The capability approach (CA), developed by Amartya Sen, Martha Nussbaum and other social theorists is a broad, human-centred normative framework for the evaluation of individual and group well-being, quality of life and social justice. Sen and Nussbaum’s ideas have influenced global, national and local policy, such as the annual Human Development Reports of the United Nations Development Programme since 1990, over 500 regional or country-level Human Development Reports and many local policy initiatives in different countries. The CA has also been influential in a number of academic disciplines, inspiring a vast and expanding literature in diverse fields of academic and policy research, evaluation and practice. The approach has been taken up most notably in development, international justice and human rights and, more recently, also in welfare, social policy, the labour market, education, gender, health and disability. However, so far have the CA remains largely unnoticed in sociology. In this interview, Martha Nussbaum explains briefly the rationale behind her version of the capability approach. In this article, I try to explain why this is, and why the capability approach could be very interesting and useful for sociologists and can contribute to a publicly engaged sociology. Below are some resources on the Capability approach and examples of its application.

A BSA Bourdieu Study Group Event: Are Elite Universities Meritocratic? (2014-06-21 08:00)

Are Elite Universities Meritocratic?

A BSA Bourdieu Study Group Event

Tuesday 8th
July 2014 10am-5pm
Keynote Speakers
Professor Diane Reay and Dr. Vikki Boliver

Bourdieu talks about university being a process of 'elimination' for those who lack the type of 'capital' valued by those institutions. In the UK meritocracy is promoted, the idea that one's position in society is determined by ability plus effort rather than background. However, despite the gap closing slightly in recent years, young people from disadvantaged backgrounds are still much less likely to be admitted to higher education and specifically to elite universities. UCAS data (2013) shows that young people from the most advantaged areas are still 7.5 times more likely than those from the most disadvantaged to enter a higher tariff institution. Moreover Black and Asian young people are much less likely to receive an offer from a Russell group university than their White counterparts. In a context where universities are charging up to £9,000 it is important to scrutinise their admissions processes. This conference will do just that, asking the following questions: Are elite universities meritocratic? What role does class and race play in their admissions processes? The conference will also consider the question of what happens to the minority of disadvantaged students that do make it through the system. Overall asking a crucial question: Are elite universities –themselves- reproducing inequality?

To cover expenses, the event costs: £35 – BSA member students; £40 -BSA member non-students and £50 – Non-BSA members. Lunch, refreshments and a wine reception will be provided.

To register please go to:

Programme

10:00- 10:30: Registration/Tea and coffee

10:30 -10:45: Welcome by convenors

10:45 – 12:00: Dr Vikki Boliver 'Meritocracy and fairness in elite university admissions'

12:00- 13:00: Lunch
13:00 – 14:15: Professor Diane Reay 'Elite universities and their centrality in the reproduction of educational inequalities'

14:15 – 14:30: Tea and coffee break

14:30 – 16:00: Panel Discussion- Dr Vikki Boliver (Durham University); Professor Harriet Bradley (UWE Bristol) Professor David James (Cardiff University) Professor Diane Reay (University of Cambridge); Mr Richard Smith (HEFCE)

16:00 – 17:00: Wine reception

17:00: Close and depart for dinner/drinks

For further info contact: events@britsoc.org.uk or (0191) 383 0839

CfP: Crisis and Social Change: Towards Alternative Horizons (2014-06-22 08:00)

Crisis and Social Change: Towards Alternative Horizons.
Call for Papers. Deadline Monday July 21st.
Organized by the Department of Sociology, Cambridge University
Date: Sep 26-27, 2014

Venue: Faculty of Human, Social, and Political Sciences, Free School Lane, Cambridge, CB2 3RQ

This conference moves beyond crisis as a category of diagnosis and critique to explore alternative horizons, raising fundamental questions about the nature and extent of ruptures and continuity in the contemporary social world.

Among the multiple horizons in view, we are motivated by the generational need to draw upon the legacies of critique, while shifting toward the production of alternative futures.
From diagnosis to treatment. From deconstruction to reconstruction. From negation to vision. From crisis to progress. Such is the responsibility of our Age, from which positive social change might rise.

We welcome contributions from researchers, activists, artists, and professionals from across the world on the following topics, though this list is by no means exhaustive, and we are keen to receive contributions on other topics aligned with the conference theme:

- Critical and Empancipatory Thought and Action
- Social Transformation and Cities
- Alternative Economic Practices
- Work and Life
- Media
- Education
- Revolutions and Social Protest
- (Post) Democracy
- Environment

We have also introduced a soapbox session within the Conference programme and encourage speakers to participate. For the natural orators out there, the soapbox session provides you with the opportunity to stand up for 2 minutes and air your fiery, risky, extravagant and controversial views on the following question: WHAT IS RADICALISM?

The conference is organized by PhD students from the Department of Sociology, University of Cambridge. To give attendees time to explore the city’s history and socialise, the conference will be held over two days.

KEYNOTE SPEAKERS:

We are pleased to announce our three distinguished keynote speakers:
- Professor Greg Philo (School of Social and Political Sciences, University of Glasgow),
- Professor Emeritus Goran Therborn (Faculty of Human, Social and Political Sciences, University of Cambridge)
- Professor Ted Benton (Faculty of Social Sciences, University of Essex)

PLENARY PANELS:

The conference will also host two plenary panels on the following themes:

- Plenary panel 1: The Great Recession and Varieties of Social and Political Responses
  Chair: Professor Andrew Gamble
  Dr. Rowan Williams (tbc)(Master of Magdalene College, Cambridge), Professor Larry King (Dept. of Sociology, Cambridge), Professor John Kelly (Dept. of Management, Birkbeck), and Dr. Jeff Miley (Dept. of Sociology, Cambridge)

- Plenary panel 2: Mobilisation, Social Change and Revolution
  Chair: Barrister Dexter Dias QC
Professor P.G Klandermans (Dept. of Applied Psychology, University of Amsterdam), Emeritus Reader in Sociology Dr. David Lane (Dept. of Sociology, Cambridge), Professor Jane Wills (Dept. of Geography, Queen Mary University of London) and Dr. Manali Desai (Dept. of Sociology, Cambridge)

HOW TO SUBMIT:
Paper presentation: abstract (300 word max.) and biography (100 word max.)
Poster presentation: abstract (300 word max.) and biography (100 word max.)
Soap box presentation: abstract (100 word max.) and biography (100 word max.)

SUBMISSION DEADLINE:

The deadline for the submission of abstracts is Monday, July 21st 2014. There is no registration fee.

All abstracts must be submitted by visiting the Ex Ordo abstract submission system (you will be required to setup an account first): [1]http://csc2014.exordo.com/

Successful applicants will be informed by July 31st, 2014.

The selected applicants are expected to submit an outline of their presentation (or the power point slides) by September 1st, 2014

PUBLICATION AND AWARDS:
Awards will be given for Best Paper, Best Poster and Best Soap Box Presentations at the end of the Conference in recognition of originality and excellence. The Organising Committee also plans to publish selected papers of the highest quality in a special issue of a UK journal or as an edited volume.

FURTHER INFORMATION:
For further details on our distinguished keynote speakers and plenary panelists please visit [2]http://www.towardsalternativehorizons.wordpress.com, email the organising committee at towardsalternativehorizons@gmail.com or visit our Facebook page [3]http://www.facebook.com/events/850509748311055

The Destruction of Public Space (2014-06-23 08:00)

In the past few days, this bench has made an outrage among my Internet community. I had to look it up and discovered that it is a public installation by the German designer and conceptual artist 2730
Fabian Brunsing intended to pervert the idea of public space as a satire of the commercialisation of modern life.

But the idea behind this piece of art is not entirely new. In 2001, a Seattle gallery exhibited the piece [1] "SeatSale: Licence to Sit": an "Internet Chair with magnetic stripe card reader and spikes that retract when a seating license is downloaded from a license server in response to input from the card reader incorporated into the chair".

After some time (e.g. after the movie has finished) a bright flashing animated version of the following is displayed:
Now if we go back to real life...We are all familiar with the relatively recent emergence of anti-seater seating in UK public spaces:
In 2007, as a poor East-European MA student in the UK, I went to Brussels and got stuck there overnight because I stupidly missed my flight. I discovered that both the Central Train Station, and Brussels Airport, are designed to make sleeping very hard. There were no spikes, but the walls of the station were curved in such a way to make it impossible to sit or lie next to the wall; if you lied down, you would be almost in the middle of the hall, and exposed to a horrible cold draft. In the airport, all benches had arm rests and there were no flat surfaces. Having filled my camera with photos and my time with an improvised photoshoot, exasperated, [3] I finally fell asleep at 5am on a bar table. I caught a bad cold and spent three weeks ill on antibiotics. And I am very, very far from homeless.

[4]

Spikes for the prevention of rough sleeping are used under bridges in China:
A couple of days ago, the Guardian reported that a new housing development on Southwark Bridge Road in London has installed metal spikes to deter beggars and homeless people sleeping there.
Historians reading this would be better qualified to comment - but I am sure that this has been happening throughout history. The first example which comes to mind is the Window Tax - a property tax based on the number and size of windows in a house which existed in England, Scotland and France in the 18-19 Centuries. The point is not whether defensive urban architecture, or other restrictions of public access to nature or necessities, is a new phenomenon, but that the public outrage it causes is usually too short-lived to resist it. Dystopian art can warn us about the dangers of the future, but sadly, we rarely listen.

has a significant public (enough people/clout to be effective) really ever been brought to progressive public action by avant-garde art, and why would we attend to speculative art more than we do to actually alleviating present day outrages? we really need to start to come to terms with peoples' cognitive-biases if we want to make a difference that makes a difference...

I don’t know whether avant-garde art has ever been successful in bringing about public action. It’s a good question. I’m not sure I know where the boundary lies between avant-garde art and popular art, I think some avant-garde art influences the wider public indirectly, by influencing other artists who then create stuff that reaches wider publics. Any idea of where to find research on that? Which exactly cognitive biases on that list did you mean? Who are "we" and do you mean that we need to learn about our own ones, or about the biases of the public we try to influence? Say more!

The historic Lincoln Prison has seats that have a very similar shape to the curved ones shown here. They are almost impossible to sit on. For those with an interest in the panopticon there is further description and pictures here: http://loonyliterature.com/2012/08/31/writing-embracing-characterisation-in-a-haunted-victorian-prison/

The Muppets explain Phenomenology (2014-06-24 08:00)

Its philosophical accuracy is questionable but it is very catchy:
I recently heard [1]Gene Stanley, an affable and [2]rather polymathic physicist, reflect on his experience of collaborating with economists. He was concerned to make clear the different skill sets that physicists and economists bring to collaborative work, with each able to do things which the other can’t. But what really caught my imagination was his description of their divergent sensibilities. As I live tweeted at the time:

This is a topic that has intrigued me for a long time. One aspect of my PhD research which got slightly lost amidst the many other aspects was the aspect of self-selection involved in choosing a university degree. Obviously many
other factors are in play here but I was curious about what, if anything, draws people towards certain subjects? Are certain kinds of people attracted to certain kinds of disciplines? Much of one thesis chapter was devoted to unpacking this claim. Leaving aside the limited scope of the data itself, it's important to avoid imputing a uniformity to decision-making on these matters that manifestly isn't the case. Many people have no feeling of being 'drawn' towards a discipline. Even amongst those who do, it is balanced by many other concerns (e.g. employability, location of university, grade requirements for the course, confidence in the subject matter) which are weighed up in a way that is clearly purposive but often far from being 'rational' in any abstract sense. Furthermore, many students simply acquiesce entirely to the advice of their trusted interlocutors or inflect their own preferences through the assumptions loaded into the advice of authority figures.

Another complicating factor is the opacity of the cultural system, particularly when we were are young. Our intellectual journeys are path-dependent, leading us to push against the limitations of what we encounter and search for intellectual variety, often without knowing exactly what it is we're looking for. Peter Preston nicely captures how what can be a fundamentally messy process of intellectual engagement begins to consolidate through graduate school and into academic careers:

If one stands back from the day-to-day demands of professional routine, it becomes clear that an intellectual trajectory is not organised in advance, we do not begin by surveying the intellectual ground before deciding upon a line of enquiry; rather, as Hans-Georg Gadamer might put it, we fall into conversation; our starting points are accidental, our early moves untutored, they are not informed by a systematic professional knowledge of the available territory, rather they flow from curiosity; we read what strikes us as interesting, we discard what seems dull. All this means that our early moves are quite idiosyncratic, shaped by our experiences of particular texts, teachers and debates with friends/colleagues. Thereafter matters might become more systematic, we might decide to follow a discipline, discover an absorbing area of work or find ourselves slowly unpacking hereto deep-seated concerns. It also means that we can bestow coherence only retrospectively. This idiosyncratic personal aspect of scholarly enquiry is part and parcel of the trade, not something to be regretted, denied or avoided; nonetheless systematic reflections offers a way of tacking stock, of presenting critical reflexive statements in regard to the formal commitments made in substantive work.

- Peter Preston, Arguments and Actions in Social Theory, Pg 1

The process of pursuing graduate education and even an academic career necessitates continued self-selection, often through making choices which have increasingly pronounced disciplinary characteristics (though this is far from universally true). However it can also reflect social inertia, as people continue making choices which increase the opportunity costs of future exit while privately doubting whether academia is for them. My meandering point is simply to stress the complexity of this process – it’s inherently biographical, unfolding from iterated choices within an environment which entails a variable constellation of constraints and enablements each time, in a way which can’t be divorced from the context itself. The ideographic complexity of this process finds itself reflected in the kinds of intellectual biographies someone like Ray Monk writes (e.g. Oppenheimer, Russell, Wittgenstein) who deftly traces the multiplicity of ways in which the character of these thinkers and the character of their work co-condition each other within the context of an unfolding human life. Analysis with this level of detail obviously doesn’t scale but it’s important that we remember the complexity of the lived lives we’re abstracting from.

Which brings me to the topic I started with. Can we talk about the pleasures of disciplinarity? Can we talk about the things that thrill physicist and economists? I would certainly like to. As an accidental sociologist (and far from the
only one) I'm very conscious of the what appeals to me about sociology. I've been also been aware recently of the ease with which I could have 'discovered' social psychology as a frustrated philosophy masters student in much the same way I 'discovered' sociology. This is Peter Preston's point in the extract above. Where the pleasures enter into it is how these possible routes would have felt to me – would social psychology have fascinated and frustrated me in the way that sociology has? I suspect not. There's a complex interplay of factors driving the pleasures we derive from disciplines and they are made all the more complex by the fact that we too are changing as we are socialised (and socialise ourselves) into disciplines. In other words, I think the different 'thrills' that physicists and economists derive from their work is in part simply a reflection of their having been trained to do that kind of work, though of course sustaining this training necessitated their co-operation (at the minimum) and more likely their growing commitment. So if there are not 'physics people', 'economics people' and 'sociology people' could there be potential physicists-to-be, economists-to-be, sociologists-to-be co-existing within the same person prior to the training which gives life to these peculiarly intellectualising ways of being-in-the-world? I suspect so, though probably not all at the same time. I'm aware of not having really answered my own question here. But I'm also aware of being entirely comfortable with that fact yet nevertheless wondering what it says about the peculiarity of my own intellectual socialisation (or perhaps simply my own peculiarity).

Recently I have been reading up on contemporary social and cultural geography's take on race and racism, and I have come across a very interesting and useful edited collection by Claire Dwyer and Caroline Bressey (from the Department of Geography at University College London). New Geographies of Race and Racism is principally based upon conference proceedings in 2005 where leading academics and researchers discussed issues of race and racism in the UK and Ireland. The book focuses on contemporary academic discourses of difference, inclusion, exclusion and religious discrimination in a post 9/11 and post 7/7 world, and explores how these discourses are related to issues of race and racism, particularly in contemporary Britain where geographical imaginaries are central to political discourses of race and ethnicity.

The book contains detailed case studies from the UK and Ireland which illustrate the richly complex and interconnecting areas of race, nation and place. The chapters in this edited volume revolve around three key themes of racial and ethnic identity: the complexity of contemporary categories of race and ethnicity, micro-geographies of every day ethnicities, and the theoretical aspects of race and ethnicity. According to the editors the shifting demographic, political and policy framing of ethnicity and race is apparent in urban geography writings, and thus they have included chapters which respond to current debates. The edited collection also places great emphasis on historical significances, reminding us of how the past informs the present: Alastair Bonnett’s chapter on "Whiteness and the West" focuses on the historical and geographical elements of transition that impact upon the changing trajectories of whiteness.

As well as providing illuminating case studies, the book engages with philosophical and epistemological aspects to the question of race, and thus helps us to understand methodological implications of studying race and ethnicity, particularly as some say we are living in a post-race world, whilst others argue that racism is ever present in contemporary societies. Moreover, the book moves away from solely concentrating on England by including case studies from Scotland, Northern Ireland and Republic of Ireland. We learn about identity politics through reading about constructions of whiteness in the context of Europe, Arab activists in Britain, Bengalis in the East End of London, and Scottish Muslims amongst others.

The chapter “One Scotland, Many Cultures" by Jan Penrose and David Howard draws on the interconnections between race and place in Scotland by looking at how attitudes towards race and racism have changed over time, and examining the anti-racism campaign conducted by the Scottish Executive. Penrose and Howard explore the language of multiculturalism and anti-racism as presented through discourse on Scottishness. John Clayton's chapter "Everyday Geographies of Marginality and Encounter in the Multicultural City" concern race relations in the city of Leicester, often seen as harmonious multicultural success story, from the perspective of the white working-class.
youth and their everyday experiences. Una Crowley, Mary Gilmartin and Ron Kitchin reflect on the experience of the Republic of Ireland where emigration was once the norm, but now increasing immigration is having an impact upon ideas of race, place and identity, and thus there is a political discourse that attempts to define and place the new immigrants.

