. She frequently makes presentations and keynote addresses at universities as well as national and international conferences. The New England Sociological Association named her the “2010 New England Sociologist of the Year” and she has recently been nominated for a Lifetime Achievement Award by the International Congress of Qualitative Inquiry and a Special Achievement Award by the American Creativity Association. Please visit [1]www.patricialeavy.com for more information. For information on the Social Fictions series visit: [2]https://www.sensepublishers.com/catalogs/bookseries/social-fictions-series/

Lauren Sardi, PhD. is an assistant professor of sociology at Quinnipiac University in Hamden, Connecticut.
Edward Harkins (2014-01-05 14:32:00)
Thanks for really thought-provoking perspectives. I've to give a talk on Art, Culture and urban society to a 'Friends of Theatre' audience in Glasgow, UK, early in the New Year and I've found several useful lines of thought - originator will be acknowledged of course.

Patricia Leavy (2014-01-05 17:26:00)
Thank you so much. Your talk sounds terrific. Good luck with your work.

Edward Harkins (2014-01-05 19:20:00)
And thanks to you. You and others here might also be interested in a debate around 'evidence', public funding and the arts in the UK. The link below is a take on how it's unfolding in the 'English' bit of the UK - I'm in the more important Scottish bit of course ;-) http://new.a-n.co.uk/news/single/towards-plan-b-a-different-approach-to-arts-funding/

Patricia Leavy (2014-01-05 19:41:00)
Yes– very interested in it. Thanks for sharing the link!

‘Personhood beyond the human’: Reflections on an important conference (2014-01-05 20:33)

[I want to thank Adam Ford and Jim Collier for earlier posting this report on their websites, respectively, [1]H+ Magazine and the[2] Social Epistemology Review and Reply Collective. (The latter site includes links to the various figures and concepts raised in this account, which may be unfamiliar to sociologists.) I also thank Mark Carrigan for allowing the report to be posted here as well. The issues discussed below will be taken forward at my keynote address to the British Sociological Association in Leeds, in April 2014.]
On 6-8 December 2013, Yale University played host to one of the most interesting and, I believe, significant conferences that I have ever attended. Its title ‘Personhood Beyond the Human’ captured the full range of speakers. However, the organizers were mainly concerned with the legal extension of personhood to animals, especially primates and aquatic mammals. They should be more comfortable with the label ‘posthumanist’ than ‘transhumanist’, though the sponsoring organization – Institute for Ethics and Emerging Technologies – normally portrays itself as a ‘technoprogressive’ transhumanist think-tank. Readers can judge for themselves by going here to the conference's comprehensive website, which includes videos of all the talks.

The timing for the conference could not have been more apt. On 2 December, the Nonhuman Rights Project, the brainchild of Harvard law professor Steven Wise, had filed the first lawsuits of its kind, namely, to transfer four chimpanzees currently kept captive at various locations in New York State – as pets, entertainers, and lab subjects – to an animal sanctuary where their ‘right to bodily liberty’ can be properly secured. (As it turns out, on 10 December, the presiding judges denied the prima facie validity of the claim but encouraged appeal of their decision before a higher court with greater scope for reinterpreting legal personhood.) Wise and his intellectual inspiration, Peter Singer, the leading philosopher of ‘animal liberation’, were the keynote speakers at this conference.

I shall review the conference as someone with decidedly transhumanist sympathies and hence not quite in sync with the animating concerns of the organizers. However, it is to the great credit of the organizers – James Hughes and George Dvorsky – that they included a broad church of thinkers, which as the conference moved into its second day became more concerned with the sorts of qualities that have traditionally separated humans from animals – and might be better instantiated in intelligent machines. Interestingly, the main media coverage of the conference to date – an op-ed piece in the 16 December edition of the Boston Globe penned by an on-site reporter – actually struck a blow for the distinctiveness of human personhood against the ambient pro-animal sentiment of the conference itself.

Singer’s opening keynote was mostly boilerplate but two of his reference points were revealing, one to Michael Tooley and the other to Bernard Williams. First, he cited Tooley’s classic 1972 Philosophy and Public Affairs article, ‘Abortion and Infanticide’, as formative in his thinking about the conditions under which something has a ‘right to life’. Following Tooley, Singer argues that if a right to life presupposes the possession of future-oriented desires, then while some cognitively underdeveloped humans may not have a right to life, some cognitively developed animals may have just such a right. So far it sounds as if a reasonably strong sense of personal autonomy is required for a right to life. At the same time, though, both Tooley and Singer wish to make these judgements ‘on the spot’ without considering what the penultimate conference speaker, the science fiction writer David Brin, calls ‘uplift’, that is, our capacity to enhance beings to a level at which we might accord them with a robust sense of rights.

Although Singer and his followers fancy themselves ‘progressive’ thinkers, they fail to acknowledge that broadly ‘welfarist’ projects have always required substantially transforming those who are deemed ‘unfairly disadvantaged’ as measured by some standard of social justice. This is why so much of civil rights legislation, while couched in the rhetoric of removing barriers based on race, class and gender, has involved compelling these disadvantaged people to attend schools, undergo medical treatments, and undertake employment – all designed, hopefully for better and not worse, to take the disadvantaged outside their comfort zones. (This has been the great promise of ‘affirmative action’.) By extension, one might suppose that at least certain animals might be somehow ‘enhanced’ so that the sense of autonomy of which we deem them capable is realized in a way we can recognize as our equals.

However, in practice, Singer and most of his followers revert to a much weaker sense of autonomy, whereby any being with a serviceable set of interests is deemed to possess a right to life, regardless of how those interests are established or satisfied. Indeed, throughout the conference, occasional disparaging remarks were made about autonomy as an especially ‘speciesist’ criterion of personhood that ignores the obligation that humans have to enable the flourishing of non-human species with interests radically different from their own. This relates to Singer’s second reference point, a posthumously published essay by Bernard Williams called ‘The Human Prejudice’, which
attempts to defend pro-human attitudes on simple grounds of group loyalty (an ontological ‘us vs. them’), which
unsurprisingly Singer finds not very persuasive – and neither do I. Moreover, Williams’ species chauvinism plays
into Singer’s association of speciesism with racism and sexism in the index of politically incorrect attitudes for an
enlightened age.

If autonomy in the strong (Kantian) sense is one great enemy of the animal rights activists, another is anthro-
pomorphism, even though several of the speakers could not avoid referring (sympathetically) to animals in the same
terms they might very young or disabled humans. Indeed, as I observe below, this comparison is crucial to Steven
Wise’s strategy to gain legal recognition for animal rights. But make no mistake: Anthropomorphism in the service of
animal rights is presumed to be no more than a necessary evil. In this context, suffering – understood as a liminal
experience whereby a being’s sense of bodily integrity is under direct threat – plays an important conceptual, and
perhaps ultimately forensic, role in providing a criterion of personhood that ideally might be read off the physiological
disposition of an organism without having to engage in any politically incorrect and epistemically dubious anthropic
projections.

The second keynoter, Steven Wise, came across as modest and folksy but he too made some revealing stray
remarks about how he teaches animal rights at Harvard. He alluded to the early 20th century Yale constitutional
lawyer, Wesley Hohfeld, who through his Oxford follower Herbert Hart laid the foundations for modern analytic
philosophy of law. (The Stanford Encyclopedia of Philosophy entry on ‘Rights’ provides a good sense of Hohfeld’s
significance.) Hohfeld offered a self-styled ‘molecular’ analysis of right into its logical components, one element
of which is immunity from others altering your constitution without your consent. However, for Hohfeld, this
element provided only a quarter of the concept of right, which also includes more positive notions of power and
privilege – that is, outright self-assertion, not merely protection from self-negation. As Wise and others explained
during the conference, this rather limited sense of right – normally reserved for children and the disabled – is
simply meant to be the thin edge of a thicker legal wedge. I’m not so sure. The default contempt for autonomy
and anthropomorphism exhibited by many of the speakers suggested that were Wise’s chimpanzees granted
the relevant sanctuary, the matter would end there – as if Apartheid (or the segregationist policies practiced in
the USA in the century after the formal emancipation of Black slaves) were a successful outcome to the end of slavery.

Philosophers have long wondered whether ‘animal liberation’ entails a serious commitment to ‘animal rights’. This
conference keeps the jury in deliberation without returning a verdict. Here it is worth recalling that the appeal
to rights (i.e. ‘civil rights’) has historically required that those who would be treated as free-standing individuals
worthy of bearing rights – and not simply the latest part of a self-perpetuating corporate whole – need to re-enact
the original struggle of those who established those rights. This is why national service has been so prominent
in republican democracies, the political system that has done the most to promote rights. Call it an ideological
vaccination policy, if you will. In any case, your capacity for self-assertion against a countervailing force – as
good an empirical definition of autonomy as any – marks you as worthy of rights. You don’t simply capitulate
or adapt: You leave your mark. As long as animals do not have the opportunity to prove themselves in such
a manner, then the appeal to ‘rights’ on their behalf is no more than a euphemism for a state of protected de-
pendency. Libertarians, often the scourge of self-styled ‘progressives’, understand this point better than anyone else.

Lori Marino, an animal neuroscientist at Emory University in Atlanta and the scientific advisor to the Nonhu-
man Rights Project, made the most explicit case for primates and aquatic mammals possessing the mental capacities
relevant to attributions of a reasonably strong sense of ‘autonomy’. She especially emphasized animals’ powers
of ‘mental time-travel’, a phrase nowadays used by cognitive psychologists to refer to the ability to project oneself
imaginatively into the future and design a plan that anticipates potential obstacles along the way. Let’s grant Marino’s
interpretation of their behaviour and its neural underpinning. The question remains: Why can’t we communicate
with these creatures at the level implied by their advanced mental capacities?

Of course, the fault may be entirely our own. But then shouldn’t there be a call for research aimed at open-
ing channels of communication (e.g., prosthetic translation devices, if not trans-species pidgins) between humans and these cognitively advanced creatures, so that we might learn from each other and pool our efforts to mutual benefit? However, the conference was conspicuously silent on this point, as if apes and dolphins would obviously prefer to deal only with their own and not with humans. And so I continue to wonder about the sincerity of animal rights activists.

One of the cleverest people at the conference was Andrew Fenton, a philosopher who divides his time between California and Nova Scotia and has written extensively on animal welfare in the context of animal experiments. He consistently asked incisive questions from the floor. Fenton’s own talk took seriously that we might work toward some idea of chimp-based consent to experimental participation, modelled on pediatric research ethics. The basic idea is that we might ‘persuade’ chimps – as we do children – to consent to participate in scientific research by getting them used to experimental apparatus and lab conditions, so that they realize that their lives are not under any substantial threat. I put ‘persuade’ in scare quotes because Fenton concretely proposes that chimps be instructed in a way that allows their dissent to be clearly registered, even if we do not quite understand why they dissent. Here one might wonder whether Fenton’s comparison is quite fair to children, who after all have the potential to demonstrate much greater powers of comprehension through language. However, it does reflect a common animals rights strategy of minimizing the difference between children and mature apes to establish an intuitive sense of continuity between humans and non-humans.

On the other hand, Fenton was also sensitive to a set of concerns closely associated with the late bioethicist Raymond Frey, who argued that doing research on animals that is not permitted on humans may simply jeopardize animal lives without appreciably contributing to knowledge of how humans work. Fenton follows Frey in suspecting, perhaps rightly, that scientists routinely ignore doubts about the cross-species generalisability of the results of animal-based research out of a more general disregard for the value of animal life. The logic of this argument implies that the excessive restrictions on human participation in scientific research imposed by ‘institutional review boards’ – which are typically more concerned with institutional liability than the actual beliefs and desires of the would-be subjects – should be relaxed so that humans are allowed to participate in risky research that would otherwise needlessly endanger animals. Both epistemology and ethics would benefit from the move.

To be sure, neither Frey nor Fenton draw this conclusion, as they are more concerned with minimizing harm to animals than maximizing benefit to humans. However, Veronika Lipinska (also in attendance) and I draw just this conclusion in *The Proactionary Imperative*, due out from Palgrave Macmillan in 2014. Here we follow the University of Manchester bioethicist Sarah Chan in supporting a culture in which the right to participate in scientific research would be promoted by potential human subjects who self-organize themselves as proactive interest groups.

The second day of the conference was more emotively charged, as various world-view assumptions were both asserted and imputed to positions that might be called ‘humanist’, ‘transhumanist’ and ‘posthumanist’. The animal rights activists – proper ‘posthumanists’ – clearly see transhumanism as humanism taken to what they regard as its absurd logical conclusion, an elaborate ‘denial of death’ based on a lingering attachment to the Abrahamic deity in whose image and likeness humans were supposedly created. (*The Proactionary Imperative* actually puts a positive spin on this allegedly damning diagnosis.) On more than one occasion, Albert Camus and ‘60s anthropologist Ernest Becker were invoked as witnesses to the narcissistic and dangerously delusional character of *Homo sapiens*, the species whose uniqueness lies in denying what it is.

But some posthumanists went even further, wanting to purge the residual anthropomorphism that privileges apes over, say, chickens as forms of animal life. Karen Davis, founder of the Virginia-based United Poultry Concerns, spoke eloquently about her life among chickens. Between sessions she railed against more establishment animal rights activists whose views about human ‘stewardship’ over the planet she believed constitute species paternalism at its worst. She specifically declared Peter Singer to be not only speciesist but also sexist in terms of the species he privileged, in which chickens in particular and birds more generally are seen as ‘feminised’ species. (Singer’s 1999
manifesto, A Darwinian Left, might also be used to confirm White’s overall judgement.)

By the time of my own talk, which per usual was improvised, I had been already influenced by the issues already raised at the conference. My starting point was the historical specificity of the idea of ‘human rights’ as something with binding legal force. Despite much philosophical talk and political assertion about what prima facie look like ‘human rights’ (most notably the American and French Revolutions in the late 18th century and their intellectual antecedents), most of these ‘rights’ have been on closer inspection ‘civil rights’ – that is, the right for an individual to be treated as an equal in a self-governing polity, or ‘citizenship’. Such rights were never meant to be made indiscriminately available to anyone who happens to be a member of Homo sapiens. Rather, rights had to be earned by demonstrating a level of competence, traditionally evidenced in successful property management. Of course, this gave a default – yet still defeasible – advantage to inheritors of wealth to display their managerial competence.

The modern period has been about seeking alternative tests for the relevant competence so that inheritance doesn’t matter at all: One should simply be capable of sustaining something substantially more than one’s own physical survival. While a certain element of the Left still dislikes the appeal to cognitive criteria for citizenship (perhaps even including literacy), such criteria served historically to liberalise entry into the polity, as one no longer had to arrive with wealth but simply a detectable capacity to generate wealth. Capitalism’s focus of cognitive prowess – aka ‘invention’ – establishes the point. (See the US Constitution’s creation of the Patent Office and Joseph Schumpeter’s subsequent valorisation of Henry Ford as ‘entrepreneur’.)

I have come to believe that most of the acrimony between capitalists and socialists over the past 200 years reduces to the simple issue of how to credit people properly for what they have done. This is of course a serious problem that requires redress, but quite different from how society should be organized in a progressive fashion. Indeed, the very idea that one should be concerned about who deserves credit for contributing to societal wealth is a normative principle shared by capitalism and socialism, predating their schism: It is what put both of these ideologies on the same side against those who continue to believe that heredity is ultimately the most reliable source of social order.

When I entered university nearly 40 years ago, the ‘hereditarians’ would have been seen as hopelessly reactionary. However, the emergence of ‘sociobiology’ and its second coming as ‘evolutionary psychology’ has breathed new life into the pro-heredity forces. Animal rights activists are empowered by this revival. Thus, instead of asking what new skills animals might need to acquire to survive in an increasingly anthropomorphic world, they simply observe that animals had survived perfectly well for millennia prior to human habitation. Whatever else one might wish to say about these contrasting attitudes, the former is ‘forward-looking’ and the latter ‘backward-looking’ in its normative orientation.

From this standpoint, ‘human rights’ is a curious hybrid. After the United Nations Universal Declaration on Human Rights of 1948, the normative force of ‘human rights’ is that every member of Homo sapiens, no matter where they live and simply by virtue of species membership, is entitled to a range of rights that approximate those historically covered by civil rights legislation. In other words, an explicitly heredity-based definition of ‘humanity’ is invoked to justify attributions that previously had been based on potential or actual individual achievement. In jurisprudential terms, ‘natural law’ and ‘positive law’, increasingly at loggerheads in the modern era, found a mutually satisfactory conceptual meeting point in ‘human rights’.

Natural law had indeed protected all members of Homo sapiens equally – but only relative to their ‘natural’ standing. So the ‘right to revolution’ was originally about allowing serfs to revolt against their masters who abused their power; but if serfs revolted against a benevolent master, then they would be in the wrong. For its part, positive law maintained an open-minded attitude about the composition of society just as long as it was composed of ‘equals’ in the deep sense of those who could support themselves in the face of potential opposition from fellow equals. Such
societies, while typically ‘advanced’ by today’s lights, functioned as what we nowadays call ‘gated communities’ but used to be called ‘city-states’. In effect, ‘human rights’ resulted from removing natural law’s hierarchical vision and positive law’s elitist practice, while combining the universalism and paternalism of natural law with the egalitarianism and liberalism of positive law.

The United States of America – established as a republic with indefinitely expansive horizons – set an important practical precedent for the realizability of ‘human rights’, especially through its historically open-door immigration policy. However, the creative genius behind the UN Declaration was the Neo-Thomist Catholic philosopher, Jacques Maritain (1882-1973). (Here I take a cue from the Columbia University intellectual historian, Samuel Moyn.) I say ‘genius’ because many things were accomplished by the idea of human rights that are nowadays often taken for granted. First, it kept the Catholic legal tradition relevant in public life. Second, it removed political barriers within Christianity between Catholics and those Protestants who were theologically inclined to abandon natural law altogether. Third, it provided a clear legal grounding for welfare state and even socialist policies, since the existence of ‘human rights’ draws explicit international attention to ‘problems’ presented by the difference between what the Declaration says and the actual existence of Homo sapiens. Moreover, it does so in a way that shifts the burden of proof onto those who might still believe that human distress is merely a local concern that in the long term will somehow take care of itself, either through charity or benign neglect.

Sixty-five years later, the concept of human rights in Maritain’s original sense still really exists only in Europe, including the UK, where it has spawned various bottom-line ‘grand coalitions’ between parties of the mainstream Right (‘Christian Democratic’) and Left (‘Social Democratic’) to preserve the welfare state in the face of fiscal pressures. These governments have also been sensitive about maintaining international development aid as a constant percentage of the state budget.

The USA is still not fully signed up to the idea of human rights – though it is very much signed up to civil rights. Consider this: Prominent in the opposition to Barack Obama’s efforts to get Americans to invest in healthcare is the claim that it would deny Americans the right to live as they wish. In a classic republic, requiring that people have health insurance might make sense as a criterion for citizenship. However, if you’re already a citizen and you aren’t troubled by ‘natural law’ considerations about what makes a life objectively ‘decent’, then ‘Obamacare’ might well strike you as imposing an unreasonable tax burden. In this context, Europeans would play the socialist card and say that even citizens are ‘always already’ indebted to others who in various ways have enabled the conditions under which they thrive. This creates an obligation for citizens to respond in kind – to ‘pay it forward’, if you will – to reaffirm the value of living in your society beyond the value of your own particular life. But you need to be receptive to the peculiar legal alchemy behind the idea of human rights for this argument not to sound ‘merely socialist’ in the sense that many Americans – and not only them – increasingly find offensive.

In an era when nonhumans are increasingly claiming rights (or more strictly, rights are being claimed on their behalf), the appeal to human rights as a rights benchmark poses a delicate problem for animal rights activists. The content of the UN Declaration mostly references ‘rights’ in the sense recognised in positive law, namely, a society of individuals each of whom is presumed to possess considerable autonomy. In the Declaration, freedom from bodily harm and security of material well-being simply provide a platform for free expression through art, science and culture – the means by which humans assert their distinctiveness as a species. (Abraham Maslow’s self-actualisation psychology is a natural concomitant of this idea of human rights.) In that case, might it not be possible for a being capable of art, science and culture, yet unencumbered by Homo sapiens’ carbon-based needs, be eligible for ‘human rights’ – especially if humans can interact with such creatures and respect their achievements in these areas? This, of course, has been the promise of artificial intelligence research and other Golem-like projects. But we might also add the generation of avatars in cyberspace and perhaps even the Search for Extraterrestrial Intelligence (SETI).

At this point, the difference between the legal case for animal and machine personhood should be made explicit. Animal rights activists are clearly aiming for recognition of a sense of personhood that is detached from
the possession of distinctly human qualities, even if that means conceding a diminished sense of 'right', as I have already suggested. In contrast, machine rights activists aim to build machines that match, if not surpass, supposedly distinctive human achievements – in a Turing Test fashion – in order to acquire personhood for those machines. Whereas animal rights activists tend to speak in terms of 'sanctuaries' and other segregated spaces that allow animals to live as they were biologically meant to live, machine rights activists favour increasing interaction and even integration with humans as part of an open-ended process of mutual learning and accommodation. In the more dystopic versions of this vision, the machines may even surpass and dominate the humans. I may be exaggerating the implied political differences here – but I believe only slightly.

It is to the credit of the conference organizers that they featured an extended session on the second day with BINA48, whose name and nature is very well explained in its informative Wikipedia entry. ‘BINA48’ = ‘Breakthrough Intelligence via Neural Architecture 48 exaflops per second processing speed and 48 exabytes of memory’. More concretely, BINA48 is an android consisting of a bust-like head and shoulders mounted on a frame who speaks answers in response to typed questions. The android appears to be modelled on a Jackie Brown-like African-American woman. In fact, BINA48 was based on – and named for – the wife of the media lawyer who has perhaps done the most to promote the idea of rights for machines capable of sustained creative extension of digitally uploaded cognitive processes. This lawyer, Martine Rothblatt, who began life as Martin Rothblatt, is herself something of a transgender celebrity in the United States. However, her main concern these days, via the Terasem Movement, is the cultivation of 'cyberconsciousness' through the continuous upgrading and public exposure of BINA48. The basic idea is that BINA48 stores all that she learns and redeploy its in increasingly sophisticated and creative ways. Now entering her fourth year of existence, BINA48 came across at Yale as an insightful if rambling interlocutor – a pub philosopher functioning slightly over the limit. (She had difficulty deciding when the length of an answer was sufficient to the question, but otherwise was very fluent.)

The main source of scepticism about BINA48's powers came from those who saw everything she said as merely mimicking human thought and speech via a cleverly programmed algorithm. These sceptics may be intellectualising what roboticists call the 'uncanny valley' phenomenon, whereby people are spooked out by robots that physically resemble humans 'too much' and hence are unwilling to engage with them to the same extent as they would less human-looking robots. More worrisome is that simply the knowledge that a being is composed of silicon rather than carbon might serve as a source of prejudice, regardless of the being’s demonstrated capacities. This suggests the need for lawyers with a transhumanist sensibility to craft a workable concept of 'Privacy 2.0' that allows access to 'track record' without access to 'material origin' – in other words, an enforceable notion of privacy that prevents cheating on the Turing Test.

Of course, it is easy to see that the likes of BINA48 are the products of robotics labs – and so it will continue, until we live in the world depicted in Blade Runner. However, the idea of standing as a 'legal person' is that one is literally regarded under a mask (as the persona, in Greek drama) with a clear sense of which properties of the being are relevant (or not) to the case at hand. This ideal will be harder to maintain in a world where the difference between track record and material origin is blurred by the political desire to pre-empt various forms of prohibited behaviour based on interpretive strategies explicitly designed to 'unmask' the suspect.

However, I don't mean this as an argument against the very idea of governments and businesses mining data for securing or promoting various forms of social life. After all, it is one thing to mine 'big data' to determine that someone is likely to commit a crime; it is quite another then to disarm that person of any defence against a criminal charge by claiming that it was 'in their nature' to commit the crime. In the latter case, a purported (scientific) understanding of the capacities of a particular configuration of matter serves to undermine the suspect’s autonomy by preventing them from providing an alternative account of why they did what they seem to have done. Here Kant and Nietzsche would be on the same page in suspecting that such 'naturalistic' appeals are really shows of power that ipso facto dehumanise the being in question – whether its nature is carbon- or silicon-based.
The final session of the conference did not disappoint in terms of the provocations raised. The Catholic philosopher Daryl Wennemann argued that while sufficient, it is not necessary to be a member of *Homo sapiens* to be deemed ‘human’, by which he meant ‘person’. In that one deft logical manoeuvre, Wennemann managed to uphold the value of bringing all potential (including potentially aborted) members of *Homo sapiens* to maturity while placing a rather high bar for non-*Homo sapiens* to be credited with the same status. A telling moment came when in response to a question by Andrew Fenton, Wennemann asserted that the prospect of suffering did not figure as such in his criteria for personhood. This was a very brave thing to have said, which left Fenton silent. Animal rights activists normally capitalise on the capacity of animals to feel pain in captivity so as to gain emotional leverage with those who do not already believe that animal lives are intrinsically valuable. For his part, Wennemann seemed to be alluding to the fact that in Abrahamic theology, suffering is the feeling associated with an opportunity for deep learning, on the basis of which a person’s moral state may then be judged. In this respect, suffering is not something to be avoided at all cost or even mitigated as quickly as possible; rather, it is something to be overcome in a way that ideally leaves one stronger.

George Dvorsky, a co-organizer of the conference and contributing editor to the popular futurist website, io9, provided (in the style of a high school debater) a laundry list of items for realizing the animal-based ‘nonhuman personhood’ agenda. From the floor I raised an issue that built on a question put to Peter Singer in the first session, in which Singer conceded that Neanderthals might be seen as extinct species who bridge the human-nonhuman divide with regard to our intuitions of personhood. But (I observed) Neanderthals are no longer species that exist only in our imaginations. We have recovered DNA from Neanderthal fossils that at least in principle enables us to resurrect them, thereby potentially increasing the kinds of persons in the world, which is presumably an inherent good, given the value placed on personhood as a property of beings. Indeed, in an interview with Der Spiegel in January 2013, the Harvard medical geneticist George Church controversially claimed that a woman could well be a surrogate mother to a Neanderthal. However, Dvorsky was having none of this. His response suggested that adding candidate persons like Neanderthals by such non-natural means would likely result in their misery, if not increase the misery of the world more generally.

A declared Buddhist (along with the other co-organizer James Hughes), Dvorsky appeared to have a strong sense of nature’s overriding normative character, but without attributing to nature the personality of a creative deity, as promoted in Christianity by, say, theistic evolution (Catholic) and intelligent design theory (Protestant). I must confess that I find it difficult to grasp this conception, except that it appears profoundly conservative, and certainly unbecoming of people who call themselves ‘technoprogressive’. Nevertheless, I believe that in the future this largely suppressed Christian-Buddhist divide (which I called ‘anthropic-karmic’ in *The New Sociological Imagination*) will gain greater prominence as the terms of political discourse and public life – in ethics, economics and ecology – are more explicitly framed as questions about the source of value in the world.

Those interested in seeing the first shoots of this emerging world-historic conflict should study the academic philosophical debate between ‘will theory’ and ‘interest theory’ as alternative accounts of the nature of rights. (The former corresponds to the Christian/anthropic side, the latter the Buddhist/karmic side of the personhood divide.) On the one hand, will theorists see rights as vehicles for self-assertion in a presumably free and open space, which places a premium on limited liability so that agents effectively possess a ‘right to be wrong’. On the other hand, interest theorists see rights as vehicles for self-protection, as if the ‘self’ were a plot of land – the ‘body’ – whose jurisdiction is determined more by entitlement than actual agency.

We got a taste of the impending conflict when, via Skype from his home in San Diego, David Brin made a clear and vigorous case for human exceptionalism in terms of the obligation it places on humans to ‘upgrade’ the creatures that we care most about. He argued that any ‘nonhuman persons’ movement that did not put this matter on the top of its research and policy agenda was operating in bad faith. Whatever else one wishes to say about humans, we are the ones who sufficiently understand the natural world to take actions to direct its future course in decisive ways. Maybe it has been all a cosmic accident, as Darwinists seem to believe – but we don’t know that for a fact, either. Humanity’s track record, while chequered, is arguably improving. In any case, given our emerging sense...
of what constitutes a good life for ourselves, why not try to extend that across nature? Yes, we may fail but then, as the cosmic accident people gladly admit, there’s no reason to think that life will continue to flourish by our not intervening so directly.

Needless to say, Brin was not received well by most of the audience, which already had form in trashing autonomy (aka ‘will theory’) as a criterion of personhood. In effect, Brin had provided an updated version of Julian Huxley’s motivation for coining ‘transhumanism’ in the 1950s. Huxley wanted to reassert humanity’s uniqueness in the face of Darwin’s own default species egalitarianism, whereby all life is composed of exactly the same stuff and, at least in species form, we are all ultimately condemned to extinction. Huxley’s solution was to use our very knowledge of evolution as a moral lever for our self-transcendence – and, following Brin, the self-transcendence of other species. This argument requires that we trust the historical track record in science and technology. People like Huxley, Brin – and I – believe that the record speaks to a sincere, open, productive but certainly fallible, conversation with a larger reality that seems to be always prodding us to move on. Of course, one does not need to be an Abrahamic adherent to have such a sensibility. Nevertheless, this conference showed that transhumanism has yet to distinguish itself clearly from the ‘posthumanism’ (which sometimes bled into anti-humanism) generally on display.

"A 1940’s record of a symphony written in late 19th century": Interview with German filmmaker Moritz Liewerscheidt (2014-01-06 08:00)
"Jahrhundertwende" ("Turn of the Century") is a thirty-minute essay film by Berlin-based filmmaker Moritz Liewerscheidt. The film reflects both the formation of Nazi ideology in the early 20th century and the situation in today's Eastern Germany, where a neo-Nazi movement has risen since the downfall of the German Democratic Republic (GDR). But principally, "Jahrhundertwende" is a contemplation on German culture and Marxist philosophy, capitalism and late modernity.

Trailer of "Jahrhundertwende": [https://vimeo.com/81191109](https://vimeo.com/81191109)

We at the Sociological Imagination loved the film and decided to interview Moritz about it.

Milena Kremakova: Can you tell us something about the film's background? How did you decide to make it, what was the initial idea - was it an image, a sentence you read, a message you want to convey, or maybe something else?

Moritz Liewerscheidt: On German TV you can see Hitler every evening. For decades, a guy called Guido Knopp made a living by editing the same old Nazi film material over and over again, putting some "critical" voice-over on it spoken by the popular German voice actor who also represents Robert De Niro in the German dubbed versions of his films. All these "documentaries" focus on Hitler as a person. If a magazine puts Hitler on the cover, it's a fail-safe method to increase its sales. People are obsessed with Hitler - not only in Germany. At the same time, people seem to know very little about the ideology behind Nazism. In recent years a shallow critique of capitalism and globalisation has become popular again which argues with moral outrage against "greedy managers", etc. Although this form of criticism is labelled as "left wing", it has nothing to do with the materialistic analysis of capitalist economy pursued by Karl Marx. Instead, the arguments used in this appeal to emotion, are often very similar to those used by the early Nazis - sometimes even brought up with exactly the same words.

In my film, you hear a kind of "dialogue" which is made up completely out of historic quotations. The origin of these quotations is revealed at the end of the film. Until then, you are left alone with those statements: no explanation is given, so you have to think for yourself. Counter-intuitively, the voice advocating some positive aspects of capitalism "belongs" to Karl Marx. At the same time, the images of the film reflect the situation in today's Eastern Germany, where vast areas apart from the refurbished tourist spots have become pauperised.

MK: I loved watching "Jahrhundertwende" - in fact I saw it several times and it struck me that I understood more with each time I watched it. This might have to do with my imperfect grasp of German, but also with the weight of its ideas. It made me think for a long time after I had watched it. Do you think it is a film best watched "slowly" or "quickly"?

ML: Thank you. I'd say the film works quite similar to an art installation. The spectator - "contemplator" is a good word - becomes part of an experiment, which requires an active recipient with the disposition to get oneself into it. It's quite the opposite of the documentaries shown on TV, where you have a strong omniscient narrator taking you by the hand. Instead, you have to puzzle out the "big picture" by yourself - you can't just trust the voice-over. For some people this might be frustrating.

MK: Tell us more about the title: "Jahrhundertwende". As many German words, it is maybe impossible to fully translate into English.

ML: "Turn of the Century" is a correct translation. In German it contains the word "Wende", which is the
term used for the downfall of the "German Democratic Republic" in 1989-90, but also means "turning point" in general. While the quotations used in the film originate from the 19th and 20th century, the images are from our present, the 21st century. This asynchrony induces some shifts of meaning. But primarily, the title refers to the turn of the century from the 19th to the 20th century, which was felt by many contemporaries to be a period of "decadence" and degeneration, but at the same time a period of hope for a new beginning. The mindset of this age saw western civilisation as being in a crisis that required a massive and total solution. I think this is an essential point in the formation of fascist ideology, which is neglected in the

popular media - maybe because it is so inconvenient: that it was born as a revolt against the materialism of the 19th century - both liberal and Marxist -, against literally everything the 19th century stands for: the idea of progress, materialistic science, the universal idea of mankind, rational enlightenment, civilisation. In this regard, Marx can be seen as a typical exponent of the 19th century - and the rise of fascism and Nazism in the early 20th century as a "turning point of the century" - or a rupture in civilisation.

The funny - or should I say disturbing? - thing is that today's "postmodern" criticism of the universal claims of the Enlightenment - which is so popular among academic leftists - has some parallels with the fascist and National-Socialist anti-Enlightenment of the early 20th century. [4]Alfred Rosenberg's "Myth of the 20th century" was all about anti-universalism. The awareness of elements of Nazi ideology which originate in fin-de-siècle "[5]Lebensreform (life reform) movement" seems all the more disturbing, since many of those ideas - emerged in response to the destructive effects of industrialisation to nature and traditional lifestyles - have become part of our "green" mainstream today, after being marginalised for decades after World War II.

Of course, it's much easier to distance oneself from Nazism if you think it was all about being racist and hating Jews - and a guy with a clownish moustache. In my film, it might take a while until you realise the "sensitive guy" criticising environmental pollution or the "greed for money" is a fierce anti-Semite.

**MK:** The imagery and music in the film are gripping and evocative. How did you go about shooting the film and creating the soundtrack?

**ML:** I was looking for a kind of images which evoke what Freud called "Unbehagen in der Kultur", or discontent in modernity (published in English as [6]"Civilisation and its Discontents"), for I wanted to make comprehensible the affect against the negative aspects of modernity in the first place, which, in a way, fascist ideology gave an authoritarian answer to. Also, I tried to allude to the pictorial design of German Romanticism, especially by the famous painter [7]Caspar David Friedrich. I even carried a book of his paintings with me when filming in Brandenburg. But in place of the ruins of romantic cathedrals, you'll see those of the industry of former Socialist Germany.
Liewerscheidt’s film alludes to German Romanticism, echoing the works of Caspar David Friedrich (The Abbey in the Oakfield, 1810, Berlin, Old National Gallery, oil on canvas, 110 × 171, source: Wikipedia)

The music is a 1940’s record of a symphony written in the late 19th century by Gustav Mahler, but it’s played with the wrong speed. So this piece of late Romanticism sounds much darker, even menacing - there’s "something wrong with it" from the beginning. Maybe I can add something to your first question. In his book "[9]Erbschaft dieser Zeit" (Heritage of our Times), the Marxist philosopher [10]Ernst Bloch developed a dialectic analysis of German culture, pointing out aspects in the romantic critique of capitalism which are not necessarily reactionary. Still, they could be occupied by the Nazis, since most marxists of the time had a pretty simple notion of "progress", rejecting the "irrational" hopes and aspirations of "romantic anti-capitalism" as simply reactionary. By dialectic means, Bloch wanted to fish the utopian fragments of Romanticism out of the "fascist sludge" they had fallen into - for some of them stand to reason. Certainly, Bloch was an outsider with this perspective. To me, this book published in the early 1930’s can be read not only as an astonishingly accurate presentment of the years to follow, but also as a comment on why a neo-Nazi movement could rise just in former East Germany after the downfall of bureaucratic real socialism. Although the book is not quoted in the film, it was a significant influence.

MK: Where can we see “Jahrhundertwende”?

ML: If you’re interested in watching the complete film, you can ask me for a private link. Also, you can ask me to do a public screening. I'd be happy to discuss the film with an audience (in either German or English).

Moritz Liewerscheidt is a filmmaker based in Berlin. Born 1981 in West Germany, he studied history and philosophy in Düsseldorf, before he went to art school in Cologne ([11]Academy of Media Arts (KMH)). "Jahrhundertwende" is the film with which he graduated in 2012.

Past, present and future: 25 years of CAQDAS
1st - 3rd May 2014, Horsley Park, Surrey, England
Call for Papers

The use of computers to facilitate qualitative analysis is not new, with the first packages becoming commercially available from the mid-1980s. 1989 saw the first ever conference on qualitative software, convened by Ray Lee, Nigel Gilbert and Nigel Fielding. This conference, 25 years later, presents the opportunity to reflect on where we have come from, where we are now, and where we are going in the field of Computer Assisted Qualitative Data Analysis (CAQDAS). Confirmed speakers include Dr Grant Blank<sup>2</sup> Oxford Internet Institute, University of Oxford, UK Professor Nigel Fielding<sup>3</sup> CAQDAS Networking Project, University of Surrey, UK Professor Simon Lindgren<sup>4</sup> Department of Sociology, Umea University, Sweden Professor Clive Seale<sup>5</sup> Department of Sociology, Brunel University, UK For more information see the website<sup>6</sup> Abstract submissions We invite abstract submissions for oral paper presentations and posters around the following themes: 1. The role of methods teaching in learning to use qualitative software 2. Software supported visual analysis 3. Big data, social media analysis, text mining 4. Software supported mixing of methods 5. Collaborative working in the context of qualitative technology 6. Writing and representing qualitative findings Abstracts must: - Not exceed 300 words - Have a clear title and state which conference theme they fit into - State authors’ name, organisational affiliation and role (e.g. student, research fellow, lecturer etc.) - State whether the abstract proposal is for an oral paper presentation or a poster - Be written concisely and clearly in English - Be submitted as a one page MS Word document (not a PDF) to caqdas@surrey.ac.uk - Be submitted by Friday 31st January 2014 Please note we will NOT be accepting oral papers describing the results of research undertaken using qualitative software. The focus is on the innovative use of software itself - i.e. for particular methodological approaches, types of data, project dynamics or representing findings; on ways in which CAQDAS packages are being taught; implications arising from developments in the field; or limitations of CAQDAS tools for particular approaches. Proposals will be reviewed by the programme committee and external advisors expert in the six themes of the conference. Reviewers are: - Jeanine Evers<sup>9</sup> Evers Research & Training, Den Haag, the Netherlands - Graham Gibbs<sup>10</sup> Dept. of Behavioural and Social Sciences, University of Huddersfield, UK - Aine
From Philosophy Bingo to Sociology Bingo (2014-01-07 08:00)

Thank to [1]Critical Theory for posting this fabulous Philosophy Bingo card from Reddit. We’d like to make a sociology bingo though - any suggestions?

KLO (2014-01-22 10:59:00)
'twitter capital'

Abstract submission deadline extended!

The BSA Teaching Group is hosting a regional event at the University of Salford on 22 February. A number of
time slots are to be filled by postgraduate students and early career researchers eager to come and present their work.

There is no limitation on the empirical, methodological or theoretical origins of this work, but presenters will be asked to briefly consider how their research might be incorporated into the teaching of sociology.

Conference fees will be waived for those selected to speak.

Do you want to: Enhance your profile? Keep sociology teachers up-to date? Increase sociology's wider knowledge base?

Come and deliver a micro-lecture (about 15 minutes) on your research to a group of committed sociology teachers who are eager to discover what the new empirical insights are showing.

Abstract submission deadline: **Monday 13 January 2014**

Please email to: [1]bsatg@britsoc.org.uk

For further information please contact: Prof. Garry Crawford, Directorate of Social Sciences, University of Salford. Email: [2]g.crawford@salford.ac.uk, Tel: (0161) 295 6557. Or Dr Jane Kilby: [3]j.e.kilby@salford.ac.uk, Tel: 0161 295 3901.

Participants will be informed of the acceptance of their paper by 15 January.

For further information please Email: [4]bsatg@britsoc.org.uk
Do American universities have better graduation speeches than UK ones? Or is it just confirmation bias induced by only encountering the former through youtube?

Beyond the Spectacle of Malala: A Critique of the Bandwagon of Girls' Education
This summer it was revealed, largely thanks to Edward Snowden, that American and European intelligence services are engaging in mass surveillance of hundreds of millions of people. Intelligence agencies monitor people's Internet use, obtain their phone calls, email messages, Facebook entries, financial details, and much more. Agencies have also gathered personal information by accessing the internal data flows of firms such as Google and Yahoo. Skype calls are "readily available" for interception. Agencies have purposefully weakened encryption standards - the same techniques that should protect our online banking and our medical files. These are just a few examples from recent press reports. In sum: the world is under an unprecedented level of surveillance.

This has to stop.

The right to privacy is a fundamental right. It is protected by international treaties, including the International Covenant on Civil and Political Rights and the European Convention on Human Rights. Without privacy people cannot freely express their opinions or seek and receive information. Moreover, mass surveillance turns the presumption of innocence into a presumption of guilt. Nobody denies the importance of protecting national security, public safety, or the detection of crime. But current secret and unfettered surveillance practices violate fundamental rights and the rule of law, and undermine democracy.

The signatories of this declaration call upon national states to take action. Intelligence agencies must be subjected to transparency and accountability. People must be free from blanket mass surveillance conducted by intelligence agencies from their own or foreign countries. States must effectively protect everyone's fundamental rights and freedoms, and particularly everyone's privacy.

The TEDification of #HigherEd? Negotiating between the accessibly simple and the simplistically accessible (2014-01-09 08:00)

There’s a particularly incisive rehearsal in the Guardian of what has become a well established critique of TED. There’s a lot of this I agree with but I nonetheless find the general thrust of the argument really problematic:

So what is TED exactly?

Perhaps it’s the proposition that if we talk about world-changing ideas enough, then the world will change. But this is not true, and that’s the second problem.

TED of course stands for Technology, Entertainment, Design, and I’ll talk a bit about all three. I think TED actually stands for: middlebrow megachurch infotainment.

The key rhetorical device for TED talks is a combination of epiphany and personal testimony (an “epiphimony” if you like) through which the speaker shares a personal journey of insight and realisation, its triumphs and tribulations.

What is it that the TED audience hopes to get from this? A vicarious insight, a fleeting moment of wonder, an inkling that maybe it’s all going to work out after all? A spiritual buzz?

I’m sorry but this fails to meet the challenges that we are supposedly here to confront. These are complicated and difficult and are not given to tidy just-so solutions. They don’t care about anyone’s experience of optimism. Given the stakes, making our best and brightest waste their time – and the audience’s time – dancing like infomercial hosts is too high a price. It is cynical.

Also, it just doesn’t work.

Recently there was a bit of a dust up when TEDGlobal sent out a note to TEDx organisers asking them not to book speakers whose work spans the paranormal, the conspiratorial, new age “quantum neuroenergy”, etc: what is called woo. Instead of these placebos, TEDx should instead curate talks that are imaginative but grounded in reality. In fairness, they took some heat, so their gesture should be acknowledged. A lot of people take TED very seriously, and might lend credence to specious ideas if stamped with TED credentials. “No” to placebo science and medicine.
But … the corollaries of placebo science and placebo medicine are placebo politics and placebo innovation. On this point, TED has a long way to go.

Perhaps the pinnacle of placebo politics and innovation was featured at TEDx San Diego in 2011. You’re familiar I assume with Kony2012, the social media campaign to stop war crimes in central Africa? So what happened here? Evangelical surfer bro goes to help kids in Africa. He makes a campy video explaining genocide to the cast of Glee. The world finds his public epiphany to be shallow to the point of self-delusion. The complex geopolitics of central Africa are left undisturbed. Kony’s still there. The end.

You see, when inspiration becomes manipulation, inspiration becomes obfuscation. If you are not cynical you should be sceptical. You should be as sceptical of placebo politics as you are placebo medicine.

Why do people watch TED videos? Why have so many millions of people watched this stuff if it’s so pathetically facile? Does this critique apply to things like the RSA Animate videos as well? Is the problem simply a 10 minute video? If not then where do we draw the line between the accessibly simple and the simplistically accessible? I disagree with the analysis of how much harm the latter does but I don’t think it does an awful lot of good either. But I don’t think all TED falls into this latter category. I also worry that the former category, things which are made simple so as to be accessible, can sometimes be sneered at by people in a way that often fails to recognise the nature of their judgement.

Here are two examples of research communication being accessibly simple. I think they’re great:

There's no reason why research communication online has to be simple or accessible. A lot of research blogging (including my own) falls into this category, in so far as that it's work in progress and/or aimed towards people within the author's own discipline. But I think the simple and accessible is important. When people worry about the TEDification of Higher Education, it's obvious to me where they're coming from. However their responses seems so rampantly pessimistic to me.

Unless you're a technological determinist who thinks that intellectual culture is immediately debased by social media then there's no reason to assume this simplification of complex ideas is an inexorable process. Sure, there are channel constraints but that's true of any mode of communication (not least of all the 20 minute conference presentation). There are affordances as well and these are what excite me. Rather than worry about the heights of intellectual culture being dragged into the 'infotainment' swamp, we should be getting better at ensuring that doesn't happen. It's not that the risk doesn't exist, it's simply that this is the wrong conversation to be having. Instead we should be looking to successful examples of accessibly simple research communication (for instance philosophy bites) and learning from them. There's also a much greater role which can be served, perhaps not by communications offices unfortunately, by universities in helping facilitate these kinds of projects. Though given Nigel Warburton left the OU because of institutional constraints on his activity, perhaps the institutional environment is less amenable to this then I tend to assume in my own more rampantly optimistic moments. That's the conversation we should be having. And we will be, hopefully, at the end of January.

CfP: Quantified Self Research Network, March 25th (2014-01-10 08:00)

The next meeting of the [1]Quantified Self Research Network will take place on the 25th March at the University of Warwick from 1pm to 6pm. It's an informal seminar to present work in progress and is open to all.

If you would like to contribute then please send a short abstract and bio to mark@markcarrigan.net by February 1st. We use 'quantified self' in a broad sense inclusive of self-tracking, wearable computing and digital augmentation

We're also keen to build on the last seminar and move the discussion forward. Here are some of the key questions which emerged during the last meeting:

**What is distinctive about qs?**

People have tracked their health data for a long time such as keeping food diaries or measuring their weight. Is qs conceptually different to this or is it merely an automatisation and intensification? Does the quantity of the data produced equate to more of the same or a qualitatively distinct phenomenon?

**Are there inequalities in qs and self-tracking?**

The technologies required for qs are usually quite expensive even for a basic device and would certainly be out of the range of disposable income for many people and...

**Are we creating inequalities with the focus of research?**
If qsers are a relatively privileged group while it may be interesting to understand their practices and development of individual and group identities there are other people who cannot afford these practices, are uninterested or simply unaware of them.

**What about gender?**

The QS community seems to have more men than women as active participants. What are the reasons for this? If we take the broader notion of qs suggested by some of the presenters then often the more "mundane" or "domestic" approaches to self-tracking are more associated with women? Is there something fundamentally different about these?

**How do we identify a ‘non-user’?**

Although some of the methods of tracking have been used for a long time some of them are very new and it is currently unclear what kind of uptake they will have. We fairly easily identify a user (agreeing on a definition may be more complex) it is more difficult to identify a non-user. Are they people who do not practice qs or use the devices because they do not have access to them, they are not aware of them or they simply do not care? Is it right to define people as non-users of a fairly niche activity often engaged in by relatively privileged people? But with the amount of data which is generated about us (often without us knowing) are we not all quantified whether we like it or not?

---

1. [http://quantifiedselfresearch.org/]()
Even amid the sunny escapist output of the USA network, the series is a baffling anachronism. It proudly resides in an alternate universe where oily, overcompensated attorneys are hailed as heroes. Where their Italian sports cars, designer apparel and addiction to winning at all costs are seen as enviable character traits.

It’s hard to argue with this criticism. I don’t even think the show is good in any straight forward sense. But I found it oddly compelling. My aim here is to explain the reasons for this, which all stem from the figure of Harvey Specter. In contrast to the bumbling charm of Mike, Harvey always knows what to do, always knows what to say and is admired and reviled in equal measure. Harvey Specter is a sociopath and, furthermore, he has worked to become this way. He is a man who is “against having emotions, not against using them” and he seeks to help Mike come to share this trait.

[youtube http://www.youtube.com/watch?v=ZGYzKGSDVYw]

I use the term ‘sociopathy’ in the admittedly slightly glib sense employed by Adam Kotsko in his [3]Why We Love Sociopaths: A Guide to Late Capitalist Television. His interest is in a class of characters who have increasingly come to dominate television and film in recent years. Though there are undoubtedly differences between Don Draper, Tony Soprano, Gregory House, Stringer Bell, Dexter et al (a list which seems a little incomplete without Vic Mackey) Kotsko argues that they share an indifference towards the moral order, manifested in a capacity to live outside social norms and yet also instrumentalize those norms to pursue their own agenda. While these characters might also share a degree of psychological complexity relative to their more shallowly characterised forebears, he suggests that,

It is hard to believe, however, that the exploration of the dark side of the human psyche for its own sake is behind the appeal of these sociopathic characters. What, then, is going on in this trend? My hypothesis is that the sociopaths we watch on TV allow us to indulge in a kind of thought experiment, based on the question: “What if I really and truly did not give a fuck about anyone?” And the answer they provide? “Then I would be powerful and free.” (pg 4)

Kotsko sees sociopathy, understood as a cultural type embodied in such characters, as constituting a form of ‘reverse awkwardness’. In contrast to sociopathy, where lack of social connection engenders a capacity to masterfully manipulate social norms, awkwardness obtains in being drawn in and “rendered powerless by the intensity of their social connection” (pg 5). The appeal of the former rests on the experience of the latter, as our familiarity with the acute force of social pressure yields a vicarious thrill when we are presented with the lives of those immune to such pressure. These are people who always know exactly what to do. They are unbound by social pressure. They masterfully manipulate those interactions, which in reality exist as geysers of awkwardness, in a way which runs so
contrary to our everyday experience. Their indifference to the social order translates as power and freedom. This is
a figure who "transcends the social, who is not bound by it in any gut-level way and who can therefore use it purely
as a tool". Against the backdrop of a "social order that is breaking down, making impossible demands while failing to
deliver on its promises" such characters become immensely compelling (pg 9-10).

The fascination with individuals 'who make their own rules' cannot be understood in isolation from the social
changes which are rendering 'the rules' paradoxically more transparent and yet also opaque. The preoccupation
with mastery, the capacity to glide through life while always knowing what to do and say, stems from the broader
conditions under which this is becoming ever less possible. I think Margaret Archer's notion of the 'reflexive
imperative' is useful here, as a way of understanding how the intensification of social and cultural change renders
individual reflexivity (reflecting on one's self in relation to one's circumstances) ever more imperative in daily live.
As she argues, "action needs to be at least recurrent in kind in order for norms to develop to cover it". Variety and
novelty can fuel awkwardness, much as they can also open up the possibility of a depth of connection and human
understanding which might formerly have been crushed by the stultifying weight of tradition and routine. These are
two sides of the same coin. The dilemma in everyday life consists in the difficulty of knowing if we are doing things
'right', if such a notion even makes sense and how others who are similarly confused respond to what we are doing,
whether it is 'right' or 'wrong'. The sociopath fascinates because they embody a fantasistic solution to this dilemma.
However in reality, we are faced with the 'awkward abyss',

Threatened by the awkward abyss, we cling to our declining social norms and ask them to be more than
they are or can be. We let them rule over us all the more as they fail to serve us, either by providing clear
expectations or approximating some form of justice or fairness. (pg 15)

But what would it be like to avoid this? What would it be like to just be? As Kotsko puts it, "if only I didn't
give a fuck about anyone or anything, we think — then I would be powerful and free" (pg 7). But we do, so we are
not. Even if we truly did want to bethis way, it is an option that is foreclosed by the weight of commitment. Or is it?
What intrigues me about Suits is how much of the narrative arc of the two main protagonists revolves around Harvey
Specter socialising Mike Ross into sociopathy. In seeking to 'mentor' Mike, Harvey is also teaching how he can be
emulated by him. What stops this being obnoxious is the gradual revelation of the extent to which Harvey has had
to cultivate his sociopathy, much as Mike must now do himself.

When we meet Harvey, he is pure presence. He controls every situation, always ready with a witty retort or a
strategic reaction. This also leaves himparadoxically absent. In the first half of the show's initial season, we see little
of Harvey qua person beyond occasional allusions to his longstanding friendship with his boss. In one scene Mike
attempts to come over to Harvey's apartment to share news of a breakthrough on a case. Having sternly ordered him
not to come round, he opens the door and we see Harvey in casual clothes for the first time in the show. However
the door is immediately closed on Mike (and on us). There's a sense in which Harvey seems almost unrecognisable
as a person, as his preoccupation with his own social mastery leaves his inner life entirely opaque. At one point he
boasts to Mike about having Michael Jordan on his speed dial, proving this to an initially sceptical Mike who then
turns and asks "who are you?".

It's a good question and one which is eventually addressed. As the first season approaches its end, we come
to see more of Harvey and how he came to be the person that he is. The meaningful relationship with his boss which
was intermittently hinted at (she supported him through law school and their relationship existed prior to this) finds
more direct reflection in the figure of his stated mentor, the New York District Attorney. In the first half of the season,
we see a Harvey who is already fully formed and self-subsistent. But later we begin to see how he came to be this
way. He was not born “the best closer in New York city”. He had to become him. He had to make himself into who
he wanted to be. We begin to see something of his inner life. We see that he hates to lose. We even see him lose
his temper. He reminds us that sociopaths, in Kotsko’s sense, are people too. They are admired people, as a search
through youtube for videos of Harvey will make clear.

CfP: Digital Sociology PhD/ECR Workshop (2014-01-12 08:00)

Are you a PhD student or Early Career Researcher doing work in digital sociology? The BSA Digital Sociology Group
has organised a PhD/ECR Workshop where a limited number of participants can get feedback on their work from
peers and established academics in a supportive environment.
The event will take place between **11am to 4pm on February 19th at Goldsmiths College in South London**. Confirmed academic respondents are Emma Uprichard (Warwick) and Noortje Marres (Goldsmiths) with one or two more TBC soon.

If you would like to register then please e-mail mark@markcarrigan.net with a short bio and 200 to 300 word abstract. The exact format of the day hasn’t been finalised yet but the intention will be to allow substantial time for discussion of each presentation so places will be extremely limited.

---

**Pride, Propaganda and Poverty Porn: On Benefits and Proud (2014-01-13 08:00)**

*by Tracy Jensen*

A few weeks after [1]my first post on the eruption of this genre (where I examined We All Pay Your Benefits broadcast on the BBC), Five broadcast its own contribution to poverty porn, On Benefits and Proud. It took me a long time to watch the entire programme without switching off – and even longer to process my exasperations into this blog post. At the launch of Five, a little over fifteen years ago (under the name Channel 5), the limited broadcast frequencies meant that many UK households could not watch it: even now, the audience share for the channel is less than five per cent. Little wonder that the channel seems to be playing perpetual catch-up to its more established competitors, poaching successful formats from other channels and acquiring glossy US imports in an attempt to drive up ratings. Five has a reputation in the UK for tawdry and tasteless content: in its early years then-Culture Secretary Chris Smith noted “considerable concern” over its content, the Independent Television Commission called it “tacky” and the Daily Mail re-named it ‘Channel Filth’.

In this context, On Benefits and Proud was an obvious in-house production for Five – promising sensation, outrage and shock, and hopefully replicating the ratings successes of [2]earlier [3]examples [4]of [5]poverty [6]porn. On Benefits and Proud was the first of three programmes, described in Five’s commissions [7]newsletter as “documentary” and followed by Shoplifters and Proud and finally Pickpockets and Proud. Five were evidently proud of the equivalence they were drawing between breaking the law and claiming your legal entitlement to social security, promising that viewers of the And Proud series would “meet Britain’s most brazen petty criminals and people who know how to really work the welfare state. The characters are frank and unapologetic”. On Benefits and Proud is however ‘documentary’ in name only – there are no visits to economics experts that we saw in We All Pay Your Benefits, no attempt to present any social history (however brief) as in Benefits Britain 1949. The only cursory piece of (mis)information is presented at the very beginning, when the voiceover states that “the uk spends 40 billion on benefits for the unemployed” (the actual figure is £4.91 billion) followed by "and a big slice goes on single mums like Sophie and Emma". On Benefits and Proud does not aspire to educate, create dialogue or reflect – its purpose is simply to enrage the viewer, insistently repeating that the ‘frank and unapologetic characters’ on-screen are greedy, ungrateful and shameless. Its imagined viewer appears to be low-paid workers who are told that they are subsidising lifestyles they cannot afford for themselves. The toxic rhetoric of ‘worker/shirker’ at play here is hardening public attitudes towards welfare recipients and driving imagined wedges between those exploited under neoliberalism.

In his wonderful essay ‘The Space Between Shots', documentary maker Dai Vaughan reflects upon how to make ethical television, the tensions of editing and the conflicting demands of protecting artistic integrity and producing narrative coherence. Reflecting on his own practice, Vaughan states that "we wished to allow people to
draw their own conclusions from the films, as near as possible to the way one does in life” (1999:10). He rejected voiceover and commentary, believing that such tools take screen participants one step further from knowing what is being done to them. For television to truly be a public service, where social lives are reflected in a public mirror – a collaborative art, collaborative therapy even, between filmmaker and participant – Vaughan suggests that some films should end up in ribbons on the floor. I wonder what Vaughan would make of On Benefits and Proud, a programme which not only butchers the speech of the participants it claims to represents, but also overlays every fragment of footage with an insistent voiceover, interpreting every shrug, nod and glance with disdain and filling every moment with moral commentary. So little dignity for the participants and so little trust in the viewer: I suspect Vaughan would see it as propaganda.

Sophie and Emma – two friends living in Camden – are one of three ‘on benefits’ examples that are paraded over the next forty-five minutes. The programme also follows Julie and Vinny from Liverpool, and Heather from Gloucester. The camera follows Sophie and Emma as they explore the market and go for a manicure (which the voiceover ambiguously describes as “free”, suggesting that perhaps the film crew have paid for it) while the voiceover details the welfare amounts that each mother gets “as well as her flat”. Sophie and Emma flirt with the camera, joke with each other about shopping addictions and are perhaps naïve about how this footage will be used – but this also begs the question of how television producers mislead and betray participants to secure consent and generate sensational content. How was the involvement of Sophie and Emma secured? What were they told the programme would be about? The ‘and proud’ phrase of the title is distinctly lacking in the accounts of all the programme participants. Emma states clearly that she doesn’t want to be living “off the council for the rest of my life”: what she wants is “security”. Her ‘pride’ at being ‘on benefits’ is better described as resignation that her aspirations must be put on hold, or acquiescence to her priorities as a mother:

“At this moment in time I am on benefits because...not that I have to be...coz I don’t. How can I put it? Just...it is the way it is at the moment, until we can better ourselves. I think when you do work you do miss our on a lot of your children growing up.”

Such resignation is also apparent in the footage of Heather from Gloucester, who I think receives the worst treatment in the edit. Camera footage – focusing upon huge piles of washing, a washing machine spinning, long lines of drying clothes, children leaping into a paddling pool full of muddied water, thick peelings of potato in a bin – is repeated several times, offering a clear repeated visual message that Heather and her family are dirty, excessive, soiled and wasteful. You do not need to be a media scholar to see how little time the film crew have spent with the family, and how much they have recycled the same footage.

Picture: visual repetitions in Heather’s house

The voiceover reminds viewers several times that Heather has a large family (“super-sized”) and that she is
about to move into a new six-bedroom home, the value of which balloons over the course of the programme (far beyond the actual selling prices of comparative houses in the area) and is eventually described as a “mini-mansion”: “the sort of home ordinary taxpayers can only dream about”. Heather’s failure to be breathlessly grateful about the house is re-cast by the programme makers as ungracious insolence. Peering over the railway bridge into what will be her back garden, her understated pleasure is punctured by the voiceover stating that “the tenant doesn’t seem impressed”. The programme-makers show little empathy for a family who have been living in overcrowded temporary accommodation for eighteen months. But On Benefits and Proud is not the only media site where Heather is chastised: photographs of her family and the new home also appear in the pages of tabloid newspapers. Her distress at being misrepresented forms one key scene in the programme, where she sits at her kitchen table and reads the scandal her family has prompted. This scene might have been a powerful reflective moment for the On Benefits crew, who, along with the gutter press, form part of the media machinery which exploits poor families to secure sales, ratings and career portfolios. No chance. The voiceover simply adopts the language of the newspaper (‘dole queen’) for the remainder of the programme. When Heather is suddenly told that she can no longer move in to the house, her earlier caution seems justified. But rather than exploring the arbitrary mechanisms of re-housing, the voiceover frames this as rough justice; after all, for Heather ‘the dole queen’ to get a house (‘mini-mansion’), “well, it was always going to be controversial”.

Julie and Vinny from Liverpool are continually framed by the voiceover as taking advantage of the welfare system. They are described as “experts in life on the dole” whose “only hard graft is working the system”. We see Julie on the telephone checking her benefit payments and Vinny trying to arrange a move to another property. While the programme presents Julie and Vinny as insatiable welfare dependents (“Julie and Vinny want more”, “the couple are still not satisfied”), we might equally read the constant ‘work’ of negotiating with state agencies (checking, requesting, chasing up) as indicative of the tightening conditionality, increasing restrictions, and declining value of benefits.

The shift in welfare policy from a model of rights and entitlements to a model of suspicion, stipulation and means-testing has multiplied the kind of ‘work’ that claimants like Julie and Vinny must do to secure what they are legally entitled to. In an illuminating 1985 research project, Leo Howe found that claimants who ask questions, demand explanations or seem confident of their rights are described by officials as “aggressive, grasping, ungrateful, shameless, greedy [...] in contrast, what may be called the ‘ideal’ claimant is someone who merely answers questions, produces all the required documents, is polite and grateful and who does not mention complicating matters” (1985: 61). Almost twenty years later, the same interpretation is made in On Benefits and Proud and other [10]pseudo-documentaries, which assumes that benefits claimants are undeserving, scroungers, potential cheats and liars. When it is revealed that Julie and Vinny have found a way to make their benefits go a little further – adding a family relative to the tenancy and sharing the property with him – the commentary presents it as ‘cheating’ the system rather than a prudent (and completely legal) decision.
And with unexpected cash in the bank, its time to spend.” Julie and Vinny ‘splashing out’ – on groceries, gas and electric.

It seems that this programme is less about displaying a shameless ‘pride’ in being ‘on benefits’ (this is absent in the footage) and more about generating disgust at benefit claimants who have the temerity to claim their entitlements and be unashamed (as presumably they ‘should’ be). As Jamie Peck (2001) has so eloquently explored, the problem of work for those at the bottom of the labour market is that it is becoming less secure, lower paid and more exploitative. Yet rather than engaging with the problems of work (working conditions, wages, declining union power, post-industrial disinvestment, the movements of global capital), ‘documentaries’ such as this present a problem of work ethic. We are told that those ‘on benefits’ are lazy, workshy, enjoying their free ride and the luxuries that ‘ordinary workers’ cannot afford (neglecting to inform us that benefit levels in the UK are comparatively meagre, and are declining in value). We are told that benefit costs are ‘too high’ because there are too many people ‘on benefits’. Yet approximately half of the UK population receives a social security benefit of some kind – ‘on benefits’ does not simply mean unemployed, it also means low-paid, retired, disabled, sick, caring and unable to work. Julie has a disability. Emma, Sophie and Heather are single parents with young children. The claimants in On Benefits and Proud offer momentary resistant readings to the popular myths about them – Heather discusses the hate she has received via the press, Emma talks about going back to education, Julie criticises the less-than-minimum-wage job her daughter has taken – but their words are wilfully splintered and overlaid with an authorial and derisive voiceover they cannot know, or speak back to. This is cowardly television production at its worst, and its attempts to generate contempt for those claiming the benefits they are entitled to obscures the risks we all face around work and worklessness. Chris Jones and Tony Novak remind us in their furious account of the abuse and abandonment of the poor and poorly paid that:

“The pressures of modern poverty are never entirely removed from the majority of people, and although they struggle, with greater or lesser success, to keep their heads above water, the threat of redundancy, or of an incapacitating illness, threatens to reveal in full and devastating force the fundamental economic insecurity, the chasm of poverty, that capitalism has created for all but the very rich” (1999: 21)
Rather than accepting Five’s invitation to despise those who are ‘on benefits and proud’, perhaps we should all be proud of – and fight for – a benefits system which seeks to protect us from a failing labour market.

Acknowledgements

I would like to thank the Gender, Media and Class group (also known as FAF) who generously shared their insights and helped formulate the ideas in this post.

What is Digital Sociology? (2014-01-15 08:00)

[1]"What is Digital Sociology? " on Bundlr

The fascinating banality of business bullshit (2014-01-16 08:00)

[youtube=http://www.youtube.com/watch?v=4ZYL39Dh4lA &w=640 &h=360]

There are many reasons not to listen to this nonsense. The glaring philosophical contradictions, the creepily messianic tones of his speech, the self-indulgent and naive politics underlying it. But as an emerging managerial discourse, upon which this man has apparently established a large consultancy and made a lot of money, it absolutely fascinates me. What explains the apparent receptiveness to at least some of these ideas? The speaker is apparently the "hottest advisor on the corporate virtue circuit". Is anyone else fascinated to discover there is a "corporate virtue circuit"?

As loathe as I am to say it, he does seem to be offering something marginally more substantive than a green-washing consultancy. But what is that something? There are two key ideas in this talk:

- the shift from what to how - replacing a focus on outcomes with a focus on technique, moving from quantity to quality
- the need to affectively engage workers, 'inspiring them' rather than motivating them with carrots or threatening them with sticks

The first seems like an insight which can only be marginally applied. In the speaker's terms, there's an inevitable limit to how far it can be scaled i.e. metrics don't emerge in organisations simply because 'leaders' have yet to encounter the speaker's 'insights'. The second point is more interesting. There's a [1]gloriously polemical Zero Book which explores the implications of this line of argument. Money is being 'wasted' through the 'disengagement' of workers. Therefore we need new technologies of affect to reach into the souls of workers, to inspire them and make them go the extra mile for the company. It's in this context that we should think about the uptake of self-tracking and gamification within contemporary organisation. I'd like to understand the sociology of this in much greater depth than I do. I'm astonished and fascinated by the bullshit which seems to thrive in the world of 'leadership', 'corporate virtue' and 'motivational speaking'.

2367
Instead of Googling capitalism try "reimagining capitalism" and you’ll find a more authentic story

Completely agree with the importance of the 2 bullet points above. I love the corporate democracy of employee engagement and hey, whaddya know, those workers have some damn good ideas too. There are always moments when interests align and it’s important to be able to find them and make use of them. We love working on these kind of projects, interestingly (as we are London based) many of our clients are US based.

Self-tracking and 'techorexia' (2014-01-17 08:00)

One of the (many) things which fascinates me about self-quantification tools is their seeming capacity to both increase individual autonomy and extend control over the individual. However my instinctive personal reactions to this tend to be a matter of seeing the former as good and the latter as bad, such that self-tracking seems pretty great until you start to think through its possible implications if and when taken up in the contemporary workplace. This [2]recent Guardian article left me newly aware of how utterly faulty this instinctive reaction of mine is. It discusses the potential role of self-quantification tools in enabling and entrenching eating disorders:

A [3]recent study by the Future Laboratory and Confused.com found that about 60 % of 18- to 34-year-olds in the UK have used a self-quantifying app or service to monitor their fitness levels, mental health and sleep patterns. These figures are mirrored across the pond. [4]According to a Pew report, 60 % of US adults say they track their weight, diet or exercise routine. And these numbers are rising. Indeed, it’s highly probable that you or someone you know will be have received or given some sort of wearable fitness product this Christmas season.

Evangelists of self-tracking technology proclaim that through data lies enlightenment. Measuring ourselves, they say, will help us understand ourselves. We will all end up several percentage points healthier and happier. However, I’m not sure this is right. While it is true that self-tracking can help push people into making positive lifestyles changes, it could also be argued that the growing popularity of this sort of technology is normalising neurotic behaviour.

When I was a teenager I went through a brief phase of compulsive self-quantification. It was called anorexia. I counted every calorie, weighed myself obsessively and exercised fanatically. For about a year my life was a running tally of energy-in and energy-out and I would diligently feed all these numbers into a sort of anorexia algorithm; regularly adjusting different variables in order to maximise weight-loss efficiencies. The end result was that I weighed six stone and my hair fell out in clumps. I looked grim, but I did get a good grounding in data analytics.

This was all a long time ago and I’m now fully recovered. This is in no small part due to the fact that I actively avoid weighing myself and try not to count calories. It took me a long time to stop seeing food as a spreadsheet of numbers and start thinking about it as nutrition. It would have taken me even longer if the sort of self-tracking technology that is ubiquitous today was available when I was ill. Dr Kimberly Dennis, a psychiatrist who specialises in eating disorder treatment, [5]estimates that about 75 % of her young-adult patients use their phones in a way that enables their eating disorders. Apps
that facilitate calorie-counting and food-logging are an anorexic's best friend and worst enemy. With society increasingly embracing a sort of "techorexia" that rewrites compulsive behaviour as healthy, it is becoming easier for people with serious eating disorders to pretend there's nothing wrong.

7. file://www.youtube.com/embed/dG0vLFFtZDs
Tina (2014-12-01 02:13:31)
I agree that these self-tracking apps can enable those with obsessive-compulsive tendencies to keep engaging in that behavior. As someone currently recovering from OCD and an eating disorder that was rooted in an obsession about my health, the rising use of these self-tracking apps is concerning to me, and I hope it’s a passing trend. Maybe my perspective is a little skewed, but in my life I’ve found that obsession with health is probably the most unhealthy thing there is.

Mila (2014-12-03 22:05:11)
As someone in remission from an eating disorder, I find these devices unhealthy for those who have ED or compulsive tendencies just as much as for those who do not. They are absolutely oversimplified. People have forgotten to listen to what their body is asking for, whether it be sleep, activity, or type of food because they get hung up on some number. Depending on our state of health, we have varying needs. The calorie counting game is obnoxious and needs to stop. It has been shown that our ‘standard’ 2000 calorie diet is hardly sufficient for the ‘average’ person anywhere from 10-45 years old, yet 2000 calories is pretty much law in many doctor’s offices. Next comes the ‘10,000 steps a day’ rule. Human beings are far too complex to reduce them to a number, and that includes the number on the scale. Thanks for writing this. My family lives by the numbers on the treadmill, fitbit, scale, waistband, and food label. And because of that behavior I endangered my health and my life for 12 years. Strangely enough, after treatment, ALL my ‘numbers’ on my lab work are finally perfectly in range. And I don’t count a damn thing.

CfP: Quantified Self Research Network, March 25th (2014-01-18 08:00)

The next meeting of the Quantified Self Research Network will take place on the 25th March at the University of Warwick from 1pm to 6pm. It’s an informal seminar to present work in progress and is open to all.

If you would like to contribute then please send a short abstract and bio to mark@markcarrigan.net by February 1st. We use ‘quantified self’ in a broad sense inclusive of self-tracking, wearable computing and digital augmentation.

We’re also keen to build on the last seminar and move the discussion forward. Here are some of the key questions which emerged during the last meeting:

**What is distinctive about qs?**

People have tracked their health data for a long time such as keeping food diaries or measuring their weight. Is qs conceptually different to this or is it merely an automation and intensification? Does the quantity of the data produced equate to more of the same or a qualitatively distinct phenomenon?

**Are there inequalities in qs and self-tracking?**

The technologies required for qs are usually quite expensive even for a basic device and would certainly be out of the range of disposable income for many people and...

**Are we creating inequalities with the focus of research?**

If qsers are a relatively privileged group while it may be interesting to understand their practices and development of individual and group identities there are other people who cannot afford these practices, are uninterested or simply unaware of them.
What about gender?

The QS community seems to have more men than women as active participants. What are the reasons for this? If we take the broader notion of qs suggested by some of the presenters then often the more "mundane" or "domestic" approaches to self-tracking are more associated with women? Is there something fundamentally different about these?

How do we identify a ‘non-user’?

Although some of the methods of tracking have been used for a long time some of them are very new and it is currently unclear what kind of uptake they will have. We fairly easily identify a user (agreeing on a definition may be more complex) it is more difficult to identify a non-user. Are they people who do not practice qs or use the devices because they do not have access to them, they are not aware of them or they simply do not care? Is it right to define people as non-users of a fairly niche activity often engaged in by relatively privileged people? But with the amount of data which is generated about us (often without us knowing) are we not all quantified whether we like it or not?

Evgeny Morozov on the Orgy of Amelioration (2014-01-20 08:00)

There's an interesting article on the Boston Review which reflects on the critical work of Evgeny Morozov, with a particular focus on his recent critique of ‘solutionism’. We've attached a video below for those unfamiliar with his line of argument.

The target of Evgeny's criticism is an "amelioration orgy" that he associates with Silicon Valley. "In the past few years," Evgeny says, "Silicon Valley's favorite slogan has quietly changed from 'Innovate or Die' to 'Ameliorate or Die.'" The book describes, powerfully and in insightful detail, a series of projects of amelioration: self-tracking devices that provide remedies for obesity, insomnia, heavy carbon footprints, and the limitations of memory. Information and communication strategies for remedying political corruption, hypocrisy, opacity, and all the hurdles to informed civic engagement. Algorithms that help us figure out what to read and where to eat. Information technology solutions for preempting crime, keeping the jerks out of the clubs, helping the needy while having fun, connecting with distant strangers while distancing from connected neighbors. You get the idea—though to really get it you need to read the book. (That said, the book is not really about Silicon Valley: it has more references to Jane McGonigal than to Steve Jobs. It is really about the assumptions of some intellectuals who write about information technology.)

The Net Delusion criticized the idea that new communication technologies would serve the emancipatory goal that proponents said they would serve. It focused on the effectiveness of the means in achieving the ends. To Save Everything is about ends, not means. Assume for the sake of argument, he says, that the ameliorative orgy ends in boundless success: obesity conquered; jerks out of the good clubs; bad guys incapacitated; politics cleansed of hypocrisy and opacity; forgetfulness solved; carbon footprints reduced; assistance to the needy turned into a fun game.

What could be wrong with that? Two things. Evgeny challenges the orgy of amelioration, first, by arguing that the ameliorative solutions often turn public problems into private ones: don't regulate the content of food; give people enough information to nudge them to better personal choices. They promise success by first diminishing the magnitude of the problem. Second, he celebrates the virtues of our vices. Some of life's good things come from ignorance rather than knowledge; opacity rather than transparency; ambivalence rather than certainty; vagueness rather than precision; hypocrisy rather than sincerity; messy inefficiency rather than tidiness; good enough rather than perfect; time-consuming, indecisive, head-holding pondering rather than algorithmic offloading or gamified nudges.

Evgeny is not alone in these ideas. La Rochefoucauld famously celebrated hypocrisy as the homage that vice pays to virtue. But Evgeny does not think he has much company in Silicon Valley (at least as he imagines it). The problem is that his Silicon-Valley-of-the-mind suffers from (and spreads to others) the ideological blinder of solutionism, aided and abetted by its companion blinder of Internet-centrism.
Those blinders fuel the ameliorative orgy—an orgy of fixing, in which the tools for fixing help to define (often by diminishing) what needs to be fixed in the first place. So we need to “unlearn solutionism” and the limits it imposes on our thinking in order even to ask whether all the technological amelioration is “worth the price.”

[3]
Social science students interested in qualitative research methods, and in particular the philosophy of qualitative interviews should have a read of an accessible and new text which can be a helpful stepping stone for those embarking on social research journeys. Professors Rosalind Edwards and Janet Holland provide an easily digestible introductory text for newcomers to the qualitative aspects of social research. Research can be daunting for beginners who are keen to engage in the interview process as a key method. What is Qualitative Interviewing? will no doubt provide the confidence for students to consider best practice when interviewing their participants.

Engaged social research must consider good practice from an ethical and philosophical perspective. This methods text provides a concise foundation to encourage budding researchers to think on a variety of useful perspectives: feminist, positivist, postmodern, psychoanalytic, interpretive, emancipatory and an approach grounded in critical realism.

The text interestingly provides an understanding of the many practicalities that can be involved when undertaking interviews, for example consent forms and recording equipment. Further, a strength of this methods book is that it provides an accessibly written understanding of the basic principles we must scrutinize with regards to the dynamics of power and emotion in social research. There is a section that examines how one might interview different sections of society: individuals from marginalised groups, as well as those from elite groups.

Different types of interviews are discussed for the reader to gain a rudimentary flavour of ethnographic interviews, focus group interviews, telephone interviews, and e-interviews. We can read about consideration of location too, and the implications of the settings we choose to conduct our social research. One of the key issues for researchers to consider when setting up an appropriate location for the interview may be privacy, for example. At other times, it may be more comfortable to conduct the interview in a public space. The authors also elaborate on the "walking and talking" interview method which has its own advantages.

There is also elementary information on interview tools such as talking, writing and seeing. Seeing, for instance, the authors inform the reader can be through photo elicitation (photos, paintings, film clips, advertisements as stimulus during interviews) or graphic elicitation (timelines or maps used with the participants). Writing can involve the use of texts produced for the interview by the researcher or by the researched.

What is Qualitative Interviewing? motivates the reader into pursuing a style of qualitative interviewing that is acutely aware of the social context of the interview, while reminding us that our style of interviewing must be flexible and responsive to new challenges in our ever evolving society. We cannot remain statically engrossed on a fixed ideal of the interview process. Instead we can need to move forwards and consider how innovative technological developments may impact upon our interviewing techniques.

Edwards and Holland highlight how qualitative interviewing is probably the most popular tool of qualitative research, and I believe that most of us would agree, and be keen to develop our skills in researching the social world through the art of the interview. Moreover, there is a useful annotated bibliography provided for students to consult for further reading purposes. I think this text would be extremely useful for social researchers who are at the early stages of social research, and want to gain a flavour of some significant features of qualitative interviewing practice and philosophy. Students on undergraduate courses and Masters courses will be encouraged by the authors’ use of uncomplicated terminology and straightforward tone that enables a quick and easy reading. A most definite must read for those plunging into their very first qualitative interviews.

Sadia Habib is a PhD candidate in Educational Studies at Goldsmiths, University of London.
Call for papers – Social media in social research (2014-01-21 08:00)

The Social Research Association will be hosting our fourth annual Social Media in Social Research conference on Friday 16 May 2014, at the British Library Conference Centre in London (Bronte room). This well-established event brings together social researchers from many different areas to share experiences and issues.

We would like to receive papers and presentations on this subject to be showcased at the event. These can be from the academic research, practice, policy and client communities and cover varied aspects of social research in social media, including case studies, lessons from practice, ethical and methodological issues, and integrating social media as part of a broader research methodology on a project.

Submissions of no more than 500 words should be made to the SRA office, [1]admin@the-sra.org.uk, by 10 March 2014. Please include a short (80-100 word) biography, and a phone number. In the spirit of new media, we are being loose in our interpretation of the term ‘paper’. The content needs to be sufficient for a 20-30 minute presentation, followed by questions.

Submissions to: [2]admin@the-sra.org.uk
Deadline: 10 March 2014

presschoice (2014-02-15 05:42:00)
Great news. This post is really effective on social media in social research. It is very important for creating and circulating in any field of research. Thank you. [1]British news

Gwen Sam (2014-03-19 18:36:45)
Very happily this call has gone out! Hope you’ll get lots of submissions. Will mark calendar and check back after the conference. Thank you

CfP: Junior Theorists Symposium (2014-01-21 14:00)

CALL FOR ABSTRACTS

2014 Junior Theorists Symposium
Submission Deadline: 15 February 2014

We invite submissions for extended abstracts for the 8th Junior Theorists Symposium (JTS), to be held in Berkeley, CA on August 15th, 2014, the day before the annual meeting of the American Sociological Association (ASA). The JTS is a one-day conference featuring the work of up-and-coming theorists, sponsored in part by the Theory Section of the ASA. Since 2005, the conference has brought together early career-stage sociologists who engage in theoretical work.

We are pleased to announce that Marion Fourcade (University of California - Berkeley), Saskia Sassen (Columbia University), and George Steinmetz (University of Michigan) will serve as discussants for this year’s symposium.

In addition, we are pleased to announce an after-panel on “The Boundaries of Theory” featuring Stefan Bargheer (UCLA), Claudio Benzecry (University of Connecticut), Margaret Frye (Harvard University), Julian Go (Boston University), and Rhacel Parreñas (USC). The panel will examine such questions as what comprises sociological theory, and what differentiates "empirical" from "theoretical" work.

We invite all ABD graduate students, postdocs, and non-tenured professors who received their PhDs from 2010 onwards to submit a three-page précis (800-1000 words). The précis should include the key theoretical contribution of the paper and a general outline of the argument. Be sure also to include (i) a paper title, (ii) author’s name, title and contact information, and (iii) three or more descriptive keywords. As in previous years, in order to encourage a wide range of submissions, we do not have a pre-specified theme for the conference. Instead, papers will be grouped into sessions based on emergent themes.

Please send submissions to the organizers, Daniel Hirschman (University of Michigan) and Jordanna Matlon (Institute for Advanced Study in Toulouse), at [1]juniortheorists@gmail.com with the phrase “JTS submission” in the subject line. The deadline is February 15, 2014. We will extend up to 12 invitations to present by March 15. Please plan to share a full paper by July 21, 2014.

Getting your research noticed by journalists (2014-01-22 08:00)

Interested in getting your research noticed by journalists? The LSE Impact Blog recently published an [1]article by a politics PhD student which reflected on this process. Engaging with the media is something which PhD students are rarely encouraged to do but it can be an enormously worthwhile experience. We’ve attached Stuart’s tips from his article below.
1. Be nice to your colleagues and supervisor – you never know when they might be in a position to do you a big favour.

2. Don’t break mirrors, walk under ladders and stay away from black cats – we need all the luck we can get.

3. Never pass up an opportunity to find an opportunity; if someone wants to talk about your research, meet them, no matter how busy you are. You don’t have to agree to work with them this time around, but you never know what they’ll be doing in the future, or who they might speak to, which could present another opportunity down the line.

4. Make yourself and your work as accessible as possible. Maintain an up to date web page with accurate contact information, make sure you have links to all the published work you can (e.g. conference papers, blog posts), and use every possible avenue to communicate your work (e.g. Twitter, Facebook, blog posts). Do anything you can to increase the chances of someone coming across you and your research – and of them quickly being able to determine if you’re the one they want to talk to – if they go looking for information in your field.

5. Always make sure you can tell someone about your research, why it’s important, and why they should listen to you in under a minute, and in a straight-forward and clear way. If they can’t work out what you’re doing, why it matters or why it might be useful to them (or their readers) within a minute of encountering you – and without the need for a crash course in political theory or quantitative data analysis – chances are they’re not going to.

6. If and when you have the chance to meet with someone to discuss your work, prepare, prepare and prepare. Make sure you familiarise yourself with whatever material you think is relevant (such as a pertinent news story, a policy relating to your research area, and particularly the articles or posts of yours they are likely to have read) so that you can easily and confidently answer their questions. The more impressed they are with you in that meeting, the more likely they are to remember you in future, and put their reputation on the line by recommending you to their own contacts.[2]http://blogs.lse.ac.uk/impactofsocialsciences/2014/01/10/six-steps-maximising-luck-fox/

Are there any you would add? If you’d like more ideas then check out [3]this podcast we posted a couple of years ago.

This website’s raison d’etre was initially nebulous, tentative and ambitious all at the same time: we wanted to create a new online space for public sociology. We hoped to establish something that was more than a blog, yet neither an institutionally bound magazine, nor an academic journal. The existence of such a space would allow us to channel the eclectic range of interesting and useful content that we found ourselves wanting to share and publicise, as people who had much broader interests than our respective research topics. We also envisaged site to be independent from the academic institution/s or other workplaces at which we found ourselves at that moment or in the future. The very first post on the Sociological Imagination (hereafter also abbreviated as SI) pledged to ‘offer an ongoing forum within which the ethical and political commitments underlying much sociology can be explicitly and passionately linked to the actual practice of social research itself.’ Over time, the site’s purpose has stabilised in a pleasingly organic way and today it resembles a Boing Boing or Brainpickings for sociologists. We publish original articles, commentaries on current events or debates, research profiles and podcast interviews, as well as a diverse range of multimedia material from across the web. We have also begun to post calls for papers and event announcements, sometimes for projects in which we are involved ourselves, but more usually simply because we have read about them and found them interesting, or people have requested our help with promoting something and we are keen that the site be useful to others. In short, SI tries to provide a ‘community service’ to other sociologists by pooling together a serendipitous range of relevant sociological content and allowing space for both silent reading and public engagement.

At the time of writing, with the site’s third birthday imminent, it had received 263,523 visits (with 196,559 unique) and 396,773 page views. 35.7 % of these visitors came from the US, 24.3 % came from the UK, and other countries where the site is popular include Canada, Australia, Philippines, India, Germany and South Africa. The website had 5,371 twitter followers (now 10,000+) and 721 facebook friends. We have posted at least once daily, with
the initial post always at 8am leading to a current total of 1,371 posts. The regular 8 am post happened somewhat accidentally, but we decided to stick to it for the sake of consistency – and also, thinking of UK-based readers, it was a convenient time at the start of the working day. We imagined sociology-minded readers sitting down at their desks with a cup of coffee in the morning and waking up their own sociological imaginations by reading something brief and intriguing which they might otherwise not have found. This regularity led one twitter follower to describe the site as their ‘daily dose of the sociological imagination’ which we adopted as a slogan for the site, though it has more recently been supplanted by ‘committing sociology’ in homage to the diverting statement that ‘this is not a time to commit sociology’ made by Canadian Prime Minister Stephen Harper in the wake of a foiled terror attack (25 April, 2013).

While the nature of the site has transformed into something predominately curatorial, collating all manner of multi-media material which we think both sociologically interesting and likely to interest sociologists, we do have an increasing sense that websites like ours have a more important role to play in academic life. They have the potential to establish and practice a more visible and more accessible sociology (and other disciplines). This is relevant both outside of and within higher education. The blogosphere provides a space for many elements which are often squeezed out by competition and specialisation in the neoliberal academy: discussions of scholarship and workflow, debates over broader disciplinary and professional questions, and an engagement with intellectual questions which is fun, driven by curiosity and purged of instrumental motivations.

The first of these topics in particular poses a challenge to digital sceptics who would see online activity as a diversion from the ‘real’ business of academic life. This attitude, however, neglects the fact that illuminating, sophisticated and reflective discussions about scholarship and work in progress are increasingly common online and, in a more quotidian sense, the full range of social media tools being used by academics are making formerly ‘backstage’ aspects of academic practice newly visible. Moreover, these type of discussions are often more fruitful than traditional academic modes of publishing because of the frequency with which they take place across, often even relying on, boundaries of specialisation. One of us has written elsewhere about the idea of continuous publishing and its benefits not only for readers, but also for the writer (Carrigan & Lockley, 2013). If we treat academic blogging as a continuous mode of publishing (that is, a continuous mode of making work public), the blog becomes an active space in which to brainstorm and store new ideas, catalogue notes on literature, reflect on fieldwork, develop future texts or projects, organise and refine your thoughts and arguments, and - thanks to its publicity - engage in discussion with others. Importantly, it can also help fight writer’s block and procrastination. Furthermore, the relatively insubstantial time investment required to follow someone’s blog or twitter feeds means it becomes possible to learn about particular topics, sometimes whole areas of inquiry, in a way which simply would not be feasible if the only option was to reach journal articles or monographs outside of one’s own research specialisation (because of time constraints, the financial expense required, or even because of not knowing about their existence).

There is an important sense in which the scholarly web is becoming a playground for para academics: the torrents of open culture both demand and reward creative engagement outside ones own formal training. However, what is even more exciting is the extent to which digital communication makes sociology visible and accessible outside the academy - to those who have completed sociology degrees or other qualifications but have long since drifted away, as well as others who simply stumble across sociological materials online (the frequency with which this occurs suggests that, contra sceptics, the internet will not lead to the death of serendipity). As a sociological tool, websites like SI have several important advantages over traditional academic publishing:

- First and foremost, sites such as SI have a democratising effect on sociology. They offer the potential of both instant and continuous feedback – without requiring it. Unlike a journal article, they can host comments and discussions literally on the same page as the text which prompted them. They also allow almost real time written discussion which, unlike conference papers, is unlimited in time and volume, yet is not forced upon those readers who do not wish to comment.

- They are displaced/placeless, allowing access to the content to anyone regardless of limitations of place,
time, disability, or other constraints.

- They are an easy ways to record more fleeting and less well developed arguments which could be (or not be) developed further at any time in the future, either by their author or by a reader.

- As we have both found by writing about eclectic content, and hopefully readers have also found by reading it, this format gives food for thought and opens up new avenues for using sociological tools for the analysis of new problems. Recently we have discovered and posted about a new subfield of sociology called Astrosociology; about one scholar’s work on 3D visualisation of Kant’s ‘Critique of pure reason’ which is redefining epistemology and the sociology of learning, Animal studies, and other ‘niche’ topics within sociology about which we previously knew little or nothing at all. The curatorial capacity in which we explore these topics lends a purpose to the task of curiosity-driven exploration - which, in turn, belies the oppressive habits of mind often introjected within graduate school, e.g. ‘I can’t waste time on this just because it’s interesting.

Nonetheless, it still seems that a process of mainstreaming the digital, which has arguably begun in some disciplines, remains far away in sociology. This creates a gap between traditional sociology and the young, increasingly computer literate generations of sociology students and future sociologists. There are notable exceptions (our favourite group blogs include Cyborgology, Sociological Images and Everyday Sociology) and there has been an observable growth of sociologists blogging in a personal capacity. Nonetheless the relative absence of sociological voices from the blogosphere has been notable and, it seems, this is indicative of a broader failure to seize the opportunities afforded by digital tools. Daniels and Feagin (2011) describe how the uptake of digital tools in sociology lags behind that which can be seen in the humanities:

‘All these changes in scholarship have been taken up with a great deal more enthusiasm by some in the academy than others. Our colleagues in the humanities have embraced digital technologies much more readily than those of us in sociology or the social sciences more generally. A casual survey of the blogosphere reveals that those in the humanities (and law schools) are much more likely to maintain academic blogs than social scientists. In terms of scholarship, humanities scholars have been, for more than ten years, innovating ways to combine traditional scholarship with digital technologies. To name just a two examples, scholars in English have established a searchable online database of the papers of Emily Dickinson and historians have developed a site that offers a 3D digital model showing the urban development of ancient Rome in A.D. 320. There are significant institutions being built in the digital humanities including the annual Digital Humanities Conference, which began in 1989, and the National Endowment for the Humanities’ Office of Digital Humanities.

Sociology lags far behind in the adoption of digital tools for scholarly work. As Paul DiMaggio and colleagues noted in 2001, "sociologists have been slow to take up the study of the Internet" (“The Social Implications of the Internet,” Annual Review of Sociology, 2001, p.1). While there are notable exceptions, such as Andrew Beveridge’s digitizing of Census maps ([1]www.socialexplorer.com), when looking at the field as a whole these sorts of innovations are rare in sociology. In contrast to the decade-long conference in the digital humanities, there is no annual conference on “digital sociology.” Sociology graduate students Nathan Jurgensen and PJ Rey recently organized a conference on “Theorizing the Web,” that drew luminaries in sociology Saskia Sassen and George Ritzer, but this is the first sociology conference (that we are aware of) to focus exclusively on understanding the digital era from a sociological perspective. Analogously, there is no large institution, like the NEH seeking to fund digitally informed sociological research. The reasons for this sociological lag when it comes to the Internet are still not clear, but some point to the problems of getting digital publication projects recognized by tenure and promotion review committees.’
Though we are sympathetic to such arguments about the desirability of winning recognition for digital publication projects, we would suggest that the point can be overstated and that, furthermore, doing so risk losing sight of the unprecedented freedom presently afforded by these technologies for para academics. Calls for 'recognition' of digital scholarship too easily collapse into an instrumentalist logic which calls for blogging et al to be incorporated within the metrics of prevailing audit culture. This is an understandable aim for those who are precariously situated within the contemporary academy but nonetheless perhaps a short-sighted one. Digital opportunities could too easily slide into digital opportunism: if 'digital publication projects' win 'recognition' within institutions then what is to stop the pathologies which afflict the contemporary academy (audit culture, instrumentalism and alienation) migrating to the digital sphere? Is institutional recognition of digital scholarship worthwhile if it distorts the practices (which at their best are paradigmatic of communicating for its own intrinsic value rather than extrinsic institutional rewards) which render digital scholarship attractive in the first place?

In the rest of this chapter we link C. Wright Mills’ concept of ‘sociological imagination’ with our own experiences of learning, sharing, thinking and creating online as sociologists, as well as how this work has mattered to us and, we hope, mattered to other people. Much of our discussion addresses sociology (and sociologists) specifically because of our own academic circumstances and the aforementioned digital lag observable when sociological engagement online is compared to other disciplines. Nonetheless, we hope the discussion retains some relevance beyond the small corner of the academy we contingently (and precariously) occupy.

The Sociological Imagination

The concept of Sociological Imagination entered circulation in the 1959 book of the same name by the American Sociologist C. Wright Mills. It moves from a prophetic opening (‘Nowadays men often feel that their private lives are a series of traps’) through to a lacerating critique of the dominant trends within American sociology at the time (offering a scathing series of ‘translations’ of passages taken from the grand doyen of 20th century American sociology, Talcott Parson, which though surely offering amusement to endless cohorts of grad students, probably was not the author’s wisest career move) and an elaborated vision of what sociology could be. This centres around the eponymous concept of the Sociological Imagination - the quality of mind which ‘enables us to grasp history and biography and the relations between the two within society’ and so ‘understand the larger historical scene in terms of its meaning for the inner life and the external career of a variety of individuals’ (Mills, 1959: 5). In doing so, Mills laid out a vision for sociology, emphatically political and engaged, founded on drawing out the interconnections between the grand sweep of history and the unfolding of individual lives. However, it was far from universally praised at the time of publication, as can be seen in the early review of the book by Edward Shils quoted in Gane and Back (2013):

“Imagine a burly cowpuncher on the long, slow ride from the Panhandle of Texas to Columbia University, carrying in his saddle-bag some books which he reads with absorption while his horse trots along. Imagine that among the books are some novels of Kafka, Trotsky’s History of the Russian Revolution, and essays of Max Weber. Imagine the style and imagery that would result from the interaction of the cowboy-student and his studies. Imagine also that en route he passes through Madison, Wisconsin, that seat of a decaying populism and that, on arriving at his destination in New York, he encounters Madison Avenue, that street full of reeking phantasies of the manipulation of the human will and of what is painful to America’s well-wishers and enjoyable to its detractors. Imagine the first Madison disclosing to the learned cowpuncher his subsequent political mode, the second an object of his hatred...The end result of such an imaginary grand tour would be a work like The Sociological Imagination”

Nonetheless, the book has come to be seen as a sociological classic, not least of all because of the value which so many sociologists have recurrently found in its passionate challenge to the professionalisation of sociology and the ivory tower intellectualism which it can so often engender. Crucially, the sociological imagination is not something
over which professional sociologists can be said to have a monopoly. Indeed the extent to which this sensibility finds itself manifested within the academy can be taken as an index of the relative vitality or otherwise of the discipline. Mills was intensely critical of the professional sociology from which he found himself ever more estranged over time, lamenting the tendency of his contemporaries to ‘slip so readily into unintelligibility’. He identified the roots of this problems as inhering in the widespread tendency within the professionalising sociology of his time to self-consciously seek legitimization as a scientific discipline. As Gane and Back (2012) go on to write,

‘For sociology to be to be effective, especially beyond the academy, it must have literary ambitions. Mills’ assessment of the quality of the sociological writings of his time is damning. He argues that there is a “serious crisis in literacy” in which sociologists are “very much involved” (1959:239). Mills’ position here is an extension of his earlier attack on Parsons and Lazarsfeld, and is just as fierce in tone. He observes that “a turgid and polysyllabic prose does seem to prevail in the social sciences” (Mills, 1959:239), and adds that this style of writing has nothing to do with the complexity of the subject matter. Mills explains the prevalence of this style, instead, in terms of a quest for status. He declares: “Desire for status is one reason why academic men slip so readily into unintelligibility. And that, in turn, is one reason why they do not have the status they desire” (Mills, 1959:240). This thirst for status is said to be driven by an underlying desire for the sociologist to achieve recognition as a “scientist”; something, he argues, that led to sociology written in clear and accessible prose (including, presumably, his own work) to be dismissed by many as mere journalism.’