Like Anoop Nayak's [2] Race, Place and Globalization: Youth Cultures in a Changing World, Dwyer and Bressey's edited collection is excellent in making contemporary arguments about race and ethnicity accessible for students and researchers from all backgrounds. In fact, New Geographies of Race and Racism contains a chapter by Nayak on racism and anti-racism in northeast England, illustrating how white youth articulate issues of race and racism in a mainly white post-industrial place. Even though these texts are grounded in the field of social geography, they can be utilised by sociologists and educational researchers, as well students of politics, interested in learning more about race and ethnicity in modern times. The book reinforces the importance of examining how race and place are inextricable in modern times (and past times), and thus challenges theories that promote the idea that globalisation has led to a sense of placelessness, whilst providing readers will fascinating case studies about the lived realities of race and racism in the UK and Ireland.

A New Way of Thinking. The Sociological Imagination of Harriet Martineau (1802-1876) (2014-06-26 08:00)

by Nina R. Jakoby and Michaela Thönnes

The classical social science tradition would remain incomplete without mentioning the first female sociologist Harriet Martineau (1802-1876) – a pioneer of sociological theory and social research (Rossi 1973). When C. Wright Mills (1959) elaborated his idea of Sociological Imagination and referred to the sociological classics Marx, Weber and Durkheim, among others, he did not consider the outline of a sociological discipline written by a British woman in the middle of the 19th century. Her theoretical and methodological concept of a "science of society" (Martineau 2002 [1838]: 15), even before the name sociology was established and institutionalised as a science, has mostly been forgotten in mainstream sociology. Yet the plea for substantial, relevant, theoretical as well as empirical social inquiry – in the sense that Mills (1959) had in mind – is found in her pathbreaking work How to Observe Morals and Manners (1838) and her study Society of America (1837). Both have to be recognised as sociological classics. Further, Martineau must be acknowledged because of her "condensed and free translation" (Martineau 1958a: 8) of The Positive Philosophy of Auguste Comte (1858). How to Observe Morals and Manners (1838) was the first book on methodology in sociology, published nearly fifty years prior to Durkheim’s Les Règles de la Methode Sociologique (Hill 2002). How can we capture the sociological imagination of Harriet Martineau? Well, it is best to let her speak for herself.

The Observer of Man and Manners stands as much in need of intellectual preparation as any other student. [...] the science [of Morals] which of all the sciences which have yet opened upon men, is, perhaps, the least cultivated, the least definite, the least ascertained in itself, and the most difficult in its application (Martineau 2002 [1838]: 13–15).

Her work reveals an early outline of sociology as a distinct social science that includes micro and macro analysis,
social structure and institutions, quantitative and qualitative analysis as well as the use of types and classifications (e.g., religion, suicide). "Things" serve as indicators of morals and manners in a given society, as the following quote demonstrates impressively:

The grand secret of wise inquiry into Morals and Manners is to begin with the study of THINGS, using the DISCOURSE OF PERSONS as a commentary upon them. Though the facts sought by travellers relate to Persons, they may be most readily learned from Things. The eloquence of Institutions and Records, in which the action of a nation is embodied and perpetuated, is more comprehensive and more faithful than that of any variety of individual voices. The voice of a whole people goes up in the silent workings of an institution; the condition of the masses is reflected from the surface of a record. The Institutions of a nation, - political, religious or social, - put evidence into the observer's hands as to its capabilities and wants which the study of individuals could not yield in the course of a lifetime. The Records of any society, be they what they may, whether architectural remains, epitaphs, civic registers, national music, or any other of the thousand manifestations of the common mind which may be found among every people, afford more information on Morals in a day than converse with individuals in a year (Martineau 2002 [1838]: 73-74, original emphasis).

The investigation of the "physiognomy of a nation" (Martineau 2002 [1838]: 71) implies the following fields of research that are necessary to understand the morals and manners of a society by investigating the "general tendencies of any society" (Martineau 2002 [1838]: 225):

- **Religion** (churches, clergy, superstitions, suicide),
- **General moral notions** (epitaphs, love of kindred and birthplace, talk of aged and children, character of prevalent pride, character of Popular idols, epochs of society, treatment of the guilty, testimony of criminals, popular songs, literature and philosophy),
- **Domestic state** (soil and aspect of the Country, markets, agricultural Class, manufacturing Class, commercial class, health, marriage and women, children),
- **The idea of liberty** (police, legislation, classes in society, servants, imitation of the metropolis, newspaper, schools, objects and form of persecution),
- **Progress** (conditions of progress, charity, arts and inventions, multiplicity of objects).

Martineau's social analysis is guided by an overarching purpose underlying her research: to promote human happiness, including the values of liberty, equality and the participation of both men and women (Martineau 2002 [1838]: 25–26).

To test the morals and manners of a nation by a reference to the essentials of human happiness, is to strike at once to the centre, and to see things as they are (Martineau 2002 [1838]: 26).

Therefore she addresses "substantive problems", as Mills (1959: 128) emphasises that sociology should do, especially social inequality constituting a public issue as well as a personal trouble interwoven with social values, historical and social structures (Mills 1959: 130). Martineau's conception of sociology as a distinct discipline incorporates the ideas
of Mills’ Sociological Imagination, integrating biography, history as well as social structure as key elements of social analysis.

In a later article, Martineau (1958b: 1119) addresses relevant issues of the development of a new social science by defining the subject methodically, laying down the definition of terms and its features, and ascertaining the essential principles around which this science revolves. With How to Observe Morals and Manners (1838) she successfully lived up to her own expectations by specifying the content, methods and principles of the new science that is now called sociology. She indicates the importance of the quality of social research because “if the instrument be in bad order it will furnish a bad product, be the material what it may” (Martineau 2002 [1838]: 23). Her recommendations and guidelines include sensibility towards “hasty generalizations”, ethnocentrism, and a “bias” due to the error-proneness of human perception and the “narrowness of the mental vision” (Martineau 2002 [1838]: 24–25, 229, 223). To complement the study of “things”, representative data must be collected based on a variety of interviews “with all classes of the society […], – not only the rich and poor, but those who may be classed by profession, pursuit, habits of mind, and turn of manners” (Martineau 2002 [1838]: 223).

The Martineauian sociological imagination offers a sociology that connects theory and life, theory and empiricism, and a mode of living devoted to scholarship and public enlightenment. The science of society is always comparative and historical, because “if he explore[s] only one country, carries in his mind the image of all; for, only in its relation to the whole of the race can any one people be judged” (Martineau 2002 [1838]: 29). With regard to these values and the sociological possibilities Martineau personified and demonstrated in her work, she must be included in the historical narrative of sociology (Hill 2003). Her sociological imagination avoids one-sidedness and trivialisation by considering man, woman and society, micro and macro, theory and empiricism, “verstehen” and ”erklären” as the main objectives of sociology, written in an absolutely intelligible language. She reminds us that sociology has always been a critical social science with a public mandate to distribute knowledge and shed light on major societal problems, social inequalities, values or taken-for-granted truths. Remembering Martineau as a sociological classic means learning from a conception for gaining scientific insights that is still modern to this day – a conception that holds itself to the standard that its results be relevant to the reality of the object of research and thus demonstrates what has always been the strength of sociology in analysing social issues and problems. Sociology cannot afford to forget her.

[Dr. Nina R. Jakoby is Senior Research and Teaching Associate in the Institute of Sociology at the University of Zurich]

Michaela Thönnes is a Research Associate in the Institute of Sociology at the University of Zurich[/nbox]

Thanks for this. A couple of years ago I actually called for someone to do a Ph.D. on Martineau’s work – indeed on this very blog: http://sociologicalimagination.org/archives/10796. One problem that Martineau suffers from – and this may apply to other marginalised figures from the early history of sociology – is that she self-identified with a movement that has fallen out of fashion, in her case ‘positivism’, which you deftly manage to avoid mentioning. Moreover, it was easy for her to avoid the theoretical/methodological dichotomies that have plagued modern sociology because she lived before they were institutionalised. She is basically from the generation before Dilthey and the Neo-Kantians started carving up the disciplinary space between ‘naturalistic’ and ‘humanistic’ modes of inquiry. Now some interesting consequences follow: (1) The original positivists may not be as ‘positivistic’ as we imagine them to have been. (2) That we might want to reconceptualise sociology from the standpoint of what the field would have looked like, had the naturalistic/humanistic distinction never been drawn, as Martineau clearly did in her own practice. (She was not alone, of course. John Stuart Mill is another obvious case in point.)

Five Recommendations for Social Scientists in responding to big data (2014-06-27 08:00)

This is our 2000th post!

I recently came across this post by [1]Helen Margetts on the LSE Impact Blog from a few months ago. It’s worth reading the post in full but what really caught my imagination were the five recommendations she makes at the end. I don’t think the methods training I received was bad but in retrospect I think it was hugely limited (and consequentially limiting). This needs to be addressed institutionally because otherwise conversations surrounding ‘big data’ are likely to become absurdly lopsided over time, as successive cohorts of data scientists are trained in a way that is relatively insulated from the traditional concerns of the social sciences. I think Helen’s third point is important as a matter of technical proficiency but perhaps even more crucial as a precondition for sustained interdisciplinary
communication. So while my current strategy of gradually working through Code Academy might be useful for me, it’s not exactly a scaleable solution for the social sciences more broadly (though it does fit worryingly well with the privatisation of upskilling in order to ensure one’s own occupational viability in a changing labour market). These are Helen’s five recommendations:

1. Accept that multi-disciplinary research teams are going to become the norm for social science research, extending beyond social science disciplines into the life sciences, mathematics, physics, and engineering. At [2]Policy and Internet’s 2012 Big Data conference, the keynote speaker Duncan Watts (physicist turned sociologist) called for a ‘dating agency’ for engineers and social scientists – with the former providing the technological expertise, and the latter identifying the important research questions. We need to make sure that forums exist where social scientists and technologists meet and discuss big data research at the earliest stages, so that research projects and programmes incorporate the core competencies of both.

2. We need to provide the normative and ethical basis for policy decisions in the big data era. That means bringing in normative political theorists and philosophers of information into our research teams. The government has committed £65 million to big data research funding, but it seems likely that any successful research proposals will have a strong ethics component embedded in the research programme, rather than an ethics add on or afterthought.

3. Training in data science. Many leading US universities are now admitting undergraduates to data science courses, but lack social science input. Of the 20 [5]US masters courses in big data analytics compiled by Information Week, nearly all came from computer science or informatics departments. Social science research training needs to incorporate coding and analysis skills of the kind these courses provide, but with a social science focus. If we as social scientists leave the training to computer scientists, we will find that the new cadre of data scientists tend to leave out social science concerns or questions.

4. Bringing policy makers and academic researchers together to tackle the challenges that big data present. Last month the OII and Policy and Internet convened a workshop in Harvard on [6]Responsible Research Agendas for Public Policy in the Big Data Era, which included various leading academic researchers in the government and big data field, and government officials from the Census Bureau, the Federal Reserve Board, the Bureau of Labor Statistics, and the Office of Management and Budget (OMB). The discussions revealed that there is continual procession of major events on big data in Washington DC (usually with a corporate or scientific research focus) to which US federal officials are invited, but also how few were really dedicated to tackling the distinctive issues that face government agencies such as those represented around the table.

5. Taking forward theoretical development in social science, incorporating big data insights. I recently spoke at the Oxford Analytica Global Horizons conference, at a session on Big Data. One of the few policy-makers (in proportion to corporate representatives) in the audience asked the panel “where is the theory”? As social scientists, we need to respond to that question, and fast.

CfP: What are conferences for? The Political economy of academic events (2014-06-28 08:00)

The [1]Sociological Imagination invites short articles (500-1500 words) critically reflecting upon the prevailing forms of intellectual meeting within the contemporary academy. What are their strengths? What are their weaknesses? How could they be done differently? What are the sociological implications of these standardised forms of intellectual meeting? Whose voices do they amplify and whose do they suppress? What behaviour do they reward and what behaviour do they discourage? What are their intellectual implications? How far does intellectual form follow conference function, limiting time and expression in the interests of the event’s logistics? Why do people attend seminars? Why do people attend events? What are the wider significance of these common reasons? Are there other motivations for attending academic events which tend to be squeezed out in the neoliberal academy. How might we do things differently? What alternative forms can we imagine? What would the implications for the academy be of DIY academic events becoming common? We’re particularly interested in receiving articles on the political economy of conferences, seminars and workshops?

If you would like to submit an article please send mark@markcarrigan.net a 500-1500 word article, attached within the body of the e-mail, as well as biographical details to be displayed with the post.

debлина (2014-06-29 08:26:42)
Hi want to know till when can we submit? is there any deadline?

Sociological Imagination (2014-07-01 19:08:14)
Nope, no deadline

"Worker analytics" - Taylorization 2.0? (2014-06-29 08:00)

This article on [1]Pop Matters is an interesting critique of the growing trend towards 'Worker analytics' and how it meshes with productivity culture to expand the scope of workplace control: 2746
Both Taylorism and People Analytics are largely based on the idea that the human worker can be effectively represented through a composite of statistical metrics, and that an understanding and wielding of the information produced by those collective metrics will allow the managerial class control over the worker. However, there still exists a gap between a human being's capacity to be fully measured and data-technology's capacity to fully measure. Whole industries still misinterpret data all the time in pursuit of their respective goals (for a good example of this, check out [2]this discussion on “click-baiting” and digital publication analytics, on Time.com ). That gap is precious, and it represents the battleground over which the worker and the manager/corporation will struggle; the former for freedom, the latter for control.

This is better than a festschrift!

Rediscovered: C. Wright Mills’ 1951 book “White Collar – The American Middle Classes” (2014-07-01 08:00)

by Hannes Antonschmidt*

If he could look into the faces of work commuters on public trains of Western cities today, C. Wright Mills would be quickly convinced of the continuing relevance of his 1951 book, “White Collar – The American Middle Classes”.

The core thesis of his work is that the ongoing mechanization and automation of the factory halls has caused the same unpleasant symptoms that had become normality at the assembly lines. Estrangement from the product and oneself, demotivation and a sharp spatial and emotional split of work and leisure, according to Mills, no longer
only hit the proletariat but increasingly also the "white collar" employees.

In postwar America his book caused mixed reactions. Criticism, however, was mainly directed to the rigidity of his conclusions with its harsh and sometimes dark views and prospects. Mills' general analysis was largely appreciated. The New Republic said the book "offers an absorbing though somewhat bitter picture of the new white-collar middle-class personality", while the New York Times even lifted it to the level of a seminal publication "that persons of every level of the white collar pyramid should read and ponder."

Let me first summarise Mills' argument, before relating it to today's situation.

Mills regards the US farm crisis of the 1920s as the starting point of the rise of the new, mass middle classes. Mills writes that it was the farm crisis that lead to a market consolidation and concentration which, in turn, made the former independent farmers and their sons and daughters, no longer able to find employment on their farms, available for the labour market. Instead of operating as autonomous market actors in the free interplay of supply and demand, they were absorbed by the expanding administrative apparatus of the new main influencers of America's economic fortune: the increasingly powerful big industries and central government. (Chapter 2 "The Transformation of Property"/Chapter 4 "The New Middle Class, I")

Mills' argument was that, additionally fuelled through this new supply of labour, the trend towards bureaucratization, mechanization and professionalization then began to reach the whole middle class. The old traditional middle class professions, such as doctors and lawyers, were commercialized, the independent entrepreneur became an anachronism, the free intellectual dies out. Instead, a management stratum arose within the corporations, which, completely removed from the production process, manipulatively steers the army of small employees while having to obey the nervous orders of their capital investors. (Chapter 5 "The Managerial Demiurge"/Chapter 6 "Old professions and New Skills")

Accordingly, the common daily routine of this new middle class, according to Mills, consisted of two parts: The working part, dominated by superficial, calculating friendliness, a striving for power and money and an increasing loss of the meaning of technical abilities, on the one hand; and the leisure part that allowed for a temporary escape in an unreachable glamour world, on the other. This short-term fulfilment of the personal craving for recognition which Mills called a "status cycle"(1969, p.257), for example on holidays, gained further importance, as the previous status bases (higher education and training, income, or origin) noticeably lost their exclusivity, as the new middle class became a mass stratum. (Chapter 10 "Work"/Chapter 11 "The Status Panic")

Those who, driven by "status panic" (Mills 1969, p.240) wanted to keep their sinecures were compelled to take the path of agility and sell themselves on the personality market. The self-reliable entrepreneurial personality was thereby replaced by the well-trained hierarchy climber, who, on his way to the corporate Olympus, has to assert himself or herself against an army of likeminded careerists. (Chapter 8 "The Great Salesroom")

Opportunism also shaped the process of politicization of the new middle class. Mills saw unions and parties as becoming polluted to become instruments for gaining the biggest share within the distributive struggle of the political economy. Systematic change was hindered because the members of the new stratum would always attach themselves to any political stream that just possessed the most power within the prevalent political order. (Chapter 15 "The Politics of the Rearguard").

It is astonishing that Mills 60 years ago recognized trends and phenomena that do not only shape the lives of members of the middle class today, but also significantly influence political decisions in industrial democracies in the 'west'.

This political dimension can be demonstrated by reference to a very adequate example of recent public sector reform in Europe: The Bologna Process, a university reform agreed upon by then 30 European countries in 1999 that
established the so called European Higher Education Area (EHEA) (Benelux Bologna Secretariat 2009). Its aims, to harmonize European degrees, while at the same time increasing graduates’ mobility and labour market readiness, implied a change of the role of universities which are now expected “to equip students with the knowledge, skills and competences that they need in the workplace and that employers require” (Working Group on Employability 2009, p. 5). Higher education institutions are seen as “partners [of politics and economy] in a joint venture that will create a good future” (Fejes 2008, p.525). Key player in this process is the (newly constructed) European academic citizen characterized in political planning as autonomous, flexible and mobile (ibid.).

The commercialization and its influence on graduate’s personalities were also two major findings of Mills’ analysis of the American university sector of the 1950s. His dark discovery that “high schools, as well as colleges and universities, have been reshaped for the personnel needs of business and government” (Mills 1969, p.266) is by the same time a complaint against a nation that has become a ”great salesroom” (Mills 1969, p. 161). Mills finds the finished product of the educational machine to be ”the successful man” (ibid.), a good employee within the “society of specialists” (ibid.), yet no ”good citizen” (ibid.).

“Little Man, What Now?” – Hans Fallada’s famous appeal is only rudimentarily addressed by Mills. The upheaval, the revolution must come – but what should it look like, who can start it, what comes after it – the Texan professor abandons the reader alone with these important questions. Considering that many trends Mills describes have neither slowed down, nor attenuated, in the past 60 years, we must pose additional questions: Was this course of history simply inevitable fortune? Was it the result of an (implicit) agreement? Or did people just fail to realize and discern the underlying processes? The latter seems rather unrealistic if one recognizes the apparentness with which the European Union can pursue goals that caused Mills’ outcry in his days. A third explanation might be that postmodernism has (with few exceptions) made even academics apathetic enough simply not to mind what is going on with themselves.

Especially in this respect, Mills’ book remains enormously relevant, since his relentless look behind the scenes sheds light on the constituting processes of everyday life and provokes a consciousness for reality that has become a scarce social good in modern mass society.

The DIY PhD and the transformation of intellectual life (2014-07-02 08:00)

As so often happens, [1] a post by Pat Thomson recently caught my imagination and left me thinking more deeply about an aspect of my own academic experience. There are lots of reasons I find the mechanics of postgraduate education interesting, foremost amongst which is probably the fact I’ve been one for rather a long time (and don’t feel like I will have stopped being one until my viva in September). But this personal dimension to my interest goes hand-in-hand with an intellectual fascination in the process by which postgraduate education is responsible for the reproduction of disciplines (or failure thereof). It has a similar importance for the university as an institution (today’s graduate students are tomorrow’s academics) and to actually existing HEI’s as organisations (today’s graduate students are today’s underpaid teaching assistants and tomorrow’s precariously employed lecturers – not to mention financial assets). When we look at this nexus (intellectual disciplines, higher education and specific universities) and the manifold tensions within it, it’s important not to forget the individual lives unfolding through it, as reflexive individuals try and negotiate a way through circumstances which may not be what they expected prior to choosing, drifting or being placed in postgraduate education but nonetheless constitute the reality they find once they are there (so basically S-A-C to anyone familiar with the latest realist lingo). Some of them may already know each other, they meet many others, develop enduring friendships (or resentments) and coalesce into networks which incorporate into and extend beyond the existing structure of social relations they initially encountered within these organisations and disciplines. They develop commitments to shared projects and values, unite around share identifications and even sometimes organise collectively (though usually not). They experiment with (and within) existing institutional forms, organising events, supporting certain norms (often implicitly propagating others) and both aggregatively and collectively begin to contribute to the reproduction or transformation of this complex system within which they were once so starkly peripheral, in spite of their continual centrality to the life of the organisation.

My point is that the way in which higher education changes is very complex but that the converging movements of graduate students into the system is crucial to understanding the dynamics we find within it. The issue patter’s post raised for me, which I’ve obsessed about from time to time but struggled to articulate clearly is: are graduate students becoming more reflexive and, if so, what are the implications of this for higher education? For younger graduate students, I’d argue this reflexive imperative reflects a broader set of social processes, though would certainly accept the reality of [2] social inertia being facilitated by privilege. I’d argue that pursuing education at a later age is inherently reflexive (see the late John Alford’s [3] PhD thesis which I’d love to help get published at some point). But does higher education itself lead to an intensification of this reflexivity and, if so, what are its implications for the system itself? This is where I found patter’s post so thought provoking and helpful. The post is definitely worth [4] reading in full.

2751
The plethora of advice books (Kamler & Thomson, 2008) were probably the first major indication of the trend to de-institutionalise doctoral education through DIY pedagogy. The advent of social media has exponentially accelerated it. Doctoral researchers can now access a range of websites such as [5]LitReviewHQ, [6]PhD2Published and [7]The Three Month Thesis youtube channel. They can read blogs written by researchers and academic developers e.g. [8]Thesis Whisperer, [9]Doctoral Writing SIG, [10]Explorations of Style, and of course this one. They can synchronously chat on social media about research via general hashtags #phdchat #phdforum and #acwri, or discipline specific hashtags such as #twitterstorians or #socphd. They can buy webinars, coaching and courses in almost all aspects of doctoral research. Doctoral researchers are also themselves increasingly blogging about their own experiences and some are also offering advice to others. Much of this socially mediated DIY activity is international, cross-disciplinary and all day/all night.

We know too little about how doctoral researchers weigh up the advice they get from social media compared to that of their institutional grad school and their supervisors. We also don’t know much about how supervisors engage with this DIY sphere, particularly about how much they talk with their supervisees about what they are doing online. We don’t know what support doctoral researchers get to work out what is good and bad online advice. We don’t know how supervisors and academic developers build on what doctoral researchers are learning elsewhere.

As someone who is engaged in this DIY field with books, blogs and twitter, it seems pretty apparent to me that something is happening here and we (collectively) don’t know what it is. It’s largely outside the normative audit oriented training processes that Green and Lee were so concerned about. It’s a field which is fragmented, partially marketised, unregulated and a bit feral. But it’s big, it’s powerful, more and more doctoral researchers are into it, and it is profoundly pedagogical. I’m concerned that British universities are generally (and of course there are exceptions, but mostly this is the case) not helping supervisors to think about this DIY supervision trend and what it means for how doctoral education is changing – and crucially, what the implications for their supervision practices might be.

I find the implications of this fascinating. If DIY educational practices are becoming a dominant feature of postgraduate education then what are the implications of this for how disciplines reproduce themselves and how higher education reproduces itself? I think there’s important work to be done both in mapping this trend empirically – clearly the social media sphere is integral to this (it has been to my own DIY PhD) but it extends much more broadly. Are there more reading groups, informal seminars, DIY conferences than have previously been the case? Do universities support these activities or are people creatively using the affordances provided by social media to organise outside of their institutions? Is the nascent industry of online coaching and training likely to grow and what are the implications of this? How do ‘para-academics’ and ‘alt-academics’ figure into this trend? To what extent do precarious working practices explain this tendency and to what extent are they reinforced by it? If it’s becoming more common (note the if, I’m conscious of the risk of assuming a linearity to a change) to work as a research assistant outside the context of your doctoral education then how does this change your orientation towards your PhD itself? Does the reflexivity made imperative by a precarious labour market devoid of full time work (let alone ongoing contracts) for postgraduate students inculcate a greater degree of reflexivity about their
studies? Is this intensifying the significance of peer socialisation in doctoral education and, if so, could we securely say that this is a good thing? What are the implications of these trends for intellectual quality and endorsement of the (conflicted) norms in virtue of which we seek to assess that ‘quality’?

There are lots of fascinating questions here. Not for the first time I find myself frustrated to realise that there’s another topic I’d like to do serious work on but, only having so much time and energy, I can’t given my existing commitments. Reflecting on my own experience (and resisting the urge to dignify it with the epithet auto-ethnographic) I think that a DIY PhD has proved inimical to specialisation. The range of experiences it has encompassed have expanded my awareness of intellectual variety (things to do, stuff to read, places to go, people to talk to) in a way which makes the necessity of patiently focusing upon one topic a deeply frustrating one. I wonder what other people’s experiences of a DIY PhD have been?

(and don’t even get me started on the politics of the DIY PhD....)

March 2015 useful stuff roundup | The Research Companion (2015-03-31 22:17:12)

[...] blogging and tweeting about research papers? The importance of stupidity in scientific research Mark Carrigan on the DIY PhD. From Crisis to Sustainable Health – lessons learned from the Ebola Outbreak worth viewing in [...]

Review by James MacFarlane
The Proactionary Imperative aims to provide a comprehensive intellectual basis for the emerging progressive movement of transhumanism. This is approached though four main chapters, then culminating in a manifesto.

The first chapter sets the scene by reflecting upon the disarray of contemporary politics, which seemingly serves only to alienate the younger generation despite the world undergoing momentous socio-economic and technological changes. Such disaffection apparently correlates with ongoing techno-scientific informed transformations in humanity’s self-understanding, which the authors anticipate may lead to a reorientation of the former right-left ideological axis by 90 degrees, according to differing approaches toward risk. 21st century political discourses could well be increasingly marked by a schism between those aspiring toward a ‘sustainable’ a.k.a risk-averse humanity, versus those who would sooner embrace-risk, seeking grand technological fixes to solve the world’s problems. Correspondingly, traditionalists and communitarians would become situated ‘down-wing’ forming precautionary pole of the new ideological spectrum, whilst libertarians and technocrats would shift ‘up-wing’ according to their proactionary disposition.

The second chapter offers a theological framework for understanding transhumanism, emphasising the necessity for a literal belief in our capacity for apotheosis. Accordingly, the authors strongly identify with the conception of nature as the product of an anthropocentric yet transcendent deity as favoured by the Abrahamic religions: reality might then not only appear fundamentally intelligible to us, but can equally be imagined as perfectible under the right (techno-science enabled) conditions. Such then leads them to appropriate the neologism theomemesis (‘God-Playing’ in Greek) for attempts to acquire God’s point-of-view, capturing the apparent maturation of earlier scientific aspirations at ‘Getting into the mind of God’ (exemplified in Physics), now increasingly towards a position of ‘Playing God’ (exemplified in Biology). As Science regularly destabilises our existence, a calculated and decidedly proactionary embrace of risk is suggested to be necessary for the fullest realisation our divine potential.

The third chapter revisits the history of Eugenics, with the book predominantly concerned with human biology as the most immediate material platform for transhumanism. It is suggested to be incumbent that proactionaries
re-engage constructively with this history, as transhumanism owes itself (at least in name) to Eugenics, the spirit of which it continues to promote under the more politically correct rubric of ‘human enhancement’. The authors suggest Eugenics was originally conceived as the ‘final frontier’ for nineteenth century political economy, or effectively the conversion of humanity to capital. Aspiring toward a future bio-capital utopia would involve ensuring maximum productivity, or making the most of one’s inheritance. However, ‘irrational’ (aka traditional) socio-economic barriers are likely to prevent some individuals from achieving this ideal. While wealth redistribution and egalitarian legislation might assist in the short term, a more comprehensive long-term solution would involve improving the capital stock of humanity itself: understanding the entire evolutionary process could unlock ‘unrealised potential’ or ‘unexploited capital’. Despite the Nazi use of genetic differences to declare a race war that ultimately turned into genocide, the authors maintain that Julian Huxley (the Evolutionary Biologist who coined ‘transhumanism’) wasn’t deterred from the project altogether. Essentially then, they point out that the recognition of genetic variations does not in itself prescribe a particular societal response: the ‘is’ merely prompts but does not determine the ‘ought’ (92). Equally, prospective future strategies for a 'Eugenics 2.0' wouldn't necessarily look as they had in the 20th century. New genomic knowledge acquired in the interim means that future interventions into the gene pool could well move beyond the gross regulation of individuals breeding patterns toward more targeted approaches such as drug-based gene therapies and direct nano-level genetic re-engineering.

The penultimate chapter then provides a legal and political framework for the proactionary principle. Here the authors recognise the most obvious means of advancing a collectivised proactionary policy agenda would be for a state to require that its citizens be duty-bound to participate in scientific research. Equally though, they realise that under the current increasing privatisation of science the most likely beneficiary wouldn't be the general public, but rather those biotechnology firms poised to exploit the findings for profitable products. In which case a solution may be the right (as opposed to duty) to participate in scientific research, which would translate into science appearing as an opportunity (as opposed to obligation) for the ordinary citizen. The authors then offer the new legal concept of hedgenetics, to capture ‘collective right to gene ownership compatible with the duty of genetic stewardship’ (122). In this sense, through self-organising collectives individuals would be encouraged to seek out others with whomever they might establish a common cause through common bio-capital interests, resulting in multiple ‘hedgenetic funds’ with overlapping membership. While corporate bodies wouldn’t be directly eligible for hedgenetic status (on account of their already existing legal personality and pure commercial interest), they could become involved by way of induction payments for individuals to participate in the company’s own genetic research in exchange for ‘access units’ - a non-exclusive right for individuals to use the results of research in the event that it makes a profit or novel finding. Whilst it is beyond the scope of this review to fully expound, essentially Hedgenetics aspires toward a participatory, democratically accountable and legally binding version of eugenics written into the heart of intellectual property law and the regulation of transactions.

The books foremost strength is its willingness to address the challenging social justice issues which those on the libertarian side of the transhumanist movement might otherwise overlook. Also greatly commendable is the varied array of material the authors summon to make their case. Accordingly, anyone who identifies with the need for future collectivist and democratic (as opposed to the typical market-driven) strategies for human enhancement, will undoubtedly find this text a well-informed 21st century starting point. [nbox type="notice"]James is a postgraduate student currently studying for the MSc in Science, Media and Public Policy within the Sociology Department at the University of Warwick. His interests centre around self-identification and expression in hyper-technological societies.[/nbox] 1. http://sociologicalimagination.org/wp-content/uploads/2014/07/fuller.jpg
Transhumanism’s Big Political Blind Spot | The Sociological Imagination (2015-07-28 18:54:10)

[...] Veronika Lipinska and I have argued in The Proactionary Imperative that a truly free transhumanist society would stretch society's powers of accommodation and [...]
(2002), the authors recognise that the academic imperatives of neutrality, anonymity and objectivity often leave the intellectual producing knowledge which is ‘parasitic’ on the movement itself (cited in Cresswell and Spandler, 2012: 6). It is argued that the academic gaze of social science objectifies the movement and does little for the movement’s cause. In either misperceiving the general contours of the critical agency involved, or, worse, restoring or preserving the hegemony of academic discourse, the gaze of the social movement researcher is dispassionate, often sacrificing an activist’s own acts of collective remembrance for intellectual self-promotion (Cresswell and Spandler, 2012: 3).

Cresswell and Spandler’s point-of-departure is founded upon Gramsci’s (1971) archetypal theory of the intellectual. Here, Gramsci constructed two types of intellectual: the ‘traditional’ and the ‘organic’. The former being characterised as the ivory tower academic who secures the status quo and the latter as the activist whose function it was to construct a transformative historical bloc (Cresswell and Spandler, 2012: 4): an alternative basis of consent for social order. To sacrifice an activist’s own acts of collective remembrance, then, is considered crucial: for a theory which is animated by the production of knowledge from activist experience is considered necessary in order to respond to challenges effectively (Cox and Nilsen, 2005). Indeed, such a theory is an essential condition in order to understand what is meant by transformation in the first place: a move from ‘an unwanted to a wanted source of determination… [which] can only be effected in practice’ (Bhaskar, 1989: 90).

Seeking to develop political practice (‘movement activism’), then, is considered a privileged source of knowledge as it is cultivated through an experiential engagement with mechanisms of constraint and oppression. To treat the social movement as an object of research – ‘to be observed, described and explained’ – is to be disengaged in such a way that the ‘active processes that people […] experience’ are either ignored or side-lined (Barker and Cox, 2002 cited in Cresswell and Spandler, 2012: 4). Largely devoid of any sense of ‘reflexive auto-critique’ (Cresswell and Spandler, 2012: 4) this academic’s theoretical work is said to be ‘confined’ to a set of abstract ‘generic propositions’ (Barker and Cox, 2002), which only marginalises the position of the movement actor and, therefore, negates his or her experiential knowledge, which is considered crucial in creating a transformative historical bloc.

Adjacent to the Gramscian perspective, there is another project, marked by an academic’s will to influence the wider public. This ‘public sociology’ (Burawoy, 2004) is animated by a realist ontology (Bhaskar, 1989). It believes in not creating knowledge directly for the movement, but rather, about questioning those with power (Mills, 1963) and about having ‘an uneasy relationship with the status quo’ (Furedi, 2004: 33).

It recognises that experience cannot solely explain what is happening in the world or ‘what is to be done’ (Lenin, 1973) in order to confront the challenges that movements represent. Experiential artefacts are only part of a wider, more complex picture. There are structures and mechanisms at work which give rise to these human experiences (Bhaskar, 1989). So the role of realist theory is to go deeper; to explain those ‘inner connections’ (Lebowitz, 2003), which were important to Marx’s own ‘politico-ethical stance’ (Cresswell and Spandler, 2012: 5). This move should not render activist experience epiphenomenal. On the contrary, it is marked by urgent social and political effects – effects which guide an academic’s theory towards oppressive social structures at ‘depth’. This is important to the sociologist who wishes to augment public debate about moral and political issues (Burawoy, 2004).

Rather than being left with a confrontation between academic and activist theorising, paradigmatically expressed by the question, ‘Which side are you on?’ (Barker and Cox, 2002), this project seeks to enrich public debate about those (structural) relations between phenomena which remain unseen, felt or experienced by actors (Thompson, 1995: 26). If we foreground our theories in experiential artefacts, if we delve into the pre-packaged chaos of activism, we are better positioned to critically question the conventions that sensitise society to particular ideals and values; norms which do not always push forward human progress (Furedi, 2004: 37). In good conscience, this perspective does not discuss the minutia which constitutes motivation for political change. As Cresswell and Spandler (2012) show, it cannot. Rather, its function must be to probe beneath the surface of experiential reality, and actively seek out those
‘inner connections’ in order to theorise the (structural) conditions for a progressive public discourse.

Tom Brock is a lecturer in the department of Sociology and Criminology at Manchester Metropolitan University. He holds a doctorate in Sociology and an ESRC-recognised Masters degree in research methods from the University of Durham, where he also worked as a research associate and a part-time teacher in the School of Applied Social Sciences.

You can read the article here. His new book on this topic looks great.

Our Currency is Information (2014-07-06 08:00)

The digital age has profoundly transformed the way people find and share information. The Internet is enabling collaboration between activists, hackers and journalists on an unprecedented scale. This has led to previously unimaginable possibilities in investigative reporting. People are newly empowered to uncover hidden information, expose corruption and bring the truth to light.

Through a series of short films, Exposing the Invisible tells the personal stories of those working at the new frontiers of investigation.
We explore their tools and methods and learn how they manage the risks of information activism. The project also offers a range of resources to help activists protect themselves and their work.

We hope that *Exposing the Invisible* will inspire a new generation of people committed to transparency and accountability.

Our currency is information is the first episode of the documentary film series Exposing the Invisible by Tactical Tech. In this episode you will learn about methods for investigating corruption and organised crime. You will meet Paul Radu from the Organised Crime and Corruption Reporting Project one of the most inspiring investigative reporters from Romania.