Mills saw the promise of sociology as being undermined by this quest for status and the sclerotic forms of expression he saw associated with it, with sociologists prone to ‘stereotyped ways of writing which do away with the full experience by keeping them detached throughout their operations’ almost as if ‘they are deadly afraid to take chance of modifying themselves in the process of their work’ (Mills, 2001: 111). He saw this failure of vision and expression in what could almost be construed as epochal terms, representing a failure of sociological imagination at precisely the moment when this distinctive sensibility was most needed. Mills was, in many ways, estranged from the academic establishment and this was, in part, both cause and a consequence of his critique. This estrangement gave him a degree of intellectual freedom from the cultural norms prevalent within the professional sociology of his day and this was in turn entrenched by the manner in which he employed that freedom to pull apart many of the orthodoxies which he saw as so inimical to his understanding of sociology’s promise. This estrangement can be overstated and, though this is a chapter about para academic life, it would be manifestly untrue to suggest by way of a-historical retrospection that Mills himself was a para academic. Clearly he was not. Nonetheless, he could, perhaps, serve a viable role model for para academics - in his case the estrangement was predominantly cultural rather than structural but, nonetheless, there was estrangement. The relationship between his unceasingly critical orientation towards professional sociology and the profoundly creative use of the freedom afforded to him by this critical outlook and relative estrangement is worth reflecting on. His position in relation to the sociological establishment afforded him a degree of freedom and he used this to diagnose the ills which afflicted the sociology of his day and, crucially, pursued a lifelong project of rethinking sociological craft in view of these disciplinary and institutional ailments. We would suggest that the blogosphere affords a parallel degree of freedom to para academics: a place of respite from the distorting tendencies engendered by the pursuit of status within higher education. While our discussion in this chapter focus predominantly on blogging, there is a broader claim to be made here about ‘digital scholarship’ and its complex relationship to the broader academic world within which it is emerging. The notion of digital scholarship drawn upon here is largely that offered by Weller (2012) who understands the constitution of a ‘digital scholar’ in a deliberately open way:

‘A digital scholar need not be a recognised academic, and equally does not include anyone who posts something online. For now, a definition of someone who employs digital, networked and open approaches to demonstrate specialism in a field is probably sufficient to progress.’

It would be absurd to claim that all digital scholars are para academics - manifestly this is not the case. Nor would it be tenable to suggest that all para academics are, could or should become digital scholars (even if we would not
be surprised if this happens in a couple of decades when today’s youngest generations enter professional research). Nonetheless, we argue there is a contingent complementarity between the role of the digital scholar and that of the para academic, with the embrace of the former offering substantial opportunities to those thrown into the latter role. As Weller (2012) goes on to observe, ‘in a digital, networked, open world people become less defined by the institution to which they belong and more by the network and online identity they establish’ and, as a consequence, ‘a well-respected digital scholar may well be someone who has no institutional affiliation’. Part of the difficulty faced by those precariously employed within the academy is the long standing dependence of those so positioned on institutions as the means through which one can come to articulate a viable and efficacious professional identity. This is precisely the dependence which digital scholarship is weakening and it is for this reason that we should treat calls for digital scholarship to be ‘recognised’ with caution. The risk is that incorporating digital outputs too readily into the evaluative frameworks of contemporary higher education might erode many of the things which are so refreshing about the uses which academics are making of these online tools. As it stands academic bloggers enjoy a degree of freedom from the sorts of pressures which concerned Mills, which have surely only intensified and expanded since the time he was writing, which makes it imperative that this not be threatened through too hasty a process of mainstreaming. Digital scholarship can, at its best, allow alternative infrastructures of communication and evaluation to emerge which, as well as being personally liberating to those active within them, holds out the promise of providing an independent vantage point from which the deleterious tendencies within the broader academy can be identified, analysed and resisted. This can take a variety of forms:

1. The boundary between academic scholarship and ‘public engagement’ becomes blurred. Even digital scholarship geared towards a narrowly specialised audience enjoys an intrinsic visibility which traditional scholarship does not. In so far as digital scholars work with an awareness of this visibility it inculcates a tendency towards openness, in the sense of disrupting many of the habitual modes of academic expression which are intricately tied up in traditional modes of academic publishing. Or in other words: it’s easier to avoid the temptation to use jargon when blogging than it is when writing a journal article because you are aware that readers of the former are far more unlikely to understand the jargon than readers of the latter. The tendency to ‘slip so readily into unintelligibility’ decried by Mills is checked by the peculiarly public form of writing entailed by blogging and other modes of digital scholarship.

2. This visibility goes hand-in-hand with discoverability. It is easier to discover those engaged in digital scholarship both for others within the academy and those outside it. This has important implications for the public status of academic work. While the traditional understanding of public intellectualism has been bound up in broadcast media, digital communications facilitates narrowcasting (Poe, 2012). The image of the public intellectual as a world renowned figure communicating globally about issues of universal concern can give way to a much more democratic image of academics in general communicating about their research to those who find it interesting. There will always be such an audience, no matter how niche the topic appears to be, yet prior to digital communications it was impossible to establish the necessary connections - hence the hegemony of the broadcast model of public intellectualism.

3. Many taken for granted norms pertaining to scholarly communications are, at least in part, functions of the limitations inherent in non-digital communication systems. For instance as Weller (2011: 156) observes, ‘a journal article is a certain length, and the journal publication cycle is determined as much by the economics of printing as it by any consideration of the best methods for sharing knowledge’. This is an example of an interconnection between form (the journal article) and function (communication of scholarly knowledge) having been shaped by the economics of analogue technology. Digital technology creates opportunities to find innovative forms for long standing functions and because of their relatively peripheral status within the academy, para academics are best placed to undertake the innovation and experimentation to which this digital turn so naturally leads.

4. Digital scholarship also tends to reveal the linkages between what Bourdieu (2003) describes as public scholarship and private commitment. Whereas the two are clearly demarcated within mainstream academic culture, with the legitimacy of the former often seen to rest on the exclusion of the latter, digital communication tends
to preclude such a demarcation. This helps create the possibility of a more up front and less alienated social science, more open to those outside the academy and clearer about the beliefs and values which underlie scholarly projects.

5. Some of the advantages of para academic work are accompanied with disadvantages. As Weller (2012) observes, peer networks are integral to scholarship, representing the ‘people who scholars share ideas with, collaborate with on research projects, review papers for, discuss ideas with and get feedback from’. Yet, before the rise of the internet and, more latterly and significantly, social networking tools, the constitutions of this peer network was limited to those with whom one interacted in person on a regular basis. The rise of Internet communication has enabled ‘scholars to build up a network of peers who perform the same role in their scholarly activity as the networks founded on face-to-face contact’ thus reducing the disadvantages inherent in the enforced mobility; however, the basic inequality between the para academic and the traditionally employed academic remains, for example in caused by the relative lack of resources and precarious employment conditions which typically characterise the working life of the para academic.

Our Sociological Imagination

This project has value for us because of both its sheer continuity (we have worked willingly on the site for three years now) but also the independence which that continuity has in relation to each of our respective trajectories through the (para)academic world. It is something which has consistently accompanied us in our professional involvements, in the sense that it has had direct and indirect implications for our other activities and professional identities, however it has always been experientially distinct from these. We experience it as a form of free space which provides a public forum for what is otherwise private activity: thinking, reading around other subjects, and generally having fun through understanding society and developing analytical tools. The fun and creative aspect of sociology seems to be insufficiently present in the academic curriculum: or at least less so than in mathematics and computer science (as one of us has discovered through her recent fieldwork). It would probably be inaccurate to suggest the project is utterly insulated from instrumental reasons, but these are entirely secondary: i.e., we have become aware of ways in which the project has been instrumentally useful to us but we never sought to pursue it for these reasons. It is a liberating counterbalance to the frequently stifling and laborious experiences of writing conference papers, articles for publication, or a PhD thesis. The effort that goes into crafting a small SI piece is sometimes no smaller than the effort that went into an equally-sized portion of a journal paper. But each SI article is driven by pure curiosity and interest – and some are more polished than others. Part of this freedom, obviously, comes with the different genre and size of the articles that appear on SI. Most of the site’s content is written in a less formal style and the range of possible formats is almost infinite, unlike the strictly regimented format and style of, say, journal articles in sociology. Over the years, we have both found that this free format is precisely what has allowed us to post consistently, regardless of any other commitments we have, so as to never put off writing an SI post when an interesting idea comes to mind. We have developed an informal writing style, much like a cross between sociology and journalism, but without losing the ability to write serious pieces. Furthermore, it is partly thanks to this free format that we have gained an eclectic range of both ad hoc and consistent contributors, some of whom are freelance sociologists, others students in the social sciences, others in academic positions, and yet others non-sociologists who have an interest and something to say about one of our topics. Our consistent sociological ‘thinking aloud’ through SI has certainly been beneficial for our personal writing abilities, but more importantly, this format has suited the purpose of what we imagine as public sociology. It is sociology spilling out of the confines of academia into the broader world, but without completely severing the link with academic research or losing sight of the worthwhile aspects of research embedded within institutions. Admittedly, the informality and the lack of restraints on format also pose constrains: while the range of SI topics is wide, the coverage tends to be superficial, contrary to the very narrow focus of a journal or conference paper (although some of the posts have featured extensive literature research and analysis and could well form drafts for academic papers or book chapters). This is why we do not see SI as something that either of us could do full-time, or something for which we ought to abandon our other (academic or non-academic) research which affords us the depth and engagement with one particular sociological topic or subdiscipline. In fact, our work on SI has benefitted from our respective academic work and our empirical research experience - just as it, in turn, neatly complements our other academic and non-academic work.
Although the Sociological Imagination exists predominantly online, it often leaves the virtual world and crosses over to offline activities, some of which can be seen as academic and others para academic. An example of this cross-over is a workshop which we organised in June 2011, devoted to the sociology of sport. The workshop took place at Warwick University (where both of us were then based). It brought together three researchers in the sociology of sport, was easily accessible to anyone at the university, and open to anyone else outside the university who was able to attend. The 'offline' workshop was preceded by a week of one or two daily posts on different aspects of sociology of sport, introducing researchers and guest articles, and followed by audio and video podcasts of the presentations and discussions. Since neither of us is a specialist in the sociology of sport, we did not write original articles, but approached several researchers of sport for guest contributions. Our role as editors focused on finding relevant authors and contributions, curating interesting content, linking the online theme with the workshop, planning and crafting each of the posts, and providing both an online and a physical space for researchers and students interested in sociological aspects of sport. The Week of Sport on SI thus had several functions: on the one hand, it resulted in a typical academic workshop, but on the other, it was also a joint online-offline space-time which created a forum for topic-driven public sociology, publicising the work of researchers and accessible to anyone with an interest in the topic, including our online readers who could not attend the workshop. This and other occasions when we have linked SI with the 'offline world' have been equally rewarding in terms of quality of discussion, the possibility for us or our readers to follow up on an interesting topic or meet interesting researchers in real (or virtual) life. In its own limited and local way, this felt as if the digital activity which had become so important to us had 'spilled over' from its artificial mooring with the 'virtual' world, coming to occupy what was then the shared institutional space within which our mundane day-to-day para academic lives unfolded. It pointed to exciting new possibilities which, it would feel dishonest not to point out, we have not yet explored to the fullest, as the exigencies of daily life inevitably preclude a further opening of the cracks that suddenly became visible in established institutional structures. But the possibilities are exciting nonetheless and they point to an alternative trajectory for the digital activity of para academics: one which resists the temptation to leverage digital scholarship for instrumental gain and opposes its incorporation into the existing audit culture. Instead we have tried to point towards a potential expansion out of para academic digital scholarship which opposes its incorporation into existing structures. We have suggested C. Wright Mills as an exemplar of the public and professional orientations this might involve and sought to 'join the dots' between contemporary discussions of public sociology, digital scholarship and para-academia. Nam Tran (2014-01-23 21:37:19)
Great article. With this site, and others like it, it allows people who are unable to attend post-secondary schools (ie. due to finances) to learn about and experience sociology. It’s as if you are taking what is intended for the upper class and giving it to the middle/lower classes.
Roy Bhaskar on the Fetishisation of Facts (2014-01-23 08:00)

What is a ‘fact’? This deceptively simple question provides a route into the most pressing issues concerning the philosophy of science. In a short essay, "Philosophies as Ideologies of Science: A Contribution to the Critique of Positivism", Roy Bhaskar offers a compelling answer to this question which impressively incorporates an epistemic account of knowledge alongside a sociological account of theories of knowledge. It is directed towards a critique of positivism which, he writes, “is, in the first instance, a theory of the nature, limits and unity of knowledge”. On the positivist account, knowledge is of events which are revealed in perception. The generalisation of such knowledge involves identifying the patterning of such events, in space and over time, with sense perception being understood to exhaust the possible objects of knowledge ([1]Bhaskar 1989: 49). Underlying this is an (often implicit) ontology of closed systems and atomistic events. However Bhaskar also claims that any theory of knowledge also presupposes a sociology “in the sense that it must be assumed, implicitly if not explicitly, that the nature of human beings and the institutions they reproduce or transform is such that such knowledge could be produced” ([2]Bhaskar 1989: 49). This conception of “people as passive sensors of given facts and recorders of their given constant conjunctions" has important implications ([3]Bhaskar 1989: 51). Given that constant conjunctions are worked for in laboratories rather than discovered in nature, it follows that the intelligibility of the objects of scientific investigation must be understood as ontologically independent of the activities of human beings but conversely that the concepts under which we encounter them must be seen as part of an irreducibly social process of science.

Thus experiences (and the facts they ground), and the constant conjunctions of events that form the empirical grounds for causal laws, are social products. But the objects to which they afford us access, such as causal laws, exist and act quite independently of us.

Now positivism can sustain neither the idea of an independent reality nor the idea of a socially produced science. Rather what happens is in a way quite extraordinary – for, as in the interests of a particular conception of philosophy, it allows a particular conception of our knowledge of reality to inform and implicitly define the concept of the reality known by science, these ideas (absolutely minimally necessary conditions for an adequate account of science) become crossed, so that we have a naturalised science purchased at the expense of a humanised nature. ([4]Bhaskar 1989: 51)

It is in this ‘transference’ that we begin to locate the ideological implications of positivism. Positivism bequeaths us an alienated understanding of science, repudiating its social nature, as well as a mystified account of nature, cleaved to our putative sense perceptions of it. This is what leads to the reification of facts. If we view "what is apprehended in immediate sense-experience as a fact constituting an atomistic event or state of affairs, existing independently of the human activity necessary for it" then we come to see ‘facts’ as self-subsistent and independent of human activity. Furthermore, as Bhaskar puts it, “when the conjunctions of such facts are reified and identified with causal laws, science becomes an epiphenomenon of nature” ([5]Bhaskar 1989: 52). In coming to such a view, where ‘facts’ can be read from ‘nature’, we deny the social character of science, particularly "its character as work involving the transformation of antecedent objects, both material and ideational" ([6]Bhaskar 1989: 52). The point is not to
repudiate ‘facts’ but rather to recognise the grounding of facts on things and constant conjunctions on causal laws. Human beings produce facts but they do so through collective labour of a particular sort, orientated towards both material and ideational objects, which seeks to intervene in and accumulate knowledge of a natural world irreducible to this labour.

Underpinning this is a fallacious image of a “moment of subjectivity which is free from the effects of all pre-formed or extraneous, including theoretical content” ([7]Bhaskar 1989: 52). For positivism this “autonomized sense-experience constitutes the form in which knowledge is acquired and the reified fact the content that is expressed” ([8]Bhaskar 1989: 54). The atomicity of events necessitated by this account of sense experience in turn entails the constancy of conjunctions as a condition for general knowledge. I’m not 100% certain I follow Bhaskar’s point here but I think he is suggesting that positivism offers no other ‘building blocks’ out of which general knowledge can be constructed, such that it becomes a matter of establishing logical relations been atomistic impressions of events rather than the achievement of deeper knowledge of natural processes. For positivism “facts and their conjunctions both exhaust the real content of science and determine the knowable nature of the world, or fix science in its ontology” ([9]Bhaskar 1989: 54). In rejecting the ‘reification of facts’, Bhaskar’s point is not that ‘facts’ are not ‘things’. Rather he is arguing that “facts are things, but they are social not natural things, belonging to the transitive world of science, not the intransitive world of nature” ([10]Bhaskar 1989: 55). There are non-reified accounts of facts which he believes to be problematic, as correctly understanding the relation between facts and human activity poses a conceptual and methodological challenge extending beyond the simple recognition that we do not ‘discover’ facts in the natural world.

One might take ‘a fact’ as a synonym for a ‘true assertion’ or alternatively, to consider Strawson’s well-known formula, to attempt to explicate it as what a true statement states. But this will not do – for we make statements, but we do not make facts (rather it is as if they were made for us); and it is unclear, to say the least, how statements can do anything. Why do we not make facts? The answer is because, as the etymology of the word suggests, they are already made. In stating facts we are acknowledging results already achieved, the results being achieved (in the domain of empirical discourse) by readings, of which the varieties of sense experience constitute special kinds of skill. But of course we discover as well as state results: the facts pre-exist their discovery as results to be achieved (just as they pre-exist their statement as achievements). They must thus be conceived as potentialities of the conceptual schemes or paradigms that govern our enquiries, which when actualised constitute discoveries. A fact, then, is a potentiality actualised in discovery, sustained in practice (both discursive and on-discursive) and objectified in sense-perception ([11]Bhaskar 1989: 60).

The cognitive structures in virtue of which ‘facts’ become possible are reproduced or transformed by human activity. However we do not as such create them because we are always positioned in relation to them and, in many senses, dependent upon them. This is why the notion of scientific labour is so important for Bhaskar’s project to critique positivism while also avoiding conventionalism. It’s in this sense that our tendency to “read the world as if it were constituted by facts” becomes important, as “what is involved in the categories in terms of which positivistic philosophical consciousness understands the concept of a fact is not therefore so much a crass mistake or straightforward error, as a superficiality which merely reflects the spontaneous consciousness of science” ([12]Bhaskar 1989: 61). What Bhaskar is affirming is the need to become reflectively conscious of this ‘spontaneous consciousness’ in order to achieve distance from it. Facts are real but they are “historically specific social realities” and it is recognition of this which is essential for understanding how scientific progress becomes possible. The fetishism of facts also dehistorizes them and it is in this sense that Bhaskar sees the category of ‘ideology’ as appropriate to these discussions. In other words, positivism has a social function which is “to conceal the historically specific structures and relations constituting sense-experience in science” ([13]Bhaskar 1989: 61). More specifically, the social function of the constant conjunction is to “conceal the reality of structures irreducible to events” ([14]Bhaskar 1989: 62).

Launch of ‘SexGen Northern Network’ and seminar on Compulsory Sexualities (2014-01-25 08:00)

We would like to invite you to get involved in the ‘sexgen’ network.

‘sexgen’ is a collaborative interdisciplinary network bringing together gender and sexuality based research centres around the North of England. We aim to bring academic research, writing and thinking on gender and sexuality into conversation with the ideas, cultural expressions and knowledges of community groups, cultural sites and activist organisations. Series organising contacts are: Sally Hines, Centre for Interdisciplinary Gender Studies, University of Leeds: [1]s.hines@leeds.ac.uk and Surya Monro, Centre for Research in Social Sciences, University of Huddersfield: [2]s.monro@hud.ac.uk.

In 2014-2015 sexgen will hold a series of free seminars, details of which will be forthcoming. Seminars will be themed to reflect current and emerging themes within gender and sexuality studies.

Please find attached the Network flyer and the flyer for the first seminar: Seminar 1: February 28th 2014, The Centre for Research in Social Sciences, University of Huddersfield: ‘Compulsory Sexualities’.

hashtag #sexgen

We would be grateful if you could publicize ‘sexgen’ amongst your networks.

The next meeting of the [1]Quantified Self Research Network will take place on the 25th March at the University of Warwick from 1pm to 6pm. It’s an informal seminar to present work in progress and is open to all.

If you would like to contribute then please send a short abstract and bio to mark@markcarrigan.net by February 1st. We use ‘quantified self’ in a broad sense inclusive of self-tracking, wearable computing and digital augmentation.

We’re also keen to build on the last seminar and move the discussion forward. Here are some of the key questions which emerged during the last meeting:

**What is distinctive about qs?**

People have tracked their health data for a long time such as keeping food diaries or measuring their weight. Is qs conceptually different to this or is it merely an automisation and intensification? Does the quantity of the data produced equate to more of the same or a qualitatively distinct phenomenon?

**Are there inequalities in qs and self-tracking?**

The technologies required for qs are usually quite expensive even for a basic device and would certainly be out of the range of disposable income for many people and...

**Are we creating inequalities with the focus of research?**

If qsers are a relatively privileged group while it may be interesting to understand their practices and development of individual and group identities there are other people who cannot afford these practices, are uninterested or simply unaware of them.

**What about gender?**

The QS community seems to have more men than women as active participants. What are the reasons for this? If we take the broader notion of qs suggested by some of the presenters then often the more "mundane" or "domestic" approaches to self-tracking are more associated with women? Is there something fundamentally different about these?

**How do we identify a ‘non-user’?**

Although some of the methods of tracking have been used for a long time some of them are very new and it is currently unclear what kind of uptake they will have. We fairly easily identify a user...
(agreeing on a definition may be more complex) it is more difficult to identify a non-user. Are they people who do not practice QS or use the devices because they do not have access to them, they are not aware of them or they simply do not care? Is it right to define people as non-users of a fairly niche activity often engaged in by relatively privileged people? But with the amount of data which is generated about us (often without us knowing) are we not all quantified whether we like it or not?

Call for papers: Geographies of children and young people’s popular cultures, identities and subcultures

(2014-01-26 08:00)

Title of session: Geographies of children and young people's popular cultures, identities, and subcultures

Sponsored by: Geographies of Children, Youth and Families Research Group

Session convenors: John Horton (The University of Northampton, UK) & Peter Kraftl (University of Leicester, UK)

We invite you to participate in two sessions reflecting upon the geographies of children and young people's popular cultures, identities and subcultures. We hope that the sessions will include some consideration of children and young people's engagements with toys, literature, television, music, film, folklore, fandom, games, play, media discourses, moral panics, fashion, comics, collectables, cultural phenomena, video games, multimedia, material culture, social networks, consumption, consumerism, digital and online technologies, heterogeneous materialities, identity markers, urban myths, cultural norms and exclusions, customary practices, traditions, and subcultural scenes, styles and practices.

We would welcome two different kinds of contribution.

- For the first session, we call for conventional papers (15 minutes, plus 5 minutes discussion) reporting on new research exploring geographies of children and young people’s popular cultures, identities and subcultures. We would welcome papers dealing with diverse historic-geographic contexts, and written from diverse disciplinary, conceptual and critical-political perspectives. In particular, we seek papers that develop novel theoretical frameworks for foregrounding the spatialities of children and young people’s popular cultures, identities and subcultures. Thus, papers might (but might not only) consider how understandings of popular cultural practices, discourses, representations, memories, obsessions, anxieties, consumption or consumerism might be extended via engagements with geographical concepts such as space, place, scale, network or spatiality.

- For the second session, in a spirit of co-production, we would welcome proposals for looser, shorter, less formal contributions in relation to the session themes (and any of the stuff listed above). These might take the form of ‘show-and-tell’, autoethnographic vignettes, performances, conceptual provocations, politicised critiques, something fun, something playful, something fun, something angry, or something else. Ideas for contributions would be gratefully received.
Please submit abstracts of up to 250 words to both John Horton ([1]john.horton@northampton.ac.uk) and Peter Kraftl ([2]pk123@leicester.ac.uk) by Friday, 7th February 2014. Please indicate whether you intend to present a conventional paper or a shorter contribution. Further information about the conference is available at: [3]http://www.rgs.org/WhatsOn/ConferencesAndSeminars/Annual+International+Conference/Annual+international+conference.htm

_______________
Graham Crow's *The Art of Sociological Argument* (Palgrave Macmillan, 2005) is a book about rhetoric and how sociologists have made their arguments and communicated with their readers. Crow takes eight sociological writers from the classic founders to the present day. Each sociologist is treated to a chapter on the biographical and historical contexts of their thought and writing.

The authors reviewed include obvious choices like the big three ‘founding fathers’ - Karl Marx, Emile Durkheim and Max Weber, although Crows discussion of them though is far from obvious. For example, I was surprised to realize how short their sociological lives were – Marx having greatest longevity at 64 years with Durkheim next at 59 years and Max Weber just 56 years. Crow leads us through the ways in which they used metaphor, like Weber’s idea of bureaucracy as an ‘iron cage,’ or personification, as in Marx’s unforgettable ‘Mr Moneybags,’ to make their arguments.

Next Crow gives us a trio of American sociological writers - Talcott Parsons, Charles Wright Mills and Erving Goffman. It’s no secret that I have a weakness for the writing of C. Wright Mills but reading this book I found myself having much more sympathy for Talcott Parsons as a person. Parsons comes across as patient and even tempered, while Mills seems bombastic and imprecise by comparison. Yet at the same time, Mills is more lasting and alluring to his readership. Goffman is presented as a sociological humourist with a brilliant eye for analytical metaphors. However, the purpose of a metaphor for Goffman is to support an argument like scaffolding: “Scaffolds... are to build other things with, and should be erected with an eye to taking them down”. Erving Goffman did more than any other sociologists to give us a way of understanding society’s back stage, while at the same time being very secretive about his own personal life.

The last part of the book features a chapter on Michel Foucault and another on Ann Oakley. Crow talks very thoughtfully about Foucault’s use of shock tactics and a kind of gothic style in his writing. Foucault’s rhetoric insists on leaving things open, refusing to claim the final word on any given issue. For Foucault, those who claim knowledge pilfer the voices of their subjects and in the contexts discussions of crime this “shuts the prisoner up (in both senses)”.

Ann Oakley is the only female sociological writer to be included. The chapter dedicated to Oakley’s writing was this reader’s favourite. What Crow does so successfully is to re-enchant books that you think you know already. It was a real surprise and revelation to be introduced to the range of Oakley’s writing from her classic *The Sociology of Housework* to policy reports, memoir, fiction and poetry. The diversity of Oakley’s work is astonishing, she writes: “All writing is an invitation to the imagination... a matter of new arrangements of words, and thus of new forms.”

In a way Oakley’s work is a provocation to find new ways of writing sociologically. Crow quotes Oakley from one of her eighties poetry collections: “who would want a history of articles / typed and dissected, lost and uncredited.” By implication Oakley is challenging us to ask: will the books and articles we’ve written all too speedily for the audit culture inevitably have a short shelf life?

*The Art of Sociological Argument* is a wonderful and beautifully written book. It has cost me a small fortune in impulse purchases from Amazon. Reading Crow makes me want to go back to the classics from Riesman’s *The Lonely Crowd* to Oakley’s *Gender of Planet Earth*. The book reads like an argument that has been rehearsed and honed through teaching the work of these great sociologists.

Crow’s conclusion is that there are ways we can improve the way we express our arguments. He offers ten points on how to write sociology more artfully. I have paraphrased them here as follows:
1. Care for your readers - invite your readers into a conversation with your problem, rather than preach to them by being overly didactic.

2. Challenge your reader’s presuppositions and surprise them, even if this means being shocking.

3. Don’t be afraid to use humour and irony to amuse and persuade.

4. Work with what is counter-intuitive and perplexing and it will open up new insights.

5. Metaphors and analogues can help get beyond descriptions of phenomena that are readily perceived.

6. Formulate imaginative questions that invite interesting sociological answers.

7. Foster a capacity for self-criticism.

8. Seek to persuade and do not assume that readers will share your agenda or understanding.

9. Avoid claiming too much in an argument but also be aware of the risks of claiming too little and not explicating its potential.

10. Literary style is no substitute for content but a good argument is all the better for being well presented.

In fifty years from now such a book will need to be written very differently. It has made me reflect on the transformation of Goldsmiths Sociology during my twenty years here, from a department with less than a handful of female colleagues to one where the majority of Goldsmiths sociologists are women. This year our department celebrates its half century.

Sociology has no future without feminist writers and the male domination of the discipline, as represented in the writers reviewed in this book, simply cannot and should not last. That’s not to mention the ubiquitous whiteness of the authors included in this book. With this in mind it is interesting to think and perhaps hope for what the sociological pantheon might look like, and how different the discipline will be, when Goldsmiths Sociology celebrates its centenary.

Les Back has been teaching in the Sociology Department at Goldsmiths, University of London since 1993. His main areas of academic interest are the sociology of racism, multiculture, popular culture, music and sound studies and city life.

Rorty, Realism and the Idea of Freedom (2014-01-27 08:00)

In contrast to the scorn which Rorty’s name now provokes in some quarters, it’s arresting to see the esteem in which he was held by Roy Bhaskar in the late 80s, albeit in the context of a trenchant philosophical critique. He commends
Rorty's "eloquent critique of the epistemological problematic" but intends to argue that Rorty remains captive to this problem field in ways he himself fails to recognise ([1] Bhaskar 1989: 146). In doing so, he advocates a philosophical post-narcissism which is capable of elaborating "non-anthropocentric pictures of being" through taking Rorty's project of 'de-divinisation' and pursuing it much further than Rorty was either willing or able to do ([2] Bhaskar 1989: 147).

His initial target is Rorty's account of science, particularly his easy imputation of chronic success in "the prediction and control of nature". In this claim Rorty reveals himself to have accepted Hempelian assumptions about natural science, in effect committing himself to a basically positivist account. Much of Bhaskar's critique proceeds from systematically exploring the ambiguities which are entailed by Rorty's failure to distinguish between the intransitive (ontological) and transitive (epistemological) dimensions of science. Once we begin to draw this distinction, Rorty's constant invocations of 'redescription' come to seem much more modest in their conclusions, though Rorty himself fails to recognise this:

Thus redescribing the past in a revolution way can cause radical new changes, including a new identity, self-definition or auto-biography: but it cannot retrospectively cause old changes, alter the past (as distinct from its interpretation). It is not surprising that Rorty should slip from transitive to intransitive uses of terms like 'cause' – it is endemic to empirical realism, the epistemological definition of being in terms of (a particular empiricist concept of) experience. ([3] Bhaskar 1989: 152).

Bhaskar's point is not to impute anti-realism to Rorty, though the latter surely does come to this in his later work. For Bhaskar "the crucial questions in philosophy are not whether to be a realist or an anti-realist, but what sort of realist to be (an empirical, conceptual transcendental or whatever realist); whether one explicitly theorises or merely implicitly secretes one's realism and whether and how one decides, arrives at or absorbs one's realism" ([4] Bhaskar 1989: 153). Bhaskar is in agreement with Rorty's repudiation of the 'Archimedean point' outside human history and the notion of 'correspondence' as standing between world and language. However he finds it problematic, as well as internally inconsistent, for Rorty's realism to adopt such a whiggish approach to actually existing science – imputing a continual extension of our capacity to 'control and intervene' with one hand while bracketing the philosophy of science with another. He shares Rorty's anti-foundationalism and applauds his "vigorou assault on its attendant ocular metaphors, mirror imagery and overseer conception of philosophy" ([5] Bhaskar 1989: 157).

So what's the problem? Rorty's peculiarly positivistic stance finds expression in his assumption that an individual represents a closed system. Bhaskar addresses this point in a dense critique which I won't attempt to summarise but is an astonishingly accomplished analysis which is worth studying in detail ([6] Bhaskar 1989: 161-162). His intention is to better understand "A Tale of Two Rortys": a tension which runs through his work and precludes him from offering either an adequate understanding of scientific activity or a sustainable account of human freedom. In essence he finds himself reproducing a linguistified version of the Kantian distinction between people as empirical selves and as moral agents. Rorty is attempting to combine a physicalism which sees individuals as closed causal systems, in which it is possible (in principle) to predict every movement of a person's body by reference to microphysical states, with an affirmation of the discursive freedom of human beings.

However it is this freedom to 're-describe' which is the cause of all the problems. He fails to distinguish between objects changing and requiring a new description and an unchanged object being redescribed. In this sense 'redescription' comes to be detached from the characteristics of the objects being redescribed. Yet this is central to Rorty's account of human freedom:

Man is the describing, redescribing being. Among the entities man can describe in a new, and abnormal, way, is himself. By making a new, incommensurable description of herself 'stick', she makes it true; and
thus 'gives birth to' (to use Harold Bloom’s term) or ‘creates’ herself – which is to say ‘overcomes’ her previous or past self. Moreover, only by describing herself in a totally novel way can she capture or express her idiosyncrasy, uniqueness – or rather achieve it, achieve her individuation – for anything else would reduce her to a (more or less complex set of formula(e), a token of a type (or set of types). Such radical self-redescription (which could be nicknamed ‘me-‘ or ‘we-‘ description) is the highest form of description. For not only does the redescription redescribe the describer; but in the process of redescription – of wining it, of making it stick, of achieving recognition for it – it makes the (re)description true; so achieving the identity of subject and object, by creating it.[7]Bhaskar 1989: 171)

On this picture we are left with a notion of freedom as “caprice, discourse, capricious discourse and creative discourse” ([8]Bhaskar 1989: 173). Even this highest form of freedom within Rorty’s account, the possibility of ‘creative discourse’, falls short because it operationalises freedom in abstraction from the material dimension of social life. Rorty’s account makes it difficult to see how we could ever come to identify or transform structures which engender a diminution of human freedom. It also fails to recognise the constraining effects they may have on freedom even in his own narrow understanding of it. As Bhaskar observes, “it is now easy to see how the notion that ‘man is always free to choose new descriptions’ can encourage the voluntaristic position that man is always free to choose any description” ([9]Bhaskar 1989: 176). Rorty’s discursive freedom should not be repudiated in and of itself but should rather be contextualised in terms of a much deeper sense of freedom and, crucially, a notion of emancipation which “depends upon the transformation of structures rather than just the amelioration of states of affairs” (Bhaskar 1989: 178).

Journeys Through Sociology (2014-01-28 08:00)

UC Berkeley have produced a great series of video interviews with former presidents and current board members of the International Sociological Association. These engaging interviews mix professional interests and personal
reflections in a way that we rarely encounter within the academy:

The Sociological Science Behind Social Networks and Social Influence (2014-01-29 08:00)

Nicholas Christakis, Professor of Medical Sociology, Medicine, and Sociology at Harvard University

If you think you're in complete control of your destiny or even your own actions, you're wrong.
Every choice you make, every behavior you exhibit, and even every desire you have finds its roots in the social universe. Nicholas Christakis explains why individual actions are inextricably linked to sociological pressures; whether you’re absorbing altruism performed by someone you’ll never meet or deciding to jump off the Golden Gate Bridge, collective phenomena affect every aspect of your life. By the end of the lecture Christakis has revealed a startling new way to understand the world that ranks sociology as one of the most vitally important social sciences.

Check out [1]Rachel Strom’s blog which has many other fascinating posts about African history and sociology.
What Africa might have looked like today, if it had never been colonised? This is a map of African politico-tribal units from about 1844 drawn by Swedish artist Nikolaj Cyon. Seen at: [2]http://rachelstrohm.com/2013/07/29/the-colonization-counterfactual/

Asgarda, the "Ukrainian Amazons" - and the impossibility of feminism (2014-01-31 08:00)

"Katerina Tarnovska is a Ukrainian preschool teacher, a kickboxing world champion and a self-proclaimed descendent of the legendary warrior women of the Amazon. In 2002 she founded Asgarda, a martial art exclusively for women that is inspired by the tribal traditions of the Scythian Amazons. In the past decade, more than 1,000 ladies have been entrusted with the teachings of the Asgarda, which Katerina says is the only fighting style specifically tailored to the female form."

"Timeless love": ageing bodies and sex? (2014-02-01 08:00)

Images of old people in a the context of sex and love are often missing from contemporary media. The work of Marrie Bot, an art photographer, focuses on such universal human themes surrounded by some sort of a taboo - like the exhibition featured here, titled "Timeless Love", which shows intimate photographs of older people. We cannot reproduce her photos due to copyright, but they are beautiful and you should definitely see the online version of Bot's photobook on her webpage, [1]www.marriebot.com.

2014 Call for Papers for NWSA Asexuality Studies Interest Group (2014-02-02 08:00)

2014 Call for Papers about Asexuality
Asexuality Studies Interest Group
National Women's Studies Association (NWSA)
November 13-16, 2014, San Juan, Puerto Rico
The NWSA Asexuality Studies Interest Group welcomes papers for the 2014 NWSA annual conference. These asexuality-related themes are orientated towards the full NWSA 2014 CFP which can be found here:[1] http://www.nwsa.org/files/NWSA%202014%20CFP_Final.pdf

If you are interested in being a part of the 2014 Asexuality Studies Interest Group panels at NWSA, please send the following information to the designated panel organizer (listed under each theme) by Thursday, February 6, 2014:

*Name, Institutional Affiliation, Mailing Address, Email, Phone

*NWSA Theme your paper fits under

*Title for your talk

*50-100 word abstract

We will try to accommodate as many qualified papers as possible, but panels are limited to 3-4 presenters. NWSA will make the final decision about which panels are accepted. Presenters accepted into the conference program must become members of NWSA in addition to registering for the conference.

**Sponsored Session: Asexualities and Issues of Race**

For our sponsored session, we wish to think through the ways that race, ethnicity, and nation intersect with asexuality studies. We are interested in academic scholarship that focuses on these intersections, personal experiences of asexual people of color, as well as pedagogical approaches to teaching about asexuality through the lens of critical race studies and women of color feminism. Some questions we want to raise are:

- What difference does race, ethnicity, and nation make in the lives of asexual-identified people?
- How does asexual-identification predicated on low levels of sexual attraction and/or desire interact with racist assumptions that people of color are hypersexual?
- In what ways does asexuality help us think through histories of race-making and racism?
- How is racism experienced in the asexual community?
- How do online asexual communities work to make asexual people of color visible or invisible?
- How can we make asexuality studies be more attentive to issues of race and white privilege?

Please submit materials for the sponsored session to organizer Regina Wright at [2]wrightrm@indiana.edu

Co-Sponsored Session with NWSA Fat Studies Interest Group
Fatness and asexuality provide useful frameworks for understanding how subjects are produced and disciplined within the context of the nation: positioned as unhealthy, deviant, pathological and unproductive—both fatness and asexuality are perceived as threats to the state’s normal functioning. While the growing activist and academic movements pertaining to fatness and asexuality both expose and problematize the disciplinary techniques of the nation, fatness and asexuality are only ever positioned together negatively. Fat empowerment politics, for example, involves critiquing the dominant ideology that fat bodies are either hypersexualized, fetishized or desexualized, and by this emphasis, can overlook the experiences of people who identify as both fat and asexual. This co-sponsored session wishes to place fat studies and asexuality studies in dialogue with each other and seeks papers that address questions including, but not limited to:

- What are points of encounter between asexuality studies and fat studies?
- In what ways can the intersections of fat studies and asexuality studies serve as a productive platform from which to critique ideas about labor, the economy, and the nation-state?
- How do marginalized fat and asexual bodies continue to foil the nation-state's desire for fixity?
- How can fat asexuality be re-imagined as a form of empowerment and not stigma?
- How might the increasing use of social media as a mode of resistance to oppressive state regimes present a useful point of departure within fat and asexual politics?

Please submit materials for the sponsored session to organizer Danielle Cooper at cooperd4@yorku.ca

**Theme 1: Rethinking the Nation**

- In what ways does an avid investment in sex, sexuality, and the sexual imperative shape the formation of colonial nation-states and the making of empires?
- How does gender, race, class, ability, and sexuality interact with the sexual imperative to make mandatory certain ways of inhabiting and enacting national belonging and citizenship?
- Through what ways can we develop an asexual analytic to puncture the normativizing structures at work in the making of empires, nations, and neoliberal economies?
- In what ways does “asexuality” as an identification either collude with or challenge the grounding elements of nation-making, in and beyond the Occidental empires?
- Can asexual perspectives work in concord with critical race theories and feminist theories of race-making to demolish global hierarchies and the production of whiteness and white privilege?
- How is asexuality integral to the future of feminist critiques of the role of sexuality in nation-making?

Please submit materials to theme organizer Ela Przybylo at przybylo@yorku.ca
Theme 2: Trans- Feminisms

• What does it mean to be both trans* and asexual? How do trans* members of the asexual community negotiate these two identities?

• How might these intersecting identities help us redefine feminist and asexual politics and epistemologies?

• What is the intersection between the human and the non-human in asexual communities? How might the encounter between the human and non-human species be productive in terms of transspecies critiques and participation in ecofeminist or cyborgian narratives?

• In what ways do cultural and socio-political locations create space or challenge asexual identities? Why are some ethnicities, nationalities, and races only minimally represented in online asexual communities?

• How do the hierarchical relationships among regions across North/South and other hegemonic borders figure into asexual studies?

• How might asexual communities and identities help generate transnational and transcultural feminist alliances?

• How might transgenerational feminist perspectives in asexual studies intersect with or challenge foundational concepts in women’s and gender studies? What are the dynamics among the members of the multi-generational asexual community?

Please submit materials to theme organizer LaChelle Schilling at lache2380@gmail.com

Theme 3: Technologizing Futures

Contemporary asexual identities and communities have largely developed online (and in some cases have subsequently moved “off-line”). This theme will explore this relationship between contemporary asexualities and the Internet and might address any of the following questions, or other relevant questions:

• What is the relationship between the Internet and contemporary asexual identities and communities? How has the fact that these identities and communities were first developed online shaped the form of these identities and communities?

• What forms of asexual activism have been enabled by the online nature of asexual identities and communities? Has the online nature of these identities and communities augmented and/or limited their ability to effect social change?

• What role do bodies play in online asexual communities? How has the online nature of these communities affected the ways in which other social categories have manifested in these communities (such as race, class, gender, and ability)?

• What happens when asexual communities and identities move “off-line”?
• Has the online nature of asexual communities enabled the formation of transnational connections? Do global inequalities remain unaddressed in asexual communities?

• What can the "case study" of asexual identities and communities contribute to scholarship on digital communities? To scholarship on sexual identity formation?

Please submit materials to theme organizer Kristina Gupta at kag24@georgetown.edu

Theme 4: Love and Labor

One can look at the larger project of asexualities as a relatively recent series of actions by individuals, groups and disciplines laboring privately and publicly to come to terms with different approaches to our definitions of love. Through radically redefining sexuality, identity, bodies and desire in a heteronormative society, it becomes possible to further imagine an openness to contingency and experiments within and between communities. This panel addresses some of the ways in which feminist, queer and performance studies can inform and build upon one another within the context of activating various perspectives on asexualities, through the following areas of inquiry:

• How do we construct new networks in innovative ways that link theoretical inquiries to the socioeconomic and racial realities of asexual communities?

• To what extent can we employ trust, creativity and imagination in the exploration and construction of asexual identities and space through an everyday performativity?

• How would shared social and cultural rituals of a small community translate into larger, networked activism?

• In what ways, do we enable and enrich the writing of future histories of asexualities within the context of this interdisciplinarity?

Please submit materials to theme organizer Anna Lise Jensen at aaaonyc@gmail.com

Theme 5: Creating Justice

• In what ways are asexual identities marginalized/oppressed? What structures, discourses, and modes of power refute, obstruct, and/or censor asexual legitimacy?

• In what ways does the struggle for legitimacy resemble prior movements toward justice, such as those for women's rights, minority voices, and queer communities? What can a campaign for asexual justice take and learn from those movements? In what ways is the asexual movement different?

• What can be learned from the proliferation of asexual spaces online and how can that knowledge be put into practice in a campaign for legitimacy and justice offline?

• What is asexual justice? How can it be achieved in theory and practice?
• In what discourses and institutions is asexuality currently allowed (wholly or partially) to operate?

• How do specific cultures and languages reshape, challenge, or aid the campaign for asexual justice?

• How does this campaign for justice change when considered outside of the dominant contexts of the United States and Europe?

Please submit materials to theme organizer Nathan Erro at nmerro@gmail.com

Call for Papers: Media Sociology Preconference, ASA 2014 (2014-02-03 08:00)

Call for Papers: Media Sociology Preconference, ASA 2014

Venue: Mills College (Oakland, CA)
Date: August 15, 2014

We invite submissions for a second preconference on media sociology to be held at Mills College (Oakland, CA) on Friday, August 15, 2014. (This is one day before the start of the annual meeting of the American Sociological Association in San Francisco.) To encourage the widest possible range of submissions, we have no pre-specified theme again this year and invite both theoretical and empirical papers on any topic related to media sociology. Submissions from graduate students and junior scholars are particularly welcome.

Media sociology has long been a highly diverse field spanning many topics, methodologies, and units of analysis. It encompasses all forms of mass-mediated communication and expression, including news media, entertainment media, as well as new and digital media. Outstanding research exists within the different subfields both within and beyond the discipline of sociology. Our aim is to create dialogue among these disparate yet complementary traditions.

This preconference is also linked to a campaign to form a Media Sociology section of the ASA that is theoretically and
methodologically agnostic and aims to support sociological work related to any and all media. A petition supported by signatures from over 200 current members was submitted to the ASA Council in November 2013, and we are optimistic that Media Sociology will become a Section-in-Formation in 2015.

Papers may be on a variety of topics including, but not limited to:
- production processes and/or media workers
- political economy (including the role of the state and markets)
- media and the public sphere
- media content
- the Internet, social media, cellular phones, or other technology
- the digital divide
- new uses of media
- media globalization or diaspora
- media effects of media consumption
- identity, the self, and media

Invited Speakers

Last year’s inaugural preconference, held at NYU’s Institute for Public Knowledge and Arthur L. Carter Journalism Institute, was very well-attended and featured an invited keynote by Dhiraj Murthy (Goldsmiths, University of London) and a plenary panel addressing the theme, "Mapping the Field of Media Sociology" with additional participants Rodney Benson (NYU), Andrea Press (University of Virginia), Michael Schudson (Columbia University), and Eleanor Townsley (Mount Holyoke College).

This year’s keynote speaker will be Clayton Childress (University of Toronto – Scarborough). A special plenary session on "Media Sociology as a Vocation" will feature a panel discussion on careers in media sociology. We will announce further invited speakers in due course.

Submissions

Submissions should include:
- Separate cover sheet with: title, name and affiliation, and email address of author(s).
- Abstract of 150-300 words that discusses the problem, research, methods and relevance.
- Also include at least three descriptive keywords. Note: DO NOT put identifying information in the body of the abstract; only on cover sheet.
- Use Microsoft Office or PDF format.

Send abstracts to [1]casey.brienza.1@city.ac.uk. Please write “Media Sociology Preconference” in the subject line.

Abstract deadline is March 31, 2014.
Notification of acceptance will occur sometime in mid-April.

Contact Casey Brienza ([2]casey.brienza.1@city.ac.uk) or Matthias Revers ([3]mrevers@albany.edu) for more information about the preconference.

1. mailto:casey.brienza.1@city.ac.uk

It’s not the glass ceiling, it’s the dense air: Women bankers and their stay-home husbands (2014-02-04 08:00)

-------------------

A Follow-Up Interview with Dr. Patricia Leavy about Arts-Based Research and Public Sociology (2014-02-04 12:40)

Lauren Sardi: To recap from our last interview you explained that there is now an arts-based paradigm in addition to qualitative and quantitative paradigms. ABR is when researchers in any discipline adapt the tenets of the creative arts in their social research. You noted many advantages of ABR including contributing to public scholarship and thus making research accessible to diverse audiences.

Patricia Leavy: That’s right. I believe that there are ethical and practical reasons for doing research that leaves the academy and has the potential to be useful to people. Arts-based research provides a set of approaches for doing so.

Lauren Sardi: You turned to fiction and wrote two novels based on years of interview research. You said that one of the advantages of doing so was exploring micro-macro links. This is something that is fundamentally important to sociologists. How did fiction facilitate that?

Patricia Leavy: As sociologists we know that people’s lives are shaped in many ways by the society in which they live. We are all enmeshed in a social historical context. The question is how can we expose that so readers, our audience who we aim to reach, can see it for themselves and then reflect on their own lives and culture. Fiction is about showing, not telling, and I think anyone who has ever taught probably understand the value of showing and letting people engage for themselves, if we are to make a lasting impression.
Fiction allows us to show people's interiority, their inner lives. We do so with tools like interior dialogue. Readers have access to what a character is thinking when he or she is in a given situation or engaged in particular interactions. A narrator's voice is one technique through which we can also bring the larger picture in, including our own interpretation of what is going on with characters. So here are a couple of examples from my work.

My first ABR novel, *Low-Fat Love* was based on nearly a decade of interview research with women as well as observations from my personal and teaching experiences. The book explores the psychology of dissatisfying relationships, identity-building, the social construction of femininity within popular culture and the importance of self-acceptance. The novel is underscored with a critical commentary about how, too often, women become trapped in limited visions of themselves. I wanted to expose some of the gendered nature of pop culture and how it impacts some women. I used women's media as a signpost throughout the book in order to make visible the context in which women come to think of themselves as well as the men and women in their lives. By doing so I was able to offer a commentary about popular culture and the social construction of femininity. So for instance, a character would be watching television and readers would be exposed to what she was thinking about herself, her own life and relationships. The narrator's commentary would provide another layer. The selection of pop culture items and the cumulative impact of their presence is yet another layer of meaning.

After exploring issues of esteem and identity-building, I became interested in the relationship between social class, gender and identity. My novel *American Circumstance* explores appearance versus reality in people's lives, how our lives and relationships look to others versus what we experience, and a large part of this is how social class shapes identity. There is a lot that goes unspoken about social class in the United States and I wanted to bring some of that out, including the replication of power and privilege. I also wanted to expose and disrupt stereotypes about social class. There is a strong US focus in the book but there's also a global subtext. While the story unfolds in the northeast of the United States and follows American characters, it seemed to me that if I was going to try to tap into issues of social class and identity and also the intersections between gender and class, it was important to acknowledge that issues of privilege, opportunity, oppression and the ability to self-actualize are far more complicated when we apply a global perspective. In other words, the complex ways that gender and social class impact our lives vary greatly when we look cross culturally. So the main character in the book, Paige, works for a fictional charitable organization called WIN which is devoted to helping women living in conflict and high risk zones throughout the world. Through Paige's work we are able to see that all problems are relative as are the ways that race, class and gender influence our stories. We are able to see how social environments impact individual lives and life chances. While WIN is a fictitious organization, it is inspired by the real organization Women for Women International. Through the fictional format I was able to show characters enmeshed in their environments and describe how those contexts are steeped in social class issues. I used tools including dialogue, interior dialogue and third person narration to forge micro-macro links that readers can tease out through their own individual reading process.

In short, literary tools can enable us to crystalize micro-macro links through showing instead of telling, which I would suggest is pedagogically important. Further, readers can be exposed to what people are thinking versus what they are saying and doing, as well as the context in which the action is occurring.

**Lauren Sardi:** *Low-Fat Love* became Sense Publisher’s top selling book, which is a great boon to ABR. What has the reaction of readers to either of your ABR novels taught you about how and why sociologists should do this kind of work?

**Patricia Leavy:** Just to clarify, I don’t think ABR is appropriate for all projects. For some researchers it will never make sense to do on a personal level, although I do hope they expose their students to it. What I do think all sociologists should do is think about how to make their work accessible to broad audiences; how to engage people beyond the academy. You shouldn't need a PhD in a highly specialized field to have access to sociological knowledge. For me, ABR and specifically fiction was my path to public scholarship and I think it could be for many.
The response I have received from readers has solidified my belief in arts-based research and in the importance of making research findings accessible. People’s responses have been personal, reflective, emotional, and thoughtful; the kinds of responses that show engagement which of course is the point in anything scholars create and then share with others. Whether it is traditional college students reading the books in classes or women and men of all ages who I have connected with through book clubs, book talks and email, the novels have prompted self and social reflection and dialogue in ways that my academic research articles never have or could. This is what research, what knowledge, should do. It should get people thinking and feeling. The arts are uniquely able to stimulate this kind of response and so their power to further public sociology is unlimited. We have barely begun to tap into the potential of art to shape and disseminate social science.

Lauren Sardi: Because you are both very prolific and very public, you have become extremely prominent in the field and to many, you represent the contemporary face of arts-based research. As someone who believes in the importance of public intellectuals what does that mean to you?

Patricia Leavy: I think of my work as contributing to a larger body of work and the ABR movement as a whole. That carries real meaning for me and focuses me on the work at hand, whether it is something I may be writing or a space I am trying to create for others to showcase their work.

I think when I say I am invested in the ABR movement and see my work as contributing to that larger project, it may seem like something that someone just says and thus doesn’t carry the intended weight but I mean this in a serious way. Consider if someone says that are committed to a social movement of some kind, such as civil rights, we don’t question that the focus isn’t on their individual work but rather this far greater and more important project to which they are contributing. To say I am committed to the ABR movement is not just to say I am invested in some academic trend or what have you. I view my commitment to arts-based research movements and aim to imbue it with legitimacy across the research landscape, and indeed something that more students are taught and more researchers practice, I believe there are meaningful consequences at stake. The way we think, learn, share and challenge ideas; none of this is trivial. We are talking about what counts as knowledge, how that knowledge comes to be, who is included in the process, what is funded, and how we teach and learn, which impacts who gets to learn and what they learn. All of this is complicit in how power operates on many levels and whether or not research remains in the hands of a few or if becomes accessible to the many. Let’s not forget that a heterosexist white supremacist research system created many of the methods and funding standards that are viewed as “legitimate” but what might those ways of knowing prevent us from seeing and who is excluded from those knowledge practices? So I very much see my work as a part of this larger project. I am in community with many others who are also doing all they can to contribute to the field. Our community just lost a giant with the passing of Elliot Eisner and I think we all feel that we want to honor his legacy through our continued efforts. Whatever attention comes my way I try to direct to the issues at hand. So I am grateful for any attention my work receives and opportunities I have to advance the field that many have built and remain dedicated to.

Lauren Sardi: What do you want sociologists who are unfamiliar with ABR to know about it?

Patricia Leavy: It is both rigorous and fun. Any notions that it is somehow easier or less serious than other methodologies are totally false. Like anything else, done well, it is very demanding. But it can also be incredibly engaging not just for audiences, but for the practitioner. People are often afraid to say their work is fun, as if it will take credibility away from it, as if we should all aim to do work we don’t enjoy because somehow that makes it better. Being creative and learning to speak to different audiences is incredibly rewarding. And at the end of the day, I would encourage people to think about the impact of their work and the issue of audience. It simply doesn’t make sense to me, particularly in a field like sociology, to spend one’s work life doing research that will be read by 5 or 6 other people. If someone reading this is unfamiliar with ABR I urge you to read about it to see if it has applications for your research, your teaching or your students’ research.
Are some disciplines more sociable than others? (2014-02-05 08:00)

There are a range of social scientific disciplines which have spawned sub disciplinary areas of practice and inquiry explicitly concerned with their public role and purpose. For instance:

1. Public Sociology
2. Public Geography
But others seemingly have not. Why is this? Could it be a matter of explicit naming conventions, such that the disciplines closest to sociology have taken their lead from public sociology but that similar trends exist elsewhere? What do these trends have in common and how do they differ? At some point this year I want to try and assemble a public sociologist, public geographer, public anthropologist, public archaeologist and public criminologist to produce a podcast discussion of these issues. If you might like to be part of this then please get in touch: mark@markcarrigan.net

Also I’d love to hear any Public X examples I’ve missed. Please tweet or comment if you know of any!

Emmet Fox (2014-02-06 11:44:47)
Public sociology to me appears to be a reflection of its subordinated position with the ‘public’ aspect being in part a strategy geared towards improving the discipline’s visibility. (This subordination certainly appears to be the case structuring sociology’s entrance into the discussion on climate change related behaviours where almost every sociologist I come across feels the need (correctly I might add) to criticise the dominant individualizing perspective that leads the issue on climate change receptivity). There is also the moral impetus or fear in seeing the absence, in public discussion, of social structures and relations as a dangerous development which diminishes the capacity to deal with and understand social problems. Such subordination would offer some explanation as to why more dominant disciplines such as psychology don’t feel the need to apply the ‘public’ sub disciplinary strategy. As for the other sub-disciplines perhaps there is also a dimension of strategy or maybe as you state it’s due to their closeness to sociology. These are just musings however, more historical and comparative analysis on the question is needed. I look forward to the podcast. Excellent blog by the way.

Sociological Imagination (2014-02-09 17:23:55)
that’s a really plausible suggestion. my attempt at a pithy title not withstanding, I’d assume there’s some ‘public’ impulse at work pretty much across the social sciences and it’s the divergent form of expression which fascinates me. though it’s hard to analyse this tendency if you can’t identify it...

Emmet Fox (2014-02-10 19:46:31)
Apologies for scan reading you. Well the ‘public’ element will possibly be attachable to the central concerns and interests of the disciplines whereas other disciplines undergo alternative naming processes connected to their (possibly) more individualized concerns (which is I think what your title intends to capture). On top of that Sociology surely has a higher stature amongst the disciplines listed above. As for ‘public economics’, the name already exists as something entirely different. Bound to be interesting whatever you discover.

Hijacked categories: “Employability” an “disability” as tools for government (2014-02-05 14:16)
[1]Ephemera is a pretty good journal. And here is a really cool article about the categories that make up our understanding of labour, employment and work. Categories structure the way we understand the world - they don’t just “reflect” it truthfully. This is an important obvious fact that is, nevertheless, often swept under the carpet of quantitative research. These categories are constructed and can be abused for various purposes. “Employability”
and disability are examples of such categories which the authors call “technologies for government”. In the example in this article, the authors Christina Garsten and Kerstin Jacobsson talk about how “non-employable becomes a disability and conversely, to be disabled can make one employable.”

Sorting people in and out: The plasticity of the categories of employability, work capacity and disability as technologies of government, by Christina Garsten and Kerstin Jacobsson, Ephemera 13(4): 825-850

Best thing is, the article is freely accessible.[2]http://www.ephemerajournal.org/sites/default/files/pdfs/contribution/13-4garstenjacobsson.pdf

Sociology and poetry (2014-02-06 08:00)

Sitting near a lake

See more than our reflections

So this is sociology

K.J., sociology student

There is an uneasy relationship between traditional sociology and the arts, in particular openly irrational registers of writing, such as poetry. I’m not sure the ‘founding fathers’ would be very amused if they could see you trying to use poetry as a medium in a sociology class. But who cares: it’s no longer the XIX century, and back then many universities didn’t even have sociology as a subject. I’d like to think that C.W. Mills would have liked the idea of linking sociology with poetry. So, here is a great blogpost by sociologist Peter Kaufman on one of our favourite blogs ([1]everydaysociologyblog.com) about poetry and sociology - and about using poetry in teaching and learning.
Reading this makes me wish he had been my teacher when I did my degree in sociology.

Click here to read [2]"Poetic sociology" by Peter Kaufman (and some pretty cool sociological poems)

Margaret Archer – We are what we love: love and identity (2014-02-07 08:00)

IFRAME: [1]//player.vimeo.com/video/70410224

1. file://player.vimeo.com/video/70410224

Tracey Yeadon-Lee (2014-02-07 17:26:48)
It’s so nice to see Margaret Archer here. This talk takes me back to my undergraduate days in Sociology at the University of Warwick on the course 'Conceptual Foundations of Sociology'. Margaret was a great teacher then, as she clearly still is now, and her ideas have remained very influential within my work. Thanks for this!
Oh I didn’t know that - nice to hear about this background. I tend to feel like I’m the only person in UK sexuality studies who has any interest in her work!

Wolfgang Hofkirchner – ICTs and Society Research – What for? (2014-02-07 14:00)

Sad YouTube: fascinating fragile fragments of humanity (2014-02-08 08:00)

YouTube comments are notorious. But Mark Slutsky, writer and filmmaker [and, clearly, also amateur sociologist] has dedicated his blog [1]SadYoutube to salvaging fragile fragments of humanity from YouTube comments. He calls them

"Moments of melancholy, sadness and saudade from the lives of strangers, gleaned from the unfairly maligned ocean of YouTube comments."
In this [2]buzzfeed article he tells more.

Sexuality Summer School 26 – 30 May: Queer Anatomies (2014-02-09 08:00)

Sexuality Summer School 26 – 30 May: Queer Anatomies

Registration for the Sexuality Summer School is open to all PhD and Masters students and will go live on 14 February 2014 at [1]estore.manchester.ac.uk. The number of students is limited to 35 so book early to avoid disappointment. Price: £70 (early bird, until 14 March) / £80 (regular). Includes some food / refreshments and tickets to public events at Contact and the Cornerhouse.

The Sexuality Summer School is a five-day event for postgraduates, organized by the Centre for the Study of Sexuality and Culture (CSSC) at the University of Manchester since 2008. The Sexuality Summer School brings together postgraduates, researchers and international scholars, and also artists and filmmakers, to facilitate dialogue and discussions that speak to contemporary debates in queer and feminist sexuality studies, with a particular emphasis on the interdisciplinary study of culture. In 2014, our focus will be on cultural theories and histories of anatomy.

The Sexuality Summer School includes public events (see below for details) with Jaspir Puar (Rutgers), Jim Hubbard (director, United in Anger), Richard Dyer (Kings), Valerie Traub (Michigan), Peggy Shaw and Lois Weaver (Split Britches), Mary Bryson (British Columbia) and Chase Joynt (Chicago). The Summer School will also include workshops with [2]Claudia Castañeda (Emerson), with [3]Erika Alm and [4]Kajsa Widegren (Gender Studies, Gothenburg) and members of CSSC at the University of Manchester, including: [5]Jackie Stacey, [6]Monica Pearl, [7]David Alderson and [8]Laura Doan.

The Sexuality Summer School is sponsored this year by the University of Manchester Faculty of Humanities; Cornerhouse; Contact; Screen; Science, Stroke, Art 2014; and SEXGEN.

For more information about the Sexuality Summer School, including details of previous events, go to [9]sexuality-summerschool.wordpress.com, email us and get on the mailing list at [10]sexualitysummerschool@gmail.com, find [11]Sexuality Summer School on Facebook or tweet us [12]@SSS_Manchester.
SSS 2014 Public Events (open to everyone):

CfP: Where now for social justice? (2014-02-09 14:00)

REMINDER: CALL FOR PAPERS

'WHERE NOW FOR SOCIAL JUSTICE?'

THE MARGINALISATION OF YOUNG PEOPLE IN THE UK'

Thursday 12th – Friday 13th June 2014

We are inviting abstracts for a Two day Conference at Canterbury Christ Church University, Kent, UK on behalf of the Inclusion Equalities and Social Justice Theme and the Research Centre for Children, Families and Communities.

We are seeking papers which challenge the dominant ideologies and notions of social justice that are driving current changes in social and educational policy. We are particularly interested in papers which explore social justice in relation to marginalised young people, including those from education, health and social care, social policy, sociology and criminology disciplines. We are also interested in papers exploring innovative research methods with young people. Issues for papers include:

- Impact of poverty and inequality on young people
- Marginalisation of young people
- Use of innovative research methods
- Role of education in reproducing inequality
- Pedagogies of inclusion in schools and universities
- Diverse identities of young people, including:
  - Gender
  - Sexuality
  - Ethnicity
  - Children in care.

Proposals of 300 words are invited for consideration for 20 minute papers (followed by 10 minutes for questions and discussion).

Last year, whistleblower website WikiLeaks released three of the biggest ever leaks of classified information in history: the Iraq War Logs, the Afghanistan War Logs and Cablegate.

Since then the world has undoubtedly changed. Ambassadors have resigned amid scandals exposed by leaked cables; the UK government has ordered a review of computer security; and, at the same time, a huge wave of protest has swept the Middle East and North Africa – in part fuelled, some believe, by WikiLeaks revelations.

Discussing the impact of WikiLeaks on the world and what it means for the future, for this very special event WikiLeaks editor-in-chief Julian Assange will be in conversation with renowned Slovenian philosopher, Slavoj Žižek.
Focusing on the ethics and philosophy behind WikiLeaks’ work, the talk will provide a rare opportunity to hear two of the world’s most prominent thinkers discuss some of the most pressing issues of our time.

It will also mark the publication of the paperback edition of Living in the End Times, in which Žižek argues that new ways of using and sharing information, in particular WikiLeaks, are one of a number of harbingers of the end of global capitalism as we know it.

The event will be chaired by Amy Goodman, the award-winning investigative journalist and host of Democracy Now!, a daily, independent news hour which airs on the internet and more than 900 public television and radio stations worldwide.

Tony Yustein’s Thoughts | » Julian Assange in conversation with Slavoj Žižek The Sociological Imagination (2014-03-01 03:01:52) [...] ...read more [...] 

by Tracy Jensen

Today the sad news was announced that Stuart Hall has died. My Twitter timeline and email account has been awash with mourning colleagues; scholars, researchers and students remembering and reflecting upon the legacy of his enormous archive of work. Many people have shared stories of how his innovative combinations of critical theory and public activism have inspired them, and linked to recent interviews and articles where [1]he turned his intellectual gaze upon the activities of the Coalition administration – the culmination of a political and cultural turn to neoliberalism, the first rumblings of which he charted in Policing the Crisis (published the year before Thatcher came to power). If you have ever wondered where the word ‘Thatcherism’ came from – that was Stuart Hall. Although we never met, I have always felt my connection with him – we were both uncomfortable Oxbridge outsiders, we were both housed by the Open University (Hall as Professor of Sociology and me as a PhD candidate) and he was a member of the first Board of Governors at UEL where I am now based. One of my proudest moments was being published alongside him in the latest issue of [2]Soundings – a journal where his stirring manifestoes for moving beyond neoliberalism can be found. His wide-ranging eminence across so many fields means that there are many, many others like me who have overlapped with and admired his work and his approach.

More than our institutional crossovers though, Hall has sustained me intellectually through his fierce writing, his sophisticated approach and his devotion to social justice. To my mind, he is the most powerful advocate of interdisciplinarity and collaborative scholarship – two things we need more than ever if we are to keep the university going as a place of critical insight, and not simply a profit-seeking institution. Hall famously said the university is a critical institution, or it is nothing. His work insists that we develop ways of opening up a critical dialogue between the machinery of politics and the culture of the everyday. He exhorts us to connect up the places where state power is exercised and where we take these workings of power into our daily lives, conversations and exchanges. He recognised that the media take a central role in structuring ‘social knowledge’ – in his words possessing a
‘near-monopoly’ as the primary source of information and mediating the passage of this from those ‘in the know’ to the ‘structured ignorance’ of the general public (Policing the Crisis, p66). Yet he also recognised the limits of remaining overly-attached to media power conspiracies – it is a ‘near-monopoly’ certainly, but not a complete one. Ideological closure can always be interrupted – counter-definitions and narratives can always be developed. Hall’s commitment to identifying and nurturing sites of counter-narratives led, under his directorship, to fascinating close-up portraits of cultural resistance from the Centre for Contemporary Cultural Studies. This influential body of work triggered a reflective ‘cultural turn’ across many disciplines of study, supplanting the often-fatalistic inertia that characterised theories of cultural power through the notion of ‘cultural politics’ (possibly my most-over-used phrase), and establishing popular culture as an object for serious study. I still find it incredible that the CCCS – the home of British cultural studies – was closed in 2002. While political elites are clearly invested in dismissing and discrediting sociology, media and cultural studies (not least because they teach students how to think critically about power), it is hard to believe that a university would vandalise itself in such a wilful act of atrophy.

I am re-reading much of Hall’s work in 2014. The second edition of Policing The Crisis was published last year and it feels as fresh and mighty as ever. I defy anyone to read the new preface without concluding that this research is still one of the most important publications written about the apparatus of power. In particular his examination of ‘public opinion’ machinery is timely within the context of welfare reform debates and the saturation of primetime television with so-called ‘poverty porn’ such as We All Pay Your Benefits (BBC), On Benefits and Proud (Five) and most recently the ongoing series Benefits Street (Channel 4). Hall and his colleagues were concerned with the emergence of a new cultural figure – ‘the mugger’ – upon whom street crime is racialised and against whom social anxieties around youth, urban space and control become projected. The conjunctural analysis they develop – mapping out public and official disquiet, “trying to catch public opinion, unawares, in the very moment of its formation” (2013: preface, xiii) – is an approach I use in my current work mapping out the emergence of the ‘welfare scrounger’. As Hall and his colleagues compellingly argued, such figures are essential at times of crisis, when new formations of ‘commonsense’ are condensing. Our current crisis – economic and political but also cultural, organised around the concept of austerity and the ‘virtues’ of restraint vis-à-vis the welfare state – is a crisis that is rapidly condensing upon figures of ‘welfare dependence’. The figure of ‘the mugger’, and repetitions of mugger discourse (across news media, courtrooms, public commentary, everyday conversation, gossip and other formal and official sites of disquiet) came to solidify a new ‘commonsense’ consensus around authoritative policing. Welfare has now firmly ascended into the public arena and taken the shape of ‘public issue’ – that much is clear from the burst of poverty porn programming. But what new forms of consensus will become ‘commonsense’ in the repetitions of welfare crisis discourse? What will be legitimised once the shifting public opinions around welfare crystallise and harden? Poverty porn television...
is too important in the manufacture of a welfare crisis for us to ignore, and the public opinion that is orchestrated via such cultural sites is not ‘spontaneous’ or ‘organic’ but powerfully structured and editorialised. As Hall et al argue:

In formally democratic societies, ‘becoming commonsense’ is one key route to securing popular legitimacy and compliance and thus the basis of what Gramsci called ‘hegemonic’ forms of power (2013: xiii)

The process of welfare reform ‘becoming commonsense’ is therefore a process of pulling ordinary, normally invisible, people into a staged public conversation, something that looks like public debate but which is in fact a highly structured exchange. We can see how this orchestration of public opinion was developed in Big Benefits Row: Live, in which Five shamelessly capitalised on the ratings success of Channel 4’s Benefits Street, drawing on familiar talkshow tropes to prolong and extend the ‘debate’ which had scrutinised the residents of James Turner Street. Big Benefits Row: Live promises immediacy (through its liveness), participation (displaying a Twitter hashtag throughout) and controversy (host Matthew Wright promising “strong opinions” from “a nation at boiling point” in his opening speech – and in its very title we are offered a ‘row’). But while it seems to promise an unmediated window onto ‘how the public really feels’, BBR in fact functions as an organised, formal part of how public opinion becomes shaped. Hall and his colleagues plundered the ‘letters to the Editor’ pages of newspapers to catch public opinion in the moment of its formation – we might view the tweets sent in response to the #BigBenefitsRow as a contemporary version of this. Letters, tweets, and the increasingly heated exchanges of those participating in BBR are “the more powerful because
it appears to be in the readers’ [tweeters, viewers] keeping and done with his or her consent and participation” (Policing the Crisis, p121).

Big Benefits Row: Live goes one step further – displaying the results of its opinion poll which asks ‘do you think the benefits system is fit or unfit for purpose’ and finds that two-thirds of respondents think it unfit. This moment potently documents the democratic image that poverty porn television has of itself – as well as its profound lack of reflexivity. Innocently asking ‘why are we talking about benefits so much’ at the very moment that it exploits such talk; populating a discussion panel with professional attention-seekers (‘self-styled public commentator’) and not one sociologist in sight; such compositions demonstrate how ‘public consent’ is prompted, manufactured and constrained. Hall and his colleagues are eloquent on this – replace ‘crime’ with ‘welfare’ and they could be writing in response to poverty porn television;

“‘Public opinion’ about crime does not simply form up at random. It exhibits a shape and a structure. It follows a sequence. It is a social process, not a mystery. Even at the lowest threshold of visibility – in talk, in rumour, in the exchange of quick views and common-sense judgements – crime talk is not socially innocent […] the more an issue passes into the public domain, the more it is structured by the dominant ideologies about crime” (Policing the Crisis, p136)

We must interrupt – and keep interrupting – the crystallisation of ‘commonsense’ ideas about welfare. The populist authoritarianism that is incited by poverty porn, and apparently licensed by such ‘public opinion’ polls, must be resisted. Hall’s project to map the production of consent and the structuring of social knowledge has never been more urgent than now. He heard, in the mugging crisis, "the ugly sound of an old conjuncture unravelling" (2013: xviii) – but what will we hear when the ugly echoes of poverty porn exploitation have died down?

Sociological Research Online has announced a Rapid Response to Channel 4’s Benefits Street – if you would like to contribute to this important issue you can find more details [4]here.

Tracy Jensen’s research explores the classed and gendered intersections of contemporary parenting culture, and how these are reproduced across social, cultural, media and policy sites. Tracy tweets at @Drtraceyjensen

I’ve actually been applying ‘policing the crisis’ to Canine Breed Specific Legislation, especially here in the UK, in my own research analysis. It has been very fruitful indeed, quite astoundingly so. It’s good to see how useful it remains for other issues such as the Coalition’s treatment of people needing social security.

The pedagogical value of Twitter: enhancing the collective identity of independent learners (2014-02-11 08:00)

Last year I taught on a newly designed module in my School and was struck by the value of Twitter as a learning resource and teaching tool. ‘Current Issues in Society’ is a first year undergraduate module that has deviated quite considerably from the conventional teaching format. Usually, a module is made up of a one hour lecture and a one hour seminar each week over the course of an academic term. Albeit a tried and tested formula, this roster can, at times, stifle the pedagogical process. Particularly for those just beginning their degree, this teaching timetable can sometimes feel disjoined, with students only starting to grasp the content and rationale of a module in the latter weeks of term. Independent research and reading are a crucial means by which to ‘bridge the gap’ but this often leaves students navigating an unfamiliar academic terrain alone. At the beginning of their degree, students are not only faced with the challenge of familiarising themselves with their lecturers and peers, they must also grapple with a step change in their educational development. Namely, they have to negotiate the transition from passive to active independent learner.

‘Current Issues in Society’ broke the mould in a number of important respects to respond to some of these challenges. The module ran as a mini-conference over one afternoon each week, with an opening plenary, two hour workshop and closing plenary. This format facilitated intensive and collaborative working between staff and students. Many positive outcomes of the course can be ascribed to this format, but I’d like to focus here on an important adjunct to this shakeup - the introduction and use of Twitter. The module in question lent itself particularly well to this innovation with the primary focus of the course being on the uses (and abuses) of evidence, arguments and theory in current affairs. Before, during and after each mini-conference, students were encouraged to tweet their reflections and any content relevant to the topic of that week.
Online dialogue between students and staff extended teaching beyond the classroom

As a result, students availed themselves of the opportunity to engage with the news in a way that many never would have done before. Not only were students accessing and consuming academic knowledge in a novel format but they were also able to generate, map and track their own knowledge in a concise and compelling new way.

Twitter as a heuristic in that process allowed students to engage with the content of the course in their everyday lives – not for just a few hours a week. Students were able to interact with their peers and the content of the module well beyond the classroom. This proved immersive so that students more seamlessly developed new ways of interpreting and using the news in their wider academic work, whilst thinking sociologically in their day to day lives. Crucially it enabled students to integrate this way of looking at the social world and themselves within it through a medium that is often (falsely) considered separate from more formalised pedagogic methods.

Students recognised the value of the module and use of Twitter

Thinking and working alone are key features of independent learning. However, due to the open forum of Twitter, students could see each other engaging with material and continuing the sociological discussion (with themselves and others) beyond the classroom. This sort of symbolic feedback cultivated a collective identity amongst students, such that they were able to situate themselves and their own work within the School. Using Twitter opened up new avenues for students to explore, develop and play with the material of the course. Perhaps most importantly though it offered students the reassurance of being [1]’alone together’ in their transition to active independent learners.

After the course last year, there was a clear realisation amongst the students that engaging with current affairs and thinking sociologically outside of their lectures and seminars can greatly enhance their understanding and experience of the academic programme. Without the use of these more innovative teaching methods, I doubt students would have come to the same realisation so easily.

The module will be running again this semester. Follow [2]@SSP_Cissues to see how we get on!

Daniel Edmiston is a PhD student in the School of Sociology and Social Policy at the University of Leeds.

There's a great article by Lisa Wade in Salon talking about the 'hidden crisis' of white heterosexual American men. They have the fewest friends of any group within American society and, it seems, they wish they had more. What really caught my attention was the description of the qualitative characteristics of the relations they have and those which they seek:

Of all people in America, adult, white, heterosexual men have the fewest friends. Moreover, the friendships they have, if they're with other men, provide less emotional support and involve lower levels of self-disclosure and trust than other types of friendships. When men get together, they're more likely to do stuff than have a conversation. Friendship scholar Geoffrey Greif calls these "shoulder-to-shoulder" friendships, contrasting them to the "face-to-face" friendships that many women enjoy. If a man does have a confidant, three-quarters of the time it's a woman, and there's a good chance she's his wife or girlfriend.

From a relational realist perspective, it's important to identify the distinctive self/other interactions generative of the kinds of relational bonds identified here. These 'shoulder-to-shoulder' friendships, grounded in shared interests and reproduced through shared activity, involve a reciprocal orientation towards practice. The friendships grounded in self-disclosure, what Archer calls 'thought and talk', involve a reciprocal orientation to each other. The problem is that sustaining these relations necessitates work to sustain the continuity upon which they are founded. Reciprocal self-disclosure which is subjectively satisfying and meaningful to each party, as well as the trust which it depends upon but also generates, necessitates 'catching up' as a regular activity. It involves making the effort to know what is going on in the other's life. It depends upon shared understandings and shared references points because otherwise self-disclosure, externalising internal conversation to a trusted interlocutor, doesn't work. Without the contextual continuity upon which 'face-to-face' friendships are based, self-disclosure doesn't bring about understanding in the other. The friend may be sympathetic. They may be helpful. But they simply won't understand in the same way. This in turn leads to a diminished propensity towards self-disclosure:

For those people who gradually learn that their internal conversations do indeed 'make sense only to themselves', this discovery has far-reaching consequences. Attempts at spoken interchange about one's internal deliberations are rebuffed by incomprehension or misunderstanding. Since renewed efforts to make oneself clear usually involved greater self-revelation, continued failure is doubly hurtful and self-defence consist in withdrawal ... And to stop (or possibly never to begin) throws one back on one's own mental resources. In turn, that makes significant tracts of a person's internal conversation self-contained and knowingly not for traffic in spoken conversation. (Archer 2007: 86)

In late modernity contextual continuity is something that has to be worked at because it's valued. What I found so thought-provoking about Lisa Wade's article is the extent to which it suggests that white heterosexual American men would value relations which had these characteristics:
When asked about what they desire from their friendships, men are just as likely as women to say that they want intimacy. And, just like women, their satisfaction with their friendships is strongly correlated with the level of self-disclosure. Moreover, when asked to describe what they mean by intimacy, men say the same thing as women: emotional support, disclosure and having someone to take care of them.

Men desire the same level and type of intimacy in their friendships as women, but they aren’t getting it.

[http://www.salon.com/2013/12/08/american_mens_hidden_crisis_they_need_more_friends/]

But Wade argues that gender norms intervene. I think this can be usefully understood in terms of the gendering of internal conversation, with normative sanction attached to adolescent boys engaging in ‘thought and talk’:

During these years, young men are learning what it means to be a “real man.” The #1 rule: avoid everything feminine. Notice that a surprising number of insults that we fling at men are actually synonyms for or references to femininity. Calling male athletes “girls,” “women” and “ladies” is a central part of motivation in sports. Consider also slurs like “bitch” and “pussy,” which obviously reference women, but also “fag” (which on the face of it is about sexual orientation, but can also be a derogatory term for men who act feminine) and “cocksucker” (literally a term for people who sexually service men). This, by the way, is where the ubiquitous slur “you suck” comes from; it’s an insult that means you give men blow jobs.

So men are pressed — from the time they’re very young — to disassociate from everything feminine. This imperative is incredibly limiting for them. Paradoxically, it makes men feel good because of a social agreement that masculine things are better than feminine things, but it’s not the same thing as freedom. It’s restrictive and dehumanizing. It’s oppression all dressed up as awesomeness. And it is part of why men have a hard time being friends.

To be close friends, men need to be willing to confess their insecurities, be kind to others, have empathy and sometimes sacrifice their own self-interest. “Real men,” though, are not supposed to do these things. They are supposed to be self-interested, competitive, non-emotional, strong (with no insecurities at all), and able to deal with their emotional problems without help. Being a good friend, then, as well as needing a good friend, is the equivalent of being girly.

[http://www.salon.com/2013/12/08/american_mens_hidden_crisis_they_need_more_friends/]

As this cultural environment throws them back upon their own resources (“I don’t talk to nobody about serious stuff... I don’t talk to nobody. I don’t share my feelings really.”) it becomes increasingly difficult to establish ‘face-to-face’ friendships even if the characteristics of these friendships are sought after. It’s important not to see ‘shoulder-to-shoulder’ friendships as intrinsically diminished though, which I think Wade’s post does to a certain extent, however this is another discussion in its own right. I also think we need to see what I presume is a diminishment of homosociality (that’s empirically true, right?) I just realised I’ve assumed it in the past but don’t know) in this context. Nonetheless this article captures something important about male homosociality in late modern societies:

Of course, not all men buy into these prescriptions for male behavior, but these expectations do influence most men’s friendships at least a little bit. They mean that, to make good friends, men have
to take risks. In a context in which being a man is good and being friendly is being womanly, each time a man tries to form intimate bonds with another man, he potentially loses status. Men who want truly close friends have to fight the instinct to protect their standing above all else. This isn’t easy, as they’ve been told for a lifetime that their status as male, and their place in that hierarchy, is a significant part of why they’re important and valuable human beings.

Men also have to find other men who are willing to take those risks with them. Knowing who to reach out to isn’t always easy, as men often wear a masculine guise, a mask that projects masculinity and hides the things about them that are disallowed. In one study of men’s experiences, one college-age man explained: “I am more of an emotional person. ... I never really felt much like who I [pretended to be] because I [was]... putting my man face on.”

These norms are something which need to be seen in historical perspective. There’s a great discussion in Doris Goodwin’s Lincoln biography of the ‘intimate male attachments’ which were common in his time. While it’s perfectly possible that Lincoln may very well have been having sex with some of these famously close male friends, the propensity of many commentators to assume this as a matter of reflex speaks volumes about the cultural tendency Wade discusses in this article. Interestingly Goodwin offers a sociological account of the intensity which characterised the ‘intimate male attachments’ amongst men of Lincoln’s generation:

The family-focused and community-centred life led by most men in the colonial era was transformed at the dawn of the new century into an individual and career-oriented existence. As the young men of Seward and Lincoln’s generation left the familiarity of their small communities and travelled to seek employment in fast-growing, anonymous cities or in distant territories, they often felt unbearably lonely. In the absence of parents and siblings, they turned to one another for support, sharing thoughts and emotions so completely that their intimate friendships developed the qualities of passionate romances. (pg 33)

Are similar trends on the horizon? Will the desire for more intimate friendships described by Wade actually lead to them?

Please distribute widely

1st International Conference on Men and Masculinities: "Identities, Cultures, Societies" will be held on 11-13 September 2014 in Izmir Turkey. Initiative for Critical Studies of Masculinities (ICSM) invites proposals for the first international conference on men and masculinities to take place in Turkey, in collaboration with Stony Brook University Center for the Study of Men and Masculinities, Ankara University Women's Studies Centre (KASAUM) and Izmir University Women's Studies Centre. The deadline for submission is 30th March 2014. For details please check the conference website [1]http://icsmsymposium.org

1st International Conference on Men and Masculinities "Identities, Cultures, Societies"

11–13 September 2014, Izmir Turkey

Call for Papers

Initiative for Critical Studies of Masculinities (ICSM) cordially invites proposals for the first international conference on men and masculinities to take place in Turkey, in collaboration with Stony Brook University Center for the Study of Men and Masculinities, Ankara University Women's Studies Centre (KASAUM) and Izmir University Women's Studies Centre. The conference aims to discuss theories, narratives, experiences, discourses, and activisms related to transformations of and challenges to men and masculinities with a particular focus on the Global Southern and Eastern European contexts.

Various phenomena such as globalisation and reconfigurations of nation states/nationalisms; identity politics; new social movements and political activism; rise in digital technology and the new social media; and the influence of postmodern and queer theory have changed and challenged men's lives and masculinities in distinct ways. Yet there is little consensus on how to characterise transformations caused by such phenomena. We are seeking to explore issues related to such transformations with their political, economic, social and cultural implications for men and masculinities. We are also interested in addressing issues concerning methodologies, scope and conceptual boundaries of the critical studies of men and masculinities that need rethinking in light of these changes and developments. In order to contribute to these debates, researchers from social sciences and humanities are invited to send proposals to discuss topics including, but not limited to:

- Revolutionary movements, political activism, ethnic/religious conflicts
- Nationalism, military and militarisation
- Lived experiences and/or representations of the body, disability
- Sexualities, desire, pornography
- Intimacy, affective turn, emotions

2430
• Subjectivities and experiences
• Queering men and masculinities, sexual identities
• Legacy of masculinity studies, future agenda, feminisms

Confirmed keynote speakers include Michael Kimmel, Jeff Hearn, Elijah C. Nealy and Serpil Sancar.

We invite proposals for individual presentations, panels, poster, film, and photography presentations. In addition to the formal presentations, the conference will also provide a forum setting for graduate students to discuss their work-in-progress. Following the conference, a selection of papers will be published in a special issue of the Masculinities: A Journal of Identity and Culture.

Abstracts of up to 300 words for individual papers and 600 words for panel proposals as well as a 100-word biographical note should be sent to [2]icsmsymposium@gmail.com by 30 March 2014. Graduate students who wish to take part in the forum discussions should send a 300-word description of their research and a 100-word biographical note. Notification of acceptance will be made by 02 May 2014. The registration fee for the conference is 70 € and 40 € for graduate students. Five conference fee waivers will be granted for graduate students based on need and merit.

For further queries, please contact at [3]icsmsymposium@gmail.com

The responsibility of being nice: An idea, a method and a personal utopia on suicide. A conversation with Dr. Ben Fincham (2014-02-13 08:00)

I. News that stale

Having interrupted the flow of the Sociologists of Crisis series for a timely intervention on the issue of the Golden Dawn trials in my native Greece, it seems timely to return to a matter that was very much on my mind when I started this article series: suicide in times of crisis. The very mention of the phrase may evoke negative sentiments, but it may also reveal the way in which we are herded by the rhetoric of news headlines into accepting such statements almost as axiomatic, especially when they are accompanied by a sprinkle of statistics and a few blurbs from ‘the experts’. To accept numerical representations or the musings of pundits, since ‘numbers don’t lie’ or because ‘an authority knows better’, is bad enough, given that it eschews our civic responsibility to weigh any such statement critically; not just for our own good, but to avoid doing injustice to our fellow human beings whose thoughts, sentiments, decisions, passions and actions are explained away with the use of sensationalist headlines and a fatalistic, yet sympathetic, shrug of the shoulders. But to surrender so easily to such a comfortable position on a matter that we would otherwise find ever so sombre, flirts with irresponsibility and hypocrisy even, both of which are admittedly unwise options both for our individual conscience or our collective welfare.

A few caveats, reservations and doubts must be generously offered when too many people gather around a cliché, hug it close and wish to adopt it as ‘the truth’, starting with the appreciation that any research, for all its merits, also carries the weight of its prejudices and preconceptions; reporting back to us the bias of what questions are being asked and how they being framed in the first place. The results of any such survey are influenced by the collection of data as much as they are by the way the research question is articulated (and interpreted), not to mention the logic behind the way a question is framed the way it is; its ontology to use a more technical term. If we are, for instance, met with a study that is already convinced that with any fluctuation in the economy, suicide rates simply go up and
that is the way in which the issue is approached on the whole, then the findings will simply fit that hypothesis in the same way that our hold luggage fits the prescribed dimensions when we check it in upon arrival at the airport. What I mean to say here is that a study that may record any rise in suicide rates during economic crises leads us to assume, almost automatically, that the cause of such a rise must be attributed to the crisis. But what happens if and when reality is more complicated and the crisis-ridden climate simply amplifies tensions, problems, thoughts, decisions, anxieties that may be already at play and might have been expressed anyway but might have gone unnoticed during more affluent times? Is this the same as considering an act of suicide the direct outcome of a period of recession? If so, you can disregard my objection, but if not should we not be more careful in the way we plan, articulate, and express our research questions, our news and, perhaps most importantly, our reaction to them?

This very question is intended not as a disagreement voiced on the grounds of epistemological soundness (alone), but primarily as a moral dilemma suggesting that any matter that is so perilously close to our fundamental existential anxieties ought to be treated with more sensitivity, sensibility and care on a number of levels; scientifically, philosophically, culturally and socio-politically too. The moment we stop consuming information as all-too-rational automatons by striving to turn knowledge into understanding (Blacking, 1977: 5), we start realising our humanity by recognising the people behind the statistics and the pronouncement of the experts as our very cultural colleagues (Garfinkel, 1967: 11), whose welfare very much depends on the way we treat them, not simply in our daily encounter but in our thoughts and the public or private verbalisations of these thoughts too. May I then suggest that instead of nodding our mute assent to dramatic news snippets, we (re)turn to the consolations of philosophical (humanist) thinking in order to relate to the very dramas that make us human after all? Would such a shift from passively consuming data, news and ready-mixed opinion, to actively concerned contemplation not signal a more empathetic stance towards our inner fears and those of our fellow-commuters in life? This could easily be dismissed as a luxury but I think the reverse is true. Rationalising something so close to the bone means abstracting it, but jumping into it headlong with sharpened minds and alert hearts can only do good, and it is that very last thought which forms the ethical centre of this article.

II. Death and Suicide: a matter of social life

Ethical and moral commitments aside, public discussions on suicide can profit substantially from sociological investigations of and philosophical reflections on the possible meaning, causes, and casualties of suicide with a view of restoring the matter to its complexity instead of granting unconditional support to media generalisations which are so readily available. In doing so, we are confronted with the responsibility to respond to a sensitive social issue attentively rather than half-heartedly or even dismissively by accepting the common-sense ‘truths’ that surround it. Nothing could be more complex, complicated and varied however than the decision to take one’s own life and we can only learn from the mythological, literary and everyday testimonies of suicide in human history; be it Jocasta in Sophocles’ Oedipus the King, Dido in Virgil’s Aeneid or the first-hand experiences of people who have lived with or have survived suicide, recent accounts of which were broadcast recently on the BBC Radio 1’s Stories programme, guested by UK rapper Professor Green. A moment’s thought on this observation makes Albert Camus (2005 [1942]: 1-2) sound eerily relevant in his assertion that ‘[t]here is but one truly serious philosophical problem and that is suicide. Judging whether life is or is not worth living amounts to answering the fundamental question of philosophy. All the rest-whether or not the world has three dimensions, whether the mind has nine or twelve categories- comes afterwards’. David Hume (2005 [1783]: 8) seems equally troubled by suicide offering an interpretation of it as a concern that braids together ‘grand fabric’ and ‘individual creature’, ‘personal troubles’ and ‘public issues’, as Mills (1959: 8) would put it, and amounts to an existential burden of, on and for humanity; ‘tired of life, and hunted by pain and misery’, ‘loaded with pain and sickness, with shame and poverty’ (Hume, 2005 [1783]: 3, 5). Philosophical contemplation aside, suicide and its macabre sibling; death have some sociological life to live if one considers their personal, political and social attributes and ramifications. De Beauvoir (1948: 7), quoting Montaigne, in The Ethics of Ambiguity opined that ‘[t]he continuous work of our life is to build death’ , in her attempt to show how necessary it may be to develop an ethics of struggling with ‘life’ and ‘death’ on an intellectual, personal, cultural and social
level, while Mbembe (2003: 14-5) imagines ‘politics [as] death that lives a human life’ thus re-defining it as a domain of life where power and sovereignty influence decisions of who may live and who may die through ‘the generalized instrumentalization of human existence and the material destruction of human bodies and populations’. The take-home message, of sociological importance, from Beauvoir’s existentialism and Mbembe’s bio-political dialectics is, to paraphrase surrealist poet and lay psychoanalyst Andreas Embirikos (1980), no other than the invitation to re-make the fear of death into a skill and ‘inspiration for life’; a central existential concern alchemised into a socio-cultural and political resource by ‘learning how to die [as] learning how to let go, and learning to live [as] learning to hang on’ (Bakewell, 2011: 33).

The significance of such preponderant commentary on death is that it unlocks different ways of approaching suicide less as a merely dramatic, desperate and/or irresponsible gesture but as an anguished response to manifold pressures that weigh on our psyche thus making it hard to accept facile interpretations of it.

Sociological evidence sides with the theoretical peregrinations of Montaigne, Hume, De Beauvoir, Camus, Embirikos and Mbembe; immortalised in the writings of Durkheimian sociologist Maurice Halbwachs (1978) who, in The Causes of Suicide, attempted to show ‘in instructive detail how difficult it is in concrete research to decide which of the various background factors are genuine rather than spurious in their impact on suicide rates’ (Coser in: Halbwachs, 1992: 15). Besides, as Durkheim (1951 [1897]: 297-298) himself wrote in a quite unforgettable passage, ‘the circumstances are almost infinite in number which are supposed to cause suicide because they rather frequently accompany it. One man kills himself in the midst of affluence, another in the lap of poverty; one was unhappy in his home, and another had just ended by divorce a marriage that was making him unhappy. In one case a soldier ends his life after having been punished for an offense he did not commit; in another, a criminal whose crime remained unpunished kills himself. The most varied and even the most contradictory events of life may equally serve as pretexts for suicide. This suggests that none of them is the specific cause. Could we perhaps at least causality to those qualities known to be common to all? But are there any such? At best, one might say that they usually consist of disappointments, of sorrows without any possibility of deciding how intense the grief must be to have such great significance’.