For more information see: [2]exposingtheinvisible.org/

The title of this post comes from Ian Craib’s wonderful book *The Importance of Disappointment*, which I wrote about a couple of months ago. His concern is with a contemporary inability, pervasive to the point that we may regard it as epochal, to live with disappointment. We struggle to tolerate the failure of our plans or the frustration of our expectations, instead resolving to change our selves or our circumstances in order to evade these limitations on our next attempt. We are hyperactively concerned to fix things because, argues Craib, doing so allows us to avoid confrontations with our own limitations and the recalcitrance of our world. His point is not that deliberation or planning are intrinsically delusive but rather that we invest ourselves in them in a way which is. Unintended consequences, thwarted ambitions and unrealised hopes are an unavoidable aspect of the human condition and yet we repudiate this reality, in our manner of being even if not our reflective judgements, because doing so helps us avoid the ambivalence which unavoidably follows from it. We strive to do better next time, moving on to something new in the belief that we can arrange the pieces of our life in a way that provides the grounding which we are peripherally aware of lacking. The problem is not that we try to better ourselves but rather in what we avoid through ‘self-improvement’: displacing our confrontation with disappointment by orientating ourselves towards next time in such a manner that we foreclose the capacity to experience this time.

The themes from Craib’s book came back to me when I recently read Oliver Burkeman’s *The Antidote: Happiness for People Who Can’t Stand Positive Thinking*. I’ve attached a video below from a lecture in which he summarises the book’s argument. It’s a great read and I couldn’t help but think of it as basically being *The Importance of Disappointment* if you substitute experimental psychology and cultural commentary for psychoanalysis and social theory (though this is probably unfair to both authors by conflating the distinctive qualities of each book).
much more nuanced than this, it’s hard not to wonder if the ‘h’ word in the title was insisted upon by the publisher). His target is not just the banality of these books but rather their tragically counter-productive character, with their inevitable tendency to provoke an attitude towards life which intensifies dissatisfaction and leads to the purchase of further books:

This is why, among themselves, some self-help publishers refer to the ‘eighteen-month rule’, which states that the person most likely to purchase any given self-help book is someone who, within the previous eighteen months, purchased a self-help book – one that evidently didn’t solve all their problems. When you look at the self-help shelves with a coldly impartial eye, this isn’t especially surprising. That we yearn for neat, book-sized solutions to the problem of being human is understandable, but strip away the packaging, and you’ll find that the messages of such works are frequently banal. The Seven Habits of Highly Effective People essentially tells you to decide what matters most to you in life, and then do it; How to Win Friends and Influence People advises its readers to be pleasant rather than obnoxious, and to use people’s first names a lot. One of the most successful management manuals of the last few years, Fish!, which is intended to help foster happiness and productivity in the workplace, suggests handing out small toy fish to your hardest-working employees.

This is why I found myself so unwaveringly categorising The Antidote as a companion volume for The Importance of Disappointment. The self-help industry depends upon and contributes towards the widespread evasion of disappointment whereas, as Burkeman, rather succinctly puts it: “the effort to try to feel happy is often precisely the thing that makes us miserable”. Our desire to avoid mess, refuting disappointment by energetically seeking solutions to our perceived problems, intensifies our inability to cope with our circumstances. What worries me though is how to stop this critique, persuasive as I find it, from leading to passivity – either at the level of personal life or social change. Both authors are sensitive to this issue but didn’t seem to resolve it in any substantive fashion. Perhaps I’m expecting too much? After all, we do not need to live with this mess but mess in general. So the recognition that there are problems which need to be solved can co-exist with a rejection of problem solving as a general condition of life. But this is by definition something that’s hard to write about in the abstract and it’s our own tendency to think about it in abstract terms (generalising our dissatisfactions and projecting into the future rather than engaging with their particularity in the present) which is such a large part of the problem both authors diagnose in their different ways.

Looking back through my kindle highlights I realise I’m perhaps being unfair by saying that Burkeman’s approach to this issue was unsatisfying. The stoics were the aspect of the book I was least familiar with but also perhaps the most interesting, at least in this particular respect:

It is essential to grasp a distinction here between acceptance and resignation: using your powers of reason to stop being disturbed by a situation doesn’t mean you shouldn’t try to change it. To take one very obvious example, a Stoic who finds herself in an abusive relationship would not be expected to put up with it, and would almost certainly be best advised to take action to leave it. Her Stoicism would oblige her only to confront the truth of her situation – to see it for what it was – and then to take whatever actions were within her power, instead of railing against her circumstances as if they ought not exist. ‘The cucumber is bitter? Put it down,’ Marcus advises. ‘There are brambles in the path? Step to one side. That is enough, without also asking: “How did these things come into the world at all?”
The economies and ecologies of Big Data (2014-07-08 08:00)

In this fascinating talk from the NSMNSS conference last year, [1]Evelyn Ruppert discusses the economies and ecologies of Big Data. Her research flowed from the [2]Social Life of Methods project and led to the establishment of the exciting journal [3]Big Data & Society which recently launched.

Would you like to write for Discover Society? (2014-07-08 21:01)

Discover Society is a free online magazine featuring articles on social research, policy analysis and commentary. It is supported by Policy Press and endorsed by the British Sociological Association and the Social Policy Association.

We publish short (1500 word) research-based articles on a variety of topics. We also publish: ‘Viewpoints’ (on current social issues); ‘Policy Briefings’; ‘On the Frontline’, and a longer, ‘Focus’ article in each issue.

Deadlines: mid-month for publication first Wednesday each month.

Potential contributions can be discussed in advance with the editors via a short ‘pitch’ sent to: [3]discoversociety@outlook.com

3. mailto:discoversociety@outlook.com
This essay by Kate Crawford (from Microsoft Research) at the New Inquiry explores the relationship between big data, the anxieties it provokes and normcore ("Having mastered difference, the truly cool attempt to master sameness"). If one accepts her contention that normcore reflects "the dispersed anxiety of a populace that wishes nothing more than to shed its own subjectivity" then the argument comes to seem very important. In the absence of sustained macro-political responses to the Snowden revelations, at least thus far, it's imperative that we look to the cultural consequences of this sudden awareness of institutionalised digital surveillance.

What does the lived reality of big data feel like?

2014 is the year we learned about Squeaky Dolphin. That’s the Pynchon-worthy code name for a secret program created by British intelligence agency GCHQ to monitor millions of YouTube views and Facebook likes in real time. Of course, this was just one of many en masse data-collection programs exposed in Edward Snowden’s smuggled haul. But the Squeaky Dolphin PowerPoint deck reveals something more specific. It outlines an expansionist program to bring big data together with the more traditional approaches of the social and humanistic sciences: the worlds of small data. GCHQ calls it the Human Science Operations Cell, and it is all about supplementing data analysis with broader sociocultural tools from anthropology, sociology, political science, biology, history, psychology, and economics.
An Alternative History of Sociological Thought (2014-07-10 08:00)

This idea occurred to me earlier today when I read this great article on Harriet Martineau for a second time. I’d first heard of Martineau through a conversation on twitter, ultimately leading to this proposal by Steve Fuller. The longer I study sociology, the more I learn about these figures, whom for whatever reason did not make it into the sociological cannon and yet made hugely original and important contributions to sociological thought. I’m thinking of people like Harriet Martineau, Patrick Geddes, William Du Bois and even Gabriel Tarde (though his championing by Nigel Thrift and Bruno Latour has contributed to a renewal of interest in his work). I’m assuming there are many others I’ve not encountered. Who else should figure in an alternative history of sociological thought?

While resisting the urge to commit myself to another project for the moment, it also occurs to me that such an alternative history would by its nature be something which benefited from a diverse range of contributions. Given what I assume to be a multiplicity of processes that can lead important and valuable figures to be historically marginalised and excluded from the cannon, it stands to reason that attempting to sole author a history of these exclusions would be an unavoidably difficult task - the very fact of the exclusions means that first contact with particular thinkers would likely be accidental, with a continued engagement reflecting the value that the reader found in their work despite the relative lack of status accorded to the thinker in question. So the wider the range of perspectives that figured into this alternative history, the more likely it would be to serve the purpose I’m proposing for it.

Why does this matter? There are lots of ways to answer this question, some of which are more politically inclined than others. But the one that seems most immediate and obvious to me is the intellectual implications of how narrowly conceived the contemporary cannon of sociological thought is. I recognise the likelihood of national differences, with this being an important issue that an alternative history could explore, but with regards to British sociology I agree with the assessment made by William Outhwaite:

The last 35 years or so in British sociology (by which I mean sociology written and taught in the UK) have been marked, I think, by two processes of ‘canonization’. The first is that of the holy trinity of Marx, Weber and Durkheim (sometimes including Simmel) as the ‘founding fathers’ of sociology as we know it. The second, more contentious, is the emergence of what seems at present like a fairly stable ‘canon’ of theorists ascribed a comparably prominent super-star role in contemporary sociology; my tentative list here (in alphabetical order) is Bauman, Beck, Bourdieau and Giddens.
In the five years since Outhwaite wrote this paper, we have approached a point where Latour could be added to this list (and we could conceive a point where Giddens might, rather unfairly, drop out of it). But it's remarkably limited in many ways. It's an empirical question whether these theorists do have the status which Outhwaite suggests they enjoy but, assuming he's correct, I find it easy to see all sorts of deleterious consequences which are likely to flow from the narrowness with which this cannon is constituted. These are probably the subject for another post. But I think there's an obvious need for a broadening out of the sociological cannon, not necessarily for an attack on canonisation as such but for a debate about what it means to have made an important contribution to the development of sociology.

An interesting way to stimulate such a debate would be to allow people to argue for those figures who they believe to have been unfairly excluded from the sociological canon. The point would be to give an overview of their work, explain your own enthusiasm for it and make a case for the distinctive contribution that the sociologist in question has made to the development of the discipline. Each contribution would include an annotated bibliography in order to sign post a way for the interested reader to explore their work in greater depth. The point would not simply be to say 'so and so is brilliant and should be more widely recognised' but rather to elaborate upon what it is precisely about their work which is particularly valuable in virtue of wider trends (positive or negative) within the discipline.

Such a project would benefit from being as accessible and open-ended as possible. This is why I think a platform like PressBooks would be so useful for producing something like this. This is a Wordpress like platform which can be used to collectively produce an electronic book - I could imagine this being an ongoing effort, resulting in successive volumes as more people make contributions to the project, with the intention being that the resulting book would be freely available in a variety of electronic formats.

The contributions would be:

1000-3000 words in length
Include an additional annotated bibliography, providing full bibliographical details about notable texts and a brief description of their content
Referenced in Harvard
Making a case for the importance of the sociologist in question in terms of broader disciplinary themes
Does this appeal to you? If so then please get in touch (mark@markcarrigan.net) - it's going to be a few weeks before I have time to sit down and get the logistical side of this off the ground. But I think this is feasible and I'm serious about going ahead with it if there's enough contributions. To be clear: the book would be self-published. But it would be freely available in Kindle, iBook, PDF and on the web - it will likely have a much broader reach than if it were issued by a publisher. I also imagine that this is something which could grow over time in a way that would potentially be hugely valuable, perhaps providing scope to systematically explore some of the broader issues which would be partially addressed by individual contributions.

SIR James Ubuo (2014-08-08 07:04:20)
The history of sociological thought is the history that is incomplete. Social sentiments were applied during the period of putting the sociological thought together. We all should know that Sociology became academic discipline in the late nineteenth century but some sociological writers put that it was in early 20th century. However, Marx, Max and Emile even Auguste claimed to be the founding fathers. This then seems to be sentimental. As Sociology is said to study social behaviors, that is, individual differences in group, it is necessary for a core Sociologist to go down deep to avoid social sentiment.
The World Cup in Brazil and the Political Economy of Mega Events (2014-07-11 08:00)

This fascinating discussion offers a penetrating critique of the politics of the world cup, reflecting on the 'echoes of dictatorship' that can be seen in the implementation of such a mega event within a country that has only been a democracy for a few decades. If you wonder what the next stage of post-democracy will look like, the political economy of events like the world cup and the Olympics would be quite a good place to start. The analogy could certainly be overstated but the opacity of decision making, the naked capture of resource allocation by powerful interests and the increased 'efficiency' of judicial processes ('World Cup courts' is a terrifying phrase) in order to avoid disruption are all disturbing trends. What would they look like if they're generalised? I interviewed Andrew Feinstein about similar issues in the South African world cup a few years ago.

Accessible Books on Social Theory (2014-07-11 23:01)

The following two books are extremely useful for those embarking on a social theory journey and getting to know social theorists. The books would suit undergraduate students in fields such as Sociology and Politics, as well as
postgraduate students who require an accessible and absorbing introduction to the key themes and concepts that have influenced social theory in the past, and continue to affect contemporary thinkers and writers. Both books use language that makes social theory easy to comprehend and enjoyable to study, whilst allowing us to consider the nature of modern society and its institutions, identities and the significance of structure v agency through appropriate sociological terminology.

An Invitation to Social Theory by David Inglis with Christopher Thorpe

“Learning about theory is like learning a new language”. For those who are keen to gain a solid and engaging introduction to the sometimes heavy and complex writings on social theory, you would do well to pick up a copy of An Invitation to Social Theory by David Inglis, to learn about the terminology of social theory. The book invites to you to gain a good foundation in key social theorists and social theories – "what they are saying and how they are saying it" by explaining the principal ideas and concepts that are relevant to contemporary social theory. At the beginning of the book, you can read a historical perspective about the classical paradigms of theory from the nineteenth and early twentieth centuries that have influenced contemporary theorists, as well as been influenced themselves by German philosophers like Immanuel Kant and George Hegel.

The three recurring themes that are prevalent in social theory are outlined for the reader: knowledge (ontology and epistemology), structure and action (agency) and modernity. The book reminds us that the area of social theory for beginners can sometimes be exciting to venture into, yet at other times it can be confusing. The advice given is to persist in getting to know the social theories and theorists, and do not be put off by obscure jargon or elite pretensions, as in the long run you will develop your knowledge and understanding, and discover the social theories and theorists you can connect with the most. The book also reminds us that social theory sometimes reflects what we already know, thus confirming the beliefs we hold, but other times it succeeds in changing us slightly or dramatically by providing us with new perspectives about the social world.

Newcomers to social theory will feel confidently informed about the main paradigms in social theory, from Functionalism to Marxism, Symbolic Interactionism to Feminism and more. You might just peruse certain relevant chapters of the book or you might read the entire book chronologically as it is an easy read. However we are advised to ensure we read Chapter One first because the classical paradigms referred to are what sow the seeds for later social theory and contemporary social theory. Readers of the book will be able to understand enough of the basic
significant concepts of social theory to go onto further reading. Readers will also, over time, become more confident in applying the concepts acquired through reading such an introductory text to social theory, and understand the significance and relevance of social theory to the contemporary world.

Social Theory: Continuity and Confrontation – A Reader edited by Roberta Garner

2nd edition

Continuity and confrontation are the key themes of this reader on social theory, as the editor explains: “...ideas develop both through controversies and continuities...”, and thus her aim is to "emphasize the restless, rebellious side of social thought". Continuities concern revisiting and rethinking of social theories, whilst confrontation refers to the development of social theory through debate, discussion and controversy. Over time, as social changes take place, theories must be revised or rendered obsolete, the editor reminds us. Like An Invitation to Social Theory, this book also relates the excitement of studying social theory, and reminds us that we can overcome any frustrations about the sometimes dry and abstract nature of social theory. The book provides vivid and important writings for us to get a taste of well-known theorists as well as those we may not know so well. It is a must-read for anyone who is new to social theory and wishes to gain a brilliant breadth, for the book presents a wide scope of key readings to help you develop an extensive understanding of the scope of social theory.

One of the benefits of this reader on social theory is that Roberta Garner has aimed to connect classical theory with accessible empirical studies, allowing the reader to make the vital links that will illuminate key social theory ideas and concepts, as well as the relationship between theory and empirical reality. Further, the book highlights how it is essential to question the social world, and not solely explain it. Being critical and open to change is crucial to the works of many social theorists. Thus, Garner incorporates works in this book that are diverse in content and style, and from both mainstream and "marginal" sociology. Garner rightly points out that writers and readers of social theory change over the course of their lives, and therefore theorists, texts and readers do not remain static and fixed in interpretation.

The book is divided into three parts covering distinct historical epochs. Beginning with the impact of Machiavelli’s The Prince on society's awareness of the powerful and the political, and then moving onto introduce the reader to Edmund Burke and August Comte, the book is always engaging and surprising in the content and selections from original texts imparted to us. The second section of Part One focuses on classical theory: Karl Marx, Friedrich
Engels, Emile Durkheim, Georg Simmel and Max Weber. Part Two moves onto examining the importance of ethnicity and race by introducing the reader to W.E.B. DuBois, as well as The Chicago School, Charles Cooley and George Herbert Mead. We then get to know about the social theorists like Antonio Gramsci writing around the time of the war, and then post-war perspectives from Talcott Parsons and C. Wright Mills. Symbolic Interactionism is explored by examining Howard S. Becker, and Ideology is considered from the perspective of Louis Althusser. Part Three delves into the more contemporary theorists like Michel Foucault and Pierre Bourdieu, as well as raising issues of gender and sexuality through theorists like Dorothy E. Smith and others. Media, culture and globalisation are expanded upon towards the end of Part Three.

VALUES BEYOND VALUE? BEV SKEGGS ASKS "IS ANYTHING BEYOND THE LOGIC OF CAPITAL?" (2014-07-12 08:00)

IFRAME: [1]//www.youtube.com/embed/7vLeYNVUAEk
Writing and your imagined audience (2014-07-13 08:00)

Do you imagine an audience when you write? I've become aware recently of how rarely I do this. The main reason for this has been the jarring experience of finding myself overly conscious about the particular audience I happen to be writing for in recent projects. I wrote a chapter on asexuality for a handbook on sexuality and was suddenly aware of the fact it would presumably be trainee councillors, sex therapists and psychology students reading the chapter. The uniform chapter headings that were built into the design of the book produced all sorts of angst about how I was writing i.e. if I'm writing under the heading 'implications for applied practitioners' (or a phrase to that effect) then I can't help but wonder who are these practitioners and what will they think of how I'm writing? More recently, with Social Media for Academics, I've found myself very conscious of what will presumably be a diverse audience and worrying about the ways in which disciplinary specific norms and styles might be creeping into my writing in a way deleterious to the readability of the book.

I've found these experiences strange because I'm rarely aware of an audience the rest of the time when writing. Obviously I realise reflectively that people read things that I've made public. But this awareness rarely enters into the process of writing itself. It makes me second guess, immediately read back over what I've written and agonise over word choice and sentence structure. It seems to preclude the sort of 'flow' that my orientation towards writing generally leaves me seeking out. It reintroduces my internal conversation into the writing process and I write much more slowly and enjoy it much less. This left me thinking about how you make sense of this imagined audience, as internal conversation – it makes me think of pragmatism, with this 'other' entering into my inner experience while I write, offering a judgemental gaze in virtue of which I find myself assessing what I have written rather than losing myself in the process of writing. But my sense of this other is partial at best and entirely imagined at worst. I don't really know these audiences and that's why they're entering into my writing process in such a censorious way. But then again do I know my 'usual' audience, the familiar group to which I'm implicitly contrasting these unfamiliar others? I really don't and I find it oddly unnerving to pursue this line of thought. Perhaps if I pursue it too far, I'll find a real generalised other, in Mead's sense of the term, entering into my experience of writing and forevermore be prone to self-censoring in the face of its stern yet ephemeral gaze.

Six principles for organising academic conferences in the 21st century (2014-07-13 21:03)

by Steve Fuller

After my recent keynote at the 2014 meeting of the British Sociological Association, I was interviewed about my views on the conference. Perhaps somewhat unexpectedly, I said that a large professional conference such as this one is a great place to catch up with old friends and hawk some book ideas to publishers, but rarely memorable for its intellectual substance. Generally speaking, only junior, relatively unpublished academics really need to go to such conferences to acquire visibility among prospective employers and colleagues. And, of course, it is also an esteem indicator to be invited to speak in plenary fashion at such occasions. Otherwise, there is little else to recommend.
attendance at an academic conference in its current form. However, the six principles below are designed to turn the conference into a unique sort of academic event well worth attending.

1. A conference is a distinct channel – perhaps even genre – of academic communication. It is not a watered-down or zombie version of the academic print culture. It requires its own ‘peer review’ standards that do not simply trade on the conventions of academic writing. Thus, instead of abstracts, prospective presenters should send video clips of 1-3 minutes that convey what will be said and how it will be said.

2. Presenters should be strongly discouraged from reading their presentations. More generally, presenters should be forced to make a special case for presenting material that is already available in print. The norm for conference presentations should be new material – unless a presenter hails from a field with which conference members are unlikely to be familiar.

3. Presentations heavily reliant on Powerpoint should be gathered thematically into what are essentially high-tech poster sessions rather than be given stand-alone speaker slots. This may mean that a larger percentage of the space in the conference facility is given over to such sessions. Indeed, organizers may wish to consider that the explicitness of many Powerpoint presentations render the human presenter redundant. Thus, interested conference goers may simply be directed to a computer terminal where all the Powerpoint-based presentations are loaded, perhaps with recorded voice-overs from the absent presenters.

4. In short, my ideal conference would have fewer presenters but who give stronger, fresher performances. Most of the texts associated with a conference would not be found in the thick book of abstracts normally distributed when the conference begins but in the social media streams that are generated during and after the presentations.

5. It also follows that funding for conference attendance should not be tied to a formal presentation but to a requirement to make one’s participation visible, through the various forms of live interaction that the conference allows and social media enables to be documented. Among other things, this would have the effect of keeping most people engaged with the conference beyond simply the session in which they deliver their presentation, as often happens now.

6. A large hall in the conference facility – perhaps where the book exhibit or reception is – should be open throughout the conference for the organization of what Silicon Valley calls ‘unconferences’, namely, spontaneously generated academic interest groups that are made up of anyone drawn to the topic. A noticeboard could be available where such groups could book rooms or tables in the conference facility for particular times. If the groups are especially well-organized, they might even record their meeting for archival purposes on the conference website.

[Steve Fuller is Auguste Comte Chair in Social Epistemology at the University of Warwick. He tweets at [1]@ProfSteveFuller.[/nbox]

1. http://www.twitter.com/ProfSteveFuller
In the last few years my interest in asexuality has shifted from a concern with the experience of asexual people to a preoccupation with why those who aren’t asexual find it as confusing as they do. This can seem to be a confusingly niche interest, or at least I occasionally worry that it might come across that way. It emerged from one recurrent theme in the many personal stories I encountered in my research: the incomprehension with which most asexual people have at times found their asexuality greeted. What makes the notion so hard to grasp? I’ve written about this at length in the past and I don’t think I have anything new to add to the discussion at this point. What’s more important is how this incomprehension can lead people to act. This inability to grasp asexuality as a concept can bring otherwise well meaning people to act in deeply hurtful and marginalising ways. It can leave those who are far from well meaning acting in even more unpleasant ways than they might otherwise. What these actions usually have in common is a failure to believe asexuality exists as a possibility and a concomitant tendency to explain it away. Offering asexuality as an account of themselves, asexual people are instead told that it can’t exist... it must be their hormones, psychological damage, repressed child abuse. Don’t they know that sex is natural? Don’t they realise that sexuality is an integral aspect of the human condition? Perhaps they’re just a late bloomer? Or maybe they haven’t met the right person yet? In terms of the broader cultural frameworks within which we think and talk about sexuality, some of these reactions are entirely comprehensible to me (and this is why I find the reaction of non-asexuals to asexuality so interesting from a sociological standpoint). But they’re often deeply hurtful and what frustrates me is how unnecessary the hurt caused is. What we need is some sort of accessible introduction to asexuality, providing a readable overview of the many ways in which these reactions (and their underlying assumptions) are mistaken. Thankfully we now have one, with the publication of Julie Sondra Decker’s The Invisible Orientation: An Introduction to Asexuality.

Written by a well known and respected figure within the asexual community, Decker’s book benefits from a personal familiarity with the issues concerned that lends an air of implicit authority that the author manages skilfully throughout. The tone is just right for a book of this sort: friendly and conversational yet also authoritative and precise. It begins with a personal story which illustrates the first-hand experiences Decker brings to the book, which is intended as a "starting point for people interested in asexuality". It begins with an ‘Asexuality 101’ that introduces the basics in a way satisfying to the reader yet also firmly repudiating some of the most common miscomprehensions that one might bring to a book such as this. It then moves on to the varying experience of those who identify as asexual, introducing the potentially confusing panoply of terms which have proliferated within the asexual community but skilfully showing how these are grounded in specific kinds of experience. The next section, unsurprisingly my favourite given the nature of my own interest in the subject, addresses the (many) myths surrounding asexuality. The final sections offer practical advice to those who are asexual (or questioning whether they may be) and to those who
know someone who is asexual (or suspect that they might be). The book then concludes with a helpful compendium of resources that the reader can use to explore further.

This is a long overdue book, offering the general purpose introduction to the subject which has heretofore been lacking. It is an essential addition to any academic reading list that encompasses asexuality and should be required reading for any therapists with an interest in sexuality. It provides a sense of what it is like to be asexual that can sometimes be missing from academic work and engages with the literature while nonetheless refusing to be constrained by it. It is also immensely readable, providing an authoritative overview that sign posts the reader who is keen to explore further. I can’t recommend The Invisible Orientation highly enough and hope it has a wide readership. Given how effectively it critiques the myths surrounding asexuality, helping those who are not asexual themselves better understand something that can at first be deeply confusing, it is a book with the potential to make a positive difference to many people’s lives and help combat what the author describes as the “insidious form of exclusion” that asexual people continue to experience.

---------------------

A Conversation with Sudhir Venkatesh (2014-07-15 08:00)

In this videocast Sudhir Venkatesh, well known for his authorship of [1]Gang Leader for a Day, discusses his experience of being invited to work with the FBI as a roving advisor on issues related to gang related crime. He describes how "as a researcher and a geek" it was fascinating to see the FBI from the inside out:

Sudhir Venkatesh, William B. Ransford Professor of Sociology at Columbia University, talks with Vera director Michael Jacobson about his 18 months advising the FBI on working with local law enforcement agencies to deal with gang-related crime and his current research on informal justice systems in urban communities. This podcast is part of the 2011-2012 Neil A. Weiner Research Speaker Series.

Discover Society is a free online magazine featuring articles on social research, policy analysis and commentary. It is supported by Policy Press and endorsed by the British Sociological Association and the Social Policy Association.

We publish short (1500 word) research-based articles on a variety of topics. We also publish: ‘Viewpoints’ (on current social issues); ‘Policy Briefings’; ‘On the Frontline’, and a longer, ‘Focus’ article in each issue.

Bev Skeggs discusses the contemporary sociological imagination with Les Back (2014-07-16 08:00)

In this lovely dialogue hosted on the Goldsmiths website, thanks to Dave Beer for flagging it up, Bev Skeggs discusses the contemporary sociological imagination with Les Back. To begin they discuss discomfort and dislocation as an integral aspect of the sociological imagination, engendering an inability to take the familiarity of things for granted, instead prompting a search for the patterns underlying it:

Les: It can be about discomfort. I think sometimes often people come to sociology with an incredible sense of discomfort or dislocation. I have something within myself, you know, a discomfort, a disquiet sense of not quite fitting in place or being out of place, or even being confined or suffocated by the place in the world that one occupies, you know.

Bev: So it’s about a complete lack of ontological security?

Les: It can be–, sometimes students are absolutely suffocated by that lack of ontology. Of a sense of, you know, ‘I just don’t fit in this world’...

Bev: Or know how to? On a tangent, this is very interesting in terms of Bourdieu's habitus, because he had the model of subjectivity, which is about fitting dispositions to positions, and I've always thought it was highly problematic because I think most people just do not fit the fields into which they are positioned. It's a theory of adaption that does not work for me.

Les: And in a sense he was betrayed in his own biography. It is a sense of being displaced; being displaced not only from the world he enters in the Ecole Normale and all that whole world that he described in Homo Academicus, but he also doesn’t fit in the world in which he identifies so strongly.

I found the critique of Bourdieu here particularly interesting. As Bev Skeggs puts it, “he is trying to understand that lack of fit, but then he comes to a theory of fit.” This prompts a lovely exchange about ‘crampedness’ and its relationship to the sociological imagination.
Bev: And you’re saying that you think the politics—, and let’s be clear, it’s the politics of the sociological imagination, is understanding the lack of fit?

Les: A lack of fit or I think a sense of kind of suffocation often people feel in their place in the world.

Bev: Crampedness?

Les: Crampedness, being hemmed in, there’s something very powerful in Mills’ formulation when he says—, although I’m not sure it holds true now, but he says, people experience themselves as if they’re spectators in their own lives.

You know, and I think there’s something about that that is very powerful as a formulation, as an invitation. And I suppose what the politics of the sociological imagination and I’ll just put to one side the question of what you do with sociological imagination as a practice, but part of the politics I think is to have an enlarged sense of an understanding of one’s place in the world.

The whole thing can and should be read in full [1]here. There’s one additional section I can’t resist quoting (and not only because it offers such an eloquent formulation of why the Wire is sociologically fascinating):

Bev: So you’re saying what’s happened is that the technologies of sociology, say, the methods of empirical understanding, be it measurement or ethnography, are detached from a very particular form of sociological attention, a detachment from critical political understandings of power relations, and it’s that detachment that has enabled the spread of the sociological imagination but only in its limited technical forms

Les: I think sometimes it’s reduced to those bare technical forms and other times it’s really fantastically alive, at its most imaginative. And that’s part of the—, of the difficulty in summing up exactly that thing about where sociological imagination has moved to, because partly, you know, I think in some ways the sociological imagination is much more alive in The Wire than it is in most seminars about urban ethnography.

Bev: And that I would want to argue, is because The Wire pays attention to big explanations whilst locating those big explanations, which are institutional, they’re economic, in characters. So it comes back to what you were saying about how the characters’ crampedness carries the precarious conditions of the global in which they creatively struggle to survive. So it’s not about positioning them as passive or victims, it’s about looking at how people are struggling within those incredibly cramped conditions, paying attention to that intensity of struggle and the reasons for it.

1. [https://www.gold.ac.uk/media/les%20back%20soc%20imag%20june%202010.pdf](https://www.gold.ac.uk/media/les%20back%20soc%20imag%20june%202010.pdf)
The next phase of post-democracy? Political disagreement becoming personal prejudice (2014-07-17 08:00)

I listened to a [1]fascinatingly crap podcast while in the gym earlier – Robin Aitken, introduced solely as a ‘Tory supporter’ but last seen complaining about [2]institutional discrimination against conservatives during his career at the BBC, has produced an episode of Analysis on Radio 4 exploring whether anti-conservative sentiment is the last acceptable prejudice. It’s a rather confused argument, simultaneously explaining away blanket criticism of a political party as prejudice while also arguing that the Tories have changed and so the ‘nasty party’ tag is inaccurate (thus implying that it might have been an accurate assessment in the past). It’s also rather oddly produced, with the most prominent commentators including Norman Tebblitt, who talks about the need to ‘hurt the population’ in a documentary arguing that Tories aren’t nasty, as well as Roger Scrutton, who has been dismissed from journalistic roles for writing about ‘tobacco issues’ while [3]failing to declare the generous salary he was being paid by tobacco companies, in a documentary arguing that Tories aren’t greedy and self-serving. It was all a bit inadequate really, leaving me surprised that it had been made, even allowing for the over-eager interpretation of ‘balance’ likely to be in play when someone like Aitken produces something for the BBC in the present political climate.

However I’m intrigued by the attempt to subsume political disagreement under the logic of identity politics. Not only because it is so axiomatically relativistic a move being made by those who so habitually attack relativism. It also suggests something interesting about broader developments in political culture. As one cringe-worthy Tory analyst said during the podcast: “modern politics is as much an exercise in self-expression as it is in self-interest”. Leaving aside the philosophically and empirically dubious status of such a claim, it nonetheless points to questions about why this form of argument has begun to emerge in the last decade or so. What interests me is how this notion could creep into common circulation, as opposed to its rhetorical deployment by journalists producing bad radio documentaries. I mean things like this, which I found at random through google:

[4]

The notion of ‘anti tory prejudice’ becomes an organising concept through which other political claims are made. Take for instance [5]this thread I found on the Student Room, in which a poster asks for a ‘survival guide for ultra conservative students’:

2780
Are there any other social/cultural conservatives here who feel that they are being or have been marginalised in an increasingly liberal modern society?

Why do you think this has happened? and how do you cope with it?

Are there any careers which you feel are more suitable for ultra conservatives? Most modern workplaces seem to be dominated by extreme trendy liberals so which careers are still suitable for a social conservative (outside of the Church)?

I think we can see this psychoanalytically, in terms of the kinds of arguments made by [6] Iain Craib and others, in which many of us are becoming progressively less able to live with discomfort, disagreement and disappointment – in this sense, finding one’s views at odds with those of the people around us comes to feel as if we are attacked by our environment or that we may at any point become so. We shore ourselves up by affirming that they have a problem with us - we confront their prejudice, revealing them to be bad and ourselves to be an innocent victim. Or maybe we just self-select? I guess I’m proposing a particular psychosocial mechanism driving homophily (a statement I write as someone who to the best of my knowledge has never had a right-wing friend).

I think it would be a mistake to treat this entirely at the level of the psychosocial though – if this is a trend, which is far from clear, it’s a complex issue that points to a range of potential factors driving it. I think Colin Crouch’s work on post-democracy could be useful here, offering a framework through which we can begin to ask questions about the political psychology of post-democracy. This is how Crouch describes the underlying idea:

The term was indeed a direct analogy with ‘post-industrial’. A post-industrial society is not a non-industrial one. It continues to make and to use the products of industry, but the energy and innovative drive of the system have gone elsewhere. The same applies in a more complex way to post-modern, which is not the same as anti-modern or of course pre-modern. It implies a culture that uses the achievements of modernism but departs from them in its search for new possibilities. A post-democratic society therefore is one that continues to have and to use all the institutions of democracy, but in which they increasingly become a formal shell. The energy and innovative drive pass away from the democratic arena and into small circles of a politico-economic elite. I did not say that we were now living in a post-democratic society, but that we were moving towards such a condition.

I’m interested in how the social psychology of political (dis)engagement changes when “the energy and innovative drive pass away from the democratic arena” – what does the political come to feel like under conditions of post-democracy? Chantal Mouffe has argued that those who might otherwise be seen as adversaries (to be opposed) instead come to be seen as enemies (to be destroyed). Her argument concerns the construction of ‘political antagonism’ – could the reduction of disagreement to prejudice be a form that antagonism takes at the level of everyday life?

1. http://www.bbc.co.uk/programmes/b047ws86
I don’t like ‘viral videos’. I like many videos that have gone viral. But the notion of producing ‘viral videos’, with a deliberate strategy to engender virality, irritates me – it entrenches commodification of internet culture, often involves trying so hard that it doesn’t work and contributes to the blurring of the boundary between commercial and non-commercial contributions to the internet. When deployed for marketing, they attempt to highlight the specificity of an object but paradoxically obliterate this specificity by drawing on the most generic cultural forms in circulation - by their nature viral forms lend themselves to infinite substitutability and thus trivialise their object rather than valuing it.

They particularly vex me in higher education because they’re one of the most distinctive expressions of marketization. They reflect a change in higher education marketing which can be traced directly to the government’s higher education ‘reforms’, with the sudden imperative to differentiate prompting an expansion of investment in marketing and communications – I’ve tried to argue, in a conference paper at WES 2013, that this creates a vested interest in intensifying what are fundamentally deleterious trends. I don’t think marcomms creates the trend but I think its expansion, as well as a growing centrality within institutions as a whole, creates incentives to discursively exaggerate the necessity of this activity, lobby for further investment and contribute to a marketing arms race which risks consuming ever greater proportions of university budgets:

There are obvious inefficiencies in this competition as increasing resources have to be devoted to marketing and recruitment ... The cost of financing higher education through the botched loan scheme means that the Treasury has insisted on an overall cap on student numbers. This creates a zero sum game where the sector is unable to expand overall and individual institutions are fighting for market share.