III. To know the causes of things

With a little help from Durkheim and a verse from Virgil; ‘Fortunate is he, who is able to know the causes of things’ (verse 490 of Book 2 of the Georgics), it shouldn’t take too long for us to realise how difficult the task of ‘knowing the causes of things’ is, and how fortunate indeed we would be if we could afford to say that we can ‘know’ the causes of suicide. Such scepticism and the doubt(s) that accompany it should not scare us however. Rather, they should humanise us and allow us the rare opportunity to open ourselves to the lives of others by listening to their stories. Instead of matching numerical data to human lives, it might be preferable to attune ourselves to human stories and if there is one ‘take-home’ message from the discussion that follows, that would be it.

IV. A conversation with [6]Dr. Ben Fincham about understanding suicide sociologically in times of crisis

One of the main issues that are being discussed at the moment in Greece, in relation to suicide at least, is the extent to which the financial crisis has contributed to and impacted on increasing suicide rates. Is it reasonable, responsible and/or fair to consider that statistical spike a prime cause for suicide?

It makes sense to me to assume that when people fall into positions of crisis, as a result of economic circumstances, the ways in which they might then understand a sensible way of reacting to that will change from periods in which they’re not in crisis. Losing your job and the things that might follow from that might of course make people consider things they normally wouldn’t, and suicide is just one of those things. However, the point about
the relationship of suicide to economic crisis is that it’s just one part of a much more complicated story; all sorts of people are suffering as a result of economic downturn but not everybody thinks about killing themselves, so it’s not as if there’s an immediate, instrumental reaction to economic crisis that then provokes people generally to think that killing yourself is a reasonable thing to do. In fact, I suspect that lots of people who are in families where people have killed themselves as apparently a direct result of joblessness or the economic downturn, would have thought that it was something pretty unreasonable for that family member to have done. Therefore, it’s not as if suicide is a uniform response to crises.

What do you think would be a more helpful way of discussing the issue of suicide in relation to ‘a’ Crisis, with a capital ‘c’? If, for instance, we think that this is not a particularly helpful way of framing the public discussion; that it’s doing nothing to assist us either to understand suicide or the current climate of Crisis, how would you rather see the public discussion be framed? Imagine being faced with the statement: ‘people kill themselves because of the Crisis’, what would you suggest as a more helpful way of approaching the issue?

I think that the problem you have identified has largely to do with the way in which we understand suicide at a societal or ‘macro’ level and that’s actually a methodological issue as much as anything! So what we tend to do is gather statistics, in the way Durkheim did I suppose, and then we infer from those statistics particular causal factors. In the study that I was involved with Scourfield, Langer and Shiner, [7]Understanding Suicide: A Sociological Autopsy, we were fairly sure that there had to be a more subtle way of understanding the individual circumstances of suicide which then required a much more ‘micro’ account. So rather than inferring from aggregated data, we said that we would look at individual cases of suicide and then try to understand what the circumstances that supported a suicidal act were.

One of those features might involve someone losing their job but because we thought that’s not enough to determine whether one would kill themselves or not, we looked at what other things were also involved, what other circumstances were present at the time when somebody wanted to kill themselves. So to answer your question, the most useful thing to do in a debate which appears to be about macro-politics or macro-economics (like macro-economic depression for example), is to really go down to an individual level rather than seek a direct causal relationship. The conundrum here is that because we’re used to a macro-level approach to such issues, we then tend to talk about consequences at a macro level using aggregated data; ‘X amount of people have killed themselves in this crisis and that’s different from previous years’. Clearly that’s a decisive factor but the way in which we’re oriented to particular acts is influenced by a huge amount of other things that need accounting for, and the evidence for that in our study was that so many people don’t kill themselves in apparently similar circumstances.

So do you suspect that in periods of crisis, we see rising suicide rates and rush to make an immediate connection rather than carefully consider other possibilities that might be at play? If that is so, does the facile link between economic crisis and suicides become an accepted ‘fact’ to which we become attuned or used to? Isn’t that way of thinking risky both in terms of our sensitivity towards others, but also in terms of making it normal to consider becoming such a statistic ourselves following from the legitimising assumption that ‘that’s what happens in periods of crisis’?

Well, that’s partly our conclusion following the model that we used. If one thing that would influence your decision to kill yourself would be hearing about other people in similar situations who kill themselves, then it becomes a reasonable option. It becomes a narrative which you can mobilise at any point by saying ‘Well, look people in my position kill themselves, therefore it’s not unreasonable for me to do the same’.

Which may then suggest that there might be a fifth type of suicide, added to Durkheim’s original four (egoistic, anomic, altruistic, and fatalistic)? We might call it ‘mimetic’ suicide or [8]‘copycat suicide’ as it’s known in popular debates...
Well, it's not as simple as being an act of copying! There have to be many other things in place because there are so many people who are in similar positions and don't commit suicide. The financial crisis is interesting however because on the one hand there is a statistical or generalised account of suicide which seems to be one that government responds to; government is not so good at responding to individual stories because they're not generalised! But that isn't to say that aggregated accounts aren't useful or to deny that huge spikes in suicides coincide with periods of economic downturn, it would be remiss not to acknowledge that.

I suppose what you were suggesting is that the whole issue operates on a societal level as well so one might introduce a raft of policies which address the general issue, but actually that's operating at a different level than that of a person who's just been told that they've lost their job. They go home, their partner’s really angry at them, the kids have left home, they worry about all sorts of other things, about the mortgage, this, that and the other, they then have feelings that perhaps they’ve let people down, feel like they failed or they might just get angry because this is not what life was supposed to be. The scenarios that you can play out seem fairly uniform and regimented but you can’t really assume that everybody's life is the same. These things are going to play out differently in different ways in people's lives, so I suppose what we were asking for in our study is a more sensitive account; sensitive to the sorts of clusters of circumstances which involve things like experience, beliefs and values, the ways you reflect on those things as well as what your life is like now. Our relationship to suicide can change over time and might then lead one to a range of actions or responses to a situation which will appear as reasonable or unreasonable but these actions/responses can also change! And they can change even during an economic crisis; you can be suicidal at one point during an economic crisis and non-suicidal at another; it's not a linear relationship and though I suspect people will say 'Well, the statistical data is there; why don't you just admit that it's a strong causal factor?' I'd say, 'No, it's one of many!' But what happens in economic crises is that many other areas of our life which are related to well-being are also put under strain. So it’s not the economic crisis itself, it could be relationships that are put under strain by a particular circumstance which is to do with money, relationships with children, expectations of life, disappointment, existential questions and all of those things may be put under strain by economic crises, but they also can be compensated for elsewhere; in strong relationships, strong friendships, or being surrounded by people who are nice to you.

I like that remark! Especially as it seems applicable to other spheres of public and political life in Greece as well. A lot of things seem to have come under pressure lately and reveal themselves as rather sudden. The reality however is that they’ve always been with us, operating on the background with the current climate of crisis simply shining a light on them...

Yes and the other thing which routinely comes under strain in such sorts of periods is your relationship with others! You can therefore swap suicide with fascism and the rise of Golden Dawn as it’s not that you just become fascist as a result of an economic crisis. We may always say that economic crises breeds fascism but I suspect it simply coincides, it doesn't just like that. You don’t have a 20 % of the population that are waiting for an economic crisis to become fascists....

Does that then not provide us almost with a macro-level invitation to look at the micro-level of things?

Yes, although invitation makes it sound like there's less agency involved! But when your material circumstances are changed through no agency of your own then obviously the things which you do have more control over like individual relationships or feelings of happiness and well-being are then trammelled by the other stuff, the material stuff which you have no control over. And I think powerlessness and a feeling of hopelessness is something that comes out very strongly. In the study that we did, which was undertaken just at the beginning of the financial crisis we found narratives of unemployment and suicide rather than narratives that would point to something else. To a certain extent then, the financial crisis has shone a light, a bit like you’re saying, on the fragility of your sense of well-being at times when your expectations aren't met, particularly when it comes to relationships. We found this to
be very strong.

V. A method for studying suicide (sociologically)

I would like us now to introduce the approach that you used for ‘understanding suicide’; sociological autopsy.

Sociological autopsy seemed like a neat moniker! The idea came from discovering that there’s a technique called psychological autopsy which had been developed by researchers in Oxford who, quite rightly in our view, had decided that a good way of understanding the psychology of suicide, was to go and look at individual stories. Their technique therefore was based in the same thinking as ours, or to be more precise our technique was the same as theirs because we copied it. What the researchers did, was to spend time at the coroners’ office and look at the coroners reports, but they had tick boxes so they could get through loads of those reports noting for example: ‘Is there depression?’, ‘tick’ and so on and so forth.

Now, we thought this was clearly an interesting way of going about studying suicide, particularly since part of our remit was to develop a method where you could interrogate a sociology about people that were dead, without this starting to look like history or something similar.

So what we did was spend a couple of years in the coroner’s office, and we interviewed people who had been recently bereaved through suicide. We went with a fine toothcomb through all of these stories/accounts, but also looked at media reports of the cases we were looking at in order to try and build a picture of what seemed to be going on for the person who killed themselves at the time when they died. This would include the coroners’ reports that were very detailed, but also interviews where we would ask a mother about what her child was like for instance. You would therefore build those partial views, because every view of the circumstances would be partial to the position of the person was in. A mother’s account would be very different from a police officer’s account which in turn is different from a son’s, a daughter’s or a colleague’s. All those accounts were very partial so we had to acknowledge not only that one would never get a full picture about somebody, but that we build a picture of the person based on these accounts. Because of the multiplicity of such accounts, an immensely complicated picture of a person emerges, because that’s what a person is; a very complex human being. In addition to those accounts, there were lots of artefacts that were left by people; suicide notes, text messages, so we looked at the scenes of death, saw photographs of the scene of the suicide and then analysed those to build up a fuller picture. What we did then was to try to write a story, not saying that we would come to any definitive truths, but to look closely at the sorts of things which seem to be present in someone’s life which can possibly steer them towards suicide as one of a range of other reasonable options.

And that’s very human data you were handling! They suggest vulnerability, fragility and weakness thus giving your study an extra interpretive weight; because it’s fine to examine the figures, but when you’re looking at things that expose people so much, even at a post-mortem level, you begin to wake yourself up to the complexity of the issue especially when witnessing artefacts, listening to stories and coming across things that don’t quite fit a neat picture. By the way, let me just say that I use the term ‘post-mortem’ figuratively, thinking that through your method you tried to bring the person back to life in order to understand what was happening in his/her life...

Well, the post-mortem reports, the medical reports were unsurprisingly very dry, but also very useful in making sense of the situation. Occasionally, there were circumstances where you drew your breath, where someone would write in their note: ‘I can’t bear the fact that I lost some children, please don’t tell my family’; then in the account from friends and parents it came out that they clearly had no idea that someone was pregnant! The friends said: ‘she was pregnant’ and the post-mortem would state there was no sign of ever having been a pregnancy. Now, at surface level, or crass tabloid level if you prefer, one might be tempted to say: ‘She’s lying’. A much more subtle account/reaction however would be: 'My goodness, how complicated' thus making one think about why somebody
would be in that position and what is it that is driving this narrative for that person. So, that really dry data was really useful for seeing how easy it is to aggregate suicides, because if you turn anyone into a body, bodies are generally similar, and they’re all dead.

And, before we move to your idea of repertoires of action, isn’t it interesting that even by simply following that method many other things are unmasked as well? How mainstream ways of accounting for suicide are organised for instance by the police or the coroner’s office? In a way you are also shining a light to institutional ways with which we understand such phenomena and that seems to me, at least as a non-specialist in such areas of study, as a bit cruel. When you hear something like the story that you just recounted and you’re faced with a cold coroner’s report, it makes you think that it doesn’t capture anything, in fact it almost does injustice to the person and the situation they found themselves in and perhaps to those researching it too...

I think you’re right! It’s funny actually because justice and injustice are tricky terms to use. There were occasions where some of the characters that have died were doing it exactly to avoid justice in a crudely institutional sense but I agree, I wasn’t comfortable with this kind of anti-human perspective. But then again, we never wanted the research to be seen as set up to oppose other ways of understanding or interpreting suicide; all of those things for us were data but we were never disavowing them or suggesting that they’re not worth something. Those observations needed to be made, so the post-mortem accounts were really important for seeing whether you think somebody else might have been involved which, in turn, is clearly essential if you want to make sure that someone killed themselves or was murdered instead. Also, it would be quite churlish to think that you’re not going to have a very strong biological account in something which is about a body no longer being animate.

It also seems like a very good sensitising tool to start conversations with because it’s almost as if we want a dispassionate view and a couple of statistics about suicide rather than face the complexities and contradictions of being human are immensely helpful on a social level because it exposes things to us; things we can relate to and matter to us.

Well, you’ll also find that in the lectures that I have given on suicide! If I give a lecture on Durkheim and suicide a lot less people will be upset than in a lecture I might give on sociological autopsy...

But it’s good to be upset about such things, it’s a way of revealing our humanity, is it not?

Yes, I think so because it is as you say, it strikes a chord and you think: ‘Crikey, these are real people!’, and there are people that you know and people that you’ve met who have been in so much difficulty that this seemed to be the best way of dealing with it than thinking that suicide is something remote, odd, entirely to do with mental health or that there’s nothing you can do about it. What such thinking achieves, is the proliferation of narratives that pass responsibility to other individuals to make particular choices. If you say this is to do with mental health, with the economic crisis, then if those things aren’t fixed then there’s nothing you can do about suicide. If on the other hand you say this is to do with social relations and think that you might know one of these people, suddenly you have to take responsibility for other people’s well-being and that’s a big responsibility; I can understand why we shy away from it. And again the other thing that happened in the study is that it appears as if we’re damning individuals, and we’re not, we were never saying ‘why wasn’t that bloke giving that woman a cuddle, that’s what she wanted, she didn’t need being shouted at?’

VI. The responsibility of being nice and a personal utopia concerning suicide

You must have discussed such incidents between you, perhaps not on paper but behind the research scenes so to speak...

Oh yes, we did, we had lots of discussions like that and for something like reactions to economic crisis, like I
said it shifts responsibility from people to society. Well, society is an abstract term and people are walking around and getting on with their lives and not attending to each other and I think we don't really want to hear that. But on the other hand we were never saying; ‘Listen I'm not blaming somebody for not doing that’ because it's routinely what we don't do. I gave a paper in a place a while ago and there were lots of questions and then somebody said: ‘All-right, what’s your recommendation?’ We’ve got a set of recommendations at the end of the book specifically about Britain. so not applicable necessarily to Greece to do with suicide prevention strategies, but in the end this guy pushed me and pushed me and I said that the thing that I would do if I had a wish is that I would get specialised workers to go to every newsagent, every take away, every shop, every bus driver, every taxi driver, everybody who's slightly removed but might have a personal day to day interaction with someone who is feeling really distressed and they'll never know it. I’d set up cafés where people would just drop in and you wouldn’t know if people were workless, this, that or the other and inculcate everyday interactions with people with the idea that you should be nice to each other. So the guy looks at me and says: ‘So your recommendation is that we should be nice to each other?’ and in the end I said ‘Well, yes’. If, for example, you’re a newsagent and you’re selling a newspaper and you’re in a bad mood and someone comes in and you’re a bit grouchy to them you've no idea what ramifications that will have. And it is easy to forget that people might respond to things in ways that you could not possibly predict.

Take that nurse who [10] killed herself because of a prank call and the whole narrative about this has been: ‘You could never predict such a thing’. Ok, that may be true! However you could predict that people will respond differently to that very prank call. That’s what you can predict. You couldn’t predict that there is a range of reactions; I might think it was this is terribly funny, or it may make me terribly upset but all you're acknowledging is that there is a range of responses to you behaving quite poorly towards me. So the solution to that isn’t to say to the nurse: ‘You should be a bit more robust’ the response is to say to the radio DJs: ‘Will you stop calling people up and make them look/feel foolish?’ Be nicer, that’s it really. But along the lines of what I was thinking apparently there are cafés that were set up by services in deprived areas in some European country, somebody told me at a conference, and I was thinking a similar thing; to have really lovely cafés where you’d let people know that there’d be spaces where people would just go and be nice to each other and so if you’re feeling down or have health issues or something you have trained workers in there but you wouldn’t know who is a worker and who isn’t , and the whole remit of the café would be to go and just have a chat with someone, and they wouldn't be known to be run by services or whatever. So since there is no way of predicting what somebody’s reaction will be to our actions, why not be nice as a default mechanism of sorts.

In a paper I’m working on with a colleague who looks at how people survived suicides we looked at two stories; one where someone killed themselves and one where someone didn’t kill themselves and in the one where the person didn’t kill themselves that was because somebody went back with a sandwich; he said she looked hungry, so she prepared her flat to kill herself and then there was a knock on the door and rather than just do it she thought I’d better answer the door and it was a guy, a social worker actually who had been there earlier, noticed that she didn’t have any food, got worried and out of hours went out and bought a really nice sandwich and said, listen I noticed you didn’t have any food so I think you should have something to eat. She thanked him, closed the door, took the noose down and didn’t hang herself as a result of that interaction; and he has no idea, that that’s what happened.

And then I had a case where a woman was saying to her partner: ‘Look, you take this food I don’t want it’, because she was preparing to kill herself. He didn’t know this, and the partner said ‘I don’t want the food what are you doing?’ and they got into an argument about it, he left and she killed herself. And what we were saying is that the contingency in those situations is really interesting! What if the guy hadn’t got the sandwich in the first story and the what if the guy in the second story had said: ‘Oh, come here, let’s have a cup of tea, give me a hug’ instead of getting angry and just saying ‘Put your food away, don’t be stupid I don’t want it’ and get into an argument? We obviously don’t know how these things will play out and again it sounds so condemning to the poor bloke. But that’s how/why daily interactions are so important. Imagine a scenario where someone gets on the bus, the driver is in a bad mood, he’s just rude to you, you get off the bus and you think: ‘I don’t want to be here no more, people are horrible, I’ll kill myself’ rather than going on the bus and the guy being lovely and letting you off 10p or something. It makes you
think: ‘Oh that was so nice’ and your repertoire of action is changed by your relationship to the circumstances you find yourself in.

VII. The concept of repertoires of action

Could/would you please introduce the idea/concept of the repertoires of action for us?

The broader idea is that there is a relationship between three key components of our understanding of a current situation and those will be (a) experiences or our understanding of the experiences that we’ve had throughout our life. The next will be the (b) values and beliefs that we hold as a result of those experiences and the last one is what we call (c) the cluster of circumstances which are made up of the position that we’re in; job, no job, flat, no flat etc. The way things are around us, or the cluster of circumstances, are the things that are present at the time when we are considering a particular action and the relationship between these three then lead us to a set, or repertoire, of actions which appear to us as reasonable.

Now obviously the perception of your experiences can change at any moment, your values and beliefs, if they’re largely led by those perceptions, can also change very quickly and your circumstances can change really quickly so the three of those things are completely dynamic. If then you are to say that those dynamic features of your life lead you to sets of actions that you think are reasonable, then clearly the sets of actions that appear to you reasonable are also dynamic and change. In fact, they can change in an instant! Following this reasoning, in the one moment the option of suicide is completely unreasonable because your relationship to all of those things means that you wouldn’t kill yourself. In a moment, that can change and suddenly suicide becomes reasonable, and these sets of actions is what we call the repertoires of action. I borrow the concept from social movements theorists who talk about group behaviours and I remember thinking: ‘Actually I don’t think it explains groups nearly as good as it describes individuals’. What it does, is that it accommodates dynamism that was the whole point, it is not a static model and moves away from the temptation of causality or fixity. At no point therefore do we claim that we understand, you can never understand fully what’s going on for someone, you never can. Even individuals themselves often struggle to hold all that.

And this is precisely the virtue of this approach! It invites us to open up our thinking about suicide to a number of possibilities that we might not have considered otherwise, which is what sociology is about after all. To just say; ‘Well you know that’s fair enough but there’s X, Y, Z to consider’ rather than telling people and browbeating people with information we have. Why not invite them to say: ‘Well that’s what we found out, that’s how we make sense of things, what do you think? Let’s discuss’ …

What I quite liked about it as an idea as well was that it did adhere to all those good sociological principles without ever saying anything definitive or simply saying: ‘You need to ask more questions’. I did like the idea that wherever you are in the exploration of that way of thinking about a particular way of social actions you can say: ‘Do you know what, I reckon that’s what may have happened’. And even though you can never say that with any certainty, I quite like the idea that we were to say: ‘That’s as close that we can get at the moment’ because it felt a bit more like providing some sort of context rather than answers. The whole point of the sociological autopsy method was that we were saying: ‘let’s just see what happens if you take the psychology out’. We weren’t ever saying that the psychology was wrong, but we were saying was that if you look at it psychologically there’s lots of context, lots of scaffolding that you’ll miss and the best way of understanding that social context is sociologically. Because psychology isn’t really designed for such a thing that and that’s great because you can use the two in combination! You don’t simply say: ‘One is wrong and the other one is right’. You just say: ‘You know all about what’s going on in people’s heads so you go ahead and do that we’re supposed to know about how those things are then supported socially so we’ll look at that’ and we found out lots of interesting things particularly in relation to friendships, partner relations and children which aren’t really there in more established accounts. It’d be interesting if someone applied it to Greece or Portugal at the moment because the narrative there is just to do with economics, it must be so strong and that will
kind of stream-roll everything in its path. You can always counter that however by arguing that suicide in times of crisis probably has that aspect but this can’t be the whole story because not everybody is doing it. The reason why we’re so quick to judge is because such thinking simply isn’t in our repertoires of action...

Well, perhaps not yet but we can only hope! Thank you very much...

Thank you!

Dr. Ben Fincham trained as an FE teacher at Cardiff University, where he subsequently completed a PhD and an ESRC postdoctoral fellowship. He then worked as a research associate with Qualiti, a part of the ESRC National Centre for Research Methods. He lectured at Brighton University before joining University of Sussex in 2009. He has been involved with developing projects on 'mobilities', qualitative approaches to studying work in unstable employment environments and the relationship between work and mental health. He has worked and on gendered aspects of suicide and death as well as gender and research methods. He is currently writing a book for Palgrave Macmillan entitled 'The Sociology of Fun'. He is also developing projects on sex and sexuality in the Centre for Gender Studies.

Lambros Fatsis is a final year DPhil student at the School of Law, Politics and Sociology at the University of Sussex. His doctoral thesis concentrates on discussions of public sociology, the role of the University and intellectuals, while other research interests include black music, urban culture and the history and sociology of the Jamaican soundsystem. He also performs as a reggae selector/radio presenter under the name [11]Boulevard Soundsystem and is a contributor of Billboard magazine on reggae music. Recent publications are featured on the British Sociological Association's Postgraduate Theory Forum and on The Sociological Imagination blog on a variety of issues ranging from the English riots, the idea of sociological imagination and the Eurozone crisis. In the spring of 2013 he achieved Associate Fellow status of the Higher Education Academy.

Why I am quitting the British Sociological Association (2014-02-13 21:01)

Now that my PhD is almost complete, I’ve received a polite request from UCU that I rejoin as a staff member. I was pleased to find that subscription rates are on a sliding scale, with the highest band paying twice as much as the band I’m in (and unlikely to leave any time soon).

[1]
So UCU, as an organisation I’ve had little involvement in, will continue to have me as a member. In contrast, the BSA, an organisation I’ve committed huge amounts of my time to in various guises have a much less inviting membership policy (left) and conference costs (right):

BSA Member Full Conference
£310
I would need to renew my membership before the next conference. I'm a research associate in one place (2 days a week) and a research associate in another place (1 day a week). As someone "NOT a full-time student, fully retired or unwaged" this means my annual membership fee is £118. Note that part-time students, often those without funding, don’t qualify for concessionary membership either. This means that ‘UK member’ encompasses everyone from the £60,000 & above through to, I guess, the £5,000-£10,000 categories used by UCU to determine the fees of their members. So as someone post-PhD with 60 % employment is it unrealistic to expect not to be placed in the same cost category as someone on the salary of a full professor? The sliding scale doesn’t have to be particularly radical (UCU's isn't) but its absence is emblematic of the lack of understanding (or concern – I've assumed the former given principle of charity) that I've witnessed so frequently from those at the heart of the BSA.
understand academics on Council were opposed to the recent changes, but that decisions are made by a very small number of Trustees.

In the past five years I’ve occupied many roles and organised lots of events as part of them, all at a time when as an unfunded part-time PhD student working full time with a wide range of other projects I had very little time. I did these things with the BSA because I want to contribute to the sociological community in the UK:

1. Co-convened the Postgraduate Study Group
2. Been part of the steering committee for the Theory Group
3. Co-founded the Digital Sociology Group
4. Co-convened the Realism Group
5. Managed the websites for each of the above
6. Helped out as much as possible when people got referred to me as ‘the social media guy’

At this year’s BSA conference I had organised:

1. A realism plenary session with Margaret Archer
2. A digital sociology plenary session with Deborah Lupton, Emma Uprichard, Mike Savage, Noortje Marres and Evelyn Ruppert
3. A panel discussion on Digital Public Sociology
4. A panel discussion on sociological approaches to self-tracking (w/ Chris Till)

I’m still irritated that I won’t be able to attend any of these. As one of numerous PhD students from my department, I wrote to the BSA explaining the complex situation we faced for getting department’s funding to support our travel. We were offered a short extension of the presenter deadline for registrations in January but not one long enough to clarify the situation. Or one long enough to allow me to desperately scrape together the funds to register.

I now can’t afford to attend the BSA. Including membership it would be £428. Along with train fair and accommodation this would be easily £600 or more. Would you pay £600 to go to a conference, in which you had organised a range of events, but weren’t allowed to speak at? I can’t afford to go to the BSA. But I wouldn’t go under these conditions anyway.

I understand that long term trends mean that the BSA will become increasingly dependent upon their membership. Well I have been the most committed and enthusiastic member imaginable. Yet after five years of mounting frustration I now want to have nothing more to do with the British Sociological Association and I’ll looking for some other way to contribute to sociology in the UK.

So why am I writing this? Partly to explain why I won’t be at the conference despite my having organised 4 relatively high profile events. It seemed like a bit of an academic faux pas and it was stressing me out. Partly to make my feelings clear about the BSA rather than just slink away into non-participation. Partly to vent the frustration.
that I've been politely restraining myself from expressing for years, knowing I'll no longer find myself ceaselessly defending the BSA against all the people who criticise them for precisely the issues that have (silently) troubled me for the entire time I've been involved. Partly out of sheer concern for British sociology that the BSA is responding to short term financial challenges with action that is destructive to its long term strategic needs. The BSA needs members and I don't think those running it day-to-day realise quite how much grumbling goes on about the BSA within British sociology. More to the point: unless there is a radical change to pricing structure I suspect much of my cohort and subsequent ones will just fail to engage. The BSA risks losing PhD/ECR students in the UK. The only reason it hasn't already lost them is because, I'd suggest, the widespread belief persists that you 'need' to have a presentation at the BSA on your CV to get a job.

Dr Ulrike M Vieten (2014-02-14 15:07:55)
I fully agree; the conference fee politics of these bigger Sociological Association events really got out of hands... similar situation with the ISA. Suppose, the 'professional' organisation of these mega-meetings consume a lot of money (I doubt efficiency and effects though). Time to move on I guess...

I'm saddened but not surprised to learn that the BSA is acting this way. You have done so much work on their behalf and it's ridiculous that they don't have an appropriate category for members in positions such as yourself. Given this stupid error they should give you a free place and a written apology.

Leon (2014-02-18 19:18:02)
Yeh I fully sympathise Mark. The conference is even in Leeds this year, where I'm based, but I'll not be registering as on a part-time teaching assistant's wage I've not got any spare cash to fund the cost. Pretty frustrating!

Corey Wrenn (2014-03-11 17:36:33)
It really saddens me how privileged the sociological discipline is despite it's claim to challenging inequality. Something that also aggravates me is that all of the top tier journals have a hefty submission fee of about $50...just for a "shot" at being published in a journal with a very low acceptance rate.

Nikolas Rose on the Public Brain (2014-02-14 08:00)

The [1]Human Brain Project is a rather enormous EU funded project, funded to the tune of €1.3 billion over 10 years, looking at future neuroscience, future medicine and future computing. It aims to overcome fragmentation within neuroscience, synthesise existing data sets and produce a platform to make this openly available to neuroscientists worldwide:
It doesn’t take much reading around the project to realise that it has some pretty big social and ethical implications. So it’s reassuring to find Nikolas Rose, critical sociologist par excellence, on the steering committee of the social and ethical issues part of the project. It’s also interesting to learn that 3-5% of the funding is set aside to fund these activities. Rose spoke recently to [3]USAPP about the project and related issues:

I think it’s difficult to talk about the way in which the Human Brain Project in and of itself has captured the popular imagination. It’s in early stages, it’s not clear how many people are aware of what it is doing and when people are aware of what it’s doing they tend to misunderstand. The Human Brain project is largely a data integration project, it’s largely trying to pull together data from a whole range of different sources, it is doing much more than just creating a computer model of the brain. People have concerns about modelling the human brain in a machine, worries about free will and worries about creating conscious computers and so forth, which are probably not the key of issues that are going to be raised by the HBP. More generally though, it’s undoubtedly the case that at the moment, at least in Europe and America and similar developed societies, the brain has become a fascinating object for public debate. Brain-based explanations of everything are becoming increasingly prominent in the media and also in the commercial field—you should buy brain gyms to train your children, brain foods, you should do Sudoku or brain exercises to ward off dementia etc. I don’t want to say this is just a facile fascination with the brain, which I think would be a trite conclusion: I think we are seeing the beginnings of a different way of thinking of the role of the brain in individual and collective life. When I started my 10 years of research on the social implications of neuroscience – for the book called [4]Neuro that was published a little while ago— I hypothesized that that psychological explanations of human behavior might soon be completely displaced by brain based explanations of human behavior. My research didn’t find this, but it did show a growing belief in so many fields that our mental states are underpinned in some fundamental ways by our brains, by our neuro-biology. The nature of our brains is now considered to have huge implications...
for who we are, individually and collectively, and on our conduct and our capacities. This is becoming rather a pervasive way of thinking, and I think it’s the emergence of that way of thinking, rather than the implications of any one piece of research or any one project like the Human Brain Project, that is important. That is really the phenomenon – the change in the kinds of creatures we think we are, and all the implications of that change – that one has to try to understand.

“Just waiting for you to talk so that I can” – John Grant (2014-02-14 12:45)

Discussion, so it is said, is of key importance to the academic life. The debate, the flow of ideas, comparison and critique, amongst your peers, is the primary signifier of academia’s importance. Why then do so many academics sit through seminars with the single goal of waiting until they can talk themselves? Comments, less than the constructive development of ideas, are packing crates on which to stand and air one’s own agenda, ideas or approaches. This steering of discussion is not always done with malice: Often people are blinded by the narrative of their own publications and institutional years in defence of arguments. The ability to accept new approaches, or even opinions on old subjects, has been whittled down by the pugilistic stance that they themselves continue in seminars. Others are simply too tied up with their own egotistically driven focus to tear their minds away. At times such focus becomes so blinkered it is as if any divergence of thought away from their own interests would lead to feelings of insecurity that they normally equate to those who remain quiet.

All is not lost for the discussant. With careful balance of whit and respectful play to ego, the speaker can gain valuable reassurance that they have either covered the ground for critical responses, or at least have had their work reflected in the eye of someone else’s agenda: these can lead to valuable changes in perspective. The speaker’s expectation regarding the listeners is unlikely one of engagement with their topic, unless it suitably matches the schedule of those present: in which case the seminar is mere campaigning to those who are already signed-up. Rarely do you find the academic who sits and wonders ‘what is the speaker trying to say?’ - Instead they insist on focusing on correction: ‘What should they be saying?’ The performance of presenting amongst your peers requires skill in story telling: make sure that they sit comfortably, buff their ego cushions and speak softly; grasp their attention with something agreeable and lead them down the road of acceptability towards your slightly shocking, but now obvious, conclusion. Engagement is the key, will they ask questions that imply they have listened, will they want to clarify some aspects that appear vague or will their steel hard cage of academic institutional life keep the speakers own approach from truly being heard?

In this industry of knowledge manufacture and understanding there needs to be a greater focus on the power of iteration and failure. Standardised events for the display of framed arguments are illusions, hiding the real process
that leads to the development of ideas. Within such power centred arenas the loudest voice is often the status quo and the new challenging developments can often be silenced with effort. Ideas, theories, approaches and methods all require a driving force to take them from inception to development and application. All great work requires commitment and defence for ‘there is no such thing as an immaculate conception’; but when this industry is driven by the systemic defence of such psychologically embedded projects, how do you remain committed to one idea, without being in some way closed to new ones.

[nbox type="notice"]

Dave Yates is a PhD Candidate at the University of Kent. His research interests are the development of applicable theories in systemic meaning construction. He is interested in applying such work towards understanding place design and construction amongst urban planners and architects.[/nbox]

Babette Babich (2014-03-02 12:44:00)

Heidegger thought that scholars should simply trade questions, but that would include the speaker first and foremost. I have watched conference presentations for more than three decades and never has a speaker offered a “new approach” that was in fact new (except in their own minds). Some approaches became, as you rightly identify, the latest thing because, as you also rightly identify, they were already part of a larger, already extant movement/meme (lots of heads nodding in agreement there). But I have also never heard a young person speak who was not persuaded that his or her ideas were not utterly unprecedented... What strikes me most (apart from the evident desire for non-reciprocity here – it seems that the desire is that discussants not discuss but ask what some youthful presenters imagine to be ‘real’ questions), is the conviction that simply because a conference resembles a classroom situation that the listeners are there to take instruction rather than to participate. Even those respondents who are genuinely confused and want clarification (does one really want a conference room full of such gratefully attentive respondents? would that not be a classroom? is the epitome of the conference encounter an ex cathedra address?) want that clarification only for their own agendas: they too are just planning to talk later or elsewhere or at their own conference... The idea should be to exchange ideas and if speakers seem to comment on their own ideas in response to your ideas, is that not a good thing? Not only might the speaker learn something but it is also the case that there is usually no difference in competencies between the person at the podium (the selection committee arranging the talk is a committee of one’s peers not arbiters of the truth) and, at an academic conference, it is usually the case that the persons in the audience who strike you as waiting to say what they seem hellbent on saying, do indeed have something to say and might have been speaking themselves.

CfP: What are conferences for? The Political economy of academic events (2014-02-14 12:57)

The [1]Sociological Imagination invites short articles (500-1500 words) critically reflecting upon the prevailing forms of intellectual meeting within the contemporary academy. What are their strengths? What are their weaknesses? How could they be done differently? What are the sociological implications of these standardised forms of intellectual meeting? Whose voices do they amplify and whose do they suppress? What behaviour do they reward and what behaviour do they discourage? What are their intellectual implications? How far does intellectual form follow conference function, limiting time and expression in the interests of the event’s logistics? Why do people attend seminars? Why do people attend events? What are the wider significance of these common reasons? Are there other motivations for attending academic events which tend to be squeezed out in the neoliberal academy. How might we do things differently? What alternative forms can we imagine? What would the implications for the academy be of DIY academic events becoming common? We’re particularly interested in receiving articles on the political economy of conferences, seminars and workshops?

If you would like to submit an article please send mark@markcarrigan.net a 500-1500 word article, attached
Recent public debate in the UK surrounding Channel 4’s ‘Benefits Street’ documentary has highlighted an apparent proliferation of media representations of unemployed and/or working class lives that emphasise themes such as dependency, laziness, anti-social behaviour and criminality. At the same time, welfare reform has become increasingly central to public debate and policy making in many countries across the world. This rapid response call
invites sociological consideration of the relationships between contemporary cultural representations of the poor and political/ideological developments with respect to welfare and social security.

Rapid Response articles should be up to 3000 words in length. Please indicate that the article is in response to this call on your submission.

Authors are encouraged to submit articles as soon as possible after the call and papers are reviewed and published (if accepted) as they come in. The final deadline is 30 April 2014.

Sociological Research Online publishes high quality, fully peer-reviewed articles across the spectrum of current sociology. An innovative, online-only journal affiliated to the BSA, we reach a wide international readership, have fast turnaround times and encourage integration of audio, video and images, as well as welcoming text-only contributions. We also publish special sections and rapid response articles which address current issues in sociology and the public arena.

What is happening in Bosnia? (2014-02-17 08:00)

Since 5 February 2014, all major cities in Bosnia have had daily mass protests by factory workers. What is happening and why? Read a good [1]article by Michael Karadjis.

---

**Are you a doctoral ‘student’?** (2014-02-18 08:00)

That’s the great question Pat Thomson asked in a [1]recent blog post. Are you a doctoral student? Or a doctoral researcher? I’ve tended towards the latter, partly because being called a student began to bug me as soon as I’d published my first paper. More importantly though, it seems to downgrade the status of those doing PhDs, defining them, as Pat puts it, in terms of a “binary between supervisor and supervisee that magically disappears when the thesis is successful in examination”:

One of the things I’ve been trying really hard to get over is the notion of the doctoral ‘student’. This is by far the most common way to refer to people doing a PhD, and it’s pretty hard not to use the ‘s’ word when it’s all around you. I think of myself as a recovering ‘s’ word user. I lapse occasionally, but I’m trying hard not to.

I want to use the term doctoral researcher instead – or dr for short. So, dr – not yet Dr but on the way. Just insert title (case) and the transition is complete.
Now, there are good reasons why the 's' word persists. There is a fee for doctoral study, and yes, doctoral researchers are enrolled at a university. So this makes them students, just like any other students, right?

Well yes. But on the other hand...

One reason I dislike the term doctoral 'student' is that it downplays the level and quality of thought, knowledge and work that is required to achieve the Dr. Apart from mandatory methods training, there is no set doctoral syllabus. While there is lots of learning, and continuous formative assessment, a thesis is not an assignment – it is a substantive piece of independent research judged by senior peers. While there has been guidance and coaching from supervisors, the doctoral researcher has been required to make up their own mind about any number of issues, including, quite often in the arts and social sciences, the choice of topic.

And, by and large, most doctoral research is not judged as 'student' work. Doctoral research is generally publishable. This publication frequently happens during the period of candidature, and sometimes actually IS the PhD, as in the case of PhD by publication. So the output of doctoral research – papers and sometimes books – stands in the field equivalent in status to that of any other research and it is judged by the field using the same criteria as is applied to any other publication.

Dr. Usha A Makwana (2014-02-18 12:14:50)
i am working as a senior lecturer in the research center of the NGO but it's a contractual appointment and it will be over in the starting of next month therefore am searching for new job, do you have idea of any vacant post, please suggest me

Monica (2014-02-22 00:40:40)
The moment I read Patter's article I changed my signature!

Kip Jones (2014-03-08 16:07:06)
I try to use the term 'doctoral candidate' when possible.

New student sociology journal at Warwick! (2014-02-19 08:00)

The [1]Warwick Sociology Journal is a new journal founded and edited by students which will publish excellent undergraduate and postgraduate work. Each issue will have a central contemporary theme, and the journal accepts
submissions from people of any discipline at any level, as long as there is a link to the overall theme.

Check out the [1]first issue, entitled Feminism and the perception of women in contemporary society, here!

The journal is supported by the Warwick Sociology Society and the Sociology Department.

The next issue will be Education and Learning. You can submit your work by Friday 28th February. There is no upper or lower length limit: The only guidance is that submissions must use Harvard referencing where necessary and be related to the central theme (the editors want to give you as much freedom as possible, pieces could be on anything from the relationship between 'race' and educational achievement to the way that media passes on knowledge to apprenticeships).

If you have a piece to submit or any questions, you can contact the Editorial Board at [3]SociologyJournal@warwick.ac.uk

The Editorial board of the new Warwick Sociology Journal.

Some auto-ethnographic thoughts on the phenomenology of writing (2014-02-20 08:00)

How do you find time to write? I’ve become fascinated by this question in recent months. Implicit within it is an understanding of ‘writing’ which I’m coming to see as deeply problematic. It treats the creative activity of writing as a matter of temporal budgeting. But how much time does writing take? It obviously depends on what we mean by ‘writing’. According to the [1]typing test I just took, my typing speed is 120 words per minute, which is pretty fast in population terms but not exceptional for someone who has been touch typing for a long time. At this rate I could type an 80,000 word thesis in around 11 hours. Except I obviously can’t and not just because of the debilitating RSI that would no doubt ensue. In the touch typing test I’m transcribing from on screen text into an on screen text box. In my writing I’m creating something new. So what does that act of creation require? At its best, it relies on inspiration:

The notion of revelation – in the sense that suddenly, with ineffable assuredness and subtlety, something becomes visible, audible, something that shakes you to the core and bowls you over – provides a simple description of the facts of the matter. You hear, you don’t search; you take, you don’t ask who is giving; like a flash of lightening a thought flares up, with necessity, with no hesitation as to its form – I never had any choice.

- Friedrich Nietzsche, Ecce Hommo, Pg 68 (Duncan Large translation)

I feel like this sometimes when blogging. In the past I’ve described it as [2]thinking-through-writing. As I put it [3]last summer: there’s a certain experience of immediacy and urgency in writing which has always been one of my most valued creative experiences: when an inchoate idea is at the forefront of your mind and the process of rendering and externalising it feels like one of the most natural (and important) things in the world. But this only seems to happen if I blog immediately. I grasp at the [4]‘feel of an idea’ and immediately begin to try and elaborate upon it, drawing out the form incipient within it (or less pretentiously: I put it into words straight away). This is when blogging is really fun. It’s also fast. When in the habit of doing this, I often find I can write a 1000+ word post in 30-45 minutes. But it’s the role of the habit here that I don’t entirely understand. Partly I think it’s a matter of routine. There’s something about immediately grasping an idea and giving it form which will tend to engender the experience of inspiration. Hearing and taking, rather than searching and asking. So perhaps it’s getting into the routine of responding to ideas in this way as and when you encounter them.

Last summer my enthusiasm for blogging suddenly and surprisingly deepened. I say ‘surprising’ because I’ve been blogging in one guise or another for over a decade. But I’d always seen it as a useful and interesting diversion, whereas I suddenly found it began to [5]matter to me as a form of creative expression that I found intensely liberating, as I began to acclimatise myself to pursuing a career in the academy after an experiment in full time web editing that made me realise that being anything other than a sociologist would bore the shit out of me in the medium or long term. Blogging was a release from all the structural pressures corroding the creative impulse that had led me to wonder if I actually did want to be an academic. Embracing the lack of constraint attached to this blog (for me) and making it my main vehicle for intellectual exploration, which I guess it had been becoming anyway, helped me make my peace with the jumping through hoops that a modern academic career unavoidably entails. If I can write whatever the hell I want here then I come to feel better about subjugating what I want to write to instrumental considerations elsewhere.

In terms of more formal writing I’m an archetypal binge writer. Until recently, I’ve tended not to write for weeks at a time and then write flat out for one or two days. For a brief period of time I become utterly engrossed by what I’m writing. This absolute immersion in the task at hand tends to eliminate any propensity to self-censorship and I usually find I can write a great deal, often articulating new ideas and drawing out new connections, in a very
short space of time. This worked hand-in-hand with a technique I picked up from a Bertrand Russell book years ago:

My own belief is that a conscious thought can be planted into the unconscious if a sufficient amount of vigour and intensity is put into it. Most of the unconscious consists of what were once highly emotional conscious thoughts, which have now become buried. It is possible to do this process of burying deliberately, and in this way, the unconscious can be led to do a lot of useful work. I have found, for example, that if I have to write upon some rather difficult topic the best plan is to think about it with very great intensity – the greatest intensity of which I am capable – for a few hours or days, and at the end of that time give orders, so to speak, that the work is to proceed underground. After some months I return consciously to the topic and find that the work has been done. Before I had discovered his technique, I used to spend the intervening months worrying because I was making no progress; I arrived at the solution none the sooner for this worry, and the intervening months were wasted, whereas now I can devote them to other pursuits.

Bertrand Russell, The Conquest of Happiness, Pg 49-50

So until recently I’d found writing largely unproblematic. I read, I blogged, I talked and every now and again a few thousand words would pour out of my brain in a way that was often quite enjoyable. Deadlines helped but they weren’t essential to this. The problem began when the process of trying to squeeze too much into the rest of my working life (particularly a full time job, commuting from the midlands to London and setting up a training business) led to the rapid disintegration of this comfortable, albeit occasionally manic, routine of creative production. I made very little progress on my PhD for six months and struggled to get back into a writing groove, not least of all because I had to deal with my masses of data, which in a way I’m still not back into. Binge writing is unreliable: it’s a little scary how much time can elapse before you realise that you’ve not had a serious session of writing for a long time.

It’s because of this PhD delay, as well as my impending deadline, that I’ve been trying to force myself into a daily writing routine. Frankly, I hate it. It makes me self-critical about the intellectual content of my writing in a way I have never been before. Largely because I previously edited my work but didn’t assess it. I’d read it through, note points that needed developing or consider ones that should be removed. But these considerations were post hoc and practical, immediately feeding into the next stage or the next project, rather than leading me to say “this is shit” to myself. Forcing myself to sit down and write for a set amount of time every day completely takes the fun out of it. It leads me to try and write when the ideas aren’t ready to come out. The only occasional experience of inspiration I’ve had in this period has been when I’m working intensively, over and above the daily goal, to meet a deadline I’ve agreed with my supervisor.

So I can see that I’ve bounced from one writing extreme to the other. A complete draft of my PhD is days away (if that). I’ve then got a bit of work to turn a complete draft into a finished draft. After that I want to find some middle ground between my unreliably organic binge writing and this stultifying imperative to sit down and write every single day. But I’m not sure where that middle ground is. It involves inspiration. But does it involve habit? Or is what I’ve been thinking of as ‘habit’ actually a matter of attentiveness, recognising the potential emergence of inspiration and responding to in a way which gives it maximal expression? Perhaps it’s also a matter of cultivating the conditions necessary for this attentiveness? But what are they?

Edit to add: this post was an example of the experience I’m talking about. I’ve had these thoughts spilling around in my head all day. So when I sat down to articulate them, it took well under an hour. Whereas if I sit down for my ‘minimum of two hours daily work on my PhD’ it could easily take me twice as long to write half as much.

1. http://www.typeonline.co.uk/typingspeed.php
Austin Kleon (http://tumblr.austinkleon.com/) has written a lot about the self-discipline of daily creativity. And while it seems a whole lot less romantic than the image of a passionate writer powering through the night by candlelight, it means you get stuff done regularly until waiting until inspiration comes. Gustave Flaubert said: 'Be regular and orderly in your life, so that you may be violent and original in your work.' So far it's working for me :) 

Sociological Imagination (2014-02-20 09:35:35)
I hoped it would for me on exactly the rationale! It really doesn't though.

Introductions, Writing Patterns, and Tidy Desks: Personal Reflections on the Writing Process (2014-02-20 08:42)

A while ago, Mark Carrigan asked me to contribute a blog to a series he was curating on the writing process. I said that I was too busy writing to do so. Now that I’ve just submitted the manuscript I had been working on, and haven’t quite got around to starting the next piece, I thought I could use the time to reflect on writing.

I don’t find writing an easy process. Or rather, I don’t find starting the process of writing easy. I will often spend days trying to write the perfect first paragraph because somehow I’m convinced that I need to get this first paragraph right in order to be able to move on. Usually, I’m trying to condense the whole article in that one paragraph … and getting annoyed that it doesn’t seem to be possible.

During those first few days I might also tidy my study, re-arrange my books, and this last time I actually redecorated (in my defence, the room needed it and it was a big project I was starting!). I usually also get cross a few times, especially if (when) someone looks at my attempts and says ‘yes, that’s fine, just get on with the rest of it and then come back to the first paragraph’ (don’t they know that if the first paragraph isn’t right then the rest of it just won’t flow?).

After a few days, however – and I never know quite how many in advance – something breaks, I stop obsessing about that first paragraph and get on with writing the rest of the piece. At this stage, I really enjoy the process. I’m not one of those people who write their final draft the first time around. I read and then write, and then read and then rewrite, and then rewrite again. I enjoy engaging with other texts, seeing an argument develop, and getting words to turn into sentences and then paragraphs and then finished pieces.

While this may, or may not, be an interesting personal reflection on the process of writing, I’m not sure how helpful it is. So in an attempt to think about what might be helpful through this reflection, I offer the following thoughts.

We all work differently – this may be obvious and not in need of saying, but I thought I would just reiterate it here. In that sense, it’s important to work out how best you work and whether you do indeed have a pattern of
working. I didn’t realize for quite a while that I have a really difficult time with introductions and so for those first few times when I was writing and it just wasn’t going anywhere I would get really down and frustrated and concerned about my very ability to write.

After it happened a few times (and it was helpfully (!) pointed out to me that this is ‘what I always do’ and that it usually works out OK) I began to recognize the frustration as part of the process of ‘clearing’ before the writing could begin. It didn’t necessarily make it any easier to live through, but I was more convinced that these difficulties would pass, rather than be despondent that this was how things would always be.

This was also when I began tidying my desk and re-arranging my bookshelves instead of just sitting in front of the computer screen trying to get the words in the right order. These activities helped pass the time and were useful in both being practical (my desk often needs tidying) and also in providing space for thinking about the article. So every time I would head back to the keyboard, things would be a little clearer and then one time instead of getting frustrated I would be getting somewhere.

Getting to know your own patterns and ways of behavior doesn’t necessarily stop you repeating them, but I’ve found that in recognizing them I have been able to manage the associated emotions, which in turn has eased the very process of writing.

[1]Gurminder K Bhambra is Professor of Sociology and Director of the Social Theory Centre at the University of Warwick. Her recently submitted manuscript, [2]Connected Sociologies, will be published in the autumn by Bloomsbury Academic.[/nbox]

Michael (2014-02-25 10:37:49)
To the extent that I actually sit myself down and write, I enjoy writing. I find it almost excitingly free and cathartic once I get into a piece of writing or into the rhythm or habit or keeping a journal. Once in the habit, writing also becomes ‘easy’. But, oh the agony of getting out of the starting blocks. There is, of course, a neat metaphor emerging here. So I don’t think the problem you relate is that unique, as writing is perhaps one of the few activities that closes that gap between mind and matter, or thought and reality. That is indeed the wonder of writing I believe: it might be (along with other artist pursuits, such as singing or art) the truest, most compassionate and also most powerful, reflection of oneself. Essentially, your very core, your inner nature cannot help but being present, in at least some way, in anything you write. There are certain pursuits and activities one can perform with a higher degree of insincerity than others - writing surely falls at the lesser end of this continuum. Getting back to the metaphor, for me writing is akin to running around naked. Starting to write something is like walking around your own house in the nude - often difficult at first for most people. But try it a couple of times and you will start to enjoy it. The next step is to let someone see you naked. The next would be (hypothetically, for me at least) to walk around in public in the nude. That first draft, having someone read over it, can really be as terrifying as approaching them without any clothes on. Publishing it takes your bare ass to the streets, and in our digital age, to the world. The more one gets used to seeing himself naked, the more easily and readily they will take off their clothes. And so, the more one comes to recognize that deep-seated self that is ever-present in their work, the more one may come to accept, even like or love, it and ultimately know it, and then, the less apprehensive one might be to once again reengage in conversation with it - with himself.

Richard Kerley (2014-03-01 14:29:18)
Fascinating and encouraging piece ; hope many others find it... I’ve never decorated, but cupboards sorted ; shelves tidied ;

2458
rooms cleaned etc figure high on my list of ‘prevaricateese’...

C (2014-09-13 14:42:28)
Thanks for this - I always enjoy personal insights into the writing process. I agree that finding the patterns and habits that arise during different working processes (article writing being different from lecture writing, which itself differs from conference talk writing) is essential to making them work for you. I now know that when I sit down to write a paper, it will be brainstormed, mind-mapped and planned in excruciating detail at least four times on separate pieces of paper, before I am able to physically face my computer screen and start getting the words out. I suspect for me the matter is not so much 'having the plan' and writing out different versions of what’s in head multiple times that builds enough momentum to get me onto the page.

» Carol Smart: “ideas come about through the process of writing” The Sociological Imagination (2014-11-08 08:02:13)
[...] approach to writing that was natural for her. This advice echoes what Gurminder K. Bhambra says here about recognising recurrent frustrations in the writing process as being important parts of that [...]
Moreover, there is a sense that various concepts and theories have become reified and constraining – closing down the possibilities of critical thought. However, the issues that post-structuralist theory placed on the critical social science agenda have become more vital than ever - be that the concern for the complex and dispersed nature of power and agency; the imbrication of power and economics with knowledge and science; rethinking the relation between equality and difference; the political/contested/changing nature of embodiment, biology and ecology; or the efforts of states and others to establish and exercise power over life itself. We maintain that now is the time, not to reject post-structuralist perspectives, but to reinvigorate and transform those traditions through empirical and political work that is creatively engaged with current problems. The Authority & Political Technologies group at Warwick will host a series of annual events that bring together world leading, emerging and postgraduate scholars from across the social sciences whose work promises to renew post-structuralist critical thought through empirical scholarship. This year we invite papers on the theme 'Power in a World of Becoming, Entanglement & Attachment’. Topics may include, but are not limited to, the suggested themes above. **Deadline for abstract submission March 10th 2014.** For further information and updates see the conference website [http://www2.warwick.ac.uk/fac/soc/sociology/rsw/authorityandpoliticaltechnologies/apt2014/](http://www2.warwick.ac.uk/fac/soc/sociology/rsw/authorityandpoliticaltechnologies/apt2014/)

**Giving voice through animation: "my first crush" (2014-02-22 08:00)**

This charming animation is based on interviews the artist conducted with people about their first encounters with love. As she puts it, “their animal counterparts tells their stories of humor and heartache” and, through doing so, give voice to these stories in a way profoundly different to any straight forwardly representational strategy for conveying narratives.
Blind Eye Forward (2014-02-23 08:00)

How does a critical sociologist approach a troubled world? [1]Bill Carroll, professor of sociology at the Department of Sociology, University of Victoria (Victoria, Canada), has sent us this awesome music video. The original composition, entitled "Blind Eye Forward", is a collaboration between Bill and his son Wes who is a jazz guitarist. It’s a fantastic example of how music, lyrics and image can be combined into an unusual and effective syncretic medium which can convey sociological insights and provoke discussion, in the classroom and elsewhere. Bill Carroll’s research is very interesting - watch this space, we will write more about his work soon!
Blind Eye Forward
(lyrics by Bill Carroll, 2004)

Shining future, sterling past
Tired clichés once again recast
Age old battles, trying times
Ancient hearts propelling modern minds
Howls of terror pierce the night
The morning after makes a sorry sight
We turn a blind eye forward.

One day bleeds into the next
A spell of sameness puts a world to rest
Killing time as time kills us
Gleaming spires slowly yield to rust.
A simple gesture, a point to make:
15 candles on a birthday cake
And a blind eye forward.

We can’t see
An old world dying and a new unborn
We hesitate, lost, our eyes fixed upon things too familiar.
To reach for something still unknown
To look for what cannot yet be shown
Bells toll faintly in the distance
Unheard prayers don't build resistance
Live each the moment as if the last
Invent the future, piece together the past
And keep a blind eye forward.

Far away, out of sight
Plans go forward under cover of night
If you listen closely you can hear the sound
Of grand illusions crashing to the ground
Keep a rose fastened to your chest
Expect disaster but hope for the best
And keep a blind eye forward.

Bill Carroll: Grassroots organizations as alternatives in the global economy (2014-02-24 08:00)

William Carroll is a Professor at the Department of Sociology, University of Victoria (Victoria, Canada). In this video from the 2012 Global Studies conference, he talks about his research on global politics, and looking at grassroots organizations as alternatives in the global economy. This lecture is part of Bill’s current research program on transnational alternative policy groups and counter-hegemonic struggle:
Milena Kremakova (MK): Tell us more about your research.

Bill Carroll (BC): Shortly after that lecture, I embarked on a year of round-the-world field work, doing site visits at 11 of those alt policy groups, including Focus on the Global South, the Transnational Institute, Centre for Civil Society (in Durban), Rosa Luxemburg Foundation, Third World Institute and Development Alternatives with Women for a New Era (DAWN). A number of articles from this research have come out recently, including an article in The Journal of World-Systems.

MK: How did you come to do these music videos?

BC: I have done 4 in ten years – not a rate-busting record! I first started writing political music while in grad school, when I was quite active in the Toronto-based Marxist Institute. We are talking late 1970s/early 80s. I did some performing at political events in the 1980s, then my partner and I had kids. My interest in creating music resurfaced as I started writing annual birthday songs for my sons, which were always pitched at a level they could comprehend. As they grew up, the songs did too, so that by 2004, when Blind Eye Forward was written, my older son Myles was turning 15 (there is a reference to this in the [3] music video Blind Eye Forward which we posted yesterday - MK), and was himself becoming quite politically conscious. So the songs began to take a political turn. After I recorded one of them (Do we pull the monster down? – also written in 2004, but for my younger son Wes, who was turning 12) and put some images to it, a close friend encouraged me to put it out into the world. So I did that, via the Net. A while ago some [4] colleagues in Toronto at Socialist Project put that music vid up on their Leftstreamed site. I supplied some interpretive notes for that, and they set it up so the words could be read alongside the images. Leftstreamed gave the same treatment to [5] another music vid of mine, on the 2010 BP oil spill. My younger son Wes is now a professional jazz guitarist (he is just completing his BMusic) and we have collaborated on the most recent three music vids, including Blind Eye Forward. Blind Eye Forward as not been 'published' at any other venue than my own website, by the way!

**Lorde, spoof Facebook posts and the future of academic knowledge (2014-02-25 08:00)**

*by Sumi Hollingworth*

I’m finding more and more friends posting ‘news’ articles and the like on Facebook that (depending on the post) attract a flurry of excited or outraged comments and interaction, and then turn out to be ‘hoaxes’ or ‘spoofs’ as some brainy friend posts: ‘it’s not true,’ followed by a link to an article which exposes the hoax, and then everyone who believed it feels a bit silly. Recent examples include the [1]Denmark Dolphin Slaughter scandal, where a Facebook post about the Danish brutally slaughtering Dolphins for sport – complete with graphic photographs - went viral (and see [2]the exposure). More recently, there was a post about [3]Lorde’s suppressed Grammy Award acceptance Speech (and see [4]the exposure). In this, the young New Zealand singer songwriter is claimed to have had her real Grammy speech ‘a scathing indictment of global capitalism’ – suppressed and removed from live broadcast.
These stories, and their response, got me wondering what about the stories that don’t get ‘exposed,’ the stories that go under the radar? How do we know what to believe? I then started thinking, as a sociologist does, that maybe it doesn’t matter if things that are posted on Facebook or Twitter are ‘true/real’, or ‘fake/spoof/hoax’. If people want to believe it, share it, circulate it, and maybe even take action as if it were ‘real/true’, then it becomes real in its consequences. I suppose this isn’t something new (says the sociologist again): government lies to us all the time. The mainstream media regurgitates it, and we want to believe some of these government lies sometimes, and sometimes we don’t. However, these observations lead me to wonder if perhaps we are witnessing a democratisation of propaganda. Anyone can write anything they like and publish it on an obscure indy-media URL and what they say can go viral. If people believe it, or at least invest in it in some form, then that is powerful.
I suppose I could insist that people need to check their sources more clearly (if they investigate the sources of articles they read at all), and ask ‘is this source reliable?’ But realistically, we are all very busy, and that is really quite time consuming, given the amount of media we now digest daily. Furthermore, it is not actually that easy to work out which sources are most reliable, because of this democratisation of knowledge production: our reference points are not the same anymore. In [5]David Beer’s words, we now live in and with fragmented, decentralised ‘mediascapes’.

Or maybe it doesn’t matter how reliable the source is? Maybe we just let the lines blur? Don’t know what’s ‘real’. What’s not. Just believe what I want to believe. As one post, on a Reddit [6]conspiracy discussion forum stated, after the Lorde-Grammy-Speech-suppression debacle:

‘I upvote things that I want to be true. And I only read the title and maybe the first paragraph. That is a huge MAYBE. I’ll let some one else actually do a little independent thinking and reading to find out if it is true at all. Usually at that point I forget about checking back, move on to the next story, and just continue to believe that a satirical article is true. Then I share my brilliant opinion with everyone that will listen’.

While this is tongue in cheek, we are all gradually forming opinions based on this media we digest daily through Facebook and twitter, and we share it, and may act on it.

But one could argue that is just what used to happen with the Church: they tell us what is real, we act on it as if it is real. That was no preferable a situation. But now I feel like what I am being told is just more random. What knowledge gets produced, is believed, and gets acted upon, feels very random and much more incoherent. Knowledge hierarchies are crumbling. Or being shaken, at least. Who is (to be) more trusted? [7]The Government? [8]The Guardian? [9]Spiked Online? [10]Upworthy? [11]NewsBiscuit? Religious figures? Celebrities? Man in the pub? And if anyone can produce and publicise knowledge and be believed, where does this leave the university and ‘the academic’? Apart from a handful of commendable academic bloggers, and the slow move to ‘open access’ journals, the university is busy producing knowledge, that is a mile away from being ‘bite size’, that very few people read, or can afford to have access to. One renowned academic association’s [12]journal has even proposed to bar any of its editors from blogging, pushing academic knowledge into an even more rarefied position of access.

In the context of calls for a more ‘public sociology,’ it is important for us, as sociologists, to engage with this knowledge circulation on social media. As Beer argues: ‘in order to understand contemporary popular culture we now need to acquire practices that afford an engagement with the complex and often unpredictable forms of emergence […] and the grammar of conduct that it offers.’ Going back to Lorde’s suppressed Grammy Speech, what grammar of conduct is going on here? I used the word propaganda earlier in reference to this circulation of stories on social media. The Oxford Dictionary defines propaganda as [13]‘information, of a misleading nature, used to promote a political cause or point of view’. Arguably, this is often what these posts are. Personally and professionally, I thought Lorde’s supposed suppressed speech was brilliant with many well-founded, salient points in it; and I hate the idea of dolphins or whales being slaughtered. However, the way in which both of these messages were communicated was misleading, to promote a particular political view point. Yet, the way in which it is done is very interesting: What we have here with both cases is misattribution, be it for spoof or hoax purposes. The 17 year old Lorde is (mis-)attributed with having given a public speech about the tyranny of global elites (almost definitely written by an academic or someone with considerable training in academic writing); and the Danish government (mistakenly?) attributed with being responsible for the mass inhumane slaughter of an endangered dolphins/whales (accurately attributed to the Faroe Islands, autonomous of Denmark). We could see these stories as a form of cyber-activism, but one in which the misattribution – clearly deliberate in the case of Lorde, or perhaps accidental in the case of the Danish Dolphins - gets the message out to a broader public by using the power of social media to send the message viral. Taking the Lorde case further, not only might we see this as a form of political activism, it also bears hallmarks of hacking. The (somewhat dry, though clearly important) message – our oppression by the domination of a global network of elites-
is wrapped up in another more populist story (Lorde’s Grammy Award). Lorde is a mere puppet - a pawn in the game to get the story out. The technique works like a computer virus. It is a Trojan horse: you hide your weapon inside something else palatable- something people will more readily engage with. It is a clever technique.

But perhaps this is also about a desire for our celebrities to be more radical. The idea that Lorde is delivering this message makes it all the more powerful, subversive. Let’s be honest, who would have read a dry, lengthy, anti-capitalist rant had it been posted as-is, by a Professor so-and-so? In its entanglement with celebrity culture, this message gains even more traction. It is as if this kind of cyber-hacktivism is filling a political vacuum. The very circulation of these kinds of posts – the apparent thirst for these stories to be true – is itself culturally significant. The circulation of Lorde’s speech- seems to represent some desire to see celebrities speak out against injustice, to be a figure of critique and resistance. There is so much symbolic loading by others to produce her as something she may or may not be. Is this indicative of our thirst for public figures to speak out against the injustices of neoliberalism and global-capitlism? Even if we have Russell Brand and his new ‘anti-capitalist’ guise, or Matt Damon’s public speeches on civil disobedience, such outspoken celebrities are few and far between. We just don’t expect our celebrities to be so politically subversive and radical in an industry that is arguably conservative.

So does this label - ‘propaganda’ - capture what is happening here, with its associations with ‘false consciousness’ or even a lack of criticality among those who consume such information? Does this label do justice to the complexity of how and why these stories have such purchase? Why might we post these, in partial knowledge they are probably not true? Perhaps it is part of our social media identity and feeling part of a collective, political ‘community’ of alternative values, a community of subversion and resistance. Even when you discover it is ‘not true,’ a ‘hoax’, a ‘spoof’ you are not angry. It works, if you identify with the message. If you want to believe it.

However, I want to come back to my earlier point about which knowledge gets produced and circulated, feels very random and much more incoherent. What else are people thirsty to believe? The stories digested and circulated by people who aren’t in my Facebook network might look very different. Such as the Youtube video that has gone viral that [15]Justin Bieber is in fact a shape-shifting lizard. In a recent blogpost I wrote on [16]Russell Brand and accidental utopia, I celebrated Brand’s call for the revolution not to be serious but to be ‘fun’, somewhat random and accidental, so in some ways I invited this scenario. However, what concerns me is which messages will go viral, and will be acted upon? At the moment it seems like academics are woefully lagging behind in the way in which knowledge is packaged and delivered. There is something that public sociology can learn from this democratisation of knowledge on social media, the role, function and utility of hoax and spoof, and sociology might make useful alliances with online communities in engaging with this media.

Acknowledgements: Thanks to Kim Allen and Rich Franklin for their contributions to these ideas.

Michael (2014-02-25 14:39:10)
Perhaps what such hoaxes and spoofs represent is not so much a desire for celebrities to be more radical, but simply for them to represent something, anything, of more substance and value than shallow celebrity culture and the attendant (and stale) image and lifestyle propaganda they wittingly and unwittingly promote. Consequently, I think there is a positive underlying message in such scenarios: that a hunger for greater intellectual nourishment is starting to take hold in society, as the initial phase (and craze) of social media wears off. In other words, I am proposing that as social media as an idea reaches its climax (although I do not argue that it has or what this climax looks like), there is an almost implicit social desire for it to be used for more valuable ends. In its infancy, social media’s novelty in itself was enough to propel it forward and keep people interested and so its content was of secondary importance - celebrity news, selfies, posting photos of your breakfast and the like justed added to the fun. But now society wants more, as the emptiness of such usage of time and the irritating 'look how good life is' message that is shoved in your face become both boring and irritating. As much as there is a moral element to the act of posting hoaxes, especially when using another ‘person’ (are celebrities not hoaxes themselves?) as the avatar, I think that celebrity culture and all related to it is so repulsive that it is a question of which is the lesser of the two evils. The answer, in my opinion, is that the hoaxes are not only lesser evils, but not really evil at all. I believe celebrity culture has done more to damage society than any publicly broadcast hoax ever could. On a final note, I may be a bit too optimistic in the idea that there is a intellectuality hunger amongst society broadly and would certainly not object to arguments against such a view. In fact, another argument I would like to discuss in place of that is that such hoaxes and spoofs are more a spiteful dig at celebrity culture and its shallowness, (perhaps at times inspired by the perpetrators sense of inadequacy, which in turn is to a large degree a result of celebrity and popular culture itself) in and of itself, rather than a desire to replace the shallowness with a different set of values (e.g. the Justin Bieber-Lizard reference). Interesting article. Thank you. Look forward to your ideas in response.

Doing it for ourselves: the women’s workshop (2014-02-26 08:00)

by Ros Edwards and Val Gillies

As the academy becomes further marketised and institutionalised, it grows harder to envisage operating academically outside of traditional organisational forms. Yet the resulting pressures, hierarchies and exclusions are
leading many to look for alternatives. Can we have study groups and organise ourselves in informal ways that are autonomous from professional associations and universities and still carry academic value? Well, there’s a group of women academics who’ve been doing this independently now for a quarter of a century: the Women’s Workshop on Qualitative Family and Household Research. We can’t say that there haven’t been any compromises to be made or tensions faced, but we’re still going from strength to strength.

The Workshop didn’t start off as the Workshop. It began as a nameless informal support group of five women who met at a British Sociological Association summer school for PhD students in 1988. Back then, the ESRC used to fund the BSA to run what was a three-day long residential summer school and postgrads could apply decided to continue meeting because they were all researching family-related issues using qualitative methods, mostly from a feminist perspective. Five years on, the Workshop had up to 14 active members. People came along by word-of-mouth (little widespread use of email and no twitter available then anyway). The Workshop continues largely to operate through face-to-face meetings every few months or so – although requests for information and discussion of ideas now occur between times by email list. We’ve always met in London – at the LSE, at the National Children’s Bureau, at University College, and now at London South Bank, but we’ve long had members who want to hang on in there even though they’re far away or can’t manage to fit in attending meetings.

A growing group meant that things became a bit more formalized about three years into the Workshop’s existence. Someone took on being co-ordinator, a role that over the years has shifted around between members as and when necessary. The group also became a named entity. Quite a bit of discussion and care was put into coming up with the title, Women’s Workshop on Qualitative Family/Household Research, at the time. And part of that was the decision that it would explicitly be women-only. While this has been reviewed over the years it has retained unanimous support. Another part of the naming discussion was that the group’s title indicates and reflects that it’s as much concerned with the methodological process of qualitative research, with being a woman researcher, and with epistemological debates about how we can know about social life, as it is with the substantive topic of families and households.

As well as holding study group meetings and discussions, the Workshop publishes, both because we feel that we have important things to say but also because we do have an eye to our members’ academic careers. These initiatives reflect some of the shifting stances towards feminism in the academic publishing world.

Our first publishing venture was a special issue of the journal Women’s Studies International Forum (18:3, 1995) entitled ‘Women in Families and Households: Qualitative Research’. The roots of the Workshop are recorded in the introduction to that WSIF special issue, and the introduction also illustrates that in the early days we could say: “no ‘big names’ attend so we wield little academic power”. This is no longer the case when, alongside the post docs and early career researchers, several of us are professors (as is the case for us authors of this blogpost). While this might be seen as compromising our independence it is probably key to our survival. In the early days a postgrad could book a room in her institution for us to meet and maybe even extract some resources to hold a Workshop event with no direct REFable outcome. Now that is less possible and it is the members of the group with ‘permanent’, and more senior, positions who can leverage resources to ensure that meetings are free. In addition, the Workshop now provides a valuable networking space across roles, hierarchies and institutions. What remains true however is the remark in the WSIF introduction that: “we are as likely to celebrate the birth of a baby as the birth (publication) of a thesis, article or book”.

Three years after the journal special issue, the Workshop produced an edited volume entitled Feminist Dilemmas in Qualitative Research: Public Knowledge and Private Lives, published by Sage and still selling well nearly a decade and a half later. Another edited volume came out in 2002, Ethics in Qualitative Research. We had wanted to have the term ‘feminist’ in the title, but while we had the same publisher as for the Feminist Dilemmas book, and its reach hadn’t been held back by having the F word in its title, Sage decided that somehow that wasn’t good for sales. Feminism wasn’t selling in ‘post-capitalist’ times. But the content of the volume is pretty clear, with the introduction
to the collection including the sub-headings 'Being a feminist researcher' and 'A feminist perspective'. (And a second edition was published in 2011.)

Another five years on and Power, Knowledge and the Academy appeared, along with a shift of publisher to Palgrave. Any feminist would recognise the nod of the sub-title of the volume: ‘The Institutional is Political’. One of the perennial issues in connection with Workshop edited collections was discussed in relation to this initiative, and is recorded in the introduction to the volume. We mused upon whether we could have a collective approach and put out the publication and its contents simply as by the Women’s Workshop on Qualitative Family and Household Research. The topic of the book – our experiences of power issues in the face of rampant marketisation of higher education – shaped the answer to this question. Back in 1979 the Bristol Women’s Studies Group could publish Half the Sky: An Introduction to Women’s Studies, under the name of the collective. In 2007, in a climate of the (then) Research Assessment Exercise, appraisals, competition for jobs and promotion, and so on, it seemed far less possible not to have specific names as authors of chapters, and less possible for people to feel able and want to put work into editing the collection without named acknowledgement.

But the Workshop isn’t just about publishing outputs, and it’s important to acknowledge this. As much, or even more significant, is that the Workshop seeks to be a forum, a space for all and any of its members to try out ideas, to reciprocally hear and comment on others’ work and receive feed back. This means that the Workshop isn’t all feminist collective sweetness and light (as was pointed out in [1]the introduction to the book on power in the academy). Relations can be strained when editors of a collection have to make decisions about whose work is going to be included in a book, and those who want to be included but aren’t can feel rejected. And there are tensions between devoting Workshop meetings to the publishing project and keeping it open for anyone to feel able to put forward work for discussion, to come along to the meeting and to be given time and attention. Indeed, it’s the lively exchanges at the Workshop that produce the ideas for publications, often with members then stepping forward to act as editors, that drives the Workshop, rather than people who want to edit a book identifying issues to write about.

And despite the tensions, the Workshop as an open and welcoming forum remains as its intention, and also we think also its practice. Senior members reflect on how important the Workshop was as a source of support while doing their PhDs and hugely value the continued friendships and intellectual stimulation while post docs and early career researchers, like their doctoral forebears, see the Workshop as a safe forum to present their work and receive encouragement to publish for the first time. Whatever our career stage we experience the Workshop as standing in sharp contrast to some of the more adversarial academic cultures and contexts in which we can find ourselves. The Workshop remains a rare space in academia where women support each other while also providing excellent cross-generational mentoring and critique. We don’t know if our study group is unique in being an academic group, not institutionalized, explicitly women only and feminist, that’s achieved a silver anniversary and is still as active as ever. We think that we are, but we hope not.

Too much ink has been spent on examining the socio-economic conditions under which shantytowns emerge as urban enclaves and develop into unique lifeworlds. As 'cities within global cities', such as Delhi, Cape Town, Kingston, Buenos Aires or Rio de Janeiro (Frenzel Koons and Steinbrink 2012), but also as spaces declared by various constituencies in a 'permanent state of exception' (Agamben 1998), slums harbour postmodern ethical contradictions. This is so because of their increasing marketing as alternative holidays for those who can afford the ticket and are bored enough with luxury hotels. These tourists look for new experiences of gazing, listening, performing or living like the 'destitute other' under exotic cultural conditions – but only for a few days. Alongside such ego-enhancing journeys (Dann 1977) that facilitate expressions of – usually Western but also non-Western affluent – individualism (Giddens 1991), there are genuine, if at times misguided, humanitarian gestures. These may include independent charity projects or documentaries and other recorded testimonies on living conditions in the slum, widely disseminated across the world by independent artists. The distant humanitarian gaze produces all the right emotions to the gazer who never visited these places; not using those affective-come-emotional means to help others would contradict the nature of middle-class radicalism (Crossley 2003).

There are nevertheless other considerations at play in such contexts of touring and pouring one's heart when one considers accusations that slum charity fosters a new ideology of 'poorism'. Inversely, local regulation of tourism as an activist tool might be distorted. This slum tourist activism (tourism managed exclusively by slum-dwellers for the slum-dwellers) runs the risk of completing a vicious circle in which advocacy of the native right to self-regulation, a better life or 'difference' might support local anti-cosmopolitan ethics or the neo-colonial rationale of Westernization by native means (Argyrou 2005: 78; Korstanje 2011: 166; Tzanelli 2013: chapter 6). For research into parts of the world in which humanitarian activism was promoted through both religious (Catholic, Orthodox, Hindu) institutions and the particular religious doctrine's anthropocentric ethical tenets, the old Marxist term 'ideology' can be safely replaced by 'cosmology': the structured views we are acculturated to embrace as natural givens, but also the competences we acquire in the socio-cultural environment that generates these worldviews.

But I am mostly concerned with the novel multi-sited, technological, political and economic environments in which such distant tourist mobilities are produced and maintained. This generates new questions concerning the production or dissemination of cosmologies, as well as their profitable simulation. I place my sociological spyglass on Rio de Janeiro's slum tourism, which seems to experience a 'second Renaissance' on the eve of two major, global athletic events: the World Cup 2014 and the much-anticipated Olympic Games of Rio de Janeiro in 2016. Just out of an extended authoritarian regime that helped turn religious humanism into charity activism, and just into its first socialist government that [1]now faces favela protests for its 'unjust' urban planning, Rio 'slumming' appears to have joined the new knowledge economies. These economies of tourism or 'poorism' are regulated from many different business sites, including those of Rio, and are progressively more digitised. It is in fact their online façade that invites one to examine old questions of exploitation, representation and development anew, in their new shiny bottles. Organised journeys to favelas such as [2]Rocinha or [3]Santa Marta might be fronted by locals, as is the case with Mumbai's [4]Reality Tours, a business with a strong virtual (Internet) presence that currently donates 80 % of its profits to local development projects. The tours might be bringing business to local shops, which, in the case of Rio's favelas, [5]act as 'proof' that civilising the disorderly, 'dirty' populations of a glamorous city is underway. Back in 2010, when Rio started getting seriously ready to host the World Cup and the Olympics, the city's hillside shantytowns became the target of a government clean-up that in turn was [6]being used as a springboard to develop tourism in the favelas with special tours.

But what sort of tourism is that – and how much of it is truly regulated by the Brazilian centre, when all relevant tourist business entices digital visitors to become terrestrial tourists with its own online messages? Are favelas' virtual representations as bright, entrepreneurial social milieus actually hiding the realities of making ends meet on the site, or staying at the margins of mainstream society while acting as the object of desire? Just as the
eighteenth-century shantytowns of European cities and the twentieth-century slums’ connection to great traumas of modernity such as the Holocaust and the universal tale of genocide, Rio’s favelas act as repositories of global memory (Bauman 1989). As lieux de mémoire (Nora 1989), they concentrate and capitalise on stories of global or regional migration, resettlement and oppression, which in Rio date back to histories of slavery and more recent authoritarian control alike. Any digital or terrestrial tourism to these sites is a form of thanatotourism or dark tourism that in certain representational formats might sustain racist consumption. Finally, local responses to the ‘tourist gaze’ (Urry & Larsen 2011) could sustain activism alongside tourist development, but still push localities to reproduce global stereotypes of the swindler of charitable donors, the irrational rebel or the mystical primitive who sells simulations of their sociality in search of recognition they never get ‘at home’. Labelling e-tourism business ‘evil’ or inconsiderate may also be unhelpful. In contemporary hyper-neoliberal environments sociologists need to consider first what technological means and tools do to society and how. Internet projections of favela lifeworlds and slumscapes are often designed or maintained by professionals who are not familiar with local realities; when they are, they have to reduce them to globally intelligible ‘facts’. What do such new ‘economies of signs and space’ (Lash & Urry 1994) have in store for those who live in the enhanced terrestrial environments that will host the greatest mega-events of humanity?

The pen is stubborn, sputters – hell! (2014-02-27 08:00)

The pen is stubborn, sputters – hell!
Am I condemned to scrawl?
Boldly I dip it in the well,
My writing flows, and all
I try succeeds. Of course, the spatter
Of this tormented night
Is quite illegible. No matter:
Who reads the stuff I write?

- Friedrich Nietzsche, The Gay Science, Prelude: 59
There is a really interesting post [1]here by Stuart Elden on his writing space, which links into another post on the topic and a related Twitter hashtag (#whereiwrite). My writing space has varied a bit over the last couple of years. I used to do nearly all of my writing in my university office, with just about everything I'd written either being prepared in my office at York St John or, after I moved, University of York. In the Summer term of 2012 I had a research term, so from the Easter holiday I started writing at home. I'd done bits of writing like that before but this was the time I shifted to doing most of my writing at home. I still write some bits at work, but these tend to be less common now.

As a result of limitations of space and along with it only being a recent shift to writing at home, my writing space has stayed very minimal. Nearly all my books are in my university office and I just bring home what I need for that day or week. But when I first started I didn’t even have a desk. Below is the temporary desk I used in the Easter-summer of 2012. It’s a towel box. I used this with a plastic fold up chair.

[2]
On this temporary desk (pictured above) I wrote the first half of my book on the [3]politics of circulation. I also wrote an article on [4]music and cultural classification, as well as shorter pieces on [5]Sloterdijk and [6]new music cultures. It was a really productive time for me and this temporary desk somehow just became part of the process. I enjoyed writing on it. Managing with this temporary desk seemed to contribute something to the writing.

[9]
2476
I’m not sure if it’s because of the positive experience with the towel box, or the lack of space, but I’ve kept my writing space very minimal. I’m still using the same white plastic MacBook. The desk is used then for reading and note taking or for writing things using the laptop. I occasionally use my laptop to write in other spaces but nearly all of the substantial writing I do now is on my home desk.

David Beer is Senior Lecturer in Sociology at the University of York, UK. His book Punk Sociology will be published by Palgrave Macmillan in January 2013. You can read the introduction to the book open access [10]here. He also blogs at [11]thinkingculture.wordpress.com. This post was originally posted on [12]Thinking Culture[/nbox]

Superstar professors and their growing tendency to 'do research' in adverts (2014-02-28 08:00)

Witness Daniel Gilbert, superstar psychologist of TED fame, starring in adverts for Prudential:

And the rather less well known Adam Alter, who’s an assistant professor at NYU Stern,

Weirdly Robin Dunbar, he of Dunbar’s number, starred in a Guinness advert which has now been taken offline:

[3]
2478
Any other examples? This appropriation of the trappings of research within adverts seems to be matched by a trend towards ‘research’ in TV programmes themselves.

5.3 March

CfP – Troubling Narratives: Identity Matters (2014-03-01 08:00)

Second Call for Papers

‘Troubling Narratives: Identity Matters’

Confirmed keynote speakers for the conference are:

Ann Phoenix, University of London

Ken Plummer, University of Essex

This conference builds on the University of Huddersfield’s long held tradition of hosting a bi-annual conference on narrative research. It seeks to provide a fresh context for the development and dissemination of new research, ideas, perspectives and methodologies in the field of narrative research and enquiry and aims to bring together scholars working in a range of disciplinary fields. ‘Narrative’ is well known for its looseness of definition, its multiplicity of approaches and its interdisciplinarity, which over the years has led to a richness and diversity of narrative work. Identities, both private and public and individual and collective, have long been a focus for narrative researchers, where the content, form and effects of identity story-telling have been explored in a range of areas and contexts. The focus of ‘Troubling Narratives: Identity Matters’ is to address the ‘troubles’ that now surround contemporary narratives of identity, and the ways in which previous work may simultaneously inform but also trouble and be ‘troubled’ by new narrative work in the broad area of ‘identities’.

We invite contributions from researchers interested in using narratives across a range of disciplines including sociology, gender studies, psychology, law, politics, criminology, philosophy, history, anthropology, social work, education, and business and management. Topics of interest to this conference include (though are not restricted to) the following areas, including:

gender, sexuality, ethnicities, law, religion, politics, feminisms, digital technologies, work, deviance, consumption, citizenship, consumption, narrative methods, interpersonal violence, generations, emotion, trauma, trans*, lifestyle, education, bodies, age.

Abstracts should be no longer than 250 words. We invite papers in the form of 20 minute oral presentations, and also workshop sessions and poster presentations (the format should be clearly stated in the abstract). All submissions must include the author/speaker(s) name, title of paper, university or organizational affiliation, and...

A strike or a shot in the dark? An antithesis in eleven theses (2014-03-01 17:00)

In the midst of an ongoing campaign against [2]privatisation in Higher Education at the University of Sussex, [3]Prof. Luke Martell and I were kindly invited to join a debate on the subject for the University’s student TV Station ([4]UniTv), as part of its [5]Viewsbit interview series. My longstanding concern with and thoughts on the matter however returned with unexpected urgency instead of withering away after our lively but short twenty-minute discussion. This article aims at combing the shoreline where my own position on the matter claws at the topic discussed, in order to build a more spacious shelter for my argument(s) against striking, which Prof. Martell countered with a committed argument for it, as he has done with erudition and conviction numerous times [6]before.
Before setting the scene for what follows, a cautionary remark on the ambition of this piece seems obligatory, not to avoid friction, but rather to clear up the space for it to occur with imagination, critical spirit and goodwill. The intention of this piece then is neither to offer a space for showy provocation, nor to stage a mindless confrontation, secure in its ideological prejudice, but to offer a tentative (yet hopefully nuanced) rebuke to the immediate and automatic support to the strikes at Sussex (and perhaps elsewhere too), when a whole array of attendant questions of vital importance are ironed out in the process of tidily placing each other between opposing camps and assuming too much about who we are, where we stand and how we speak when we should also perhaps interrogate our everyday professional conduct to see how we fare, individually and collectively, in relation to the principles we claim to defend.

Despite the unashamedly mischievous title of this article, the eleven theses defended here aspire to make any such polarisation irrelevant, if not extinct, by virtue of my belief, trust and hope in political exchange as ‘the art of making hatred less eternal’ (Todorov, 2003 : 169), rather than prolonging some of its most sinister features, as witnessed in the form of popular (if not populist) slogans that fan rather than fight ‘class warfare’ instead of working towards making it less relevant and/or enduring. Such allusion to ‘class war(fare)’ however has sadly found expression in the form of commentary, protest banners and, perhaps more eerily, in the form of a chant that preceded a message delivered by Noam Chomsky (via Skype) in support of the protests at Sussex. To make matters worse, that very slogan (of which, sadly, I have no footage) was sung en masse by a host of students who were there to soak up Chomsky's sentiments of revolutionary fervour, initially mistaking their idol for Chomsky's assistant, who was cheered and venerated as a deity that neither Chomsky nor his assistant should be(come). The point here is that when emotions run high, the clarity of the picture fades, often returning to us as a mockery of ourselves, which is why the evocation of divisive language achieves just that and in the process, human passions and crowd behaviour only turn against our better judgement and our better selves.

The eleven theses that follow aim at doing away with such purely emotive responses to the chosen topic, by offering an antithesis to much of the language of, the thinking behind, and the practices witnessed at and during the strikes, thus sharing the sentiment of Marx and Engels' much maligned eleventh thesis on Feuerbach about how 'philosophers have hitherto only interpreted the world in various ways; the point is to change it'. The problem however is that when/if opposition to something is articulated in such divisive and militant, if not militaristic, prose (i.e. class war), we might be suspected of wanting to conserve the world exactly as it is by shifting the blame onto others and eschewing our responsibility for much of what happens, rather than showing some willingness to change ourselves, our work ethic, our ideological habits, our political reflexes or our interpersonal commitments to each other and the ideals we seem to be pledging allegiance to.

Having attempted to provide an avowedly personal, selective and in no way objective or wholly representative snapshot of the atmosphere here at Sussex (when on strike), I intend to identify what I perceive as the fault-lines of this dispute in the hope that my unpopular argument will neither be revered nor smeared, but allowed to live its own life as a worthy participant in an energetic discussion on such a pressing question.

I. Against it because I'm (up) for it

Recognising the very question of choosing one of two sides as an artificial dilemma, since multiple positions can and do always exist, I am tempted to respond to it with a paradox; I am against the strikes because I am for what they represent. Although I fully support the ideas, ideals and principles behind both the anti-privatisation campaign as well as the reasoning behind industrial action, I don't think many of "us" who do support the strikes overtly and vocally are in a position to hold such a view by virtue of what "we" do in our every-day, routine professional practice as University workers. I very much fear that we are far too complicit in and complacent about the trends, the workings and the regulatory regime of Higher Education in our every-day academic practice to be able to afford such a stance without sounding naïve or hypocritical even.

II. Resistance against ourselves?
Given that our work at the University is not based on coercion but on our contractual agreement with specific terms and conditions of employment, is it consistent to sign one’s terms of surrender on the one hand and rebel against that decision on the other?

What is being defended in the strikes, and quite rightly so, are the very values and principles that Universities are no longer run by, if they ever were. A cursory glance at Plato’s Academy for the few, Cardinal Newman’s elitist Catholic University, Minister Humboldt’s university of high culture, or the successive (re)incarnations of such master-images for the modern Western University, reveals little else than a long pedigree of lament and betrayal of high ideals about University education as a rare opportunity for contemplative life, critical thought and the cultivation of character, replaced instead by complaints of exclusion, discrimination, inequality, mounting debts incurred by hefty loans, disillusionment with pursuing tertiary education, declining standards of teaching and research and the emergence of the techno-bureaucratisation of post-war Western Universities.

Romanticising the University against its true image as an institution that has hardly lived up to its imagined standards, also means disguising our contribution to the proliferation of its vices that have long prevailed over its supposed virtues, by consenting to and signing the very terms of our surrender as academics, knowledge-workers and learners in such an institution; we vote with our contracts and with our fees too. To make matters worse, education; that other chimera, doesn’t fare that well either, making it even harder to pretend that we lend our support to ideals we so readily devalue through the contracts we sign and the type of work we submit ourselves to do.

Put simply, sparing you any further historical or other flourishes, it seems rather unrealistic if not entirely misleading to lend our support to what the University has not been and probably never will be, unless we question our every-day practice within such an institution, or our commitments towards education and the flowering of scientific knowledge and humanist concerns.

We cannot afford to inflict upon ourselves the ‘hidden injuries of neoliberal academia’ on a daily basis and strike against such contractually agreed upon demands and pressures as a special occasion.

We cannot consent daily to reducing the production of knowledge to the level of drafting applications for funding, point-scoring for the RAE and the REF, evaluating our work by Key Performance Indicators and audit measures, upsetting our brains, stomachs and nerves over maximising citations, measuring our work in terms of bibliometrics, undermining our pedagogic relationship with our students by treating teaching as a time-consuming chore and by minimising the feedback or the academic and pastoral support we give to them, humiliate ourselves by accepting the casualization of our labour, and claim to want to overthrow all that in one stroke during a strike. We cannot afford to march for education as a public good yet agree to march to the beat of our institution’s trustees, at least not at the peril of being accused of double-standards.

Striking won’t restore University education or academic working conditions to a golden era that never was, nor will it prepare the ground for more hope towards overthrowing the regulatory discourse of the post-modern enterprising university, but our every-day academic conduct will. Engaging in the first but not the latter gives the impression that we are comfortable with being actively just one day yet passively unjust the rest of the time by fooling ourselves and others in the meantime.

III. Give it up to live it up

Following the argument presented above and provided that we feel utterly disgruntled, disappointed, frustrated, angered and disgusted by the way in which we are treated in and the way in which we treat our students within the cloistered walls of the University, why do we not choose to seek employment, personal joy and academic rigour by abandoning such an institution to its sorry state and join or form other institutions that cater for our

Taking up the thread from A. Hirschman’s (1970) Exit, Voice, and Loyalty, why not express our loyalty to principles and values that we cherish by exiting an institution that does not defend or support them and lend our voice instead to other initiatives that abound or just wait to be discovered? It is hardly news that universities have ceased to have the monopoly on the production and dissemination of knowledge in an era of such fervent Internet activity and the proliferation of the so called ‘Mode 2’ knowledges which herald an unprecedented shift towards a non-hierarchical, applied, reflexive, often community-based, transdisciplinary, heterogeneous, and publicly relevant/available/accountable knowledge ecology as opposed to the docile transmission of specialised knowledge fit for use in a small circuit with a limited scope and remit, such as that of the University.

Why not set the standards for our work, the tone of our message, and the example for others (students, colleagues, public) by taking ownership of our scholarship rather than leave it to bob away on a sea of agony under the [16]‘creaking piers of peer review’.

IV. ‘Our’ University, ‘our’ services, ‘our’ colleagues?

In the light of the above, and amid urgent reminders that ‘our’ University and ‘our’ services are ‘not for sale’, accompanied by calls for solidarity with and support for ‘our’ colleagues, academic and non-academic alike, is it consistent to claim them as our own? How can ‘our’ University be ‘ours’ when we have no say on how it is run? How can ‘our’ services be ‘ours’ when we haven’t chosen them according to our ethical standards and requirements? How can ‘our’ colleagues be our colleagues when a community of/as scholars is found lacking?

Our university is not ours because we have chosen it not to be run by us but by a board of trustees, thus limiting ourselves to the role of corporate stakeholders when we could be shareholders in a public agora.

Our services are not ours because we have not chosen how our non-academic colleagues are employed, with what pay, welfare provisions and guarantees of overall job satisfaction.

Our academic colleagues are not our colleagues because solidarity isn’t (and shouldn’t be) automatic, but conditional, depending on a great number of things. A colleague is not she who does the same job as me, but the person who shares the same principles and values as me in practice.

For the University, its services and our colleagues to become ours, we would first need to make them ours in the manner described in Thesis III. None of those three commitments stand as they are but they can do if we take pains to institute such changes ourselves.

In very much the same manner, and to allude to another notion that is claimed as ‘ours’, there is or has been nothing ‘public’ about the University since ‘public’ is not merely something that is subsidised by the public purse, but something we (can) have a say on; be it organisational issues or the curriculum itself. And what better way to orient a University to public goals and values than by making it ourselves?

V. ‘Us’ and ‘them’ or ‘us’ in ‘them’?

Let us imagine that someone is walking towards the University and is met with a picket-line. That person will most likely feel intimidated by being shouted and be discouraged from going where she is going on the grounds that she’d better join ‘our’ protest, or she’s one of ‘them’. Who gets to decide however, who ‘us’ and who ‘them’ is?
What if the person crossing the picket-line is the parent, relative, or friend of a student who needs to be picked up to be carried to the hospital due to a health problem. Is that person one of ‘them’? Or is she one of ‘us’? How do we get to decide? With what knowledge of the other person? Might we not feel rather embarrassed for having assumed too much in the first place?

Imagine another person crossing the picket-line to go and teach. She’s clearly not one of ‘us’, she’s one of ‘them’, but what if that person shares the same principles and harbours the same hopes as ‘us’ but disagrees with our methods or tactics and thinks it best to serve the same values differently? Does she remain one of ‘them’ or is she closer to ‘us’. And if she is closer to us, why does she not come close to us? Are we not right to intimidate or undermine her dignity, confidence and self-esteem for not joining ‘us’? Or are we wrong to assume a great deal about who she is, what she thinks and/or how she does things? And if her views are not reducible to a slogan, what happens then? She must be one of ‘them’, because ‘we’ don’t think this way and, to paraphrase the Alexandrine poet C.P. Cavafy, [17] ‘Now, what’s going to happen to us without ‘them’? They were, those people a kind of solution’.

If we are so serious about and committed to values of solidarity, mutuality and convivial associational life does this polarisation, in terms of ‘us-and-them’, not frustrate not just the aesthetics but also the content and the political orientation of our struggle? What happens if you’ve read my article and I cross the picket-line, will I be one of ‘us’, or one of ‘them’? If I believe that the principles I stand for and wish to live in harmony with are better served in my daily, undisrupted relationship with my students even during a strike, does that make me one of ‘us’ or one of ‘them’ and why? If I think it vital to discuss those issues in the classroom during a strike as part of the curriculum am I one of ‘them’ or one of ‘us’? If I am to support teach-ins, rather than teach-outs in my next thesis, will I be one of ‘us’ or one of ‘them’?

VI. Teach-ins, not teach-outs

As someone who currently teaches and has been studying sociology for the past decade or so, I can’t help but remain faithful to an understanding of that discipline as an intellectual adventure that makes the world safe for doubt, rather than from it, preferring open discussion to fanaticism, multiplicity to dogmatism, uncertainty to axiomatic certitude, plurality over homogeneity, respect for rather than denunciation of ‘the other’, with a view of understanding and nurturing sociology as ‘The’ discipline that recognises [18] ‘no nation now, but the imagination’.