I’m not personally hostile to people working in communications (far from it) but I believe something is happening in UK universities that I find both sociologically interesting and politically worrying. I’m not advocating that we should resist viral videos or anything like that. I think they’re pretty inconsequential. But I do believe they reflect the aforementioned trends and that it would therefore be valuable to consider alternative ways in which universities and departments can promote their activity. So here are a few ideas, in a list I contemplated formatting in the style
of BuzzFeed but couldn’t be bothered:

1. Find innovative and engaging ways to highlight the work your PhD students are doing. Such as these [2] ‘your PhD in 60 seconds’ videos that my university produced a couple of years ago.

2. Help promote the research culture and facilitate the vibrant life of the institution. See informal events as a resource to be supported rather than an irrelevance or potential threat to the brand – put resources into improving internal communications, helping initiatives that come from staff & students then use what you’ve done as a selling point for the institution.

3. Highlight the opinions of your students about the university rather than seeing them as a threat. RT positive comments but engage even with the comments that aren’t positive.

4. Support a departmental presence on social media across the university. Encourage them to be engaged, answer queries and provide resources for this if necessary. See this as a practical contribution to enhancing ‘student experience’.

5. Encourage your staff to use social media freely and help them build an audience through RTs, twitter lists and well advised departmental accounts.

6. Provide training and drop in sessions for staff and students. Demonstrate the technical capacity of tools but also encourage debate around best practice.

7. Support initiatives which profile your staff, particularly those who have been part of the institutions for a long time. Don’t trivialise these by reducing them to sanitised talking heads – take the lead from the staff themselves and let each project unfold by its own logic to the greatest extent possible. [3] This is one of the best examples I’ve seen of this sort of activity.

8. Encourage best practice by recognising and profiling staff who are active on social media and are using it to contribute to the life of the institution.

9. Be open to aspects of your institutional identity which emerge naturally through social media. Some of these might not be positive and it would be a mistake to promote them. But don’t see this solely in terms of potential threats and instead engage with the online culture already in existence (and that grows through your encouragement) – otherwise you’ll miss important opportunities for the elaboration of institutional identity.

10. Curate the content which is being produced within your institution and support the creation of further content! Encourage and support multi-author blogging. Track new social media initiatives and offer practical support. See this as content marketing from below.

______________________________
2783
In recent months I've been slowly working through some of Jeffrey Alexander’s work. I'm interested in what cultural sociology has to offer as I begin to try and extend my PhD research on internal conversation & biography into my planned post-doctoral work on the sociology of thinking. However I've found Alexander’s work slightly hit and miss, occasionally leaving me wondering whether I've misunderstood his project or perhaps overestimated its potential relevance to my own. This post on Daniel Little’s book has clarified my sense that cultural sociology is highly relevant to me but also something I need to be critical when engaging with:

It seems clear that human beings bring specific frameworks of thought, ideas, emotions, and valuations to their social lives, and these frameworks affect both how they interpret the social realities they confront and the ways that they respond to what they experience. Human beings have “frames” of cognition and valuation that guide their experiences and actions. The idea of a practical-mental frame is therefore a compelling one, and it should be a possible subject for empirical sociological investigation.

[...]

The term “cultural sociology” is sometimes used to try to capture those research efforts that try to probe the meanings and mental frameworks that people bring to their social interactions. We can postulate that human beings are processors of meanings and interpretations, and that their frameworks take shape as a result of the range of experiences and interactions they have had to date. This means that their frameworks are deeply social, created and constructed by the social settings and experiences the individuals have had. And we can further postulate that social action is deeply inflected by the specifics of the mental and emotional frameworks through which actors structure and interpret the worlds they confront.

I think these internal constraints and enablements are underemphasised in Archer’s work on reflexivity. They are integral to her account of meta-reflexivity, in the sense that such individuals come to orientate themselves to a cause they have encountered or jury-rigged together from elements in their environment, but she lacks a comprehensive theory of what these resources are. The elements necessary for such a theory, an extremely sophisticated one in fact, can be found in her wider body of work - the distinction between the cultural system and socio-cultural relations, as well as the various situational logics that obtain at this interface, simply needs an account of how cultural relations are mediated at the level of everyday life to flesh out this aspect of human experience.

I’ve conceptualised this in terms of recurrent relations between ‘me’ and ‘I’ - at any given moment, my repertoire of routine responses is conditioned by the cultural elements I reflexively orientated myself to at a previous moment in time, in turn shaping how I respond to present cultural variety and coming to constitute the ‘me’ to my ‘I’ at some future point in time. In other words, I’m always constrained by my past but presently able to act freely* within them. I like this framework and it seems to work quite effectively, with my intention being to flesh it out at much greater length when I extend my PhD thesis into a monograph.

I’m hoping cultural sociology will be very useful for this purpose but thus far it hasn’t been. Little helpfully sums up what is of value in cultural sociology but also why I don’t like what I’ve read thus far:
But this kind of research becomes especially interesting if we find that the mental frameworks and systems of meanings that actors bring with them actually make substantial differences to their social actions and the choices that they make. In this case we can actually begin to create explanations and interpretations of social outcomes that interest us a great deal. (Why are some extremist militants so ready to put on suicide vests in actions that are almost certain to bring about their own deaths?)

My problem here is with the failure to conceptualise the interface between the personal and the cultural – it’s a parallel to what I earlier referred to as the lack in Archer’s work of an account of how cultural relations are mediated at the level of reflexive individuals (it’s there in parts, it just hasn’t been worked out thoroughly). Little refers to this as a need for cultural sociology to pay “more attention to the interface between frame and actor”. I don’t think this is simply an oversight but something which would constitutively reorientate the entire approach – I think it would involve an engagement with the ontology of media (e.g. books), biographical questions about how culture reorientates lives and an analysis of the cognitive processes by which ideas are appropriated. At the very least ‘cultural frames’ are inflected through the path-dependent orientation of particular individuals but I think I’d argue for the stronger claim that they are transformed through this appropriation or rejection by individuals – with this individual action contributing to the reproduction or transformation of the frames themselves which are more broadly in circulation within the social world.

*I’m talking purely about internal constraints and enablements here for sake of brevity. Obviously external constraints/enablements, as well as the relations between those operating internally and externally, would be considered in practice.

Sociologies of Everyday Life – Still Time to Submit Your Paper (2014-07-19 08:00)

Sociology

A journal of the British Sociological Association

Sociologies of Everyday Life

Special Issue Call for Papers

Deadline for submissions: 31 August 2014
Everyday life sociology is a well-established tradition in the discipline and interest in ways of understanding day-to-day worlds continues to be significant. These engagements are becoming increasingly interdisciplinary, across the social sciences as well as outside them. It is in this context that the 2015 Special Issue aims to provide a timely opportunity to take stock.

We aim to be able to collect together a series of papers that variously reflect the breadth and diversity of sociology's enchantments and engagements with everyday worlds as well as the imaginative and innovative ways in which the discipline has sought to analyze and respond to it.

We invite papers that explore, through the lens of everyday life, one or more of the following indicative themes and/or areas:

- Theories of everyday life and conceptual approaches
- Materialities, cultures and senses
- Social practices, activities and interactions
- Social divisions and exclusions
- Animals, entities and the more-than-human
- Senses of community and belonging
- Selfhood and identifications
- Public, semi public spaces and the built environment
- Domestic spaces and routines
- Institutions and organisations
- Affect and intimacies
- Landscapes, localities, places and place making
- Convivialities and socialities and social interdependencies
- Everyday racism, cultural difference and everyday multiculture
Environmental practices and consumption

In/security and violence

Methods – researching the everyday

The Editors welcome contributions on relevant topics in any field of social science engaging with sociological research, from early career and established academics, and from those outside academia.

Queries: To discuss initial ideas or seek editorial advice, please contact the Sociology Editors by email on [1] karim.murji@open.ac.uk or[2] sarah.neal@surrey.ac.uk

Full Call for Papers can be viewed at

Two upcoming quantified self special issues (2014-07-20 08:00)

[1] Sensor Informatics and Quantified Self

Deadline: 18 December 2014

Preventing disease through promotion of healthy lifestyle choice is a potentially cost-effective approach to modern healthcare challenges. Choices such as diet, physical activity, sleep, smoking and alcohol, have all been associated with many medical conditions. The purpose of this special issue is to address key topics in sensor informatics and quantified self, with focuses on novel sensor design, stratify patient management, long term continuous monitoring of therapeutic response, social and psychological aspects related to self-tracking practices, policy, security, piracy of personal wellbeing data, etc.
What sociologists actually do and what social theorists think they should do (2014-07-21 08:00)

There’s a great post on Daniel Little’s blog which uses a critique of analytical sociology and critical realism to explore a premise which he argues they both share: ontology dictates methodology. As he [1]frames the issue:

Both groups have strong (and conflicting) ideas about social ontology, and both think that these ideas are important to the conduct of social-science research. Analytical sociologists tend towards an enlightened version of methodological individualism: social entities derive from the actions and nature of the individuals who constitute them. Critical realists tend toward some version or another of emergentism: social entities possess properties that are emergent with respect to the individual activities that constitute them.

Both groups tend to design social science methodologies to correspond to the ontological theories that they advance. So they tacitly agree about what I regard as a questionable premise — that ontology dictates methodology.

I want to argue for a greater degree of independence between ontology and methodology than either group would probably be willing to countenance. With the analytical sociologists I believe that social facts depend on the availability of microfoundations at the level of ensembles of individuals. This is an ontological fact. But with the critical realists I believe that it is entirely appropriate for social scientists to examine the causal and structural properties of social entities without being forced to attempt to provide the microfoundations of these properties. This is an observation about the locus and nature of explanation. There are stable structural and causal properties at the social level, and it is entirely legitimate to investigate these properties in full empirical detail. Sociologists, organizational theorists, and institutional researchers should be encouraged to investigate in detail the workings, arrangements, and causal properties of the regimes that they study. And this is precisely the kind of investigation
that holds together researchers as diverse as Michael Mann, Kathleen Thelen, Charles Perrow, Howard Kimmeldorf, and Frank Dobbin. (Use the search box to find discussions of their work in earlier posts.)

This is an issue I'm very interested in but have struggled to come to any firm conclusion about. My most serious attempt to think through these issues is [3]this working paper. On the one hand, I find Margaret Archer's argument that social ontology regulates the kinds of entities which can be admitted into explanation intuitively plausible. On the other hand, I find myself intuitively hostile – even actively irritated by – the style of social theory that someone like Dave Elder-Vass sometimes lapses into, in which he appears to argue that sociological investigation is unable to proceed adequately until social theorists have provided the domain specific ontology sociologists need to undergird their activity.

I guess a lot depends on what we take the claim about 'regulation' to mean. Does ontology regulate methodology? Should ontology regulate methodology? Could ontology regulate methodology? I think a similar ambiguity can be found in Little's own framing of the relationship between ontology and methodology in the aforementioned post:

Ontology is not irrelevant to methodology; but it provides only weak constraints on the nature of the methodologies social scientists may choose in their pursuit of better understanding of the social world.

Is this an empirical statement about sociological practice? If so then we're in the domain of the sociology of social theory - a notion that I've played around with in the past and at some point in my life, when I've read an awful lot more than I have at present, intend to come back to. If it's not an empirical claim of this sort then what is it? This is the question that interests me and it's one I don't feel I have a sufficiently firm grip on to try and answer - descriptive claims about sociological practice unavoidably include normative claims within their scope (i.e. describing what sociologists actually do includes descriptions of what their theories tell them they should do) and yet as such a purportedly neutral sociology of social theory comes to constitute a move within the same game.

I'm very interested in the possibility of an ethnographic study of how sociologists actually use theoretical concepts as part of the research process. But at the same time I find the possibility of the neutrality this would entail to be rather implausible... I guess this is why I'm so confused (and yet fascinated) by questions like the relationship between ontology and methodology. The tendency seems to be for explicitly normative claims about what the methodological implications of social ontology should be. My problem is not with the normativity here but rather with the slipperiness of the grounding, if any, in facts of the matter about sociological practice. I'm interested in the sociology of social theory as a normative project - how do sociologists actually use theoretical resources and what conclusions can we draw about how they should use them in light of such a state of affairs? This is a project which unavoidably confronts a messy reality, in which an underlying impulse towards theoretical tidiness (which I think animates the work of many social theorists even if they reflectively deny it - I've had a post about the psychodynamics of social theory which I've intended to write for ages) runs headfirst into the tangled reality of empirical research.

I guess what I'm saying comes down to this: can we incorporate what sociologists actually do and what social theorists think they should do within a unified frame of reference?
Justine (2015-04-22 16:11:35)

Trust a sociologist to go fractally-meta on meta. I had actually hoped this was going to be one of those "What my mum thinks I do / What social theorists think I should do / what I actually do" type memes. To answer: Yes, I think we can unify methodological theory with research practice. Apart from using words like, "underpinning" in methods sections, I think this is what solid methods classics such as eg. Charmaz on GT already do. The ontological comes into normative argumentation about the basis of how we view social relations: our unifying frame of reference is just that. We need to be pragmatic, and think about approach in terms of explanations for the social. You paraphrase Elder-Vass as, "...until social theorists have provided the domain specific ontology". But this should not be a concern, because it is like saying that unless we can label grammar, we cannot use language. Reflexivity is probably a basic requirement to doing sociology, but as sociologists we engage in reflexive praxis. Our epistemological ground will usually stem back to one or other of the great philosophical paradigms, or be defined in opposition to one. As intelligent people, we do not need case specific, domain specific theoretical guidance as we are able to transfer previous understandings to new research situations (indeed, probably can’t avoid it). We synthesise knowledge from the mundane, ordinary daily life with abstractions, theory - and we make it sociological. This is why sociology is so sublime. Given the right conditions, I’m a relativist. My standpoint is putty in the hands of a persuasive writer. Whether their premise for sociological explanation goes from the myriad of individuals that make up the ant-heap, or the more familiar 'I put it to you that' methodological collectivist approach. Methodological individualism is actor oriented and (yet) you could say it lends itself to quantitative, positivist approaches because if the social is simply the sum of all these little parts, then why wouldn’t we just add them up? But then, Weber was probably a mild methodological individualist - methodological Individualism lets us think about roles, meanings, action, networks. What a weird collection of micro-ish and big data-ish sociology that approach lends itself to. Its ontological basis is well established (unfortunately, thanks Margaret "there is no such thing as society" Thatcher). Just goes to show that ontological position and choice of method CAN be two quite different things. I strongly agree that, "social ontology regulates the kinds of entities which can be admitted into explanation intuitively plausible." That would have to be a basic premise. I don’t quite see how it contrasts with Elder-Vass on slipperiness. Where sociology is not watertight (and yes, I do think this is a problem) is in qualitative research with lack of reflexivity. Firstly, researchers must fess up to who they are. Note that the word "are" is the word "to be": who we ARE is our ontological grounding. Like, I think, therefore, etc! The only slipperiness from a research point of view is if readers don’t have a fair shot at a more than one-dimensional interpretation of that ‘being’. Secondly, did the researcher spend a convincing amount of time with these people who they presume to describe and report on, and base a version of reality on them? Am I convinced that the researcher KNOWS them, their lives? Because if these two conditions are met, BEING and KNOWING, then we are ontologically safe. So in other words, sociology has to be rooted in data. Not exactly in a Glaser and Strauss way, but in the sense that we are doing sociology, not philosophy. We can argue about at what stage data must come into the project, but the decisive is that it does at some point. And if it does, then we’re a LOT better off with sociology than standing on our own wobbly opinions. ie. sociology is better than an opinion at the pub, whether we’re talking about a regression line, or an understanding that gives us socially transformative potential. Further, sociology assumes normative argumentation about social relations - this is what lets us interpret what we’re looking at through our little lenses. Is this a normative claim? Well yes, but essentially its a description of the parameters of what sets sociology as a practice apart from at one end everyday musing, and at the other, philosophy
Maya Angelou’s Letter to Her Younger Self (2014-07-22 08:00)

This wonderful letter by Maya Angelou was [1]featured on Brainpickings recently. It was a contribution to a 2006 anthology, [2]What I Know Now: Letters to My Younger Self, in which forty-one famous women wrote letters back in time to their former selves. The anthology itself looks very interesting & Maya Angelou’s letter is wonderful:

Dear Marguerite,

You’re itching to be on your own. You don’t want anybody telling you what time you have to be in at night or how to raise your baby. You’re going to leave your mother’s big comfortable house and she won’t stop you, because she knows you too well.

But listen to what she says:

When you walk out of my door, don’t let anybody raise you — you’ve been raised.

You know right from wrong.

In every relationship you make, you’ll have to show readiness to adjust and make adaptations.

Remember, you can always come home.

You will go home again when the world knocks you down — or when you fall down in full view of the world. But only for two or three weeks at a time. Your mother will pamper you and feed you your favorite meal of red beans and rice. You’ll make a practice of going home so she can liberate you again — one of the greatest gifts, along with nurturing your courage, that she will give you.

Be courageous, but not foolhardy.

Walk proud as you are,

Maya

The politics of facebook (2014-07-23 08:00)

This post by [1]Zeynep Tufekci on her Medium site is the best thing I’ve read yet about the recent [2]facebook controversy.
I’m struck by how this kind of power can be seen as no big deal. Large corporations exist to sell us things, and to impose their interests, and I don’t understand why we as the research/academic community should just think that’s totally fine, or resign to it as "the world we live in". That is the key strength of independent academia: we can speak up in spite of corporate or government interests.

To me, this resignation to online corporate power is a troubling attitude because these large corporations (and governments and political campaigns) now have new tools and stealth methods to quietly model our personality, our vulnerabilities, identify our networks, and effectively nudge and shape our ideas, desires and dreams. These tools are new, this power is new and evolving. It’s exactly the time to speak up!

That is one of the biggest shifts in power between people and big institutions, perhaps the biggest one yet of 21st century. This shift, in my view, is just as important as the fact that we, the people, can now speak to one another directly and horizontally.

This strikes me as an important fault line, in so far as a superficial difference (i.e. whether or not this bothers you) tracks much broader divergences in political orientation which are likely to become more pronounced as these trends develop over time. However the risk is that this one contentious study becomes a distraction because, as Tufekci points out, this is something Facebook does on a daily basis. What could be lost here is a sense of the political apparatus coming into being and its broader implications.