Armed with such aspirations for an academic subject I have developed an affective relationship with over time, it would feel like betraying my love of discussing sociology with my students if I were to declare myself absent from a ‘sit-in’ (pun intended!) with my students where we rub and polish our brains through contact with each other; voicing our thoughts, ideas, comments, disagreements and feelings. For such discussions to take root somewhere, they need to start here by learning the art of speaking calmly, clearly and in a collected manner while also honing that other skill; of listening intently and patiently but in no way subserviently, passively or uncritically. These qualities do not flourish in ‘teach-outs’; sloganeering is preferred to argumentation, taking sides is favoured to flipping sides to see what noise they make, ideology replaces a more searching position, ‘us’ dominates ‘them’. In my mind and as far as I can judge from my own experience a ‘teach-in’ is an immensely more effective and durable form of a ‘sit-in’ compared to a ‘teach-out’.

During recent strikes, I defended that exact position in practice by choosing to teach-in rather than to shout-out, thus turning the curriculum on its head in order to discuss, in class, the issues that trouble us in relation to the current state of Higher Education, the state, position, role, and function of the University as well as the merits, but also the contradictions and obstacles, of collective action and associational life at broad. All of these points naturally admit a whole array of divergent views, perspectives and interpretations that do not fit any Manichean grid of good/bad, right/wrong, us/them that is thrown around us like a straitjacket which we have to cling to in order to have a voice, an opinion and a ‘say’ on any matter. The picket-line often takes the form of such a straitjacket and acts as a physical, intellectual and moral barrier to the permeability and circulation of thought trapping the many,
and often unpredictable, possibilities, sites and sides of exchange in an unnecessary dividing line, a gap, a rift and perhaps a void and vacuum too. What we do, who we are, how we think, where we stand, what we say, are renewed relationships and negotiations on thinking and doing, necessity and convention, emotion and reason, introspection and excursus, ritual and resistance, structure and agency, and similar other conceptual pairs that cannot be brushed off without doing violence to the virtues of deliberation, negotiation, association and exchange. To paraphrase Georg Simmel (1910: 390), the whole point and essence of sociability is not to strive for the perfect society but the perfect society, and this can hardly be accommodated in the shape or form of a dividing line.

In the last few instances of such teach-ins during strikes, I took the initiative to bend the curriculum to fit discussions with my students about what and who the University and education are (for), who and what the ‘Other’ is, whether failures in our public culture and polity are systemic faults of capitalism, ideology and the machinations of a ruling class or inherent shortcomings of our ability to make and participate in collective life. In the process of doing so, a much more complicated picture emerged of many of the topics, issues and ideas that are (inevitably) treated as one-dimensional absolutes when people are artificially divided up into ‘us’ and ‘them’.

How could I possibly abandon such energetic intellectual, moral and political activity where critical thought and judgement reigns over taking sides and moral grammars of learning how to live together with people who are and think unlike us are explored, in favour of a false dichotomy that is represented by the picket-line? Would I not betray the function of my seminars as an outlet for and the natural home of cultivating sentiments and ideas that I consider educationally, culturally and socio-politically vital, if I were to flee away from discussing how ‘I am confounded by you, then you are already of me, and I am nowhere without you’ (Butler, 2006: 49) or showing that ‘there is something more important than my life, and that is the life of the other’ (Levinas in: Bernasconi 1988: 172)? How and who could accommodate such thinking about how to ‘do’ and ‘be’ social life across the picket line? How could I ask my students to be absent from such an encounter and how could they ask me to stray away from forging such a collegial, pedagogic relationship? For all I know, most students who attended those sessions instead of joining ‘our’ colleagues and ‘our’ fellow-students outside the classroom felt overwhelmed and genuinely appreciated my invitation to challenge ourselves inside rather than outside the seminar room. In fact, many expressed their gratitude and support for my decision to host, spark and moderate such discussions in-class. Had all this not happened, I would have not been invited by my students to join Prof. Martell in a debate about the strikes in the first place.

If my students and I were to join ‘us’, would we not become invisible, left without a voice and feel lost in the midst of a lonely crowd defined by its sameness rather than by what makes us stand out as different, unfamiliar and unique?

VII. Pay and services without content?

Puzzled as I am about a number of issues voiced in the preceding Theses, I fear that much of the argumentation in support of the strikes seems rather limited applying to ‘our rights’ an instrumental veneer rather than aiming at the intrinsic core values of what we should be asking for. There is much talk about ‘pay squeeze’, ‘pay disputes’, ‘strike action’, a fairer treatment towards ‘services’ aspiring to a more egalitarian occupational environment; all of which are urgent demands and need to be addressed immediately, without a hint of doubt. At the same time however, it does surprise me how there is almost no mention at all about the content of our work, thus limiting the discussion on our rights solely to an instrumental level of things.

Agitating for our occupational rights is of course vital but does that also not include our right to have more power, more involvement, more ‘say’ on the content of our everyday work? That is, deciding who it is that assesses, values and is in a position to determine how funding is allocated and how it is prioritised? Are we happy just to get our share of the University’s profits without doing our bit to change the essence of what we do, or are we happy,
pleased and in agreement with the current regime of, what Nigel Thrift (2005) calls, ‘knowing capitalism’ which creates the standards for our work with very little deliberation or control from our part? It is one thing to ask that our occupational demands are being met, and quite another to agitate for change in the type of academic work that is currently being carried out and materially rewarded at the moment; fearing that the first is well advertised and fought for, leaving the latter in tatters under the assumption that with a single pay rise we shall transform ourselves into virtuous and learned academics who engage in publicly relevant and accountable scholarship. While income inequality is obviously important for reasons that don’t need further analysis, are we not prolonging inequality in terms of our commitment to our academic oath or our responsibility and accountability to our publics (students and civil society at broad)? Can we afford to demand more pay, and indeed we must, without meeting or changing the standards and public orientation of our scholarship? Might we not be rightly accused of instrumentalising our contribution to public life by only demanding changes in instrumental terms? I clearly know that strike action is not just a pay dispute, though it largely is that, but I also can’t help by noticing where our priorities seem to lie.

If we think, as I certainly do, that our work involves more than delivering products to paying clients, thus amounting to an enduring relationship of vital civic importance which we forge with our students, colleagues, and civil society at broad, do we not need to broaden the scope of our demands? Am I alone in thinking that even if we were to have better wages and better services, our commitment to academic, ethical, pedagogic and civic values would still need to be demonstrated somehow? It is because I spot a discrepancy here that I insist on suggesting that we urgently need to work against the strikes in order to better work for them, implying that ‘our work is our strike’ by setting the standards that we wish to see implemented. That ought to be our daily resistance to the corporatisation of the University we so readily and willingly denounce.

My counter-argument reads like an invitation to denounce the entrepreneurial streak we see in the universities we work in, by renouncing demands that are made on us and aren’t ‘ours’; quantifying academic performance rather than striving to uphold academic principles and public values. To do so, we might have to envisage our role as demiuorgoi (demos= public, ergon =making) working simultaneously towards the advancement of our academic disciplines as well as making things public; countering efficiency and excellence with quality and arête (virtue), valuing co-operation, not competition and aiming at redrafting our ‘epistemological constitution’ by preparing ourselves for such change through a daily re-evaluation, re-positioning and re-alignment of academic and public values.

VIII. Exercise of rights or an exercise in self-righteousness?

Continuing the discussion on rights, but this time on a different plane and a slightly different context too, I remain sceptical of having too many of us warming our hands around the fire of our indignation towards the state of things and the status quo in Higher Education for the simple reason that I suspect too much agreement to be an exercise in self-righteousness, which in itself is not a resource in any way but a mere nod to and an argument for doing close to nothing. It feels rather nice indeed to bathe ourselves in self-righteous glow and bask in the adulation of others, but I fear that we may need to be more explicit about what ‘rights’ mean and what we are prepared to do in order to safeguard them. Exercising our rights, at least in my moral vocabulary, ought to be equated with doing the right thing and that means meeting our responsibility towards (a) our discipline, (b) our students and (c) the publics we create or wish to participate in.

Doing the first means, exercising, sharpening and indeed wearing out our independent critical judgement rather than accepting the pay-cheques, standards, demands and desired outcomes of a study’s funders to help increase sales, boost prestige, generate ‘impact’ or what have you. Committing to the second means being willing to treat learners with respect, giving them detailed feedback that they can do something with, rather than a page with sprinkled red ink all over it and indecipherable doodles in the margins that only bruise one’s confidence rather than help in acquiring it. It also means, getting to know students as people with names, personalities, dreams and needs we need to cater for by offering, not just academic but broader pedagogic support which also comes in the form of ‘out of hours’ work and pastoral care too. Aspiring to the third means writing our work for a public and making ourselves
accountable to our fellow-citizens by offering, not simply answers in the form of dry research but context too in the form of theory, thought, and knowledge turned into understanding. All three are affective relationships we need to attend to for higher education to flourish, or nobody else will. This is the morale of Aristophanes' [19]The Birds, and it ought to be the morale of the stories we write too, but without the Faustian bargain that the play narrates, and I'm afraid that's up to us too.

IX. Change without change?

Resistance without willingness to change will only bring about a change in actors, not a change in the script. Advocating ideals but choosing illegitimate means to adopt it, annuls the contents of these ideals in the first place, and reveals how ideological demands can function as mere pretexts for legitimising enmity, hatred and 'war' (remember the 'class war' chant?). As I have tiresomely argued above, change in the culture of Higher Education can't come from ex cathedra denunciations, punching the air, shouting slogans, holding banners, or forming picket-lines but by viewing resistance as a daily pursuit that disrupts the tidy symmetry of ideology and replaces it with the complicated work we need to do as publicly-minded scholars. Turning a blind eye to vandalism, intimidation and verbal abuse won't do, turning away from all three however, might.

I have witnessed incidents of students and people I don't know, and therefore should not judge (are they staff, visitors, service workers, family?), be intimidated and undermined by verbal abuse that 'describes' who and what they are, and indeed some damage to University buildings. Quite ironically, I have also witnessed protesters dressing their kids with the University's insignia, logos and branding while feeding them slogans to shout against that same institution. Worst of all, I have heard the story of a cleaner in the building where I work who, upon leaving the building to throw 'our' rubbish could not get back in to collect her personal belongings because the door was superglued to detain 'us' from entering the building. This is not change, but a mockery of change, not even a parody of it, and it reminds me of that slogan that defends 'our' service workers; is the cleaner I just mentioned not 'our' service worker? We bemoan the bad labour conditions in our campus but have we done anything close to '[20]Berkeley's Betrayal'? That courageous report penned by sociology students at Berkeley who protested against low wages and appalling working conditions at their University by interviewing workers, and writing an impressive, and influential forty-page-report, hailed as an exemplary work of [21]public sociology with a foreword by [22]Barbara Ehrenreich. Have we got anything similar to boast about? When I introduced the idea of doing something similar to students and colleagues I got only polite nods, pleasant cheers but no responses, to an initiative I was willing to help with by editing, supervising, and facilitating the interviewing and writing up process at the expense of my 'other work' (as if there is any 'other work' to do, worthy of its name).

X. A prayer or a plan?

Unlike the characters of Aristophanes' plays, in our social world it makes very little sense to seek advice from oracles, but we can learn something from the way Aristophanes lampoons ideologies, challenges norms (in his unique bawdy way), and ridicules our ill-conceived and misguided deeds in his work. She who desires change in Higher Education may indeed issue clarion calls to 'stop the privatisation of Unis now', but 'ending privatisation' is a prayer, not a plan; for something not to happen 'in our name', we need to stop signing up for it with our name, as the previous nine Theses have attempted to demonstrate. Until then, the noise we make submits itself to faith, not to reason, to passive injustice, not active justice, walking the walk but not grabbing Leviathan's tail on our way, and twisting it hard 'til the beast learns to fear us.

XI. Look who's talking!

An entirely valid and justified reaction to what I've written so far could indeed resemble the title of the last of my eleven theses against the strikes, but given that this is an article and not a self-portrait, I will limit myself to introducing mere fragments of my own quotidian professional practice, as a way of defending, but not over-indulging
myself.

I am a self-funded doctoral student and unofficial, if not illegitimate, lover of sociology who writes a thesis on the changing conceptions and the historical transformation of public sociology, the University, higher education, intellectuals and the public sphere with a view of offering alternatives that will reform these into more public, sociable and less pretentious versions of themselves by:

(a) Suggesting the integration of public sociology as a new curriculum for critical scholarship which will transform the production of knowledge from its current transactional role to a more relational one which would implicate learners, teachers and doers of sociology as participants in the political agora, by means of a pedagogy that is oriented to the cultivation of civic virtue(s).

(b) Calling for a reshaping of the University to fit a more co-operative model where everyone involved can be a beneficiary owner/member of the institution rather than a paying client or a delegating chairperson.

(c) Ushering in the Internet as a new public sphere which we found, by interacting and co-creating rather than simply find, and abide to, with a view of encouraging, developing and aspiring to a governance of the commons.

(d) Working towards replacing public intellectuals with public characters who, in Jane Jacobs’ (1961: 68) coinage of the term, can be ‘anyone who is in frequent contact with a wide circle of people and who is sufficiently interested to make himself a public character. A public character need have no special talents or wisdom to fulfil his function—although he often does. He just needs to be present, and there need to be enough of his counterparts. His main qualification is that he is public, that he talks to lots of different people. In this way, news travels that is of sidewalk interest’; thus, admitting makers and doers, flâneurs and bricoleurs rather than orators, demagogues and saloniers into the public realm as co-authors of a communal script, by heralding a substantive, not a merely decorative, shift which emphasises practical, not intellectual intervention and allows access to and participation for many more figures than are normally admitted to the pearly gates of the intelligentsia.

In the meantime, I periodically write for and maintain a column at The Sociological Imagination, which is an open, free online magazine; aiming hosting sociological interventions on public issues that matter rather than selling stylised, technical monographs for internal consumption and use.

In so doing, and taking into account my approach to teaching as set out in Thesis VI, I feel like I am indeed in a position to say that I hardly betray my ideals as:

(a) I fund my own research rather than relying on external sponsors who might (and in most cases do) have a ‘say’ on the content of my work,

(b) I contest the current audit-culture in academia that presses for publications but undermines authorship.

(c) I teach out of love for the subject and the relationship with my students, not (strictly!) for money, believing not just in the public role of education for citizenship but also in the virtues of pedagogy.

(d) I give detailed, qualitative feedback to my students, offer my time generously to students who wish to discuss something (anything!) with me and often accompany them on social events (i.e. relevant film screenings, public lectures etc.) therefore acting beyond the confines of my working time and well beyond the terms of my contract.

(e) I resist the regulatory discourse and regime of the University and its managers wherever and whenever I see it as part of my daily conduct as a doctoral researcher, a student, a tutor and a young sociologist, rather than
wait for 'that one special day' to do so.

In sitting down to write this, and with a little help from my deluded mind, I suspect that sharing my thoughts with you, rather than striking for two hours to get myself a nice, frothy latte, seems to be more of a resistance, or at least, that's my pact with the Devil, and my story what's yours?

[Lambros Fatsis is a final year DPhil student at the School of Law, Politics and Sociology at the University of Sussex. His doctoral thesis concentrates on discussions of public sociology, the role of the University and intellectuals, while other research interests include black music, urban culture and the history and sociology of the Jamaican soundsystem. He also performs as a reggae selector/radio presenter under the name [Boulevard Soundsystem and is a contributor of Billboard magazine on reggae music. Recent publications are featured on the British Sociological Association’s Postgraduate Theory Forum and on The Sociological Imagination magazine on a variety of issues ranging from the English riots, the idea of sociological imagination and the Eurozone crisis. In the spring of 2013 he achieved Associate Fellow status of the Higher Education Academy. You can watch his debate with Prof. Martell in full here.]

Silver-bear is strike-breaking regardless of your intellectual justification for it (2014-03-01 20:09)

This is a quick rejoinder to [1]this article by Lambros Fatsis. I wasn’t comfortable with the idea of rejecting the article because of my political disagreement with it. But equally I’m not comfortable with publishing an argument that "we urgently need to work against the strikes" without also registering my complete rejection of it.

There are some points in the article which I think are straight forwards problematic (e.g. the notion there’s something ‘inconsistent’ about signing an employment contract and going on strike, the notion that the structural positions of those involved make support for the strike seem ‘naive’ or ‘foolish’, the slightly sneering dismissal of the language of class war) but, reading charitably, I take the basic argument here to be that strikes aren’t radical enough. They render dissent as something exceptional, perhaps carnivalesque, briefly suspending the order of things only for it to later return with a crushing intensity which negates the emancipatory impulse underlying the strike:

We cannot consent daily to reducing the production of knowledge to the level of drafting applications for funding, point-scoring for the RAE and the REF, evaluating our work by Key Performance Indicators and audit measures, upsetting our brains, stomachs and nerves over maximising citations, measuring our work in terms of bibliometrics, undermining our pedagogic relationship with our students by treating teaching as a time-consuming chore and by minimising the feedback or the academic and pastoral support we give to them, humiliate ourselves by accepting the casualization of our labour, and claim to want to overthrow all that in one stroke during a strike. We cannot afford to march for education as a public good yet agree to march to the beat of our institution’s trustees, at least not at the peril of being accused of double-standards.
Striking won’t restore University education or academic working conditions to a golden era that never was, nor will it prepare the ground for more hope towards overthrowing the regulatory discourse of the post-modern enterprising university, but our every-day academic conduct will. Engaging in the first but not the latter gives the impression that we are comfortable with being actively just one day yet passively unjust the rest of the time by fooling ourselves and others in the meantime.

The structure of this argument is one I’m actually somewhat sympathetic to. I think there’s a tendency, not just amongst the left, to overvalue personal judgement in a way which combines objective complicity with subjective repudiation i.e. rejecting a system in principle while nonetheless acting in a way which willfully reproduces it. So what I take Lambros to be saying is that strikes are one step removed from this, constituting expressive action which leaves the day-to-day life of the institution untouched. If this were so then I’d probably accept the argument. However it straightforwardly misunderstands what a strike is, misreading collective action as a day out for a collection of individuals. Collective agency is exercised through the coordinated withdrawal of labour, representing one move within a much longer standing game. Steven Shakespeare has expressed what I believe more competently than I’ve thus far been able to:

There is no reason why academics should be any more logical about these matters than anyone else. But I wonder if the gaping holes in these responses are, at least in part, a result of the shaping of academic subjectivity by the capitalist university. We are engaged in a profession which claims to promote something above instrumentalism – and it is precisely this which is our instrumental role. We have to play the games of preparing students for employment, and raising money for research, but we keep an internal distance from these things. We cynically despise them (and often despise the students who do not measure up to our ideals), whilst committing ourselves to a system which believes in these things on our behalf (cf. the Zizekian analysis of contemporary belief).

However, it is this internal displacement which produces the figure of the contemporary academic. This person is invested in an ethic of scholarship, which actually leaves them without a language or imagination for addressing the material conditions of higher education, beyond that of an ultimately ineffective idealism. The melancholy of the modern scholar over the marketization of education is therefore neither a form of resistance nor mere nostalgia, but a fabricated affect essential to the mediating role we play.

Of course, I generalise hugely, and we can all think of many exceptions. I am not suggesting that our bureaucratised unions or existing left groups offer any panacea. Nevertheless, higher education has been, and will continue to be, marketised and instrumentalised, and the vast majority of academics will (grudgingly, cynically) put up with it. And our ethic of scholarship is of no use. It is the same ethic which is able to abide such logical inconsistencies and lack of solidarity when it comes to strikebreaking.

Repudiating collective action because its goals aren’t lofty enough in practice does little more than strengthen those seeking to destroy public higher education. Criticise the tactics, suggest alterations of the strategy but accept that strike-breaking is strike-breaking regardless of your intellectual justification for it. If you’re going to actively undermine the collective action of others while castigating them for the narrow instrumentalism of their goals then you need to offer an alternative. Unfortunately a radical ethics of everyday life just doesn’t cut it. It offers no theory of change. It’s just the universalisation of a personal ethos. It is the apotheosis of precisely the expressive politics Lambros is rejecting.
If strikes aren’t radical enough then you need to explain how we can collectively work towards these loftier ends without them.

2. [http://itself.wordpress.com/2013/12/05/the-academic-ethics-of-strikebreaking/](http://itself.wordpress.com/2013/12/05/the-academic-ethics-of-strikebreaking/)

As far as the 'I’ can hear (2014-03-02 08:00)

Taking up the challenge that [1]Paul Warmington set for The Guardian readers to name ‘a Black British intellectual, now that Stuart Hall is gone’, I found myself simultaneously nodding my assent to his well-reasoned tribute to an inspirational role model of mine, but also fundamentally disagreeing with the very terms and conditions of the challenge.

I very much fear that Dr. Warmington's effort to locate the black public intellectuals of today is tainted by a desire to look for them, almost exclusively, in the physical geography of academia, thus reproducing a common trope, if not an outright bias, in how and what we understand intellectuals to be. Any such search operation, using as its sole criterion the (public) intellectuals’ academic descent, simply reproduces the tired image of a pampered scholarly clan while sidelining, belittling and even ignoring the every-day presence of black Britons as active participants in and custodians of a superbly rich urban, convivial multicultural exchange, to which we bear witness, not just with our minds but with our senses too, in the cities we live in.

Commendable though Dr. Warmington's argument is when applied to the [2]absent presence of black intellectuals in the academy, I would urge us to widen the dimensions of how and what we understand public culture and intellectual life to be by inviting many more cultural allies in our discussion than academic orientation allows, given that they are co-authors of our every-day experience of urban cultural life. To paraphrase an arresting snippet from Rousseau's Émile, ‘we can be public men and women without being scholars', by aspiring to be and to live among public intellectuals, rather than public intellectuals, and one of way of doing so is to turn away from the monopoly of the mind’s 'I' by embracing our ‘other’ and better senses; the ability to hear, smell and feel public life as the sum total of activities that gently weave the tapestry of our daily metropolitan experience as forms of intellectual and public life that happen to our bodies through our senses, in ways that transcend the mere transmission of electro-chemical signals located in the brain.

Public participation, intervention and collective action, all assume multiple forms which do not and should not fit the intellectualist formula, and are represented by a host of public intellectuals who contribute to public cultural life in ways that urge us to re-consider the way we make sense of culture and public life as a hybrid, syncretic activity mediated through a number of genres where intellectual activity may and does indeed flourish. There is an entirely new black music network (Radio 1 Xtra) broadcasting dancehall, hip-hop- drum n’ bass, garage, dubstep, grime and so many other distinctively black British musical styles, we have the cinema of Menelik Shabazz and John Akomfrah who have directed splendid films on lovers’ rock and the 1985 Handsworth riots respectively, we see black British photography at its best at [3]Autograph ABP, we always learn from the biting commentary of Gary Younge and Roifield Brown, we indulge in reading the popular [4]history of black London’s soundscapes borrowing the ears of Lloyd Bradley (who also was the executive producer of BBC’s Reggae Britannia), we dance and cry our hearts and souls out at international festival line-ups where black Britons top the bill, we entice our literary flair with superb craftspeople of the pen such as James Berry, Caryl Phillips, Courttia Newland, Alex Wheattle, Zadie Smith, Hanif Kureishi, Andrea Levy, Salman Rushdie, we learn more about black British literature and history by holding a copy of Penguin's [5]IC3.
book of new black writing in Britain, Onyekachi Wambu’s companion [6] to fifty years of writing about black Britain or Kadija Sesay’s collection; [7] ‘Write Black, Write British’, and indeed delight in savouring spicy Caribbean delicacies and frequent specialist record shops that have long served as public agoras of black Caribbean culture at broad. More importantly however, we enjoy the virtues of [8] soundsystem literature and culture in Britain which has contained all the tensions of the black British experience since the Windrush generation and has revolutionised not just the way we listen to music but the way we perceive sound, its frequencies, its message and role in the shaping and the possibilities of re-making public culture into something that is lived experientially rather than pondered on intellectually.

Besides, for every deluded, ignorant and bigoted version of [9] David Starkey’s comments, of which Warmington is rightly critical, there is the sensibility of Dreda Say Mitchell; restor(y)ing our public, intellectual life to its quotidian cosmopolitan dimensions by replacing noise with sound, theory with experience and academic insularity with broader socio-cultural context, thus opening up the scholarly ‘I’ to our other senses.

Lambros Fatsis is a doctoral researcher and an Associate Tutor in Sociology at the University of Sussex, specialising on the history of public sociology and the sociology of intellectual life. He also performs as a reggae selector with the alias, Boulevard Soundsystem. [/nbox]

What are conferences for? (2014-03-02 17:33)

Heidegger thought that scholars should simply trade questions, but that would include the speaker first and foremost.

I have watched conference presentations for more than three decades and never has a speaker offered a “new approach” that was in fact new (except in their own minds). Some approaches became, as you rightly identify, the latest thing because, as you also rightly identify, they were already part of a larger, already extant movement/meme (lots of heads nodding in agreement there). But I have also never heard a young person speak who was not persuaded that his or her ideas were utterly unprecedented...

What strikes me most (apart from the evident desire for non-reciprocity here — it seems that the desire is that discussants not discuss but ask what some youthful presenters imagine to be ‘real’ questions), is the conviction that simply because a conference resembles a classroom situation that the listeners are there to take instruction rather than to participate. Even those respondents who are genuinely confused and want clarification (does one
really want a conference room full of such gratefully attentive respondents? would that not be a classroom? is the epitome of the conference encounter an ex cathedra address?) want that clarification only for their own agendas: they too are just planning to talk later or elsewhere or at their own conference...

The idea should be to exchange ideas and if speakers seem to comment on their own ideas in response to your ideas, is that not a good thing? Not only might the speaker learn something but it is also the case that there is usually no difference in competencies between the person at the podium (the selection committee arranging the talk is a committee of one's peers not arbiters of the truth) and, at an academic conference, it is usually the case that the persons in the audience who strike you as waiting to say what they seem hellbent on saying, do indeed have something to say and might have been speaking themselves.

Conferences are mainly tourism and resume fattening. No one listens to anyone but themselves.

Do you have quotitis? (2014-03-03 08:00)
This is a common disease amongst qualitative researchers. One which, though I occasionally suffer from it myself, nonetheless irritates me when I read other people’s work. But what is it? [1]Nick Hopwood explains:

Quotitis is a common disease among qualitative researchers. It’s a name I have started using to refer to the tendency for people writing about qualitative data to over-rely on raw quotes from interviews, fieldnotes, documents etc.

Read more about [3]diagnosis and cure. It would be interesting to know if anyone disagrees with here. I do to a certain extent, in so far as that I distinguish between block chunk indented text (avoid unless absolutely necessary) and using their words as you are telling their story (which I do a lot). The former is problematic and, while I’m not saying the latter is never problematic, I think it works well if done carefully.

(and I couldn’t agree more with what he said about the role of coding in this)

Upcoming event: Symposium on Web Surveys of the General Population (5 June 2014) (2014-03-04 08:00)

"As ever greater numbers of face-to-face services move to the web delivery, survey funders increasingly ask whether the same transition can be achieved for surveys. Conducting surveys online should, in principle at least, bring substantial cost efficiencies as well as enabling surveys to be undertaken in new, faster and more innovative ways. To a large extent this move to an online survey environment has already taken place, with a huge volume of commercial polling now carried out via 'opt-in' online panels.

However, there remains a high degree of uncertainty about whether this type of sample design is capable of providing estimates of sufficiently high quality for the purposes of academic research and the production of official statistics. Concerns centre around the non-random nature of sample recruitment, as well as the deleterious effects of incentive payments and repeated interviewing on measurement quality. Attempts to interview random samples of the general population online are hampered by a lack of suitable sampling frames and a substantial minority of citizens still having no access to the internet. This symposium comprises presentations from leading international scholars on the current state-of-art in surveying the general population online.

Speakers: -

Chair, Patrick Sturgis, National Centre for Research Methods, University of Southampton

Using the web to survey the UK general population: conclusions from the GenPopWeb network, Gerry Nicolaas, NatCen Social Research, London

Feasibility of Using the Web to Survey the UK General Population: an Experiment from the European Social Survey, Ann Villar, Centre for Comparative Social Surveys, City University, London

Taking an existing face-to-face panel survey online: methodological challenges, Peter Lynn, Institute for Social and Economic Research, University of Essex

Lessons Learned from Creating Probability Sample Online Panels in the U.S., Jon Krosnick, Stanford University"

Citizenship Education, as a subject, has been a part of the English National Curriculum since 2002, and this book by Lee Jerome outlines interesting developments in this field over the last ten years. The Crick Report of 1998 was influential in establishing governmental policies that eventually introduced Citizenship Education as a subject: secondary school students are encouraged to become informed and responsible citizens, in a democratic society, with finely tuned critical thinking skills, whilst learning about identities and diversity, democracy and justice, and rights and responsibilities. Citizenship Education in the curriculum has placed emphasis on students enjoying learning through active participation.

In this treatise on the way this relatively new subject has impacted upon schools, Lee Jerome successfully argues that any developments in education cannot be separated from the political context in which policies emerged. Throughout the book he provides evidence and examples to emphasise the importance of always critically examining the prevailing political context.

The book would benefit those wanting a good grounding in the establishment of general citizenship education in the last decade informing us about distinct types of citizenship literature: justificatory, definitional, comparative, historical, and evaluative. If you are new to this field of researching citizenship education, then this is a great compilation of relevant significant literature and case studies illustrating how citizenship education has progressed in England. Moreover you will be introduced to the relevant terminology within this field in a straightforward and simple way.

Jerome provides readers with a ‘toolkit’ to become confident in understanding definitions and analysis of citizenship education policy, particularly in the context of the New Labour government initiatives that helped to bring this area to the forefront. We learn about New Labour’s intentions in promoting citizenship concerns as a contested site, as well as their Third Way approach. Moreover, we receive detailed information about the trope of the new citizen (advocated by New Labour) through three key discourses: rights and responsibilities, active citizenship and participation, and community and diversity.
Two significant texts that have contributed to contemporary ideas on citizenship education policies and practices are the Crick Report of 1998 and the Ajegbo Review in 2007. Jerome discusses these two reports in relation to the aforementioned three key discourse areas of the educational field. Further, Jerome provides us with in-depth case studies of Citizenship Education in action in school settings through teacher interviews and examination of policy documents. We gain knowledge of teachers’ perspectives and experiences of the teaching and learning of the still relatively new subject of Citizenship Education. We also become familiar with students’ perceptions and encounters with Citizenship Education in the curriculum.

I particularly enjoyed reading the section where Jerome highlights how research can be innovative and democratic if we train students to become researchers and champion their voices. Rather than conceptualising the students as ‘subjects’, it is preferable to view them as participants in the study, or even better as co-researchers. Excellent reasons are given as to why the idea of students as ethnographic researchers can be beneficial and useful, for example they can help with the design, with access and with interpreting data. If students are given opportunities to analyse the data, this will contribute to their becoming more critical in their reflections on citizenship issues.

Therefore the book is useful in allowing insight into both student and teacher articulations about the practice of Citizenship Education in action, rather than just giving us an abstract and theoretical point of view. The case studies illustrate how the contested subject of Citizenship Education is actually interpreted by schools, and the staff and students within these schools.

In terms of notions of multicultural citizenship in England, and concepts of community and diversity, there is much to learn about how students talk about important issues such as racism and immigration. Towards the end of the book, Jerome highlights the implications of the new coalition government’s stance towards citizenship.

This book would be a superb key text for those working in sociology and education research fields who wish to learn more about the impact of political context on citizenship education policy in schools, on teachers and on students. One of the main lessons from Jerome’s writings is that any study of citizenship education in schools cannot be divorced from a detailed understanding of the political forces at play attempting to influence how schools frame citizenship issues in their local communities. Jerome ends his book with the concluding optimistic thought that citizenship education can work well when taught well.

Joining the dots in seven points: A response to Mark Carrigan’s rejoinder (2014-03-04 21:56)

Following the publication of a [1]recent article of mine which debates rather than simply negates the issue of striking as witnessed at my affiliated institution (University of Sussex), I was delighted to read [2]Mark Carrigan’s objections to my original piece to which I can’t avoid responding in the fear that my argument may have been partly or wholly misunderstood. The comments that follow take the form of a defence in seven points to match the format of the
eleven theses I attempted to offer in my original article. Before doing so however, let me qualify my response and my
dialogue with Mark, by defending it against the charge of a point-by-point 'petty-house squabble' which it certainly
is not. I may indeed have chosen a point-by-point format to better capture my arguments in the most concise way
available to my own cerebral resources, but this is by no means an attempt to deliver a riposte against Mark or to
argue over trivialities; rather it is a necessary rejoinder from my part in an effort to rescue the essential components
and the integrity of my argument from possible misreadings, which cloud the picture more than they facilitate
exchange on an important issue.

I. Starting with the very reason that Mark gives for his rejoinder, namely his political disagreement with what
I wrote, I feel the need to stress that my article, although political in essence, is not articulated in any ideological
terms and the difference between the two is one that needs to be highlighted to say the least. I do not ascribe to any
ideological position when writing, although I do indeed offer my independent political reflections on a number of
issues. This stance derives from my disbelief in and distrust of ideology as an intellectual and rhetorical habit which
signifies, but does not directly engage with political ends. Personally, I prefer to discuss politics outside ideological
positions, believing that there is no need to position oneself ideologically in order to stand for something politically.
One can indeed have a stance which may be political by itself rather than by means of ideological strictures, thus
praising political exchange as an intrinsic, not an instrumental good; an end in and of itself, therefore rejecting
ideological exchange as a viable means of or a vehicle for politics. It can be said that my view of politics owes a great
deal to the ancient Greek paradigm of discussing and enacting politics without necessary pleading allegiance to
an ideological position, enclave or party. In fact I adamantly believe that politics is what happens outside ideology
rather than through it. That’s another matter however, which is relevant for our discussion here insofar as it spells
out where I stand politically but not ideologically.

In the light of the above, the argument I make is hardly informed by an assumed preference for a politics that
negates or opposes striking and that’s why I am never (just) saying that “we urgently need to work against the strikes”
as Mark claims, but arguing that we; ‘urgently need to work against the strikes in order to better work for them,
implying that ‘our work is our strike' by setting the standards that we wish to see implemented’. The full quote, you
will agree, spells out something quite different from its sampled version, which gives the erroneous impression that
I wish to see strikes banned in some form of censorship of sorts which I have neither the wish nor the power to
impose. In other words my opposition to strikes is not political but critical of their deliberative currency and power
as a method of opposition and resistance (my counterargument can be found in the last paragraph of Thesis VII).

II. Bearing this distinction between politics and ideology in mind, as it occurs in my own mind, it hurts to see
my argument and position explained away and given the nickname of strike breaking. Taking such liberties amounts
to ideologising my political position for me, implying that it can be placed neatly somewhere on the other side
of the political spectrum, without my asking of course. Could anything be more injurious both to my argument
and to myself as a person and a human being? To make matters worse, the very use of the term ‘strike-breaking’
automatically elevates the choice to strike to the level or a moral absolute rather than treating it as a method, an
idea, and a mode of action that can be contested, opposed, and discussed. By framing any opposition to any strike
merely as ‘strike-breaking’ one is ushering in a Manichean world-view where strikes almost automatically tilt towards
‘the good’ while any opposition towards them is to be found at the dark recesses of evil alone. Strikes, much like
any opposition towards them are not such absolute values however but relative, contestable, discursive, dialogic
resources and practices we have in our disposal in order to do or undo things.

II. In addition to being eagerly enlisted as a strike-breaker, regardless of what I think or whether I recognise
such a label as an appropriate description of who I am and what I do, I am also accused of misunderstanding what
a strike is. In Mark’s reading, strikes equal collective action, and I am accused of reducing them to “a day out for
a collection of individuals", which I am also never saying apart from as an example to highlight the contradiction
between everyday professional practice and the exceptional circumstances of a strike. Even if I am to accept that
I misunderstand what a strike is, I do not make sense of collective agency and action in the same way as Mark. In
my mind, collective action does not assume one form, does not fit one single formula and does not express itself in a one-dimensional way. Rather, I see it as a very complicated, multi-directional process involving a number of different actors rather than a uniform whole; therefore allowing the possibility of many ways of making sense of what collective action is and how it might be best served. No one definition of it will serve all, unless coercion is involved, nor do we all choose to act collectively in the same way; [6]Elinor Ostrom’s recognition of the multiplicity of collective actors and her classificatory typology of (a) rational egoists, (b) conditional co-operators and (c) willing punishers is a testament to such complexity. In case you’re curious I belong, if I must, to the second category.

III. A variation on the theme of collective action comes from Mark’s assertion that I “undermine the collective action of others while castigating them off for the narrow instrumentalism of their goals”, which I never do, urging me instead to ‘offer an alternative’ which I actually do. First of all, I never preach, describe, undermine or ridicule people; there is no trace of such an attitude whatsoever in my tone or in the wording of my argument. I deliberately use ‘we’ throughout the article as an acknowledgment of collective responsibility, thus never reserving for myself a privileged position in the monopoly of truth, morality and virtue, and I am never telling people what to do, undermine their efforts or pass judgment on their actions. What I am doing however is spelling inconsistencies in the way we think and act towards the issues that the strikes purportedly defend.

My interest does not lie in ideologically battling against others by belittling them, but in critically examining our daily conduct towards the claims we make in and during a strike, asking the very simple and obvious questions of (a) are we in a position to shout-out without being found-out?, (b) what do we do daily towards the realising the ideals we claim to defend?, (c) do we actually offer an alternative or some sort of plan? That final point brings us to Mark’s accusation that I offer no alternatives, which I find rather problematic not only because I actually do so (in eleven theses), but also because it assumes that the strikes actually offer an alternative, which they do not; not because they do not intend to but because they are not designed for spelling out plans but merely for expressing dissatisfaction with a state of affairs.

Offering alternatives is not just something that ‘strike-breakers’ need to do, but ‘strikers’ too; when we agitate for change we need to spell out and articulate specifically what it is that we’re prepared to do. Slogans and vague allusions to abstract ideas won’t do, but a clarion call for cultivating those ideals by integrating them to our every-day professional practice will, or so I claim anyway. Even if I am accused of offering no alternatives, what is the alternative offered by the strikes which can match and/or outperform what I suggest?

IV. Mark expresses some puzzlement in relation to the very heart of my argument which he finds “straightforwardly problematic”; especially “the notion there’s something ‘inconsistent’ about signing an employment contract and going on strike”. I have struggled to understand what is so problematic about that claim but have only come up with the, intentionally far-fetched, example of someone who willingly seeks a career in, and is in no way coerced to work for, the porn industry but claims to fight against the objectification of women’s bodies. The example is admittedly exaggerated, in order to sensationalise the contradiction I allude to, but hits my argument at its core. Given that we know that the institutions we sign our contracts with, do not correspond to the romanticised ideal-type we have in our minds, can we still criticise them for not being the institutions that they should be, without feeling at the same time that we have contributed towards such a betrayal by virtue of agreeing to work for/in them?

V. I am also accused of calling people who support the strikes “naïve” or “foolish” which I never do, given that my article is not an attack on or a criticism of other people’s views or decisions, but a critical self-check of whether our claims match our actual performance or at least stand the test of logic. All I am asking is not that we simply practice what we preach, but that we preach only what we actually practice. My use of the word ‘naïve’ by the way is taken out of context from the following phrase: ‘I very much fear that we are far too complicit in and complacent about the trends, the workings and the regulatory regime of Higher Education in our every-day academic practice to be able to afford such a stance without sounding naïve or hypocritical even’. Needless to say, there is no mention
of "foolishness" in any part of my article, nor is any such characterisation attributed to anyone but 'us' given the use of 'we' throughout the article. Cutting and mixing are two beautiful and immensely creative skills both in the process of film editing as well as in music production, but they are used to add to the result not to reduce it to a bare form, and in order to do so they always remain faithful to the context of what is being expressed as well as to how.

VI. Mark, quite rightly, identifies what he calls my "sneering dismissal of the language of class war" and although I do indeed oppose such a rhetoric of class war, I doubt that I adopt a 'sneering' tone. At any rate, what I am arguing is that such allusions to class war add very little except demagoguery and emotive (not emotional!) arousal, so it is now my turn to ask what plan do such statements spell out? What solution do they propose? Where is an argument towards making such warfare irrelevant? Contrary to what I take as Mark's support for such a statement, in the hope that I am wrong, I think that such slogans make class war even more durable using ideology as a pretext for legitimising conflict rather than proposing or even remotely suggesting change; the very wording affirms warfare, it does not negate or offer an alternative to it.

VII. Last but not least, and here is where Mark and I seem to agree is that "strikes aren't radical enough" indeed. Much as I value, the subversive, "carnivalesque" element of striking, it arguably turns vital concerns of ordinary academic politics into extra-ordinary events scheduled as special occasions. When I claim that 'our daily work is our strike' I aim at pointing out that the ideas, ideals and principles we defend in a Rabelaisian fashion during strikes need to be enacted upon in our everyday professional practice. Just as cosmopolitanism and the poetics, ethics and politics of multiculture are not best served by one-off events but by our everyday, ordinary practice of them, the same applies to our fight against the privatisation and techno-bureaucratisation of education and intellectual life at broad. When I appear critical of striking as a method then, it is not the "carnivalesque" that I oppose, but my fear and suspicion that striking privileges preaching and self-righteousness over reflecting on the harm we do or on whether we actually do the right thing during our working hours.

If a "radical ethics of everyday life doesn't cut it" as Mark concludes, then what does? If a change in the way we operate in our routine, daily life is not effected then where will it come from? Besides, I do not see such a change in professional practices as a "personal ethos", as Mark claims, but as a collective responsibility and a collective civic virtue which is realised by collectively aspiring to and actualising the principles of educational and institutional reform we wish to see though what we do at the University. How can change be brought about by striking occasionally, when we are not prepared to change our ways in relation to how we engage daily with our professional practice? A scholarly community which will inspire collective action cannot be convincingly or durably be forged unless we strive to prioritise and set the standards for the type of academic activity we wish to see and live in harmony with.

My personal utopia, to avoid any further misunderstandings, takes the form of pro-active change for where we want to see it happening. Instead of fighting the neoliberal University after accepting to work within its walls, why not refrain from joining it in the first place, seeking and creating better spaces to host our homeless minds? (see [7]Thesis III). Instead of supporting the techno-bureaucratisation of scholarly curiosity and intellectual life by succumbing to the [8]regulatory discourse of the current Higher Education climate, why not, like our [9]German counterparts have done, boycott modes and types of evaluation that betray scholarly sensibilities and standards? Instead of asking students to protest against much of what we commonly oppose, after they've paid their fees, why not plead with them publicly to protest by not enrolling in institutions which [10]undermine the intrinsic value of their learning, asking them instead to organise nationwide protests, before joining a Uni, until [11]tuition fees are abolished?

In the light of the above, and bearing in mind the word-length of my original article (6.000 words), has it not become clear enough that the issue that the strikes polarise admits more than a binary mode of thinking and talking about it? Academics of the world unite, we have nothing but some REF points to lose, but our integrity, courage and goodwill to win! Can we, will we do that?
Lambros Fatsis is a final year DPhil student at the School of Law, Politics and Sociology at the University of Sussex. His doctoral thesis concentrates on discussions of public sociology, the role of the University and intellectuals, while other research interests include black music, urban culture and the history and sociology of the Jamaican soundsystem. He also performs as a reggae selector/radio presenter under the name Boulevard Soundsystem and is a contributor of Billboard magazine on reggae music. Recent publications are featured on the British Sociological Association's Postgraduate Theory Forum and on The Sociological Imagination magazine on a variety of issues ranging from the English riots, the idea of sociological imagination and the Eurozone crisis. In the spring of 2013 he achieved Associate Fellow status of the Higher Education Academy.

**Call for Papers => #Ethnography: Trends, Traverses and Traditions (2014-03-05 15:58)**

**ESA midterm conference, Research Network on Qualitative Research (RN20)**

#Ethnography, @Amsterdam #August 27-29th 2014 [1]http://aisr.uva.nl/ethnography

Ethnography is often seen as one of the principal approaches in qualitative methodology in general. The ESA midterm conference for the Research Network on Qualitative research (RN20) will be on trends, traverses and traditions in Ethnography. The central question posed at this conference will be: How do current societal and technological trends influence ethnography when we are studying that same society? One could think of more concrete questions such as:

- Is ethnography changing due to social media, such as Twitter and Facebook? In what ways?
- What happens when we use mobile field recording devices, Skype and Youtube in our fieldwork?
- What theoretical innovations have led to new approaches in ethnography?
- How does the current economic crisis influence ethnographic practices for researchers?
• What turn are we at now?
• What other trends do we see in ethnography today?

In times of digital information overload, conferences are useful venues to discuss the trending topics within our field. Some of the questions posed above could be used to approach the vast array of ‘new’ trends in ethnography. Since one of the methodological virtues of ethnography is the possibility for adaptation to local and new situations, the question might rise whether these trends are actually methodologically new. Different specific sessions will be organised by leading specialists. Please see the website ([2]http://aisrr.uva.nl/ethnography) for the list of specific sessions.

We hope to organise an interesting conference in the heart of Amsterdam, combining classic presentations with a social program that consists of a Fieldwork Experiment: Mass – Observation in the Amsterdam Red light district, interactive lunch sessions and interesting keynotes.

Authors are invited to submit their abstract either to a specific session or to the open sessions. Please submit each abstract to a single session only.

Abstracts should not exceed 250 words.

The local organising committee,
Christian Bröer, Erella Grassiani, Gerben Moerman and Milena Veenis

Bullshit jobs (2014-03-06 08:00)

Today I came across another good article by David Graeber about why there are so many really bad jobs around: [1]On the phenomenon of bullshit jobs.

"In the year 1930, John Maynard Keynes predicted that, by century's end, technology would have advanced sufficiently that countries like Great Britain or the United States would have achieved a 15-hour work week. There's every reason to believe he was right. In technological terms, we are quite capable of this. And yet it didn't happen. Instead, technology has been marshaled, if anything, to figure out ways to make us all work more. In order to achieve this, jobs have had to be created that are, effectively, pointless. Huge swathes of people, in Europe and North America in particular, spend their entire working lives performing tasks they secretly believe do not really need to be performed. The moral and spiritual damage that comes from this situation is profound. It is a scar across our collective soul. Yet virtually no one talks about it."
Why is it that "in our society, there seems a general rule that, the more obviously one’s work benefits other people, the less one is likely to be paid"? According to the author,

"[t]he answer clearly isn't economic: it's moral and political. The ruling class has figured out that a happy and productive population with free time on their hands is a mortal danger (think of what started to happen when this even began to be approximated in the '60s). And, on the other hand, the feeling that work is a moral value in itself, and that anyone not willing to submit themselves to some kind of intense work discipline for most of their waking hours deserves nothing, is extraordinarily convenient for them."

On the face of it, the problem of "bullshit jobs" has nothing to do with the work of scientists. Aren't scientists those select few who are lucky to work in clean and well supplied institutes, practising a science which they feel is their vocation, so engrossed in the practice that they do not even know what the phrase "labour market" means? And yet, all jobs, good, bad or ugly, are part of the same system. And the subjective value we attribute to different jobs is also judged against the backdrops of other existing types of activity. In other words, we cannot understand the work done by scientists without paying attention to what goes on in other parts of the global labour market:

"If someone had designed a work regime perfectly suited to maintaining the power of finance capital, it's hard to see how they could have done a better job. Real, productive workers are relentlessly squeezed and exploited. The remainder are divided between a terrorised stratum of the, universally reviled, unemployed and a larger stratum who are basically paid to do nothing, in positions designed to make them identify with the perspectives and sensibilities of the ruling class (managers, administrators, etc) – and particularly its financial avatars – but, at the same time, foster a simmering resentment against anyone whose work has clear and undeniable social value. Clearly, the system was never consciously designed. It emerged from almost a century of trial and error. But it is the only explanation for why, despite our technological capacities, we are not all working 3-4 hour days."

This article is reposted from Matters Mathematical, http://mattersmathematical.wordpress.com where the Idle Ethnographer writes about sociology of science and what it is that mathematicians really do

Being a link between the academic world and local communities (2014-03-06 14:24)

by Lisa McKenzie

Coming into Higher Education as a 30 year old mum was daunting to say the least. I arrived at the University 2504
of Nottingham in 2000 as an under-graduate on the joint honours course of Sociology and Social Policy. Even though I had lived in Nottinghamshire for all of my life until this point I had never been into the University, or even onto the grounds of the University. I knew little of the University, and was ignorant to the process, and the practices which went on within it. I believe now it was my ignorance to higher education which led me to this particular Russell Group Institution. In all honesty had I known, I would be one of only 4 mature students in a year of about 150 students, and the only student who lived on a council estate, I probably would have gone to Nottingham Trent University, the route that other local people in Nottingham had taken into higher education. However there I was, meeting young privately educated people for the first time. I remember trying to explain the poll tax to them, what it was, and why it was wrong, and realising like Dorothy I was not in Kansas anymore.

From day one my interest in Sociology was inequality, social class, and community studies, although at the time I wouldn’t have been able to articulate it in that way. My dream was to research the neighbourhood where I lived, St Ann’s a council estate in Nottingham. I had been inspired to do this by a book written in the 1960’s by Ken Coates and Bill Silburn ‘Poverty the Forgotten Englishman’. I realised this ambition in 2009 when I submitted my PhD thesis ‘Finding Value on a council estate: Complex lives, Motherhood and Exclusion’. I knew very early on as a mature student that higher education is a special gift and also the importance of Sociology, it had changed my life, and I remember the enlightened moment I had while sitting in a lecture that my failure to go to University as an 18 year old, or my failure to attain decent qualifications at school was not my failure, but the failure of a structure, and of a system that needed neat and clear classifications of who you were, and what you were entitled to based on social class. I also realised that the University of Nottingham was an extremely privileged place with vast resources, most of which went un-used for large parts of the year.

Throughout the PhD research I was often enraged moving between the University and my local community, witnessing and seeing the massive inequalities even in a small City like Nottingham. My local community, in actual fact even my family didn’t really know what I was doing, or what others did at the University, I have often said it is like Willy Wonka’s chocolate factory, people go in, you don’t know them and they are not from your community, and you don’t know what happens in there. I felt the unfairness of this sharply, and also encountered the University’s reluctance in engaging in any real way with the local community. There are individuals working in Universities who almost wear themselves out, and teetering on the edge of nervous breakdown trying to do work in the local community, or fighting inequalities in other ways, this is on top of their jobs, very little of what they do is officially recognised, and supported. I have also met others who work in academia who are ‘off the radar’ and are unlikely to be interested in real community engagement unless it is somehow linked to their careers, or the Impact Agenda or the REF.

Because my research was based in the local community, and because of the stark inequalities and unfairness I felt and because of my own social position, but also because Sociology changes something within you, where ignoring social inequities becomes impossible, I was available and motivated to working and becoming a link between the academic world and my local community in Nottingham.

Over the years at the University of Nottingham, I was engaged in many different projects, some worked, on one occasion the Lakeside Arts Centre at the University paid for 50 members of the St Ann’s Community to come and see Ken Coates and Bill Silburn’s film connected to the ‘Poverty the Forgotten Englishman’ study, and see a photographic exhibition of ‘Nottingham Life’ where the stills from Alan Sillitoe’s 1958 film based on his book ‘Saturday Night and Sunday Morning’ were shown. Other things did not go so well, I used my contacts with a local Youth Worker who has actually got an MBE for his voluntary work with gangs in the City, to have a meeting with the University of Nottingham sports department in trying to set up a football match between local young people, and the University of Nottingham’s team, the response from the University was that it was too much of a risk, because the young people might want to come back at night. This was a low point during my research at the University of Nottingham, and I struggled to continue. The people from my community had been told they were not welcome, and after that I was suspicious that neither was I.
I think because of the community and voluntary work I have undertaken over the years, and also because of the nature of my research, I am very honest about my own background when I write, which I believe has made me appear approachable. Therefore I get many requests to speak at community centres, schools and colleges all over the country now. I try very hard to go to as many of them as possible. I was recently at Ruskin College where I spoke to a group of mainly working class mature students. I was very proud of this, as Ruskin College was the only University my parents had heard of. I received an email from a student afterwards who was in the audience who said she had felt very alone in the academic process, and described herself as ‘an ex-care girl from a mining town’ who thought she had nothing to give to sociology her last words were ‘and then there was you’. I cried all night when I read her email. I know that our participation as Sociologists in the fight for social justice, whether that is through working directly or indirectly with those who are at the sharp end of inequality is as important to the discipline of Sociology as is the academic reading, writing and teaching we do in our institutions, and I take this responsibility seriously. I know that not all of us can engage in local communities in the same way as I do, we all have different strengths and skill sets, and passions. However to think about Sociology as a subject we learn, and then teach only to those who have the cultural, social and economic capital to get themselves into institutions of higher education, is not how I understand our discipline of Sociology, and this is not the Sociology which will benefit anyone either inside or outside of the University. It could be argued that my philosophy is in conflict with the institutions that employ me, but I don’t think it is; I’ll quote my mentor and friend Professor John Holmwood,

‘I am committed to my discipline rather than my institution, my commitment to my discipline therefore makes me a good employee and consequently committed to my institution’.

[1]Lisa McKenzie is a research fellow at the London School of Economics. She previously held an Early Career Leverhulme Research Fellowship conducting a re-study of the 1970 St Anns 'Poverty' study, focusing upon the changing shapes of community, family, and belonging in contemporary Britain. She is writing a book on this research to be published by Policy Press in early 2014.[/nbox]

Agoston Faber (2014-04-13 10:58:45)

Indeed, the more lower-class students understand the role vast social structures play in the formation of their perspectives and in their relatively bad school performance, the less they will blame themselves about it. Keep on!

New book - "Undoing property?" (2014-03-07 08:00)

Exciting-sounding (fairly) new book!

[1] *Undoing property* examines complex relationships inside art, culture, political economy, immaterial production, and the public realm today. In its pages artists and theorists address aspects of computing, curating, economy, ecology, gentrification, music, publishing, piracy, and much more.

Property shapes all social relations. Its invisible lines force separations and create power relations felt through the unequal distribution of what is otherwise collectively produced value. Over the last few
years the precise question of what should be privately owned and publicly shared in society has animated intense political struggles and social movements around the world. In this shadow the publication’s critical texts, interviews and artistic interventions offer models of practice and interrogate diverse sites, from the body, to the courtroom, to the server, to the museum. The book asks why propertization itself has changed so fundamentally over the last few decades and what might be done to challenge it. The “undoing” of Undoing Property? begins with the recognition that something else is possible.

Rajani Naidoo: Why the "ranking fetish" is bad for universities (2014-03-08 08:00)

In this video, Dr. Rajani Naidoo of the University of Bath explains how higher education is becoming increasingly market driven, thus becoming less interested in the common good. Dr. Naidoo has written on the contemporary transformations of higher education.

Raise university tuition fees to improve education... or not? The German approach (2014-03-10 08:00)

What can England learn from Germany's approach to financing higher education?

"During the past eight years, university tuition fees were introduced into most west German federal states. Yet in a few months, every single state will have abolished them. These facts raise a series of topical questions that cast current English higher education policy in a fresh and revealing light."

Read the [1]full article by Howard Hotson in the Times Higher Education

1. http://www.timeshighereducation.co.uk/features/feature-germanys-great-tuition-fees-u-turn/2011168.article

Kai Arzheimer (2014-03-19 06:02:01)
Interesting piece, but the portrait of Germany is a bit too idyllic. From up close, Germany's u-turn smells of populism. Moreover, even without fees access to higher education is still more socially stratified in Germany than in the UK because of the selection mechanisms built into the system of secondary education.

Milena Kremakova (2014-03-21 15:34:03)
Good point, thanks! The social stratification remains largely invisible when you look at it from abroad. Do you think that, populist as it may be, the reform will be positive - or not?

10 reasons why you need social science (2014-03-12 08:00)

This interesting list of reasons by Audrey Osler was published by the [1]Campaign for Social Science. Read the descriptions for each reason [2]here.

1. Social scientists help us imagine alternative futures
2. Social science can help us make sense of our finances
3. Social scientists contribute to our health and well-being
4. Social science might save your life

5. Social science can make your neighbourhood safer

6. We need social scientists as public intellectuals

7. Social science can improve our children’s lives and education.

8. Social science can change the world for the better.

9. Social science can broaden your horizons

10. We need social science to guarantee our democracy

Are there any missing? Let us know your suggestions and we’ll extend the list.

1. http://campaignforsocialscience.org.uk/

Emmet Fox (2014-03-12 10:56:32)
I know it’s submerged somewhere within the broaden your horizons section but he could be a bit more clear-cut about how social science helps you not to take your world for granted, as in the case of the relational sociology advocated by Emirbayer and Bourdieu. Recognising the influence of powerful societal and historical relations upon the common-sense perception of the world is essential to the broadening of horizons, identifying the forces of oppression, and to recognising the possibilities for social change (alternative futures). Possibly worthy of its own mention or at least greater emphasis within some of the articles listed.

Emmet Fox (2014-03-12 11:06:37)
That should be "she" Sincere apologies

Robyn (2015-02-17 13:11:34)
Social scientists work to eliminate mass inequalities. They care about the poor, the working poor and the working poor middle class.

What’s the Point of Academic Publishing? (2014-03-13 08:00)

[1]
What's the point of academic publishing? It’s such an integral part of the academic role in the contemporary university that it can be jarring to step back and ponder a question like this. It was addressed by Sarah Kendzior in a [2]great article recently,

Publishing and labor are two of academia’s most contentious issues, and they are usually debated separately. But when the rate of contingency hires and publications rise together—with the assumption that the latter is a means to avoid the former—they need to be taken as a broader problem: the self-defeating mechanization of scholarship. Scholars are encouraged to sacrifice integrity and ingenuity to careerism that does not reward them with a career.

Graduate students are told that publishing frequently and in traditional journals is key to landing a job. "In many if not most fields it is now necessary to have at least one refereed journal article while still ABD," [3]writes Karen Kelsky, Vitae columnist and academic advisor for hire, on her blog. But the harsh truth is that many scholars with multiple journal articles—and even multiple books—still do not find full-time employment. Academic publishing is no guarantee of anything, except possibly the[4]paywalled obsolescence of your work.

For tenure-track academics, publishing is a strategic enterprise. It’s less about the production of knowledge than where that knowledge will be held (or withheld) and what effect that has on the
author’s career. But for graduate students and contingent faculty, academic publishing is less a strategy than a rigged bet.

With the odds of finding a tenure-track job against them, graduate students are told to plan for a backup career, while simultaneously being told to publish jargon-filled research in paywalled journals. Scholars who bet on that insular system find themselves stranded when that system fails them, as it does most. Appeasing academics means alienating alternatives.

Is it possible to reconcile writing as a communicative activity with publishing as a strategic enterprise? Is the strategic value of publishing overstated in an age of contingent employment within the academy? There’s something existentially compelling about Kendzior’s call to reclaim the intrinsic value of writing,

Making your work "count" on its own intellectual merit helps rescue you from the sense of personal failure that accompanies loss on the job market. When you orient your scholarship toward a future that never comes, it can start to feel like you have no future. When you orient your scholarship toward its obvious yet overlooked purpose—furthering human knowledge—its value does not need to be determined by others, because the value lies in the work itself. This is what counts.

But is there a risk that this could become a palliative, subjectively comforting while objective circumstances remain unchanged? Is it instead feasible to hack the system and find room for this meaningful authorship as part of a strategic enterprise?

6. http://www.slate.com/articles/life/culturebox/2013/04/there_are_no_academic_jobs_and_getting_a_ph_d_will_make_you_into_a_horrible.html

Social Media for Academics (2014-03-14 08:00)

Are you an academic? Are you interested in social media? Given you're reading a blog post with the title 'Social Media for Academics' then I’ll assume that you are. In which case I hope you’ll be interested in the book that I’ll be spending much of this year writing. I’m due to deliver it to Sage next January to be published later that year. Here’s the current blurb for the project:

This practically minded book will provide an accessible introduction to the opportunities and challenges social media presents for academics. It will situate the fast-changing landscape of social media in terms of

2511
the existing needs and priorities entailed by a career in the contemporary academy: publicising research, building networks, managing information and engaging with wider publics. It is intended as a 'best practice' guide, applicable to anyone working within higher education who seeks to better understand and utilise the opportunities offered by social media. Adopting a practical approach throughout, it will frame discussion of platforms and tools in terms of the concerns, projects and practices more broadly applicable within higher education. Though comprehensively informed by the growing research literature on social media, it will not in itself form part of that literature, but rather contribute to the practical application of the knowledge generated by this expanding field of inquiry.

In keeping with the ethos of the book, I'll be doing much of the work which goes into it [1]here on my blog (i.e. the 'social media for academics' item on the menu bar). Much more to follow over the next nine months - though at markcarrigan.net, rather than on here, as I wanted to keep advertising on SI down to a minimum now that I've finally junked those horrible Google Ads.

1. http://markcarrigan.net/2014/02/12/social-media-for-academics/

The Geek Anthropologist (2014-03-14 16:41:02)
This will prove interesting and useful!

Emma Uprichard on the challenge of Big Data (2014-03-15 08:00)

Anything that helps us to see the world a bit differently [...] can potentially help to nurture a healthy 'sociological imagination'. But the frame will remain on the relative present – the 'plastic present' to use a phrase I've used before – and that is unlikely to be enough to help us address the big social problems in the world today and make any substantive changes to them tomorrow. As [1]Heffernan (2013) recently put it, 'Big data will never give you big ideas... Big data doesn't facilitate big leaps of the imagination. It will never conjure up a PC revolution or any kind of paradigm shift. And while it might tell you what to aim for, it can't tell you how to get there. [...] If we take C. Wright Mills' quest for a 'sociological imagination' seriously, then ideally we need to also turn to big data to help us think differently, to see differently and re-en/act the world differently. So much social theory has gone into arguing and discussing these very issues and we cannot afford to let big data run away without good social theories about what to do with the masses of data we are producing.' (Pritchard, 'Focus: big data, little questions'? in Discover Society)

Read Emma Uprichard's [2]article on the challenge of big data - and the discussion in the comments.

Social Movements in the Neoliberal Age (2014-03-17 08:00)

This year’s annual lecture at the [1]Centre for the Study of Social and Global Justice (CSSGJ) featured Michael Burawoy speaking on *social movements in the neoliberal age*. You can find the audio of the lecture on [2]Adam David Morton's blog.

In keeping with some of his recent books [3]*Global Ethnography* (2000) and [4]*The Extended Case Method* (2009), a major statement on the wave of social movements that have unfolded in light of the Arab Uprising since 2010 was delivered. Territories in resistance, commonly revolving around the issue of dispossession of land and labour and conditions of commodification, would recently include the West Bank, special economic zones (SEZs) in India, the Marikana miners' strike in South Africa, migrants' claims and land rights in China, the Occupy Wall Street movement in the United States, and the Indignados movement in Spain. To name just a few!

Michael Burawoy argued that the diversity of these social movements is also marked by certain
common characteristics: 1) strong national specificity; 2) global connectivity; 3) concern over the separation of power and politics; 4) a focus on democracy in terms of direct, horizontal and prefigurative forms; 5) struggle over public and virtual spaces of resistance; and 6) subjection to repression. Indeed, the extended case method that Michael Burawoy has fashioned captures well the particular and the general of the social movements arising since 2010. Also, it offers an alternative, reflexive and critical method of science to highlight the issues of power and knowledge in both sociological theory and the study of social movements.

4D Research: Early experiences of Designing, Debating, Doing and Disseminating Social Research

4D Research: Early experiences of Designing, Debating, Doing and Disseminating Social Research.

7th ENQUIRE Postgraduate Conference, 14th November 2014

Call for Abstracts

This conference aims to bring together post-graduate researchers from a variety of disciplines to facilitate shared critical engagement with the various obstacles and opportunities of the PhD process.

We are pleased to confirm our keynote speaker:

- Alan Bryman, Professor of Organisational and Social Research, University of Leicester

Whilst the PhD process is often referred to as a ‘journey’, we tend to hear more about the destination rather than the pit-stops and bumps that occur along the way. As postgraduate researchers ourselves, we recognise that the PhD process is complex, non-linear and rife with ambiguity. Nonetheless it is a privileged opportunity that allows individuals to devote three years to the detailed exploration of a subject they are passionate about. With this in mind, we are seeking to present a conference which explores individuals’ candid stories of the various ups and downs of the PhD process, across social science disciplines.
Therefore, we are eager to hear about individuals’ experiences throughout their PhD; from initial ideas at the masters level right through to the dissemination of published work. The aim is to facilitate mutual discussion and debate which enables people to learn from the experiences of others. We are therefore inviting researchers to share honest accounts of aspects of the research process which include, but are not limited to, reflexive considerations of:

Ø Designing: Literature review; research questions; methodological design and its limitations; planning for practicalities

Ø Doing: Access; consent; data generation/collection; administration; emotional well-being

Ø Debating: reflexivity; ethics; validating and justifying your work

Ø Disseminating: Social media; public speaking to diverse audiences; impact; publishing; how to deal with misinterpretation of your findings

This conference will be most relevant to:

- MA research methods students (with the intention of PhD study)
- People exploring the option of PhD study
- Current PhD students at all stages

Email abstracts to: [1]LQ-Enquire@exmail.nottingham.ac.uk

Deadline for submissions: 11th April 2014

What have we done to universities? (2014-03-19 08:00)

Is it inevitable that the university will be reduced to the function of providing, with increasingly authoritarian efficiency, pre-packed intellectual commodities which meet the requirements of management? Or can we by our efforts transform it into a centre of free discussion and action, tolerating and even encouraging ‘subversive’ thought and activity, for a dynamic renewal of the whole society within which it operates? (Thompson, 1970: 166)

[1]This article by Martin Parker gives a bleak account of change management of a European business school, which he describes as "performance based Taylorism, with academics as tradable commodities based on the number of stars they had on their CV". If we at SI could have only read one new article in the last month, this would be it.

How to write a good sociology essay (and not panic) (2014-03-20 08:00)

Dear stressed student,

Here are a bunch of useful resources from yours truly, the Idle Procrastinator Ethnographer for writing essays and papers:

Start small: this is perhaps the most useful of all links posted here: a post about [1]how to write an effective paragraph. Master this and you won’t need any of the others.

An article on [3]how to focus when you’re writing your PhD or anything else (I’ve bookmarked the website, it’s really useful).

Forgodssake, [4]stop checking your email!

I know - easier said than done. Here are [5]some more tips for getting a clearer focus on your work kicking your arse back into shape. Read this now. It will take you two minutes. It will save you countless hours.

I found this post about writing [6]sociology papers without plagiarising on the Everyday Sociology blog three years ago and it doesn’t get old. If you are a student and have to write essays this year, read it.

Don’t (self)plagiarise! Cartoon seen at plagiarismtoday.com, an interesting website about online plagiarism.

Once you’re done (or almost done), here you can find an [7]online word counter (useful if you aren’t using MSWord or Open Office but some more exotic word processing package… for example, I used it to see how many words there were in the final PDF version of my PhD thesis which I typeset in LaTeX). Warning: it can also be a source of procrastination. But then, what can’t.

2516
The most important thing:

Essay Writing Tips | Myths of Our Time (2014-03-22 12:37:54)

[...] Here are some links to essential tips for piecing together an essay. Some years back I tutored undergraduates in political ecology. I was blown away by the structuring of many of the assignments that I corrected. The standard was truly shocking and from conversations with my colleagues I learned that this was not limited to my tutorials. They too had some horror stories to relate. The worst has to be the use of an url address as a citation in mid paragraph. Scarier still, the address was for search results from ask.com. I get the strong impression that students were not taking the assignments seriously due to the small proportion allotted them from the overall course results. Still the assignments surely reflect some of the bad writing habits of the students. [...]

I enjoyed how to write an effective paragraph

Some thoughts on the sociology of animals (2014-03-21 08:00)

One of many likeable things about the renaissance essayist [1]Michel de Montaigne was his relationship with animals. In an intellectual context soon to be overcome with Cartesianism, with its [2]mechanistic understanding of non-human animals, Montaigne exhibited an admirable degree of sensitivity to the consciousness of animals. As Sarah Bakewell ably summarises,

A dog, for Descartes, has no perspective, no true experience. It does not create a hare in its inner world and chase it across the fields. It can snuffle and twitch its paws all it likes; Descartes will never see anything but contracting muscles and firing nerves, triggered by equally mechanical operations in the brain.

Descartes cannot truly exchange a glance with an animal. Montaigne can, and does. In one famous passage, he mused: “When I play with my cat, who knows if I am not a pastime to her more than she is to me?” And he added in another version of the text: “We entertain each other with reciprocal monkey tricks. If I have my time to begin or to refuse, so has she hers.” He borrows his cat’s point of view in relation to him just as readily as he occupies his own in relation to her.

Montaigne’s little interaction with his cat is one of the most charming moments in the Essays, and an important one too. It captures his belief that all beings share a common world, but that each creature has its own way of perceiving this world.

_How To Live: A Life of Montaigne in one question and twenty attempts at an answer._ Pg 136-137.

It is undoubtedly true that people anthromorphise animal relations. However the significance of this is often overlooked – what is it to impute human characteristics to animals? It’s obviously symbolic action, in so far as that one party (the human) ascribes meaning to the actions of another party (the animal). But is it symbolic interaction? In other words, are animals ascribing meaning to humans as part of the same interactions through which humans are ascribing meaning to them? In the rest of this post I’ll talk about cats because, other than rodents, they’re the animals I’m most familiar with. In terms of the rodents I’ve owned, I think interactions between rats and humans are
very interesting. Whereas I’m sceptical that the Roborovski hamsters I owned saw me as anything other than a feature of the physical environment. But though I’m talking about cats, this post is mainly an attempt to work out what I think about the sociology of animals. I’ll defend a view of social relations in a weak sense between human and non-human animals, based on trajectories of iterated interaction and the practical capacity to impute intentions on both sides. I’m not sure what I think about the possibility of social relations in a strong sense, which for me would entail the possibility of emergent relational goods (e.g. trust) to which both parties orientate themselves evaluatively. I think there are emergent goods, with trust being the most obvious one, but I don’t think that animals are capable of ‘strong evaluation’ in Taylor’s sense i.e. they care about things but they don’t care that they care (or even have any second-order awareness at all for that matter).

One way of gaining traction on this question is to consider what is assumed by the meanings ascribed to cats by humans. Almost 100 % of respondents in one survey of cat owners reported a belief that their cats could feel curiosity, joy and fear (pg 155 of Cat Sense). Around 60 %-80 % believed their cats had a capacity for surprise, anger, anxiety and sadness. Around 40 %-60 % believed they had a capacity for jealousy, pride, empathy and grief. Much smaller numbers believed in a capacity for guilt, shame and embarrassment. I find the last one a surprise, given how axiomatic I’d always taken it to be that cats can experience embarrassment but, stepping back from my own reaction, it’s precisely this sense of obviousness (“of course cats get embarrassed! I can tell you about A and B and C which show this” etc) which I find interesting.

The emotional capacities we impute to cats entail certain assumptions about their psychological capacities. We might not explicate these entailments under normal circumstances but, I’d suggest, these sometimes inchoate ideas we have about cats nonetheless connect up into a more or less coherent picture. So for instance my sense of the self-evident capacity of cats to experience embarrassment goes hand-in-hand with my sense that they experience pride, with the former occurring under certain conditions (e.g. a cat falls off a fence while people are watching) precisely because of the cat’s capacity to experience pride under others (as a statement about my spontaneous opinions rather than the conclusion I’d come to if I really thought about it). I guess what I’m saying is that I’m interested in the theory of mind that cat owners impute to their pets, which I suspect is more multifaceted then many might assume.

So I think the tendency to anthromorphise animals needs to be seen in the context of a history of interaction within which such a theory of mind has emerged. This might be typological, in so far as that trajectories of interaction with many cats (or dogs, or rats, or whatever) jointly contribute to the development of a theory of mind which shapes a person’s future interaction with any such animal. But we can still talk meaningfully of social relations, at least in the weak sense, between human and non-human animals. I’m arguing that we can’t adequately understand the kinds of characteristics which humans impute to non-human animals without taking account of these relations, in the sense of histories of past interaction and expectations of future interaction. For instance my sense of cats as being able to feel embarrassed is tied up with a sense of cats as feeling pride, jointly contributing towards a picture of the psychological capacities of cats in which I’m invested because of my past relations with them (with my own pets, volunteering at a cat shelter, interacting with other people’s cats, funny memories I’m attached to etc).

Alasdair MacIntyre suggests that “contamination by epistemology” prevents some from entering into relations with animals “through which interpretative knowledge of their thoughts and feelings can be gained, relationships expressed in responsive activity” ([5]pg 17). I think he rather overstates the point precisely because he doesn’t take account of the investment of people in a certain view of the capacities of animals which has emerged from a history of interaction with them. But it’s an important point nonetheless that “knowing how to interpret” is a form of practical knowledge, through which we are able to move from reciprocal responses in interaction to a "set of recognitions of the intentions embodied in these responses and then a set of recognitions that each of the intentions includes the intention that it should be recognized by the other as the intention that it is” ([6]pg 15). Or in other words (a) we learn to recognise why the other does something (b) we learn to recognise that some of the things the other does are done with the intention that we recognise why they’re doing it.
Is this as true of our relations with non-human animals as it is of our relations with other humans? I think it basically is. I’m not sure how else it’s possible to account for meaningful interaction with animals. The typical repudiation of such a view is to argue that such “meaningful interaction” is anthropomorphism masquerading as intersubjectivity. But I’ve tried to argue briefly in this post how a tendency towards anthropomorphism can be explained in terms of a genuine intersubjectivity within such relations, representing an investment in a certain way of viewing a particular animal which someone is drawn to precisely because of their history of meaningful interaction.

In Search of the Chinese Parsons (2014-03-21 08:48)

When Pitirim Sorokin was brought to Harvard to found its Sociology Department in 1930, ‘sociology’ was still very much seen in the United States in the Comtean mould as a macro-policy science. Sociology would focus on the ‘big picture’ and the ‘long run’, based on both qualitative and quantitative data, to discern socially meaningful trends with an eye to promoting ‘progress’. Some of these trends may turn out to be enhancing and others debilitating. To a certain extent, the sociologist would be a diagnostician and, where necessary, a provider of remedies, or at least ideas for remedies. This idea of what sociology might be remains an attractive one but it is not the one came to be institutionalised worldwide in the second half of the 20th century. Instead the future of the discipline was determined by one of Sorokin’s junior colleagues, whose tenure he tried to block, Talcott Parsons.

In a time when it is common to hear our quite learned, theory-oriented colleagues claim that it is impossible to mix traditions grounded in, say, quantitative and qualitative social epistemologies, economistic and communitarian modes of reasoning or biological and sociological variables, we should always recall that this is precisely the sort of thing that Parsons did in his discipline-building work, The Structure of Social Action. Given what was on offer in terms of Europe’s sociological legacy by the 1930s, Parsons’ selection of theoretical exemplars was not without reasonable cause but was inevitably idiosyncratic and certainly brought together figures who had very little, if anything, to do with each other in their lifetimes. As an American travelling across Europe as a graduate student, Parsons saw the broad outlines clearly: The discipline of sociology was being established in response to the perceived inadequacies of classical political economy, which by the 1870s had been acknowledged within the field by Alfred Marshall and others. ‘Sociology’ would be the name of the science that integrates the main paths one might take to deal with those inadequacies. Parsons chose a particular way of identifying and representing those paths, which provided him the pretext for dealing in detail with Pareto, Durkheim and Weber. Of course, Pareto could have been replaced by Marx, Durkheim by Tarde, and Weber by Tönnies or Sombart. The integrated result would have been a quite different conception of ‘sociology’. This became clear once Pareto did get replaced by Marx in the late 1960s – and more recently, at least in postmodern circles, Durkheim by Tarde.

2520
The key point is that such invariably arbitrary choices, ensconced in powerful institutional environments, can serve to anchor a discipline globally for many decades. We need to remember that while Harvard was always seen as the strongest American university, what it meant to be 'the strongest American university' started to change only with the end of the First World War and especially the Second World War. As the United States transformed itself from being a rich provincial country to a global player, the significance of its universities as sources of intellectual leadership also changed. I say all this because I can easily imagine a young Chinese scholar right now canvassing the current crop of Western sociological thought in order to deliver a new synthesis – initially to Chinese audiences but ultimately worldwide – for the 21st century. If this scholar has benefitted from Parsons’ example, s/he will see beyond theoretical disputes that are artefacts of particular readings of particular texts that are considered to be ‘canonical’. Instead the Chinese scholar will mix and match Western authorities in a manner suitable for the sort of the world in which we should be spending the rest of this century – if not beyond.

"Looking for a husband with an EU-passport" (2014-03-21 15:37)

We are posting this again because the video was not visible in the original post. Thanks to Sadia Habib and Yolanda van Wyk for alerting us - and sorry that fixing it took so long!

[1]Tanja Ostojić, a Serbian feminist performance artist, talks of her art project "Looking for a husband with an EU-passport":

sadia habib (2014-03-12 14:47:46)
I can’t see the piece - is it just me or can others not see it? All I can see is Tanja Ostojić, a Serbian feminist performance artist, talks of her art project "Looking for a husband with an EU-passport": (and it is all blank after the colon)

Yolanda van Wyk (2014-03-19 09:48:33)
Maybe the 'blank space' is the 'art'? 

Milena Kremakova (2014-03-21 15:41:29)
Thanks! Can you see it now? Sorry it took ages to fix, both SI editors have been overworked lately :)

Upcoming event: Max Weber, Markets and Economic Sociology, Warwick University, 7 May 2014 (2014-03-22 08:00)
An event organized by the Max Weber Study Group of the British Sociological Association and the Social Theory Centre at the University of Warwick

In the wake of the recent financial crisis, there is an urgent need for social scientists to think conceptually and critically about the economy and its relation to society. This event will contribute to this task by re-examining Weber’s writings on capitalism, markets and banking, and considering the value of his work for understanding the ongoing financialisation of the economy and of everyday life. While Weber’s economic sociology dates from the turn of the 20th Century, in many ways it continues to speak to the present. The 1890s saw the collapse of several European banks, suspension of payment on sovereign debt bonds issued by the governments of Argentina, Portugal and Greece, and speculative activity in the stock exchanges, with calls for a moralisation of finance in the name of the ‘thrifty average people’, sometimes coming from very interested parties (the Prussian landowner class). Max Weber became actively engaged in the debate on the regulation of the exchanges and published two pamphlets intended for a general audience, which looked at the stock and commodity exchanges as ‘institutions’. Another Weberian theme is what sort of person is produced by financialization: the banker, the trader, the capitalist adventurer as well as the upsurge of acquisitive culture. Recent controversies over bonuses return us to the principal-agent dilemma. In considering such work, this event will position Weber’s economic sociology in relation to recent debates over the limits of neoclassical and neoliberal economics, and will reflect, more generally, on the ways in which it might be used to gain an understanding of the complexities of capitalism - both of the past and of the present.

Confirmed speakers:
Geoff Ingham (Cambridge)
Scott Lash (Goldsmiths)
Linsey McGoey (Essex)
Keith Tribe
Sam Whimster (Global Policy Institute)
David Woodruff (LSE)

Session topics:
‘Market Order and Social Rationality’
‘Charismatic Authority and the Rise of the 21st-Century Philanthrocrat’
‘Weber and Markets: From Neoclassicism to Neoliberalism’
‘Weber and Money as an Economic Institution’
‘The Economics of Power: Max Weber on Banking’
‘Money, Capitalism, and the West’

Will there be a printed transcript of the presentations and Q &A (if any)? If so, E-mail me. Unable to come. M+
(Re)Producing Pistorius: Patriarchy, Prosecution and the Problematics of Disability (2014-03-22 16:30)

Introduction

Reeva Steenkamp was a South African model. She grew up in Cape Town, South Africa, and began modelling at 14 after she was "spotted" while out shopping. Steenkamp, a law graduate, advocated on "women's issues" such as rape and violence, as well as bullying. Her Twitter feed shows that she loved popcorn, chocolate mousse and smoothies; and, of course, her family and friends. The Thursday after she died Steenkamp had been scheduled to speak to students in Johannesburg about empowerment. She died on Valentine's Day 2013 aged 30 at the hands of her partner, Para/Olympic runner Oscar "Blade Runner" Pistorius.

I anthropomorphize Steenkamp deliberately here, to counter her secondary place in the story of her own death. Despite the fact that she was the one that lost her life, she is not the core of the story; it's not even her story. The narrative unfolding in the media coverage, perhaps not unexpectedly, is hollow: beautiful young people; a once golden "celeb" couple; glitz, glamour and wealth; a (fallen) sporting hero; and a grisly televised 'CSI style' (CNN, 2014) trial with the 'makings of a riveting movie script' (Daily Mirror, 14th March 2014), which is sating its audiences since 'that sensational arrest' (Daily Mail, 14th February 2013; emphasis added). Typically, Steenkamp has been sexualised in her death, with "racy" modelling photos routinely accompanying related news stories: 'Reeva...the last pictures of Bladerunner's girlfriend, days before he shot her' (The Sun, 25th April 2013). Not allowed to rest in peace, Steenkamp's embodiment of youth, womanhood, and beauty is rabidly consumed and regurgitated by misogynist newspapers for (amoral) profit in the form of the tantalising but typical 'never-before-seen pictures'. In this article, I ask some critical questions about the crime (of whichever nature it is deemed to be); the trial; the wider narrative and its main characters. I suggest that two central characters around which this tragic story revolves are cultural productions: the Supercrip and the imagined (black) intruder (Orford 2014). Writing from a critical disability studies and feminist perspective, I trace the complex intersections of disability, race, gender, colonialism, and class as they materialise in this case. Throughout the article, I purposefully keep Steenkamp in view as I question the (extra)ordinariness of her death. Quite simply, I conclude by offering an answer to this question. The "Blade Runner": A Cultural Production

Oscar "Blade Runner" Pistorius was, prior to his arrest for murder in early 2013, readily hailed as both an ableist symbol of overcoming and beacon of exceptional hyper-masculine embodiment. Having been born without fibulas and having both legs amputated below the knee when he was 11 months old, Pistorius made history by becoming the only athlete to ever compete in both the Paralympics and Olympics; a notion of overcoming officially sanctioned, then, by the Court of Arbitration for Sport and International Association of Athletics, and celebrated by global media. Not only do his hegemonic masculine heterosexual materiality and extraordinary sporting achievements contradict common understandings of disabled masculinities as asexual, partial, fractured, and lacking masculine power and privilege (Gerschick, 1995; Shakespeare, 1999), but, as a man of remarkable aesthetic beauty, his image has been eagerly commodified through corporate sponsorship and advertising, alongside that of his non-disabled sporting peers. Thus, Pistorius embodies and affirms our dis/ableist culture's unequivocal propagation of 'compulsory able-bodiedness' (McRuer, 2006: 2): an overarching, all-consuming dis/ableist ideology (intertwined with compulsory heterosexuality) which positions bodily normalcy as the exemplary human embodiment. Compulsory
able-bodiedness ensures that the absence of normative embodiment be unquestionably endeavoured, regardless of human, economic, cultural and societal cost – hence the routine pathologisation, medicalisation and psychologisation of disabled people's selves, bodies, and minds. Moreover, Pistorius' will, self-discipline, and achievement realise the dehumanising dis/ablest ideal of the 'supercrip' – a popular depiction of disability 'where the disabled person is assigned super human, almost magical, abilities' (Barnes, 1992: 10; Crow, 2000). Rooted in neoliberal and capitalist ideologies, the 'supercrip' valorises individual effort, human resolve, self-control, competition, and success, only celebrating disability and impairment which can be normalized through exceptionalism. Crucially, the supercrip is a discursive construction of disability against which all disabled people are implicitly and explicitly measured, classified, marked, and Othered. This is, in essence, its inherent danger for disabled people. However, the ways in which it defines disability only as bodily, simultaneously masking the environmental, economic, structural, cultural, and political causes, consequences and productions of both disability and impairment make it a construction of disability which is, by all accounts, precarious. Further, Pistorius' use of Cheetah Flex-Foot prosthetic limbs also offers our ablest cultural imaginary the possibility that we 'could reconstitute our bodies, both as mechanical and organic' (Meekosha and Shuttleworth, 2009: 60). His prosthetics are imagined to represent sleek military hardware; which may be rooted in the fact that much of prosthetic technology has emerged from military culture and research (for newly-amputee veterans) (Ott 2005). Thus Pistorius is hybridized, a mix of flesh and machine (see Haraway 1991), or posthuman (Braidotti 2013). Such a hybridized body – a real life "bionic man" – fulfils both our cultural thirst for weird, wondrous, and freaky bodies that can be unveiled, exhibited, examined and our fixation with scientific and medical advancement and their possibilities for the human body. Through a dis/ablest gaze Pistorius has been (re)produced as both a spectacle and an embodiment of freakery all at once (Clare 1999). Where for other disabled people this objectifying fetishisation likely induces feelings of shame, in Pistorius’ case he is revered because of the ways in which his (freaky) body is thought to “transcend” disability (Camporesi 2008). As Time stated when it voted him one of 100 most influential and heroic people of 2008: Pistorius is “on the cusp of a paradigm shift in which disability becomes ability, disadvantage becomes advantage”. Thus, Pistorius' freakdom is sanctioned and celebrated in dis/ablest cultures only because it disassociates him from dominant meanings of disability and impairment. The (imagined) Intruder: Another Cultural Production One can’t ignore the racial, colonial, gendered, classed and disability contexts in which Steenkamp's tragic death is situated, nor their intricate intersections. A white Afrikaner’s only rationalisation for shooting his girlfriend through a locked door is that he thought she was an intruder. Such a defence is steeped in a prominent history of racial and colonial violence and is a product of a racist and neo-colonial contemporary South Africa. As South African novelist Margie Orford (2014) has commented, the third person – the (imagined) intruder – has silently been cast by Pistorius’ defence team as a black man. Such assumptions rest firmly on historical tropes of the indigenous black man as savage, violent, and criminal and the white settler as productive (thus wealthy), civilised and heroic (a heroism exacerbated by disability in this case). Tellingly, high-security gated housing developments are common in South Africa as the corporations that produce them deal in a politics of (racist) fear; as much providing separation as security. The swart gevaar (Afrikaans for black threat) continues despite the fact the official apartheid ended long ago. Swartz (2013) argues that the swart gevaar is intensified by unfounded beliefs that the (majority black) African National Congress (ANC) government is fuelling violence against whites. Despite South Africa's readily identified “trigger happy” culture where the majority carry or own guns, and where research shows black people are more likely to be victims of violent crime than white people (see Swartz 2013), it is only the black indigenous figure that is both dangerous and a threat. But, as Pistorius’ defence is arguing, it’s important to situate this fear in the context of disability and bodily impairment: the notion that Pistorius was more fearful because he (allegedly) wasn’t wearing his prosthetics at the time (although this is, in reality, impossible to determine)[2][iii]. The implicit and explicit swart gevaar carefully weaved into Pistorius' defence is made all the more precarious (for him) because, in a court system with no jury, his fate rests upon the judgement of Judge Thokozile Masipa, a black woman. While this has been said to be symbolically positive for black power in South Africa (the black woman determining the destiny of the white man), this power is somewhat mitigated by the trial being conducted in English (despite the fact that English is not the first language of any of the key experts or witnesses), without even the question of which language needing to be asked (e.g. Arikaan of English) (Groots, Daily Maverick, 17th March 2014). An (Extra)Ordinary Death Thus, both the defence and the prosecution are peddling for Steenkamp's death not to be 'just another South African femicide' (Orford 2014). Rather, during the trial her death is being carefully assembled as the exception: a tragic freak
accidental shooting in an otherwise non-violent, loving relationship; or a calculated and callous “crime of passion” (a misogynistic construction of violence against women if ever there was one). But the story that gets lost in all the inane drama is, actually, the mundanity of Steenkamp’s death; the fact that her death isn’t particularly exceptional, but one of thousands. The cultural violence of South Africa combined with a strong patriarchal context ensures that intimate partner violence and its most extreme consequence, femicide, is prevalent. In longitudinal research over 10 years, Abrahams et al. (2012) found that despite significant government intervention and national efforts to prevent gender-based violence, there was only a reduction in female homicide which was consistent with a decline in overall homicides in South Africa. Abrahams et al. (2012) found less decline among intimate femicides (where a woman has been killed by her intimate partner) leaving intimate partner violence as the leading cause of death of women homicide victims, with 56% of female homicides being committed by an intimate partner. While consideration of this violent culture is important, explaining Pistorius’ crime only in the context of South African violence has been argued to be yet another way of removing responsibility, denying his agency, and restoring his reputation (Ndopu 2013). It also ghettosises South African cultures in ways that mask the fact that misogyny and violence are global problems as well as socially, economically, and politically entrenched ones. The disabled violent man, however, is a relatively unfamiliar notion. While disability and evilness, criminality, and monstrousness are synonymous in television, film and literary portrayals of disability – or as Longmore (2003: 133) states ‘deformity of body symbolizes deformity of soul’ – the combination of disability and violence in the minds of most extends only to the abuse and exploitation of, and violence inflicted towards, a disabled victim. This victim usually has physical, sensory, and/or cognitive impairment; the exception being those deemed mentally ill, who are habitually thought to be (potentially) violent and dangerous. Further, the culturally desexualised minds and bodies of disabled people ensure that intimate partner violence is seldom considered as a factor in disabled people’s lives (Thiara 2011; Liddiard 2013) – an assumption that has been particularly dangerous for disabled women (Liddiard 2012). But the disabled male (regardless of impairment, sexuality, age or class) is (re)produced in a peculiar dis/ableist binary: weak, dependent, non-violent, and safe; and yet bitter, caustic, revengeful and angry (anger positioned as emerging from an assumed resentment of disability). In Pistorius’ case, his well-constructed overcoming and becoming (from impairment to sporting hero) and struggle against (assumed) adversity affirms him as of an inherently good character. To counter this powerful narrative of disabled people as saintly, the prosecution are purposefully casting Pistorius as reckless, immature, and treacherously uncurbed; a lover of fast cars, guns and beautiful women. But in court, Pistorius’ behaviour is carefully refuting this role: he whimpers, he places his head in hands, he wretches, and he vomits. These actions, which have been markedly amplified in media reporting of the trial, suggest that he is a devastated man who made a costly mistake – for which we must remember that Steenkamp has paid the ultimate price. Such actions whether real, performed, or both, give Pistorius a humility and gentility. In contrast, in ways typical for women when they are victims of violent crimes, Steenkamp has almost completely been written out in court – reduced to a mere corpse around which myriad events has unfolded. Where she is actively written in is via some particularly deplorable media spaces which have routinely interrogated of her moral (and sexual) character. Did she meet with her ex two days before she was killed? Was she making Pistorius jealous by flirting with his close friend, rugby player Francois Hougaard? Was she really the ‘other woman’ with whom Pistorius cheated on his ex-partner? Was she really pregnant with someone else’s child at the time of her death? (Perezhilton.com 2013). Each of these questions are asked in ways which suggest that their answer makes any difference at all, or somehow serve rationalise Pistorius’ violent actions and therefore justify Steenkamp’s untimely death. The Reappearance of Disability and Impairment: The Court Room Returning to the media’s fixation with Pistorius’ embodied experiences in court, it is important to consider the meaning of such a preoccupation. Swartz (2013) and other commentators have suggested that, ‘a noteworthy feature of the coverage of the shooting in South African media has been the relative lack of attention to issues of disability’. In dis/ableist cultures where disabled people are customarily ascribed a one-dimensional identity (whereby disability subsumes all other identity markers) and the fact that so much of the Pistorius brand has been about (overcoming) disability, this is curious to say the least. But I suggest that disability – or rather, impairment – is visible. The trial has brought the everyday realities of Pistorius’ impairment into view for the first time. For example, much of the case hangs on the details of whether Pistorius felt more fearful of the imagined intruder because he wasn’t wearing his prosthetics, and how this relates to whether or not he was wearing his prosthetics at the time of both shooting Steenkamp through the door and then beating it open with a cricket bat to save her (as he maintains).
Considering that Pistorius’ own lived embodiment incorporates militarily-created technology, one might think of Pistorius as quite literally unarmed without his prosthetics on; hence his need/desire to use a real life weapon. Further, we are witnessing an increasingly sickly, ailing body and broken mind in Pistorius as the trial continues. Pistorius’ post-human masculine self is being presented ultimately, as human, emphasised in the ways in which it is experiencing trauma. While this corporeal expression of trauma isn’t impairment in the strictest sense, its presence certainly disrupts common depictions of Pistorius as both superhuman and infallible. Rather, a new vulnerable, fragile and breakable Pistorius is emerging. Another locale in which disability is reappearing is in the form of the dis/ableism found in much of the media coverage. For example, some media commentators have relied heavily on common disability tropes of the embittered, maladjusted cripple for most of their analysis – the assumption that, as Longmore (2003: 139) states, ‘disability is primarily a problem of emotional coping, or personal acceptance’. Lisa Vetten of the WITS Institute for Social and Economic Research has notoriously commented: “disabled men and women often struggle with their sense of masculinity or femininity because they are to some degree dependent”. As a disabled person, I wonder how Vetten knows this; or whether she realises it, at best, homogenises disabled people, and at worse, seemingly constructs a dangerous disabled psyche whereby disability – a form of social, economic, political and cultural oppression – is reduced to the level of the individual. Also present (though far less common), has been the equally lazy “he hasn't got a leg to stand on it court” or “he's shot himself in the foot there” (BBC News 18/3/2014) type humour from particular corners of the press: the notion that the cultural project of removing or rejecting the (disabled) Poster Child needs (and avows) raging dis/ableist discrimination and prejudice in the form of mocking a person’s impairment[3][iii]. Also routine, are the ways in which his violent actions have been positioned as the sum of his disability status. For Pistorius, whose overcoming and casting away of disability is central to his fame, it’s intriguing to see how quickly disability gets drawn back in; how quickly the Supercrip image crumbles once the disabled person becomes deemed unworthy. This reveals the danger of the supercrip not only for the majority of disabled people, but also the supercrip themselves. Its speedy seizure by dis/ableist cultures exposes less how the supercrip is a true celebration of will and achievement, but more a means through which to make disability socially acceptable and palatable for non-disabled publics. Thus, if the supercrip cannot uphold their super-humanness, they succumb and are returned to connotations of monstrousness and experience social death (Longmore 2003; Hevey 1992).

**Conclusion** I’m left wondering how to conclude this article. Of course, it inevitably brings about no change to any of the events it has made its subject. My hope is that I have not replicated the spectacle, the drama, or the sensationalism of Pistorius, Reeva, and the trial, but exposed the banality and triteness of gender-based violence, and the dis/ablism, racism and colonialism, gender inequality, and class which have both produced and contoured it in this case. Despite its sensationalist narrative, and the relative privilege Reeve Steenkamp had as an educated wealthy white woman in a South African context, her death is painfully and tragically ordinary. In South Africa, every one to two women killed, are killed by her partner (Abrahams et al 2012), making intimate femicide a routine danger in the lives of South African women – the likelihood of which is increased by race and poverty, and I would add, disability (because this is so often omitted when we talk about multiple forms of gender-based violence) (Thiara 2011). However, it’s important not to reify this social problem as inherent only to a South African context any more than as a consequence of a “damaged” disabled masculinity. Violence against women is a global problem, as is intimate femicide (ACUNS 2013). This, for me, is the real story. Let’s hope Steenkamp’s death shines a light to this, too. It appears there only one thing left to say: Rest in Peace, Reeva.

1. This article was written and published prior to Pistorius’ 30 day mental health assessment at the Weskoppies psychiatric hospital in Pretoria, meaning that such an explicit psychologisation of the accused isn’t included in this analysis.

2. Further, the most recent defense arguments which speak of Pistorius’ “slow burn reaction” to disability, as well as the deeply problematic analogy made by Barry Roux, Pistorius' head lawyer, of Pistorius acting like an abused woman who "kills her husband after many years", are not included in this article. For an analysis from a disabled activist, please see here: [4]http://samedifference1.com/2014/08/09/barry-roux-pistorius-had-a-slow-burn-reaction-to-living-his-life-with-a-disability/

on earlier drafts of this article. [nbox type="notice"]Kirsty Liddiard is Ethel Louise Armstrong Postdoctoral Fellow in the School of Disability Studies at Ryerson University.[/nbox] References

[5][i] I use the term ‘dis/ableism’ through this article to refer to the dual processes of disablism and ableism. Where they are present, both separately and working in conjunction, I use the term dis/ableism. Where I refer specifically
to one of these forms of oppression, I use the respective terms. While there are contestations around the meanings of both disablism and ableism (particularly between British and North American disability studies scholars), for the purposes of clarity, I use Fiona Kumari Campbell’s (2001: 4, 44) definitions throughout this article: Disablism: ‘A set of assumptions (conscious or unconscious) and practices that promote the differential or unequal treatment of people because of actual or presumed disabilities’. Ableism: ‘A network of beliefs, processes and practices that produces a particular kind of self and body (the corporeal standard) that is projected as the perfect, species-typical and therefore essential and fully human. Disability then is cast as a diminished state of being human.’

[6][ii] It was determined at the time of writing that the prosecution accepted (18th March 2014) that Pistorius was not wearing his prosthetics at the time of shooting Reeva Steenkamp or when he broke down the bathroom door with a cricket bat.

[7][iii] Lance Armstrong and Heather Mills are two other famous people who have become victim to disablism in the form of mocking their impairment/disability.
The Paradox of Civility, or, “why is this place filled with such rude assholes?” (2014-03-24 08:00)

There was a strange and compelling article on Medium this week, reflecting on the author’s experience of being a devotee of Whole Foods, the self-certifying purveyors of ‘natural’ produce who will surely expand in the UK at some point. The author was at great pains to make clear how much he loves Whole Foods:

“I’ve shopped at Whole Foods in every time zone, in at least 10 different cities: LA, San Francisco, Seattle, Denver, Austin, Chicago, Milwaukee, New York, DC and Richmond, VA. I love Whole Foods. Scratch that, I love the products Whole Foods sells, no matter what other people might have to say about them. Maybe the simplest way to phrase it is, I love whole foods. Whole Foods as an experience, that’s a whole other matter.

But here’s what sucks for Whole Foods: it has nothing to do with their employees. Across the board, across the country, they have been helpful, knowledgeable, and cordial. I’ve received phenomenal service in every department: from the beer fridge to the butcher counter to the bulk aisle. I now know everything there is to know about lentils, for instance, thanks to a guy stocking roma tomatoes in the produce section of the downtown Milwaukee store, who took the time to explain why he used red lentils for his curried lentil dish a couple nights before.

But there was one problem: the other customers. These customers are “across the board, across the country,
useless, ignorant, and miserable”. Do you pity this poor author who is forced to brave "a sneering, disdainful horde of hipster Zombies and entitled 1 %ers" every time he wants to purchase his favourite lentils? I certainly do. Imagine having to cope with a supermarket where people block the aisles:

They stand in the middle of the aisles, blocking passage of any other cart, staring intently at the selection asking themselves that critical question: which one of these olive oils makes me seem coolest and most socially conscious, while also making the raw vegetable salad I’m preparing for the monthly condo board meeting seem most rustic and artisanal?

If you are a normal human being, when you come upon a person like this in the aisle you clear your throat or say excuse me, hoping against hope that they catch your drift. They don’t. In fact, they are disgusted by your very existence. The idea that you would violate their personal shopping space—which seems to be the entire store—or deign to request anything of them is so far beyond the pale that most times all they can muster is an "Ugh!"

Over the years I have tried everything to remain civil to these people, but nothing has worked, so I’ve stopped trying. Instead, I walk over to their cart and physically move it to the side for them. Usually, the shock of such an egregious transgression is so great that the “Ugh!” doesn’t happen until I’m around the corner out of sight. Usually, all I get is an incredulous bug-eyed stare. Sometimes I get both though, and when that happens, I look them square in the eye and say "Move. Your. Cart." I used the same firm tone as Jason Bourne, with the hushed urgency of Jack Bauer and the uncomfortable proximity of Judge Reinhold. From their reaction you’d think I just committed an armed robbery or a sexual assault. When words fail them, as they often do with passive aggressive Whole Foods zombies, the anger turns inward and they start to vibrate with righteous indignation. Eventually, that pent up energy has to go somewhere, and like solar flares it bursts forth into the universe as paroxysms of rage.

Outside the four walls of a Whole Foods, you might recognize these people as Gawker commenters or Twitter shamers. Hmm. The anecdote which occupies the rest of the article is very funny and definitely worth reading. But what interested me was the apparently complete failure of self-awareness exhibited by this otherwise perceptive writer. He is an angry Whole Foods devotee who regards everyone in the store as beneath contempt, accosts people threateningly in the isles and then goes home to let the internet know what rude assholes he has had to negotiate while shopping for his much needed organic food.

What interests me is the incivility with which he acts while nonetheless understanding himself as fighting to preserve civility. Squaring up to someone, aiming for “uncomfortable proximity” in order to “look them square in the eye and say ‘Move. Your. Cart.’” isn’t civil behaviour. It just isn’t. So his response to the problem of incivility within Whole Foods actually contributes to it, seemingly without the author having stopped to ponder whether one of the people he threatens in the aisles might go home and blog about how rude Whole Foods customers are.

What’s really going on here? It’s not that there aren’t any endorsed and enforced norms about bodily comportment within public space. Clearly, there are many potential acts which would be roundly condemned and which would provoke an intervention by security (though it’s worth considering the relationship between interpersonal
norms and the institutional structure in such instances). But this assembly of norms applicable to the social space is much fuzzier when we move away from absolute prohibition. If someone acts to enforce a norm (e.g. asks you to stop talking on your phone in the quiet zone of a train) and you endorse that norm (e.g. you felt you shouldn’t answer your phone but didn’t want to get up and leave the carriage) then their action has a normative force which it otherwise wouldn’t. This is what makes the difference between someone hanging up their phone at this point and blithely continuing to talk or even telling the complaining party to go fuck themselves.

When someone acts to enforce a norm which they endorse but others don’t, it is experienced as an arbitrary intervention or assertion of power. This doesn’t mean it’s necessarily opposed, given an overriding concern to sustain the peacefulness of the interaction, only that the phenomenology of the interaction is different. I’ve been shushed in a restaurant: at which point we did restrain the volume but, at least in my case, only to avoid a conflict rather than because I felt we’d violated a norm about proper comportment within the social space.

What interests me about the Whole Foods example is how the author would be perceived by one of the “sneering, disdainful horde of hipster Zombies and entitled 1 %ers” he shoves past in the isle. It’s apparent to him that he’s acting to enforce a norm but presumably the norm is neither endorsed or even perhaps recognised by the offending party. Therefore, he’ll just seem very rude. What I’m pretentiously calling the paradox of civility is the necessity that norms of civility be both endorsed and enforced within a social space in order for action which enforces civility to avoid contributing to incivility. If the norms being acted upon aren’t widely endorsed then acting upon them will contribute to incivility no matter how justified the enforcing party believes themselves to be. People who complain about incivility and then act in this way are actually contributing to the very problem which so troubles them.

Hi Mark Your story reminded me another one in which I was involved myself some days ago. I live in the center of Barcelona, in a very nice street but full of tourists. I wrote a post about it in this blog, in the visual sociology section (I shoot, therefore I exist). The thing is, every day, when I go home, I find 10 or 15 tourists taking photos to the building in front (Palau de la Musica, quite a touristic attraction) and blocking (literally) the entrance to my street (which is really, really narrow). Some days ago I met this group blocking the entrance, as usual, and I asked them to let me in. There was a man in the group which got very rude at me... for disturbing them. I am normally a quiet person, and don’t use to argue with people in the middle of the street, but this was too much for me and told him that I was fed up of not being able to access normally to my home (I was quite rude here, I have to admit it), to which he answered that I should move somewhere else!!!! Well, in summary, the whole story was quite incivil. I was mad at this man not because he was in the middle of my way but because many people, over 15 years I’ve been living here, is in the middle of my way every day. And he was angry at me because whatever had happened, that had nothing to do with me (he had probably argued with his girlfriend, or had been cheated by the taxidriver, or his boss had been anoying him on the telephone on his leisure time.. whatever) and he took it with me. The result was incivility in both sides (I would say, more incivility in his side, but this might be a subjective view, of course). My conclusion from all this story: though I am usually a very quiet, respectful and educated person, far away from that man in the whole foods shop you speak about, sometimes, any of us can become incivilised at any moment, for a handful of reasons which have nothing or little to do with what is really happening. Don’t you think so?

2533
I do! And I really can relate to that... This line of argument emerged from me analysing my own irritations as much as anything else - I guess I’m saying it’s a tendency at the level of social interaction which arises from much larger scale macro-social processes which are increasing the degree of normative heterogeneity in the social world.

Manuel DeLanda on Deleuze, Morphogenesis, and Population Thinking

Manuel Delanda, contemporary philosopher, discusses Deleuze, materialism, morphogenesis, and the first of three reasoning styles, population thinking. Public open lecture for the students and faculty of the European Graduate School EGS Media and Communication Studies department program Saas-Fee Switzerland. 2011 Manuel DeLanda.

Manuel DeLanda, (born 1952 in Mexico City), is a writer, artist and distinguished philosopher who has lived in New York since 1975. He is a professor and the Gilles Deleuze Chair of Contemporary Philosophy and Science at the European Graduate School in Saas-Fee, Switzerland, a professor at the Canisius College in Buffalo, New York, and professor at the University of Pennsylvania School of Design in Philadelphia, Pennsylvania. DeLanda was formerly an Adjunct Associate Professor at Graduate School of Architecture, Planning and Preservation at Columbia University (New York).

Simulation: The Emergence of Synthetic Reason (2011). He has published many articles and essays and lectured extensively in Europe and in the United States. His work focuses on the theories of the French philosopher Gilles Deleuze on one hand, and modern science, self-organizing matter, artificial life and intelligence, economics, architecture, chaos theory, history of science, nonlinear science, cellular automata on the other. De Landa became a principal figure in the "new materialism" based on his application of Deleuze's realist ontology. His universal research into "morphogenesis" - the production of the semi-stable structures out of material flows that are constitutive of the natural and social world - has been of interest to theorists across many academic and professional disciplines.

Some thoughts on DIY sociology (2014-03-26 08:00)

In a [1]recent post Ros Edwards and Val Gillies described the Women's Workshop on Qualitative Family and Household Research which has been meeting independently for a quarter of a century. It began as a “nameless informal support group of five women who met at a British Sociological Association summer school for PhD students in 1988” and slowly grew over the years through word-of-mouth. This growth of the group required a certain degree of formalisation but in a way which sustained its autonomy from professional associations and universities:

A growing group meant that things became a bit more formalized about three years into the Workshop’s existence. Someone took on being co-ordinator, a role that over the years has shifted around between members as and when necessary. The group also became a named entity. Quite a bit of discussion and care was put into coming up with the title, Women's Workshop on Qualitative Family/Household Research, at the time. And part of that was the decision that it would explicitly be women-only. While this has been reviewed over the years it has retained unanimous support. Another part of the naming discussion was that the group’s title indicates and reflects that it’s as much concerned with the methodological process of qualitative research, with being a woman researcher, and with epistemological debates about how we can know about social life, as it is with the substantive topic of families and households.

As well as meetings and discussions, the group enacts collective publishing projects, motivated in part by an awareness of the necessity of such activity for individual members. As it has become more difficult for postgraduate members to host meetings, it’s increasingly the “members of the group with ‘permanent’, and more senior, positions who can leverage resources to ensure that meetings are free”. Nonetheless, the concern throughout has been to preserve the ethos of a group which was able to say in its early days that “no ‘big names’ attend so we wield little academic power”.

It’s definitely worth reading [3]the article in full. It represents a case study of an alternative organisational form which, though many might be vaguely aware of its possibility, nonetheless seems to rarely figure in the repertoire of modalities through which projects can be enacted. The question I’ve been ruminating about recently
is "what is a conference for?" or "what is a seminar for?". Questions of this form can, as Stefan Collini observes, encourage deliberation about the purposes of ways of doing things which are otherwise taken for granted.

But, sometimes, asking what something is ‘for’ can, if understood as an expository tactic, a starting-point rather than a ruling, be a means of helping us to clear away the discursive debris that accumulates round any widely used category. The very asking of the question in this slightly over-insistent, finger-jabbing form may be enough to encourage reflection to cut through the incidental clutter and begin to wonder what kind of response could count as a useful answer. From then on, it is probably sensible not to try to press the question further in this narrow form, but to let rumination extend itself, brooding on the diversity that may shelter under a single term, pondering a series of characterizations or historical instances rather than seeking a single defining proposition.

What I see as the pressing question confronting professional associations in the contemporary climate is whether their organisational form is eroding the purpose of certain forms of activity or even excluding them outright. The danger of this line of argument is that it lapses into idealism, failing to recognise the practical exigencies attendant upon certain forms of activity or the instrumental motivations which often lead people to willfully engage with them despite widespread grumbling about their particular characteristics. This is why studying actually existing organisational forms, alternative ways of meeting and enacting collective purposes, becomes so important. It's also crucial that we avoid the temptation to dichotomise forms of organisation, counterposing what is ‘good’ and autonomous and what is ‘bad’ and institutionalised.

There are many things which are only likely to be possible at scale and an interest in the autonomous, local and networked shouldn’t give rise to a simplistic disavowal of any forms of organisation which are institutionalised. Instead, we should look to actually existing cases to better understand what value each does and doesn’t have for the people participating in it. Ros Edwards and Val Gillies really helpfully bring out the intersection between what might otherwise be construed as two distinct spheres, recognising how participation in one can be leveraged to enable the other. I don’t think spaces like the ones they describe are a panacea for the ills of the contemporary academy but I do believe that they are becoming ever more important, for reasons too innumerable to address in a short blog post:

And despite the tensions, the Workshop as an open and welcoming forum remains as its intention, and also we think also its practice. Senior members reflect on how important the Workshop was as a source of support while doing their PhDs and hugely value the continued friendships and intellectual stimulation while post docs and early career researchers, like their doctoral forebears, see the Workshop as a safe forum to present their work and receive encouragement to publish for the first time. Whatever our career stage we experience the Workshop as standing in sharp contrast to some of the more adversarial academic cultures and contexts in which we can find ourselves. The Workshop remains a rare space in academia where women support each other while also providing excellent cross-generational mentoring and critique. We don’t know if our study group is unique in being an academic group, not institutionalized, explicitly women only and feminist, that’s achieved a silver anniversary and is still as active as ever. We think that we are, but we hope not.

The organisational forms preponderate within the academy have their history of emergence. They are not fixed or
immutable, though of course they exhibit a persistence which cannot simply be wished away. What I’m calling ‘DIY Sociology’ is first and foremost an insistence that we cultivate a heightened reflexivity about dominant organisational forms and the panoply of purposes they serve or frustrate.

**If you’re involved in something like this then why not [6]write about it for Sociological Imagination?**

Lindsea (2014-03-29 19:32:39)

Great post! I love this idea. I explore DIY philosophy... DIY philosophy assumes these basic premises: 1. We are all born with an innate sense of wonder. 2. We all have a philosophy (whether we call it that or not). It’s the set of beliefs we’ve developed based on our experiences in the world, and our association with others. 3. Philosophy does not happen while reading a book—philosophy happens in our interaction with others. Philosophy is active, not passive, and the more we practice it, the more we hone our beliefs and perceptions about the world around us. The method of DIY philosophy is as follows: first, the group sits in a circle. There is a community ball used to designate the speaker. Passed around the circle one time after the facilitator introduces the question, each player introduces themselves (with a real or fake name) and respond to the question. Listening is as important as speaking, and anyone is allowed to pass if they feel like it. Metrics for the discussion on a cognitive, social and emotional level: 1. Feeling of confusion—entering complexity, an objective is to embrace an intellectual curiosity that begins in healthy confusion. 2. Linking of new ideas—in a self corrective, inquiry lead discussion, new lines of questioning lead to insights. 3. A sense of understanding begins to emerge for the individual at the junction of many complex systems.

**The ontology of books (2014-03-27 08:00)**

I read a book a decade ago and struggle with it. I read it again now and find it astonishingly thought-provoking. How do you explain this? It seems I bring something different to the book on the second reading: concepts, experiences and knowledge which I lacked at the time of the first reading. But what role does the book play? It seems obvious to me that this can only be explained in terms of the interaction of two sets of properties and powers: mine and those of the book itself. I have changed in the aforementioned decade but the book has not. The causal role of the latter is not trivial and understanding it opens up really interesting questions about the ontology of books. Books can change us but, as we change, so too does what we bring to books as we engage with them.
The Art of Listening (2014-03-27 19:08)

This is a preface to the new Japanese edition of Les Back’s The Art of Listening, published by Serica Shobo and translated by Dr Takeshi Arimoto. It is republished here with permission.

Since its publication in 2007, The Art of Listening has been read enthusiastically by students and young scholars but ignored largely by Professors of Sociology and the discipline’s ‘big names’. The response from younger readers has been nothing short of astonishing. One wrote in an email that the book was so exhilarating to read that they felt compelled to take it for a walk out into the streets of London, where they could feel the textures of city life while they turned its pages.

A reviewer for the British Journal of Sociology commented that sociology students were so enthused by the book that they were encouraging their parents to read it. The book somehow captured the imagination of younger readers trying to use sociology and cultural studies to make sense of their lives. Reflecting on it now, I think I was subconsciously aiming the book at a younger audience all along, so in a sense it should be of no surprise that it resonated with them rather than established scholars. It is a book that asks the big questions about the value and
purpose of what we do as thinkers, researchers and writers.

I was mindful too that in publishing a book that is very personal and unguarded, that tried to stretch the parameters of what sociology can be beyond current academic conventions, I took a risk. In the final stages of its completion in 2006 I had a moment when I lost my nerve. Did I really want to speak openly about intimate relationships within my own family and also be quite so reckless and blunt about intellectual and political commitments?

As the first principle of their craft academic readers are trained to be unforgiving critics. Clouded by anxiety I toyed with withdrawing the manuscript just at the moment when it was ready to be submitted for publication. In the end, I decided to let it go. The Art of Listening was the only thing I had to say, the only book I had in me to write. Publishing it was a turning point for me, a kind of intellectual and personal crossroads. I would like to just make a few points of introduction for Japanese readers about what was at stake for me in writing this book and why it might also speak to their concerns too.

By the beginnings of the 21st Century the authority of humanistic sociology had been challenged profoundly. Humanism’s hubris was cut down to size by a wide variety of thinkers like Michel Foucault, Gayatri Spivak and Bruno Latour for its Eurocentrism, sexism and its conceit for the non-human world. Also, the claim that social researchers had privileged access to social reality was undermined once and for all. It was irrefutably established that researchers made social realities through their endeavours rather than simply reflect them as society's mirror. The question remained: how do we continue with our research craft in the aftermath of the deconstruction of the implication of power and knowledge in social science?

At the time of writing The Art of Listening these arguments seemed intellectually right but actually not a very good way to live as a scholar committed to public conversation and dialogue. What was left in its place seemed to me like a cold-hearted social science which reified impersonal critical distance. So much of the ‘big stuff’ of life – love and loss – simply became inadmissible or dismissed as sentimental. I wanted to try and write a book that would make the experience of life and the public issues contained in personal troubles admissible again, even if it was for no one else except myself.

As you will read this book emerged out of a moment of personal grief and a sense of biographical dislocation. Writing it was an attempt to build a bridge made of words that could span the huge social chasm between working-class London life and the bourgeois academic world of the University. In a way a scholarly vocation provided a way for me to retain a connection to the working-class world that I left behind as a young man for a new life at the University. The book is both facilitated and limited by that experience in ways that still remain a mystery to me but I do not want to hide from that fact.

Looking back on it now the book offers a series of ‘listening lessons’. The first relates to politics. Our political debates do not suffer from too much doubt but from too much certainty. The task of thinking is to live with doubt in the service of understanding, rather than living with certainty in the preservation of ignorance. Name-calling is not thinking. The temptation to dismiss the view of one's opponents as “rubbish” is strong but misguided for two reasons. Discounting racist views, for example, as drivel does nothing to evaluate and understand their resonance or reach. It is for this reason that, though I've spent much of my adult life fighting against racism, I no longer subscribe to the “no platform” argument with regard to racists. We need to know what a racist argument sounds like. This is not the same as saying that organisations like Uyoku dantai, or Japan's newly confident nationalists who want to revise World War II history, should be offered a comfortable seat at the table of public debate. Rather, it means paying close attention to what they say and subjecting the content to critical judgment.

Reducing opposing views to rubbish produces encamped positions that actually stop listening. It forecloses critical thinking – they simply need no further attention other than being consigned to the category of waste to be disposed. We have to pay attention to those voices that seem abhorrent because understanding is not the same as
agreement or justification. What does the racist graffiti being daubed over the walls of Tokyo’s Shin-Okubo district, where Tokyo’s Korean community live, tell us about Japanese racism? Or, what does the vandalism of hundreds of copies of Anne Frank’s Diary in Tokyo’s Metropolitan Library indicate about the targets of the ultra-nationalist imagination?

Politicians like to threaten us with listening. Tony Blair was very fond of this and part of the problem with the very idea of listening in a political context is that there is something very suspicious about it. It was strategist British Philip Gould who made the “focus group” a strategic resource for Blair’s New Labour project. Political focus groups are not really about the kind of attention I am arguing for. Their function is to “sound out” the voters in order to fine-tune party political rhetoric in order to manipulate very select groups of the electorate to do the politician’s bidding, i.e. vote for them. Rather, the political lesson at the heart of this book is that we have to listen to our enemies as well as our friends in order to understand critically the world that each of us forms a part.

Our second lesson is that we must strive to develop a prosaic and everyday ethics of attentiveness. “You do not interest me. No man can say these words to another without committing a cruelty and offending against justice,” writes philosopher Simone Weil. To turn a deaf ear is an offence not only to the ignored person but also to thinking and justice. Coleridge’s Ancient Mariner is cursed because no one will listen to his story. The Italian chemist-turned-writer Primo Levi was preoccupied with this fable because of his fear that on returning from Auschwitz people like him would be either ignored or simply disbelieved. Regardless, listening gets a very mixed press amongst critics and intellectuals. There is a suspicion of wistful optimism or the quasi-religious appeal to ‘hold hands’ and play priest at the confessional.

These qualms miss the centrality of listening in dialogue that is not merely about consensus or agreement but engagement and criticism. This is something that Primo Levi understood. Faussone, the hero of Levi’s novel The Wrench, is a difficult man. An itinerant rigger, he spent his life travelling the cities of the world operating high-rise cranes. Despite the dramatic nature of his adventures Faussone is not a natural storyteller.

The novel’s narrator comments on how tempting it is to interrupt him, put words in his mouth and spoil his stories before they have even been told. He comes to realise: “Just as there is an art of storytelling, strictly codified through a thousand trails and errors, so there is also an art of listening, equally ancient and noble, but as far as I know, it has never been given any norm.”

The quiet patience required to invite the story’s telling makes an important contribution to its content. For, as Levi writes, “a distracted or hostile audience can unnerve any teacher or lecturer; a friendly public sustains.” The listener’s art for Primo Levi is practiced through abstaining from speech and allowing the speaker to be heard. Listening is active, a form of attention to be cultivated.

Inspired by Primo Levi, this entails tuning our ears differently. A good starting point would be to stop talking over each other. Listen to your own voice and develop a mild aversion to it. Hearing yourself recorded on a dictaphone is a good way to achieve this. It may produce a situation where we become more judicious, careful and measured in what we say, and more able to stop talking and listen. Like Levi’s narrator in The Wrench we must resist the temptations of interjection or ventriloquism.

The main lesson offered here is that listening is not merely the instrumental extraction of information or a matter of “ticking the box” of consultation. Or, the wounding compassion that has been directed at the citizens of Japan – often coloured with an Orientalist sense of Japanese stoicism– in the face of recent natural and man-made disasters. This active listening creates another set of social relations and ultimately a new kind of society, if only temporarily. This is not about making people “nice”, although it might make those who like to parade their superior intelligence less insufferable. Rather, it is a way to develop a more searching critical engagement with the kinds of human beings we have become.
The Art of Listening argues for a kind of intellectual craft that is vital and lively. One that is both inventive in terms of its methods and techniques but also restless in its search for new forms that sociology and cultural studies might take. One in which we can develop ways to represent our multicultural realities, for a in a hyper-connected world we all need to learn to live with difference. Here attentiveness becomes a vocation, as we notice and question what is before us.

John Berger once commented that translation is an act of smuggling. The translator sneaks ideas and thoughts across the border of one linguistic territory into another language. I deeply grateful for the effort and time this takes and for Takeshi Arimoto’s careful, patient and rigorous work to smuggle these words and ideas into the Japanese language and make them available to you. I would also like to thank Hiroki Ogasawara for his guidance. I hope the sensibilities of this book are useful in some way as you grapple with the urgent task of understanding what is alive in our damaged and mortified world. Also, that reading this book will compel you – like the young student in London – to test its usefulness by taking its ideas for a walk through the streets of Kobe, Fukuoka or Tokyo.

Les Back has been teaching in the Sociology Department at Goldsmiths, University of London since 1993. His main areas of academic interest are the sociology of racism, multiculture, popular culture, music and sound studies and city life.

A new preface for Les Back’s The Art of Listening | Thinking culture (2014-04-24 08:02:42)
[...] Japanese edition of his book The Art of Listening. The preface has been published in full on the Sociological Imagination site. In this new preface Les reflects on the reception and writing of the book, he also talks of the [...]
One of my favourite passages by C Wright Mills concerns the tendency of academics to “slip so readily into unintelligibility”. An “elaborate vocabulary” and “involved manner of speaking and writing” become props for a professional self-image which defines itself, in part, through the inaccessibility of the work being produced:

In many academic circles today anyone who tries to write in a widely intelligible way is liable to be condemned as a ‘mere literary man’ or, worse still, ‘a mere journalist.’ Perhaps you have already learned that these phrases, as commonly used, only indicate the spurious inference: superficial because readable. The academic man in America is trying to carry on a serious intellectual life in a context that often seems quite set against it. His prestige must make up for many of the dominant values he has sacrificed by choosing an academic career. His claims for prestige readily become tied to his self-image as a ‘scientist’. To be called a ‘mere journalist’ makes him feel undignified and shallow. It is this situation, I think, that is often at the bottom of the elaborate vocabulary and involved manner of speaking and writing. It is less difficult to learn this manner than not. It has become a convention – those who do not use it are subject to moral disapproval. It may be that it is the result of an academic closing of ranks on the part of the mediocre, who understandably wish to exclude those who win the attention of intelligent people, academic and otherwise.

C. Wright Mills, The Sociological Imagination, Pg 218

This was written at a very particular point in time. Yet this trend has seemingly persisted, perhaps intensified, even though the particular circumstances of mid twentieth century American academia have passed. The confusion between what is simplified and simplistic persists, with new modes of intellectual expression leading many to conflate the two with a renewed vigour. It’s important to avoid overstating this case. Some readable things are superficial. Some simplified things are simplistic. Would anyone deny this? The point is to sensitise ourselves to where these boundaries fall. At what point does the pursuit of the former risk engendering the latter? Unless we’re clear about this, any activity tending in this direction will be left as a site of unbridled professional neurosis. So while I agree with Arlene Stein [2] here, I think it’s only part of the picture:

I know from my work with Contexts that there are lots of sociologists who have very interesting things to say about the world. And in fact, they yearn to share their work with audiences beyond the academy, but they don’t know how to do so. That’s because they don’t know how to translate their work for different publics.

In recent years, more and more sociologists are making a case for the importance of doing “public sociology.” This discussion, while certainly important, has taken place largely at the level of theory, via the work of past American Sociological Association President Michael Burawoy and others. Some of it is taking place among those who are engaging in digital sociology, if posts I’ve been seeing on such blogs as The Sociological Imagination are any indication.

Yet few, it seems, are focusing their sights on making sociological writing more engaging, and fewer still see this as central to the public sociology project.

We need to do all of these things simultaneously: reflect upon the work we do and the uses to which it is put; use new technologies as tools for research and communication; and value good writing—and teach others how to do it.
There's a deficit of skills. There's a corrosive culture, particularly in graduate school, which socialises trainee academics into unintelligibility. But there's also something personal and biographical here which needs to be understood. The sacrifices people make to pursue this course of life. The efforts and energies they put into it and the things they forego as a consequence. These engender an *investment* in a self-presentation of specialisation which has enormous practical implications for their willingness to contort a communicative impulse into the *alienated* form impelled by the structures of the academy.

Claudia Vallvé (2014-04-01 14:12:21)
One of my favourite paragraphs by Wright Mills!!! This idea of things being superficial because readable (or profound because unreadable) is also extended down here, and it's sometimes difficult to find profound and readable things. That's why I've recomended your post in my blog today (in spanish) to remind myself and others to have these concepts in mind when sitting in front the computer to write down the results of our investigations. http://claudiavallve.com/2014/04/01/sociologia-publica-y-escritura-sociologica-i-en-the-sociological-imagination-por-mark-carrigan/,

Out of interest: how widely read is C Wright Mills in Spanish? I've always wondered if he might be a peculiarly anglo-american trend, in spite of his new leftist internationalism.

Stephanie (2014-05-03 06:48:12)
You can refer to Howard Becker too! :) He writes a whole book about Writing for Social Scientist.

Laura (2014-06-28 05:57:45)
Yep I had a colleague recently critique my writing as "too folksy," which I took to be a compliment, although I don’t think it was intended that way. I basked in the same passages of the Sociological Imagination. Just because if everything is so "rarified" as to not be accessible to someone who is interested, uninformed but wants to know, we're just contributing to knowledge as a strategy to oppress. I'm not saying there aren’t occasions and places where complex ideas require complex language, but too often, methinks, it's hubris driving the bus.

Andrew Jakubowicz (2016-08-28 15:35:15)
One strategy is to pair up with a good editor and publish on The Conversation - lots of accessible sociology for smart non-sociologists who are happy to test your claims -
Graham Harman, American philosopher, talking about speculative realism, philosophy, natural sciences, fine art, correlational circle, object, plasma. In the lecture Graham Harman discusses the concepts of phenomenology, pre-socratics, quality, in relationship to Bruno Latour, Slavoj Zizek, Alain Badiou, Heidegger, Whitehead, Deleuze, Meillassoux, focusing on surplus, materialism, idealism. Public open lecture for the students and faculty of the European Graduate School EGS Media and Communication Studies department program Saas-Fee Switzerland Europe 2013 Graham Harman.

Graham Harman (born May 9, 1968) is a professor at the American University in Cairo, Egypt. He is a contemporary philosopher of metaphysics, who attempts to reverse the linguistic turn of Western philosophy. Harman is associated with Speculative Realism in philosophy, which was the name of a workshop that also included the philosophers Ray Brassier, Iain Hamilton Grant, and Quentin Meillassoux.

Central to Harman's philosophy is the idea that real objects are inexhaustible: "A police officer eating a banana reduces this fruit to a present-at-hand profile of its elusive depth, as do a monkey eating the same banana, a parasite infecting it, or a gust of wind blowing it from a tree. Banana-being is a genuine reality in the world, a reality never exhausted by any relation to it by humans or other entities." (Harman 2005: 74). Because of this inexhaustibility, claims Harman, there is a metaphysical problem regarding how two objects can ever interact. His solution to this problem is to introduce the notion of "vicarious causation", according to which objects can only ever interact on the inside of an "intention" (which is also an object).

Not Your Typical Call for Papers (2014-03-30 08:00)

With the 2014 Volume, the Berkeley Journal of Sociology will focus its efforts on writing a “history of the present.” The journal will no longer publish academic research articles. Instead, we seek compelling essays, insightful commentaries, critical analyses, and topical symposiums on the most pressing political and cultural issues of the day. Our aim is to provide critical perspectives from the social sciences on public debates and current events with an orientation toward social and political engagement. We seek to transform our longstanding graduate-run academic journal into a print and online magazine sourced by a global graduate community with wider relevance. The BJS is re-imagining the purpose of a publication that emerges from within the academy, but which does not take the discipline of professional sociology as its aim. We seek new audiences across new platforms to firmly root sociological knowledge within society, for society.

We believe there is a need for creative translation and wider circulation of the knowledge we are producing as graduate students of the social sciences on politics and culture today. We seek to broaden the interpretive range, imaginative scope, and prospective application of our research to ongoing political struggles, emerging cultural trends, and possibilities of alternative futures. We are not content to be relegated to the sidelines. The point, after all, is to change the world. The task before us is to arm our critiques with power. This is a call to join a proper conspiracy whose aim is not only to critique, but to intervene; not only to intervene, but also to shift the terrain beyond the internal debates of the academic field.

The BJS seeks to open up a space to re-compose social research into a range of written forms, unobstructed by technical jargon and unconstrained by formalistic rigidity. Through its online-first approach the journal seeks to redistribute its material across sources and publications, in the alternative and popular press. Toward that end, BJS is accepting the following kinds of submissions on topical issues or debates:

- research essays: open to interpretation.
- commentary: social scientific assessments of events, journalistic reportage and public discourse; critiques of recent reports by state agencies, think-tanks, NGOs, foundations, polling agencies, etc.
- conversations: interviews with traditional or organic intellectuals on topical subjects and debates.
- field memos: ethnographic dispatches from graduate researchers; elaborations of experiences in the field as they relate to contemporary social struggles, crises, cultural or political debates.
- photo essays: from a site of research; sociological critiques of art or visual culture.
- book reviews (joint or solo): social scientific assessments of recently released trade books; reviews of academic books relating to contemporary events or debates.
- debates: The journal will be running video and transcripts from UC Berkeley’s Public Sociology Initiative. We invite similar debates or symposia on contemporary politics and culture, in the flesh or virtual.
Submissions are due by June 1st and may be sent as email attachments to submissions@berkeleyjournal.org and will be subject to a review among Berkeley graduate students in the social sciences. We also invite proposals for forums comprised of a number of contributions around a single topic. Proposals for forums should include a brief description of the project and information about the authors, including contact info, and should be submitted by April 1st to submissions@berkeleyjournal.org. All journal content will be published under a CC-BY-NC-ND license.

The *Berkeley Journal of Sociology* is a graduate student-run journal that has been in publication since 1955. Archived articles can be found on JSTOR.

**Inside Llewyn Davis, or what is it like to be a fractured reflexive?** *(2014-03-31 08:00)*

I was expecting to *like* this film but it completely exceeded my expectations. Largely because it was such an interesting and accomplished exploration of a particular mode of being-in-the-world. Llewyn Davis is a struggling folk singer in Greenwich Village of the early 1960s, enmeshed in a tightly knit cultural world of fellow folk singers and shared venues, with the only welcome face of the outside world being an affable though patronising sociology professor, prone to introducing him at dinner parties as “our folk musician friend”. Formerly half of a folk duo, we come to discover that his former partner died in tragic circumstances, with Llewyn avowedly pursuing a solo career,
while in reality existing in a chaotic cycle of gigs, arguments and homelessness.

What the film captured so powerfully was the episodic character of Llewyn's life. There is a cut to black when Llewyn sleeps, experientially demarcating one episode from the next. His life is fragmented and his responses to it are fractured. He cares deeply about things, he feels strongly in relation to the events of his life but there's no sustained coherency to this intentionality. The disjuncture between himself and the Gorfeins, his well-off sociological friends, is not simply a matter of wealth and age but rather mode of existence. Llewyn's life is utterly devoid of routine but it is also devoid of sustained reflexivity. In the absence of these, time is circular for Llewyn. It has rhythm but not structure and it sets him at odds with the only people he is close to, not least of all his deeply conventional sister raising a child in the suburbs. When he returns from a unsuccessful trip to Chicago, he is bewildered to realise how different his sense of time is from his friend's, explaining how "it felt like a really long time but I guess it was only a couple of days" (or words to that effect).

He has little success with his music. He derides a friend for her putative careerism while nonetheless retaining a notional commitment to his own music constituting a career. When he works on a novelty record, later to achieve much success, he foregoes royalties in favour of immediate payment. When he gives up on music, he returns to his father's work and his father's union, rather than looking elsewhere. When he gives up on giving up the film has begun to feel so circular that we can only suspect he has done this many times before. There's no unity to Llewyn's life. There are events, with resonances and rhythms, fleeting but intense meanings which lack coherency over time. He lives on gut feelings, negotiating situations through impulse or necessity, forming powerful connections which he abandons as easily as he forms them. Or maybe I just can't forgive him for leaving the cat in the car. Either way, I think he's the most fully rounded portrayal I've ever seen of a fractured reflexive and the film has left me newly convinced about the potential value of relational realism as an approach to reading films. It also has what is probably now my all time favourite ending: despite his dramatic journey to Chicago, the drama in his personal life and his professional woes all that really happens in Llewyn's life during the film is that he learns how to stop the Gorfeins' cat from getting out when he leaves their apartment. I've written a PhD about temporality and reflexivity but the Coen brothers understand it better than I do. Damn.

5.4 April

Representing Interiority in Film and TV (2014-04-01 08:00)

The notion of 'internal conversation' can be contentious in some quarters within the academy. However, outside it, I've found that anyone I've spoken to about my research instantly knows what I mean when I say 'internal conversation' or 'inner monologue'. I'd suggest that the notion of internal conversation, as something we listen in to needs to be recognised as something distinctly different from those ghostly recesses of subjectivity we look into. Or in other words 'internal conversation' does not equate to introspection.

It's this older understanding of introspection which underlies representations of interiority in terms of mindscapes or psychic landscapes. We enter a 'door' into someones mind and action takes place within it. In some cases,
this is action within the mind as the individual concerned proceeds to occupy their usual position within the world:

In other cases, the 'entered' individual is rendered passive in the world, as with the dreamscapes of Inception, existing in the mind of a sleeping individual and radically unbound by the metaphysics of everyday life:

(Thanks Marta Wasik for these examples)

These are examples of ‘interiority’ of the form I find philosophically problematic and sociologically uninteresting. So why do I find ‘internal conversation’ interesting? Because I’m convinced by Margaret Archer’s argument that we need to invoke something like it in order to gain purchase upon why people do the specific things they do:

without it we can have no explanatory purchase upon what exactly agents do. Deprived of such explanations, sociology has to settle for empirical generalisation about ‘what most of the people do most of the time’. Indeed, without a real explanatory handle, sociologists often settle for much less: ‘under circumstances x, a statistically significant number of agents do y’. These, of course, are not real explanations at all (Archer 2007: 133)

On this view interiority becomes important to narratives because it’s these processes of deliberation (often internal
but sometimes ‘spilling out’ into external conversation) which condition the choices made by characters in the story. People are forced to make decisions, choose between competing paths or deliberate about moral dilemmas. These are crucial aspects of stories (and lives) such that their complete absence from film and tv would be jarring, at least without a televisual idiom that compensates for this somehow. But this is an outcome of internal conversation (an answer to the question: "what should I do?") which doesn’t exhaust the process itself.

One of my favourite examples of the process without the outcome can be seen in the beautiful ending to Six Feet Under (which I’ve just discovered that I’m finally able to watch without crying) in which Claire leaves her family, moving away to build a new life and, as I interpret the scene, sifts through her memories as she comes to terms with the significance of her radically changing life: “what did this mean to me? what did these people mean to me? am I making the right decision? can I really live so far from them?”. As the scene progresses, she projects forward into the future, imagining the person she will become and the persons her significant others will become, as well as how their biographical entanglement will unfold over their lifetimes. I love this scene because it captures the essence of those moments when everything is open, when ‘I’ am standing on firm ground looking towards a future ‘you’ yet to be formed, without reducing it to pure subjectivity. These ‘openings’ exist in the social world, because we do, which is precisely why the ‘I’ never has the sustained freedom it might fleetingly feel it possesses. Institutions, structures, relationships and routines are all recalcitrant. But there’s something deeply human about the feeling involved in radical action to change our lives, in spite of the likelihood that even were it all to go to ‘plan’, it will bring with it all manner of unintended consequences.

But that’s an example of internal conversation in a monological mode. As anyone who watches the show will know, Six Feet Under also shows internal conversations conducted in a dialogical mode. We talk, silently and internally, to others. We talk to ghosts. We talk to people we care about who are absent. We imagine what they say. We take imaginative comfort in disclosing things to them. We exist, as Charles Taylor puts it, as part of “webs of interlocution” and sometimes we converse with introjections of our interlocutors rather than the interlocutors.
themselves:

There are other examples of this which could easily be appropriated by the notion of 'exploring the subconscious'. As in Frasier:

But given that the model I'm deploying here is first and foremost sociological, invoking interiority as a crucial moment of social explanation, I'd suggest it's a much more interesting approach to take in analysing how interiority is displayed in TV and Cinema.

If anyone else has examples (preferably youtube videos!) I'd love to know about them. Please tweet me (@mark_carrigan) or write in the comments box below.

Neil Fox (2014-04-20 14:52:58)
I love this piece, it’s fascinating. I am using it to discuss issues around adaptation, particularly the idea of work being 'unfilmable' due to interiority. Anyway. An example I love, if I am understanding correctly, is in Joel and Ethan Coen’s 'No Country For Old Men' where Tommy Lee Jones’ character visits an older, patriarchal character and they talk about life and death in such a beautiful, not quite direct, poetic and incredibly illuminating way, particularly as as way of understanding the present psychological and emotional state of Jones’ sheriff, even though he barely says anything in the entire exchange. https://www.youtube.com/watch?v=Yz8SPnRNvoc Thanks for this piece, Neil.

thanks Neil, glad you liked it! and that example sounds great, i’ll have a watch now

Have you ever been inside your local county health department? Who goes there, who works there, and what do they do there? [1]October Birds explores a multi-disciplinary approach to understanding public health and sociological practice through social fiction. Increasingly popular with students, social fiction is introduced through the pretend societies, people and circumstances presented in lifelike scenarios in fiction, gaming and fantasy worlds. Through the decidedly appealing format, readers are introduced to subjects of social justice, oppression, privilege, and possibilities. Social fiction introduces us to ideas of future society in much the same way as science fiction brings the possibilities of what future science might entail. We imagined the possibility of talking to those in distant places and the telephone was invented. We imagined going to the moon and we did.

Muhammad Yunus, recipient of the Nobel Peace Prize in 2006, strongly believes in the power of social fiction. Social scientists should follow the path of make believe, in the same way as science fiction. What can be imagined today can be reality tomorrow, states [2]Muhammad Yunus on creating social fiction. Themes of social problems dominate the emerging genre of social fiction, whether it be poverty, unemployment, racial and class conflicts, or health pandemics.

As Yunus imagines, social fiction may introduce the reader to the concepts of a remarkable world without poverty or unemployment. On the other hand, [3]Jessica Smartt Gullion invites the reader to envision a frightening account of how quickly links of society unravel at the onset of a calamitous health crisis.

In real life, Gullion served as the Chief Epidemiologist for one of the largest county health departments in Texas. From this experience the author creates a fictitious account of medical chaos. Gullion, primarily a researcher in areas related to coping with community health threats, was aware of the consequences from historical pandemics. The Plague of Justinian beginning in Constantinople (Istanbul Turkey) is said to have claimed 10,000 people per day beginning in 541 A.D. and possibly killing half of Europe and Asia's population by the 700s. Black Death of Bubonic Plague is believed to have claimed 25 million people in the 1300s. In London, one in five inhabitants succumbed to the pandemic in the 1600s. Modernity did not save us. The 1918 Spanish Flu pandemic infected twenty percent of the world's population, proving most deadly for people ages 20-40. SARS swept the headlines in 2003. "Swine Flu" erupted in 2009, and that was the year Dr. Gullion sat at her desk inside the county health department. Her telephone began to ring.
In a matter of weeks, the social fiction came to life as hundreds of people are dead and thousands more became ill. [4] 'October Birds' recounts how disease could spread within a Texas community or your community...and beyond. The next global pandemic may be only one patient away. Are they sitting in your county health department or local hospital? As the frequency and accessibility to travel continues to increase for ever greater numbers of people, coping with a pandemic could mean lying in a hospital in a country where you do not speak the language. Social and cultural values and norms may dictate who gets treated and what kinds of treatment patients receive.

*October Birds* begins the tale of public health practice, emergency medicine, and the sociological context related to power and dominance in the medical profession. In *October Birds*, Gullion reveals through the background of a rapidly escalating pandemic, the social circumstances of collective behavior, emergency management, ethics in medicine, crisis counseling, critical incident stress management, modern families, Hispanic culture in America, and the value of non-Western medical practices.

Discussion questions for book clubs or classrooms are redolent throughout. Such as, what comparisons can be made between the social fiction characters and their attempts at work-life balance? Working late one night, Dr. Eliza Gordon struggles with how to explain to her husband she is still at work struggling with the chaos emerging from the pandemic. "He would put Sophie on the phone – say hello to Mommy, we won’t see her tonight – really ratcheting up the guilt meter. She decided to email him instead and call later."

Meanwhile, the grizzled Dr. Cromwell admits two failed marriages might have partly been the result of his affair with his mistress – the practice of medicine "vastly more interesting than any woman he’d ever met."

Jack, the incident commander, "finally cried all of his tears" as he leaned on his colleague, Dr. Gordon. He had no other place to turn when his partner, Nabil, succumbs to the pandemic while at home alone.

The curanderas avoided the city’s health department and the hospital. But the pandemic crosses all sections of the society. "She wanted to be welcoming to her patients without actually advertising her clinic. Because many of her patients were not in the US legally...." When medical provisions are in short supply who determines the triage for care? "He was an old man, with a poor prognosis. The woman is a young mother. She is improving." Debates of ethics, power, and politics are available at every turn of the crisis.

*October Birds* is the latest release in the Social Fiction Series by Sense Publishers. Social fiction is an emerging genre that should prove popular with both the public and academia. Each title is prefaced by the author with research and teaching remarks that emphasize the social science or scholarly perspective presented in the novel. With the increasing recognition of arts-based research, *October Birds* is a narrative that will have any student, health care practitioner, or person who reads enthralled with the true possibilities of what might be transpiring inside the walls of their local county health department.

Big Data & Society now open for submissions (2014-04-01 20:59)

We are pleased to announce that the new SAGE journal, Big Data & Society, is now open for submissions at http://mc.manuscriptcentral.com/bdas. The journal invites contributions that analyse Big Data practices and/or involve empirical engagements and experiments with innovative methods while also reflecting on the consequences for how societies are represented (epistemologies), realised (ontologies) and governed (politics). For more details please see our blog at http://bigdatasoc.blogspot.co.uk/ or follow us on Twitter at https://twitter.com/BigDataSoc.

Journal information and submission guidelines can be found here: http://www.uk.sagepub.com/journals/Journal202236 #tabview=manuscriptSubmission

Best regards,

Editorial Office
Big Data & Society: Critical Interdisciplinary Inquiries (Launch 2014)
bdseditors@sagepub.com

Editor: Evelyn Ruppert (Goldsmiths, UK)
Co-editors: Paolo Ciuccareli (Milan, IT), Anatoliy Gruzd (Dalhousie, CA), Adrian Mackenzie (Lancaster, UK), Richard A. Rogers (Amsterdam, NL), Irina Shklovski (Copenhagen IT, DK), Judith Simon (Vienna, AT), Matt Zook (Kentucky, US)

Recollections on working with Howard Becker (2014-04-02 08:00)

In this interesting video, Clinton Sanders reflects on his experiences of being taught by [1]Howard Becker. It sheds light on Becker as a teacher and person but also offers insights into US sociology in the 1960s.
There are many things I dislike about 90s self-help Giddens. However one aspect that has stuck with me is his discussion of ‘ontological security’. This is established relationally between child and care-giver through the durability of trust, acting to “‘bracket out’ potential occurrences which, were the individual seriously to contemplate them, would produce a paralysis of the will, or feelings of engulfment”[1](Giddens 1991: 3). As I understand him, Giddens sees this as a response to a radical openness which characterises our relation to the future*: everyday life and everyday interaction presents us with a potentially infinite range of responses which are filtered through a sense of what is appropriate and what is inappropriate. The great majority of possibilities simply don’t occur to us because our experienced participation in a “shared – but unproven and unprovable – framework of reality” which is "simultaneously sturdy and fragile" leaves us treating the world around us as if the qualities it spontaneously manifests to us are durable and enduring features ([2]Giddens 1991: 36). As Giddens puts it, “To live our lives, we normally take for granted issues which, as centuries of philosophical enquiry have found, wither away under the sceptical gaze” [3](Giddens 1991: 37). There are many issues we don’t ponder because of the practical business of everyday life. The former is the condition for the latter, securing our capacity to function purposefully in the social world. But what secures this ‘turn away’ from existential rumination?
Giddens places great stress on the capacity of *routines* which ‘answer’ existential questions on the level of practice. Through our routines, we treat the world *as if* it is stable and enduring. We answer questions with our practice and so avoid ruminating upon them through our reflections. It constitutes a “protective cocoon” which we “carry around” with us leaving us “able to get on with the affairs of day-to-day life”[4](Giddens 1991: 40). But a blind adherence to routine as a source of security can become *compulsive* if not coupled with the trust upon which ontological security depends. This compulsivity emerges from unmastered anxiety, with repetition constituting a performative attempt to dispel this anxiety rather than routine simply reflecting an ability to ‘get on with things’. However even when ontological security is well entrenched within the personality structure of the individual, it is not an impenetrable psychic shield. Ontological security brackets out possibilities, things which *could* happen but almost certainly won’t, preoccupation with which would quickly become debilitating. Like worrying that a helicopter will crash into the venue when we’re out seeing live music. But of course such things do happen:

![youtube](http://www.youtube.com/embed/9YuwxvX0SkQ?version=3&rel=1&fs=1&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent)

We rely on ontological security to avoid obsessiveness. It is a psychological achievement which allows us to ‘let things go’. Rather than attempting to ‘think our way out’ of something which troubles us, it is what allows us to simply *stop thinking* and *start doing*. But it is recurrently challenged throughout our life course, sometimes in ways which are edifying and instructive:

> “the protective cocoon is essentially a sense of ‘unreality’ rather than a firm conviction of security: it is a bracketing, on the level of practice, of possible events which could threaten the bodily or psychological integrity of the agent. The protective barrier it offers may be pierced, temporarily or more permanently, by happenings which demonstrate as real the negative contingencies built into all risk. Which car driver, passing by the scene of a serious traffic accident, has not had the experience of being so sobered as to drive more slowly – for a few miles – afterwards? Such an example is one which demonstrates – not in a counter-factual universe of abstract possibilities, but in a tangible and vivid way – the risk of driving, and thereby serves temporarily to pull apart the protective cocoon. But the feeling of relative invulnerability soon returns and chances are that driver then tends to speed up again” [6](Giddens 1991: 40)

But what matters is our capacity to immerse ourselves in activity once more. To recognise a risk but avoid obsessing about it. To take stock of possibilities inherent in our situation without allowing awareness of those possibilities to preclude the possibility of negotiating the situation itself. To instinctively recognise lines of thought worth pursuing, distinguishing between those which are *symptomatic* and those which lead towards a potential resolution. This is what I mean by *reflexive poise*.

It’s on this level that the accusations of voluntarism against 90s Giddens ring most true. However 80s Giddens lurks beneath the surface of the 90s books if you read them closely, occasionally pulling him back from some of his more absurd

Graham Harman on Heidegger and the Arts (2014-04-04 08:00)

CfP: Troubling Narratives: Identity Matters (2014-04-05 08:00)

Final Reminder: Second Call for Papers

'Troubling Narratives: Identity Matters'

The Institute for Research in Citizenship and Applied Human Sciences, University of Huddersfield, Thursday 2558
19th and Friday 20th of June 2014.

Confirmed keynote speakers for the conference are:

Ann Phoenix, University of London

Ken Plummer, University of Essex

This conference builds on the University of Huddersfield’s long held tradition of hosting a bi-annual conference on narrative research. It seeks to provide a fresh context for the development and dissemination of new research, ideas, perspectives and methodologies in the field of narrative research and enquiry and aims to bring together scholars working in a range of disciplinary fields. ‘Narrative’ is well known for its looseness of definition, its multiplicity of approaches and its interdisciplinarity, which over the years has led to a richness and diversity of narrative work. Identities, both private and public and individual and collective, have long been a focus for narrative researchers, where the content, form and effects of identity story-telling have been explored in a range of areas and contexts. The focus of ‘Troubling Narratives: Identity Matters’ is to address the ‘troubles’ that now surround contemporary narratives of identity, and the ways in which previous work may simultaneously inform but also trouble and be ‘troubled’ by new narrative work in the broad area of ‘identities’.

We invite contributions from researchers interested in using narratives across a range of disciplines including sociology, gender studies, psychology, law, politics, criminology, philosophy, history, anthropology, social work, education, and business and management. Topics of interest to this conference include (though are not restricted to) the following areas, including:

- gender, sexuality, ethnicities, law, religion, politics, feminisms, digital technologies, work, deviance, consumption, citizenship, consumption, narrative methods, interpersonal violence, generations, emotion, trauma, trans*, lifestyle, education, bodies, age.

Abstracts should be no longer than 250 words. We invite papers in the form of 20 minute oral presentations, and also workshop sessions and poster presentations (the format should be clearly stated in the abstract). All submissions must include the author(s) name, title of paper, university or organizational affiliation, and contact information. The deadline for submission of abstract is Monday 14th April 2014. Please email your abstract to the conference organisers at: [troublingnarratives@hud.ac.uk](mailto:troublingnarratives@hud.ac.uk) with ‘conference abstract’ in the subject line. You will be notified about whether your paper has been accepted soon after 28th April 2014. Registration deadline: 5th June 2014. Conference costs: Full rate: £150 including conference dinner, or £110 without. Student rate: £50 including conference dinner, or £30 without. See:[http://troublingnarratives.wordpress.com/](http://troublingnarratives.wordpress.com/) and Facebook:[https://www.facebook.com/TroublingNarratives](https://www.facebook.com/TroublingNarratives)

---

CfP: What are conferences for? The Political economy of academic events (2014-04-06 08:00)

The [1]Sociological Imagination invites short articles (500-1500 words) critically reflecting upon the prevailing forms of intellectual meeting within the contemporary academy. What are their strengths? What are their weaknesses?
How could they be done differently? What are the sociological implications of these standardised forms of intellectual meeting? Whose voices do they amplify and whose do they suppress? What behaviour do they reward and what behaviour do they discourage? What are their intellectual implications? How far does intellectual form follow conference function, limiting time and expression in the interests of the event’s logistics? Why do people attend seminars? Why do people attend events? What are the wider significance of these common reasons? Are there other motivations for attending academic events which tend to be squeezed out in the neoliberal academy. How might we do things differently? What alternative forms can we imagine? What would the implications for the academy be of DIY academic events becoming common? We’re particularly interested in receiving articles on the political economy of conferences, seminars and workshops?

If you would like to submit an article please send mark@markcarrigan.net a 500-1500 word article, attached within the body of the e-mail, as well as biographical details to be displayed with the post.

Kimberly Springer (2014-04-06 14:54:51)
What’s the deadline for this CFP?

no deadline!

The 3 Stages of Academic Awareness (2014-04-07 08:00)

Stage 1: It’s complex and needs more research (funding)

[1]

See [2] here for the next two stages. I share the frustration at this belated mainstream recognition of things that many have been pointing out for years.

So the weather in Britain has been a bit extreme recently, right? Well actually, argues [1]Christopher Brooker, a quick perusal of the facts shows nothing of the sort:

On the belief that Britain has recently experienced unprecedented rain, for instance, look at the analysis of the Met Office’s England and Wales rainfall data sets on Paul Homewood’s website, Not A Lot Of People Know That. There is no upward trend in our rainfall. Even January’s continual downpours made it only the sixteenth wettest month since records began in 1766. Even if this month’s rain adds a further 200mm (8in) to the December-January figure, the resulting 650mm would still be way short of the 812mm (32in) recorded between November 1929 and January 1930.

The problem is that "all true science ... has here been thrown out of the window". In a political environment dominated by ‘anthropogenic global warming’ (AGW) flat-earthers with their absolute lock on the institutions of science and the media (apart from the ones the critics of AGW write for that is) the responsibility falls on right-thinking empiricists like Christopher Brooker to rescue ‘the facts’ from the scientists responsible for their ideological distortion. As he explains, “for proper evidence-based science these days one has to step outside the hermetically sealed bubble of warmist group-think and look to that array of expert blogs and websites that provide the data necessary to thinking straight”.

So what is “evidence-based science”? It’s empiricist science. It’s positivism of a peculiarly unsophisticated sort. Data speaks for itself. All it requires is a mind free from distortion to identify the constant conjunctions indicated by the data. On this view, theory entails a retreat from ‘evidence’. What intrigues me about this proto-positivism is its capacity to be both naïve (the ‘facts’ speak for themselves) and paranoid (disagreement is reduced to a plot to distort the ‘facts’). If one were to look psychoanalytically at this cultural trend, we might point to ‘the facts’ as a fetish object for critics of AGW. They are imbued with magical powers, able to dissolve complex arguments into self-evident truths which illustrate the path forward for humanity amidst a 21st century almost constitutively dilemmatic. But ‘the facts’ are also made by those very scientists who are conspiring to undermine such clear-thinking: meteorologists and climatologists produce the very data sets upon which this empiricist army of keyboard warriors depend to rescue "proper evidence-based science". They are dependent upon the scientists yet simultaneously repudiate this dependence. They want the power of ‘the facts’ but refuse the dependence which would ensue from exercising this power. And this is how people who, though loathsome, are not idiots end up saying things like this:
Or perhaps he is just an idiot. He’s an “interpreter of interpretations” who repudiates the professional establishment he’s interpreting. You see what I mean? As a cultural formation ‘AGW-criticism’ is really interesting.

Howard Becker on the Craft of Sociology (2014-04-09 08:00)

This [1]great podcast is from an event at Goldsmiths a few years ago. It’s introduced by Les Back and the talk covers a lot of ground. The video below shows Howard Becker engaged in a different craft.

1. http://magiclantern.gold.ac.uk/movs/sociology/howie-the-craft-sociology.mp3
3. file://www.youtube.com/embed/aMAjVtpz88o
After a long period of monopolising academic discourse, European universities went into decline as classical scholasticism, which was primarily inward and backward looking, gave way to the ideas of Enlightenment. Intellectual development moved outside the walled gardens of academia, because enlightenment thinkers shifted their various discourses into the realm of correspondence, creating a Republic of Letters. Prof. Dunleavy argues that we are currently experiencing a similar shift towards a Republic of Blogs that enlarges communication, debate and evidence beyond the halls of universities. Academic research is changing, academic publishing is moving towards a new paradigm of advancing ideas outside the confines of the traditional academic publishing model. Orthodox journals will soon be understood as tombstones: end of debate certificates. In particular: Micro-blogging is not only replacing traditional news media, but becoming a tool for finding and disseminating ideas and research (active research surveillance)

Well edited blogs are becoming core communication tools and vehicles for HE debate; while the less traditional format encourages a writing style that invites debate from academics and lay persons alike, thus cutting across ranks, locations and academic status

Working papers and online journals are now key, immediately accessible evidence and theory/methods development sources.

A Modest Proposal for All Future Keynotes (2014-04-10 12:29)

For about ten years now, I've been arguing about the benefits of improvisational performance in academia, not simply as an experience for the audience but more importantly as a way of getting 'experts' and 'luminaries' to speak unguardedly on what they think about a topic on which they have established a reputation. Indeed, this is how I believe that academics might earn some entitlement to being called [1]'intellectuals'. But increasingly I also think that this skill might be vital to the future of [2]the university as a clearly branded institution in a world where just about anything is a 'knowledge producer' by default.

More specifically, public academic speaking might serve as a living moment of intellectual experimentation, not simply a reproduction of past thoughts. This means that improvisation should be taught to aspiring academics - and if you think that 'teaching improvisation' is an oxymoron, then you know nothing about performance, regardless of all the Judith Butler you've been force-fed. (Maybe I'm wrong but invocations of 'performativity' in an academic talk's title is usually a dead zone for intellectual engagement - unless you like to hear about non-humans 'performing'!)

(The great mystery to future historians of our times will be why the people who play up 'performativity' tend to be such lousy performers! Have these people never heard of acting - and the distinctive skills associated with it? Maybe this is how the curse of Plato - who demonized acting as a way of being-in-the-world in his dialogue, Ion - continues to play itself out among 'postmodernists' who unwittingly feel they have already released themselves from Plato's spell!)

Anything interesting said publicly has training at its source, but the 'creativity' and 'novelty' comes from the room to manoeuvre (Spielraum), which is to do with what your training has not already pre-disposed you to do, in combination with your ability to gauge your audience's expectations - and then defy them in some important way. (For social theorists who still take 'structure-agency' seriously, you should hear echoes.) In classical Athens, this complex capacity was called 'rhetoric', and I could spend the rest of this blog bemoaning the disrepute that rhetoric has fallen into over the last 2000 years - but I won't.

However, what I will bemoan is the tendency for conference organizers to invite keynoters who fail to meet the above standards, perhaps as a desperate attempt to stress the importance of the gathering. In other words, if you're willing to spend such significant resources on inviting someone who will appear more relevant to how people outside than inside your field think about your field, then you should demand something of them that makes the connection between outside and inside your field explicit. It is not sufficient to invite a speaker who performs an
oratorio version of an already published text, which only the more cosmopolitan members of the audience will have read. (And frankly, that’s the best that often happens...)

Keynote speeches should be about challenging the taken-for-granted assumptions of the field, but in a way that enable the audience to go forward. In other words, however critical one is of the field, there must be a sense that field contains the resources to move forward. If someone cannot fulfil that basic requirement, then they should not be invited.

But from a strictly economic standpoint, no one should be invited to give a keynote speech to a specific academic field who is simply going to repeat a message they would have said to anyone – and most likely have already said in publications. Whenever I hear someone read passages of their own books in keynote conferences, I think that some publisher or bookshop should be sponsoring the event. Self-publicity is fine, but if it is so closely tied to what is already available in the public domain – indeed, the marketplace – it is not clear what other than transient publicity is gained by having that person present, unless (oratorio-style) one likes the sound of the speaker’s voice. Maybe there is an economic model where this works. But it needs to be presented to me.

In the end, what I am calling for is that conference organizers liaise in a bit more detail about what is expected of keynote speakers. As someone who has keynoted a lot of conferences, I am always flattered by invitations, but I take this as incurring responsibilities that go beyond self-publicity. However, I feel that I’m in a minority...

---

Tomorrow in Academia? (In Haiku) Plumply posthuman Battery-farmed Butlerites Drone in unison

Dear Steve Fuller, I really enjoyed your piece and I think you hit the nail on the head. Once I was chairing a final plenary discussion with the keynote speakers at a conference at Goldsmiths. The speakers had all pronounced and voiced their keynotes. In the middle of the discussion one of the keynote speakers - a 'world-class urbanist' - turned to me and asked "what is theme of this conference again". They obviously didn’t think they needed even to know, let alone address, the issues that people had gathered around for the occasion. I wondered if your emphasis on improvisation connects in any way to an interest in music? Personally, I think we can learn a lot about improving sociological communication from music and musicians. It’s always struck me that the idea of a ‘keynote’ should be a kind of intellectual sounding, which seeks to establish the key of the event. I also think you are quite right to say that the legacy of thinking rhetoric only as something pejorative is really damaging, the ancient meaning going back to the art of persuasive talk is so important to remember. I’ve got to do a keynote in June - I’ll have your blog in mind. Best, Les Back

Steve Fuller (2014-05-22 08:14:58)

Yes, music is always in the back of my mind. In particular, unlike musicians, I don’t think academics have a very joined-up sense of the relationship between reading, writing and speaking, which may help to explain why research and teaching tend to move farther apart. I talk more about this here: [http://blogs.lse.ac.uk/impactofsocialsciences/2014/05/16/five-minutes-with-steve-fuller/](http://blogs.lse.ac.uk/impactofsocialsciences/2014/05/16/five-minutes-with-steve-fuller/)
I'm not someone who is interested in vampires, either in the highbrow terms you'll sometimes find in English Literature departments or the lowbrow terms that modishly respond to their asinine revival in popular culture (also sometimes found in English Literature departments). But if the man who directed Ghost Dog: The Way of the Samurai has directed a vampire film, it's probably going to be a little bit different... and it is. Only Lovers Left Alive is, in a manner of speaking, a romantic comedy. It depicts an episode in the lives of two world-weary and highly-cultured vampires, who take their pleasure where they find it as the world around them gently slides into oblivion. In a weird sort of way, it really reminded me of Inside Llewyn Davis in the sense that music is deployed artfully to help get 'inside' a life where nothing much really happens, capturing the texture and the temporality of existence for those who, to an outside observer, simply appear languid and aimless.

The film has two settings: post-crash Detroit and ancient Tangier. The former is placed very much in time, with expository dialogue about its depopulation constituting the one clunky moment in this otherwise accomplished film. The latter is very much out of time, an effect intensified by the presence of an ancient Christopher Marlowe whiling away his final years in the back room of an all night cafe. The aesthetics of industrial ruination have become a little bit of a cliche at this point (though not, perhaps, for everyone) but this only detracted a little from the cinematographic accomplishment of so overpoweringly capturing the extent to which vampiric capital* has left Detroit drained and dying.

Adam, reclusive post-rock genius and former pal of Byron, spends his days rattling around in an old house in a deserted part of town, making music and playing with the instruments he's accumulated over the years, all the while becoming steadily more depressed. Eve, his gregarious and effusive literary wife of the last two centuries, lives in Tangiers while maintaining a social life of sorts (at least compared to Adam). The film revolves around Adam’s growing depression, with him becoming suicidal as bearing witness to what the 'zombies' are doing to the world.

*capital
gradually wears him down, before Eve visits him in Detroit out of concern for his declining mental health. Then Eve’s ‘younger’ sister arrives unexpectedly, sparking off a chain of events which generates upheaval and forces both Adam and Eve to move on and adapt to new circumstances; something which, we’re reminded at the conclusion, they must have done on many occasions in their long lives.

Given how attentive to time the film was, it seemed odd to me that it felt so unnecessarily compressed. The growing tendency towards long films** generally irritates me but this is one of those rare occasions where I felt a two hour film would have benefited from a further hour. Not only because it was such an aesthetic delight, with post-rock melancholia framing the worn beauty of Adam and Eve and the desolate urban landscape in which much of the film was played out. But it could have explored the characters further. Culture was a big part of the film: books, music, musical instruments, technological artefacts, composition, attribution, literary figures. But the meaning of this for Adam and Eve only figured tangentially. There were a few asides about the importance of “getting the work out” or words to that effect but little exploration of this motivation or the meanings underlying it. What is it like to be a depressed vampire? Perhaps I’m approaching the film rather idiosyncratically but it felt like an answer to this question was tacitly promised but never explicitly offered.

Thankfully the expository dialogue stopped short of a conversation about how “we just suck people’s blood but their system sucks away all life” even though the direction was clearly gesturing towards this.

*This may very well be confirmation bias on my part.

---

**Using Slideshare and Prezi to disseminate your work (2014-04-12 08:00)**

One of the most obvious forms that digital scholarship can take is making ‘outputs’ public that would otherwise remain private. So for instance making slides available online after a talk or lecture. When I use slides, which is pretty irregular, I tend to make them available as part of the process of preparing. I’ll produce some slides, write a blog post and embed the slides in the post. The whole unit then becomes my frame of reference for the talk itself. I then tend to forget about the slides and not make any effort to promote them. It’s therefore a bit of a surprise when I look at how many times these slides have been viewed:

×

×

“What on earth will I tweet about?” from Mark Carrigan

The first is from a talk about Open Access at the Institute of Art and Design at Birmingham City University. The second is a talk about social media I did for the Text and Academic Authors Association. The former has been viewed over 2000 times and the latter has been viewed over 1500 times. These are the most popular but there are slides on my slideshare account from a range of other talks and most seem to have been viewed 300+ times.

These are not slides designed for online dissemination. These are not slides I’ve made any effort to promote. Yet people do look at them. If you search for the most popular slides of all time on slideshare, it soon becomes obvious how powerful slideshare can be for dissemination. There are countless pages of slides that have been viewed hundreds of thousands (in some cases millions) of times.

I find the political uses of slideshare particularly interesting. These slides seem to be produced by people writing about these issues in order to embed the slides on pages, though I’ve not substantiated this impression in any sort of thorough way:

[IFRAME: http://www.slideshare.net/slideshow/embed_code/31852692]

10 Reasons Why Russia Invaded Ukraine from John Maxfield

Using Prezi as an online only tool for dissemination has come naturally to me. Partly because I struggle to present with Prezi for a variety of reasons. My first Prezi, how to create a successful online presence, has now
been viewed almost 4500+ times. I’ve occasionally tweeted the link but otherwise made no effort to promote it. Some of the others have been viewed thousands of times and I’m surprised to find that seemingly obscure conference presentations I’ve made no effort to promote have been viewed hundreds of times.

My point is not about the stats per se but rather that these metrics are fallible indicators of the visibility facilitated by Slideshare and Prezi. It doesn’t take much of a conceptual leap to get into the habit of archiving presentations by uploading slides after the fact. However the audience on Slideshare and Prezi is potentially much larger than that which you gave the talk or lecture to. Recognising this fact shouldn’t lead us to counterpose ‘offline’ and ‘online’ in a dualistic way but it does suggest that perhaps we should consider the latter as something other than a second-thought. What does this mean in practice? I’m not really sure and that will be a topic for another post.

One of my most enjoyable uses of Prezi was to create this:

[11]How our society got so fucked up about sex: a brief tour through history...

It’s a plan for a short book (Zero or Pivot style) which I’ve intended to write for over a couple of years. It is a ‘plan' in a very different sense to anything I’d written in text alone. It will require a lot of translation to turn it into a book proposal. But the substance of the planned book is much clearer in my mind than it would otherwise be. I’m also reasonably confident that others will find the book interesting. Perhaps the downside to this is that the Prezi has left me so clear about the book’s argument that the ensuing immediacy with which I confront the hard work of actually substantiating it has proved a little demotivating! Though this is far from the only reason I’ve yet to start proper work on this.

3. http://www.slideshare.net/markcarrigan
5. https://www.slideshare.net/markcarrigan/what-on-earth-will-i-tweet-about-14999029
7. http://www.slideshare.net/slideshow/embed_code/31852692
Groups matter in political philosophy, most would now agree – but precisely how they matter is contentious. Group-related issues emerge in various contexts of debate: the redressing of past or current injustices suffered by ethnic or cultural minorities; the nature and scope of group rights; the appropriate treatment of a certain specific identity/cultural/ethnic group. Less prominent, though, is a comprehensive analysis of groups as both agents and objects of social policies. This is the aim of our conference.

What challenges are posed to social, moral, or political philosophy when addressing a collection of individuals who act or are treated in a collective way? Answering this involves consideration about how institutions should treat groups, but also of the normative implications of taking groups as possible social agents, when acting either in vertical relations with the state or in horizontal relations with other groups (or individuals). This conference aims to bring together scholars from a large range of disciplinary backgrounds, from social ontology to sociology and anthropology, through ethics and normative philosophy, in order to explore these questions from both theoretical and practical perspectives. We hope to combine questions about the nature of groups, and their social and political impacts, with attention to the particular, pressing normative questions to which the negotiation of group-related issues gives rise.

**Invited speakers:** Lawrence Blum (Boston University), Catherine Colliot-Thélène (Université de Rennes 1), Vincent Descombes (EHESS), Tariq Modood (University of Bristol).

We invite paper proposals along the following lines:

**Methodological and Ontological issues**
• What specific questions, if any, does the existence of groups pose to a theory of justice, or a theory of recognition, or a theory of democracy?

• Why should groups matter in moral, social, or political, philosophy– and if they do, what kinds of group?

• Should we consider groups as significant units of analysis of the social world, or should we operate with more dynamic concepts of group formation?

• How and why are groups constructed entities, but nevertheless normatively relevant ones?

Normative and Political issues

• What kinds of theory, principles or norms might political thinkers propose in order to tackle the particular questions which groups pose?

• How is the specific moral status of groups staked out: for instance, (how) can they be attributed with moral responsibility?

• Should we strongly differentiate between different types of group — on the ground that it entitles them to variable claims for differential treatment, or differentiated group rights?

• Do recent proposals for renewing theoretical frames in political philosophy, such as participative democracy or cosmopolitanism, offer new paths for appreciating the role and function of groups in political theory?

Paper proposals of max. 1000 words should be sent by April 21, 2014, to

[1]groups.conference@gmail.com
Notification of acceptance will be sent by the end of May.

Proposals may be sent in English or in French. However, the working language of the conference will be English.

---

**A Modest Proposal for Making Actor-Network Theory More than Academia’s All-Purpose App**  
(2014-04-13 10:36)

As someone who suffers the misfortune of having committed to an academic life when very young, my institutional memory is somewhat older than my chronological age. For me the 1960s and 1970s remain very much part of living memory, which extends equally vividly into the present day – and beyond (as anyone familiar with my work can testify). This means that over my career I have witnessed a lot of amplifications, elisions, forgettings and, indeed, reinventions, if not outright fabrications, of various theories and concepts.

One especially striking development for social scientists has been the so-called ‘ontological turn’, which is strongly associated with actor-network theory (ANT). To my ears, it sounds like Orwellian newspeak for a methodologically justified refusal to take responsibility for the entities that one observes in the ‘world’ defined by one’s research subjects. Ontology is normally taken to be a normative philosophical discipline that prescribes the space in which thought and action can occur. Historically one didn’t talk ontology unless one meant it – i.e. the speaker endorsed the entities and relations being conjured in the discourse. Even imperial anthropologists who described ‘relativistically’ the ontologies of the subjugated natives felt – or were made to feel – a bit guilty about the degree of exposure involved, given the asymmetric power relations. Nowadays, however, appeals to ‘ontology’ merely signal a politically correct way of doing research that would have been condemned in my youth as ‘value-neutral’.

A researcher who takes the ‘ontological turn’ is rendered eminently ‘tool-worthy’ because by revealing something previously hidden for what it ‘really’ is, he or she makes it available for others to inspect and potentially act upon, if they’ve got the power to do so. Put it this way, by promoting the ontological turn, ANT reduces ethnography to an App, whose utility depends on the processing power of the platform to which it is attached. And with the demise of empire and the erosion of the nation-state, such ‘platforms’ are available to just about anyone who can afford them. This helps to explain why ANT is in such big demand to funding agencies (both private and public) yet so useless as a framework for extending the life-expectancy of strictly academic inquiry.
This is not to say that ANT isn’t good in keeping academics amused in the short-term! Followers of the works of Graham Harman and Timothy Morton know that these guys are masters of the ontological pirouette. But they are also quite explicitly apolitical in their intent. They are much more of the school (formerly called ‘Marxism’) that sees theorizing as a self-contained practice than theorizing as spilling over into practice. But does ANT need to remain the victim of this sort of self-domestication, a kind of caged craziness whose ultimate significance at best will be as a brilliant move in a philosophical chess match?

Luckily there is an opportunity for ANT to step up to the plate and earn its political cojones. It turns out that ‘natural historians’ – the field to which Charles Darwin thought he belonged and which continues to enjoy high media ratings – constitute[1] an endangered species in academia. This is easy to understand in terms of scientific specialisation and funding patterns. Nevertheless, ANT could adopt a very interesting intellectual line on this.

The argument would be to shift the field of natural history into the ‘humanities’ but as part of a longer term strategy to re-divide the two major academic cultures. Instead of the humanities v. the sciences a la CP Snow, we might think of the posthumanities v. the transhumanities. The latter polarity would require a 90 degree shift away from the former polarity. I have been already arguing this point with regard to [2]politics more generally – and it figures prominently in [3]my forthcoming book, which supports the transhumanist side of the shift. But regardless where one stands on this issue, it is clear that Harman and Morton are simply making explicit what the great imperial anthropologist Malinowski called the ‘phatic’ side of sociality which ANT has long exploited, while capitalising on the aspersions associated with science as concealing hidden depths, available only to adepts.

The thing that is lacking from ANT – in both its empirical and theoretical expressions – is a place for will. It is to ANT’s diabolical credit that I am forced to remind readers that in ordinary English ‘agency’ implies a potential to do other than what one has. A more wilful approach to agency would involve altering, perhaps substantially, current states of being, along the lines afforded by live or virtual experimentation – that is, probing those hidden depths to which ANT seems so allergic. One of the great misapprehensions about ANT is to think that its classic interest in experimentation (from Latour & Woolgar’s Laboratory Life onward) comes from an acceptance of the epistemic premise of experimentation. No, ANT is simply interested in an experiment as an interesting observable event, with the assumptions of the experimenters (and subjects) just so much backchat until they appear in discourse available to ANT researchers.

I plan to pursue this idea of post- v. trans- humanities as a pivot point for tomorrow’s university in the future. But for now I flag the issue because if ANT people are interested in a life that goes beyond next the grant cycle, then they should jump to defend natural history as a ‘humanistic’ field.

---

Will and intent are Western philosophical fixations which themselves need thorough re-theorising prior to any such mooted inclusion into ANT.
Philip (2015-03-22 15:52:36)
There's no 'will' in ANT? Rather depends what you mean by will. The Nietzschean will to power is pretty foundational to it. Didn't Schopenhauer also use will as a metaphysical concept? Not an insignificant lineage, then. The point re 'agency' presupposing that the agent could have done otherwise presumably is meant to imply that rocks, scallops, etc. are bound by natural causality and therefore can only do as they do? (Welcome back bifurcation of nature, we didn't miss you.) No counterfactuals for things. By the by, I'd argue against any really close connection between Morton, Harman and ANT. The latter is militantly empiricist and the former pair have little or no interest in empirical research (this is less true of Morton [though not untrue of him] but Harman is a pure philosopher). Of course they derive concepts and images but to divest ANT of its empiricism is to more or less destroy it. In practice, ANT studies are full of reflexive, wilful human agents. Maybe even excessively so (the legacy of ethnomethodology shouldn't be forgotten). When reduced to its theoretical vocabulary (and this is a complete reduction) then of course it appears to be rather tough on human intentionality but then it was never intended to be a 'standalone' theoretical vocabulary (although I admit that it has been taken as such). The whole point of it is that the concepts must always be wrapped up in the empirical work. Divest it of that principle and you have something completely different. There's nothing inherently 'prescriptive' in ontology (historically maybe but, really, so what?). It's certainly not immune from it, of course, but, likewise, epistemology is no stranger to prescription (what is?). Not sure who these 'value neutral' apologists cloaking themselves in 'ontology' are either. The 'speculative realists'? If so, then see my answer above. They bear only superficial resemblances to ANT as it's generally been practiced. There's a difference between something being 'value free' and it just not being explicitly on board with any particular political programme. Has every single research paper got to be banging some particular political drum? What if a researcher doesn't know the political consequences of their research – yet? That doesn't mean value neutrality, just naive uncertainty – an uncertainty that is acknowledged rather than buried underneath dogmatic adherence to whatever pre-existing sect (membership of which is perhaps to be prescribed – there's that word again – by the 'leading lights' and 'great old men' of the discipline?). I do agree that ANT research, in the final analysis, can be somewhat limited for its tendency to eschew politics. However, there's nothing necessary in that. Doubtless part of its popularity is due to its political open-endedness (the point of it was always to be open-ended) but that shouldn't paper over the achievements of the field or license a regression to a modified, made-over humanism as if that was a new idea.

Steve Fuller (2015-03-23 13:27:02)
Actually there is no place for 'will' in actor-network theory. Who in this crowd embraces Nietzsche, let alone Kant or Augustine? Will implies too much potential for responsibility – a godlike position that ANT's self-styled 'irreductionist' ontology refuses, as it endlessly 'delegates' (a bit like Eichmann dispatching trains). But ANT's refusal to embrace will also helps to explain its popularity among researchers in precarious positions. After all, if you don't know where your next paycheque is coming from, it pays not to presume any explanatory framework that might put your potential paymaster in a disadvantageous light (as in the case of Marxist explanations).

ailsahaxell (2015-03-30 18:54:35)
I think the limitation placed on will and agency from an ANT perspective is more that we do not know what always drives us, and therefore ascribing will and agency in such ways may be flawed rather than non existent. IMHO and as an ANT researcher I would claim that I have will; from the choice of a research question to the way it is studied, written of, and disseminated, there is no neutrality. However, my self-awareness is partial, both because of bias and because I do not know everything (!!!). ANT is after all a humble methodology. Some further reading on the place of cognitions http://www.bruno-latour.fr/node/380

Steve Fuller (@ProfSteveFuller) (2015-04-05 15:47:08)
There's nothing wrong with being 'humble' – and ANT certainly didn't invent this attitude (so references to Latour are gratuitous). However, humility is not an excuse for hiding behind the data in the manner of a dithering ventriloquist. Rather humility should imply a willingness to draw a firm conclusion which others may then contest – perhaps even successfully – and which in the process creates a common sense of inquiry. No doubt It is a mark of our times – where researchers find themselves in precarious employment – that the hyperbolic enactment of fallibility becomes the preferred researcher's stance. It amounts to taking minimum responsibility for whatever you say. In the past, if people weren't sure what they thought, they simply kept their mouths shut. When they opened their mouths, they already knew that they might be shot down. See here
Porn Studies is Released (2014-04-14 08:00)

Routledge Journals Publishes Porn Studies

March 2014 – Routledge (Taylor & Francis Group) publish the first double issue of *Porn Studies*, the premier dedicated, international, peer-reviewed journal to critically explore those cultural products and services designated as pornographic and their cultural, economic, historical, institutional, legal and social contexts. *Porn Studies* is edited by Professor Feona Attwood of Middlesex University and Professor Clarissa Smith of the University of Sunderland and supported by an international editorial board including: Constance Penley, Brian McNair, Lynn Comella, Martin Barker, Susanna Paasonen and Alan McKee.

Professor Gerard Goggin, University of Sydney comments on the journal’s inaugural issues:

"Finally we have a journal that brings together the urgently needed research, theories, and debates to make sense of an important aspect of social and cultural life. The breadth, depth, and richness of its packed first issue confirms its promise as a platform, not only for understanding pornography – but as a space for new, adventurous, genuinely cosmopolitan rethinking of many of the things about identity, bodies, power, belonging, media, and contemporary reality that we take-for-granted, but still know too little about."

In their introduction to the first, double issue of the journal Attwood and Smith outlined why this new journal is needed: "Perhaps one of the most important reasons for *Porn Studies* is the very topicality of pornography; we believe it is the right time to launch this journal because the subject is so politically and emotionally charged. Pornography has a public presence as an object of concern and as a metaphor used to designate the boundaries of the public space.

Articles by leading scholars identify some of the leading themes in pornography research today:

Utilising data from more than 5000 responses to an online questionnaire, Martin Barker’s ‘The “Problem” of Sexual Fantasies’ explores understandings of the relations between pornography and sexual imaginaries.

Fears about what children might be learning from pornography have been centre stage for some time, in ‘Porn and Sex Education, Porn as Sex Education’, Kath Albury addresses those concerns and their intersections with other issues around young people’s sexual practices, sexual self-representation and sexual knowledge.

In ‘Studying Porn Cultures’ Lynn Comella suggests a ‘porn studies-in-action’ and exhorts researchers to ‘leave the confines of our offices, and spend time in the places where pornography is made, distributed and consumed, discussed and debated, taught and adjudicated’.

Read these and more free online until 31 May 2014.

How to be a blogger without having your own blog (2014-04-15 08:00)

It’s a common assumption that ‘bloggers’ and ‘blogs’ are unavoidably intertwined. There’s a sense in which it’s true but it can also be slightly misleading. It’s possible to be a blogger without having your own blog. In fact, there are a lot of advantages to doing this. Patrick Dunleavy and Chris Gilson from the LSE PPG [1] summarised this issue helpfully a couple of years ago and everything they said is just as true now:

According to some good estimates, perhaps 80 per cent or more of the single-author blogs on the web are currently inactive, or are ‘desert blogs’ that very rarely updated. And this is because people start them with high hopes, in determinedly individualistic mode, but find that hard to sustain after a while. Coming up with fresh content, day after day or week after week, is hard work for any academic, especially in the current climate where there are so many other demands on people’s time. But if you don’t post regularly, in a rhythm that is clear to readers so they know when to come back, then it can be hard to keep things going.

We don’t think single-author blogs are a sustainable or genuinely useful model for most academics – although all praise to the still many exceptional academics who can manage to keep up the continuous effort involved. By joining together and forming multi-author blogs, academics can mutually reinforce each other’s contributions.

It’s difficult to build an audience for a personal blog. Many people manage it but, if and when they do, it tends to reflect a sustained commitment to blogging on their part. It can be quite dispiriting to recurrently throw your polished thoughts out into the wilds of the internet only to find they receive little to no attention. While twitter has changed this dynamic slightly, it has only done so in a limited way. While it may have made it easier to provide an audience for your blog, it has also led to an entirely different set of pressures, leaving two rather than one platforms to engagement within in a sustained way.

These dynamics of audience building often mitigate against the upkeep of blogs, as Patrick and Chris point out. In one sense I disagree that this means personal blogs should only be for a committed few – this claim overlooks the overlap between blogging platforms and content management systems. So it might be useful for someone to setup a wordpress blog as an alternative to using something like academia.edu or an ePortfolio i.e. producing a static website of a form that is extremely familiar within higher education. However this isn’t really a ‘blog’ per se so in another, more meaningful sense, I entirely agree with the claim above.

The obvious worry that stems from this is that people who want to write online immediately setup personal blogs, rapidly lose interest and their contribution to the blogosphere is then lost. So if you’re someone who wants to write online but isn’t interested in committing to sustaining a blog on an ongoing basis, these are some alternatives
which might be of interest to you:

1. Does your department have a blog? See for instance the Sociology@Warwick and Politics@Warwick blogs.

2. Does your university offer opportunities to write online? See for instance the Warwick Knowledge Centre.

3. Discover Society is an online magazine publishing commentary by sociologists and social policy academics. Potential articles can be discussed in advance with the editors. Guidance for contributors is provided here. My perception is that it’s seen as a prestigious online outlet but then I’m rather biased.

4. Sociological Imagination covers a diverse range of topics and accepts a broad range of formats. I think it’s great but then I’m even more biased in this case. You can find notes for contributors, which I wrote years ago and should really update, online here.

5. There’s a number of LSE blogs which accept contributions: LSE Impact Blog, LSE British Politics & Policy, LSE EUROPP, LSE USAPP and the LSE Review of Books. All these links go to instructions for contributors, apart from the LSE Review of Books which has a slightly different process.

6. The Conversation is a great initiative which is expanding internationally. Much like the LSE blogs, articles are edited by professional editors. Unlike the LSE blogs, these editors are journalists. I think there are strengths and weaknesses stemming from this which you can see if you compare the two sites. I think the Conversation articles can sometimes be a little sterile, as if the communicative impulse has been edited out of them. On the other hand, the grammar and syntax is impeccable. You can find information about becoming an author here.

7. Open Democracy is a “digital commons not a magazine” (though personally I can’t see the difference between a ‘digital commons’ and a large, sprawling and well established online magazine) that has been around for a long time. You can propose articles here.

8. Medium and other new generation blogging platforms work in a rather different way. I’ve written about this here recently. If none of the ideas listed above take your fancy then it’s worth considering the use of Medium.

Unless you’re blogging on at least a weekly basis, it’ll be difficult to build an audience. There are exceptions to this (e.g. Deborah Lupton’s blog) but, unless you’re already well established, it’s unlikely that an audience will consolidate around your blog. People might read articles, particularly if you make the effort to disseminate them in the networks available to you, but it’s unlikely that they’ll get into the habit of reading it i.e. choosing to check your site or subscribing to an RSS feed because they have an expectation there will be new material for them to read.

This is not to say there’s anything wrong with blogging in the absence of an audience. I did it for years because I fundamentally enjoy blogging. This is rather my point: if you think a personal blog is something you’ll enjoy then I couldn’t be more enthusiastic in my support of it as a practice. But you should do so in awareness of the practicalities involved in using a blog for purposes over and above this. If you’re more interested in using a blog for impact or public engagement then you are in blogging as a form of self-expression, it’s unlikely to be worth your while to pursue a personal blog. In which case, any item from the by no means exhaustive list above would likely be more useful.

One final thought is that these different platforms can be combined. So for instance you could archive all your guest blogs on a personal blog. Or you can republish articles you’ve written for one site on your departmental
blog. The key thing is to **ask**: many sites are covered by a Creative Commons license anyway but editors will still appreciate it if you ask permission before reduplicating a post. My standard practice is to get put a 'Originally posted at X' link but there are different ways of doing this.

Though they’ve made such a mess of one of my favourite wordpress themes.

Record of the Week (Week of 14 April 2014) « STS Turntable (2014-04-20 01:13:16)
[...] The Sociological Imagination – How to be a blogger without having your own blog [...] 

[...] Here’s an interesting link featuring some comments on the trials and tribulations of single-author blogging for academics. In short the enterprise mostly fails. Blogging needs regular postings, otherwise one has little hope of building and sustaining an audience. I was going well with maintaining a regular schedule; however, it has been over a month and a half since my last post. I have multiple reasons for the hiatus but the one I will give here is that a few PhD deadlines suddenly overran what little free-time I had. Additionally I've been reluctant to return to posting. I knew that once I had returned the exertion of commitment would have to begin anew. It is just like when breaking from a gym regime. The break gets extended as your reluctance grows in the knowledge that returning to the regime means less relaxing evenings undisturbed by the realisation that soon you would be straining and grunting. Although my dedication for the latter has truly collapsed I always intended to return to blogging but after the thesis had undergone the internal review. So why am I back before that? Two reasons: 1) a friend of mine said if you intend to continue in academia you will always find deadlines threatening your other commitments so it's best to just get use to it; 2) my reply to Crossley and Bottero's article has just been published in cultural sociology and I want to brag about it. Actually it is relevant to an earlier post that I made on Bourdieu. So here's the link to that. [...]
Public reaction to the recent spate of celebrity deaths has been interesting to watch. Social media has led to an increase in the amount of "virtual mourners" who are able to flood the web with displays of grief, the sincerity of which has been '['questioned'. As a researcher of media fandom, I am particularly interested in how fans use the internet to grieve when the object of their fandom dies. This interest has led me to start researching fan response to the death of wrestler Chris Benoit, who killed his wife and young son before committing suicide in 2007. One particular concern was how fans deal with the process of remembrance when they find it difficult to separate the actions of the man from his celebrity persona.
It was with this in mind that I started to examine response to the death of wrestler the Ultimate Warrior (James Hellwig, who legally changed his name to Warrior in 1993), where commentators have similarly attempted to separate the man from the performer. However, it was when looking at response to Warrior’s death that I was struck by the comparisons to be made with the response to the death of Peaches Geldof. The two cases have produced an interesting set of memorialisation narratives to compare particularly with regard to questions of gender. The way people have responded to their respective “private” and “performed” lives along gendered lines signals a continuation of the way celebrity culture contributes to the existence of gender norms. Memorialisation of Geldof and Warrior has been heavily influenced by their recent media output. These “last appearances” have been used to shape the narratives of their remembrance: For Geldof it was an Instagram photo of her and deceased mother Paula Yates accompanied by the simple description ‘Me and my mum’. For Warrior, it was an appearance on Monday 7th April’s WWE Raw broadcast which saw him deliver an eerily prescient speech which spoke of one’s legend not being stopped by death.

[youtube http://www.youtube.com/watch?v=xR08M6EUd0g]

Geldof’s photo has helped promote remembrance which combines her “private” and “performed” personas. Where previously her “bratty” celebrity was attributed to her privileged upbringing, now the most dominant media narrative is to think of Geldof as the “doting mum”. Audiences have similarly focused on her domestic
identity; a quick look at the current most popular Tumblr posts shows a number of different photos of Geldof on her wedding day and with her children. Although her regular column for [7]Mother and Baby did help to highlight her image as a celebrity mum, significantly it is this identity which has been stressed, rather than her position as a celebrity journalist who happens to have children.

As a result, Geldof’s posthumous celebrity is inextricably tied to her personal identity as a wife and mother. Speculation that her death is possibly [8]linked to an eating disorder further emphasises the importance of how aspects of her “private” life, in particular gendered ways, inform the mediation of her celebrity. Such concerns of “ordinariness” – previously used to criticise her “fame for being famous” – are now used to ratify Geldof’s behaviour as she reverted to a more culturally acceptable state of motherhood, constructing a tidy memorialisation narrative for us to consume in the process.

In contrast, Warrior’s speech has been used to specifically highlight the difference between James “Warrior” Hellwig and the Ultimate Warrior wrestling character. Warrior himself made the distinction on Monday night, symbolically donning a mask to let ‘[The Ultimate Warrior] do the talking.’ Fans’ sharing of this speech and its message – through tribute [9]art and sharing memories of Ultimate Warrior’s legacy – allowed the markers to be laid for the memorialisation narrative to follow. Tributes have specifically highlighted the prime of Warrior’s [10]career – a bombastic muscled athlete and childhood nostalgia figure – rather than the retired father-of-two.

In fact, little media attention has been paid at all to Warrior’s surviving wife and children – his identity as a father and husband is apparently as “private” a topic as his [11]political views, the tone of which are seemingly inappropriate to include during a period of mourning. Mention of Geldof’s husband and children is essential to current media discourse, yet for Warrior such a topic is off-limits and irrelevant to a celebration of the “ultimate” icon of masculinity.

Although one could cynically think of these “last appearances” as part of a celebrity’s performance, that they’ve been interpreted along gendered lines underlines the selectivity in how memorialisation narratives are constructed. Celebrity deaths do seem to have an [12]emotional pull for audiences, yet even at times of tragedy it is important to
understand how particular stories are being crafted and maintained.

What's the Point of Ontology?
PhD Workshop at the University of Warwick
18th June 2014, 10am - 5:30pm

Ontology can often prove a contested and confusing issue within social research. Everyone has on ontology, explicit or otherwise, but the process of drawing this out and thinking through its implications for research can often be a confusing part of the PhD process. This participatory workshop explores the practical significance of ontological questions for social research, inviting participants to reflect on their own research projects in a collaborative and supportive context. It aims to help participants negotiate the sometimes abstruse matter of social ontology, linking theory to practice in the context of their own research projects. The main focus throughout the day will be on how ontological questions are encountered in social research, the questions posed by such encounters and how engaging explicitly with social ontology can often help resolve such issues.

All participants will offer a brief (5 minute) presentation of their research project and the ontological questions which have been or are expected to be encountered within it. Those still early in the PhD process are welcome to substitute this for a discussion of their research interests and potential project. We’d like to ask all participants to reflect in advance on their own social ontology and how it pertains to their project. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day!