James Baldwin vs William Buckley (2014-07-25 08:00)

[1]
Thanks to The New Inquiry for the link to this video in which James Baldwin and William Buckley debate whether "The American Dream is at the Expense of the American Negro":

Brought together by the Cambridge Union Society at Cambridge University in 1965, this video shows a bunch of twee British white boys introducing one of the 20th century's greatest artists and one of the 20th century's biggest pricks. In a packed room in which he is perhaps the only person of color, Baldwin makes a devastating speech and wipes those centuries-old floors with Buckley's smug, idiotic grin.

Did you enjoy watching that as much as I did? Then check out this video of Chomsky debating Buckley on Vietnam and Buckley losing his temper at Gore Vidal. I'm sure there are more of these out there, searching for this stuff reminds me what a goldmine YouTube is, but I should probably go back to doing some real work.

Multicultural Britain: Conviviality (2014-07-26 01:42)

Multicultural Britain: Conviviality
#ShareRamadan with Neighbours, Colleagues and Friends

The political pessimism about multiculturalism is evident in announcements of its death that keep on coming nearly a decade after Gilroy (2005:1) put forth who was to blame: “the murderous culprits responsible for its demise are institutional indifference and political resentment”. The call to solely promote 'British' values also smacks of promoting patriotism above diversity in the rhetoric of some politicians, whilst others would argue that British values actually incorporate diversity.

Advocates of assimilation are frequently defied by what is happening on a daily basis in modern Britain, where multiculturalism is alive, well and healthy. Mainstream media coverage of positive stories about successful integration
amongst British multicultural society is so sparse that it is painful to purchase the ‘papers, or peruse online new sites. When it comes to reporting on issues concerning ethnic minority communities, there is doom and gloom.

Yet in spite of the politicians and the mainstream media falling short in highlighting examples of how British people experience multiculturalism amongst their friends, colleagues and family, there are glimpses of good that prove that difference and diversity are respected. There is much going on that contradicts this spiel that multiculturalism has failed. Here comes in social media democracy that allows the spread of stories illustrating the significance of small-scale social interaction between diverse Britons of diverse ethnic and religious backgrounds. One such example of Gilroy’s concept of conviviality in action is #ShareRamadan, which shows British people engaging in social practices that are beyond the confines of giving lip-service to tolerance and civility.

Ramadan 2014 is part-way through, and an interesting project aiming to #ShareRamadan with non-Muslims has been trending on social media. Those taking part in #ShareRamadan have been providing video logs of the experience of the fasts that British Muslims are experiencing this lunar year. Non-Muslims are getting to know first-hand how it feels to not eat or drink in daylight hours, and have been waking up at Suhoor time to eat a pre-dawn meal, and then breaking their fast with Muslim friends at sunset (around 9.40pm for most some parts of Britain). Throughout the world the lengths of the fasts vary according to the time of the Fajr and Maghrib prayers, with the fasts in Brazil and Australia being relatively short compared with Iceland and Britain. The Guardian online has provided a space for user-generated content where contributors from all around the world are sharing their photos and tales about Ramadan.

This exciting project reveals positive relationships in contemporary multicultural Britain, making a refreshing change from the usual onslaught of bad press against Muslims in Britain or against the modern multiculturalism. It cannot be doubted that representation of Islam and Muslims in the tabloids is frequently in relation to terrorism and extremism (Baker et al., 2013). The #ShareRamadan project started in Oldham, a place often maligned as ghettoised and segregated, or referred to in relation to “race riots”. The Oldham pioneers of this project aim to raise awareness about the experiences of the one who is fasting in Ramadan, as well as combat negative stereotypes and pre-judgements about Muslims and Ramadan. They are hoping the project will spread internationally allowing people everywhere to learn more about Ramadan. Those non-Muslims who have fasted for a day or more of have been uploading video diaries and photos to the #ShareRamadan Facebook page or Twitter page to relate their new experiences of this obligatory Islamic practice their friends and colleagues passionately partake in year after year. They have been invited to break their fast at their Muslim friends’ homes. Some of those who have attempted these fasts have further enriched their experience by attending the supererogatory prayers (tarawih) at the local mosques. For some, this has been the first time they may have visited a mosque. The much needed democracy of social media is a vehicle to promote the small-scale significances of social interaction between diverse individuals and communities.

There has been some coverage of #ShareRamadan in local media: the Manchester Evening News shared their story, and the local British Muslim Heritage Centre’s Radio Ramadan interviewed some of those involved with the initiative. Yet aside from some local coverage and social media updates about such stories of positive multicultural interactions, there has been no mainstream coverage of this. This is just one example of multicultural in action, and yet such stories are not shared enough with the general public. Agenda-setting by the major news channels means we only mainly hear about the doom and gloom of unwanted migrants and Muslims (and Muslim migrants!), with the rhetoric spewed out that they do not integrate, and they should assimilate. Almost a decade ago, we were being warned about the need to be wary and cautious about “ways in which debates led by politicians and the media quickly become the norm and end up fuelling racism” against Muslims who are racialised and blamed for not integrating in British society (Bhavnani et al., 2005:49). Yet this racialisation of Muslims as clashing with values of white Christian Britain are salient in the political and media discourses of 2014, as evident in Michael Gove’s vindictive mission to demonise normative Muslims for practising their faith. Simpson and Finney (2009) cite one of Ruth Levitas’ approaches to understanding social inclusion:

2796
...a "moral underclass discourse, which emphasises moral and cultural causes of poverty and is centrally concerned with the moral hazard of 'dependency'... [It] tends to replay recurrent themes about 'dangerous classes' to focus on consequences of social exclusion for social order, and on particular groups, such as unemployed and potentially criminal young men, and lone parents, especially young never-married mothers' (Levitas, 1999, p12) in (Simpson and Finney, 2009:34). Simpson and Finney go on to argue that if Levitas had been writing a few years later, she may have included the Muslim community in the aforementioned list of people who are experience social stigma and labelling, especially by politicians, as belonging to a "moral underclass" (2009). Nandi and Platt (2014) also discuss how the failure of multicultural policies in creating social cohesion is often cited in relation to Muslim communities, yet the perceptions and experiences of other minority groups and the White majority are rarely investigated. In their research, they found that ethnic minority communities have strong affiliations to British identity, "stronger in fact than the White majority" (Nandi and Platt, 2014:41).

Mr Turner, one of the teachers trying out fasting for a week, has found that his Muslim students have appreciated these sincere attempts to getting to know their religious practices, and are seeing him in a new light. It is well-documented that British schools are not tackling the issue of diversity effectively (Maylor, 2010). Thus, though at an institutional level, diversity is not explored in depth, there surely are more examples in modern Britain of teachers like Mr Turner who are finding novel ways to understand student identity. On Radio Ramadan, Mr Turner explained that the giving up food was not the difficult part, but he felt very thirsty throughout the day. Moreover he acquired awareness about the essence of fasting which he felt improved his self-control of behaviour and thoughts. Before experiencing the fast he had assumed it was just about abstaining from food and drink, and after he saw there was much more to the religious practice.

Some have talked about how they have reflected on their lives and what they take for granted.

Others too have discussed how they have shown solidarity with their Muslim friends and learned more about self-control and contemplation through fasting.
https://www.facebook.com/photo.php?v=575140062597098

Aside from the #ShareRamadan initiative, others have also decided to fast to share the experiences of their Muslim friends and colleagues. After fasting a whole day, my husband’s colleague had realised how difficult it was, and stated he would no longer tease his fasting Muslim colleagues by making a cheeky gesture of drinking and eating in front of them. In another workplace, a group of colleagues have used the opportunity to #ShareRamadan to raise money for charity.

Such processes of contact, cohabitation and interaction reflect how multiculture is an ordinary feature of Britain’s urban postcolonial cities (Gilroy, 2005). Further, such interactions point towards social beings engaging in social practices with genuine desires to learn about diverse ways of living, rather than merely being tolerant or civil towards diverse neighbours and colleagues.

Watch the video diaries on the #ShareRamadan Facebook page, and judge for yourself whether multicultural Britain is ghettoised, or whether the everyday lives of diverse peoples show how people want to get along and get to know one another, and share their social worlds.

The meaninglessness of the Myers-Briggs test (2014-07-27 08:00)

There's a great article on Vox discussing the massive limitations of the Myers-Briggs personality test. You can read it in full [1]here. What fascinates me is why it enjoys the popularity it does in spite of these limitations. Part of the answer to this question is a matter for organisational sociology but another aspect, no less important in my view, relates to the [2]meaning which people are able to find in their categorisation and the broader cultural context within which these (vacuous) categories are capable of becoming meaningful in this way:

The only problem? The test is completely meaningless.

"There's just no evidence behind it," says Adam Grant, an organizational psychologist at the University of Pennsylvania who's [6] written about the shortcomings of the Myers-Briggs previously. "The characteristics measured by the test have almost no predictive power on how happy you'll be in a situation, how you'll perform at your job, or how happy you'll be in your marriage."

"ANALYSIS SHOWS THE TEST IS TOTALLY INEFFECTIVE AT PREDICTING PEOPLE'S SUCCESS AT VARIOUS JOBS"
The test claims that, based on 93 questions, it can group all the people of the world into 16 different discrete “types” — and in doing so, [7] serve as “a powerful framework for building better relationships, driving positive change, harnessing innovation, and achieving excellence." Most of the faithful think of it primarily as a tool for telling you your proper career choice.

But the test was developed in the 1940s based off the untested theories of an outdated analytical psychologist named Carl Jung, and is now thoroughly disregarded by the psychology community. Even Jung warned that his personality "types" were just rough tendencies he’d observed, rather than strict classifications. [8] Several [9] analyses have shown the test is totally ineffective at predicting people’s success in various jobs, and that about half of the people who take it twice get different results each time.

Beyond the BBC: Social Media Sharing News Stories on Palestine

News items shared by those we follow on social media sites will perhaps be [1]our first point of contact with breaking news items. Many of us no longer sit down to watch the news at nine on the BBC, as we are able to access news items at the touch of our fingertips online, and we can learn what is going on in the world indirectly via social media sites like Facebook and Twitter by clicking on our news feeds or seeing what is trending, and read articles that have been shared by our friends and those we follow. Dissatisfaction with the biased nature of some traditional mainstream channels, in particular the BBC, has deterred people from gaining their news solely through this usual method. In the past, the BBC have been frequently criticised about their lack of balance and impartiality, but they have taken this too far this time as observed by their current coverage of Israel's attack on Gaza. Thus, the #BoycottBBC campaign began and [2]many protested outside the BBC offices against the biased coverage of the BBC. [3]Owen Jones severely condemned the BBC’s propaganda-like headline of Israel under renewed Hamas attack: “It is as perverse as Mike Tyson punching a toddler, followed by a headline claiming that the child spat at him. As Elizabeth Tsurkov, a Tel Aviv-based Israeli human rights activist, [4]tweeted: “We are targeted by mostly shitty rockets. Gazans
are being shelled with heavy bombs. We have shelters, sirens, Iron Dome. They have 0."

The BBC would have me believe that Israel is the helpless victim, and the Palestinians are heavily armed aggressors with their rockets and rocks. The news coverage is shockingly biased against the Palestinians who, from the reports and pictures on social media, are unarguably the ones who are suffering the most. The rise in criticism against the BBC’s news coverage of Gaza is supplemented by an increase of reliable alternative ways to gain knowledge about current affairs. The many alternative online news magazines and newspapers are telling us what the BBC is refusing to acknowledge. Many of the shares of news stories on social media sites are stories that the BBC would never dare to cover in fear of recriminations from the pro-Israel lobby.

Contrast the BBC with Channel 4. Channel 4 News has been praised on social media sites for their efforts to present the situation in Gaza. The Channel 4 News team have reported live from on the ground in Gaza. Jon Snow has been tweeting, blogging and video logging regularly about his experiences in Gaza, and providing us with a reality about Gaza that the BBC has thus far not acknowledged.

http://youtu.be/ACgwr2Nj_GQ

Channel 4 News seems to have recognised the gravity of social media reportage. Their journalist Paul Mason has highlighted [5]why Israel is losing the social media war over Gaza: "there is a massive change in the balance of power between social media and the old, hierarchical media channels we used to rely on to understand wars". He elaborates on the power of social media in showing a version of reality that is independent of what the BBC, for example, show their viewers. Further, journalists like himself, Jon Snow and others are able to bypass traditional editorial processes and report what they think matters. And I believe that nowhere is this more evident than in Twitter, where in 140 characters or less Israel’s actions are being revealed to the world by these journalists who normally were subject to stringent controls by editors. Twitter is giving these journalists the chance to say what they most want to say, and even when they have been made to delete a tweet by censorious employers, those views do not disappear from cyberspace due to retweets and screenshots by many who have recognised the validity of these reports.
Paul Mason reminds us that American mainstream media is overwhelmingly pro-Israeli, but now for the first time something monumental is occurring for the Americans are receiving their news from sources other than pro-Israeli news channels, and seeing pictures of dead Palestinian children which contrast starkly with what the mainstream news channels are reporting about Israel being under attack. [7]CNN News claims that the majority of Americans support Israel, but then of course they would if they watch mainstream American news channels. Further, those speaking for Israel are [8]spinning their tales using strategies in “fighting the media war for Israel”. The [9]US is the only country in the world who voted against the United Nations investigating human rights violations by Israel on the Palestinian people. Meanwhile, in America, another news source, Jon Stewart’s Daily Show has been criticised by the pro-Israeli lobby, but others are thankful to him for making it [10]okay to care about Palestinian suffering.

Paul Mason states that social media has put the power in the hands of the people and taken it away from the governments. And taken away the power from the previously dominant news channels too, I would add. The numbers of people who are getting their news from social media sites is on the increase: a report by Pew Research Centre found that [11]a third of Americans get their news via Facebook. The rise of obtaining news via Twitter results in us receiving reports [12]not as censored and ideologised as those that go through editorial processes. Some of the British newspapers are also allowing their contributors, even those going through their editors, to manifest the raw reality. Richard Seymour, writing in The Guardian, reveals [13]how indiscriminately the Israeli military are bombarding hospitals, beaches, residential neighbourhoods, cafes, schools and medical facilities. The BBC is unlikely to report increasing accusations that [14]Israel are attacking Gaza to gain access to the gas reserves, but The Guardian allowed this to be raised.
Twitter is being personified as a powerful political entity that challenges those who do not seem to have a handle on the reality of the situation in Gaza, as seen in this reference to those responding to Piers Morgan tweeting about Palestine: "Unfortunately, Twitter did not want to discuss the matter with the chat show host and instead just chose to mercilessly maul him". Perhaps this reaction to Piers Morgan by the personified Twitter is because Twitter has been sufficiently traumatised by the tweets from journalists that tell us Palestinian parents are having to put the remains of their children in shopping bags, children and women are dying, and those who go to hospital for help are killed. Many news reporters, celebrities and politicians are tweeting about Palestine/Israel, and thereby firmly presenting their views to their thousands of followers. Many prominent people (including film directors, musicians and writers) have signed an open letter to David Cameron demanding a halt to arms trade between the UK and Israel. After all, the BBC may not highlight this, but Press TV have rightly pointed out Britain’s relations with Israel when it comes to weapons. The BBC News are unlikely to investigate why the British government hides the extent to which it is arming Israel. Footballer Joey Barton has tweeted about the attacks on Gaza, and re-tweeted about apartheid in Israel. The Israeli newspaper Haaretz removed an article that showed the world more about Israel’s apartheid state where Africans are told to go home, because Israel is a Jewish state. The mainstream media’s reluctance to cover such stories that portray the reality of what goes on in Israel is concerning: “When Israeli government ministers incite angry mobs, calling Africans “cancer,” they are simply expressing another face of the racism that Palestinians have always experienced...Yet rarely does this knowledge make it into mainstream media."

The young people of Gaza are too letting the world know what is on their mind in moving and powerful tweets:

[25]
Twitter is also being used to call out the media establishment for its biased and unbalanced coverage:

[26]

The Huffington Post has also given voice to those generally unheard otherwise, as well as allowing more well-known figures to comment. Even Jon Snow of Channel 4 News submitted [27]his experiences of Gaza to The Huffington Post. The Huffington Post also provided important pictures showing [28]the masses coming out to demonstrate against Israel, images that need to be seen on mainstream channels like the BBC for those who do not use social media are being barred from access to newsworthy events because of the bias of BBC, Fox News and others. Al Jazeera has also given a voice to academics to provide the world with information about western governments who do nothing to prevent [29]Europeans and Americans join the Israeli military.

The impact of small-scale journalism is also such that we gain much needed perspectives that the BBC is not presenting. The Middle East Monitor is reporting and publishing what the BBC is not likely to show: [30]America's Israeli jihadists, [31]Israeli weapons add to brutality of Gaza attack, how Israel are pursuing the [32]natural resources in Gaza, and a [33]Norwegian doctor's letter about the carnage in Gaza. [34]Denmark, Norway and Finland are supporting the Palestinian people with medical aid, but the BBC is not interested in focusing on this significant point.
Hot Press is reporting that singer Sinead O'Connor has cancelled her gig in Israel. Democracy Now presents a debate on Gaza between those at the helm of smaller-scale news mediums. A group of journalists, bloggers and photographers who are the voices of the online magazine +972 have been providing us with up to date news too, for example of the largest West Bank protest in decades. The Electronic Intifada is reporting on the many academics joining the boycott of Israel, as well as giving us news about the writers in Palestine who despite the attacks, are attempting to keep on with their writing. It is the Electronic Intifada showing us that British people are challenging the BBC’s pro-Israeli bias., and publishing information on who has actually violated the ceasefire agreements. Mondoweiss has also pointed towards the growing space to voice criticism and show dissent in America against the Israeli support we have come to expect in the media: “from John Kerry's hot-mic moment expressing anger at the Israeli brutality– a moment Kerry has survived– to The New Yorker accusing Israel of a “war crime,” to TV reporters Richard Engel and Karl Penhaul describing the inhumane conditions in Gaza, to Anne Barnard of the New York Times explaining to Americans that Gaza is an open-air prison, to Lawrence Weschler’s outburst, that Israel has “rabies” and Gaza is “a concentration camp.” We can thank social media and small-scale online journalism for bringing to us injustices committed by the controlling powers of mainstream media, for instance news that An MSNBC contributor had her future bookings cancelled for speaking up on-air about the biased pro-Israel news coverage.