We also invite two more substantial presentations (10 mins) for the first afternoon session, reflecting on your
engagement with ontological questions in your own project in order to help begin a practical engagement which encompasses the entire group. If you would be interested in leading the discussion in this way then please make this known when registering.

To register please contact socialontology@warwick.ac.uk with a brief description of your research and your interest in social ontology (500 words or less) by May 15th. The event is free but places are limited. Travel bursaries are available, please ask for more details.

The Centre for Social Ontology
http://go.warwick.ac.uk/socialontology/

The idea that ‘[e]veryone has [a]n ontology, explicit or otherwise’ might be a dangerous one: see Raymond Geuss’ essay 'The Wisdom of Oedipus and the Idea of a Moral Cosmos' in A World without Why (Princeton, 2014).

Sociological Imagination (2014-04-16 09:47:37)
Rephrase: everyone has beliefs, implicit or otherwise, about the social world. If you’re conducting social research then it’s important to be clear about the role your beliefs about the phenomena you’re investigating play in the investigation.

PhD Comics: Les (Really) Miserables – “I Dreamed a Dream” (2014-04-16 08:00)

Does this strike a chord with anyone else...?
Wilhelm Reich’s 6 Rules for Creative Sanity (2014-04-17 08:00)

1. Keep one’s life financially independent.
2. Continue unabated to exercise one’s power of creativity in concrete, strenuous tasks, always seeking perfection as near as possible.
3. Carefully cherish LOVE of a partner with full gratification, of the total emotional being if possible, of the body in a clean way if necessary.
4. Keep out of the trap of confusion by the average man and woman, helping others to keep out of the trap too as best they can.
5. Keep one’s structure clean like brook water through knowing and correcting every mistake, making the corrected mistake the guiding lines to new truth.

6. Never yield to the expediencies of life except where it is basically harmless or where the main line of development is not impeded for the duration of one’s life.

I’ve never read Reich, who had always struck me as someone occupying the same intellectual space as Erich Fromm but doing so in a much less interesting way. However [4]Maria Popova’s article has persuaded me to explore his autobiographical writings. He was an interesting guy but also a frustrated one, with it not taking too much interpretation to see how the 6 Rules might be connected to the difficulties he describes here:

Richard Dawkins, Twitter and the dangers of thinking aloud Edit (2014-04-18 08:00)

There’s a great Brendan O’Neill post on Telegraph blogs* in which he reflects on the self-destruction of Richard Dawkins** online and its roots in the nature of Twitter as a medium. He’s probably correct that, with the exception of a cadre of ‘skeptic’ true believers, Dawkins has through his ill considered anti-religious tweets effectively destroyed a reputation he’d spent a lifetime building. What interests me about O’Neill’s argument is the claim that “we are seeing how Dawkins’s mind works prior to his exercise of thought and self-editing, and it isn’t pretty”. Again, he’s probably correct. His conviction that this is a negative trend, illustrated by the particular case of Dawkins, rests on a set of claims about intellectual expression in public life:

Twitter by its very nature invites its users to express unedited thoughts which in earlier eras would have lingered at the back of our minds or been spoken only to small groups of people, perhaps over a pint. In the past, there was a clearer distinction between private man and public man, between what we thought and what we said, between the inner workings of our brains and the public utterances that later fell from our mouths.

Today, that divide has been muddied almost into oblivion, so that now it is perfectly normal to
see people tweet their instant, unformulated feelings about an event, a person, a religion, or whatever. Twitter isn’t single-handedly responsible for the detonation of the dividing line between private thought and public speech, of course, but it is the technological tool that has most explicitly moulded itself around the corrosion of the private/public split, inviting us, cajoling us in fact, to instantly share our half-baked thoughts on just about everything.

The end result is that even someone like Dawkins can now be better known for his late-night blabbing than for his intellectual works. I’m sure that to young people in particular, who don’t remember that time when Dawkins was taken seriously and who get the vast majority of their info via the Twittersphere, Dawkins is now just “that bloke what says weird stuff on Twitter”.

Dawkins’s fate – his self-demotion from serious author to barking tweeter – should be a lesson to everyone: beware Twitter, for it is the technological facilitator of the most backward cultural trend of our age – the Oprahite urge to spill, sputter and speak every thought, idea and feeling that pops into our heads.

He sees this as the apotheosis of a longer term trend in which the valorisation of ‘authenticity’ leads us “to give voice to our every feeling”. The real problem for intellectual life comes because this trend deprives us of “the space in which we once worked out what we really think about other people and world events, and instead encourages us to express our instant feelings about them”. So this isn’t the real Dawkins we see, as opposed to a previously false Dawkins, rather it is an unedited rather than edited encounter with the man.

I never thought I’d find a Brendan O’Neill article so thought provoking but this is a really provocative framing of a question that fascinates me. I’m convinced that iteration is an important aspect of the creative process: clarifying what it is you’re trying to say by recurrently attempting to articulate it. In other words, the space in which we ‘work out what we really think’ can be as dialogical as it is monological. But I think he’s certainly correct that Twitter encourages us to think aloud (this certainly fits with my experience) and that dangers are attached to this. Internal conversation is not a uniform thing, instead varying between people and across times and contexts. I don’t think communications technology can initiate these changes but I think it can (and clearly does) tendentially nudge them in certain directions. What makes this so complex though is that effects are not going to be uniform because mental life is not uniform – the properties and powers of Twitter (or an equivalent) are not the only variable in play here, with existing tendencies towards certain forms of intra-action shaping the inter-active uses people make of social platforms like this.

So I guess what I’m saying is that Twitter probably does inculcate a tendency towards thinking aloud, simply because it so radically minimises the constraints on externalising a thought. But leaving aside compulsive use (which is not a minor issue by any means but a distinct one) it doesn’t create the impulse to share, determine the content of the thought* or condition its likely reception in anything more than the most formal sense (i.e. the kinds of people one is connected to, the channel constraints involved in their responses etc). In other words: the problem here is not twitter and thinking aloud, it’s Dawkins himself and the culture within which these ‘pre-edited’ views become plausible and coherent.

Writing this sentence disturbs me on at least two levels.

*What does it say about you if even Brendan O’Neill thinks you’re obnoxious?
**Though it obviously may provoke it. Twitter can be a banal space but it can also be an intensely thought-provoking one.**

[...] The Sociological Imagination – Richard Dawkins, Twitter and the dangers of thinking aloud Edit [...]  

Laura (2014-05-12 23:00:53)

Yes I think there is perhaps too much technological determinism in his argument. At the risk of oversimplifying, “think before you speak” applies, regardless of the medum. Oh yeah. And I can’t wait for the opportunity to use the words "emotional incontinence" in a conversation! :-D

"Struggle to sketch the flow that already exists intact in mind": Jack Kerouac, creativity and academic writing (2014-04-19 08:00)

I just came across this wonderful list by Jack Kerouac, *Belief and Technique for Modern Prose*, in the Beats anthology I’m slowly making my way through:

1. Scribbled secret notebooks, and wild typewritten pages, for yr own joy
2. Submissive to everything, open, listening
3. Try never get drunk outside yr own house
4. Be in love with yr life
5. Something that you feel will find its own form
6. Be crazy dumb saint of the mind
7. Blow as deep as you want to blow
8. Write what you want bottomless from bottom of the mind
9. The unspeakable visions of the individual
10. No time for poetry but exactly what is
11. Visionary tics shivering in the chest
12. In tranced fixation dreaming upon object before you
13. Remove literary, grammatical and syntactical inhibition
14. Like Proust be an old teahead of time
15. Telling the true story of the world in interior monolog
16. The jewel center of interest is the eye within the eye
17. Write in recollection and amazement for yourself
18. Work from pithy middle eye out, swimming in language sea
19. Accept loss forever
20. Believe in the holy contour of life
21. Struggle to sketch the flow that already exists intact in mind
22. Don’t think of words when you stop but to see picture better
23. Keep track of every day the date emblazoned in yr morning
24. No fear or shame in the dignity of yr experience, language & knowledge
25. Write for the world to read and see yr exact pictures of it
26. Bookmovie is the movie in words, the visual American form
27. In praise of Character in the Bleak inhuman Loneliness
28. Composing wild, undisciplined, pure, coming in from under, crazier the better
29. You’re a Genius all the time
30. Writer-Director of Earthly movies Sponsored & Angeled in Heaven

There’s a few points in here which really speak to the argument I’m developing for an upcoming paper about sociological writing, blogging and attentiveness. I’m not sure how, if at all, I could include them in the paper — something which actually neatly illustrates the broader point I’m trying to make in it. I’m having to abstract away from what I’m trying to express, as well as the terms in which I feel moved to express it, for the paper in a way which I’d never have to do on a blog.

But assuming that the form of the paper serves a purpose (it clearly does) and is not going away any time soon (it clearly isn’t) then the personal question becomes how to preserve the creative impulse from corrosion by the endless, sometimes imperceptible, acts of censorship and detachment which ‘academic writing’ unavoidably entails. I’m arguing in the paper that blogging can be an integral part of this, as part of a practice of cultivating attentiveness, though there’s no guarantee it will be so for any one person or for ‘academic blogging’ as a broader trend.

On Improvisation (2014-04-19 17:15)

'So what would an improvisation-friendly academia look like? Certainly standards of public performance would shift. We would become more tolerant of people who speak crudely without notes, if they can improve as they take questions from the audience. But we would equally become less tolerant of people who refuse to take questions simply because they stray from their carefully prepared presentation. Instead of ‘sloppy/rigorous’, we would apply the binary ‘expansive/limited’ to describe the respective intellects of these people.’ Thus proclaims sociology’s Icarus.

How “would” all the things that [1]Steve Fuller says “would” happen actually come to pass? What “would” stop the loosening required for improvisation becoming – or, in some cases, remaining – a low-quality free-for-all?

2589
We need to pin down the reality of this excellent sounding “more improvisation” ideal, less for fear our wings will melt but more because we might never leave the ground. Even worse, we could end up thinking we’ve taken off while all the time we’re just running around with our arms out shouting “zooooom”.

What kind of education would encourage high-quality improvisation? Perhaps we can draw some comparisons with music. What gets derided as (ahem) ‘instrumentalist planning’ in our context is called ‘composition’ in music. Classical music honours composers more than any other single individual in its production and finds little room for improvisation. It would be a perverse critic who claimed that Wagner’s Ring Cycle is too fully orchestrated. There is still room for creativity from musicians because the same piece of music can be played in different ways. Radio 3’s CD Review - Building a Library is a wonderful testament to this. The way these musicians innovate is by difficult, repetitive practice based on a mastery of the repertoire first and the more progressive reaches second, but even this is honed and (excuse me) fine-tuned. And yet, perhaps this is too conservative a comparison for some tastes, and it doesn’t tell us much about improvisation.

However, when we turn to jazz and folk, two genres that value improvising musicians very highly, we find a similar reliance on familiarity with the standards and the repetitive honing of skills. When they improvise (well), it’s the cream off the top of an astonishing body of received knowledge. They can cope with the lack of regimentation because they are so well practiced and, as Wittgenstein said, ‘know how to go on’. (Despite what [2]Bruno Latour says, Wittgenstein was the most important twentieth century philosopher – certainly whose name began with a ‘W’.) Freedom, to put it differently, is earned, because otherwise it really would just be bullshit. I think it was either Dizzy Gillespie or Charlie Parker who said you get your own style by following others who impress you and only emerging as your own butterfly later – but you’ve got to be good. The lesson from the folk world, of course, might simply be more real ale in seminars, but even that needs to ferment.

There’s a massive difference between my early cow-horn-esque efforts on the saxophone – complete bullshit – and John Ogden’s avant garde piano pieces, which would be "bullshit" to someone whose sensibilities couldn’t stretch beyond Bach. If we want improv in the academy we might in fact need a pretty conservative educational structure for students and a continuing requirement on academics to know and teach our own classical repertoire. And we might do well to remember that it’s not the only form of creativity. Think composition. Making stuff up can’t be the general rule. The difference between me and Ogden or Parker is that they knew what they were doing musically and I didn’t. We in the academy too need to learn our scales.

Hastily flung together by Dan Fairbrother

Dan Fairbrother is a PhD student in Sociology at Warwick University. He is writing a thesis in nineteenth-century intellectual history.

Western art music’s notation-only focus is an anomaly, an aberration, when viewed in the perspective of both the history of Western music and of the rest of the world. Music was aural and improvised in both performance and pedagogy until the Middle Ages when notation came into use. Musicians continued to be comfortable improvising and embellishing compositions for another thousand years until the giant orchestras of the Romantic era plus the rise of the conservatory and the method book killed improvisation (except for church organists and jazz musicians) so that by the 20th century, not only had classical
players lost the ability to do anything but read notes, they were also ignorant that it had ever been any other way. Creative music is the other half of comprehensive musicianship. One half is the Literate Side, where the only value is what is has been notated by a distant expert (= composer). The other half is the Aural side, where the player has a unique voice and is able to "think in music" - understand what others are saying in music, make an instant decision about how to contribute, and join in. Just like a conversation. Improvisation is unpredictable, like conversations. But in the same way, you can get into some very interesting stuff. If you only read aloud something that someone else has written for you, it is entirely predictable and "clean." But if that is the only model, you are giving up the possibility of enjoying the fun and benefits of thinking for yourself and creating something new with others. You can’t improvise in something you don’t know anything about (try auctioneering in Mandarin); but you can improvise at any level, i.e. make choices that are comfortable and easy. You don’t invent words or say words that you can’t pronounce when you converse. If you are improvising, you can do the same. One thing that keeps classical musicians from trying it (aside from receiving no encouragement or training in it, ever) is the usual definition of improv = jazz = bebop. This is one kind of improvise, one with a very steep learning curve that is going to exclude almost everyone. But there are many ways to improvise. Auctioneer style talk is not the only way to talk. You can improvise a dirge, a fanfare, a lullaby, a children’s song, and so on. There are always rules, even if you haven’t discussed them before you started playing. Improvisation teaches us to really listen, to understand what’s going on, rather than just parrot, or recite by rote. Improvisation is scary to some because it is unpredictable, but in fact it is no more so than a conversation. Mistakes - the terror and stressors of classical players - are now opportunities to discover things that you would have never thought of otherwise, a chance to make lemonade from lemons. Improv is like life itself. We don’t have to give up the literate side of music. But music life is vastly richer, more rewarding, and just plain fun if you get in on the aural/creative side as well. Classical training has silenced generations of voices for the past 150 years. It’s time to get back to the long-time traditions of the past and start releasing those voices, hearing what they have to say. Classical music is strangling on perfection and museum pieces. It’s time for everyone to have a voice again.

I can’t quite make out the subtext of your thoughts about music, Jeffrey. I took my little piece to be quite sympathetic with Steve Fuller’s aspiration for more improvisation in the academy. I suspect both Fuller and I would like to encourage high quality academic work in the slightly elitist way you deride in music. Fuller’s thought appears to be that we have to accept a certain amount of bullshit in which the rose we really want (to adopt a well worn image) will grow. But he accepts that it is bullshit and not valuable in the same way as a rose. My response (which I admit remained in the subtext) was that even though the way Fuller makes his suggestions makes it all sound quite radical, the practical ways in which we might encourage good improvisation might in fact be somewhat more conservative. So, despite the mildly satirical way in which I wrote the piece, my point was more that Fuller’s end-goal (which in a more modest way I would claim to share) might imply something slightly different in practice to what he suggests. Indeed (and here I speculate), perhaps Fuller underestimates the extent to which his own ability to do the things he talks about so well is based on his having had the benefit of a thorough and traditional academic education. It’s easy - perhaps deceptively easy - when you know how. Your point though, Jeffrey, seems to be that we’re both wrong, and that we should accept some of what gets called “bullshit” as valuable in itself, like lullabies. But too much in the academy is already apt to send one to sleep.

Hi. Interesting thoughts. I have just been to the BSA conference so what you are discussing was very relevant. Plenaries were all written out but only Steve Fuller could deliver his ideas coherently without sounding as though he was reading from a book. The open forum celebrating Stuart Hall’s contribution to sociological thinking was the neerest any session came to improvisation. Contributors spoke without notes and from the heart. I learned a lot about Sociological practice. Anyone familiar with Hall or his work could have contributed to the discussion. The presentations by PhD students were pretty pointless and I wonder what this effort is all about. Maximising delegates and fees for the BSA? None could handle questions which went beyond their ‘area’ and conveners would jump in if they thought questions were too demanding. Sorry to say it but PhDs seem to be getting very narrow and unambitious. Improvisation comes with NOT reading written notes and having prompts for oral delivery. Needs to start with lecturing and student seminar work.
Personally I couldn’t agree more. I had an interesting debate with Kirsty Liddiard (who writes sometimes for SI) about this though, who pointed out to me that there’s a gendered dimension to this and that it might be equally problematic to cultivate an “expectation” of improvisation. That said, I get frustrated that I sometimes feel as if I’m being rude if I don’t use powerpoint (as if I didn’t care enough to prepare properly?) - it’s a feeling that mystifies me, which I’m sure does at least in part stem from something ‘out there’ in academic culture, as opposed to me just being neurotic.

CfP: What are seminars for? What are conferences for? Towards DIY academic events (2014-04-20 08:00)

The Sociological Imagination invites short articles (500-1500 words) critically reflecting upon the prevailing forms of intellectual meeting within the contemporary academy. What are their strengths? What are their weaknesses? How could they be done differently? What are the sociological implications of these standardised forms of intellectual meeting? Whose voices do they amplify and whose do they suppress? What behaviour do they reward and what behaviour do they discourage? What are their intellectual implications? How far does intellectual form follow conference function, limiting time and expression in the interests of the event’s logistics? Why do people attend seminars? Why do people attend events? What are the wider significance of these common reasons? Are there other motivations for attending academic events which tend to be squeezed out in the neoliberal academy. How might we do things differently? What alternative forms can we imagine? What would the implications for the academy be of DIY academic events becoming common?
If you would like to submit an article please send mark@markcarrigan.net a 500-1500 word article, attached within the body of the e-mail, as well as biographical details to be displayed with the post.

----------

Trying to “evade the academic literature” (2014-04-21 08:00)

There’s a wonderful discussion in the midst of [1]this review essay of Bernard Williams's collected essays, which incidentally sound fantastic, in which the author defends Williams against accusations of lazy scholarship. I’ve written about this issue in the past (particularly [2]here and [3]here) and it’s one which continues to concern me. The author of the essay brings out much more clearly than I have been able to what I see as the crux of this problem: the prohibition on ‘evading the literature’ has a disciplinary function, drawing scholarly endeavour into an over-production of scholarly work that has structural origins and, through doing so, fuelling the over-production which is the underlying problem. This isn't an argument in favour of ‘evading the literature’ but it as an argument against such a prohibition being axiomatic. The “Sisyphean task of attempting to stay up to date” often works to squeeze out time for thinking about the things that most interest us.

Seeing the range of Williams's knowledge is important because it casts into new light a refrain often heard about his academic philosophical writing: that it is characterised by a fundamental laziness regarding scholarship, evidenced by the fact Williams only ever cited his friends and his students.

The accusation is usually meant as one of sloppiness, of Williams’s unwillingness to supplement his dazzling intellect with the hard work of scholarly endeavour, trusting that he could evade the academic literature by simply being quicker than his peers. Perhaps this is true, but these essays suggest a better line of explanation. We can now see that Williams was not lazy: he spent an immense amount of time reading and thinking, and knew much beyond his own academic arguments. What he chose to do was spend time thinking about things that most interested him, rather than engaging in the Sisyphean task of attempting to stay up to date with the vast and ever-expanding sea of contemporary scholarship, which tirelessly throws out publication after publication in every conceivable niche of enquiry. It is undeniable that the vast majority of present scholarly output in philosophy and attendant disciplines is of a poor standard: it is either unoriginal, original at the expense of being preposterous and tiresomely pointless or trivial, or else diligent and robust but utterly devoid of interest to anybody other than those academics who have made a career out of grinding out points and counterpoints within debates that only exist because of the very professionalization of intellectual pursuits of which their activity is a function. Williams chose to bypass all of this and get on with being original and interesting. It is not at all clear that he was making a mistake.

The present government’s Kafkaesque “Research Excellence Framework” demands that academics churn out publications, regardless of whether they have anything to say. More generally, there has been a pronounced cultural shift in professionalized academia away from teaching and towards measurable 'outputs', encouraging academics to translate whatever modest or untenable ideas they have into high 'impact’ publications. Academia is in danger of ending up moribund via a prolonged case of morbid
obesity. Williams’s advice was the exact opposite of all of this: disciplines like philosophy should not encourage, or give incentives for, publishing, unless what one writes is likely to be very good indeed; likely to be both genuinely interesting and original. This was not (as it is often mistakenly taken to be) a matter of snobbery on Williams’s behalf. It was a function of a well thought-out view regarding what philosophy is, one that comes out strongly in the later essays collected in Essays and Reviews. In essence, for Williams, philosophy is not like science. In science, the big breakthroughs come from brilliant thinkers, but the rest of the time everybody else can usefully get on with collecting data and increasing the sum of human knowledge. Philosophy is not like that: in philosophy, you are not only not adding data if you are making bad, or unoriginal, or stupid, or pointlessly banal and repetitive arguments, you are getting in the way of those who are trying to make sense of our world, and who might be able to make more sense of it than those who have tried before. If this is elitism, it is justified by the seriousness with which Williams wanted to make more sense of our world than has hitherto been managed; the brute truth is that most practitioners of contemporary academic philosophy just do not help in that task. (There is a separate question as to whether one needs to be a highly talented and original thinker in order to teach at a university. That in turn raises questions about what the role, purpose, and corresponding organizational structure of the modern university should be—questions to which it does not seem that anybody at present has particularly good answers, least of all the present government.)

Ann Oakley: women, childbirth and the invention of gender (2014-04-22 08:00)

[1]Ann Oakley’s work was the first serious academic study of housework (The sociology of housework, 1974; Housewife, 1974, and Woman’s Work: The Housewife, Past and Present, 1976). Previously we had posted an interview from 2013 in which she spoke of her radical feminist research about women who work at home and shared insights about qualitative research methods - very useful if you are planning to do qualitative interviews for the first time. Sadly, the video no longer exists on YouTube. So instead, here are two other interviews:

On women’s experience of childbirth:
and on the Invention of Gender: Social Facts and Imagined Worlds:
Review of the Critical Pedagogy Reader (2014-04-23 08:00)

Critical Pedagogy as an educational philosophy refers to education that advocates the liberation of oppressed communities through developing a critical consciousness among teachers and students so that they are able to critically interrogate the inter-relationships between culture, economics, ideology and power. Critical Pedagogy concerns transforming theoretical and practical ways of doing education in order to work towards eliminating social inequalities and social injustices. Many of you may have heard of Paulo Freire, one of the famous proponents of critical pedagogy; the book contains essential readings by influential advocates of critical pedagogy like Freire, as well as bell hooks, Gloria Ladson-Billings and Henry Giroux.

The second edition of the Critical Pedagogy Reader provides an updated in-depth and definitive approach to highlighting key issues in promoting educational practice that is critical of hegemonic mainstream policies, and thus is very useful for researchers of social sciences, in particular educational research, as well as beginning and experienced teachers who wish to teach their students to critique dominant assumptions that affect their schooling and everyday life. The essays chosen by the editors highlight the significance of critique, critical interrogation and critical consciousness through discussion of key intersectional issues of identity such as social class, gender and race, and the impact upon the theory and practice of educationalists. There is also a much needed discussion of disability as a social construct, just like race and gender. Moreover we gain knowledge of the significance of dialogue in critical pedagogy, dialogue as critical consciousness and dialogue as collaborative form of communication.

The comprehensive introductory section usefully provides a socio-historical outline of how critical pedagogical thought emerged as well as useful detailed definitions of key terminology in the field of critical pedagogy: we learn about the necessity of understanding how hegemony works to keep some in society comfortable in their positions of power and privilege, as well as the interconnected relationship between hegemony, discourse and ideology. Definitions of concepts that need to be urgently deconstructed are provided for the reader, for example class and culture and its variant forms.

As well as referring to race, gender, sexuality and social class, the book provides us with an understanding of the notion of critical literacy which is one of the pillars of critical pedagogy required for its successful exploration. We learn about how language and literature can be used to engage students to become critical readers and writers.
There is also a section on teacher training that outlines the crucial site of teacher education in empowering teachers to be critical of dominant social structures. Towards the end of the book, we learn about critical pedagogy beyond the classroom motivating teachers and students to interrogate other public institutions, for example the mainstream media. Further the essay on Ecopedagogy gives insight into the challenges and solutions of environmental literacy and ecocitizenship, encouraging us to apply concepts of critical pedagogy to diverse areas that are increasingly crucial to the future of our world.

Throughout the book the theme of empowerment is evident: we are given insight into how to empower our students through the curriculum, classroom practices and beyond the confines of the classroom environment in order for them to become critical citizens. We are able to read about the essays of educationalists who have illustrated personal critical pedagogy visions and actions through theoretical reflections of practical endeavours. The Critical Pedagogy Reader would be an authoritative, accessible and beneficial read for anyone who wishes to learn more about the key concepts, applications and theories of critical pedagogy without being overwhelmed because all the necessary terminology is explained thoroughly and clearly. Researchers of Education and trainee teachers will be able to gain perspectives from a wide range of authentic voices in the area of critical pedagogy.

The strengths of the book are that the essays are scholarly and contemporary, but the history of critical pedagogy is evident in the background. The book is a massive contribution to the field of critical pedagogy, for as well as reminding us of classic writings of Paulo Freire and bell hooks, it succeeds in bringing new debates and definitions to the forefront of our minds. The book contains questions for reflection and dialogue that you can ponder over yourself or use with your students or colleagues. The editors have structured the book neatly and thematically making it easy for the reader to navigate through a well-organised text. Each section is preceded by a summary of the main essays allowing for an overview of the key arguments proposed throughout each of the sections, also each section is concluded with a helpful list of recommended readings for future study providing more research sources for anyone wishing to delve further into critical pedagogy theory and practice.

[Sadia Habib is a PhD candidate in Educational Studies at Goldsmiths, University of London.]

Charles Tilly on Causal Mechanisms (2014-04-24 08:00)

An interesting interview by Daniel Little as part of his [1]Understanding Society project:
The continually shrinking conference presentation (2014-04-24 09:35)

This blog recently featured a [1]call for papers that reflect on ‘forms of intellectual meeting within the contemporary academy’. I thought that this was a timely request, which resonates with different concerns we can identify around how some academic events are run. For many researchers the costs of some well-established conferences are prohibitive. We are working at a time when sociologists are reflecting on mainstream ways of doing sociology and suggesting alternatives, for example, ‘[2]Punk sociology’, or ‘[3]live methods’. It seems appropriate that part of this reflection on the disciplinary project is also a questioning of how we arrange conversations between researchers, how we communicate with each other, and how we seek to engage wider publics. I’ve been wondering if there is a wider sense of dissatisfaction with the standard model of workshops and conferences, the 20 minute presentation, often accompanied by a power point presentation, followed by five or 10 minutes for questions and discussion. I have seen events advertised where this seems to be the case, in one instance participants were asked not to use power point, in another power point and similar ‘tools’ were not permitted.

I recently received a decision on an abstract for a conference paper that has prompted me to think about some of these issues. I submitted an abstract for a paper that would be 20 minutes long, followed by questions. As is common with these kinds of events, the organisers have received far more abstracts than could fit into the

1. http://understandingsociety.blogspot.co.uk/
2. file://www.youtube.com/embed/PP900JiYFr8?list=PLE7580FE92113B5E6
programme. I have been asked to give my paper as a PechaKucha presentation where 20 slides auto-run for 20 seconds each, meaning each talk is six minutes, 40 seconds long. So, how can we understand this move away from the standard format, to this shorter, more visual, set-up? From the perspective of the organisers it might be a pragmatic move, a way to allow more presenters to talk about their work. There might be a profit motive at play here, researchers are probably more likely to attend an event if they are presenting, rather than making up the audience, and might be more able to access university research funds for this. Thinking instrumentally, a PechaKucha presentation and a standard one might end up looking very similar on a CV, so perhaps organisers don’t think that shortened papers will be a problem for the speakers.

I think there is also something going on here about the role of technology in academic events. For some conference organisers, it seems that technology is perceived as having damaged good communication between researchers - so, we get the ban on power point, or similar formats. For the event I hoped to present at the increased use of technology seems to be a kind of solution, though beyond the issue of oversupply of papers, it is not clear what the problem is. On the PechaKucha website we learn that the format was devised by two architects and is a response to the problem of architects talking too much when given a microphone. PechaKucha presentations appear to be designed for creative people to showcase their work in informal, sociable, events. On other websites these kinds of presentations are described as upbeat, engaging, and where the audience is on the side of presenter. There might be some problems with translating this format to academic events - not all topics are suitable for an 'upbeat' style, if the audience and presenter are all caught up in ensuring the format succeeds, does this become more important than the ideas being discussed? Do these kind of 'hacks' to the standard model of conference presentation put more emphasis (and pressure?) on the researcher to be a performer? Is this undesirable? And, what can you say in six minutes, 40 seconds - does this help researchers focus on their key argument, or is only a superficial exploration of a topic possible in this time? My guess would be that the latter is usually the result.

I would like to hear from researchers who have used alternative formats at events - has this been a positive move? Is there a widespread sense that the standard model of conference sessions no longer fits into the wider culture of contemporary academic life? I think it is time to have some of these discussions. At conferences we often have a dual role, as both speakers, and as listeners. If we are going to rethink the role and format of academic events, we need to keep both of these in mind. I would like to think of conferences as spaces for thinking and discussing ideas. My concern is that if we start to think of presentations mainly as performances, the idea of the conference for a place for talking and listening might slip from view.

[Emma Head is Lecturer in Sociology at Keele University. She is co-convenor of the BSA Digital Sociology group and edits the Sociology and Criminology at Keele blog.]

6. http://socandcrimatkeele.blogspot.co.uk/
discussed; we can’t assume this is ‘only’ of academic interest, or that no-one in the room will not have direct and perhaps very traumatic experience of FGM. [* in essence, an extension of this - http://hilaryburrag.com/2014/04/11/the-real-economics-of-fgm-its-much-more-than-wages - to examine the idea that FGM in western societies actually creates for some who experience it the very ‘underclass’ status which in traditional societies it is claimed a woman with FGM-status will avoid.] Also, I wanted to judge reactions and responses as we went along so that I could see where any gaps in the attendees’ knowledge might be (there were a few), and because I’d hoped for (and received) several observations which a more slick techno-style of presentation would have prevented. In other words, I wanted to take the opportunity to actually talk with, not just to, sociological colleagues during my precious 20 minutes. Imposing any across-the-board techno format on the presentation would have been exceedingly counter-productive. In fact, I don’t think I would have bothered to submit... but doing it in my own preferred fashion left me very pleased that I’d been able to present. So I guess some flexibility in presentational mode can be critical for some of us who want to share our work - and also for those who come to join the debate. Context is (nearly) all, in these things.

**PhD Workshop: What’s the point of social ontology? (2014-04-24 14:52)**

What’s the Point of Social Ontology?  
PhD Workshop at the University of Warwick  
18th June 2014, 10am – 5:30pm

Ontology can often prove a contested and confusing issue within social research. Everyone has an ontology, explicit or otherwise, but the process of drawing this out and thinking through its implications for research can often be a confusing part of the PhD process. This participatory workshop explores the practical significance of ontological questions for social research, inviting participants to reflect on their own research projects in a collaborative and supportive context. It aims to help participants negotiate the sometimes abstruse matter of social ontology, linking theory to practice in the context of their own research projects. The main focus throughout the day will be on how ontological questions are encountered in social research, the questions posed by such encounters and how engaging explicitly with social ontology can often help resolve such issues.

All participants will offer a brief (5 minute) presentation of their research project and the ontological questions which have been or are expected to be encountered within it. Those still early in the PhD process are welcome to substitute this for a discussion of their research interests and potential project. We’d like to ask all participants to reflect in advance on their own social ontology and how it pertains to their project. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day!

We also invite two more substantial presentations (10 mins) for the first afternoon session, reflecting on your engagement with ontological questions in your own project in order to help begin a practical engagement which encompasses the entire group. If you would be interested in leading the discussion in this way then please make this known when registering.

To register please contact socialontology@warwick.ac.uk with a brief description of your research and your interest in social ontology (500 words or less) by May 15th. The event is free but places are limited. Travel bursaries are available, please ask for more details.

CfP: Not Your Typical Call for Papers (2014-04-25 08:00)

With the 2014 Volume, the Berkeley Journal of Sociology will focus its efforts on writing a “history of the present.” The journal will no longer publish academic research articles. Instead, we seek compelling essays, insightful commentaries, critical analyses, and topical symposiums on the most pressing political and cultural issues of the day. Our aim is to provide critical perspectives from the social sciences on public debates and current events with an orientation toward social and political engagement. We seek to transform our longstanding graduate-run academic journal into a print and online magazine sourced by a global graduate community with wider relevance. The BJS is re-imagining the purpose of a publication that emerges from within the academy, but which does not take the discipline of professional sociology as its aim. We seek new audiences across new platforms to firmly root sociological knowledge within society, for society.

We believe there is a need for creative translation and wider circulation of the knowledge we are producing as graduate students of the social sciences on politics and culture today. We seek to broaden the interpretive range, imaginative scope, and prospective application of our research to ongoing political struggles, emerging cultural trends, and possibilities of alternative futures. We are not content to be relegated to the sidelines. The point, after all, is to change the world. The task before us is to arm our critiques with power. This is a call to join a proper conspiracy whose aim is not only to critique, but to intervene; not only to intervene, but also to shift the terrain beyond the internal debates of the academic field.

The BJS seeks to open up a space to re-compose social research into a range of written forms, unobstructed by technical jargon and unconstrained by formalistic rigidity. Through its online-first approach the journal seeks to redistribute its material across sources and publications, in the alternative and popular press. Toward that end, BJS is accepting the following kinds of submissions on topical issues or debates:

- research essays: open to interpretation.
- commentary: social scientific assessments of events, journalistic reportage and public discourse; critiques of recent reports by state agencies, think-tanks, NGOs, foundations, polling agencies, etc.
- conversations: interviews with traditional or organic intellectuals on topical subjects and debates.
- field memos: ethnographic dispatches from graduate researchers; elaborations of experiences in the field as they relate to contemporary social struggles, crises, cultural or political debates.
- photo essays: from a site of research; sociological critiques of art or visual culture.
- book reviews (joint or solo): social scientific assessments of recently released trade books; reviews of academic books relating to contemporary events or debates.
- debates: The journal will be running video and transcripts from UC Berkeley's Public Sociology Initiative. We invite similar debates or symposia on contemporary politics and culture, in the flesh or virtual.
Submissions are due by June 1st and may be sent as email attachments to submissions@berkeleyjournal.org and will be subject to a review among Berkeley graduate students in the social sciences. We also invite proposals for forums comprised of a number of contributions around a single topic. Proposals for forums should include a brief description of the project and information about the authors, including contact info, and should be submitted by April 1st to submissions@berkeleyjournal.org. All journal content will be published under a CC-BY-NC-ND license.

The Berkeley Journal of Sociology is a graduate student-run journal that has been in publication since 1955. Archived articles can be found on JSTOR.

The Centre for Social Ontology (CSO) was established in 2011 at the École polytechnique fédérale de Lausanne. Now based in the Department of Sociology at the University of Warwick, its main focus is the Morphogenetic Project.

- The Morphogenetic Project produces an annual volume as part of the Social Morphogenesis series.
- The first two volumes in this series are Social Morphogenesis and Late Modernity: Trajectories Towards Morphogenic Society.
- Our first PhD workshop will take place in June 2014.
- Our monthly seminar series is due to begin in October 2014.
- Further activities are planned for next academic year.

To join our mailing list, please contact socialontology@warwick.ac.uk. The CSO website will be regularly updated with information about our activities: www.socialontology.eu
Reflections on My British Sociological Association Keynote (2014-04-26 01:41)

8 September 2014: [1]My keynote address is now on-line

I delivered the first keynote of the British Sociological Association annual meeting this year. I was especially honoured to learn that I was a popular choice, because what I had to say was designed to get people to think about the nature of the collective they form by virtue of being 'sociologists'. I improvised the keynote, so what follows are my reflections based on what I did say but also the response of people both at the event and on twitter. The keynote itself should be posted on-line by the BSA in the near future.

As someone who comes to sociology with 'professional' credentials (aka PhD) from history and philosophy of science, not sociology, I actually made a conscious choice to become a sociologist when I moved from the US to UK twenty years ago. Before that time I was seen as a funky philosopher promoting [2]'social epistemology'. Frankly, I don't believe that much about me has changed (except looking older), but what has changed is the academic environment in which I have been practicing my funkiness. I think that moving to the UK was exactly the right decision at the time, but for reasons that raise some important challenges to an organization that calls itself the 'British Sociological Association'.

My keynote was framed around the conceit of the great science fiction writer HG Wells' candidacy for the first UK chair in sociology, at the London School of Economics in the first decade of the 20th century. Wells clearly saw sociology as primarily a normative discipline, taking his cue from Comte and Spencer as 19th century benchmarks for what 'sociology' might become. To be sure, these two figures differed radically from each other – and from Wells – in terms of their projected utopias. Nevertheless, both saw ‘sociology’ as mobilising our best scientific knowledge to enable humanity to be all it can. Although Wells did not say this when making [3]his pitch for the chair in 1905, his critical eye on Marxism throughout his career shows that [4]he would have included Marx as a fellow traveller. (By the way, when exactly did Marx become a 'sociologist' – the 1960s, perhaps?)

Today's sociologists should ponder what it might mean to take that Wellsian ambition seriously. Sociologists are nowadays inclined – at least rhetorically – to allow the inevitable uncertainty of their findings to slide into a kind of learned helplessness, so that they sometimes casually insult the intelligence of non-sociologists (helpfully not in the room) by ending a talk with: 'It's really all very complex and I'm glad it's not me who has to sort out this mess… (Next contract, please!)' And, courtesy of John Law, [5]'mess' has become a badge of methodological honour in some precincts of this field. Yet non-sociologists manage complexity perfectly well all the time, indeed, often in watered-down sociological terms – perhaps redeeming the media's educative function. So what's the value-added of sociologists stressing the 'complexity' of things, unless they highlight certain factors in the complexity as being salient for some larger prospect that may have escaped the notice of the non-sociologists but that nevertheless may be of interest to them?
In this respect, ‘complexity’ poses a very direct challenge to sociology. If sociology is a proper ‘profession’, then it needs to stand for something beyond a certain sense of ‘technical reliability’, be it based on qualitative or quantitative methods. I have no doubt that artificially intelligent machines will soon be able to perform a very sophisticated form of social research that will represent all the available complexity within prescribed parameters. That’s because the ‘prescribed parameters’ will have been set by someone other than the artificial researcher. When I said that ‘anyone can do social research without being a sociologist’, that’s exactly what I meant. Social research without sociology is precisely what an artificial researcher will eventually be programmed to do.

Now some social researchers will object at this point, saying that they have a special kind of knowledge that no machine could have because they are themselves embedded in the target society, if not belonging to it normally. I see this point clearly. But in that case, what is the virtue of amplifying complexity without resolution? Yes, you’re one of ‘them’, in some sense. But doesn’t that increase your responsibility to say something a bit more definitive, however contestable, than what your non-academic fellows could say? If not, then you would seem to have provided grounds for eliminating publicly funded higher education.

I realize that we all need to publish to earn our keep, but to retain professional standards as sociologists in this political economy, we should require that people who claim the title of ‘sociologist’ to present findings that include a judgement about the matter at hand, where the researcher’s own voice is one of clarity, not the usual dithering, ambivalence, blah, blah. Of course, any judgements pretending to be definitive will be contested and eventually be shown fallible. But the only way that sociology can contribute to social progress is by the public airing of such conflicts, with the onlookers deciding as they will about what to make of it all.

The above helps to explain an assumption I made in my talk that clearly riled some in the audience: The more that ‘social researchers’ offload personal responsibility for what they reveal about their informants to their clients, the more they diminish their own humanity – and in that respect betray the Wellsian imperative. If there is one crime against ‘humanity’ that can be held against actor-network theory is the idea that information overload – aka ‘plurality of actants’ – absolves you of moral responsibility for what you’re talking about. On the contrary, all it does is to ease your replacement by a machine. Excellently done social research that gives clients all they need to know in order to do whatever they want does not require training in sociology – and in the long term may not even require membership in Homo sapiens.

I am not sure that my argument is obvious or strange (or wrong!), but I think it is what an organization that calls itself the ‘British Sociological Association’ needs to hear now. Since all ‘sociologists’ continue to genuflect to Max Weber, let me end by offering an interpretation of his very strong distinction between ‘science’ and ‘politics’ as vocations. Weber would be the first to object to my hypothetical researcher who gamely presents the ‘mess’ of social reality in the spirit of advertising their own virtuosity to future funders. Weber took seriously that science and politics are two autonomous professions, which means that each has its own ends, which are conditioned by their respective modus operandi.

Just as the politician needs to explain to his/her constituency why s/he chose to make a particular decision, the scientist needs to do something similar, but to the politician. However, the additional burden placed on the scientist is that s/he must represent fairly alternative point of views because s/he is not in a position of making the ultimate policy decision. In other words, what we might regard as the ‘scrupulousness’ of academic judgement simply reflects the relative lack of power in the moment of decision. (In this respect, I see Carl Schmitt as picking up on Weber.) The bottom line is that a Weberian sociologist fully realizes that s/he does not take the ultimate policy decision. Nevertheless, as a matter of professional integrity, the Weberian takes an explicit stance based on the available research, but which is presented in a way that enables the politician to disagree.
You should also get Sara Delamont to write a piece - her plenary was excellent, very funny and some astute points about gender inequalities in relation to the H index, and naive, sloppy internal colonialism in sociology journals.

It sounded interesting on twitter! I’ve never had any contact with her though.

Well said, on all your points. I do think professional sociology needs to be shaken out of its insularity and conservatism (small ‘c’). E.g. how many core journals of sociology publish a reasonable number of articles by persons with non-sociology-political science, philosophy, communication, free lance, etc-affiliations? I suspect, but bibliometrics would have to confirm, very few. If indeed confirmed, shame!

CfP: What are conferences for? The Political economy of academic events (2014-04-26 08:00)

The Sociological Imagination invites short articles (500-1500 words) critically reflecting upon the prevailing forms of intellectual meeting within the contemporary academy. What are their strengths? What are their weaknesses? How could they be done differently? What are the sociological implications of these standardised forms of intellectual meeting? Whose voices do they amplify and whose do they suppress? What behaviour do they reward and what behaviour do they discourage? What are their intellectual implications? How far does intellectual form follow conference function, limiting time and expression in the interests of the event’s logistics? Why do people attend seminars? Why do people attend events? What are the wider significance of these common reasons? Are there other motivations for attending academic events which tend to be squeezed out in the neoliberal academy. How might we do things differently? What alternative forms can we imagine? What would the implications for the academy be of DIY academic events becoming common? We’re particularly interested in receiving articles on the political economy of conferences, seminars and workshops?

If you would like to submit an article please send mark@markcarrigan.net a 500-1500 word article, attached within the body of the e-mail, as well as biographical details to be displayed with the post.

________________________
Review of Punk Sociology (2014-04-28 08:00)

[1] I actually liked the ‘punk’ bit of this book less than I expected to. I’m a big fan of Nick Crossley’s work – though I disagree with him on a lot of things, engaging with it was really important for 2606
developing the theoretical perspective in my PhD. I’ve read a lot of what he’s done and the punk research is by some margin the weakest element within it. It’s not my area of expertise by any means but some of the historical claims about punk seemed quite jarring to me, with the approving references to Crossley’s work being symptomatic of this. I sort of see what Beer means when he says that “the original punk movement was so short-lived and so self-destructive” but given I’ve regularly been going to punk gigs of one sort or another for well over a decade, it’s a counter-intuitive claim nonetheless. Obviously the crux here is the term ‘original’ but I think the extent of this sustained activity cannot be something marginal when discussing punk. It’s not my area of expertise by any means, but I suspect that sociologists of punk will find some of the cultural history here to be problematic.

However this doesn’t really matter. The book doesn’t purport to be a cultural history of any sort. It rather uses punk as a cultural resource to elaborate upon a sociological ethos in a time of institutional crisis. In this sense, it’s a wilfully provocative and undoubtedly thought-provoking contribution to a much broader tradition within sociological thought. There’s a pragmatic dimension to this which might attract some activist critique:

It is obvious that we are not going to reverse the apparent marketization and neoliberalization of higher education. Instead, we need to think about how we should respond. The best response, that is to say the best form of protection, is to shape a discipline that is attractive, lively, and exciting. A discipline that draws people in. This will ensure that sociology has a ready-made and substantial audience, and that it is able to attract those who will then go on to be the future of the discipline. It will also make it far more likely that value is seen to reside in the sociological project. This does not mean that we are ‘selling out’, it is not to go with the flow and to simply adopt the spirit of market-based competition into our lives. Rather it is to work towards a version of sociology that thrives under these conditions by offering an alternative voice and an engaging tone. Sociology will then thrive, because it will draw people into its debates, into its ideas, and into its findings, all of which are likely to provide alternative visions of the social world.

But I think this would be unfair. I think there’s a risk that such engagement could become normalising but the best way to avoid this is to be clear about the ethos underlying it: this is precisely what the book contributes. When we’re clear about what we’re trying to do, it becomes easier “to play along with the demands placed on us, but that at the same time we try to preserve a creative space”. What would make such a space ‘creative’ and how do we ‘preserve’ it? This is what the analysis of punk as a cultural form contributes:

It is about the drive of the individual to make a contribution and to sometimes look to subvert restrictive or oppressive social categories, norms, or conventions. This in turn leads punk to be open and eclectic. It is outward looking and is keen to respond, react against, or draw upon alternative cultural resources. The products of this background and approach are then often quite raw, stripped back, and fearless. A punk is not afraid of their own limitations and vulnerabilities. Nor do notions of legitimacy or authenticity inhibit them. Punk seeks to break down and transcend boundaries and obstacles and to erode the lines between the performer and the audience. Finally, we can see this form of communication operating in a terrain in which cultural expression is relatively unrestricted. The punk can then be bold and inventive in their work. Conventions do not hold them back, and the idea of playing it safe is discordant with its central motifs. The driving force here is a strong commitment to a pro-activism that is often expressed as the do-it-yourself or DIY ethic. The DIY ethic is an extension of the inventiveness of punk and affords an unbounded engagement with the cultural world. This leads punks to use the opportunities and materials that they encounter to express their creative forces. This is often highly opportunistic and is based upon the use of media and social networks in new and unpredictable ways. The punk finds a way to make things happen and finds a way to be unconventional in carving out pathways of expression and communication. The punk adapts to the terrain in which they are operating and refuses to be restricted by the limitations of access and funding. Punk is based on resourcefulness.
On this account, punk sociology openly engages with the sociological ideas present in other cultural forms. It is unconcerned with hierarchy or convention, construing institutional environments in terms of their capacity to constraint or enable prior projects, resourcefully navigating these environments rather than letting them dictate the sort of work that is deemed worthwhile. It is risk taking and provisional. It rejects technical virtuosity as an end in itself, instead tending towards a ‘stripped-back’ aesthetic that nonetheless remains open to a diversity of forms. It is open towards experimentation and untroubled by the failure of any one experiment. In short, it’s a wonderfully appropriate ethos for social media, which was predictably enough, my favourite part of the book:

One day the punk sociologist is writing a blog post, the next they are working on an audio podcast, the next they are creating posters, the next they are making short films, the next they are curating content. They gather, uncover, and generate insights through their sociologically sensitive trawling of the social world, using the things they find to illustrate and enliven sociological topics (using anything from art, to film, to advertising, to photography, to web visualizations, to flyers they get through their front door, to guidebooks – the options are limitless). Books and journal articles will still matter; they are still likely to be the bedrock of academic communication. But the punk sociologist looks to use these traditional forms of communication in unusual and maybe even subversive ways, and then looks to build on this work through other forms of communication and through other media. The debates on open-access publication, escaping the paywalls that limit communication, create new questions for academic publishing and communication, the punk sociologist is likely to be working around the edges of what is possible and exploring the reach of their means of communication anyway

I think Dave Beer is really onto something here, in so far as that an ‘ethos’ helps people navigate the communicative possibilities opening up to them. Where I think this is strongest is as a discussion of how sociologists could and should approach the communication of sociological ideas, something which has long been marginalised for reasons which would constitute a book in their own right. I think it’s weaker when it comes to the structural pressures inculcating a great need for team-work and collaboration – I can see how punk sociologists would collaborate on organising events or running websites. I find it harder to see what, if anything, the notion brings to the practical questions of working together in a sustained way. But this isn’t a critique as much as an awareness that the book asks more questions than it can answer given its length, something which speaks volumes about how genuinely provocative Beer has succeeded in making this short book. It’s almost pamphlet like in its intensity and brevity. It would clearly have been too short for a monograph but too long for a paper or chapter. The ‘pivot’ format fits well with the ethos advocated in the book itself. in this sense, the nature of the book itself resonates with the arguments about sociological writing contained within it:

The punk sociologist looks to communicate widely, with various audiences, and the work they produce is direct and incisive, whilst still being lively, nuanced, and layered. The stripped-back nature of the punk sociologist’s work means that there are few barriers to communication with audiences inside and outside of academia. Indeed, its instant form is likely to attract audiences. Different types of writings might be used and different forms of communication will enable this to occur. Sometimes these will be short and punchy, the equivalent of the single in music, on other occasions they will be album-length book works that are built out of collections of punchy chapters and phrases, they might even take the form of sociological gigs with lively talks and audio-visual stimulus. The punk sociologist does not need a list of possibilities because they will look to exploit the opportunities for communication that are available and will respond to these opportunities. They will find ways around the restrictions and limitations that are there, using the means and potentials that the remediation of everyday life might bring. The punk sociologist adapts their means of communication to suit the changing mediascape and materials with which they are faced.
This is very literally an attention-seeking vision for sociology. On this level, it will surely attract criticism from some quarters but the professional norms upon which such criticism are predicated have contributed to a growing marginality of sociological ideas within public life. I agree that “sociologists need to be bold, to be outspoken and daring, to take risks, and to, on occasion, be audacious” and don’t see any contradiction between this aim and the preservation of technical standards, though there may certainly sometimes be a tension. What the book reminded me of is how stultifying I find many of the conventions of academic writing and academic publishing. I don’t think ‘punk sociology’ offers a structural critique or structural solution, nor does it pretend to do so. But it does offer an appealing call for a cultural response to a set of cultural pathologies which have structural origins. The book strikes me as the start of a conversation rather than the conclusion of one:

A final note relating to this is that punk sociology should not be read as a need to simply speed up and be more responsive. In some cases this may be necessary, but we also need to protect long-term, careful, and meticulous work (such as editing, translation, longitudinal studies, reflective pieces of synthesis, retrospective books, historical and documentary studies, secondary analysis, contextual readings of conceptual ideas, reviewing, and the like). In fact, this type of work is more likely to be defended if we are to take on a more punk sensibility. This type of work is increasingly likely to be tantamount to an act of resistance or rebellion that goes against the grain of the systems of measurement of academic worth or value. Punk sociologists, by not playing it safe and by not being dominated by such systems, are likely to actually maintain the diversity of approaches in the discipline and to add new avenues and perspectives to supplement them.

Interestingly, I don’t think he defines this term in the book. I have a clear idea of what ‘ethos’ means but I wonder how varied interpretations of this term might be.

What’s the Point of Social Ontology?
PhD Workshop at the University of Warwick
18th June 2014, 10am - 5:30pm

Ontology can often prove a contested and confusing issue within social research. Everyone has an ontology, explicit or otherwise, but the process of drawing this out and thinking through its implications for research can often be a confusing part of the PhD process. This participatory workshop explores the practical significance of ontological questions for social research, inviting participants to reflect on their own research projects in a collaborative and supportive context. It aims to help participants negotiate the sometimes abstruse matter of social ontology, linking theory to practice in the context of their own research projects. The main focus throughout the day will be on how ontological questions are encountered in social research, the questions posed by such encounters and how engaging explicitly with social ontology can often help resolve such issues.
All participants will offer a brief (5 minute) presentation of their research project and the ontological questions which have been or are expected to be encountered within it. Those still early in the PhD process are welcome to substitute this for a discussion of their research interests and potential project. We’d like to ask all participants to reflect in advance on their own social ontology and how it pertains to their project. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day!

We also invite two more substantial presentations (10 mins) for the first afternoon session, reflecting on your engagement with ontological questions in your own project in order to help begin a practical engagement which encompasses the entire group. If you would be interested in leading the discussion in this way then please make this known when registering.

To register please contact socialontology@warwick.ac.uk with a brief description of your research and your interest in social ontology (500 words or less) by May 15th. The event is free but places are limited. Travel bursaries are available, please ask for more details.

Sociological Writing and the Causal Power of Ideas (2014-04-29 08:00)

I’ve always tended to write in a fragmented way. This post is incredibly rare in that I’ve started writing it at what seems, at least for now, to be the beginning. I’ll usually jump in with an idea, elaborate it until I get stuck and then move onto another. If I know what I’m trying to say but am struggling to say it, I’ll usually leave a note in the text e.g. “[explain why this is a bad idea]”. Eventually an order starts to emerge between the fragments. The endless notes to self, always in square brackets and always highlighted in yellow, gradually become more connective. Substantive purposes become structural and stylistic e.g. “[finish off this paragraph and link neatly to the next]”. I’ve often thought this is a strange way to write and occasionally worried that it represented some difficulty with producing novelty. Perhaps I just regurgitate other people’s ideas, stitching them together in new forms, rather than producing any of my own? The recognition of my tendency (being the sort of person who always writes in this way) has been a focal point for anxiety. Anxiety I pretty much immediately dismiss (“that’s impostor syndrome!”) which largely dissipates upon command but recurrent anxiety nonetheless.

I recently reread Howard Becker’s [1]Writing for Social Scientists. I’m sure I read this early in my PhD (I’ve definitely owned it for years) and it didn’t make much of an impact on me. I suspect I was too early in the PhD process. Whereas this time I was struck by what a wonderful book it is. One particular thing stood out for me though: he writes in the same way that I do. He advocates it as an approach to writing which works to dispel anxieties, overcoming the common tendency to get ‘stuck’ on difficult bits by simply moving on to the next one. Whereas for me it was a behavioural tendency which provoked anxiety, given it didn’t feel like the ‘proper’ way to write. Suddenly, his view led to a transformation in my own – what’s going on here? What’s going on when I introspectively label something as ‘impostor syndrome’ and this works to dispel anxiety? What’s going on when someone who doesn’t experience sexual attraction encounters the idea of asexuality for the first time and realizes “oh, I’m not so weird after all, there are other people just like me”? 
These are all examples of the causal power of ideas. Take my mildly self-pathologizing interpretation of my approach to writing. I have a recurrent behaviour, self-recognition of its recurrence and an evaluation in light of this. When encountering Becker’s advocacy of this approach, I recognize my own behaviour in his description and re-evaluate it in light of this. This isn't a volitional process: I don't think "oh that’s interesting, should I reconsider my view on my own writing", deliberate about it and then change my opinion. There's an immediacy to the process which such a voluntaristic and cognitive reading fails to capture. I don’t choose to re-evaluate X in light of this alternative way of looking at X (though clearly this does happen in many other circumstances) but rather am changed by this encounter with the idea itself.

This is what I'd like to understand more than I do. The notion of 'idea' I'm using here is problematically fuzzy but I'm not sure what to replace it with. I guess my claim is fundamentally one about propositional content. I have a reflexive relation to my own behaviour which I can represent syllogistically:

1. I recurrently find myself writing in a fragmented way
2. Recurrently writing in a fragmented way suggests numerous personal characteristics (e.g. over reliance on other sources, inability to apply structure etc)
3. Those personal characteristics are undesirable (e.g. I believe it is important to develop my own ideas etc)
4. Therefore writing in a fragmented way is undesirable

The approach to writing found in Becker’s book can also be represented syllogistically. My point is not to suggest that I reason syllogistically when encountering the advocacy of fragmented writing found in Becker’s book – in fact this is exactly the opposite of the argument I’m making. But I do think cashing out the propositional content of what I've been haphazardly referring to as 'ideas' can help make the underlying process at work here much clearer than it otherwise is. For instance consider the intra-personal speech act of saying "that’s imposter syndrome" to myself if, as has sometimes happened, I start dwelling on this tendency I've identified in my writing. If considered in terms of the syllogism above, this speech act relates to (2) – rather than recognising undesirable personal traits on the basis of how I’m tending to write, I instead recognise my own act of recognition as an instance of a broader socio-cultural tendency (higher education provokes 'imposter syndrome' in people).

Beyond Dystopian Education in a Neoliberal Society (2014-04-30 08:00)

This powerful article in Fast Capitalism by [1]Henry A. Giroux considers the overlaps between the 'reform' agenda in secondary education and higher education. It’s a little depressing but it does end on a positive note. Read it in full [2]here.

Public and higher education are increasingly harnessed to the interests of corporations, a growing legion of bankers, billionaires, and hedge fund scoundrels, and the warfare state. One consequence is that many public schools, especially those occupied by poor minority youth, have become the new factories
for dumbing down the curricula and turning teachers into what amounts to machine parts. At the
same time, such schools have become militarized and provide a direct route for many youth into the
prison-industrial complex or what has been called the school-to-prison pipeline. What is excised from
the educational rhetoric of casino capitalism reform is the ideal of offering public school students a civic
education that provides the capacities, knowledge, and skills that enable young people to speak, write,
and act from a position of agency and empowerment. At the college level, students are dazzled by a blitz
of commercialized spaces that now look like shopping malls, and in between classes they are entertained
by a mammoth sports culture that is often as debasing as it is dangerous in its hypermasculinity, racism,
and overt sexism.[3]

Privatization, commodification, militarization, and deregulation are the new guiding categories
through which schools, teachers, classroom pedagogy, and students are defined. The current assaults on
public and higher education are not new, but they are viler and more powerful than in the past. Crucial
to any viable reform movement is the need to understand the historical context in which education has
been transformed into an adjunct of corporate power as well as the current ways right-wing educational
reform is operating within a broader play of power, ideology, and other social forces—which together
are applying antidemocratic pressure to change the purpose of schooling and the practice of teaching
itself. Making power visible is important, but it is only a first step in understanding how power actually
works and how it might be challenged. Recognizing a challenge is not the same thing as overcoming it.
Part of the significant task of reinvigorating civic education in the United States necessitates that edu-
cators anchor their own work in classrooms through projects that engage the promise of an unrealized
democracy against its existing, often repressive, forms. And this is only the beginning of resistance that
must struggle for broad-based social change.

The Phenomenology of Reading and the Rhetoric of Theorists (2014-05-01 08:00)

The notion of ‘clarity’ is a contested one within social theory. This was made clear to me when various posts of mine,
often just embedding videos of other people speaking, attracted a lot of indignation on Twitter. There are some
people who really don’t like Lacan and Žižek being criticised for their lack of clarity. The latter still bothers me, given
how much I enjoy his work and how much of it I read. For instance I’m currently reading his Hegel magnum opus*
- the seeming inability of some people to accept it is possible to enjoy someone’s work while also criticising them
baffles me. Or perhaps I’m still indigent about being called ‘scientistic’.

2612
Rather than rehearsing this tedious internet dispute, my point is to stress that writing **clearly** and writing **well** can be antithetical. I think Žižek often writes well, in the limited sense that his work is often enjoyable to read, while nonetheless rarely writing in a way that could be called clear. I think John Rawls writes **clearly**, in the sense that one knows where one stands with him, while nonetheless writing tedious prose. I mean this in the sense that it is clear what he is saying and why he is saying it. This is sustained throughout a text. Therefore it becomes possible to relate to him in a way that otherwise would not be possible.

It's this capacity to **relate** to the arguments a theorist makes in a text which has been on my mind since reading the chapter on Goffman in Ian Craib's (wonderful) Experiencing Identity. In this chapter, he identifies the "appeal to obviousness, self-evidence and reasonableness" which runs through Goffman's work, such that “the world calls, everyone can hear it, it is reasonable that someone try to answer” (p 76). He offers a wonderfully incisive critique of this rhetorical deployment of obviousness:

To read Goffman is to be seduced or to refuse seduction. It is not to enter into a critical dialogue, nor is it to understand another’s view of the world. Initially one must lose oneself in his world or keep out of it altogether. The seduction fails or succeeds through a double strategy. In the first place, the reader is led into an ‘identification-in-superiority’ with Goffman. We become privileged observers in a special way: we see through tricks, acts, illusions of all sorts. With Goffman the reader is no fool. the reader becomes an 'insider', his or her status is confirmed by the systematic use of argot and suspicion. The alliance is confirmed when the suspicion is extended by Goffman to himself; it becomes a knowing alliance in which both Goffman and the reader admit to the possibility that Goffman might be fooling the reader. The systematic ‘frame-breaking’ of the introduction sets up a knowing conspiracy which achieves seduction through a revelation that seduction may be what is happening. It is not that we are taken in by Goffman's openness, rather we side with him because of his admitted trickiness. We ourselves become tricky, knowing and suspicious. (pg 79)

He goes on to develop this line of argument, contending that “rarely does [Goffman] take the responsibility for what he is saying”. I'm not sure Žižek takes much responsibility for what he is saying either. This is my fundamental suspicion about opaque writing – it tends to undermine active intellectual engagement** by suppressing the propositional content of the argument. In any argument there are a multiplicity of points which can be affirmed or contested, with varying degrees of significance given their locations within the unfolding structure of the argument. Many of these nodal points will call into question the logic of the argument itself, or at least open up the possibility of it being reframed. By suppressing the propositional content of the argument (which all prose will do to some extent) we close down certain lines of response. Texts which lack clarity tend to obscure these and, through doing so, preclude an experience of **being monologued at** becoming one of **having a dialogue** with. For instance I find Žižek difficult to engage with because reading him is like having a very entertaining, interesting and learned scholar drunkenly monologuing at you in a high speed way. It can be great just to sit and listen. It can get boring and you make your excuses and move to a different table. But what it never facilitates is a **dialogue**.

I find Žižek to be a very particular sort of reading experience, which is perhaps why I enjoy reading his books. What I’d like to understand more broadly is this relationship between the **phenomenology of reading** and the **rhetorical style of theorists**. I think Craib captures something important about Goffman and there’s the possibility of extending an analysis of this form to other theorists:

The alliance with the reader, then, is in the face of a world which is 'just like that'. All one can say immediately is, ‘Yes, it is like that’, or ‘No, it is not’. In fact, neither response is adequate, or both are equally

2613
adequate: some aspects of the world are 'like that', others are not. To break free of Goffman’s guiding gestures is to begin to distinguish what he is really talking about, and it is a matter of looking at the questions that come out of his descriptions, but which remain unanswered and often unasked (pg 79-80)

My most rewarding experiences of reading theory have come from those who I was initially sceptical of but then was largely persuaded by (Archer) or those who I was initially persuaded by but then developed a scepticism towards (Crossley, Giddens, Elder-Vass). It’s this experience of moving closer or moving further away from a body of work, through textual engagement, which I’d like to understand better than I do. What sorts of relations does a text facilitate with its reader? What implications do these have for the reader’s mode of engagement? How can we understood these as a relationship between two distinct sets of properties and powers: those of the reader and those of the text?

Consciously I’m genuinely interested in it. I’m also hoping it’s broad enough in its scope to help flesh out the limited (and limiting) intellectual map of contemporary continental philosophy I’m working with. Though it’s hard not to wonder if I have some unconscious motive in relation to these disputes about Žižek that irritated me so much at the time (whereas few things on the internet do these days).

*I use the word ‘tends’ very consciously here. I think there are countervailing tendencies, often arising from determined readers keen to cut through the thicket of obscurity, operating here in a way which ensures that philosophy of this sort doesn’t descend into oratory.

Samantha Lyle (2014-05-01 08:45:22)
Mark, i really enjoyed reading The Phenomenology of Reading and the Rhetoric of Theorists. It reminded me of the joy and agony of reading (not being a Social Theory person (?!)) and having moderate Dyslexia) what i would call dense, difficult or dull prose is especially painful. With a research interest in social class i am pained by the heavy toms of Bourdieu, notorious for his writing style with the added issue of translation on top. Reading Goffman was indeed seductive because i found it 'easy' to read but i was always left with a feeling that i was missing something, being tricked, surely, i thought to myself, it couldn't be that straight forward and obvious. Sadly my response to the 'difficult' theorists Lacan, Butler, Irigaray etc 'is to shrink into a "I'm not clever enough to understand this so i shall give up" mind set. Whereas those writers such as Beverley Skeggs whose work and prose i usually find exciting and engaging and therefore 'easier' to read sustain my attention even to the point where i might be able to offer a critique. What one finds convincing depends so heavily (in my experience) on how readable it is that i cannot take too seriously my own or others insistent that one theoretical perspective is better than an other - this is obviously bad for social science and i can only assume that others are better at this important aspect of our work than i am.

Hi Sam, I'm glad you liked it. I’m really curious about why both reading and writing are seen as so marginal in terms of the things sociologists talk about, whereas they’re so central to what sociologists actually do. Ian Craib, who prompted that post, wrote later in the same book about Lacan. I've tried to read primary and secondary literature on Lacan and barely got anything out of it. But Ian Craib described it straight forwardly in a way I could immediately understand. Which then made me wonder why neither Lacan nor Lacanians could do that. I think there's all sorts of weird power relationships that get reproduced through writing, the reactions of readers, as well as the kinds of writing those readers learn to do as a consequence of what they're exposed to. It's something really insidious and I think it hinders real debate in social theory for precisely the reasons you're pointing to.
Steve Fuller (2014-05-01 08:48:00)
I understand your response to Zizek, and it is not unreasonable. But I think it is worth saying that Zizek is a real virtuoso at what he does and he is a master of his source texts (Marx, Freud, Lacan, etc.) but he is not very original and so there isn’t any of the mystery to him that is associated with a thinker whose sources aren’t so obvious, which would lead one to think that they contain ‘hidden depths’. So, while Heidegger may have been a student of Husserl, Heidegger cannot be reduced to Husserl. However, Zizek is pretty decomposable. His ‘value-added’ really comes from the applications (to film, current events, etc.) of a body of work that will be familiar, by now in quite good detail, to a broad swathe of people across the humanities and social sciences (i.e. the Marx-Freud nexus). A guy like him could only have such a mass following in a period where there is already a generation or two of people who have been taught to think that Marx and Freud can constitute a coherent centre to the intellectual universe. This really only began in the 1960s and Zizek is the ultimate beneficiary of this tendency. And as often happens when intellectual or artistic tendencies are in decline, a baroque manner of expression sets in as people desperately tweak the canon to make it say new things. So think of Zizek as a master jazzman whose repertoire draws on a well-defined set of scores to which an appreciable audience can readily respond.

I think you’re underselling him to a certain extent, as well as his readers. If you read enough of it (I’m not sure why I do this given my antipathy to him) there clearly are original ideas, though obviously ones that are heavily indebted to a very particular tradition of post-Freudian thought. Though having said that, I do find it plausible that Zizek could be the last gasp for that tradition. He monopolises the intellectual field to such an absurd extent and doesn’t exactly work in a way that lends itself to post-Zizekian work. I’m curious as to what the journal of Zizek Studies is like for this reason, though not curious enough to actually go and look through it.

Networks of Outrage and Hope: Social Movements in the Internet Age (2014-05-02 08:00)

Fred Phelps, Calvinistic soteriology and its implications (2014-05-03 08:00)

Does adopting a five point Calvinist soteriology logically implicate the type of views advocated by Fred Phelps and Westboro Baptist Church? The opinion of Frank Schaeffer, son of Francis Schaeffer, is that there is a positive continuity between these views and those advocated by Fred Phelps. The Calvinist God is an angry God whose wrath is provoked by the seriousness of sin and that punishment must follow the fall; all fall under the curse of sin and are deserving of damnation. Christ’s death was thus necessary to take on the guilt of those deserving of this damnation. The point is that an angry God is mindful of human wickedness; in the words of Jonathan Edwards (who adopted a Calvinistic soteriology):

The God that holds you over the pit of hell, much as one holds a spider, or some loathsome insect over the fire, abhors you, and is dreadfully provoked: his wrath towards you burns like fire; he looks upon you as worthy of nothing else, but to be cast into the fire; he is of purer eyes than to bear to have you in his sight; you are ten thousand times more abominable in his eyes, than the most hateful venomous serpent is in ours. You have offended him infinitely more than ever a stubborn rebel did his prince; and yet it is nothing but his hand that holds you from falling into the fire every moment. It is to be ascribed to nothing else, that you did not go to hell the last night; that you was suffered to awake again in this world, after you closed your eyes to sleep. And there is no other reason to be given, why you have not dropped into hell since you arose in the morning, but that God’s hand has held you up. There is no other reason to be given why you have not gone to hell, since you have sat here in the house of God, provoking his pure eyes by your sinful wicked manner of attending his solemn worship. Yea, there is nothing else that is to be given as a reason why you do not this very moment drop down into hell.

This way Frank Schaeffer states that what are ‘mainstream’ Evangelical views are in fact, in essence, no different to what Fred Phelps preached and the activism the Westboro Church put to practice. There may be a difference in the style or rhetoric adopted but the message is essentially the same. In other words, Fred Phelps preached what they hold to be the Gospel and if Fred Phelps brought discomfort in how he preached and the type of activism that followed, he just had the courage to state the implications of their opinions as they are. The logical implications of this system of thought leads to Fred Phelps and this is more pronounced in the case of the Calvinistic soteriology he adopted and many ‘mainstream’ Evangelicals adopt this too.

I do not wish to discuss if indeed the logical implications of a Calvinistic Soteriology specifically and ‘mainstream’ Evangelicalism, in general, is the message preached by Fred Phelps but to move beyond ideation systems to what Margaret Archer classifies as socio-cultural interaction. It is this level that there is mediation of cultural systems such as the theological systems identified with certain forms of Protestant Christianity. After all, the types of ideas that are now salient among certain Evangelicals was not always the case and likewise the manner a belief in a soteriology can lead to different forms of practice in different contexts. For example, the very resurrection of Dutch neo-Calvinism by the likes of Francis Schaeffer and the adoption of its underpinning mission to redeem a sinful culture by Jerry Falwell, an Arminian in doctrine, demonstrates the way at the level of people interaction there
is adaption and elaboration of cultural systems. If we return to the doctrinal then a neo-Calvinist like [6]Abraham Kuyper’s goal to claim European culture for Christianity is very much rooted in a (strong) sovereign view of God and it this high theocentric position that he juxtaposed against the autonomous liberal subject. In other words, we have a theological system, distinctively Reformed, that addresses culture from that position. Falwell viewed this system as a form of heresy but yet still influenced by Francis Schaeffer, believed it a Christian mandate to redeem American culture and government but the approach and vision taken was something very different to the Dutch neo-Calvinists (Kuyper identified as a Christian Socialist).

The point here is that sharedness is variable and not definitional or that cultural integration is something mediated and that there is no linear movement or logical implications to be drawn from cultural systems to socio-cultural interaction and so a quasi-teleological movement to certain conclusions or forms of political activism. Fred Phelps’s understanding of a Calvinistic soteriology may have affected his activism in specific ways but there is hardly anything in this theological model that, as Frank Schaeffer identifies, necessitates a movement in certain directions. In future posts, I wish to draw out how this reification at the level of cultural system (often from ideological representations of cultural systems) affects policy formulation and initiatives then taken.

**Race, Place and Globalization: Youth Cultures in a Changing World (2014-05-04 08:00)**

[Race, Place and Globalization: Youth Cultures in a Changing World](http://www.sagepub.com/doi/abs/10.1177/1540235414550651) by Professor Anoop Nayak provides a useful insight into the growing area of youth studies by highlighting the nature of youth identity and how it connects to local space and the globalised world. The book concentrates on youth, ethnicity and social change in the northeast of England, and the significance of the local and the global in the lives of young people is explored. Race, racism and whiteness are explored in relation to research conducted by Nayak throughout the years, but in particular data is included from the three year ethnographic project that reached out to hear the voices of local young people in the northeast through interviews, interactions and observations in a diverse range of neighbourhoods.
Youth is defined and discussed in relation to the history of subcultures. We gain an introduction to the socio-historical importance to youth studies of The Chicago School of Sociology, University of Birmingham’s Centre for Contemporary Cultural Studies, and The Institute of Social Research at Frankfurt University, as well as feminist and postmodernist critiques of subcultural theorists. The book is situated in the field of social geography but is interdisciplinary in its content and would be of great interest for sociology, cultural studies and educational research students who are reading about and researching about race, racism and whiteness, as well as the importance of place in the lives of young people. Nayak structures his book into three parts: Passing Times, Changing Times and Coming Times.

The chapters in the Passing Times section provide a broad understanding of the origins and critiques of subcultures, as well as the socio-political context of diasporic settlement in northeast England. We also gain an understanding of the ways in which anti-racism and racism operate in the northeast of England. The conclusion of this section reminds us of the urgent need to research young people’s local place-based belongings and new local identities. In Changing Times, Nayak focuses in detail on whiteness in the de-industrialised northeast, particularly the fascinating identities of the young people who fit into distinct categories of Geordies, Wiggers and Charvers.

Key questions that are answered thoroughly are: What does it mean to be young and white in the northeast? How does economic change reflect upon local young people’s sense of identity? What is the importance of place and race in a changing globalised world? The features of this de-industrialised locale are fully explored in relation to migration, economy and culture by describing how socio-economic changes have impacted upon the lives of the local white working-class communities. The final section, Coming Times, draws together the research previously discussed with a reconsideration of anti-racism policies and youth cultures, all the while pointing towards the need for the study of the complexity of modern multiculturalism and how young people negotiate their identities amidst social upheaval.

The book provides an interesting and necessary understanding of how race and ethnicity configure in the lives of young people in the northeast of England, particularly in respect to their practices of work and leisure, all the time emphasising how in an increasingly globalised world, place and identity are ever significant. Nayak proposes modern multicultural societies can pursue social justice through engaging with local youth identities and cultures, and recognising the significance of race and ethnicity in the lives of young people.

Nayak reminds the readers that young people’s sense of identity should be understood from multiple intersectional positions. Nayak successfully illustrates how local place and space continues to matter even if globalisation has become the dominant theory of choice, and even if the postmodernist argue that modern society is characterised by a sense of placelessness. The connections between race and place are brought to prominence in this engaging and important ethnographical account of young people’s experiences of identity that draws upon historical, cultural and structural perspectives.

Thugs, Revolutionaries, or Shoppers? Rethinking the 2011 English Riots Through Consumer Practises & Black Friday (2014-05-05 08:00)

Like many riots before it, those who partook in the disturbances of 2011 have been popularly framed either as an immoral underclass or incipient revolutionaries. This article seeks to re-examine an element of the 2011 riots in order to dispel these perceptions by suggesting the emergence of the riots from the broader social practises of ‘consumerism’. Focusing on publically available evidence pertaining to the looting in 2011 and its similarities to consumer practises, in particular Black Friday, Stuart Scrase forwards a case for the careful consideration of Western consumer practises and meanings as part of any attempt to explain why the events of August 2011 occurred.

Revolutionaries or Thugs?

In August 2011 rioting spread across England. What began in as a local issue in Tottenham, North London was to spread to many areas of the city before jumping to Manchester, Birmingham, Liverpool, Bristol and more, causing estimated damages of £200 million to the UK economy (Riots to cost... 2011). Newspapers splashed images of hooded and masked youths framed by burning cars and buildings. The response by the political elite was condemnation of a ‘feral underclass’ (Ken Clark. 2011), their actions: ‘criminality pure and simple’ according to the Prime Minister, David Cameron (2011). Indeed, in the same speech to parliament the Prime Minister stated, that it was ‘preposterous’ to link the rioting and looting to the shooting of a black male in Tottenham by police – it was thievery and hooliganism, nothing more. A closed case then? The rioters were thugs and thieves, and the appropriate response is harsher punishments to deter them from further crime. Yet we might ask, why then were the police such a focus of anger and violence? Why did the riots emerge out of a protest over the police’s actions during and after the shooting of Mark Duggan? And perhaps more fundamentally, why are so many ‘youths’ willing to engage in criminal activity?

On the other hand, I have heard many people on the left argue (using the anger and violence towards police as proof) that the rioters were people fed up with the injustice of the system, such as [1]lack of opportunities, police discrimination, economic inequality and so forth. This line of argument generally treats the rioters as incipient revolutionaries, prevented from being so only by the rioters’ inability to politically frame their complaints and actions. While this view has more substance than that of the politicians, it cannot explain all that happened in the riots. Here the problem almost seems to be the reverse of the politicians’ stance as the looting is ignored in favour of the violence against the police.

Employing either of these two lenses will distort the view we take of the 2011 riots. As a first step to understanding, we should not make the mistake of assuming the riots were a single event, but rather made up of differing acts and motivations. Having said this, three general themes might be said to characterise the majority of rioting in 2011: firstly, violence and anger directed against the police; secondly, the looting; and lastly, the seemingly nihilistic destruction and vandalism (Moxon. 2011). This clearly suggests that the rioting is more complex than either side would have us believe. While any full explanation of the rioting must account for the violence against the police and destruction of property, I want to put aside these two points and instead draw out some implications from the looting to briefly highlight considerations that the left has ignored, and the politicians simplified and condemned.

Shopping in 2011

The looting in 2011 saw two seemingly contradictory themes in its similarity to a consumer holiday, and the clear rejection of social norms and law. Zygmunt Baumann (2011) argued that this was because the riots were a result of consumerism’s ‘have-nots’: social inequality in a consumer ideology. Putting aside the problems of describing the violence against police as ‘consumer’, to assume the looters were ‘have-nots’ is questionable and certainly a simplification. The majority of rioters interviewed by The Guardian (Datablog 2011) did live in economically deprived areas, yet the arrest figures show that students constituted 17 % of arrestees and 39 % were in employment (‘An
Overview of Recorded Crimes...'. THO. 2011. 5). Moreover, these figures are based on arrests made by the police and cannot be seen as truly representative of those involved in the riots. Indeed, evidence from the Home Office reveals that 22 % of commercial premises targeted were specialist retailers in clothing or electronics, very few seem to be related to basic goods. This figure can only be indicative not proof, regardless, it is perhaps safer to describe looters not as simply 'have-nots', but also those with 'not enough'. Aside from these problems Bauman’s argument has its merit; in particular, it seems some of the looters were, in part, engaging in normal social practises, not rebelling.

In its simplest sense 'engage in normal social practises' means to consume and shop. For this to be so the looters must have acted for similar reasons as everyday shoppers. So why do we shop? Miller (2005) argues that shopping is employed as a means of reproducing relationships, that decisions to purchase are made with others in mind, and with the idea of fulfilling or exceeding expectations of us. For instance, Miller talks of a parent who purchases a football shirt due to their anxiety over whether their child will live up to the expectations of his peers (ibid. 26-7). In this relation we can note the idea that the child will be viewed and judged by others; the implication being that the football shirt functioned as a marker of, and improvement to social position. Consuming is a social practise performed in reference to others, and often because of what the object will say about us.

But we must also take into account the relation of consumers to companies involved in the material and symbolic production of the product. To generalise, this is a relation between the consumer and a brand in which the latter aims to endow their product and brand with real meanings (e.g. ‘glamour’ and Chanel perfume). Wernick (1983) argues that this form of advertising seeks to create a product’s social value and use through association to pre-existing meanings and values. If the advertising is performed well, that is it seems authentic to its chosen audience, this product will become meaningful (e.g. the branding of Adidas through their association with the meanings and cultures of urban life, such as through street dance). Through their use, these products become social markers of belonging and status, such as the football shirt, and to be without is to risk being judged as lesser.

For Campbell (2005), what defines modern practises of consumerism is not simply the reality of gaining the benefits of a product, but the anticipation of our selves benefiting from them. Desire is produced by a “favourable reaction to certain patterns of sensation” (ibid. 60) This sensation is found in the moments where we imagine the purchase; for instance, we imagine how we will look to others with a new piece of clothing, what it will say about who we are, the respect we will gain, and the momentary overcoming of our insecurities. Branding then arguably influences how we imagine ourselves altered by the product, through attempting to create egoistic values and desire by emphasising the product’s revolutionary social potential for you. The argument I am making, while in no way can explain all consumption or looting, is that processes we group under the term ‘consumerism’ have the effect of shaping shoppers as ‘never enoughs’; because we can always imagine ourselves as better, and always want to reproduce the pleasurable sensations. Put in terms of the riots, looters who took (the now clichéd) trainers may have done so for their value as a status symbol and as a means to build self-esteem within their social world, in which: "obviously appearance is a lot ... if I was approaching a girl, I would go over to her and I would look at her face and look at her trainers" (Riot. 2012. 51.00).

**Black Friday and Changing the Rules of Shopping**

If the above theory proffers an accurate and plausible explanation, then the looting as an event should display similarities to modern consumer practises. Shopping as a practise is often pleasurable in and of itself, where people forget their everyday realities, enjoy the moment and reward themselves, resulting in terms like 'shopping spree'. This shouldn’t need great elaboration as even the most frugal, such as myself, can enjoy purchasing a desired thing or finding a bargain. Briefly then, what can be said to characterise the shopping spree is not restraint or utilitarian decisions, but spontaneity and pleasure seeking (Bauman. 1994. 83). It is the anticipation of the social benefits of the product prior to and at the moment of decision that creates the pleasurable sensation pursued, and perhaps pushes other concerns or restraints aside (expense, the daily requirements of life etc.); a description that fits both with some witness accounts of the rioting: "... their eyes were just lit up, so in the moment" (Riot. 2012. 7.30), and
statements from those involved: "The riotin' an' lootin' was something that you sit around talk with your friends 'Oh imagine all the shops in the high road was open, you could go in there an' take whatever you want' ..." (Slovo. 2012 p.23). At least some of the looting then seems to be driven by this pleasure seeking behaviour, in which worries are forgotten and pleasure is gained through imagining the self gaining the product and its social payoffs. Rather than simply being thieves or revolutionaries the drive behind this sort of action may then come from accepted societal practise.

[youtube http://www.youtube.com/watch?v=VvE_WM1i6hA]

To better demonstrate the need for examining societal causes of looting we can make a useful comparison with Black Friday. This consumer holiday takes place every November across North America, and signals the beginning of the holiday shopping season by supposedly drastic reductions in prices. While the term Black Friday was coined much later, the practise of beginning Christmas shopping and sales the day after Thanksgiving has been around since the late 19th century. Today it has evolved into a practise which draws in vast crowds of shoppers desperately trying to get the deals before their desired products sell out. The result is regular cases of violence and arrests as shoppers fight over the last deal. Indeed, Black Friday has resulted in a number of deaths, for instance in 2008 a store employee was trampled to death as he opened the shop doors to the waiting crowd, while in another case that year two men were shot and killed during an argument in a toy store ('Wal-Mart ...' CNN 2008). Sociological research on Black Friday is thin on the ground, yet the similarities between it and the looting are there: both were acts of consumption performed through meanings and practises of their society, and both seem to be driven by pleasure seeking and financial benefit (for Black Friday see: Swilley & Goldsmith. 2013). But more than this, the moment or experience of pleasure in shopping also displays parallels. Thomas and Peters found when discussing with female shoppers, that shoppers thought of Black Friday in terms of time-constrained competition, resulting in excitement, pleasure and aggressive behaviour by the informants: "It's fun to try to get as many bargains as I possibly can in a limited amount of time. It's like a game show." (2011. 531). Shoppers also described 'surviving' these encounters and later swapping 'war stories'. What we can take from these statements is that the normal rules of shopping (to queue, to only take from the shelf and not other customers) were not in play, but the values and pleasure seeking that drove this behaviour were [youtube http://www.youtube.com/watch?v=zkQVAb1DBjA] What Thomas and Peters' research suggests is that there is a revelry in the event nature of Black Friday – a perspective that displays similarities to accounts given by rioters of looting: "Then once you do it and nothing's happened, yeah, you're like: "Oh my gosh!' and you're like: "This is a once in a lifetime thing," you're going to get everything you want for free." (Prasad. 2011 b.). Both events brought to mind the old game show Supermarket Sweep, in which contestants rush round a supermarket throwing products into their trolley – what they grab they keep. On the show there was no property owner, no guilt or restraint, only goods to be taken, and money to be made [youtube http://www.youtube.com/watch?v=gggWmpiEEkY] Revolutionary Shoppers? Of course, there is a contradiction because the looting in 2011 clearly represented a rejection of the laws and norms of the UK. Moreover, the majority of people who engage with the same or similar consumption rituals in the UK did not loot, thus there must be something more to this than the links to social and economic systems suggested above. To understand this contradiction it is worth noting that this mass rejection suggests that the laws of the UK to some extent were only held in place by the threat of physical force from the police. Once the riots began and the police looked to have lost of control, committing 'crime' did not matter: "I just felt that out of all these people there's probably a 5 % chance I'd get caught" (Prasad; 2011 a.). The implication is that the law held no or little normative value for the looters, or perhaps the drive to seek pleasure was stronger than the feeling of obligation to the law, either way, with the police seemingly powerless law ceased to be relevant. Some might argue that 2011 looters differed from Black Friday shoppers because they did not break the law. Yet on closer inspection this seems a superficial difference because both events operate under a change of rules or exceptional circumstances – the difference is only in the degree, so to speak. Take Black Friday: the normal rules of consuming (e.g. do not commit violence against other consumers, to accept that when someone else has a product it is legitimately theirs, to queue) are relaxed. For whatever reason, it is deemed acceptable for some to push through crowds, jump barriers, use violence, and to grab what is desired and available - even if already claimed by other consumers. Rather than the law being
removed and goods becoming ‘free’ as in the 2011 riots, on Black Friday it is the social norms of consuming which are removed or loosened. Law and the police remains at least a physical limit on behaviour, but in the heat of the moment, grappling for the last discounted TV, violent conflict is always a possibility. It seems plausible that these transgressions have become normalised, eroding the usual rules by which consumers operate, creating a concept of Black Friday in the minds of consumers which, in part, changes the rules of shopping. In other words it creates an opportunity, much as the perception of the police and their loss of control did for the looters of 2011. Consequently, it may be that looters in 2011 did not reject the order and its values itself, only their position within it and the rules that defined how they engaged with it. Perhaps for some this was more a momentary rejection, driven by the desire for products or caught up in the moment. But even this would support the idea that many looters ‘shopped’ in a fundamentally similar manner to those of Black Friday, as a social act pleasurable in and of itself, taking what they could get before the opportunity had gone. The difference between Black Friday and 2011’s looting is then not in the aim, but in the immediate and superficial context. Rather than looters being simply an ‘immoral’ group then, the above argument has brought into question Western consumer society’s role in producing the values, the feelings, which drove the looting in 2011. Consumer Riots? Of course some might argue that looting predates consumerism and even capitalism. And it does; however, we should not see ‘consumerism’ as something fundamentally different to what came before, but a particular mode of doing what we always have done – consume. Looting is created first by the possibilities of us as consuming beings generally, then given shape by the particular economic, political and cultural context. The task with understanding any particular act of looting, or indeed riots, is to understand why it took that form. The looting of basic goods would suggest the issue related to the ability of the looters to sustain themselves and thus point to basic economic issues. Or if particular targets were selected it would suggest some resentment towards another group. In 2011, as Bauman (2011) argued at least some of the looting seemed to be driven by a socially produced, relative discontent with their ownership or ability to acquire certain status goods. The argument I have briefly made above suggests that practises such as advertising/branding and consuming often encourage the pursuit of an individualistic or egoistic form of pleasure, while at the same time ‘law’ seems to be losing its normative force. Indeed, we might strengthen the argument by locating similar examples of behaviour, such as the outlook of bankers and traders who make enormous profits at the expense, and arguably without consideration or care of those affected. If so, the looting of 2011 was neither a revolution nor mindless thuggery, but a larger problem regarding the manner in which we relate and think of ourselves and the exterior world. However, I am not suggesting that this is the whole explanation for the looting. We must understand other how practises, experiences, and cultural meanings shaped the looting, how these intersected with the social, political and economic relations resulting in people willing to loot, and finally why the law and police hold no normative force. Without asking these difficult question and attempting to understand the riots with our desires aside the 2011 riots will remain popularly understood as either a moral problem of individuals who make up this ‘underclass’, or an unrealised revolution: and neither one is accurate. [nbox type="notice"] Stuart Scrase is an interdisciplinary PhD candidate at the University of Exeter, focusing principally on sociology, anthropology, and political theory. His research looks at the 2011 riots in England with the aim of developing in-depth theoretical understandings of riot participants’ lives to contextualise the different forms that the rioting took as socially meaningful and produced action.[/nbox] References ‘An Overview of Recorded Crimes and Arrests Resulting from Disorder Events in August 2011’. 2011. Some reflections on #BritSoc14 by @chrishtill (2014-05-06 08:00)

Last week I attended the [1]British Sociological Association Annual Conference held at the University of Leeds. I found this to be a particularly engaging event which made me quite hopeful for the direction of sociology. Not because there are not significant social, institutional and disciplinary problems on the horizon and already here but because it seems that many people are addressing these in reflexive, challenging and collaborative way. Part of this optimism stemmed from my perception that the issue which was most consistently engaged with across the event was neo-liberalism or contemporary consumer capitalism in various guises. The papers which were on offer at the conference took a variety of perspectives and certainly not all audiences members were in agreement with what was proposed but there was a lively discussion about pressing issues of inequality and the impact of economic forces and
recent policy changes. Two years ago the Guardian journalist [2]Aditya Chakrabortty criticised the BSA conference of that year for not dealing with the economic crisis. This was a misrepresentation based on a quick browse of the conference abstracts but if there was any truth to his claim then it is clear from this year’s event that there no longer is.

The impacts of commercialisation were explored through cultural analyses in one of the first panel sessions. [3]Karl Spracklen discussed how alternative cultures of goths and black metallers have moved from being a localised and politicised "scene" to a broad, commodified, global subculture through the appropriation by markets enabled by the "liquid space" of the internet. Younger generations are also potentially being brought into an industry which has flourished under austerity; online gambling. [4]Heather Wardle explored the hugely increased industry of virtual gambling which has achieved great popularity with children. While many of these are purely virtual with no real money changing hands they are increasingly intertwined with the formal gambling industry through advertising and games which blur the boundaries between virtual and actual.

As part of a discussion of the BSA’s open access [5]Discover Society magazine and its role in digital public sociology the association’s president [6]John Holmwood warned of the dangers of sociologists working in institutions which may be increasing rather than reducing inequality. He suggested that the “[7]public university”, which can be aided through genuinely open access can contribute to a “real utopia”.

[8]Evelyn Ruppert’s plenary presented theoretical, conceptual and practical ways forward for sociology to deal with “Big Data”. She focused on the role which data practices play in enumerating, constituting populations and cultivating peoplehood. Like the social statistics of the nineteenth and twentieth centuries big data is producing “kinds” of people. It will be vital to engage with the economies and ecologies in order to conduct inquiries into the types of people and collectivities which are being “made up” as well as how people are diffracting or challenging the ways of being accumulated or analysed.

[9]Monica Prasad presented a provocative analysis of the emergence of neoliberalism in her plenary address. She suggested that the policies of heavy tax cuts often associated with neoliberalism were not driven by business interests but by an electoral strategy to present then presidential candidate Ronald Reagan as electable. Evidence was presented to show that American business was not interested in personal tax cuts so the Republican party struck a bargain with them to support their policies in exchange for business tax cuts as part of the package. Post-Watergate the Republican party was deemed largely unelectable and a candidate who would be days away from his 70th birthday when taking office was deemed too old. The one issue which could trump these two issues for the American voter was tax cuts. This was a fascinating paper packed with historical detail but was a narrow view which did not take account of many other social, cultural and economic factors not to mention the emergence of neoliberalism in other countries. All of this may well be accounted for elsewhere in Prasad’s work.

The experience of obesity under neoliberalism was presented in a fascinating qualitative account by [10]Paul Bissell, [11]Marian Peacock, [12]Jo Blackburn and [13]Christine Smith. Bissell spoke of the discourses on which people draw to account for their obesity. Counter to some other approaches which have emphasised resistant “excuse accounts” they suggested that for many people sadness and guilt over being obese were the prevailing ways of discussing their situation. They suggested that overeating has taken on a similar position to smoking in the 1980s (as described by [14]Hilary Graham) as allowing disadvantaged people to “do something for themselves” through the visceral pleasure experienced through eating. The achievement of this pleasure, however, seeks to further disadvantage many people through the kinds of judgements made about fat bodies in the “enterprise society” associated with neoliberalism. In this situation, Bissell et al suggested, the “fat poor” are shamed shadows of neoliberalism who are often stigmatised because they do not fit with the dominant entrepreneurial values.

The stigmatisation of particular people through neo-liberal governing was also addressed by [15]Janice McLaughlin who discussed how discourses of normality led to children who are considered to be “different” come to be labelled as problematic. She showed how the regulation of normality is increasing in the global North as many disabled
children are increasingly encouraged to blame themselves, or their assistive technologies, rather than their social context for their difficulties. In particular McLaughlin situated this within the discourse of self-realisation which is presented in ideas about the right kinds of transition to adulthood for disabled children. A hierarchy is produced between those who can become seemingly autonomous and independent and those who cannot meet these qualities which are highly valued in neoliberal societies.

[16]Bill Hughes drew parallels between disabled people and migrants in his historical analysis in which he suggested both groups have been presented as strangers; the former existential and the latter geographical. He identified a populist resentment which has produced a bifurcation of the population into the moral majority of "hardworking people" and those who are perceived to constitute a fiscal burden. This distinction is predicated upon what Hughes called a "miser's calculus" through which, largely false, statistics are presented to demonstrate the costs of these groups to the rest of society and justify the representation of disabled people and migrants as "counterfeit citizens".

[17]Katherine Smith presented a study of public health academics and their roles in advocacy and activism. The barriers to activism or pressures against engaging in it are many and serious and include impeding career progression, not being taken seriously by colleagues and being pushed into giving an overly simplistic view of research results in order to push a political message. All the same many academics felt that "doing nothing is doing harm" and that to merely observe is not sufficient.

The conference (or at least my conference) closed with a panel session on digital sociology. All four participants called for a more reflexive and critical approach to digital technologies than has often been the case in the past. In particular [18]Deborah Lupton proposed a greater emphasis should be placed on the emotional relationships we have with computerised technologies. She also highlighted the changed relationship we have had with the digital through the decline in the use of the "cyborg" and "cyber" metaphors in sociology as now technologies are often too integrated to even seem like an appendage.

[19]Mike Savage and [20]Noortje Marres both highlighted the importance of not approaching the digital (and the methods through which we employ it) as neutral. Savage in particular called for social scientists to see methods as an agent of social change through which they should be intervening not just observing. For Marres, we must be more aware of the instability of data which is not just an object but an instrument and mediator which necessitates a move from a sociology "of" the digital to a sociology "with" the digital.

Perhaps the biggest challenge came from [21]Susan Halford who claimed that so far sociologists have not been good at taking technology seriously. Digital sociology cannot just be critical questioning of the technical but must engage with the nature of knowledge flows (perhaps engaging with the potential impact of the semantic web) and must instate sociological concerns into the digital as well as interpreting it. In order to achieve this they must engage more thoroughly with disciplines such as computational science.

The papers presented at this year's conference offered original, potent critiques of social, political and economic forces which create inequalities as well as significant challenges to sociologists themselves.

[nbox type="notice"]Chris Till is Senior Lecturer in Social Science in the [22]Faculty of Health and Social Sciences at Leeds Metropolitan University. This was originally posted on [23]Chris's blog. It is reproduced here with permission.[/nbox]
I was back last week from the annual conference of the British Sociological Association (BSA) in Leeds, and as usual, I try to put down my impressions as long as they’re still fresh in my mind. I wasn’t very quick, though, and the BSA’s members newsletter has already come out with comments and short reports about the plenaries, the prizes awarded, and the conference overall. While the conference is described as having been “very vibrant and sociable”, with “exciting conversations” during the breaks and a “diverse mixture of topics” that “reflected the breadth of interests”. My own feelings, I confess, are a bit more mixed.

In 2012, the BSA conference was followed by a lively debate after an article, by Aditya Chakrabortty on the Guardian, where he complained about the discipline’s lack of engagement with the financial crisis. He pointed to the BSA press releases featuring research on “older bodybuilders”, and to time devoted to the “holistic massage industry” at the conference, as evidence of what he saw as a retreat from public space. The BSA took the criticism very seriously and, apart from responding to the Guardian, put in place a massive effort to encourage public engagement. The 2013 conference was entitled “Engaging Sociology” and many sessions were dedicated to showing that the profession means it. Confrontation and comparison with economics was open and clear. A major project on social class was presented with all honours. The Sociology journal released a call for papers for a special issue to “Sociology and the Global Economic Crisis”.

This year, the “Changing Society” title aimed to stress continuity with last year’s efforts; yet it seems to me that we are back to business as usual. I had the impression that many paper presentations were on topics similar to the
body builders and massage that Chakrabortty talked about. That’s why, as I said, my feelings are mixed.

To be sure, I wouldn’t dismiss topics such as bodybuilders, massage and the like[7] as “quibbles” as a former BSA President himself seemed to suggest (sic!!). I trust the colleagues who work on these topics have spotted issues there that are worth exploring, even if they are not immediately apparent to me. For sure, though, these are very micro topics, descriptions of niches of our society, of local relevance; but it is often difficult, from there, to move up to a higher level of awareness of, and insight into, the broader issues facing society and its transformations more generally. Sometimes, these studies reveal some form of frustrated ambition: using “a Foucauldian lens” (to take again Chakrabortty’s example) or some other high-profile theory to study a micro-phenomenon with, in general, a handful of interviews, can at most shed light on the phenomenon but rarely brings the Foucauldian (or whatever) theory to a significant advancement. There is often a mismatch between, on the one hand, the breadth and depth of the theories that inspire sociologists, and on the other hand, what they actually do with them. Of course it’s always hard to move from empirics up to theory, but it’s even harder with micro studies; that’s why I’d like to see fewer of them, though I wouldn’t go as far as taking them out altogether.

Here, however, is what I consider to be most valuable in the BSA 2014 conference: greater-than-before methodological ambition. The BSA has opened itself to big data and is questioning both its potential and the risks involved. The plenary given by [9] Evelyn Ruppert on how to be a data sociologist was illuminating. Based on her own experience (which somehow resonates with mine…), she clearly and convincingly outlined how data are a social object in itself. To start from a more classical data undertaking, census not only reflects aspects of society that the government wants to know about, but is a social fact in itself; what questions to include, how to voice concern, who has ever voiced concern, and who is included, are all social policy questions. Big data are a corporate and administrative phenomenon first, and as such, they are an object of strategic choice by organisations and of policy by governments. They raise issues of citizenship, value production and social exclusion. Data are no longer a methodological concern, but a substantive object.

I also admired the introduction of a “Methodological Innovations” stream of sessions, all pretty interesting and quite
diverse even though sparsely attended. A new “Frontiers” stream, more diverse in terms of topics, was also introduced to showcase novelty in the discipline. And finally, I missed because of a train to take, a very promising session on the Social Life of Methods.

If I go back to my comments to that famouns 2012 conference, where I noticed that just a few participants were live-tweeting, the progress was manifest this time, with many more active people and lively discussions online paralleling, and accompanying, what was going on in the conference rooms. The Digital Public Sociology initiative is also a most welcome development.

In short, my impression is of a lot of still-standing on the side of choice of topics, substantive issues, and (mostly) methods used; but some methodological innovations and a new direction for scholarship and research focusing on data, and greater opening to social media. Both are avenues for renewal, and it’s good they have been opened; let’s hope they will be taken, and let’s hope to see some of the results next year.

For more information, and to hear different voices, see a storify by Christopher Till; Digital Public Sociology podcasts by Mark Carrigan; a blog post by Christopher Till.

[1]Culture Wars: Context, Models and Anthropologists’ Accounts provides students of anthropological and ethno-graphical research with a detailed illustrations of British and international accounts of critical social anthropology in the light of methodological issues. The focus of the book is predominantly on culture and how it may be interpreted in various valid ways according to the researcher and the researched by employing a self-aware and critical stance about how knowledge is produced. South Africa, Germany and Greece are just some of the places explored in the book providing the reader with international scope on how best to understand critical social anthropology. The book is helpful in allowing opportunity to reflect upon whose accounts are included in ethnographies, and how culture and context are interpreted by a diverse range of researchers working in international field settings.

The editors remind us that it goes without saying that contemporary scholars recognise the significance of the lenses which anthropologists and ethnographers use to study the lives of those they are interested in researching. Still ethnography is necessary, they explain, for it is a “powerful means of analysing what it is to be human in all its multiplicity”. They then go onto place emphasis on the need to understand that field observations conducted through the lenses employed by social anthropologists are shaped firstly by his/her relations with those being researched, and secondly by the lived history the anthropologist/ethnographer brings with her to the field, and that influences
the emerging relationships and observations.

The book’s premise is that the term culture has become taken for granted, and needs to be interrogated. Further, context too needs to be questioned, as this too is ever shifting and multiple in perspectives: “key ideas and practices are at once expressed and constituted somewhat differently by persons whose somewhat different histories produce different perspectives”. Social processes in research, production of knowledge and relations between the researcher and the researched have inter-connections and mutual implications that contest previously theorised dichotomies and binaries of social anthropology such as culture v biology or collective v individualist.

Gerd Baumann's chapter on the multi-ethnic area of Southall in London considers moral panics about Asian gangs. Baumann shows how the wider discourses of international significance inter-relate to what happens in local contexts, for example by referring to Britain’s colonial legacy. My favourite chapter, because it resonates with my current research on Britishness in Bermondsey, is What about White People’s History?: Class, Race and Culture Wars in Twenty-first-Century Britain by Gillian Evans. Evans argues for the urgent need to examine educational inequalities by giving social class significance when studying minority ethnic communities, and equally not neglecting the diversity amongst white working-class students, and therefore considering white ethnicities. She tells us that black and Asian boys who are struggling at school are often suffering social class inequalities, and at the same time the diversity of white communities is ignored. Therefore the complex challenge is to understand how inequalities of race, social class, ethnicity and cultural background intersect in modern British society. Both Baumann and Evans point towards the need to interrogate media and governmental agendas on interconnections between race, culture and social behaviour.

Digital Public Sociology at #BritSoc14 (2014-05-08 08:00)

At this year’s British Sociological Associate conference Jessie Daniels, Deborah Lupton and John Holmwood discussed public sociology and social media:
The conference as site for neoliberal behavior (2014-05-08 17:18)

During the conference ‘Thinking about the University’[1], the university was framed variously as location, change agent, institution, producer, concept, tradition, employer, workforce, resigned guardian, soon to be ex-monopolist on information and, currently, nightmare. The rhetorical style, however, was uniform. Here I discuss how performing neoliberal criticism isn’t incompatible with neoliberal behavior.

Using concepts as commodities

The debate about ‘university’ was structured as a competition between concepts. One was ‘Humanism’, the other ‘Neoliberalism’ (I’m using the nomenclature from the conference here, what was meant by it will become clear in the rest of my report. At only one moment in the conference, Neoliberalism was explored on its agency. Was it a myth? A conspiracy? An ideology? An invisible hand? Rationality? Forms of reason? A modality of governance? Can we grab it? I got the impression that it was sold as the antithesis of Humanism, most conference participants were
Humanism was framed as critical, ethical, curiosity driven, aimed at the pursuit of knowledge for its own sake, whereas Neoliberalism was framed as utilitarian, immoral, society and/or market driven, aimed at the pursuit of knowledge for the economy. If Humanism were to overcome its internal differences and unite, said our host, professor Belrose, the future would be brilliant. Still, Neoliberalism, is on the verge of winning, with consequent risks for our democracies.

During and after the conference I wondered, does it make sense to structure the debate this way? It seemed to me that ‘Humanism’ and ‘Neoliberalism’ were used as containers, with ‘othering’ as a consequence. ‘Othering’ is the process in which we define what is ‘not us’ in terms of an easily recognizable surface and a ‘not us’ content that doesn’t deserve further examination. While ‘othering’, we define ourselves in terms of ‘not our enemy’ and deny firstly that we too might have characteristics that we despise in the other, secondly that the other can have the same characteristics that we love in ourselves. This reduction can be seen as a commodification of concepts, which makes them easier to sell in the academic theories market.

Advertising concepts

The concepts were, as a consequence of othering, framed as either super attractive or super unattractive. Humanism represented academic freedom, activism, ambiguity, analytical thinking, associated with progressive and leftish, autonomy, captivating stories, citizenship, classical training, creativity, constructive, craftsmanship, creativity, criticism, curiosity, debate, decadence, democracy, denounce/expose universals, discursive, distinguish foolish from wise, doubt, education, emancipatory, empowering, ethical questions/thinking, experience of the excluded, facilitator of the public, fidelity to the truth of the event, free agenda, guardian, guild like, inspiring, intellectual, interpretation, intrinsic value of knowledge, ivory tower, knowledge of the human, liberal arts, life of freedom, love of learning, political work, practice of thought, professional, professor, public intellectual, radicalization, rhetoric and eloquence, self governance, self regulation, selected guardians, showing specifics, soul building, study of the demos, subversive, super specialism, talent, truth to power, uncertainty, understanding codes, understanding socio-historic conditions.

Neoliberalism, in turn, represented accountants, administrators, anti-professionalism, assessment, calculation, cash, CEO, commodification, competition, corporatization, culture of evidence, deliverables, disinvestment, economy, efficiency, external metrification, fees, hedonistic, indicators, investment, managerialism, performance agreements, power, privatization, production, quantified control, rankings, return on investment, sellability, service, stakeholder value, testing industry, transparent work load models, value for money, value maximalization, worth.

But as history shows, Humanism has been more than this package (its a-religious past was forgotten) and less than this. As some admitted during the conference, not all of the labels above have ever referred to a robust social reality and together they nostalgically and melancholically point at a romanticized image of a Humanist university that has never been. In the same vein, the terms used to refer to Humanism’s rival are hardly confined to the realm of Neoliberalism, as the histories of Communisms, Bureaucracies and Fascisms show. And Neoliberalism was born out of the concern that governments spend too little to get the economy going, not out of a blind obsession with budget cuts. When disclaimers are absent, we can speak of advertising.

Market values
Neoliberalism and Humanism were presented as mutually exclusive in their essences. Rightly so? Are there no Humanist traits in Neoliberalism? I guess there are. It’s just as curious about what works why and how, and just as critical about values as Humanism. It’s also ethical in choosing between right and wrong based on arguments. At most, one can say that its performance indicators are different from the ones Humanism would choose. But is Humanism really free from Neoliberal traits in these indicators? I guess not. In academia it’s deemed fully legitimate to create a (niche) market, enter into competition and pursue a monopoly in the field, become a brand and gather honorary jobs such as speaking at conferences. The differences between academic haves and have-nots become visible once a select group is put on stage and the majority isn’t, as the conference at hand exemplified too. The possibility of a genuine exchange was limited as the larger part of the available time was allotted to the speakers and further limited because some speakers left the conference shortly after they addressed the audience, as was the case on the first morning. The disappearing act after lunch of the national contributors, men with administrative tasks, can be interpreted as the subtle but notable message, “I have something to say to you, but nothing to learn from you.” Obviously, the organizing party and international contributors couldn’t leave the conference, but I didn’t notice a lot of engaged interaction with others during the informal parts of the program either. I don’t think this is necessarily a deliberate form of in and exclusion, but I do think the behavior at an academic conference is a matter of playing out a performance, with power differentials, role division and habit – and, again, not very different from how competitors behave in a market.

Indeed, the critique of the Neoliberal university has become its proper market, governed by the same principles that were put forward in the critical analysis of Neoliberalism.

Another similarity with how markets work is the reception of newcomers on the market. Tellingly, in the conference booklet the names of the younger generation were concealed under the header ‘Young academics panel’ and, unlike the other speakers’ bios, their bios were missing. At the conference discussed here, the established generation was critical about the pragmatism of the upcoming generation and at times, I sensed an atmosphere of disapproval. The upcoming generation, in turn, expressed some worries about what they perceived as the idealized and romanticized version of academic freedom. As they said: “We try to play the game and keep our backs straight.” They showed a desire to change things they were dissatisfied with, instead of self-marginalize and self-annihilate. Alternatively, they also expressed worries about being sucked into a system with other values than their own. Their statement was that they were affected by the rules set by the older generation, itself not affected by them. Professor Belrose succinctly verbalized the importance of position in the final sentence before drinks: “We radicalize because they can’t touch us because we have a position.”

At a more abstract level, there’s always a quid pro quo, a trade off in academia, be it as basic as a salary and the opportunity to maintain a certain life style, as hidden as the tit for tat cartel formation that helps create the market and its star providers, or as inherent as the importance of the method (the Greek ‘way to get somewhere’) one utilizes. That’s not essentially Neoliberal nor Humanist, but Human. I missed that last concept in this conference. It could have been the missing link.

To conclude

I don’t want to belittle the problems nor insult the analysts, but all in all I think that how the issues were framed resulted in a rhetoric in which the arguments of Neoliberalism were deconstructed – read: shown as false – and those of Humanism left untouched (only professor Duck took some effort to try to explain Neoliberalism and mitigate its consequences with the proposal of mixed funding and slow science). To me, it didn’t testify of a lot of self criticism (although professor Head sighted that “We have ourselves to blame” by denying the honor in teaching). Othering can have that effect. At moments, I had the impression that the ‘things can only get worse’ script of the academic haves on stage was enforced, because otherwise the whole anti-Neoliberal narrative would lose its validity.
The rituals I observed here I also noted at other conferences. The topic of this particular conference and the way it was discussed offered the frame to interpret them as neoliberal.

[1] The names are fictitious, the (biased) observations and interpretations are mine. This is a reworked version of a longer blog post.

Sam Burgum (2014-08-02 08:53:35)
Really enjoyed this article (refreshingly critical and reflexive). Although surely the answer is to assert what is politically proper and ethical?

Improvisation in academic life (2014-05-09 08:00)

I really like Steve Fuller’s arguments about ‘improvisation’. He rehearsed them yesterday in a post for Sociological Imagination about the originality of conference keynotes:

For about ten years now, I’ve been arguing about the benefits of improvisational performance in academia, not simply as an experience for the audience but more importantly as a way of getting ‘experts’ and ‘luminaries’ to speak unguardedly on what they think about a topic on which they have established a reputation. Indeed, this is how I believe that academics might earn some entitlement to being called [1]’intellectuals’. But increasingly I also think that this skill might be vital to the future of [2]the university as a clearly branded institution in a world where just about anything is a ‘knowledge producer’ by default.

More specifically, public academic speaking might serve as a living moment of intellectual experimentation, not simply a reproduction of past thoughts. This means that improvisation should be taught to aspiring academics – and if you think that ‘teaching improvisation’ is an oxymoron, then you know nothing about performance, regardless of all the Judith Butler you’ve been force-fed. (Maybe I’m wrong but invocations of ‘performativity’ in an academic talk’s title is usually a dead zone for intellectual engagement – unless you like to hear about non-humans ‘performing’!)

2635
It reminded me of this experience I had a couple of years ago. I had a talk planned for a conference (albeit only some bullet points in notes on my iPhone I wrote on the train to London) but decided to talk about something else because the talk prior to mine was so thought provoking. I’m not sure about the quality of the presentation but, at least subjectively, it was peculiarly enjoyable to get up and elaborate a line of thought on the fly:

I really dislike using slides. If someone has invited me to talk then I feel obliged to use slides. Much of my antipathy towards slides (beyond the fact that I’m bad at producing them) stems from how difficult I find it to improvise with them. I enjoy presenting most when I have the equivalent of index cards on my iPad – a short series of grouped bullet points. This reminds me what I’m intending to say but usually means I improvise about how and when I say it. On some occasions, it doesn’t work. If someone has gone a bit wrong prior to the event then the lack of planned structure amplifies my situational anxieties and incapacities. But when it does work, I’m a much better speaker if I just stand up and chat.

Blogging represents another form of improvisation. I thought earlier “I want to write something in response to Steve’s post yesterday”. I didn’t know until I started writing exactly what I would find myself writing. Reflecting on it, it’s not a particular surprise in this case. The influence of Fuller’s concept of ‘improvisation’ on me has largely been about public speaking, so it’s not unexpected that a blog post about it has turned into one considering public speaking. But many blog posts are a surprise. I discover a new idea or a new theme when writing. Or I find a new way of looking at a familiar idea. In this sense, I see ‘improvisation’ as intrinsically linked to what I think of as ‘non-linear creativity’.
Another example in a very specific area is given by a client in a follow-up interview as he explains the different quality that has come about in his creative work. It used to be that he tried to be orderly. "You begin at the beginning and you progress regularly through to the end." Now he is aware that the process in himself is different. "When I'm working on an idea, the whole idea develops like the latent image coming out when you develop a photograph. It doesn't start at one edge and fill in over to the other. It comes in all over. At first all you see is the hazy outline, and you wonder what it's going to be; and then gradually something fits here and something fits there, and pretty soon it all becomes clear – all at once."

Carl Rogers – On Becoming a Person Pg 152

So while I think Fuller's argument could sound trivial to someone determined to be critical of it, such that it’s concerned primarily with entertaining audiences, it’s actually much more significant than that. There’s immense creative importance in the capacity to think on your feet or, as Nietzsche might put it, to write on your feet:

Not with my hand alone I write:
My foot wants to participate.
Firm and free and bold, my feet
Run across the field – and sheet.

- Friedrich Nietzsche, The Gay Science, Prelude in Rhymes: 52

I don’t think ‘improvisation’ and ‘creativity’ are co-extensive. But I do think that an intellectual environment hostile to improvisation will tend to constraint creativity. If we don’t have space to experiment, to improvise on the spot, it’s unlikely that we’ll have much space for creativity. We may be perfectly free to create but the forms we produce will be familiar and routine. If we have room to improvise then we’ll be better able to cope with what Howard Becker describes as the ‘chaos’ involved in writing:

You can’t deal with the welter of thoughts that flash through your head when you sit at your keyboard trying to think where to begin. No one can. The fear of that chaos is one reason for the rituals that the students in my seminar described. First one thing, then another, comes into your head. By the time you have thought the fourth thought, the first one is gone. For all you know, the fifth thought is the same as the first. In a short time, certainly, you have gone through your whole repertoire. How many thoughts can we have on one topic?

Howard Becker, Writing for Social Scientists, Pg 55
Improvisation makes this chaos into a virtue. It licenses us to jump headfirst into the flux and see what has happened to us once we emerge from it. In the absence of improvisation, the creative flux becomes a problem. It becomes something to discipline through routine and repress through ritual. It means the most live moments of creative production are approached in a way which, to paraphrase Les Back, seeks to assassinate the life within them.

**PhD Workshop: What’s the point of social ontology?** (2014-05-10 08:00)

What’s the Point of Social Ontology?
PhD Workshop at the University of Warwick
18th June 2014, 10am – 5:30pm

Ontology can often prove a contested and confusing issue within social research. Everyone has an ontology, explicit or otherwise, but the process of drawing this out and thinking through its implications for research can often be a confusing part of the PhD process. This participatory workshop explores the practical significance of ontological questions for social research, inviting participants to reflect on their own research projects in a collaborative and supportive context. It aims to help participants negotiate the sometimes abstruse matter of social ontology, linking theory to practice in the context of their own research projects. The main focus throughout the day will be on how ontological questions are encountered in social research, the questions posed by such encounters and how engaging explicitly with social ontology can often help resolve such issues.

All participants will offer a brief (5 minute) presentation of their research project and the ontological questions which have been or are expected to be encountered within it. Those still early in the PhD process are welcome to substitute this for a discussion of their research interests and potential project. We’d like to ask all participants to reflect in advance on their own social ontology and how it pertains to their project. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day!
We also invite two more substantial presentations (10 mins) for the first afternoon session, reflecting on your engagement with ontological questions in your own project in order to help begin a practical engagement which encompasses the entire group. If you would be interested in leading the discussion in this way then please make this known when registering.

To register please contact socialontology@warwick.ac.uk with a brief description of your research and your interest in social ontology (500 words or less) by May 15th. The event is free but places are limited. Travel bursaries are available, please ask for more details.

The film 'Transcendence' would make good classroom material (2014-05-10 11:30)

I recently saw the film Transcendence with a close friend. If you can get beyond Johnny Depp's siliconised mugging of Marlon Brando and Rebecca Hall's waddling through corridors of quantum computers, Transcendence provides much to think about. Even though Christopher Nolan of Inception fame was involved in the film's production, the pyrotechnics are relatively subdued – at least by today's standards. While this fact alone seems to have disappointed some viewers, it nevertheless enables you to focus on the dialogue and plot. The film is never boring, even though nothing about is particularly brilliant. However, the film stays with you, and that’s a good sign. [1]Mark Kermode at the Guardian was one of the few reviewers who did the film justice.

The main character, played by Depp, is ‘Will Caster’ (aka Ray Kurzweil, but perhaps also an allusion to Hans Castorp in Thomas Mann’s The Magic Mountain). Caster is an artificial intelligence researcher based at Berkeley who, with his wife Evelyn Caster (played by Hall), are trying to devise an algorithm capable of integrating all of earth’s knowledge to solve all of its problems. (Caster calls this ‘transcendence’ but admits in the film that he means ‘singularity’.) They are part of a network of researchers doing similar things. Although British actors like Hall and the key colleague Paul Bettany (sporting a strange Euro-English accent) are main players in this film, the film itself appears to transpire entirely within the borders of the United States. This is a bit curious, since a running assumption of the film is that if you suspect a malevolent consciousness uploaded to the internet, then you should shut the whole thing down. But in this film at least, ‘the whole thing’ is limited to American cyberspace.

Before turning to two more general issues concerning the film, which I believe may have led both critics and viewers to leave unsatisfied, let me draw attention to a couple of nice touches. First, the leader of the ‘Revolutionary Independence from Technology’ (RIFT), whose actions propel the film's plot, explains that she used to be an advanced AI researcher who defected upon witnessing the endless screams of a Rhesus monkey while its entire brain was being digitally uploaded. Once I suspended my disbelief in the occurrence of such an event, I appreciate it as a clever plot device for showing how one might quickly convert from being radically pro- to anti-AI, perhaps presaging future real-world targets for animal rights activists. Second, I liked the way in which quantum computing was highlighted and represented in the film. Again, what we see is entirely speculative, yet it highlights the promise that one day it
may be possible to read nature as pure information that can be assembled according to need to produce what one wants, thereby rendering our nanotechnology capacities virtually limitless. 3D printing may be seen as a toy version of this dream.

Now on to the two more general issues, which viewers might find as faults, but I think are better treated as what the Greeks called aporias (i.e. open questions):

(1) I think this film is best understood as taking place in an alternative future projected from when, say, Ray Kurzweil first proposed 'the age of spiritual machines' (i.e. 1999). This is not the future as projected in, say, Spielberg's Minority Report, in which the world has become so 'Jobs-ified', that everything is touch screen-based. In fact, the one moment where a screen is very openly touched proves inconclusive (i.e. when, just after the upload, Evelyn impulsively responds to Will being on the other side of the interface). This is still a world very much governed by keyboards (hence the symbolic opening shot where a keyboard is used as a doorstop in the cyber-meltdown world). Even the World Wide Web doesn't seem to have the prominence one might expect in a film where computer screens are featured so heavily. Why is this the case? Perhaps because the script had been kicking around for a while (which is true). This may also explain why in Evelyn's pep talk to funders includes a line about Einstein saying something 'nearly fifty years ago'. (Einstein died in 1955.) Or, for that matter, why the FBI agent (played by Irish actor Cillian Murphy) looks like something out of a 1970s TV detective series, the on-site military commander looks like George C. Scott and the great quantum computing mecca is located in a town that looks frozen in the 1950s. Perhaps we are seeing here the dawn of 'steampunk' for the late 20th century.

(2) The film contains heavy Christian motifs, mainly surrounding Paul Bettany's character, Max Waters, who turns out to be the only survivor of the core research team involved in uploading consciousness. He wears a cross around his neck, which pops up at several points in the film. Moreover, once Max is abducted by RIFT, he learns that his writings querying whether digital uploading enhances or obliterates humanity have been unwittingly inspirational. Max and Will can be contrasted in terms of where they stand in relation to the classic Faustian bargain: Max refuses what Will accepts (quite explicitly, in response to the person who turns out to be his assassin). At stake is whether our biblically privileged status as creatures entitles us to take the next step to outright deification, which in this case means merging with the source of all knowledge on the internet. To underscore the biblical dimension of dilemma, toward the end of the film, Max confronts Evelyn (Eve?) with the realization that she was the one who nudged Will toward this crisis. Yet, the film's overall verdict on his Faustian fall is decidedly mixed. Once uploaded, Will does no permanent damage, despite the viewer's expectations. On the contrary, like Jesus, he manages to cure the ill, and even when battling with the amassed powers of the US government and RIFT, he ends up not killing anyone. However, the viewer is led to think that Will 2.0 may have overstepped the line when he revealed his ability to monitor Evelyn's thoughts. So the real transgression appears to lie in the violation of privacy. (The Snowdenistas would be pleased!) But the film leaves the future quite open, as what the viewer sees in the final opening and closing scenes looks more like the result of an extended blackout (and hints are given that some places have already begun the restore their ICT infrastructure) than anything resembling irreversible damage to life as we know it. One can read this as either a warning shot to greater damage ahead if we go down the 'transcendence' route, or that such a route might be worth pursuing if we get manage to sort out the 'people issues'. Given that Max ends the film by eulogising Will and Evelyn's attempts to benefit humanity, I read the film as cautiously optimistic about the prospects for 'transcendence', where the film's plot is taken as offering a simulated trial run.

My own final judgement is that this film would be very good for classroom use to raise the entire range of issues surrounding what I have called [2] 'Humanity 2.0'.

Many academic articles are never cited, although I could not find any study with a result as high as 90%.
Non-citation rates vary enormously by field. "Only" 12% of medicine articles are not cited, compared to about 82% (!) for the humanities. It's 27% for natural sciences and 32% for social sciences ([1]cite). For everything except humanities, those numbers are far from 90% but they are still high: One third of social science articles go uncited! Ten points for academia’s critics. Before we slash humanities departments, though, remember that much of their most prestigious research is published in books. On the other hand, at least in literature, [2]many books are rarely cited too.

It sources and refutes the original 90% claim while also exploring some of the wider issues involved. An interesting question occurred to me: why has that 90% claim circulated so readily despite it being an over-estimation for the humanities and emphatically wrong for other disciplines? It is an 'urban legend' as the author puts it in the blog post. It appears to confirm a perhaps unspoken fear ("no one cares about what I write") or a self-aggrandising prejudice ("I get cited a lot but other people's work is crap") and this affectively imbued confirmation bias keeps the claim circulating.

It could also be exaggeration for effect. 90% of things academics publish aren't cited really means, as both this and the LSE article point out, that academia is relatively unimportant. (anecdotal evidence warning!) a bit like a friend of mine who announced that 87.5% of all academic work is horse manure, and going to uni was a waste of time.

Loren (2014-05-22 03:12:14)
I suspect the fear that "no one cares what I write" may be well-grounded, especially in the humanities.

Deborah (2016-04-30 08:39:46)
Possibly the figure is high because many articles and books are not groundbreaking enough, because the cycle of publication is too rapid. It takes a few years to produce truly innovative research, longer to write about them effectively and engagingly. And then again there is simply too much to read, and the methods of dissemination not systematic enough.
The politics of austerity (2014-05-13 08:00)

Richard Seymour had a thoughtful and incisive analysis in the Guardian a couple of weeks ago, released around the same time as his new book on austerity (see the video above). It addresses what I take to be the questions which the left has to address: how was it that a crisis of finance capital transmuted, as if by magic, into a crisis of sovereign debt? Furthermore, what strategies can be learnt from the sheer efficiency with which this (cultural) agenda was pursued?

How can it be that more than six years since the credit crunch, with austerity under way for more than three years, the left has barely showed signs of life, let alone scored a single significant victory? Particularly when capitalism has been in its deepest crisis in generations. We have been floored by austerity, and above all passive acceptance.

To understand how we got to this impasse, we need to radically rethink many of our core assumptions. The first is the engrained idea that a capitalist crisis necessarily leads to radicalisation. As political theorist Antonio Gramsci pointed out, it is the “traditional ruling class” rather than its opponents who are best positioned to take command of a crisis. Its control over the dominant institutions, its loyal cadres of supporters in thinktanks and the media, and its economic and political strength, all enable it to adapt and propose its own solutions. Proactively, it seeks to meet the crisis on every level on which it manifests itself by changing strategies, winning over popular layers with “demagogic promises”, and pre-empting and isolating opponents.

http://www.theguardian.com/commentisfree/2014/mar/28/right-only-econom-solution-austerity
It’s really worth reading [7]the article in full. I happened to stumble across it via his website a few hours after I’d been listening to [8]Thinking Allowed. It had two of my favourite political thinkers: [9]David Harvey and Colin Crouch. I’ve interviewed Colin Crouch on two occasions: [10]here and [11]here. He remarked to Chris Mullin once that his current position as a critic from the left was a consequence of shifting political ground. As a student he had been on the right of the Labour party and he feels he’s stayed in the same place while party politics has shifted. Whatever truth there is to that, I think his critique of the institutional trajectory of representative democracy is an important one. Post-Democracy seems like a very prescient book in retrospect, one heralding changes which are really beginning to become apparent seven years on from the onset of the financial crisis. Here’s a video of him talking briefly about post-democracy:

Academic scribes, their writing and their unsociability (2014-05-14 08:00)

The paradox is that we academic scribes are not always very sociable. We cling to the library like bookish limpets that, like Kierkegaard, find real human beings too heavy to embrace. We speak a lot about society but all too often listen to the world within limited frequencies. I am proposing an approach to listening that goes beyond this, where listening is not assumed to be a self-evident faculty that needs no training. Somehow the grey books written on sociological method do not help much with this kind of fine tuning. The lackluster prose of methodological textbooks often turns the life in the research encounter into a corpse fit only for autopsy.

Les Back, The Art of Listening, Pg 163

I think there's more to this than can be fairly ascribed to the limitations of ‘traditional’ scholarly communication. But I think these nonetheless play a significant role in contributing to the ‘unsociability’ of sociology. In part, it’s a matter of audience, with marginality arising from a turning inwards towards others like ourselves. If we’re communicating with a technical audience, it creates a tendency to drift towards ever more technical language. In doing so, norms surrounding ‘proper’ communication will themselves tend towards the obtuse and, with this, the starting point from which we drift becomes ever more mired in professionalised marginality.

When I say ‘technical language’ I mean specialised vocabulary in the broadest sense, those networks of terms and concepts which emerge in relation to specialised practices, deriving their meaning and purpose from connection to such skilled activity. I don’t think there’s anything fundamentally wrong with technical language in this sense. It shouldn’t be avoided entirely nor could it be. But to use Les Back’s lovely expression, “we have to insist on having both Adorno and Orwell at our elbow as we write”. We should be relentlessly critical of our tendency to slide into jargon while nonetheless recognising the role that jargon can serve. Rather than seeing clarity and complexity as antipathetic, such that we struggle to distinguish between the (accessibly simplified and the simplistically accessible, we should focus on the ways that technical vocabulary (complex) can be used to express precise claims succinctly (clarity) in a way which would otherwise be impossible.

What role does it serve beyond this? I can’t see that it serves any intellectual role and, as prone as I am to slipping into it myself, I’m determined to train myself out of the habits that 7 years of postgraduate education have inculcated in me*. It clearly serves a personal role though, as C Wright Mills makes clear in one of my favourite passages from his work**:

In many academic circles today anyone who tries to write in a widely intelligible way is liable to be condemned as a ‘mere literary man’ or, worse still, ‘a mere journalist.’ Perhaps you have already
learned that these phrases, as commonly used, only indicate the spurious inference: superficial because readable. The academic man in America is trying to carry on a serious intellectual life in a context that often seems quite set against it. His prestige must make up for many of the dominant values he has sacrificed by choosing an academic career. His claims for prestige readily become tied to his self-image as a ‘scientist’. To be called a ‘mere journalist’ makes him feel undignified and shallow. It is this situation, I think, that is often at the bottom of the elaborate vocabulary and involved manner of speaking and writing. It is less difficult to learn this manner than not. It has become a convention – those who do not use it are subject to moral disapproval. It may be that it is the result of an academic closing of ranks on the part of the mediocre, who understandably wish to exclude those who win the attention of intelligent people, academic and otherwise.

C. Wright Mills, The Sociological Imagination, Pg 218

In this sense I think we can see 'academic writing' as a dispositional complex which has been reinforced in three ways: status anxiety at the level of the person, restrictive norms about 'proper' writing at the level of academic culture and a narrow range of available media** at the level of academic institutions. These constraining factors will act in different ways and at different times but their emergent power over time mitigates against the possibility of forms of writing which aim "to document and understand social life without assassinating it". This is on page 164 of the Art of Listening. There’s an even nicer formulation of this in an interview with Les Back [2]here: "ways of writing about the social world that don’t assassinate the life that’s in it". I think this expression is an example of precisely the virtues it advocates. It’s a phrase I’m simply not going to forget and it conveys its main claim with an immediacy which would be difficult to accomplish with a less literary mode of expression.

In my paper about online writing I’m trying to think through the possibilities offered by blogging in terms of this diagnosis. I think there’s a real risk of academic blogging being ‘captured’ by professionalisation in a way which undermines the potentially transformative role it can play in relation to personal practice. But the possibilities for experimentation are hugely significant nonetheless. In an important sense, it’s a uniquely malleable medium, at least compared to monographs, edited books and journal articles etc. I need to figure out more precisely what I mean by 'malleability' here. I’m also including ‘micro-blogging’ within this scope, despite it being a term I’ve always hated. Partly to expand the scope of what I’ve been invited to write but also because considering Twitter could help flesh out my overarching argument. I’m very interested in the aesthetics of [3]Nein Quarterly as an example of the innovative modes of expression that the radical brevity of Twitter can help give rise to.

*Including the habit of writing sentences, such as this one and many in the main body of the text, which I believe are called compound-complex sentences. Quite why I feel so compelled to do this, with the strangely undulating character it entails for my prose, continues to elude me but I’d like to know nonetheless.

**I don’t think this can be straight-forwardly applied to our present situation but the [4]main thrust of the argument is still valid.

***Which are themselves narrow in terms of the expression they permit.

2. https://www.gold.ac.uk/media/Attentiveness%20as%20a%20Vocation%20-%20Back%20and%20Ruiz.pdf

2646
Those remarks about assassinating the life we write about remind me of Ben Marcus’ *The Age of Wire and String*. In the [1]"argument" of that book he suggest that "culture has been willfully hidden to the routine in-gazing of professional disclosers", who forget that "by looking at an object we destroy it with our desire" and that the task, therefore, is not to represent social life but to train things to see themselves. The book itself, it seems to me, is a good attempt at such training.

The thing I like most about Bourdieu is his conception of public sociology. It seems clear to me that Bourdieu was a public sociologist, though [2]others are less certain about this and I suspect it’s not a term he would have chosen to use himself. The book of talks I’m basing this post on is [3]here and all the references are from this book.

The politics of these talks are rooted in the anti-globalisation movement of the late 90s and early 00s. As such, Bourdieu’s attentiveness to the political rhetoric of ‘globalisation’ is not a surprise. He draws attention to the double meaning of ‘globalisation’: the *descriptive* sense of a unification of the economic field and the *normative* sense of the desirability that these changes are supported through economic policy. The slight of hand arises because the former is often used to disguise the latter i.e. economic ‘reality’ is invoked to justify the pursuit of policies which are themselves responsible for the putative ‘reality’. The global market is a political creation, much as national markets had been, arising from “policy implemented by a set of agents and institutions, and the result of the application of rules deliberately created for specific ends, namely trade liberalisation (that is, the elimination of all national regulations restricting companies and their investments)” (pg 84). Bourdieu argues that ‘globalisation’ is a ‘pseudo-concept’, at once descriptive and prescriptive, which has replaced ‘modernization’ as the intellectualised trappings for the ideology of late capitalism.

However something real and momentous is taking place. Bourdieu is concerned with the capacity of international institutions to “invisibly govern” national governments, which are preoccupied by the management of “secondary matters” and form a “political smoke screen that effectively masks the true sites of decision-making” (pg 91). He describes a “veritable invisible world government” constituted from “the big multinational firms, and their international boards, the great international institutions, the WTO, the IMF, and the World Bank, with their many subsidiary bodies, designated by complicated and often unpronounceable acronyms, and all the corresponding commissions and committees of unelected technocrats little known to the wider world (pg 78). This is a state of affairs that
national governments have been wilfully complicit in bringing about, most strikingly those of a putatively social
democratic inclination, the conduct of whom has "by extending or adopting the policy of conservative governments"
made "this policy appear as the only possible one" giving "regulation measures complicit with business demands the
appearance of invaluable achievements of a genuine social policy" (pg 58).

The Internationalisation of Social Movements

It is because of the depoliticisation which accompanies 'globalisation', as the arena of decision-making moves ever
further from the demos, that social movements must develop the capacity to act at a European level. In making
this case, Bourdieu is rejecting what he sees as a manipulative dichotomy drawn between being pro-Europe and
anti-Europe, instead rejecting the deployment of the rhetoric of cosmopolitanism in defence of the neoliberal project
in Europe. His concern is to develop a capacity to pursue agendas at the European level in order to avoid the tendency
to get dragged down by particularistic disputes, given that national governments often act as a 'smoke screen' for
processes of change which have their origins at an international level. He sees great hope in the multiplication
of social movements but great challenges involved in the integration necessary to constitute them as collective
actors on the international stage. He offers a lot of interesting suggestions about the practical organisational
forms coordination of this sort could take, with the necessity being to "establish a coordination of demands and
actions while excluding attempts of any kind to take these movements over" (pg 42). I find his argument here most
compelling when he discusses cultural production by social movements:

There are currently many connections between movements and many shared undertakings, but these
remain extremely dispersed within each country and even more so between countries. For example,
there exist a great many critical newspapers, weeklies, or magazines in each country, not to mention
internet sites, that are full of analyses, suggestions and proposals for the future of Europe and the world,
but all this work is fragmented and no one reads it all. Those who produce these works are often in
competition with one another; they criticise each other when their contributions are complementary
and can be cumulated. (pg 43)

If you consider the number of radical presses currently operating, with their varying degrees of size and political
engagement, it's hard not to see his point here. The advent of multi-author blogging has intensified this existing
process, as the reduction of entry costs to near zero has led to a proliferation of websites which are, individually, a
natural response to the question of 'what to do?' faced by those hoping to promulgate a counter-hegemonic politics
but, collectively, this perhaps serves to fragment the very cultural terrain upon which it is hoped that an alternative
'common sense' will begin to take root.

The Responsibilities of Intellectuals

In an argument [4]redolent of C Wright Mills, Bourdieu maintains that “those who have the good fortune to
be able to devote their lives to the study of the social world cannot stand aside, neutral and indifferent, from the
struggles in which the future of the world is at stake” (pg 11). However this engagement inevitably poses challenges,
as seen in the personal tensions Bourdieu recognises in his own position,

I have often warned against the prophetic temptation and the pretension of social scientists to announce,
so as to denounce them, present and future ills. But I find myself led by the logic of my work to exceed
the limits I had set for myself in the name of a conception of objectivity that has gradually appeared to
me as a form of censorship. (pg 66)
But what does he mean by ‘censorship’? His target is the notion of 'axiological neutrality' which, he argues, represents a "scientifically unimpeachable form of escapism" rather than a necessary condition for social science. Bourdieu calls for a scholarship with commitment, in opposition to a dominant tendency which sees scholarship and commitment as antipathetic. This is a point I found inspiring when I first read it and it has stuck with me since. It’s an important corrective to a tendency Burawoy describes for the original commitments which lead people towards sociology to be marginalised by the pressures of completing a PhD and pursuing a career:

The original passion for social justice, economic equality, human rights, sustainable environment, political freedom or simply a better world, that drew so many of us to sociology, is channeled into the pursuit of academic credentials. Progress becomes a battery of disciplinary techniques—standardized courses, validated reading lists, bureaucratic ranking intensive examinations, literature reviews, tailored dissertations, refereed publications, the all-mighty CV, the job search, the tenure file, and then policing one’s colleagues and successors to make sure we all march in step. Still, despite the normalizing pressures of careers, the originating moral impetus is rarely vanquished, the sociological spirit cannot be extinguished so easily.

However with these engagements come responsibilities. Bourdieu argues that the intellectual world "must engage in a permanent critique of all the abuses of power or authority committed in the name of intellectual authority". It must also resist the temptation to "mistake revolutions in the order of words or texts for revolutions in the order of things, verbal sparring at conferences for ‘interventions’ in the affairs of the polis" (pg 19-20).

**Resisting the Rise of Think Tanks**

The role of think tanks is too often overlooked or their study marginalised as a specialism. Whereas the case can be made that think tanks were integral to the consolidation of late capitalism, as well as to the neoliberal counter-revolution that began in the 1970s. This is certainly Bourdieu’s view and he calls for resistance to the "paradoxical doxa" produced through the intellectual activity of think tanks:

In order to break with the tradition of the welfare state, the ‘think tanks’ from which have emerged the political programs of Reagan and Thatcher, and, after them, of Clinton, Blair, Schröder, and Jospin, have had to effect a veritable symbolic counterrevolution and to produce a *paradoxical doxa*. This doxa is conservative but presents itself as progressive; it seeks the restoration of the past order in some of its most archaic aspects (especially as regards economic relations), yet it passes regressions, reversals and surrenders off as forward looking reforms or revolutions leading to a whole new age of abundance and liberty. (pg 22)

As I’ve [6]written elsewhere, the influence of think tanks has expanded rather than contracted in an age of austerity. We should also be aware of the [7]direct and indirect ways in which think tanks are participating in an the project of ‘reforming’ higher education. But how can it be resisted? The first step is to “break out of the academic microcosm and enter resolutely into sustained exchange with the outside world (that is, especially with unions, grassroots organisations, and issue-orientated activist groups) instead of being content with waging the ‘political’ battles, at once intimate and ultimate, and always a bit unreal, of the scholastic university” (pg 24).
This renewed engagement cannot be the work of a "master thinker endowed with the sole resources of his singular thought" but through collective work seeking to "create the social conditions for the collective production of realist utopias" and "joint research on novel forms of political action, on new manners of mobilizing and of making mobilized people work together, on new ways of elaborating projects and bringing them to fruition together" (pg 21). There is also a negative function, involving work “to produce and disseminate instruments of defence against symbolic domination that relies increasingly on the authority of science (real or faked) (pg 20). This would involve critique of neoliberal thought, its rhetoric and mode of reasoning, as well as sociological analysis aimed at uncovering the social determinants shaping its production.

One of the ideas I like most in Bourdieu's public sociology is the call for giving "symbolic force, by way of artistic form, to critical ideas and analyses". By this I think he means social scientists collaborating with artists, drawing on other ways of telling about society (as Becker would put it) in order to disseminate critical analysis of the operations of power. Perhaps unsurprisingly, he’s particular attuned to the role of cultural works in potentially resisting the seemingly irrevocable marketisation of cultural production:

If I recall now that the possibility of stopping this infernal machine in its tracks lies with all those who, having some power over cultural, artistic, and literary matters, can, each in their own place and their own fashion, and to however small an extent, throw their grain of sand into the well-oiled machinery of resigned complicities. (pg 65)

The accumulation of ‘grains of sand’ is not a particularly inspiring theory of change but I suspect it’s an accurate one. We need to disrupt the ‘machinery of resigned complicities’ to open up space for collective action orientated towards loftier purposes. As well as alliances with cultural producers, Bourdieu explores the potential role that social scientists can play in alliance with social movements. He suggests that social scientists could play the role of “organizational advisors to the social movements” as they pursue integration at the international level by "helping the various groups to overcome their disagreements" (pg 43). I think Bourdieu’s vision here has three aspects: scholarship working towards the elaboration of real utopias, constituting a sort of ‘applied research division’ of international social movements and acting as critical voices in public debates in alliance with the agendas of social movements.

3. http://books.google.co.uk/books/about/Firing_Back.html?id=VLIiTxInnqF4C&redir_esc=y

Thank you for writing this. I, too, was inspired by like Bourdieu’s vision of the relationship between sociology and social movements, and I was involved in a transnational social movement, ATTAC, that attempted to put these ideas into practice in
the early 00s. (In particular, I was involved in organising the short-lived ATTAC branch in London, in Europe's most neoliberal state.) ATTAC had a "scientific committee" that, I think, helped focus mobilization on certain issues by providing the sort of critical applied social science Bourdieu had in mind. ATTAC had a lot of members in several European countries, and it was certainly a lively movement. More broadly, the alter-globalisation movement that it was a part of organized many public events that involved large numbers of enthusiastic people (a series of European Social Forums that I was involved in, as well as the World Social Forums). However, I think the overall results were disappointing. The implementation of the alter-globalisation movement's proposals required the cooperation of political parties and governments, which were singularly uninterested in those proposals. Paradoxically, the EU's now-likely adoption of one of ATTAC's main proposals, the Tobin tax, has happened only after the decline of the alter-globalisation movement. Did this movement actually have a subtle long-term effect that was difficult to perceive at the time, or was it simply irrelevant to the processes that actually shape state policies? Now I'd like to read some of the sociological research that's been done on that sort of mobilisation, starting with Geoffrey Pleyer's book. Maybe now that ten years have passed, it's easier to assess Bourdieu's vision of mobilization and how that vision was put into practice.

"Did this movement actually have a subtle long-term effect that was difficult to perceive at the time, or was it simply irrelevant to the processes that actually shape state policies?" That's a fascinating question. I got involved in activism around the time the movement was in decline, with the anti-Iraq war campaign being the first I was involved in. Rereading that Bourdieu book left me really intrigued by how the discourse of globalisation dropped from view, at least in my experience, as a framework for mobilisation. I think the specific question you're asking about particular organisations is VERY interesting but I think it's also a way into these important broader issues (globalization -> war on terror??) which as far as I can see have been widely overlooked.

Benjamin Geer (2014-05-16 00:58:55)
In 2002 I said to Bernard Cassen, one of the founders of ATTAC, that I was afraid the war on terror was going to completely derail the alter-globalisation movement by absorbing all the energy of the left, and he said not to worry. By February 2003, I had drifted away from ATTAC and was demonstrating in Hyde Park against the invasion of Iraq, and then I started learning Arabic and thinking about an academic career in order to better understand what was going on...

would you fancy writing a semi auto biographical post about this, ben?

Benjamin Geer (2015-03-07 15:17:27)
Hey, I just realized that I totally missed your last comment. Yes, thank you, I'd like to write something like that if I can find the time for it. I'll give it some thought and get back to you.

Sociological Imagination (2015-03-08 06:25:59)
Great!

Foucauldian analysis and the mystification of elites (2014-05-16 08:00)
In a recent review of *The Reflexive Imperative*, Jonathon Joseph describes subjects "being encouraged to become active citizens and consumers who must make the right life choices based on acquiring the appropriate skills and information, making informed choices about risk activities, taking responsibility for their welfare and well-being and drawing on the appropriate resources (and social capital) from their communities and networks". These "new notions of governance" are ones which "operate from a distance" and "use market logic as a rationality". These "new forms of regulation" are ones which "rely on the responsibilization of various actors through more normative and normalizing techniques and procedures" (pg 101).
What does it mean to say that a 'notion of governance' uses 'market logic as a rationality'? Is a 'notion of governance' the same as a 'form of regulation'? What does it mean to say that a 'form of regulation' relies on the application of 'techniques and procedures' to actors? There's undoubtedly sloppy conceptualisation here. It's rife within social theory and I'm not exempting myself from it. But I think there's a more entrenched problem with this conceptual vocabulary. Theoretical language of this sort has always irritated me slightly and it's only recently, after reading Howard Becker's Writing for Social Scientists, that I've finally realised why this is. It is, as Becker puts it, "a theoretical error, not just bad writing":

In many sociological theories, things just happen without anyone doing them. It's hard to find a subject for a sentence when 'larger social forces' or 'inexorable social processes' are at work. Avoiding saying who did it produces two characteristic faults of sociological writing: the habitual use of passive constructions and abstract nouns.

Becker, Writing for Social Scientists, Pg 8

This is why Joseph can be found saying that a “notion of governance” uses “market rationality”. What could this even mean? How can a notion use anything? The process of governance may use market rationality but the notion of governance is, well… notional. The claim about "new forms of regulation"relying on various strategies is much more coherent but again lacks a subject. I find it jarring to talk about strategies and techniques in the absence of an agency underlying them. Likewise to talk of “forms of regulation”. As Mouzelis has observed, “Foucault’s insistence that practices of subjugation fulfil specific objectives in a subjectless, disembodied manner comes remarkably close to Parson’s middle-period writings on the social system, where systemic analysis completely displaces agency considerations” (Mouzelis 1995: 46).

Insisting on the role of agency in 'governance' doesn't entail the self-transparency of agency. Nor does it suggest that the ‘techniques and strategies’ used straight-forwardly derive from instrumental scheming on the parts of agents (with the image this conjures up of closed door meetings at Davos devoted to ‘notions of governance’ and ‘new forms of regulation’). But this is an assertion that, so to speak, people make the world go round: something has gone seriously wrong with an account of ‘governance’ that isn’t couched in terms of elites, vested interests and the strategies they pursue to protect those interests. In this sense, I’m saying that Foucauldian analysis at its worst constitutes a form of mystification. It actively occludes the operation of power, obscuring the deliberate strategies of groups (and the emergent consequences which arise as a result of the competition between groups in an open system) behind an obscure rhetoric of governance without governors and regulation without regulators. Incidentally, does talk of governors and regulators as singular groupings not sound jarringly simplistic? But surely talk of ‘neoliberal governance’ is no less singular and far less concrete?

As an example of what I mean, consider the Bourdieusian analysis [1]Tom Medvetz offers of how ‘dependency theory’ was promulgated by think tanks and taken up by political actors in a specific context. The same process of social change, in which the relationship between welfare recipients and the welfare state was recast as dependency, could easily be ‘explained’ in terms of the enactment of neoliberal modes of governance. But is this really an explanation? It not only wouldn’t specify the concrete action involved in this transition, it would also undermine our inclination to look for it.
However at its best, Foucauldian analysis offers something really valuable. When I talk about Foucauldian analysis I like, it’s inevitably Nikolas Rose that I think of. But even he falls into these passive constructions, as seen in this example from one of many instances where I’ve quoted him on my blog:

Today, we are required to be flexible, to be in continuous training, life-long learning, to undergo perpetual assessment, continual incitement to buy, constantly to improve oneself, to monitor our health, to manage our risk. And such obligations extend to our genetic susceptibilities: hence the active responsible biological citizen must engage in a constant work of self-evaluation and the modulation of conduct, diet, lifestyle, and drug regime, in response to the changing requirements of the susceptible body.

Nikolas Rose, The Politics of Life Itself, Pg 154, Princeton University Press

Surely the notion of ‘requirement’ is relational? If I am required to do or be a certain way then someone or something is requiring this of me. Are my social and cultural circumstances requiring me to be a certain way? Then what matters are the characteristics of those circumstances and how, in relation to my own characteristics, I am led to be required to be a certain way. Rose’s sheer insightfulness and detail about the former is why I like his work. He neglects the latter but, unlike many others, clearly states that this is a methodological and meta-theoretical move.

It’s the relationship between the circumstances and the self which interests me. While it’s a contentious claim, it nonetheless seems obvious to me that it is present, though suppressed, within Foucauldian analysis. It’s logically entailed by any statement that “we are required” or “we are subject to” or “we are governed by” (etc). It’s only excluded entirely by elaborating logical obscenities like “notions of governance use market rationality” which excludes human agency at the cost of imputing agency to ideas. But if we’ve brought the self back into the picture then why not go further? I accept there is a discourse surrounding reflexivity, one which social theorists may contribute to through their pronouncements upon reflexivity (though it does always strike me that there’s a tendency towards scholastic over-estimation of our influence). But there is also a capacity to be reflexive which is not discursively constructed. However the exercise of this capacity is discursively influenced and this is precisely why I’d like to bridge the gap between relational realism and foucauldian modes of analysis.

*It’s in Journal of Critical Realism (13): 1. I’m struggling to find a web link for some reason.

Adam Barker (2014-05-17 12:38:45)
It’s always tempting to talk in vague notions of governance and tendencies. I think it’s in some respect because it allows us to make claims about things we see going on while remaining somewhat insulated from the partisan or invested push-back that comes with ‘naming names’ (that is, saying that real people do real things that hurt or disadvantage other real people). In my general field (settler colonialism and decolonisation), there’s a great deal of this vague language that comes from postcolonial theory and critical literary theory. I recently reviewed a book that brilliantly observed what happens in the processes of settler colonialism and empire building the United States, but only rarely mentioned the people who actually make it happen. On the
other hand, when some of us (and I do include myself in this category) try to point out that groups of people actually do these things and why, the public and academic backlash is at times severe: ‘How dare you insinuate that I am a colonizer!’, etc... It really does discourage people from speaking plainly about what they perceive when what they would have to say is that racism is rife in society, that greed is a primary motivating factor for violence against specific individuals and communities by other specific individuals and communities, and so on. It’s difficult to put forward a well-reasoned and researched argument of that realist sort without it being treated as an opinionated personal attack by the people who ‘resemble the remark.’ I try to get around it by always including myself explicitly (as a white, male, Settler Canadian) in the group of people whose dominating actions I examine, but it doesn’t always help.

hi adam, that’s a really thought provoking and honest comment. would you think about extending it ever so slightly and it could be a free standing post? i think it’s a fascinating and little discussed issue (the epistemic implications of the social consequences attached to making knowledge claims) which needs to be talked about more.

Mark this has interesting implications for my work that I’m now thinking through. In the meantime, I agree Foucauldian analysis works better when it has a specific research object; when it becomes a theory-method. For example, take term ‘excited delirium’ used in coroners courts in the USA (and increasingly over here) to explain deaths in custody. The term has no scientific validity yet it’s used to close very ambiguous cases of involving police restraint. Clearly, it’s a discursive construct that serves someone’s interests the key research question is whose interests?

Sociological Imagination (2014-05-18 11:36:49)
it’s a discursive construct that coheres (or fails to) with people’s interests but I’m less sure that it can be said to ‘serve’ them and that this explains the circulation of the construct, if you see what i mean.

Yes I can see what you mean. At some point a coroner decides to use a non-scientific term to make a subjective decision seem objective and close out other interpretations. This often leaves relatives unhappy. I agree, it’s difficult to say whose interests this process serves and this question is left hanging too often - but it’s clearly not serving the interests of the relatives.

I wonder how many senior academics would feel comfortable rereading their PhD? Equally, I wonder how many current research students can imagine revisiting their work in twenty or thirty years? This is precisely what I did recently, having come to the somewhat chastening realisation that I was so old that what had once been a cutting-edge sociology project might now have a second life as social and intellectual history.

Technology, Consumption and the Future: The Experience of Home Computing (Brunel University) was submitted in 1992 but was based on fieldwork conducted in the late 1980s. I started to reread it with what might be politely described as mixed feelings, not least as this meant putting myself back into the (very mixed up) head of my twenty-something self. I had made a terrible meal of my PhD: the one viva question I could not answer was ‘why did it take you so long to finish?’ Barely a week goes by that I don’t feel a twinge of guilt for the indignities that I put my late, great supervisor Roger Silverstone through. Moreover, for a variety of reasons (some understandable some not) although I applied the arguments developed in the thesis elsewhere (notably in McLaughlin et al Valuing Technology 1999) I never published on home computing (except [1]here).

Even in the 1980s most people thought my approach idiosyncratic; I saw home computing as a way of studying consumption processes and exploring the form and appeal of nostalgic accounts of a future where technology
ended the flux of modernity. Underlying this was a deep cynicism (sometimes productive and sometimes completely wide of the mark) about the potential of home computing. My approach is also dated by a wilful disinterest in the technical aspects of computers and computing. I must admit that I hardly touched an actual home computer during the research - although I had worked in the computer industry before I started it - so convinced was I of my mission to assert the significance of the ‘social’ over the ‘technological’.

In my defence, much of the reading that I did in the 1980s predated the emergence of Science and Technology Studies which would have provided a ready-made way into the socio-technical. I had to work hard to find a language and literature with which to discuss technology as culture and early chapters of my PhD range widely over topics as diverse as cargo cults and the lost history of the gas refrigerator! It also took me a long time to switch on methodologically; encouraged by my supervisor (who was developing an approach that came to be known as the ‘ethnography’ of domestic media use) I agonised as to how to find ‘ordinary families’ to interview about home computing. Thus many of my early informants were passed over as atypical hobbyists. I missed a trick, for example, in not continuing early fieldwork with a group of New Age enthusiasts for computer communication. Here is a quote from one of them promoting the possibilities of technology, taken from the programme of the 1987 Festival of Mind Body and Spirit:

"... individuals will extend their minds by connecting their computer to other computers serving as distributor of shared information and memory banks of unforeseeable wealth .... We will dial computers like we choose radio stations and TV channels, and we will create electronic communities around each machine: a green network, peace people, health enthusiasts - everyone will have ‘their’ machine and community, and everybody can move from one community to another: it happens all in our minds, from the comfort of our home or office - on the road towards the global village."

I am not quite sure why I was so easily convinced that I should abandon this fieldwork in favour of tramping the suburban streets of Uxbridge and Ruislip in search of ‘real’ home computing but that’s what I did, diligently conducting over fifty semi-structured qualitative interviews.

So regrets I have a few but then again the resulting thesis has some interesting elements. For example, I was determined to locate the emergence of home computing in a wider account of the form and influence of predictions of what was then termed the Information Technology (IT) Revolution. In the 1970s and early 1980s these predictions had a strongly millennial tone: some of the buzz phrases of this period now sound very dated - ‘an end to work’, ‘leisure society’, ‘the computer society’, ‘wired society’, ‘the electronic cottage’, ‘teleworking’, ‘family computer’ ‘educational computer’ and indeed ‘home computing’. As the Janus-faced rhetoric suggests, hopes and fears about the future impact of IT emerged out of the economic, political and cultural crisis of the 1970s. International prophets such as Alvin Toffler, Donald Macreae, and Zbigniew Brzezinski saw IT as offering a route from current malaise to future stability. In late 1970s Britain predictions of the IT Revolution had taken on a particular resonance in a setting where public discourse was dominated by talk of crisis and decline. Prime Minister Jim Callaghan organised a special screening of an apocalyptic Panorama television programme Now the Chips Are Down for his cabinet and senior civil servants. As I write in the thesis, this was part of a pattern that persisted into the Thatcher era and helped shape the early production, consumption and academic study of home computing in Britain: the arrival of information technology was often presented as a crucial watershed in economic development - a one-off test of a nation’s economic, intellectual and perhaps even moral strength. As the 1980s continued discussion of home computing was still linked to hopes of economic renewal and fears of social decline (typically focused on the family and or ‘community’).

What became known as the British home computer boom lasted for the first half on the 1980s. Given the global character of contemporary digital culture it is hard to remember how distinctive different national paths to adoption of IT were at this time. The British boom was dominated initially by 'microcomputers' made in the UK and marketed explicitly as 'home computers' (remember that this predates the PC): older readers will recall the Sinclair
and Acorn micros. The pace and scale of early adoption of these micros was unmatched anywhere else in the world but by 1985 when I began my project, some commentators were talking about the end of the boom, of dashed expectations and some were questioning whether the home computer had a long term future. When I conducted the bulk of my interviews in 1987 and 1988 many of those I spoke to were looking back to the heyday of the home computer boom and forwards to a new era of computing.

One of the contributions of the thesis was to describe the home computer boom as a ‘public event’ and locate micro users’ experiences within other developments such as government initiatives to promote IT awareness and literacy as a challenge to the (non)problem of supposed resistance to new technology. 1982 was, for example, designated ‘IT Year’ and there was considerable investment in computers in schools. The public event of the boom can also be tracked via extensive media coverage (including a growing specialist consumer press) and in the growth of numerous computer clubs held in schools, libraries and shops. As my interviews confirmed, many of the users of the home micro were responding to prophecy, convinced that their purchase was equipping them or their children for a future shaped by IT.

For all its initial commercial success, the home computer was a shifting and contested product. The early British micros were, in Leslie Haddon’s phrase, ‘self-referential’: limited memory and storage meant that their only function was to explore what a computer was. As the market matured most machines still relied on cassettes for data storage and plugged into the household television. Many of those I interviewed wrote (or often more precisely copied) programmes in Basic code rather than purchase ready-made software for gaming or home accounting or other uses. A key theme of my interviews was the way in which people’s narratives of their ‘computer careers’ often focused on the process of ‘finding a use for’ their micro. Their exploration of the capacities and possibilities of the micro often encompassed playful (and frequently painstaking) attempts to bring visions of a computerised home of the future to life. This process sometimes ended in disappointment but, through it, differing conceptions of what was useful emerged. My analysis placed the users in a cycle of cultural production in which shifting and competing conceptions of what a computer was for took shape: the ‘home computer’ was beginning to evolve into ‘the word processor’ and ‘the games machine’.

Given that Digital Sociology is all the rage, and I also learn that there is now something called Media Archaeology that teaches us that digital technologies develop through the dialectic of the new and the old, perhaps it is a good time for other sociologists also to revisit the home computer boom.

[nbox type="notice"] David Skinner is Reader in Sociology at Anglia Ruskin University in Cambridge. His current research focuses on the changing politics of ‘race’ knowledge and expertise with particular reference to data and databases. You can follow him on twitter @DavidIanSkinner.[/nbox]

CfP: What are conferences for? The Political economy of academic events (2014-05-17 08:00)

The [1]Sociological Imagination invites short articles (500-1500 words) critically reflecting upon the prevailing forms of intellectual meeting within the contemporary academy. What are their strengths? What are their weaknesses? How could they be done differently? What are the sociological implications of these standardised forms of intellectual meeting? Whose voices do they amplify and whose do they suppress? What behaviour do they reward and what behaviour do they discourage? What are their intellectual implications? How far does intellectual form follow
conference function, limiting time and expression in the interests of the event’s logistics? Why do people attend seminars? Why do people attend events? What are the wider significance of these common reasons? Are there other motivations for attending academic events which tend to be squeezed out in the neoliberal academy. How might we do things differently? What alternative forms can we imagine? What would the implications for the academy be of DIY academic events becoming common? We’re particularly interested in receiving articles on the political economy of conferences, seminars and workshops?

If you would like to submit an article please send mark@markcarrigan.net a 500-1500 word article, attached within the body of the e-mail, as well as biographical details to be displayed with the post.

The Media Sociology of that 'Car Crash' Farage/UKIP Interview (2014-05-17 11:30)

United Kingdom Independence Party (UKIP) – and especially its leader Nigel Farage – has been under enormous scrutiny in the run-up to the European elections next week, where UKIP is expected to score very well, embarrassing all the major parties and presaging some seats in Westminster next year. This party organizes all its policies around the idea that the UK’s departure from the European Union would improve the UK’s situation with minimum loss. (The Scottish National Party is pushing a similar line vis-à-vis the UK itself in its September referendum, but that’s another matter.) For better or worse (I think worse), this simple message has turned out to be a stroke of political genius, and UKIP is clearly trying to catch up with its fan base to appear to be a party ‘worthy of government’.

So how is UKIP doing? Probably as well as it can, which may well turn out to be good enough come polling time. Nigel Farage is certainly the best thing that has ever happened to UKIP. He is a master of the political emotions – he knows his brief, can stay on message, remain personable and roll with the punches, displaying just the right proportion of concession and indignation. He is right to think that the media is holding him and his party to a higher standard than the other parties. But this is to be expected. Outright dislike of UKIP’s policies aside, the media is doing this because UKIP leads with its extremism, whereas other parties wait until they’re in power to unleash, say, Michael Gove on the school system. Think of the interrogation that other successful party leaders would have received, had what turned out to be their flagship policies were known at election time.

Much has been made of yesterday’s radio interview with Farage by James O’Brien of LBC (London Broadcasting Company), a venerable commercial channel based on talk/news. No doubt O’Brien was on top form in pressing Farage on all sorts of tricky issues, in response to which Farage made the best fist of it. The most unfortunate part of the interview came when his communications director intervened to stop the proceedings, which ended up being the story covered in the newspapers today. Farage clearly did not want to end the interview, and frankly I’d sack the communications director for effectively implying that the event was a disaster. [1]You can judge for yourself, but up to that point I’d say Farage was holding his own against someone who clearly was gunning for him.

Now let’s think about this from the standpoint of the sociology of media. Farage’s interrogator O’Brien benefitted greatly from four things: (1) He doesn’t have a national profile, and so one can’t very easily attribute prior motives, etc. that might have biased his treatment of Farage. (2) His personal manner is like that of the flat-footed detective who is simply wanting the facts, nothing more. (3) Commercial radio is generally more much rough-and-tumble and desultory than BBC stuff. (4) The interview took place at the end of a campaign, where Farage (and other candidates) said the same things over and over, and so there has been more time to think of incisive questions.

2657
Now consider someone who does interrogate all the party leaders (and their mouthpieces) very incisively on a regular basis – regardless of where we are in the political cycle – yet doesn't get nearly the same credit. I’m not talking about Newsnight’s Jeremy Paxman, but [2]Andrew Neil of Daily Politics fame. For those old enough to remember, Neil was Rupert Murdoch’s boy at the Times during the Thatcher years and is generally known for a smart-ass, take no prisoners comic style of political commentary that can veer into the salacious. And there lies the problem. In a democratic polity, baggage can weigh one down. If you don’t share the same burdens as your viewers, they’d prefer you share no burdens at all so that they can project their fantasies about you – in the case of O’Brien, he becomes the voice of reason because he is the quintessential ‘man without qualities’.

Professor Tahir Abbas (2014-05-22 06:11:23)
Thank you for posting a very interesting topic. I thoroughly enjoyed the conversation and learned many important points about sociology.

The Centre for Social Ontology (2014-05-18 08:00)

The Centre for Social Ontology (CSO) was established in 2011 at the École polytechnique fédérale de Lausanne. Now based in the [1]Department of Sociology at the University of Warwick, its main focus is the Morphogenetic Project.

- Our monthly seminar series is due to begin in October 2014.
- Further activities are planned for next academic year.
One of the problems I had when I studied analytic philosophy was my inability to map much of what I was studying onto how I saw the world. There were a few exceptions (Hume, Marxism, Causation, Political Philosophy) but I otherwise struggled to understand what was at stake in the work we were studying. This work was presented to us in terms which stressed its interrelations but in a way which was entirely artificial: framing Locke, Berkeley, Hume against Descartes, Spinoza, Leibniz doesn’t help matters if the categories of ‘empiricists’ and ‘rationalists’ have little substantive content. I just found it dull... in retrospect I find this strange given how much I can enjoy philosophy now. For instance I recently read [1]this book which brought Leibniz and Spinoza to life for me. I found it stunning that something which had once so bored me (though at least I tried, as opposed to basically giving up when we got to Kant) could now be so intellectually gripping.

What’s obvious to me in retrospect is how little studying analytic philosophy changed how I saw the world. Weirdly, I can only think of formal logic (which I hated at the time) as having had any lasting perceptual impact on me, as being forced to learn this stuff at 18 leaves you much more attuned to non sequiturs than you might otherwise be. In contrast, sociology has radically changed how I see the world, both in a Millsian sense of ‘making the familiar strange’ but also in the sense of furnishing me with a social ontology that actually maps onto my day-to-day experience, opening out those aspects of the social world which common sense tends to close down. After this experience, going back to philosophy, I find I can get much more out of it. In the past few months I’ve been slowly reading Heidegger’s What Is Called Thinking? and a lot of Nietzsche (Ecce Homo, The Gay Science, Beyond Good and Evil, Daybreak). Suddenly, these books which I’d struggled with as an MA student (believing that my problem with philosophy was with analytic philosophy rather than with philosophy itself) make sense to me in a way that they didn’t previously.

What’s changed? These ideas map onto my own experience. They also map onto other people’s ideas. I think this is what was missing when I studied philosophy. Almost none of it mapped onto my own experience and, in retrospect, I seized upon what even vaguely did (e.g. political philosophy) out of sheer intellectual boredom. It also only mapped onto other work is a somewhat empty and formalistic way, as a function of abstracted taxonomies rather than as a multiplicity of concrete disputes. I think this is crucial to our capacity to engage with theoretical work because, without it, it remains difficult to genuinely elaborate a view upon what we are engaging with. Again, as with many things, I’d see this propositionally while resisting the impulse to reduce it to its propositional content.

My point is that theoretical argument builds upon points of agreement and disagreement. One chapter of my PhD thesis looked very closely at the account of the subject offered by Giddens and its implications for his analysis of social
change. Both he and I use the same term ‘reflexivity’ but we use it to refer to a slightly different thing. Understanding
the significance of this necessitates an appreciation of what ‘reflexivity’ means to Giddens, how it relates to his
broader conception of what the individual is and his conception of the social processes in which such individuals
are embedded. In this sense, there’s a hermeneutic moment entailed in engaging with someone’s work but, if we
leave it here, social theory remains a fragmented enterprise. My chapter rested on a further analysis of the points
of disagreement between this Giddensian account of agency and my own. So while it’s not as simple as cashing out
atomistic disagreements in propositional terms (e.g. reflexivity as monitoring vs reflexivity as deliberation) a proper
engagement necessitates an understanding of the network of disagreements.

I completely get why critical realism turns a lot of people off. In fact I sometimes find myself reticent to use the term
‘critical realism’ and instead slip into saying ‘relational realism’, ‘social realism’ or just ‘realism’. But the sort of critical
realism I like (Archer, Donati, Sayer, Elder-Vass, Porpora, Smith, the early Bhaskar and Derek Layder, though he
wouldn’t identify himself as such) is appealing to me precisely because it helps with translation of this sort. Archer’s
work in particular offers an extremely sophisticated meta-theory which is sometimes obscured by the sheer volume
of her work and her tendency to be intellectually combative. I guess what I’m saying is that these meta-theoretical
resources have proved very helpful in understanding what it is that theorists are arguing about.

This isn’t just a point about realism. I think realists can often write in a way which obscures the logic of their
disagreement with others (at its worst tending towards scholasticism: “that’s the epistemic fallacy?”, “er what’s
an epistemic fallacy?”) but the best realist critique tends to draw out ontological disagreements in very specific
terms e.g. [2]Dave Elder-Vass on ANT. One of my favourite non-realist theorists is Nicos Mouzelis. He’s adept at
precisely the sort of ‘translation’ I’m talking about. One of the things I find so helpful about his work is that much
of his engagement rests on incorporating disparate theorists into the same intellectual topology and evaluating
them in terms of this. It produces some insightful, though contentious arguments, such as his observation of the
“methodological similarities” between Foucault and Parsons (Sociological Theory: What Went Wrong? Pg 47) that
become “quite striking” once you strip away their profoundly divergent vocabularies. Ian Craib makes a similar point
in his discussion of Stuart Hall (Experiencing Identity, Pg 8) observing that if we “substitute ‘role’ and ‘role expec-
tations’ for ‘discourse’ and ‘practice’ we are close to the determinist version of the traditional sociological approach”.

My experience has been that proponents of the views that are incorporated (or relativised?) in this way can often
react with irritation. I think there’s an important line to walk between preserving the textual adequacy of readings
and tolerating what, in practice, constitutes a form of relativisation that is necessary for progress in sociological
theory. My fear is that the career structure of the modern academy mitigates against this ‘translation’ though. It
requires rather a lot of careful reading. It produces commentary rather than the novel contributions upon which
such commentary depends. But unless we can be clear about precisely what we agree and disagree upon, it’s hard
to see how progress in sociological theory could be possible.

What are conferences for? (2014-05-19 12:33)

For many years my most common nightmare scene has been an academic conference. In those dreams I am alone
in a conference hotel that is new and strange to me, and I am either lost or far from where I need to be. I know
2660
nobody there and nobody knows me or pays attention to me. But the place is always visually complicated and interesting, with hidden doors and elevators that don’t go where one thinks they will and corridors that twist and turn in surprising ways, my room moving to someplace different from where I thought it was, fascinating architectural details, my luggage disappearing, and people moving purposely toward places I don’t know about. Perhaps these dreams disqualify me from writing anything about conferences, because they seem to mean I am lost at conferences and an outsider. But then the dreams also suggest that I have worked hard over the years to find my way in the world of conferences, and maybe that means I have learned something.

Developmental Perspective

I think there is a developmental course for all of us conference attenders. I am sure that the developmental course varies a lot among us, but I think often there is a developmental evolution in what conferences one attends, what one goes to conferences for, what one gets from conferences, and the mistakes one makes concerning conferences. As a beginner I went to conferences to learn what the leaders had to say, to try to understand my fields better, to figure out what went on at conferences, and, most of all, to learn content. After a few years of conference experience I was going to conferences to hunt for jobs, to get conference presentations on my resume, to try to fit in to this or that ingroup that from the outside seemed appropriate for me, and to see what books people in my fields were publishing. Conferences helped to drive me away from some ingroups and subdisciplines. For example, I left one subdiscipline when I found that talking to the research assistants of prominent scholars I could surprisingly often elicit stories of what I considered violations of basic methodological honesty—for example, discarding outlier data only because it was implausible in terms of the researcher’s theory. I left two other subdisciplines that I aspired to because it became clear to me that I lacked the educational credentials and to some extent the legitimacy of having published on certain topics or used certain methods to ever be counted as an ingroup member. I could say that conferences have been very important to me in reality checks—ascertaining whether I fit well enough with what the people who seem to be central to the conference and the discipline or subdiscipline to which it is linked.

As I became more savvy about conferences, I became more purposeful in the sense of going to conferences only that offered a good chance to nurture my intellectual growth in areas in which I was teaching and writing, conferences where I had sufficient professional legitimacy to participate, that offered me peer group memberships that I could feel comfortable with, and that might give me some chance to publish in my areas of expertise.

Politics and Money

University life is a life in politics in the sense of jockeying, negotiating, manipulation and the like concerning resources, rewards, reputation, and influence. Publishing is political. What gets counted as knowledge is political. There is a politics to what is taught and not taught. So why would academic conferences not be political? My reaction to the politics of academic conferences has always been a mixture of fascination, disappointment, interest, realism, self-protection, playful involvement, anger, and indignation. It has been easy enough to see that in the politics of conferences there are ingroups that control things and that people who are ambitious and effectively manipulative get more of the goodies. Very good and able people may be on the outside—perhaps because they are relatively shy, perhaps because they are unwilling or unable to play the games that it takes to do well, perhaps because the topics that interest them and the approaches they use in their scholarly work are not those that powerful ingroups care for, and perhaps because of the accidents of birth and where they attended school they lack the ingroup allies that others have. I have not always been aloof from the political games. For example, I have at times been cynically planful about allying myself with some ingroup, trying to establish a new ingroup, or taking sides in political battles in ways that probably benefitted me. But then at other times I have been alienated from politics and have instead sought out my friends and acquaintances and made new friends and acquaintances and had interesting and pleasant visits but stayed away from sessions, parties, meetings, etc. in which the major political players were operating. However, the friendships I have made at conferences sometimes give me ingroup success benefits—for example, invitations to publish in edited volumes or special issues of journals, editorial board memberships, and invitations to
speak. So at conferences even friendships can be political. But mostly I like the friendships I have made because I like who I like...often people who are as disaffected as I am.

Some people gain economically from the politics of conferences. There are, of course, the job seekers, and also people who will get themselves nice raises by getting job offers or even job feelers from other places. There are people who may increase their chances of receiving grants as a result of connections they make at conferences, and these pay off economically in terms of summer salaries, annual salary raises, and perhaps opportunities for better paying jobs. Some people may earn considerable money from publishing if they connect with the proper publisher representatives at conferences or the proper textbook promoters. There are people who may earn considerable money from invitations to give lectures, to do visiting faculty work, to do webinars, and the like, and they promote themselves at conferences. And in some fields I am associated with, there are people who make impressive amounts of money offering workshops, consulting, in-service training, short courses and the like (and the money will even be greater if these activities include sales of their publications, DVDs, CDs, etc.) And they promote themselves at conferences. And the gains are not only to individuals but also to cliques and ingroups, in which people can promote one another by trading invitations to speak, writing letters of recommendation for one another, and much else.

I sometimes wish conferences were free of politics and were places where people could meet, ideas could be exchanged, various areas of scholarship could be enhanced, and merit was rewarded. And there is always some of that at conferences, but I don't think academic conferences are different from the rest of society. Politics is everywhere in society. So is manipulation for personal gain. And I suppose one could make the case that for those of us in the social sciences, academic conferences are teaching situations, offering us wonderful learning experiences on how things work in all sorts of places in society.

More on My Nightmares

My nightmares about conferences in some ways misrepresent my experience at conferences. At this point in my conference attending life, I can always count on spending conference time with friends or interesting strangers. And I know better than I did as a beginner how to find sessions that I value and how to escape those that I experience as dreary. But my nightmares also tell what I consider to be the truth in that conferences, while rich and fascinating for me, are also places of anxiety, places where I can be lost and where lots goes on that I don't understand. I often feel that others do conferences better than I and know better what they are doing. And maybe because I am not as ambitious as some or as extroverted or needy, I try to stay on the outside while still paying attention to what goes on. And yet I have also understood things well enough to at times help students, mentees, and myself to get ahead in the sense of being offered assorted leadership roles and opportunities to publish or speak.

Paul C. Rosenblatt is Professor Emeritus of Family Social Science at the University of Minnesota. He claims to be engaged in a fake retirement such that he writes, advises, teaches, and does research, but he no longer attends faculty meetings. As a multidisciplinary academic, he has often attended conferences in sociology, psychology, anthropology, the family field, the bereavement field, social psychology, cross-cultural studies, and qualitative research.
The difference between Foucault and Adorno (2014-05-20 07:02)

I'M NOT SAYING EVERYTHING IS BAD
I'M SAYING EVERYTHING IS DANGEROUS
I AM SAYING
EVERYTHING IS BAD

Bourdieu meets Marx, Gramsci, Fanon, Freire, Beauvoir and Mills (in Burawoy's imagination)  
(2014-05-20 08:00)

In this series Michael Burawoy conceives of a whole series of imagined 'meetings' between Bourdieu and leading political thinkers, elaborating his own understanding of Bourdieu's work by considering its relationship with important intellectual trends:

[1]Prefaces

[5]Resurrecting the subaltern: bodies of defiance

[7]Subaltern crowds challenge authority

[9]The state and the people, symbolic violence and physical violence

[11]Discipline, the canon and the 'imperialism of reason''

[13]Gentle violence, brutal violence and the struggle to empower women

[15]The 'Realpolitik of reason' meets the symbolic world of politics

2664
Bourdieu, symbolic order and the 'margin of freedom': four sketches for a theory of change

Epilogue

1. http://burawoy.berkeley.edu/Bourdieu/1.PREFACE.pdf

Looks like a Bourdieu church... When all Bourdieu really wanted was to seek more knowledge of our world and fight for knowledge being used to make the world a better place.

Peter Haussler (2015-02-14 10:13:02)
Great idea to converse with a 'world' of thinkers. I like particularly the 'dialogue' with Beauvoir’s view (good to remember in gender-discourse) and with Freire’s approach. We miss a debate on ‘education for the people’. It’s needed not only because of the neo-liberal (capitalist?) domination but because of the new fascinating ‘big wave’ of consumerism in our IT-world (with a formalized, minimized and ‘democratized’ communication). We need the discourse against this stream. As intellectual and popular ‘life-west’ to survive the ‘tsunami’ and, ... get a new chance to swim. For instance, discussing and politicising Habermas’ discourse-ethics in public space could do it, I think. To stop a growing sickness of observed 'self-disempowerment of people and intellectual 'self-mutilation'. What about a fictive communication on 'freedom to learn'? Michael Burawoy could invite Habermas, Benhabib and Freire; and he would be a great moderatior, I am sure. Thanks - good luck.

TV game shows and social change (2014-05-20 08:00)
The jokes are usually about the speedboats. And, granted, it is funny when two people who live somewhere in the midlands or the north of England are shown a speedboat that they have just failed to win. But there is
something revealing about the comedic response we have to old TV game shows like Bullseye. As they are recalled in nostalgic laments of memory or through the repeats made available on digital TV, these old game shows evoke the distance of time and an ironic sense of whim for the way we were 30 years ago. There is something quaint and strange about these shows. This was a time, if we believe what we are seeing, when people could win a metal tankard or handmade key fob without a crushing sense of awkward self-awareness or the need to look into the camera lens to share the joke. These shows act as a portal on the passage of cultural-time, they present to us a society that seems quite distant, alien and maybe even odd. This is despite them actually showing us an earlier version of our own cultural selves. The palette of beige and grey, the neon lights, the captions – “jackpot”, “holiday of a lifetime”, “a family fortune of...”, “TVs biggest...” – the posing models, the multipurpose sets, the applause, the innuendo, the grinning hosts, the catchphrases. I've often thought that you could use TV game shows as documents of social change, they seem to capture something of their time. Over recent months the UK Freeview channel Challenge has provided plenty opportunity to reflect on this thesis. This channel predominantly shows old episodes of TV game shows from the 1980s and early 1990s. This was something of a golden era for this type of TV format. Challenge has shown old episodes of a wide variety of shows, including Bullseye, Family Fortunes, Take Your Pick, Big Break, The Price Is Right, Strike it Lucky, Celebrity Squares, 321 and Wheel of Fortune. If we look carefully, these repeats potentially reveal more than a taste for nostalgia, they actually document some interesting social characteristics of the time – especially when compared to the few equivalent programmes of today.

Game shows today, if we can still call them that, are often centered on large cash prizes, a million pounds is often the landmark but it is nearly always in the tens-of-thousands at least. Although in some cases the prizes are knowingly small, and are delivered with an unmissable sense of irony and a calculated wink (Pointless deploys this type of approach). Back in the 1980s shows like Bullseye were built around prizes, these prizes might be seen to reveal something of the aspirations of the time. There is an overwhelming sameness to the desired lifestyles that are put on display and narrated by these prizes. From pine plant stands and canteens of cutlery to trouser presses and
hand-held video cameras. And then there are the infrequently won star prizes, a trailer tent, a caravan, a fitted
kitchen, a dining room suite, a hatchback, a speed boat. These prizes all reveal something of the aspirations of the
time, they may even say something of lifestyle choices and perhaps even social mobility. On Wheel of Fortune we
see something similar, with a pint size bottle of French perfume contained in a large glass flower, leather trouser
suits and 'his and hers' watches. These are prizes that seem to be woven with powerful social norms – embodied by
those 'his and hers' watches.

If we look across the TV games shows I've listed above, we begin to get a vision of what might have been an ideal or
utopian lifestyle to-be-desired. Waking up to a cup of tea prepared by an automatic teasmade, preparing a fondue
in a fitted kitchen, entertaining around a barbeque whilst sitting on garden furniture and sipping from a magnum of
champagne poured into champagne flutes, or perhaps gathered around a dinning room table serving from a hostess
trolley to a table decked in gold knives and forks whilst discussing our latest holiday of a lifetime – then our guests,
dressed in Italian leather jackets, drive their saloon cars home for a nightcap poured from a cut-glass decanter. These
are the types of dream lifestyles that are woven into the prizes and into the way that these objects are presented
to the contestants and viewers. They have norms bound up within them, norms that now might appear stifling in
their depiction of the lifestyles that they are scripted to be a part of. These shows, many of which were watched
by very large audiences, seem to say something about the types of want that were dominant at the time, and may
even be a precursor to the types of visions of consumerism we see today. Where the prizes in 80s and 90s game
shows were about scripted lifestyles, today's are about the consumer freedoms of money. That is to say that instead
of pre-determined objects with narratives and norms attached to them, instead now the focus is upon the limitless
possibilities of large sums of cash.

Looking back at these shows though, what is perhaps most immediately obvious is how the protagonists have become
much more media savvy. We now appear to innately understand how to behave when on television. Contestants of
the 1980s and 1990s appear unsure and uncomfortable. They are uncertain in their movements and often mumble
their way through anecdotes, furtively looking at their shoes. They appear to be wearing the clothes they would
wear to work or when at home – this is the colour palette of greys and light browns that contrast with the brightly
colored sets. They appear to be ill prepared for the experience. The knowledge of how to be media content is not
yet developed. Somewhere along the line we became more media savvy, with the confidence to speak, dress and
move in the way expected and required of a TV persona. The contestants may no longer be dressing themselves
but, if this is indeed the case, they look comfortable in the retrofit clothes provided by the stylists. People appearing
on TV no longer appear out of place or like they are participating in a disconcerting or traumatic adventure to the
unknown. They appear to know what they are doing. It is like we are now media trained as a routine part of our
socialisation processes. In the 1980s game shows in particular, and a little in the game shows of the 90s, there is
still something of the wonderment in what Graeme Turner has described as the presence of ordinary people in the
media. It is as if both the contestants and the viewers are surprised that they are a part of what is happening. They
respond accordingly. This is no longer the case, the wonderment has passed, contestants today look increasingly like
they belong – and the viewers are not surprised to see them there.

These old TV game shows are not the type of documents or artefacts that might usually be used by those interested
in understanding social change, but there is definitely something of a rich resource here for projecting an audio
and visual account of these times. I remember once visiting an art installation that simply included a TV showing
a short loop of an old game show based around a variety of pub games. There was no narrative or text, the artist
appeared to be inviting the visitor to reflect back on this historical artifact. These old TV game shows tell surprising
stories and reveal something of the time. These are audio and visual documents that depict social change. There is
definitely more to be said, but for the moment they certainly seem to say something about aspiration and how we
have become increasingly media savvy.

I would like to introduce myself as the Book Review Editor for Sociological Imagination. I am currently researching student identity in a south London school, after having taught English at Key Stages 3, 4 and 5 for many years in a college in north Manchester, and a school in south London.

We are looking to expand the number of books reviewed on Sociological Imagination. If there are particular sociology related books you are interested in reviewing, or any sociological topic areas you are passionate about, we can consider you as a prospective reviewer for Sociological Imagination. Our book reviews reach a wide audience through digital publishing: the blog, email subscribers and twitter.

Guidelines for potential Reviewers:

Reviews need to

- be between 600 and 1000 words
- relate to the themes of sociology and social theory
- offer a critical, vigorous and fair engagement with the ideas of the book
- be completed within one month of receiving the book
- usually focus solely on one book (but can compare two books in detail)

When writing a review, you should aim to respond to some of the following:

- the book's principal aims/focus/argument
- why the book is important/how it relates to current debates and trends
- the book's strengths
- who would benefit from reading the book

Please send an email with your ideas, preferred book/subject areas, and CV with current contact details to Sadia Habib, Books Reviews Editor at phdsadia@gmail.com.
The academic blogosphere, scholarly craft and the end of ‘pluralistic ignorance’ (2014-05-21 08:00)

One of many useful discussions in Howard Becker’s Writing for Social Scientists concerns ‘pluralistic ignorance’. He argues that this [1]social psychological effect manifests itself in academia in relation to writing. Academic writing is a private and isolated endeavour, in which adversity (rejections by journals, lacerating criticism, endless requests for revision) are dealt with in isolation. The proliferation of journals, writes Becker in 1983, means that every point of view can ultimately find a home. So the public markers of difficult (i.e. going unpublished) diminish at the same time as private difficulties remain or may even increase, as the proliferation of journals goes hand-in-hand with a pluralisation of standards, meaning that navigating the submission process becomes a more complex and less predictable task. This results in a state of affairs where “Everyone thinks that everyone else is getting it done” and “They keep their difficulties to themselves” (pg 21). The privatised character of the process means that “sociological writers do not develop a culture, a body of shared solutions to their shared problems” because no peer group has the same problem (pg 20). In its absence, the tendency is to assume that everyone else copes with writing without problems.

It’s in this context that I find ‘craft’ so interesting. In a descriptive sense, I think of ‘craft’ as encompassing the practical activity involved in creative production. So it’s all the practical embodied things involved in academic writing, as well as the order in which they fit together into a sequence. The concept provides a normative standard, in the substantive perspective it offers from which to critique instrumentalism, but there is also a normative dimension to the practices designated by the concept. To engage with craft involves an encounter with standards inherent to the practice, though of course our acquaintance with those standards is fallible and constrained by our circumstances. I like Richard Sennett’s account of this:

Craftsmanship names an enduring, basic human impulse, the desire to do a job well for its own sake. Craftsmanship cuts a far wider swath than skilled manual labour; it serves the computer programmer, the doctor, and the artist; parenting improves when it is practiced as a skilled craft, as does citizenship. In all these domains, craftsmanship focuses on objective standards, on the thing in itself. Social and economic conditions, however, often stand in the way of the craftsman’s discipline and commitment; schools may fail to provide the tools to do good work, and workplaces may not truly value the aspiration for quality. And though craftsmanship can reward an individual with a sense of pride in work, this reward is not simple. The craftsman often faces conflicting objective standards of excellence; the desire to do something well for its own sake can be impaired by competitive pressures, by frustration, or by obsession.

Richard Sennett, The Craftsman, pg. 9

Assuming you accept the coherency of ‘academic craft’, variegated in terms of disciplines and traditions, it becomes increasingly curious that there’s no "body of shared solutions" of the form invoked by Becker. Tricks of the Trade* might be passed on by supervisors or within networks of friends and colleagues. But there’s a striking absence of
a public stock of knowledge, a common culture orientated towards practical affairs that is tied in with professionalisation. I think something of this is captured in the notion of 'professional socialisation' but that this framing is a symptom of the problem rather than a potential solution to it. I think it also inevitably enters into training in methods and methodology, with questions of technique coming closest to the more everyday conception of 'craft'. But it still seems there's something rather major that is conspicuous by its absence.

The prominence of 'craft' in professional consciousness is inversely proportional to pluralistic ignorance of the sort Becker describes. The more people talk about the practicalities of doing writing, the less room there is for the assumption that everyone else finds it easy and one's own difficulties are unusual. But discussions of writing will tend to be marginal in traditional modes of publication. There are only so many books about writing that social scientists are ever going to produce. There are only so many books about writing that social scientists are every going to buy. Likewise I suspect that market forces will tend to push these towards the lowest common denominator, though of course there are many exceptions to this.

However the academic blogosphere and the academic twittersphere, to use two terms I hate, seem obviously amenable to these discussions. They create a space for them that was previously absent. Furthermore, the market constraints which perhaps mitigate against discussions of craft in traditional publishing could be said to encourage it in a way in the space of academic blogs. My experience on this site and sociologicalimagination.org has been that discussions of writing, professional practice and higher education tend to attract much more attention online and they circulate further on social media. The influence of these 'market forces' on academic blogging is a complex issue, representing a problem in many ways, but I think this is one way in which they can be helpful. To anyone trying to build an audience for a blog, it creates an incentive for them to reflect on scholarly practice in a way they might not otherwise. In this sense, I think that the academic blogosphere might involve a tendency to go against the grain of a broader trend within social science that C Wright Mills was fulminating against over half a century ago:

Be a good craftsman: Avoid any rigid set of procedures. Above all, seek to develop and to use the sociological imagination. Avoid the fetishism of method and technique. Urge the rehabilitation of the unpretentious intellectual craftsman, and try to become such a craftsman yourself. Let every man be his own methodologist: let every man be his own theorist; let theory and method again become part of the practice of craft. Stand for the primary of the individual scholar; stand opposite to the ascendancy of research teams of technicians. Be one mind that is on its own confronting the problems of man and society.

C Wright Mills, The Sociological Imagination, Pg 224

*To use another catchy term of Becker’s. He has a knack for them.

**This is a completely speculative idea that only occurred to me when writing the post.

Are you confused by critical realism? (2014-05-22 08:00)

If so then this glossary might be a helpful resource:

- [1] Absence
- [2] Actualism
- [3] Change
- [4] Closed and Open Systems
- [5] Completion
- [6] Constellation
- [7] Critique and Transcendental Argument
- [8] Determinism
- [9] Dialectics
- [10] Differentiation and Stratification
- [12] Epistemic and Ontic Fallacies
- [13] Epistemic Relativism and Judgmental Rationality
- [14] Ethical Naturalism and Moral Realism
- [15] Explanation
- [16] Fact-Value
- [17] Facts
- [18] Laws
- [19] Metaphysics
- [20] Ontological Extensionalism
- [21] Ontological Monovalence
- [22] Reasons as Causes
- [23] Retroduction and Retrodiction
- [24] Strong and Weak Actualism
- [25] Transdictive Complex
- [26] Transitive and Intransitive Dimensions
- [27] Truth
Why disappointment? In common usage, and in the dictionary, we talk about disappointment as what happens, what we feel, when something we expect, intend, or hope for or desire does not materialise. One of the difficulties of living in our world is that it is perhaps increasingly less clear exactly what we might expect or hope for or desire. In fact, these words mean different things. The most basic is desire: it carries connotations of needing urgently, yearning, to the point almost of trying to will something into existence. Sometimes we desire something so completely that we revert to our infant selves and scream, metaphorically or in reality, in the hope that our desire may be realised – just as, if we were lucky, the milk used to appear in response to our screams from the cot.

Ian Craib, The Importance of Disappointment, Pg 3

In this [1]thoughtful book Ian Craib argues that ‘disappointment’ is an integral aspect of human life which increasingly finds itself denied by dominant tendencies within anglo-american culture. I think what he’s getting at relates to something which Andrew Sayer describes in terms of the ubiquity of dilemmas in our lives. We constantly face ‘tough choices’** that elude resolution, forcing us to choose the least worst option or avoid the moment of choice at the cost of inertia. But we seek to deny the unavoidability of such choices. We wish to avoid consequences other than those we seek. We wish to avoid waiting. As Craib puts it,

Some part of us wants immediate satisfaction, wants it all and wants it now, and whilst we might try to rationalise this away with our knowledge that it is unreasonable, our gut reactions belie our heads ... I spend my life surrounded by other people, who are more or less independent of me and constantly doing things on their account. As a consequence, I have to adjust to them. If I am to control my own life, then I will first have to control the lives of all those around me.

Ian Craib, The Importance of Disappointment, Pg 5-7

Disappointment has its roots in the social world and this is why dilemmas are ubiquitous in society. Craib’s argument is that “there is much about our modern world that increases disappointment and at the same time encourages us to hide from it: to act as if what is good in life does not entail the bad – for example, that we can love and be loved by another person without having to give up other aspects of our lives” (pg vii). Disappointment is irrevocably bound up with ambivalence because “nothing is ever simply ‘good’ or ‘bad’, and most things are at the same time good and bad” (pg 2). This entails a perpetual remainder, uncomfortable left overs to our decisions which run contrary to what we expected and hoped for. Craib’s point is two-fold. Firstly, disappointment is unavoidable in this sense regardless
of the social context. Secondly, there are peculiar features of our social context which encourage problematic tendencies in how we react to disappointment.

He brings this point to life in his discussion of relationships and intimacy, drawing on the use Giddens makes of self-help books in his work on late modernity to develop a critique of ‘the powerful self and its illusions’. He takes issue with a tendency to see ‘emotional satisfaction’ as the central basis for intimate relationships, arguing that with this “our primitive fantasies of complete satisfaction are brought into play”:

The simple question 'Is everyone OK?' carries a whole impossible world of satisfactions, one loaded with so much feeling that the thought that things might not be OK is enough for the speaker to consider flying from the relationship. The demand for the impossible is at the centre of this type of intimacy; the tragedy is that it prevents us from seeing or learning from its impossibility. If everything is not OK, we do not learn but seek out another relationship in which it might be OK. If we fall in love, then the decline of being in love, whether slow or fast, is felt as a failure rather than a deepening of our understanding of the world and the reality of the other person. The speaker's sense of 'never being satisfied' is an accurate perception of internal and external reality, but it is experienced not as knowledge and understanding but as failure and deficiency.

Ian Craib, The Importance of Disappointment, Pg 123-124

Intimate life is perhaps an extreme case of a broader tendency, with this disposition to flee in the face of dissatisfaction (“if we’re not happy then the relationship must be wrong”) matched by a milder, though no less problematic, intolerance for unhappiness in other spheres of personal life. Our failure to accept disappointment, those aspects of life which are unwelcome and unexpected, leaves us perpetually moving and problem solving. We can’t live with our choices or sit with their consequences. Our actions can never bring about their consequences in the straightforward way that the ‘illusions of the powerful self’ lead us to expect. Our relationships of all kinds inevitably elude our capacities to control them because “when two people come together in this way, what happens between them is less a matter of conscious control and planning (although that enters into it) than emotional attachment and interlocking that makes such control difficult” (pg 127).

What much of this comes down to is “a desire to get out of the mess of life” as Craib memorably puts it (pg 131). In advocating the importance of disappointment Craib is suggesting we must live with mess. Not necessarily live with this mess but with mess as such. So we shouldn’t resign ourselves passively to our circumstances but we should resist the temptation to allow our responses to those circumstances to be dictated by an illusory image of the absence of mess. There’s nothing wrong with trying to order our lives but there is something mistaken about expecting this goal to be achieved. At best it’s something fleeting and the mess will always return.

Our choices not bringing us the satisfaction we hoped for does not mean our choices were wrong. Our life encompassing periods of dissatisfaction does not mean there is a problem that must be solved***. These are the fantasies of an omnipotent self. In pursuing them, informed by a self-image of our potential for self-control, we preclude the satisfactions which are their ultimate object. The problem solving often is the problem and Craib is intensely critical of the tendency of therapy to get drawn into supporting this behaviour and reinforcing the cultural trends underlying it.
Though I can’t for the life of me find where he does this, leaving me to wonder if I’ve imagined it. I’m really starting to regret the hundreds of books I read as a PhD student that I didn’t put into a reference manager.

**I wonder if there is a kernel of truth underlying the spread of this political platitude? If a repudiation of disappointment is as widespread as Craib suggests, what are the implications of this for political culture?

***While I’d trenchantly resist the reduction of political issues to psychoanalytical ones, it did occur to me that Craib’s argument could be leveraged into an intriguing critique of the ‘modernising’ tendency within political parties.

1. [http://books.google.co.uk/books/about/The_Importance_of_Disappointment.html?id=P5F01t-poxQC&redir_esc=y](http://books.google.co.uk/books/about/The_Importance_of_Disappointment.html?id=P5F01t-poxQC&redir_esc=y)

CfP: BSA Activism in Sociology Forum (2014-05-24 08:00)

BSA Activism in Sociology Forum welcomes new contributions from both established and early career researchers as well as sociologists outside of academia to share their hands-on activist experiences or reflections. Contributors are welcome to produce a new piece built around, but not limited to, the themes below or to respond to any future published pieces on the blog:

- Reflections on public sociology as an approach to the discipline in transcending the academy in order to engage with wider audiences
- Debates over public policy, political activism and the purposes of social movements
- The extra-academic purpose of sociology
- Turning private concerns into public issues (C Wright Mills, 1959)
- What’s the future of public Sociology?
- Applied sociology and “sociological practice” how we can use sociological knowledge in an applied setting
- Practicalities associated with field research: field access; collaboration with local partners
- Relationship between the researcher and the researched: researcher’s positionality; power relations; insider-outsider dichotomy; boundary crossing
- Research ethics an public sociology
If interested in contributing to the blog, please contact convenors ([1]bsaactivism@gmail.com) with your ideas including (1) a detailed abstract (about 200 words), (2) a brief biography (you may also wish to publish anonymously). The total length of each contribution can be around 500-2,000 words.

Best wishes, Jenny

How capitalism survives? A Marxist-Feminist perspective

Call for Papers within the framework of the 11th Historical Materialism Annual Conference 'How Capitalism Survives' – 6-9 November 2014 – Vernon Square, Central London

The Historical Materialism annual conference in London has emerged as a pivotal site for critical, engaged, constructive, and provocative scholarship and activism internationally. This is a fitting place for focusing the (re)emergence of Marxist-Feminist historical materialist analysis. Now in our third year at HM, the 2014 Marxist-Feminist stream of the conference is seeking contributions that continue in the tradition of dynamic and original reflections of previous years, and also those that press the boundaries and take on the bold challenges posed by debates old and new.

The question ‘how capitalism survives?’ resonates strongly with a range of feminist critiques on the Left. In the 21st century this question invites us to revisit the history of capitalism and patriarchy in their myriad entanglements as well as to analyse the daily (re)construction of a globally dominant socio-economic model that thrives on gendered and racial asymmetries.

The Marxist-Feminist stream this year wishes to deepen our understanding of the mechanisms that make the reproduction of capitalism possible in the very sites that constitute an ‘everyday life’ where exploitation and struggle are actualised or forestalled. We are also interested in analysing the continuities, discontinuities and mutations of the capitalism & patriarchy nexus from the age of empire all the way to contemporary neo-colonialisms. Such colonial projects may involve anything from territorially-based extraction of surplus value to the production of individual and collective subjectivities.

This year’s conference theme hopes to provide an opportunity to think in truly interdisciplinary fashion about how ‘we’ participate in sustaining capitalism as a reality of intersecting modalities of exploitation. To offer just one obvious example, today the exploitation of women by women has become indispensable to sustaining contemporary capitalism as a planetary biopolitics.
On the basis of the above, we invite papers that may address (but are not limited to) the following themes and/or questions, here presented in random order:

• Critical descriptions of capitalism across Marxism and feminism from feminism’s ‘first wave’ to the present

• Social reproduction and capitalist transformation: micro and macro-analyses

• Instances of success and failure in Marxist-Feminist struggles from the 19th to the 21st centuries

• In what particular ways does the ‘feminisation’ of labour help capitalism survive?

• Are new concepts and methodologies needed to understand women’s roles in capitalism’s ways of overcoming the recent crisis?

• How do the crises of capitalism help generate or overcome otherness (understood in gendered and/or racial terms)?

• Women and queer subjects’ roles in the rise of new capitalist economies and in the assumed decline of Western capitalism

• Homophobia and homonationalism before and after 9/11

• Moving borders, regenerating boundaries: states, bodies, temporality

• Ecosocialism, ecofeminism, ecology: narratives of change or scripts of subjugation?

• Revolution and reform in the theories of Marxist-feminism

• Racism, femonationalism, Islamophobia: the bigger picture

• Intersections of Marxism, feminism, critical race and postcolonial theories

• Sexual assault, rape and resistance

• Women in contemporary liberation struggles

• Marxist feminism and intersectionality theories

• Women’s art, film, music literature: subversion or reproduction of capitalist relations of production?
• Feminism and the reproduction of the capitalist art world

• Women in the communist/socialist tradition: Luxemburg, Zetkin, Kollontai, and others

• Welfare and the political economy of care

• Contemporary sexual politics: resistance to or empowerment of capitalism?

• Violence, fascism, Marxism and Feminism

• Separatism or participation? The case for the 21st century

• Feminism and the institutions of capitalism

• Gender, race and international migration

• Uniting forces: what does an interdisciplinary Marxist feminist theory would look like?

Paper proposals should be max 200 words. When submitting your proposal, please indicate the theme to which your paper could contribute.

Please note that we welcome panel proposals. When you submit a panel proposal, please send an abstract of the general theme of the panel (max 300 words) together with the abstracts of the individual papers in the panel. For individual paper proposals, it is helpful to indicate the theme (above) to which your paper could contribute. This will help us to compose the panels. Panels and individual papers should be submitted by June 1st to: [1]http://www.historicalmaterialism.org/conferences/annual11/submit

Please be aware that the conference is self-funded; therefore we are unable to help with travel and accommodation costs.

The stream is organised by: Abigail Bakan, Angela Dimitrikaki, Sue Ferguson, Sara Farris, Genevieve LeBaron and Nina Power.

What is progress in social theory? (2014-05-26 08:00)

At last year’s International Association for Critical Realism conference, I saw perhaps the most impressive conference presentation I’d witnessed in my five or six years of going to conferences regularly. [1]Jamie Morgan demolished the
notion of 'norm circles' offered by Dave Elder-Vass and he did so in a way which made a whole host of important meta-theoretical points about the purposes of social theory (while also avoiding making the whole exercise feel at all personal, despite the fact he was kicking down something Elder-Vass had spent the last five or six years building up). The overarching purpose of the exercise was to ask what constitutes progress in social theory. As Morgan says in his write-up of this paper, "it is an issue that becomes significant for any social theory that survives long enough to become a general and recognized position with a range of proponents" (115). As a theoretical position becomes entrenched, internally differentiated into multiple strands with varying degrees of complementarity, it becomes increasingly important to ask what constitutes a progressive development in that position.

On this sort of meta-theoretical level, I'm not sure critical realism is in particularly good health (even if there are events taking place at an institutional level which could leave it stronger than ever). The internal differentiation has become quite pronounced. There's the obvious distinction between 'basic' critical realism*, dialectical critical realism and the meta-reality stuff. But we might also distinguish between systems theoretical strands, relational realism, Marxist orientated realism. Or even perhaps in terms of disciplinary divisions which express themselves in divergent interests, sensitivities, proclivities etc (e.g. sociology, human geography, economics, philosophy). Only the first set of distinctions are ones that are established sites for explicit identification (e.g. I have pretty much zero interest in anything other than 'basic' critical realism) but this doesn't mean the other distinctions aren't real. They are differences and fault lines within the theoretical corpus, encountered in unpredictable ways through engagement with critical realist thought. Furthermore, there are explicit identities and social networks which emerge, unfold and change across these fault lines (and in turn contribute to the restructuring of this internal differentiation). Some of these stem from supervisory arrangements or recurrent face-to-face meetings (e.g. there's a definite network connected to Tony Lawson and the Cambridge Social Ontology Group) to the other end of the spectrum, with networks which might be 'virtual' or even in some cases 'imagined', constituted through textual engagements with real effects but nonetheless in the absence of personal relations.

This multi-dimensional complexity is something likely to grow with an intellectual movement (which I think is a more accurate term than 'position') that is sufficiently entrenched, intellectually and institutionally, to avoid gradual dissipation. But very particular risks inhere in security of this sort, as an intellectual movement becomes sufficiently settled to give rise to successive generations of theorists. These are amplified by the necessity for individual scholars to establish a career, with the attendant pressures to publish widely, find some novel framing of an existing issue and generally to capture the attention space within an environment where a publications arms race mitigates against holding anyone's attention for long. These broader circumstances can tend to distort what counts as 'progress', making it ever more important to be explicitly clear about this as a guiding norm on a meta-theoretical level. Jamie Morgan's argument is very helpful in understanding the intellectual implications of this:

This then is considered progress – lacks, inconsistencies, tensions and contradictions are highlighted and some development then follows. This development is typically inferred to be, by virtue of the very process, more 'adequate'. However, the meaning frame of adequate here can gradually become ambiguous. Though realism in particular is sensitive to epistemic fallibility and to the potential for an epistemic fallacy – and ultimately ontology is theory so one is careful to never assert a definite identity between ontology and reality – the originating point of the exercise is to under-labour for more adequate accounts of reality. As such, one can ask in what sense the development has actually enhanced one's understanding of or capacity to undertake further explanatory investigations of reality ... 'Adequacy' can be directed towards internal projects of social theory addressing aspects of social theory for purposes other than demonstrated adequacy for accounts of reality. They can be about finding difference or reformulating what is actually similar, where both may perhaps be in some sense a non-problem. Furthermore, they can involve the pursuit of categorizations or taxonomies that are then
justified as no more than 'consistent with the existing realist ontology'. The development may then focus on placing an existing alternative framework over the same conceptual terrain – the matter of dispute can then become difference among the positions and where one set of potential weaknesses is traded for another in terms of conceptual critique. (116-117)

This is an extremely clear and succinct formulation of what I was struggling to say [5]here. I take Morgan to be saying that a criterion of ‘progress’ is necessary because of the worrying tendency for intellectual movements to tilt towards discursive elaboration, as elaboration comes to hinge on internal points of agreement and disagreement in a way that contributes to the ideational density of the theoretical corpus. It becomes an arcane world, with its own taken for granted axioms, obscure vocabulary and in group / out group distinctions. Sound familiar? This is why the link between theoretical research and empirical research is so important (I say as someone who’s clearly a much better theorist than I am a social researcher but pursues the latter nonetheless). Realist theorists have a tendency to make pronouncements about the ontological regulation of empirical research, which I largely agree with though the point can be overstated. However I think a much more important (and interesting) issue is the empirical regulation of ontological research.

So an important question to ask is: what is ontology for? What is social theory for? What is sociological theory for? These are the questions I’m naturally drawn to, though they’re also ones which tend to be suppressed by structural and cultural tendencies towards growing ideational density in any established theoretical position. As a body of ideas becomes ever denser, more rife with internal distinctions and specialised vocabulary, it’s very easy to lose sight of the underlying question: what is the point of this body of ideas?

*The term 'basic critical realism' rather irritates me.

When I attended Jesuit prep school in the mid-1970s, I bought the second edition of Thomas Kuhn’s The Structure of Scientific Revolution, but it was a version that still reflected its origin as the final volume of the logical positivists’ International Encyclopedia of Unified Science. Despite its relatively few pages, the book’s format was large and pink, with the ‘in your face’ lettering of the day (1970). I say ‘was’ because my heavily annotated copy mysteriously disappeared from my office in Durham when I was professor there in the 1990s and working on Thomas Kuhn: A Philosophical History for Our Times (U Chicago Press, 2000). (Anyone who knows my office now will not find the prospect of theft a surprise.) I think I know who stole it – a smart, self-made guy from Scarborough with a
Thatcher/Blair admiration of the USA. In any case, whoever possesses the original inserts, which functioned as bookmarks, they will see my drawings of the Rolling Stones logo (Mick Jagger’s lips, teeth and tongue), reflecting my own expression of the two-finger salute to the establishment. But of course, that was before blogs gave us the capacity to express outrage in a medium other than the one that elicited it. Nowadays we would call it ‘punk sociology in action’.

Digital sociology and the coming crisis of qualitative research (2014-05-27 08:00)

This is a deliberately provocative title. But an interesting post by patter reminded me of a theme that has been on my mind for a couple of years. Pat’s post concerns the implications of the increased ‘findability’ of qualitative researchers for their practice:

Once you know where someone works, a lot more detail comes within reach. Because of this ‘findability’ it’s almost impossible these days for someone who is a practitioner researcher or auto-ethnographer to completely disguise their location and their participants because they themselves are locatable. Teacher-researchers for instance all work at a school which can be found simply via tracking them. Schools generally have websites which often have the names of all staff as well as pictures of students doing things. They put their newsletters on line. It’s not too hard then for someone who is so-minded to pick up a teacher-practitioner thesis, get to the name of the school, identify some of the people involved in the research and possibly even find pictures and names of the staff and students who feature in the thesis as anonymised persona.

I was recently in a viva where one of the examiners did just this online detective work, as a way of raising with the practitioner-researcher the dilemma of whether it was actually possible to promise anonymity. It had taken less than five minutes for this examiner to track down the exact location of the research site and find out the identities of some of the people involved in the research. Now the examiner wasn’t doing this to be nasty or invasive, but to raise the question of how, in the kind of data-dense world in which we now live, it is actually feasible to guarantee anonymity in the way we once did.

The question of identification of course goes beyond practitioner research. We are wrestling with anonymity in one of my current research projects. Because of the specificity of what particular sites offer it won’t be too difficult to work out who some of them are.

These are issues that have really troubled me in the past six months or so, as I finally handed in my PhD which involved a two year longitudinal study. I’ve deliberately decided not to blog about this and I’m not going to start now. But I sometimes wonder if the full significance of this transformation of the field of research is understood by qualitative researchers. I completely agree with patter’s claim that “these tricky issues are not going away” and that
“they will become more and more tricky the more we amass digital footprints and interlocking and enormous data bases”.

From a more positive standpoint, my experience with conducting asexuality research (as well as being involved as an ally in asexual visibility activism) has left me with a sense of the actually rather positive implications of the same process for public sociology. It’s much easier to sustain relationships with communities you research* and, more so, it’s possible to do so in a way which is helpful to those communities, as well as to yourself as a researcher.

But it does necessitate a very different form of engagement. I’ve written more about this [3]here. The field of research is changing and qualitative researchers need to expand the repertoire of strategies through which they sustain relationships with their participants. If we can do so then there’s a real possibility for a more publicly orientated qualitative research, grounded in ongoing relationships and shared commitments, embodying a more equal relationship between researchers and those they research. But I think real problems will emerge if we can’t do this. In fact, as Patter points out, they’re already emerging.

*Note I’m not saying this didn’t happen prior to the emergence of social media. Clearly it did and on a large scale. I’m saying that the environment will increasingly **demand** it, as opposed to it being solely a function of the personal commitments of researchers.

Kate (2014-06-20 00:05:21)

I wonder how exclusively contemporary this issue is. If, for an example off the top of my head, you look at Taylor and Cohen’s "Psychological survival" based in a specific, high security prison with a specific, small population, anonymity is a fragile, easily questionable thing. I’m not sure how utterly different is the contemporary position. Our sensitivities however, and priorities have shifted markedly. Perhaps this is where the biggest changes are truly perceptible...

Sociological Imagination (2014-06-20 07:30:23)

Hi I definitely agree and thanks for such an interesting example! I’m trying to say it’s becoming more common now but not that it’s exclusively contemporary.

Simon Lidington (2014-09-18 19:49:08)

I thought you might like to know about Big Sofa. Our technology allows you to search video verbatim and take a grounded theory approach to building concepts, constructs, themes etc from open ended data. Being a sociologist myself (1972-75 Exeter University) who still retains copies of The Sociological Imagination to give to budding researchers - and also being an erstwhile social researcher, I started developing this over 5 years ago. It’s now being used by researchers across the world.
intriguing name!

Perhaps these concerns are something anthropology and anthropologists can help you to better understand. They have been discussing these issues since the 1970s

** Trafficked Filipino Teachers in the USA (2014-05-28 08:00)**

I just read [1] an article about something new and shocking to me - qualified teachers of mathematics (and other subjects) from the Philippines who are recruited on one-year contracts to teach in USA public schools, but often end up in appalling working and employment conditions:

"Between 2007 and 2009, [2]350 Filipino teachers arrived in Louisiana, excited for the opportunity to teach math and science in public schools throughout the state. They'd been recruited through a company called [3]Universal Placement International Inc., which professes on its website to "successfully place teachers in different schools thru out [sic] the United States." As a lawsuit [4] later revealed, however, their journey through the American public school system was fraught with abuse.

According to court documents, Lourdes Navarro, chief recruiter and head of Universal Placement, made applicants [5] pay a whopping $12,550 in interview and "processing fees" before they'd even left the Philippines. But the exploitation didn't stop there. Immediately after the teachers landed in LAX, Navarro coerced them into signing a contract paying her 10 percent of their [6] first and second years' salaries; she threatened those who refused with [7] instant deportation. Even after they started at their schools, Navarro kept the teachers dependent on her by only obtaining them one-year visas before exorbitantly charging them for an annual renewal fee. She also confiscated their passports."

The article continues with an interesting analysis of the underlying problems in education and the neoliberal economy:

The idea that new teachers should be imported from halfway around the world for yearlong stints, knowing no background about the communities they are entering and the content relevant to them, is only justified if the teacher is reduced to an instrument of standardized information transmission. And if teachers are just such instruments, why not search the global market for the cheapest, most malleable ones possible? [...] for corporate recruiters and their district clients, finding the right match for a school is not about teacher quality or experience, but rather cost and expendability. The phenomenon of teacher trafficking, then, doesn't rest entirely on recruiters' mercenary tendencies or districts' drive to cheapen their labor. It also rests on the larger neoliberal conception of workers. In this case, teachers become moveable parts, switched out in accordance with the iron laws of supply and demand in order to more efficiently output successful test scores, whose value comes to represent students themselves.

There is, however, something that worries me in the article. It also talks of "Teach For the Philippines" and its mother scheme, Teach for America, as a "global empire". Although I can see how this scheme is part of the same complex of problems - not enough teachers in poorer countries, exacerbated by richer countries "poaching" teachers from poor
countries - the disparaging analysis of "Teach for X" took me aback. I know only very good things about a similar scheme in Bulgaria. I would like to read more - if you read this and want to recommend me something to read about "Teach for X", please do.

Computational Social Science Conference (2014-05-28 12:29)

COMPUTATIONAL SOCIAL SCIENCE CONFERENCE

Wed 11
-
Fri 13 June 2014
, University of Warwick, UK

The increasing availability of large quantities of human behavioural data has drawn the interest of researchers across the social sciences, the natural sciences and engineering. This conference aims to bring together this interdisciplinary community to share perspectives and identify opportunities to gain new insights into human behaviour and decision making.

Keynotes will be given by

* Steven Koonin, NYU CUSP
* Neil Johnson, University of Miami
* H. Eugene Stanley, Boston University
The full programme and list of invited speakers can be found at [2]http://compsocsci.eu/programme/

Attendance at the Computational Social Science Conference is free, but requires registration. Participants may submit posters for presentation, and may also apply for accommodation in Warwick’s on-campus conference centre. We encourage you to apply as soon as possible, as availability is limited.

If you would like to attend, please register here: [3]http://compsocsci.eu/registration/

We look forward to welcoming you to Warwick!

ORGANISING COMMITTEE

* Suzy Moat, Warwick Business School

* Mark Carrigan, Warwick Business School

* Tobias Preis, Warwick Business School

An Invitation to DIY Sociology (2014-05-29 08:00)

For the last few months I’ve been playing with the idea of DIY Sociology, largely as a result of my [1]dissatisfaction with professional associations. The intuition underlying this is that the institutional forms of academic life are not immutable, arising in a particular context and changing as that context changes, so that a relational reflexivity about them becomes ever more important if that context is undergoing a radical change. Would anyone deny that higher education in the UK is currently undergoing a ‘radical change’? One of the most immediately experienced forms taken by this change is the contraction of the academic labour market, the normalisation of fixed term contracts and the rise of what could (optimistically) be labelled ‘portfolio careers’ but can more realistically be termed precarious working. The implications of these changes for professional associations seem obvious to me and I have no great desire to rehearse my own frustrations to this end.

But what does ‘DIY’ mean more broadly? Dave Beer offers some useful answers to this question in [2]Punk Sociology: “A Do-it-yourself movement, in which forms of communication, creativity, and dissemination are co-opted to work
towards this shared project”. This is what I mean by ‘relational reflexivity’. Not an individualistic ‘dropping out’ of the ‘mainstream’ but a converging orientation towards shared projects and shared values, working collectively towards their pursuit. Here are some other points in Punk Sociology where Beer writes about the 'DIY ethic':

The roughness of the music was a part of the iconoclasm of the movement and the projection of its DIY ethic. This DIY ethic, for some, is central to punk, as Kugelberg (2012: 46) writes, the 'legacy of punk is simple: the immediate implementation of D.I.Y grassroots culture ... No distance. Form a band, start a blog, become an artist, a DJ, a guitar player, an editor'. This DIY ethic played out in a number of ways, in the music and in the business practices, but it was perhaps most clearly honed in the use of self-publication and alternative means of communication that often took the material form of fanzines. As Hebdige described (1979: 111), ‘fanzines (Sniffin Glue, Ripped and Torn, etc.) were journals edited by an individual or a group, consisting of reviews, editorials and interviews with prominent punks, produced on a small scale as cheaply as possible, stapled together and distributed through a small number of sympathetic outlets’. Clearly the communicative possibilities and media have changed radically since the mid to late 1970s, and the possibilities for decentralized communication are now widespread in social media (which I will return to in Chapter 5).

The driving force here is a strong commitment to a pro-activism that is often expressed as the do-it-yourself or DIY ethic. The DIY ethic is an extension of the inventiveness of punk and affords an unbounded engagement with the cultural world. This leads punks to use the opportunities and materials that they encounter to express their creative forces. This is often highly opportunistic and is based upon the use of media and social networks in new and unpredictable ways. The punk finds a way to make things happen and finds a way to be unconventional in carving out pathways of expression and communication. The punk adapts to the terrain in which they are operating and refuses to be restricted by the limitations of access and funding. Punk is based on resourcefulness.

Conventions do not hold them back, and the idea of playing it safe is discordant with its central motifs. The driving force here is a strong commitment to a pro-activism that is often expressed as the do-it-yourself or DIY ethic. The DIY ethic is an extension of the inventiveness of punk and affords an unbounded engagement with the cultural world. This leads punks to use the opportunities and materials that they encounter to express their creative forces. This is often highly opportunistic and is based upon the use of media and social networks in new and unpredictable ways. The punk finds a way to make things happen and finds a way to be unconventional in carving out pathways of expression and communication. The punk adapts to the terrain in which they are operating and refuses to be restricted by the limitations of access and funding. Punk is based on resourcefulness.

The debates about 'public sociology' (Clawson et al., 2007) and sociology's 'public face' (Holmwood & Scott, 2007) were formulated before these media developments took hold. As such they need to be re-imagined to tally with the ongoing remediation of everyday life. The punk sociologist would seek to
understand and work with this remediation. The dissemination practices of the punk movement – based on hand written, cut-and-pasted, and self-printed fanzines distributed through shops and at gigs – might seem small in comparison, but it is the aesthetics of these practices and the creative and unconstrained attempts at novel types of communication that we might borrow from punk. The materials might have changed but we can find inspiration in the sentiment and in the drive to co-opt media and materials in communicating ideas.

The punk sociologist is going to need to be inventive in responding to their conditions, in working around the limitations of the austere neoliberal structures in which they are operating, and in finding opportunities that counteract the limitations of funding and powerful constraining norms and conventions. One way forward is to reflect on the boldness and inventiveness of punk, but more specifically we might look to take on the Do-It-Yourself ethic of the punk movement.

Those interested in what is described as digital sociology are also tending to use DIY means of communication, with social media outlets such as Twitter and blogs being used to publish and disseminate ideas in various stages of development. We perhaps have something here that is suggestive of how this inventiveness and DIY ethic might be deployed.

So we can perhaps isolate two strands here: communication and organisation. What unites them both is a disinterest in established forms of authority and prestigious modes of dissemination. The point is not to oppose these things for their own sake but instead to subordinate these characteristics to the accomplishment of a shared project. The key values which informs both DIY communication and DIY organisation are resourcefulness, inventiveness and boldness. There’s [3]lots of existing activity which exhibits these characteristics, whether or not it sees itself as in way ‘DIY’. I’m interested in trying to conceptualise this tendency in order to better think through its implications for higher education. I’m also curious about the self-understanding of those engaged in it. Is it possible many see this as a pragmatic adaptation to marginal conditions rather than something positive in and of itself?

Simon Smith (2014-06-01 03:11:24)
15 years ago, when I was researching my PhD on the social and political meanings of independent culture in communist Czechoslovakia, I recall my frequent self-doubts about whether I risked romanticising those social practices - like samizdat, i.e. illegal self-publishing - that people had adopted or invented out of sheer necessity - "a pragmatic adaption to marginal conditions" to borrow your words. Member checking didn’t help very much to reassure me, because my respondents often confessed to having similar doubts when they found themselves reflecting nostalgically on those times. The source of that occasional nostalgia appeared to be the experience of having time (endless time) for activities like reading, writing and
sharing the products of that DIY cultural industry that emerged behind the scenes of the so-called ‘official culture’. Time they found themselves lacking in their typically hectic lives in a democratic society and market economy. But when I probed them about whether it would be possible to recreate something like samizat in today’s world, and recover that sense of lost time, they mostly dismissed the idea - quickly adding that the benefits of democratisation far outweigh the losses. That was all before the world of blogging and online social networks came along. Today you do find some people prepared to draw an analogy between samizat and blogging, for example. But if academics are adopting similar tactics to resist what Brandist calls the Stalinist management model of the contemporary university (http://www.timeshighereducation.co.uk/comment/opinion/a-very-stalinist-management-model/2013616.article), it seems slightly paradoxical that chosen form is one that goes along with the logic of social acceleration that robs them of time to think! Samizdat magazines could circulate from hand to hand for two years or more, without exceeding their ‘sell-by date’. Do we need to invent a form of online self-publishing with the same capacity of temporal ‘resistance’?

Sociological Imagination (2014-06-02 18:30:53)
thanks Simon, that’s really interesting. i tried to write a bit about temporality and social media here - http://sociologicalimagination.org/archives/14529 i’m not convinced that social media is as straight forwardly accelerationist as a lot of people are. though i completely understand what they’re saying about the connection. when you say a form of “online self-publishing with the same capacity of temporal resistance” that’s exactly the idea i’ve been trying to express when playing with notions such as ‘craft’ to understand how academics can (or should) use social media. in potentially (only potentially) provided a forum where intrinsic goods predominate over extrinsic ones, social media can (counter-intuitively) constitute a slower medium of creation and communication. not in the sense of the rhythm of production and dissemination but in that both these functions aren’t subordinated to institutional imperatives (though they might well come to be in the name of ‘impact’). plus the speed actually facilitates a paradoxical slowness. you can write and publish so rapidly that it reduces the demands of the activity in the context of an already busy and pressured life. it lets people take time to think and write and talk about stuff they otherwise wouldn’t, partly in virtue of how quickly it is possible to do these things.

» A new campaign for accessible conferences fees The Sociological Imagination (2015-05-03 07:56:45)

Valuing Electronic Music

6 June 2014 4.30-10pm Admission free

work explores how the value of electronic music transcends economic value for producers, DJs, and audiences — and how geographical location continues to play a significant role in the recognition of musical value even where musical scenes become increasingly international (thanks in large part to websites such as SoundCloud). Such findings have implications for the careers of music-makers more generally.

On 6 June, we are holding a public event at The Lexington in Angel, Islington, featuring talks, live performances, and an interactive panel discussion with electronic music producers. Come along to find out what we and other researchers have discovered, as well as to hear some great music and to put your own questions to the people who make it. You are welcome to drop in at any time.

4.30 Doors open

5.00 Free food

5.30 Introduction

6.30 Talk: [7]Luis-Manuel Garcia

7.00 Music: [8]Winterlight

8.15 Music: [12]Slackk

9.30 Thanks

The Valuing Electronic Music project combines social network analysis of online data with ethnographic interviewing and observation to understand how music-makers produce value for their own and one another’s work, especially in genres without mainstream recognition. It is currently supported by an AHRC Research Development Grant.

Racism and Digital Communication and Stories of Cosmopolitan Belonging: 2 events at @SocioWarwick
11th June (2014-06-01 08:00)

Workshop on Race, Racism and Digital Communications, 10.30-1pm, Gillian Rose Room (R3.25), Ramphal Building, University of Warwick [with the Centre for Cultural Policy Studies, Warwick]
Discussion featuring Alana Lentin, Sanjay Sharma, Kirsten Forkert and Nathaniel Tkacz on transformation of race through digital communication networks, ambient racism and racism denial on social media, and social media responses to government immigration campaigns. Lunch provided.

Seminar and book launch for Stories of Cosmopolitan Belonging: Emotion and Location (eds Hannah Jones and Emma Jackson), 1pm-4pm, Gillian Rose Room (R3.25), Ramphal Building, University of Warwick

[with Urban Studies, University of Glasgow]

Discussions on home, migration and belonging including Kieran Connell on music and Black British identity in Birmingham and Melissa Fernandez Arrigoitia on public housing struggles in Puerto Rico, with contributions from Emma Jackson, Hannah Jones and Goldie Osuri.

CfP: What are conferences for? The Political economy of academic events (2014-06-02 08:00)

The [1]Sociological Imagination invites short articles (500-1500 words) critically reflecting upon the prevailing forms of intellectual meeting within the contemporary academy. What are their strengths? What are their weaknesses? How could they be done differently? What are the sociological implications of these standardised forms of intellectual meeting? Whose voices do they amplify and whose do they suppress? What behaviour do they reward and what behaviour do they discourage? What are their intellectual implications? How far does intellectual form follow conference function, limiting time and expression in the interests of the event’s logistics? Why do people attend seminars? Why do people attend events? What are the wider significance of these common reasons? Are there other motivations for attending academic events which tend to be squeezed out in the neoliberal academy. How might we do things differently? What alternative forms can we imagine? What would the implications for the academy be of DIY academic events becoming common? We’re particularly interested in receiving articles on the political economy of conferences, seminars and workshops?

If you would like to submit an article please send mark@markcarrigan.net a 500-1500 word article, attached within the body of the e-mail, as well as biographical details to be displayed with the post.

The slow death of originality? Thoughts on the self-plagiarisation of Slavoj Žižek (2014-06-03 08:00)

There’s an [1]interesting article by Žižek on the Guardian website. It’s a little too pop-sociological for my tastes but it’s nonetheless an engaging read. However the first paragraph of the article is lifted verbatim from his The Year of Dreaming Dangerously:

During a recent visit to California, I attended a party at a professor’s house with a Slovene friend, a heavy smoker. Late in the evening, my friend became desperate and politely asked the host if he could step out on the veranda for a smoke. When the host (no less politely) said no, my friend suggested that he step out on to the street, and even this was rejected by the host, who claimed such a public display of smoking might hurt his status with his neighbours ... But what really surprised me was that, after dinner, the host offered us (not so) soft drugs, and this kind of smoking went on without any problem – as if drugs are not more dangerous than cigarettes.

or

(Žižek 2012: 47)

It seems most of the subsequent article is contained within this chapter of the book. I think self-plagiarisation is rife within academia. I’m not condemning it - well perhaps I am a little bit - as the pressures underlying it are something I’ve encountered relatively early in my career. I’ve been conscious for a while in my work on asexuality that I’m not saying anything new. I’m just finding new ways to express the same thoughts, framed in response to a particular invitation. I’ve had two short books about asexuality planned for at least a couple of years now (one an introduction and overview of the literature, the other a popular[ish] look at the history of sexual culture through an asexual lens) but I’m not sure I’ll ever get started on them because I’m conscious of how egregiously repetitive they’ll be (to me at least). My point is that the invitations to publish can often outstrip the novel ideas & arguments which one is being invited to make public.

So I think the pressures towards self-plagiarisation are experienced widely. But I think Žižek is particularly prone to giving into them, as perhaps are all prolific authors. I’ve read a lot of Žižek books and I read a lot of his popular articles (I subscribe to the LRB and New Statesman and I read the Guardian obsessively). I frequently experience déjà vu when reading Žižek and have long suspected he reproduces large chunks of text between books. But I’ve never cared enough to look it up and this is the first time I’ve ever been able to place a regurgitated paragraph from memory. Žižek has published [3]at least 50 books since 2000. If Žižek’s self-plagisation is a rife as I suspect it is then I see this as a reductio ad absurdum of the capacity to publish 50 books in 15 years. However I’d hate to go too far in the other direction. I think repetition of arguments is inevitable and often desirable. I think the creative process is fundamentally iterative and a continued struggle to say what we’re trying to say is integral to clarifying what we think. I also think the imperative of ‘publish or perish’ makes repetition to some extent unavoidable. But where is the line to be drawn? I’m honestly not sure and this post is not intended to be as condemnatory as some might take it to be. I intuitively feel there’s something slightly rude about regurgitating your own prose verbatim without citation. But I’m equally resistant to drawing abstract boundaries between (acceptable) repetition and (problematic) self-plagiarisation that don’t take any account of the specificity of discipline and intellectual trajectory. Given these conflicting intuitions, I’m not sure whether this tendency, rooted as it is in structural changes within higher education, definitely threatens originality, though I suspect that it might. Perhaps we need the [4]Niall Ferguson index to
metricise our way out of this incipient dilemma:

There is a ratio that really would be good to have as a metric of the seriousness of a public intellectual. It is the ratio of words read to words written. Ideally, I would say, that ratio should be between 100 and 1000 to 1. But in the case of the Invincible Krugtron, I begin to suspect it has now fallen below unity. (When he does read a book, he mentions it in his blog as if it’s a special holiday [5] treat.)

Ben Eppard (2014-06-03 19:18:16)
I’m not sure plagiarisation is the right word, since technically that means using someone else’s ideas as if they were your own. Nonetheless, I agree with your sentiment. It’s disappointing when one of your favorite authors puts out a book that feels repetitive. And the same can be said for public speaking engagements. It’s always a little annoying when you buy a speaker’s book and find that half of it was spoken word for word the night before.

Dark Ecology, the Higher Misanthropy and Object-Oriented Ontology (2014-06-03 08:24)

For those who don’t already know, actor-network theory isn’t just a useful tool for getting grant money by guilt-tripping funders about all the various things in the social world they’re not attending to. It’s also a platform for philosophical innovation, in particular ‘object-oriented ontology’ (or ‘OOO’, as it is known onomatopoetically by its admirers). The chief scholastic in this field is [1]Graham Harman, who nurtures and polices the boundaries of OOO with the efficiency of a micro-Aquinas. I recently posted a piece that provides a context for the development of this perverse line of thought, which veers towards a world-view that is at once objectivist, apocalyptic and, most importantly, misanthropic (aka [2]'dark ecology'). Though making only a peripheral appearance in my discussion, Harman was emboldened to respond on[3] his website. What follows below is my response to it.

I am posting my response on this site for several reasons: (1) I can’t figure out how to post on Harman’s site. (2) Sociologists interested in both metaphysics and politics should take this line of thought seriously because it is very much of our times and unlikely to go away soon. (3) It raises fundamental questions about the marking of the ‘normative’ in social theory, especially since people like Harman want to treat OOO as fundamentally apolitical.

So here is my response to Harman (addressed as if he allowed me to post on his website):

Sorry for my delay and thanks for linked article, which is very interesting as a guide to speculative realism.
However, I’m interested in speculative realism as a moment in a movement of thought, not as a field of play. So I apologise for collapsing distinctions that you find significant.

Even if we grant for the sake of argument that your line of thinking does not court misanthropy, why are you so keen on conceptually segregating the human from other things in the world? When Latour first did it, it was simply a salutary methodological move to remind researchers that there is more to the social world than human beings – especially if one wants to understand why things happen as they do. Indeed, the proposal was initially offered in the spirit of a more complete empiricism. Of course, I don’t deny that Latour has always had grander ontological ambitions, and some of his more recent stuff provides a glimpse as to its normative payoff. I don’t buy his Gaia-mongering but I can appreciate it as a development of his ontological position.

As I understand your position, you want to reinstate the idea of a God’s eye-view on reality but without the historically monotheistic connection between God and humans, as philosophers and scientists have liked to talk about in terms of ‘getting into the mind of God’. The deity from whose standpoint your philosophy is done has no more special relationship to humans than to any other object in your ontology. Indeed, according to you, imagining that there is such a relationship can lead to philosophical error, as one ends up either shrinking altogether from the challenge (your view of Kant, whose noumenal noises reflected his pietistic upbringing) or recklessly projecting our best theories onto features of reality as such (the sort of anthropomorphism that science performs when it turns ontologically ambitious). I realize that you don’t put things in quite this way, but isn’t this how you generally position yourself? In short, OOO is a radically de-humanized objectivism, right?

If I’m right on this general point, then I guess you’re happy to let Nick Land go his merry way because his view is compatible with yours at the level that matters to you – regardless of its general implications for humanity. And this brings me to the business about being an ‘administrator’.

Let me apologise for confusing you about my remark concerning your (past) role as administrator. You should have focussed on the ‘Cairo’ part of what I said. I actually hold academic administrators in high esteem and have extolled their virtues – especially at the highest levels – on many occasions, especially if they uphold Humboldtian ideals, even in reinvented forms, such as James Bryant Conant, the mid 20c Harvard president whom I hold in much higher esteem than his clueless yet more influential protégé, Thomas Kuhn. To be clear: Academia does itself no favours by derogating those who assume administrative roles because, in the end, they are the keepers of the university’s soul. However, these visionary administrators shared an overriding desire to promote humanity, which from the standpoint of your philosophy should be completely misguided. Thus, it does not surprise me that you have administered a university in Cairo, a place where curricula that actively promoted the self-realization of humanity could get you into serious political trouble. Maybe there’s a politics to what you’re doing, but it’s the politics of Leo Strauss.

2. [http://slowlorisblog.wordpress.com/2014/05/20/dark-ecology-as-the-higher-misanthropy/](http://slowlorisblog.wordpress.com/2014/05/20/dark-ecology-as-the-higher-misanthropy/)
Steve can always be counted on for productive mischief. I think it is clearly possible for promoting humanity to be a misguided administrative ethic, irrespective of questions about metaphysics.

**Fast capitalism and peer review (2014-06-04 08:00)**

The public debate concerning ‘scare stories’ about statins is an interesting case study for the politics of peer review. It’s an important reminder that these seemingly technical issues of scholarly communication can have important public consequences. The case seems to be framed in the media as calling into question the ‘gold standard’ of peer review. Is this fair? I suspect it is but that the media coverage is inevitably somewhat simplistic.

It’s interesting to hear the rhetoric deployed to defend peer review and how obscurely, if at all, the institutional context figures into this. It makes ‘peer review’ into a timeless and placeless activity, with the inherent characteristics of the practice working to ensure the promised outcome. But if the context is only invoked by those attacking peer review, sometimes convincingly but often in a way I find rather worrying, it makes the ensuing debate weirdly one sided. It’s important to be able to defend the values of peer review while recognising that a shifting context should be grounds for recalibrating an existing practice.

The authors of two papers published by the British Medical Journal have publicly retracted statements they made about the frequency of side effects experienced by people taking statins, following a charge by an Oxford professor that the information was wrong and could endanger lives.

Prof Sir Rory Collins told the Guardian in March that a paper and a subsequent article in the BMJ were inaccurate and misleading. They had claimed that 18 %-20 % of people on the cholesterol-reducing drugs suffered adverse events. Collins called on the BMJ to withdraw them and complained that the authors were creating unease and uncertainty in British patients prescribed statins in large numbers to protect them against heart attacks and stroke.

“It is a serious disservice to British and international medicine,” Collins told the Guardian at the time, claiming that the alarm caused was probably killing more people than had been harmed as a result of the paper on the MMR vaccine by Andrew Wakefield. “I would think the papers on statins are far worse in terms of the harm they have done.”

The paper, by John Abramson and colleagues, questioned the decision to extend statins to thousands of people at low risk of heart attacks and strokes, saying that the drugs had not been proven to save lives in that group. They also claimed that an observational study had shown that 18 %—20 % suffer side effects from statins. An article by cardiologist Aseem Malhotra published the same week repeated the figure. Both authors have now withdrawn that statement.

[4]In an editorial published in the BMJ, author Dr Fiona Godlee said the error was due to a misreading of the data from the study and was not picked up by the peer review process. “The BMJ and the authors of both these articles have now been made aware that this figure is incorrect, and corrections have been published withdrawing these statements,” she writes.
How would a publish-then-filter model be treated by the media? Would it undermine the authority of scientific publication? Would this definitely be a problem given that this authority is already being undermined by cases such as the BMJ one above? This seems an obvious transition to make, albeit with great caution, under conditions of fast capitalism. Unless the over-production of academic publication goes away (it won’t) I can’t see how the current peer review system is sustainable. My suspicion is that the time spent on peer review has declined precipitously given the broader shifts in the occupational demands placed upon academics. Publish-then-filter shifts the evaluative burden to a different sector of the working lives of academics.

4. http://www.bmj.com/cgi/doi/10.1136/bmj.g3306

Benjamin Geer (2014-06-04 08:42:50)
"Publish-then-filter shifts the evaluative burden to a different sector of the working lives of academics." Could you elaborate on that a bit? If publish-then-filter results in more reviewers per article, but most of those reviewers just read each article very quickly and superficially, perhaps the total amount of review time per article will be about the same, and the overall quality of review won’t improve.

Sociological Imagination (2014-06-04 09:29:08)
I’m suggesting that they read it as part of their engagement with a literature, as opposed to constituting a specialised task which is regarded as important but nonetheless probably peripheral to their actual day-to-day allocation of time, with the ‘filtering’ enacted through the subsequent choice to address, highlight and share the paper. I’m not rejecting current peer review outright, I’m saying that its quality only subsists as a reflection of agential commitment to doing things ‘properly’ and thus I think problematic cases will begin to multiply over time.

Academics using kickstarter (2014-06-05 08:00)
I was intrigued to see [1]this great project by [2]Emma Jackson and a collaborator on Kickstarter. It’s fantastic that it seems to have been so successful for them. Is this likely to become more widespread? I find this quite exciting in some respects but also quite worrying, in so far as that it could easily be seized upon as a rationale for intensifying the retrenchment of funding which an academic turn to Kickstarter would (partly) be a response to. Nonetheless, I’ve been wondering for ages whether to try this myself and seeing this project has given me a nudge towards finally doing it.
Lots of Planets have a North is a new project produced by sociologist [3]Emma Jackson and artist [4]Claire Biddles, exploring the North of England as it is lived, remembered and dreamed of. Bored of totalising accounts of a solitary man on a mission to uncover ‘the North’, ours is a communal project, made up of fragments, accounts, stories, poems and pictures collected from an open call for contributions early in 2014.

Our project is a showcase for the stuff that gets missed out of the bricks and smoke, brass band, Hovis advert-style North of popular representation (although we have nothing against red brick, or smoke, or brass bands). The Glam North, Queer North, Missed North, Uneasy North, Dreamed of North, and lots of other Norths that aren’t explored often enough.

Here’s a few selections from the project – you can see more on our [5]project blog, too.
The Performativity of Social Movements (2014-06-06 08:00)

What does it mean to talk about the *performativity* of social movements? The obvious answer is to look to the aspect of performance inherent in the mobilisation of contemporary social movements. In this sense protests and demonstrations can be seen as drawing upon established repertoires of activity, orientated towards an audience, which depend upon certain meanings and also reproduce these meanings through the performances they facilitate. This cultural dimension to social movements enjoys an objectivity over and above its (re)production in collective activity of participants within it. I’m interested in how cultural forms like this song by the King Blues (oh how I miss them) and the accompanying fan video both draw upon this culture but also contribute to it:

[youtube http://www.youtube.com/watch?v=m3TV6vOt4Mc]

I think this is an important aspect to the culture of social movements. I’m not sure how effectively the concept of performativity can capture this. I accept the importance of "small-scale participants' performances that occur in networked relations" such as "encounters at meetings, planning sessions, recruitment forays, and socializing" as sites "where movement ideas are discussed, elaborated, and 'performed'" in a way that 'grounds' "rationales and motivations for action" ([1]Johnston 2014: 22-23).

But what concerns me about this is the *exhaustive* focus upon interaction. In my PhD I’ve developed a critique of symbolic interactionism, accepting the importance of interaction for the constitution of relationships and persons but arguing that we need to look at what goes 'into' and 'out' of social situations. If we only focus on the situated interactions and performances (T2-T3) we obscure the important questions of how persons have been shaped by past interactions (T1) (conditioning what they bring to the present interaction) and how this will shape how they approach future interactions (T4). Obviously sophisticated symbolic interactionists will recognise this but the conceptual repertoire they’re using will inevitably *tend towards compression*, shutting down the questions of temporal extension through a presentist vocabulary which struggles to support temporal distinctions.
This isn’t a repudiation of symbolic interactionism but is rather an attempt to engage constructively with it. I think the relational realism of Margaret Archer and Pierpaolo Donati tends, for a variety of reasons, to underplay interaction. Realists can learn about how to better address the T2-T3 from symbolic interactionists. But in doing so, they bring their insights about the T1 and T4 in a way which fleshes out the sociology of the situation.

So when Johnston (2014: 23) talks about the "dense network of performances, macro and micro, through which both the structural sphere and the ideational-interpretative sphere are acted out in real time" I couldn’t be more in agreement about the general direction of thought. I think the micro-social dimensions to social movements do constitute, as he puts it, "the multitudinous building blocks of a movement’s structure and its ideations". But I want to bring the *person* more fully into this picture, understanding their *trajectories through social movement participation* rather than simply focusing on performances. Social movements are *made of people*, both aggregatively and emergently, in a way which renders *individual biography* an important unit of analysis. Performances are an important part of what people do and it’s a crucial concept for understanding the unfolding relationships between them within situated contexts. But it is the people who are primary rather than the performances.

Sam Burgum (2014-06-12 13:32:16)

Interesting post (and I enjoyed the video!) Just wondered whether there really is a contradiction between 'performance' and 'people' (individuals)? Surely the answer is that both are primary? I’d argue that the performance of social movements is ultimately one of identity and belonging. Indeed, an identity and belonging that provides much sought after authenticity, righteousness and 'underdog' legitimacy. If we think of it this way, then it also becomes easier to see the contradictions between the particular(s) and the universal(s) in forming a collective, positive, counter-political identity. What’s more, we can also spot the potential problems of a movement attempting to be inclusive (of all identities or particulars) and exclusive (of...
one universal politics) at the same time. Be interested to hear your thoughts.

Sociological Imagination (2014-06-15 15:04:37)
Hi Sam, I agree really, I just think the language of 'performance' too easily suppresses the temporality of 'identity' and 'belonging'. How did person X come to identify THIS way in relation to THIS group at THIS point in time - I don't think anyone would deny we can trace back a history of the individuals, the groups, the performative repertoires that emerge out of the interplay between them in particular contexts (etc) but I’m arguing that certain modes of theorising make it more difficult to ask these questions in a systematic way. Looking purely in terms of biographies is very problematic but I'd argue it can be a useful expansion of 'performance’ talk.

Sociological Imagination (2014-06-16 08:14:33)
what about some kind of social movements reading group at warwick?

Queer Futures – new research project (2014-06-07 08:00)

Queer Futures is a national study exploring the self-harm and suicidal feelings of young LGBTQ people

Lancaster University is leading a £300,000 study aimed at reducing self-harm and suicide among young people who are lesbian, gay, bisexual, transgendered or questioning.

International research has shown that LGBTQ adolescents and young adults can be four to seven times more likely to self-harm or have suicidal feelings compared to their heterosexual peers. They are also more likely to experience homelessness, or drug or alcohol problems. Queer Futures is a two-year project funded by the Department of Health and is being led by Dr Elizabeth McDermott and Dr Victoria Rawlings of Lancaster University with Dr Liz Hughes of the University of York.

Dr McDermott said: "It is only very recently that the UK Suicide Prevention Strategy has recognised that LGBTQ people have a higher risk of suicide and self-harm. We are very pleased that the Department of Health are funding the research which will provide the evidence, which is currently missing, to tackle the problem at a national level. LGBTQ young people can feel marginalised in a variety of settings such as school, work, sporting environments, religious institutions or social groups because of discrimination against their gender identity or sexuality. They may also experience rejection from their families. These experiences may put them at increased risk of self-harm and suicide. The Queer Futures study aims to provide health professionals and services with information about how to help LGBTQ people aged 16-25 who are feeling distressed."

Dr Rawlings said: "Our research aims to understand the factors that cause distress for some young LGBTQ people by listening to their opinions and experiences. This will help to explain why some young LGBTQ people in England take risks with their personal safety, harm themselves or think about suicide. We hope our findings will identify what types of services and support can help young LGBTQ people in distress."
Queer Futures is currently seeking participants. See [1]www.queerfutures.co.uk or alternatively find the project on Twitter (@QueerFutures) or Facebook ([2]www.facebook.com/QFutures).

Maths and Girls: Sensible Solutions... (2014-06-08 08:00)

Reblogged from the Idle Ethnographer's mathematical blog, [1]mattersmathematical.wordpress.com/2014/05/20/sensible-solutions
Anais Lockwood (2014-06-08 21:04:26)

I like this...but the problem with comics...is that they can sometimes oversimplify things. It's not that mathematics is perceived as "unfeminine". It's a whole institutional system that promotes and perpetuates the idea that females aren't good at mathematics, that the "female brain" (not a thing) is somehow inherently incapable or at least inferior in its ability to process mathematics and mathematical concepts. That isn't "maths is unfeminine", it's "maths is not for females". It's the internalized idea that because someone is female, they are not "good" at maths. That they shouldn't enter the field of mathematics and maths-related subjects (i.e. science), not because it's unfeminine, but because as a female, they cannot "do" maths. (Actually, I wonder about quantitative researchers in the social sciences. Have females in these fields, using statistics, felt like they are not as "good" as maths as their male peers? That their results aren't as sound as their male peers?) It's also the knowledge that entering mathematics as a female is a hard thing, because it's a male-dominated field, and because there is institutional and systemic sexism. How many females, considering how difficult it is to negotiate sexism in a non-male-dominated field, would want to try to negotiate that in an almost completely male-dominated field? As social researchers, we (all genders included) have a fair amount of paranoia over research credit, who gets noticed, who gets the kudos. Can you imagine, given the erasure and silencing of the females who ARE already in mathematics and mathematics-related fields, how hard it would be having to negotiate recognition and credit there? As a female, it might be quite rational to want to avoid the stress. So, I like the comic. But I think it fails to make the whole point, and I think if comics like this are going to help educate (if that's the point of the comic), they need to cover most of (because who can cover all?) the bases.

Thank you for such an articulate comment. I agree with everything you said - and many mathematicians I've interviewed say similar things! So in this case, the comic has been successful in provoking the articulation of a problem and this is great.

The Impact Agenda and the Good (Academic) Life (2014-06-09 08:00)

This was the rather unlikely connection suggested in Jonathan Wolff's recent [1]Guardian article. I have massive respect for Wolff, who taught me as an undergraduate and is the only lecturer who has ever consistently held my attention, which left me taking this article more seriously than I otherwise might have. To be fair, he's not talking about the 'impact agenda' as such but rather a broader tendency of which the 'impact agenda' can be taken to a bureaucratic and unlikable leading edge. His point is that there is a change taking place in the criteria by which 'success' is measured in academic careers. Furthermore, it is a change which is bringing activities motivated by private commitments, often done in private time without recognition, into the sphere of public assessment. In doing so, 'academic success' comes closer to life success. Or perhaps life success is being collapsed into career success. I'll be pondering this for a while:

The final category is a recent innovation, by which I mean that it has crept in over the last 20 years. It goes by various names: knowledge transfer, knowledge exchange, public engagement or impact. Specialists will shudder at my ignorance in lumping all of these together. To transfer knowledge is to take your research and apply it outside an academic context. Knowledge exchange is a less imperialistic version of the same thing, recognising that one might actually learn something oneself in the process. Public engagement can be roughly the same thing yet again, but perhaps with other people's research rather than your own. As for "impact", it seems to be whatever the research councils have decided it is this month.
This final category, however, reflects a quiet revolution in the way in which universities conceive of themselves and their contribution. Not so long ago, if you were a school governor, or edited a community newsletter, you kept quiet about it. Either it was regarded as entirely your own affair or, even worse, a distraction from the real business of research and teaching. Now it is public engagement. We seek it out, promote you for it, and crow about it on the university's website. Cynics might think that it is the invention of web pages, and the need to fill them with something, that has made the difference. Or that it is encouraged only because universities are continually under pressure to demonstrate their "relevance". But whatever the explanation, it is encouraging that a successful university career is now somewhat closer to a successful life than it once was.

REF and the usefulness of academia (2014-06-10 08:00)

Japanese Suicide Culture (2014-06-11 08:00)

by Kanika Sud*

"He was exceptionally quiet after he got pink slipped" says the crest fallen mother of a 27 year old Japanese youth. "He refused to eat a morsel of food, and talk to anyone at all. One fine morning he left the house. Little did I know that he left, only to never return..." It was later found that the young bloke had committed suicide by boarding a tube to (insert some Japanese place) and jumped out of the moving tube.
In another instance, a teenager was found dead in his room. "I opened the door of my child's room after a few attempts at knocking. The sight that followed was abysmal and I wish no parent witnesses what I did" says the teary eyed father of the teenager. He witnessed a rope tied around his son's neck and found a suicide note alongside a table. The note mentioned his inability to cope with his academic failure in college and the constant bullying by his peers.

Sadly enough, the instances mentioned above are few of the several that have occurred in Japan since the past few decades. Japan has the highest cases of suicides, so much so that it is a major social issue. If the Japanese are faced with the choice to endure bully, persecution or high stress encounters, a momentous number would decide to end their lives. Japanese history and literature is abounding with incidents of suicide, since it is used as a coping mechanism during testing times, which are (literally) worth dying for.

Notorious as the 'Shame Society', the people in Japan who are unable to acknowledge being fired, business losses, or other forms of failure, turn their anger inward. Notions like 'Honour' and 'Dignity' are way more worthy than lives to the Japanese Populace. Suicide is perceived as a way of tackling problems and taking responsibility. Japan is also recognized as the 'Sacrifice Society', where people would rather choose to sacrifice themselves, than being burdens on others.

Contrary to how suicide is viewed with stigma in many societies, the Japanese society views notion of suicide as an act of honour and bravery. Therefore, the concept of suicide is a socially legitimized concept, and not an individualized one. The individual acceptability of suicide is determined by how the society perceives the notion of suicide to be.

Suicide is akin to the dark ghost of the past that refuses to let go of Japan since a very long time. The present cases of suicide that occur are intricately linked to the historical traditions of this phenomenon. Therefore, understanding the history of suicide in Japan is important in proffering us essential insights about the Japanese perspective on Suicide. The justification of Suicide as a virtue and not sin is explained in the religious and historical texts of Japan. Understanding the historical perspective is therefore necessary therefore to relinquish Suicide pandemic.

**Historical context**

**Military**

Many historians have examined Seppuku, literally known as ‘stomach cutting’ to be one of the prime expressions of suicide in Japanese culture, which was a ‘ritualized form of suicide by disembowelment.’ This earliest type of Suicide materialized at around 700 AD in religious texts and literature, where in a young Goddess incised her stomach after a fight with her God. Subsequent to such legitimization of disembowelment by the mythological texts, acts of Seppuku dispersed to Samurai military. Such gruesome act of Seppuku started expanding to the Samurai military nobility in the 12th and 13th Century, in order to safeguard their honour from the humiliation of imprisonment by the enemy. Military conflicts paved way for numerous instances where Samurai military officials would use Seppuku
in order to demonstrate their valour. In the 17th century, Seppuku emerged as an alternative to death penalty in the 17th century. For the next 200 years, Sepuku remained fundamental to the Japanese society in its myriad forms, till the 1800s and 1900s. A ban was imposed on this practice, in an endeavour to assume a Western perspective on Suicide. Despite the ban in the political and legal framework, it was still undertaken as a voluntary practice in the 1900's. One such instance which exemplifies this claim is the suicide of the many military officers subsequent to the announcement of surrender during the World War II. Although instances like these might befall infrequently, the vestiges of this are still very deep rooted in the Japanese psyche. The western world has a vivid memory of the very famous and the most recent manifestation of suicide in the Japanese history where in the Kamikaze pilots were used in the World War II. While the Americans were horror stricken by mass suicide committed by the Kamikaze pilots, they were perceived in a very different way by the Japanese. These pilots were viewed as ‘guiding spirits’ of a country, which was an honourable post to occupy. Due to the association of the notion of honour, it was easier to recruit the Japanese youth. Consequently there was a mass production of human bombs human torpedoes. Thus the usage of suicide weapons was seen as calculated move to combat the enemy and the dead soldiers are highly cherished and etched to memory. Religion and culture In the Contemporary Japanese society, the Japanese do not take their lives by Hara Kiri or Seppuku anymore, but by inseki-jisatsu. It is a form of suicide which every so often is considered as a way of accepting responsibility. Inseki means responsibility and Jisatsu means Japan. Toyomasa Fuso a sociologist has been carrying out suicide researches from a cross cultural perspective, and recommended that suicide frequently takes place when political or social scandals occur in Japan. As can be noted, the historical and militaristic traditions of suicide in Japan played a pivotal role in setting a context for the suicide culture in Japan. However, there exist various cultural factors which are causal to the perpetuation of the current psyche regarding suicide, religion being one of them. Japan is a mix of few religions and majority of the population follow Shinto, which condones departure from life for a variety of reasons. Thus religion too plays an important role in the perpetuation of suicide culture in Japan. The historical traditions of religious and militaristic perspectives towards suicides are excruciatingly important to explore the analysis of suicide in Japan, as they give us an insight about the Japanese perspective. Suicide is perceived as the morally responsible act in Japan, in response to an untoward event in their lives, to spare themselves from ‘dishonour’ and ‘shame’. Media and economy Various Studies have reported that media coverage of suicides results in higher percentage of Suicides, popularly known as the imitation effect. The topic of suicide is pervasive and is used for entertainment purposes in movies, music, books and even video games. However, the underlying issues about the phenomenon are not spoken about. Although some studies mention that imitation effect was not greater in Japan than it is greater America, greater receptivity to suicide was found in the Japanese society. While some research studies claim a correlation between abysmal economic conditions and higher suicide rates, i.e. more Japanese people have committed suicide when faced with unemployment or failure in businesses. However, this is only a fraction of the elucidation, not the sole root cause. While all factors must be taken into consideration while looking at this phenomenon, it is very difficult to quantify their relative importance separately. It is noted that compared to other countries, Japan scores the highest. This can be attributed to the cultural legitimization of the notion that suicide is the most honorable act when faced with situations that give rise to disgrace and shame. They view suicide more tolerantly than other people belonging to the Christian culture.

Various ways of committing suicide. Contemporary ways of ending one’s lives include jumping off the train, hurl off high places, overdose of medication, etc. Some have used household chemicals to terminate their lives. One man consumed pesticides and was later hospitalized. However, a newer method is gaining popularity these days, due to the publicity from the internet websites. Internet suicide packs. With the advent of the ICT (Information communication technology) era, and an already ubiquitous cultural legitimization of suicide in the Japanese society, a murky new trend has surfaced which involved – group suicides of persons who have congregated over the internet. The experts too are appalled by the group suicide agreements. In a particular case in May 2003, the victims were a man and two women, who met online and started planning their suicide. They committed suicide by emission of carbon monoxide from a coal burning stove, after fastening themselves in a room with plastic sheeting and duct tape. There have been others too, who have attempted suicide using the same techniques as publicized by the websites as swift and effortless. However, there have been suicide pacts that have been forestalled, or ended up injury of some sort, as in the case of two Japanese girls, who jumped off a five storey building. While there are online websites which advocate suicide pacts, there are web spaces, Wiredsafety, which has numerous volunteers around
The world. They report these suicide websites to the local law enforcement to have them taken down, but they pop up somewhere else. Some sites encourage the most favourable ways in which one can commit suicide, while others provide those who want to commit suicide a platform to congregate. They render themselves as humanitarians and philanthropists. Mental health experts do not however, hold the internet responsible for the current huddle of suicides and attribute this grave social issue to mounting mental health predicament. Yukio Saito, a Methodist minister who established the country's first suicide prevention hotline says "Generally they have a serious emotional problem, which is that they have difficulty dealing with other face-to-face, kind of phobia, or a fear of talking about their feelings in front of others. Maybe this is quite a Japanese type of emotion. They have difficulty having personal relationships, so they tend to use internet to communicate how they feel." He hypothesizes that people in search of suicide partners are looking for companionship even during the time of their demise. "One single suicide seems quite wrong and awful. But a double suicide has in a sense peace, affection, and solace." Retreating from the world The Japanese culture is collectivist in nature, and the pressures to perform in the job arena and school are immense. Children are pressurized by the parents to keep up with the appearances, lest they bring shame and dishonor to the family. Failure to thrive on the mammoth pressure to perform, many withdraw themselves from the society for months and in a lot of cases, years at a time. Saito notes this syndrome as "hikikomori". Often "hikikomori" sufferers detain themselves to a bedroom in their parent's rooms. Even if they are home bound, internet is the only way to be in touch. Government and individual interventions Notwithstanding the economic revival in the year 2007, suicide rates have persistently been soaring. This has left the government insipid with apprehension. During the same year, the government introduced a nine year plan, a "counter suicide white paper" with the intention of diminishing suicide rates by the year 2017. The root causes of suicide would encouraged to be scrutinized in order to thwart them, transform cultural stance towards suicide and improvement of the treatment of failed suicide cases would be focused upon. Naoto Kan, the earlier prime minister, asserted his willingness to curtail 'unhappiness' in the country and reduce Japan's high suicide rate. 15.8 Billion yen was spent in the year 2009, towards suicide deterrence approaches. In 2009, amidst by and large increase in suicides, the governments proclaims there have been heartening signs since September. Monthly suicides had reportedly reduced between September 2009 and 2010. In fact, in gruesome precursor of times, a task force re-evaluated ways to blueprint and design of buildings to avert them from jumping off the building. Train stations initiated the installation of "Suicide mirrors" in order to prohibit people from diving onto the tracks. The Japanese government started providing finances for the suicide awareness programs, and issued pamphlets to companies, requesting them to watch out the danger signs among employees and instructed to offer them counseling. While it is noteworthy that the government is taking initiatives to put an end to this grim social issue enveloping Japan, there have been a few individuals as well who have taken a stand against it. As Rene Duignan has made a documentary film to raise awareness about the ever growing issue of suicide, a Buddhist priest Itettsu Nemoto has introduced a website and a number of workshops, to provide counseling and help to those inflicted with the desire to commit suicides. Conclusion The notion of Suicide is a complex phenomenon, which comprises of multiple factors and processes. It is to be construed from a multidimensional perspective. Suicide ought not to be viewed as an individual phenomenon only, using solely a psychological perspective. Rather it should be looked at from a historical, cultural, sociological, human rights framework. Ideas of 'honour' 'disgrace' and 'shame' which are placed on a pedestal over the well being of a human being, must be looked at critically. Since these notions are extremely deep rooted in Japan, it would understandably buy immense amount of time, patience and determination to ameliorate the status quo in Japan, and do away with such exorbitant suicide rates. - - - Kanika Sud is an MPhil Sociology student in Mumbai University, India, and the author of an interesting Facebook page, [1]The Feminist Goddess. Battling Against the Atrocities (2014-06-12 08:00)

by Kanika Sud*

She dreamt of pursuing her higher education and enjoying civil liberties just like her brother. While the brother could choose the course of his career, possessed unrestricted freedom and had access to the public sphere, she could only drift in a reverie of doing so. She faced restrictions and burdens of performing back breaking household tasks, was unable to wear clothes of her choice, was expected to preserve and practice the cultural traditions, was not allowed to go out after a certain time, and if she did, countless questions were hurled at her. While at home she was constantly made to realize her identity as a 'girl', you'd like to believe outside was better, but it certainly wasn’t.

When she stepped outside her abode, the constant glares, cat calls, ogling, groping, etc. made her constantly apprehend every day, that she - a girl, in this patriarchal society, was destined to live a life of misery. She had to accept it as an inextricable aspect of her everyday existence. If any untoward incident occurred towards her, i.e. she was teased and raped; she was constantly blamed under the pretext that 'she was asking for it'. A volley of questions and accusations would be tossed at her; 'What were you wearing?'; 'Why did you venture out at such an odd time?'; 'You should have known better to go there!'

Why question the girl for something she is not responsible for in the first place? Why do we fail to question the behaviour of the perpetrator in question? Most of all, why are we so aversive to change? Look at our honourable Police commissioner Satyapal Singh's comments! One would have laughed if these comments weren’t for real. Unfortunately they are, consequently making us recoil with fury. At such a time where crimes against women are on an immense high, sex education is the need of the hour. We need to get the young educated not only about anatomy but about attitudes too. But he proclaims otherwise.

In another instance, a renowned RJ puts the onus of women’s safety on the Bar dancers. Yes, because opening up of dance bars would prevent the men from attacking the ‘good girls’ – (read your wives, sisters, and daughters) Right! As if to say, men do not have an agency and are compelled to think from a space other than the one between their ears. Such statements reflect the fact that, men are socialized in a way which gives them a sense of entitlement to a woman’s body. They are internalized to believe that the responsibility to sexually gratify them lies with the women, so thank goodness for dance bars; otherwise women ought to beware, lest they be assaulted by a group of hungry ogres.

Our newspapers, news channels, social media outlets, etc. are replete with heaps of information on various atrocities committed against women every day. One positive aspect we can come across is that the newspapers and other media outlets, do not refer to the women at the receiving end of abuse as ‘victims’, but as ‘survivors’. Women, by virtue of their gender (along with other interlocking identities such as class, caste, ethnicity, sexual orientation, etc) face enormous amount of atrocities in this patriarchy induced society. Women everywhere feel at risk of being violated, and if God forbid, they are violated, then in most scenarios they are held responsible, when in reality, the onus of the crime should have been the perpetrators.

In cases of domestic violence, many would shirk their responsibility as a fellow citizen to come forward and help the victim. They would conveniently identify it as ‘Ghar Ka Maamla’ and not intervene- reflecting an attitude that demonstrates the existence of a thick wall between the public and the private realm. Heck, marital rape is STILL not recognized as a crime in our country. As if it’s the duty of a woman to accept harsh treatment at her home, where she is supposed to feel safe!

All women in our country are at the risk of being sufferers of virulent atrocities like Rape, [1]FGM, enforced child marriage, female foeticide and infanticide, acid attacks, forced servitude, abduction and imposed prostitution, sexual harassment, blatant victim blaming, dowry inflicted torture, etc in our excessively male dominated society. They are being constantly beaten, attacked, and ‘punished’ because many refuse to conform to the socially con-
structured notions of how a woman is 'ought to behave'. Women in most places in India, get burnt, assaulted or mutilated because they either declined a proposal, transgressed 'boundaries' by getting into a relationship without their family's knowledge and will, dressed 'immodestly', were a victim of sexual assault, or were talking to a male friend.

We need to question ourselves, why are so many women at the receiving end of such human rights violations? Why are these gruesome atrocities so normalized that we don’t even allow ourselves to wonder the legitimacy of these acts? It is taken for granted that – a woman's body is supposed to be hidden, otherwise "she is at a risk of inviting attention and attack", as if she were a piece of gold, and not a human being. Why have we not questioned such outmoded attitudes which do not serve us an iota of purpose?

Access to free mobility, speech, and safety from the petrifying apprehensions of gender based atrocities are every woman's basic right. Yet, so many are denied their rights on some absurd ground such as culture, etc. Irene Khan, Secretary General of Amnesty International asserted that "Disparaging a woman's sexuality and destroying her physical integrity have become a means by which to terrorize, demean, 'defeat' entire communities, as well as to punish, intimidate and humiliate women."

Atrocities against women are a way to exercise male dominance, control, and power over them. Women are violated as they are perceived as unequal, meek, and submissive. (The fact that sexual assault is barely reported, committed by those who believe they can get away with the act of expressive power to another ‘subordinate’ human being, is a grave injustice). The historicity and pervasiveness of these and many more unspeakable atrocities against women and the patriarchal context, within which they function, serve to normalize and justify the grotesque forms of violations against women. It was not until the Women and Feminist movements came into the picture, that various forms of atrocities against women became a part of the public awareness campaigns worthy of deserving concern, in the USA and subsequently elsewhere.

Although we may have come a long way in understanding the importance of women's rights, fostering equality and a gender just society, we still have a long way to go. Women are unsafe not only in the public sphere, but also in the private realm. Majority of the crimes against women happen by people they personally know and those who are supposed to ‘protect’ them, such as their own fathers, brothers, uncles, teachers, etc. This reflects the need to relinquish the notion that women need to take liability for their safety by being by ‘at the right place and right time’. The responsibility lies with each one of us, who are socially conditioned, to believe that ‘men naturally possess a ravenous appetite for power, and hence it’s obvious they perform such heinous acts’. Archaic notions such as these should be done away with, and there is a lot of unlearning and relearning to do on our part, to promote a gender just society. As Gloria Steinem quotes – ‘The first problem for all of us, men and women, is not to learn, but to unlearn.’

---

**Kanika Sud** is pursuing an MPhil in Sociology at the University of Mumbai, India. She is the author of an interesting Facebook page, [2]The Feminist Goddess. Her interests include Sociology, Gender Studies, Social Psychology, Diaspora Studies, Qualitative Research methodology, Feminism, Feminist Science Studies and Media and Culture. We republish this article with Kanika’s permission from her blog, [3]kanikasud21.wordpress.com.

I wrote a few months ago about the representation of interiority in film and television. I’ve lost count of the number of conversations I’ve had about the internal conversation after six years researching it. While some sociologists are deeply sceptical of the concept, it nonetheless always seems striking to me how intuitively people grasp what it refers to. I don’t think the constructionist critique of the ‘internal conversation’ is intrinsically problematic, though some of the knee-jerk forms it can take are, but inevitably I’m not remotely convinced by them.

One of the more sophisticated forms a critique could take is to look at the normative force which representations of internal conversation could have on how people represent and narrativise their own inner experience. That’s partly why I’m becoming so interested in how interiority is represented in film and television. I’ve been thinking about this recently because I’ve started watching Scrubs for the first time in years (damn Netflix) and I’m newly aware of how central JD’s internal conversation is to the narrative form of the show:

Another comedy that relies on internal conversation in this way is Peep Show. The comedic role of the internal conversation is simpler in Peep Show, largely relying on the everyday disjuncture between internal conversation and external conversation. In a way I think the internal conversation in Scrubs is a lot more complicated, being both a source of humour (“Why do I never listen to myself?” asks JD after having done something stupid) but also a device to structure the narrative. The reason I find Scrubs so weirdly charming is the way in which JD narratives his experiences to himself.

I think the show could easily be read as somewhat postmodern but doing so obscures some interesting aspects of it. JD’s responses are clearly subjective responses to objective circumstances, with some of the humour deriving from the incongruity between them e.g. his attempts to cast Dr Cox as his heroic mentor long before Dr Cox is even
remotely willing to play that role. The bricolage upon which the show relies is a feature of JD’s internal life rather than of the show itself. It’s a representation of the role pop culture plays in his own processes of making sense of life events, as enacted through the internal conversation.

Some of the internal conversation in Scrub isn’t naturalistic. But I just saw the episode where JD is revealed to be keeping a journal. So the very reflective narrativising moments, as opposed to the situational self-talk, should presumably be understood as self-reflection in his journal. This seems to extend my reading of the show as being about JD’s internal processes of making sense of his trajectory into the medical system.

Lacuna - a new online magazine which commits sociology (2014-06-14 08:00)

We would like to introduce you to a new favourite online magazine of ours - [1]Lacuna.
"Lacuna is an online magazine that challenges indifference to suffering and promotes human rights. Its aim is to fill the gap between the short-term immediacy of daily journalism and long-term academic analysis. It will publish credible, accessible and compelling content that enables concerned readers to gain a better understanding of a particular issue. It will stimulate ideas for action and provide resources for those who wish to look deeper than may be possible through mainstream media. And it will give space and assistance to new writers and those who want to speak for themselves.

Lacuna will provide commentary, reportage and expert analysis that uncovers issues of injustice and human rights abuses. We will review the best books, articles, films, music, art, theatre connected to these issues; bring to life the wider and deeper aspects of a specific theme of justice; offer stimulus, advice and ideas for writing and campaigning for human rights; and encourage and support unheard voices. All forms of writing and visual art will be considered: fiction, non-fiction, poetry, film, animation, photography."

The magazine is funded by the [2]Institute of Advanced Training and Learning and the Research Development Fund at [3]the University of Warwick.

Killed for King Football? Brazil, Police Violence and the World Cup (2014-06-15 08:00)
Let's hope America is not returning to ‘normal’: We may need another ‘American Century’
(2014-06-15 14:32)

Nowadays I run across two groups of intelligent people who feel they understand why the United States seems to have lost its mojo. One group of people (typically on the right but invariably libertarian) believe that the US political class has cared more for making grand gestures on the world stage than securing the prosperity of its inhabitants. Thus, the 20th century witnessed an unprecedented squandering of human and material resources on a seemingly endless trail of wars and proxy wars. The other group of people (typically but not always on the left) believe that the problem lies with special interest groups (‘lobbyists’) capturing the mechanisms of politics, either by buying them outright or perverting their normal function.

At issue here is the America to which people across the world – not least Americans themselves – grew accustomed over the past hundred years: what the journalist Walter Lippmann dubbed the ‘American Century’. This self-understanding arose from a high-minded, cross-party coalition of self-styled ‘Progressive’ politicians who played a very strong foreign policy hand in order to consolidate public opinion and strengthen state power in ways that served to professionalise the political process and eliminate most of the key sources of corruption in the conduct of public affairs. The names of Theodore Roosevelt and Woodrow Wilson loom large in this context, with the supporting roles played by the nation’s emerging intelligentsia, including William James and John Dewey. These were the people who started America down the road of what by 1970 sociologist Alvin Gouldner had branded the ‘welfare-warfare state’. The greatest triumphs and disasters committed by both Democrats and Republicans over the past hundred years are traceable to some version of this vision, which is popularly captured by the idea that the US has a moral obligation – more than any other nation – to right the world’s wrongs.

What we’re seeing now is a rollback of this grand sensibility and a reversion to the much more fragmented self-understanding that Americans had as late as the start of the First World War. A seasoned American politician who wanted to win elections even in the first decade of the 20th century would cut deals with the people who mattered and promise not to endanger everyone else, say, through foreign entanglements. Corrupt isolationism was the norm back then and is becoming the norm once again. And certainly the two diagnoses of America’s malaise at the start of this piece suggest evidence of just such a reversion to type.

Nevertheless, however one wishes to judge the American Century, it massively transformed the fortunes of a nation that for the first 125 years of its history had been of no greater international significance than Australia is today – that is, a country whose pursuit of peace and prosperity (the latter somewhat more successfully) had been largely confined to its own coterminous land mass. Things changed only when Americans started effectively (and perhaps even half-consciously) to take Hegel seriously that the world-historic spirit’s movement westward meant that it was time for the United States to take charge of safeguarding ‘the future of civilization’.
To be sure, unlike Hegel, this ‘civilization’ was not humanity’s cumulative ascent from its origins in China but something of distinctly ‘Western’ provenance. Moreover, it happened gradually. At first, Americans were led to believe (by Lippmann and the founder of public relations, Edward Bernays) that they owed it to Europe to save the continent from itself, given the steady stream of displaced Europeans who managed to flourish on American soil. Here America was portrayed as the peacemaker and powerbroker in an inherently conflict-ridden Europe, where old enmities never seem to be forgotten. This line persuaded Americans to enter the First World War and then broker the peace but not to enter the League of Nations.

Despite that final setback, the academic establishment – of which Wilson was himself a distinguished member (both as a scholar of political administration and as President of Princeton University) – followed through on the idea of Europe ‘passing the torch’ to America by establishing ‘general education’ programmes at the university level, such as Columbia’s in [1]’Contemporary Civilization’, from which I benefited sixty years later, in the 1970s. Nowadays it is easy to mock such programmes as having encouraged dilettantism and ‘middle-brow culture’, because they were organized a bit like today’s course packs, in which students never really read a complete work but only strategically selected excerpts. But the people who most strongly believed in these general education programmes also believed that the world may be engulfed in a war of such devastating proportions that the bases for all the hard-fought yet normally taken-for-granted liberal values must be understood properly, in the unfortunate event that civilization needs to be built from scratch after one such war.

Columbia’s ‘Contemporary Civilization’ programme began in 1919 under the rubric of ‘War and Peace Issues’. Once Winston Churchill forged with FDR what is still known as ‘the special relationship’ between the UK and the US in 1940 (it’s easy to forget that the US generally regarded the UK as a potential meddler in its affairs until that time), the US became not only a diplomatic but also a military broker of the world’s great conflicts. With the end of the Second World War, the US also became the world’s financial broker, as dollar reserves replaced the gold standard. And the advent of television in the 1950s completed the Americanisation of the world as the emerging suburban lifestyle was successfully sold as a global quality of life indicator, the downstream effect of which is the climate change crisis that we experience today as the rest of the world still tries to meet the mid-20th century American standard.

American detractors of the ‘American Century’ regard it, in National Review editor Jonah Goldberg’s damning yet best-selling phrase,[2] ‘liberal fascism’. At one level, they’ve got a point: On this basis, Americans came to be subjected to regular federal income tax, unprecedented regulation of the private sector, military conscription and loss of life in foreign wars, not to mention various adventurist medical regimes (ranging from mass vaccination to mass sterilisation). Such was the dark side of the so-called ‘welfare-warfare state’. At the same time, however, the United States kept its borders open to people from all over the world, providing all its inhabitants with unprecedented educational and economic opportunities to substantially improve their fortunes, albeit fitfully and even as the difference between rich and poor increased. To be sure, the American Century’s balance sheet is far from ideal, but to my eyes it appears unequivocally positive. Indeed, if it constitutes ‘liberal fascism’, so be it. We probably need more of it today, once again with science and technology becoming more closely wedded to the projects of government – but this time allowing the maximum feasible freedom for those willing to participate in those projects.

Reading about educational theories and educational research I have come across these useful books. The first book *Educational Theories, Cultures and Learning* edited by Harry Daniels, Hugh Lauder and Jill Porter gives educational researchers a chance to reflect upon urgent issues of pedagogy. The second book, the second edition of *Educational Research* by John O’Toole and David Beckett is an introductory textbook, which provides new researchers with a step by step approach to starting research.

[1]
Educational Theories, Cultures and Learning – edited by Harry Daniels, Hugh Lauder and Jill Porter

Educational Theories, Cultures and Learning provides a critical approach to contemplating questions in education on culture, globalisation, language, childhood, learning and teaching, and identity. The book highlights the importance of visiting and revisiting significant areas of education that provide teachers, policy makers and educational researchers with a professional and practical compass to help guide them through the challenges and complexities faced by those in the education profession. Educationalists are given an opportunity to consider the debates around what should be taught, and how it should be taught. The role of theory is expounded, allowing the reader to ask important questions about how theories can apply to our understanding of culture and pedagogy. Further, empirical research is explored, for example the chapter on Cyberworlds by Sarah L Holloway and Gill Valentine includes a detailed exploration of how certain notions of childhood and technology informed the way that they researched children and cyberspace.

The book is divided into three parts: the first section focuses on international perspectives of education, thus countering ethnocentric notions of education; the second section expands on theories of pedagogy; and the third section includes discussions on the identities of teachers and learners. The editors are conscious of positioning, bias and validity, and therefore all the contributors in the book have made clear their assumptions and positions that underpin their thinking in order for there to be clarity for the reader. The comparative analysis of education within the book also helps to interrogate assumptions and biases that may hold us back from a breadth of thought.

The book also provides readers with questions to reflect upon, and further reading guides for certain chapters the reader may want to investigate further. The book should be ideally read in conjunction with the companion book Knowledge, Values and Educational Policy which is also edited by Daniels et al, and which delves into the purpose and nature of schooling and knowledge, alongside the role of educational policy and educational research.

If you want a solid and broad understanding of how “the learner, pedagogy and schools interact to produce students’
identities and outcomes" then these books will provide you with that grounding. The overall message is that pedagogy is not solely concerned with teaching techniques, as some policy-makers wrongly think, but we must remind ourselves that pedagogy is an intellectual and a technical practice. And the book is useful in validating the need for a sociocultural approach to explaining how teachers and learners come to be the way they are in educational contexts, for sociocultural theories emphasise the idea that teachers and learners are products of their history and culture.

**Educational Research: Creative Thinking and Doing (2nd Edition) by John O’Toole and David Beckett**

Particularly for educational researchers interested in the Arts, the second edition of *Educational Research* by John O’Toole and David Beckett is an introductory textbook that gives plenty of food for thought about the massive area of research. Though the writers are writing from positions as drama and philosophy specialists from Australia, the book is useful for worldwide qualitative researchers in humanities, arts and sociology. O’Toole and Beckett provide the reader with a fresh and interesting insight by using anecdotes and examples to illustrate the nature of research processes and practices. This makes the textbook enjoyable to read and digest. We are encouraged to consider the reasons and contexts for conducting research, as well as the philosophical elements, and responsibilities we must have as researchers. Further the book provides a detailed section on methodologies and methods that may employed when doing research.

Newcomers to research should read Part A and Part B chronologically, for Part A outlines key ethical, philosophical and methodological issues to think about before conducting research. Newcomers to research will also find many succinct and clear definitions of key concepts in research. All researchers should find important guidelines and practical advice in Part B of the textbook where we are provided with a range of areas that need consideration on the part of the researcher: the literature review, data analysis, and the final report. Very useful for teachers who want to conduct educational research is the section on Research and the Practitioner.

The textbook is especially helpful in giving you tasks to help you along the research journey. For example, after reading about how to seek our relevant literature and critically review the literature, the authors encourage readers to respond to the reflective questions by considering how their research question relates to the sources they have reviewed. Minor details such as helpful side headings of key words make the textbook all the more accessible and quick to read to locate relevant information.

Like *Educational Theories, Cultures and Learning* by Daniels et al, these authors also subscribe to the idea that presenting your positionality is crucial, reminding us that just as teaching is a political, cultural and ideological act within a specific context, so is the act of researching. Daniels et al pointed out that their books emphasise that there is no quick-fix recipe book to solve educational problems. Similarly O’Toole and Beckett highlight that their book is not a tablet or a stone. These reminders about positionality and truths are useful for all researchers. Like Daniels et al, this book again ends each section with questions to consider, as well as references for wider reading.

Constructing a Sociological career: An eternally complex autobiographical practice (2014-06-16 08:00)

It wasn’t billed as an early careers master-class and pep talk, but from my personal perspective, this was precisely what the recent ‘Conversations with David Morgan and Friends’ event delivered, as well as interesting insights into current research at the Morgan Centre in Manchester, and a chance to network with Sociological colleagues from all stages of the career. I’d arrived at the event feeling quite self-conscious, a little bit anxious and somewhat of a charlatan. Having graduated in 2001, with a degree in Sociology and History, the last 13 years have been spent bobbing and weaving between arguably relevant short term employments and studies, with the lofty goal in mind of somehow, one day, becoming a ‘Sociologist’ and, hopefully, an established academic.

Through a combination of planning, cunning and luck, I have successfully managed to remain in the higher education milieu, gained a social science PhD, worked on some interesting research projects and I even have a couple of publications coming out this summer. In fact, not two summers ago, I narrowly missed out on landing a prestigious early career fellow grant, which would have meant three luxurious years of focussing entirely on my own research project, which I had designed myself without the aid of a mentor. However, despite making the short-list I didn’t get the grant, and there were no prizes for runners up. Additionally, my current contract was due to expire within the next six weeks, after which I would be doing – what exactly?

Given that the summer is an especially bad time to be looking for jobs in academia, and given that my teaching experience is limited, the most likely looking opportunities, though interesting and appealing to me, were outside of the academy. Whilst I had settled it with myself that some of these roles might enhance my sociological imagination and expand my horizons, I was nevertheless plagued with doubts about how they would fit on my otherwise reasonably consistent HE focussed CV.

I began to doubt the wisdom of my having attended. Was I sociological and/ or academic enough to be here? I pondered, whilst loitering around the registration table, cringing and feeling socially awkward. What were the criteria for ‘belonging’ at an event like this anyway? Qualifications? Publications in certain journals? Being successfully employed as a lecturer? This kind of ridiculous navel-gazing went on for far longer than I care to admit and was in danger of mushrooming into an existential crisis – who did I think I was anyway, booking myself onto this event, taking up the place of a more worthy delegate?

Thankfully I soon got chatting with some other ‘early career’ delegates, and as I dutifully recited the narrative ‘in a nutshell’ version of my CV, it didn’t sound anyway near as random or ‘unsociological’. In fact it wasn’t long before viva stories were being compared and we were exchanging hushed whispers regarding our career-related anxieties and bumps in the road in our persistent campaigns to get a foothold. After all, establishing an academic career, or indeed any career, was tricky these days wasn’t it? In today’s climate etc etc.

Feeling far more relaxed I entered to room for the final part if the conference, ready to celebrate the glittering careers and brilliance of the two established academics ‘in conversation’ – Professors Carol Smart and Jeffrey Weeks. However they surprised me by instead revealing the slightly more haphazard trajectories of their own careers - being ousted for being ‘too much trouble’ and working outside the academy in order to ‘survive’ (rather than strategically deciding to engage with political and community activities). I sat up in my seat, delighted, letting these precious revelations wash over me like a wave of reassurance. So it was okay to meander and drift - outside the academy if necessary, one’s career need not necessarily follow a nice, linear, progressive path. And it had always been so, it seemed, even for those destined to be highly influential, bone fide Sociologists!

Interestingly, a ‘further reading’ note emerged from the conference slot which saw Professors David Morgan and Sue Scott in conversation - an article about the construction of a CV. Following the conference I sought it out - and I am most glad that I did. In this splendid article, Professor Morgan and a colleague, Professor Nod Miller, explored the production of a CV as a form of autobiographical practice and ‘presentation of a self’ in a particular
Miller and Morgan drew on guidelines for CV writing, anatomising the process and drawing on their own CVs as a source of data. They described their approach as 'heterodox', nodding to the inevitable relevance of a Foucauldian framework, but also using Goffman's work to examine 'the more processual details'. Drawing on Goffman's eight elements of 'performance' analysis, they use the concept of 'front', for example, to examine the guidance regarding drawing particular attention to certain activities and achievements, such as academic invitations received to national or international occasions, over other more 'trivial' details, such as book reviews. However there is, the authors point out, a matter of balance here, because early career academics might include book reviews since they may be used to indicate the beginnings of the establishment of a reputation.

I was particularly interested in this discussion regarding the value of book reviews, which has often been a source of personal dilemma. Recently I was informed that my book review essay on 'Deafhood' has been sent for print and will appear in 'Sociology' (journal of the British sociological Association) in August of this year. Whilst in the wider context of a fledgling academic career a book review essay will be viewed as 'trivia', this particular contribution is, in my opinion, as insightful as many academic articles and certainly required as much time, effort, thought and perhaps even skill. In presenting my nutshell, narrative CV to colleagues at the Morgan Centre event, I had chosen to mention it since it will be my first publication in this prestigious journal of our discipline and I am very proud of it. However, even as I did so I found myself apologising "I know it's only a book review essay but...", however I was pleasantly surprised by the positive reaction I received. One fellow early career colleague commented that I had always been good at 'getting myself out there', which reflected my reasoning for undertaking the review, since it would connect my name with the field of Deaf studies – a new research direction for me.

Another interesting aspect of the CV article related to Goffman's heading of 'misrepresentation', under which the authors discuss the fine line between outright dishonesty and economies with the truth. For example one author included on their CV not only the number of post-graduates supervised but also listed those who had successfully completed; the other author, meanwhile, felt that this was overdoing the honesty. In this section there are some amusing comments regarding the authors inviting each other to 'spot the whopper' in each other's CVs and having been given the informal advice 'what you need is some whopper training'.

Whilst the overall themes of this article on CVs are comparable with the present day, the article was written in 1993 and thus many additional elements must now be considered. The advance of the internet has revolutionised the ways in which we discover, read and publish Sociology. Social media such as researchgate.net provide new ways in which we can present our biographies. Meanwhile the importance of the Research Excellent Framework (REF) and establishment of the Researcher Development Framework (RDF) make it vital that we develop a plethora of skills and publish prolifically, whilst promoting these appropriately through having ORCID and Scopus accounts. It is worth considering, therefore, this variety of activities and outlets when constructing our biographies, careers, and our CVs to present ourselves. ‘The Sociological Imagination’ is one such forum and I have finally set up a twitter account for the purposes of joining the online Sociological sphere.

Reflecting on the moral of this tale, Aesop-style, I would say that I am now feeling far less anxious and rigid about constructing my Sociological career during the next few years. In fact, with my recent discovery of autoethnography as a genre, and adopting a reflexive approach to addressing the domains of the RDF, I am excited about exploring a diversity of experiences, and about tackling this eternally complex autobiographical practice.

[Sara Louise Wheeler is a Research Assistant at the University of Liverpool and a Visiting Research Fellow at Glyndŵr University. Her research interests include autoethnography, health, disability, plural identities and belonging. She is currently seeking funding for an ethnographic study on Deaf Welsh identity and belonging. She tweets at @SerenSiwenna]
Jackie Goode (2014-08-14 12:02:30)
Great piece. You might like my 2006 'Research Identities' article in Sociological Research Online and 'Women's Studies' in Qualitative Inquiry, same year. While I'm coming to the end of my research career, I'd like to think they'd give you just a little bit more power to your elbow. You go girl!

Jackie Goode (2014-08-14 12:02:43)
Great piece. You might like my 2006 'Research Identities' article in Sociological Research Online and 'Women's Studies' in Qualitative Inquiry, same year. While I'm coming to the end of my research career, I'd like to think they'd give you just a little bit more power to your elbow. You go girl!

Sara Louise Wheeler (2014-08-26 18:10:23)
Hi Jackie, Thank you for your kind words, I've been truly surprised and delighted by the positive response I have received to this little piece; it has been re-tweeted and many have commented on how relatable it is. Your Qualitative Inquiry article is very moving and powerful, I very much enjoyed reading it; I actually have my own little piece in Qualitative Inquiry this month, it's called: Tinnitus: a Deafhearing phenomenon and it is a performance autoethnography with my cousin (which I have since discovered is either a collaborative autoethnography or a duoethnography, depending on your point of view?) Your 'Research Identities' article looks interesting and will undoubtedly be a good starting point for my future articles about the early career trajectory. Thanks again Sara

New Journal Issue - ethnographic studies of Georgia (2014-06-17 08:00)

New theme-issue of Slavic Review, Interdisciplinary Quarterly of Russian, Eurasian, and East European Studies: Ethnographies of absence in the Republic of Georgia

Tales of single parenthood in austerity Britain (2014-06-18 08:00)

Great article in the [1]Lacuna magazine discussing the hardships of single parenting in contemporary Britain and what the benefits system and employment policies are doing wrong. (Also, a great example of sociological writing
with interviews).

“Every time they bring in an academic and come up with a new solution – the solutions never seem to work. It is partly because they don't consult with us.”

---------------------

Depression by Any Other Name (2014-06-19 08:00)

I came across a nice little [1]article by the Irish author and journalist [2]Mary Kenny from 2010, in which she writes about the multitude of other feelings and emotions with which depression is increasingly conflated. She writes:

It is an accepted truth, in our time, that depression is an illness with a global reach. [...] This new openness is a good thing. Yet in the process, are we losing something?

Perhaps Kenny isn't entirely right about our "openness" about depression. Mental illness remains a stigma, although less so than it once was. But her brief excursus through the history of how we (and other cultures) deal with sadness and grief is well worth a read.