Within Israel itself, censorship is at work to prevent the Israeli people knowing how many children have been killed. Yet small-scale journalism is presenting the evidence we need to know more about Israeli propaganda, for example Digital Resistance showed a video of a former Israeli soldier who described his experiences of the Israeli army. Israel's promotion of the the rape of Palestinian women is observed through the sharing of tweets, images and speeches that have been originating from Israel. Last year, we heard about Israel's propaganda machine as they recruited and paid students to spread pro-Israeli information on social media. This year, we are hearing about Israeli universities encouraging and supporting those who are attacking Gaza. The mainstream newspapers are also giving us much needed perspectives, for instance a voice to the Israeli reservists who are refusing to serve in the Israeli army for varying reasons. Or the Independent newspaper which has been featuring impactful article titles by Mira Bar Hillel, an Israeli-born London writer: Why I’m on the brink of burning my Israeli passport, and Israel has discovered that it's no longer so easy to get away with murder in the age of social media. The Telegraph published the names of the Palestinian children who have been killed by Israel. Our politicians are being called out for their cowardly relationships with Israel.

A few years ago, at a workshop at Cardiff University, a teacher (studying for her doctorate) mentioned to me that she did not understand the need for Al Jazeera English, as the English news channels were sufficient for her to receive her news about the world! When I attempted to explain to her that plurality of voices in news broadcasting was crucial to learning about world events, she could not fathom this. It seems that for some people the need to gain a non-Eurocentric perspective and balanced news coverage is unimportant. For others though, clearly it is an issue of significance. As I write this blog piece, notifications on my Twitter and Facebook alert me to more updates, news and pictures on Gaza. In the last couple of days alone, more and more urgent important information has been coming out on social media that I have not seen reported on the BBC News. Firstly, there are massive demonstrations taking place with huge turnouts in major cities throughout the world in support of Palestine. Some in Israel are also demonstrating, but of course this we will only know through images shared on social media.
Secondly, we learned that "[57]It Turns Out Hamas Didn't Kidnap and Kill the 3 Israeli Teens After All".

Thirdly pictures from reporters are being collated to show the destruction of the homes in Shaja'ia:
What is the BBC not telling you? Where are you getting your news from?

Adam Graff (2014-07-27 17:45:44)
I agree with this article completely. There is definitely biased reporting in many news channels including BBC and Fox, which is in favor of Israel and defaming and dehumanizing Palestinians. Where is the integrity and honesty of media when they hide facts about Gaza, tell us misinformation about the current situation in Gaza and report lies. These media channels who are reporting biased information and hiding the facts are far away from truth—basic lesson taught for core element of journalism. How people can sleep at night—while lying and not sharing about murders of children, innocent people living at home, women, hospitals and schools being bombed in Gaza. The false and twisted reporting about events happening in Gaza is unimaginable. I wish people are able to report, see and comprehend truth and stop violence and murders committed in Gaza to Palestinian people.

Qualitative self-tracking and the Qualified Self (2014-07-28 08:00)

The idea of “qualitative self-tracking” is one that I’ve mentioned on my blog before. It’s a term in which I think but it’s also one that I’m aware of being unclear about exactly what I mean by it. Searching google shows a complete absence of material relating to it – returning only three hits for the exact phrase, all for the same document, which makes reference to “qualitative and quantitative self-tracking data” as opposed to the specific sense in which I’m suggesting qualitative self-tracking can be thought of as a distinct type of practice.

There’s a lot more on the notion of the Qualified Self. This is a term that had occurred to me a [1]couple of years ago and I really like it. My point at the time was that the ethos of self-knowledge through numbers does very little for me personally. But I’m intellectually drawn to the Quantified Self because it’s a fascinating example of the intensification of reflexivity in contemporary society.

In talking about the Qualified Self I’m not disputing the complexity of the inferences that people can and do draw about their selves and their lives on the basis of quantitative data. I’m just suggesting a different starting point which might often have similar implications at the level of practice. I also think there’s an inherent tendency towards behaviourism in a lot of the discourse surrounding the Quantified Self. To be clear: I don’t have any objection to quantitative research into human behaviour (in fact I’d find such an objection absurd) but I do see it as a form of abstraction that is methodologically unavoidable in addressing certain kinds of question and/or to work at a certain level of scope. But what ultimately concerns me are the qualities of things – this is something that’s often associated
with description and narrative but I’d argue causality, in the sense of what lies beyond observable regularities, necessitates invocation of qualities. Why does X do Y under condition Z? I see how it’s possible to reject the assumptions underlying the question but I don’t see how it’s possible to address such a question without a concern for the qualities of X, Y and Z.

So rather crudely here’s an attempt at a definition of qualitative self-tracking: using mobile technology to recurrently record qualities of experience or environment, as well as reflections upon them, with the intention of archiving aspects of personal life that would otherwise be lost, in a way susceptible to future review and revision of concerns, commitments and practices in light of such a review. So obviously things like personal journals would fall into this category. Quantitative self-tracking pre-existed the Quantified Self, as well as the novel practices that began to diffuse and prompted the elaboration of the QS. But I think qualitative self-tracking goes back much further. It’s the continuities that interest me here and how examination of what is similar can help us better understand what is different about our present circumstances.

While I use the term ‘mobile’ above in a rather generic sense, it’s nonetheless the case that smart phones facilitate greater opportunities for qualified self-tracking. For instance iDoneThis, though designed as an enterprise tool, has been something I’ve increasingly enjoyed using in the last week. Every day it sends you an e-mail at a defined time asking, perhaps unsurprisingly, “what did you do today?” – to which the response is to e-mail back and say “I done this …. ”. It’s an incredibly quick process, automatically formatting each line of the e-mail into a separate entry. These are then indexed to the day in question and marked on a calendar which can be (re)viewed later:

[2]
In a little under a week of using this, though not on every day, I’ve already been struck by the variability with which I respond to it. Some days I’ve immediately been able to say “I did a,b,c,d,e,f,g,h” etc. On other days, it’s necessitated that I deliberate about what exactly I did do that day. I find this very interesting as an example of a socio-technical system inculcating a deeper degree of personal reflexivity about how you’ve spent your day. Some days, I felt I did a lot but then realised upon reflection that I hadn’t done a great deal. Other days, I thought I hadn’t done much but then realised I had actually accomplished rather a lot.

Goalstreaks is a ‘habit tracker’ which may seem an odd choice to include in a post about the qualified self. It’s designed to keep track of the number of days in which you have taken action towards a goal. The idea is that this produces a goalstreak which, as it becomes longer, feels progressively more jarring to break. I’d argue it’s qualitative, at least in the particular sense in which I’m using the term, as a result of the distinction it draws between goals and action. The idea is to define a medium term outcome (e.g. write a book) and then specify a particular daily task which contributes substantively towards achieving that goal. In this sense, it links what the social theorist Harmut Rosa describes as everyday and biographical time horizons – drawing out connections between day-to-day routine and the unfolding of your life in the longer term, with the intention of progressively reshaping the former so that it contributes towards the shaping of the latter. This is why I think meaning is integral to the process – it tracks but it does so in a way that tracks the quality of the action vis-a-vis personal concerns. The normativity is built into how you use the app rather than being something that only factors in when you interpret the data (in fact the scope for treating goalstreaks as data is quite limited I think, over and above modulating your plans because certain goals you’ve aimed for progressively come to seem as if they might be unsustainable).

[3]
Hopefully this has given some sense of what I mean by 'qualitative self-tracking'. As I said at the start of the post, it's a term I use in thinking about my own life, as opposed to one I'm necessarily serious about as a proposed concept for sociological inquiry. But this is my starting point for investigating personal reflexivity and digital technology. So it seemed a good idea to try and clarify, at least for myself, what I actually mean when I use the phrase.

Cfp: Mini Conference on Digital Sociology (2014-07-29 08:00)

MINI-CONFERENCE ON DIGITAL SOCIOLOGY
CALL FOR ABSTRACTS

[1]Eastern Sociological Society

New York City

February 26-March 1, 2015

2812
In keeping with the Eastern Sociological Society's theme of "Crossing Borders", the Digital Sociology Mini-Conference seeks papers that address the many borders crossed – national, disciplinary, theoretical, methodological, epistemological – in digital ways of knowing. As Daniels and Feagin (2011) have observed digital technologies have offered both challenges and exciting possibilities for the ways in which sociologists do their work. Yet, as Lupton (2014) notes, the field of sociology has only just begun to take account of the broader implications that the digital has raised about the "practice of sociology and social research itself." Similarly, Clough and colleagues (2014) suggest that the "datalogical turn" underway in the social sciences poses not only serious challenges to sociological methodologies, but requires more robust theorizing of the social itself.

Digital Sociology as a field is gaining more traction in Australia, Canada and the UK than the US, but the burgeoning field of digital sociology is still "before the beginning" in theorizing and articulating the digital turn for the social sciences (Wynn, 2009). Despite the fact that many of the social implications of the Internet were articulated more than a decade ago by leading sociologists such as Castells, DiMaggio and colleagues, Sassen, and Wellman, (Castells, 1997; DiMaggio, et al., 2001; Sassen, 2002; Wellman, 2001), North American sociology overall has been less concerned with defining its relationship to the digital and has instead been content to cede this terrain to those working in communication, cultural and media studies, library and information science, and journalism.

We maintain that the field of sociology has insights to offer the questions that emerge from the proliferation of digital technologies and that a sociology without a thorough understanding of the digital will be a discipline that is irrelevant to the most pressing issues of the 21st century. The digital spaces where we increasingly interact, learn, and work lack fundamental sociological frameworks that might help us better understand such spaces (McMillan Cottom, 2014). Sociologists who wish to make sense of the social and the digital are faced with developing research methods that can account for lived realities, as well as articulate structural shifts in the nature of labor, economy, politics, and governance (Gregory, 2014). Therefore, we are convening this Mini-Conference on Digital Sociology as a way of sharing new forms of knowledge creation, connecting sociologists engaged in this work, and strategizing the future of "digital sociology" within the discipline in ways that "cross borders" of North American sociology.

We will consider abstracts on a wide range of topics, including – but not limited to – the following themes:

- **Digital Sociological Methods:** How do traditional, analog sociological methods become digital? Are there new, "born digital" sociological methods? Will big data replace survey methodology? What are ethics of doing digital sociology?

- **Critical Theories of the Digital Itself:** How have we theorized the digital? What challenges does the digital pose to epistemologies underlying sociological methods?

- **Digital Structures, Digital Institutions:** The datafication of everyday life is posing unique challenges to the composition of social institutions and giving rise to new instantiations of education, finance, labor, and governance. How do we theorize, study, and conceptualize the recomposition of these institutions?
• **Identity, Community, and Networks**: How do sociological concepts of micro and macro, personal and public, “front stage” and “back stage,” evolve as digital and mobile technologies increasingly blur these boundaries? How do case studies of networks further the field of digital sociology?

• **Race, Racism and Digitally Mediated Spaces**: How do existing sociological concepts of race and racism expand our understanding of digital diasporas, racist video games, regulating hate speech in a global era, hashtag activism, racial justice social movements and racist countermovements, the ways that racialization “happens” in digitally mediated spaces?

• **Queering Digital Technology**: How do we deploy – and queer – sociological theories to make sense of the twined realities that historically marginalized groups (like LGBTQ people) use digital technologies to connect across geographic distances, share resources and to work for social change while simultaneously experiencing the expanded practices of digital surveillance, loss of privacy, and identity-based harassment, even leading to violence?

We encourage submissions from scholars at all levels, and are particularly enthusiastic to support the work of graduate students and early career researchers. We welcome submissions for individual papers and for entirely constituted sessions. The organizers share a commitment to creating a field that honors diverse voices, and as such are excited to see scholars from groups that are typically underrepresented in sociology. When proposing entirely constituted sessions, please keep this commitment to diverse voices in mind.

Because we aim to foster dialogue beyond the parameters of the meeting, papers presented will be considered for inclusion in an open-access, peer-reviewed volume on Digital Sociology. If you have any questions about proposals, topics, or session ideas please contact one of the organizers: Karen Gregory ([3]kgregory@ccny.cuny.edu), Tressie McMillan Cottom ([4]tcottom@emory.edu) or Jessie Daniels ([5]jdaniels@gc.cuny.edu).

For papers, please submit an abstract of no more than **250 words**, as well as the title of the paper, name of presenter, institutional affiliation and contact details. For wholly constituted sessions, please include a short description of the concept behind your session, and then include all of the abstracts (along with names and affiliations of presenters) in one document. Please email your submissions to: [6]ESSDigitalSociology@gmail.com. Proposals not accepted for the Mini-Conference will be submitted to the ESS general call for submissions.

Karen Gregory (2014-08-25 20:47:08)
Thanks for sharing the CFP! I just wanted to add that the deadline for submissions to the DS mini-conference is October 1, 2014. Please consider submitting. Best, Karen

Sociological Imagination (2014-08-26 06:55:43)
Hopefully I will!

Rhea Page (2014-10-17 16:39:06)
This is intriguing! But what does CFP stand for?

OkCupid, social media and the ethics of data science (2014-07-30 08:00)

Not long after a scandal erupted over Facebook’s report on the experiment they conducted on users of the service, leading to[1] an apology about how the study was communicated, the dating website OkCupid has [2]waded into the debate with an admission that they regularly experiment on users and that they are not alone in doing so. Given the form taken by this pronouncement, it’s hard not to see it as a deliberate intervention with the intention of steering an area of widespread anxiety only likely to grow with time. However at the level of data science and web development, it’s hard not to recognise the logic of their argument, even if there are ethical issues which are obscured by it. Experimenting on users is “how websites work” as the author of the blogpost puts it. He gave a convincing performance on UK radio yesterday, arguing that the OkCupid matching algorithm is something that’s been constructed through the activity of data scientists at the company and that continued engagement with available data is an integral part of refining how the matching, as well as the broader website of which it is such a key part, works day-to-day. The Guardian offers a helpful summary of the news and the reaction that it has provoked:

Dating service OkCupid has cheerfully admitted to manipulating what it shows users, a month after Facebook faced a storm of protest when it revealed that it had conducted psychological experiments.

Christian Rudder, OkCupid’s co-founder and data scientist, posted three examples of experiments the firm had performed on to the site’s OkTrends blog, in an upbeat article entitled "We Experiment On Human Beings!".

The blog, which used to chronicle the discoveries OkCupid made by observing its users’ behaviour, has been mothballed for three years, since OkCupid was purchased by dating behemoth Match.com in February 2011.

"OkCupid doesn’t really know what it’s doing," [3]writes Rudder in the most recent blogpost. "Neither does any other website. It’s not like people have been building these things for very long, or you can go
look up a blueprint or something. Most ideas are bad. Even good ideas could be better. Experiments are how you sort all this out.”

Rudder refers specifically to Facebook’s troubles over its experimentation, when the firm tweaked the content of users’ news feeds in an effort to discover what their reaction was to a higher proportion of positive or negative posts. “Guess what, everybody,” he says, “if you use the internet, you’re the subject of hundreds of experiments at any given time, on every site. That’s how websites work.

The outcry seems to relate to the particular form the experiments take. Read the [5]original post for details about two of the experiments they’ve conducted. However it’s the final experiment which has proved most contentious:

The ultimate question at OkCupid is, does this thing even work? By all our internal measures, the “match percentage” we calculate for users is very good at predicting relationships. It correlates with message success, conversation length, whether people actually exchange contact information, and so on. But in the back of our minds, there’s always been the possibility: maybe it works just because we tell people it does. Maybe people just like each other because they think they’re supposed to? Like how Jay-Z still sells albums?

† Once the experiment was concluded, the users were notified of the correct match percentage.

To test this, we took pairs of bad matches (actual 30% match) and told them they were exceptionally good for each other (displaying a 90% match.)† Not surprisingly, the users sent more first messages when we said they were compatible. After all, that’s what the site teaches you to do.

<table>
<thead>
<tr>
<th>For users whose actual match percentage is 30%...</th>
<th>30% match</th>
<th>60% match</th>
<th>90% match</th>
</tr>
</thead>
<tbody>
<tr>
<td>when we DISPLAYED</td>
<td>14.2%</td>
<td>16.5%</td>
<td>16.9%</td>
</tr>
<tr>
<td>Odds of sending one message:</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

But we took the analysis one step deeper. We asked: does the displayed match percentage cause more than just that first message—does the mere suggestion cause people to actually like each other? As far as we can measure, yes, it does.

When we tell people they are a good match, they act as if they are. Even when they should be wrong for each other.
The four-message threshold is our internal measure for a real conversation. And though the data is noisier, this same “higher display means more success” pattern seems to hold when you look at contact information exchanges, too.

This got us worried—maybe our matching algorithm was just garbage and it’s only the power of suggestion that brings people together. So we tested things the other way, too: we told people who were actually good for each other, that they were bad, and watched what happened.

Here’s the whole scope of results (I’m using the odds of exchanging four messages number here):

As you can see, the ideal situation is the lower right: to both be told you’re a good match, and at the same time actually be one. OkCupid definitely works, but that’s not the whole story. And if you have to choose only one or the other, the mere myth of compatibility works just as well as the truth. Thus the career of someone like Doctor Oz, in a nutshell. And, of course, to some degree, mine.

Should this be the case? I find many aspects of this concerning but my fear is that these media hyped instances of particular cases which seem intuitively problematic to many risk obscuring the broader picture in which increasingly large parts of our lives are mediated through socio-technical systems with workings that are opaque to us at best.
Is there a risk that a debate about the research ethics of these experiments conducted by corporate data scientists distracts us from the political implications of the social relations upon which their capacity to do this depends? Is there a risk that a debate of the utmost importance ends up being driven by intuition rather than reasoned debate? One thought these debates have left me with however is the need for a serious engagement with research ethics by data scientists. These issues are just too important to overlook.

Against the 'sharing economy'? (2014-07-31 08:00)

The notion of the "sharing economy" is entering popular circulation in a way that would have seemed extremely unlikely only a year or two ago. Yet what is it? Is this really 'sharing'? Is this capitalism creating the basis for its own transcendence? Or is it a particularly noxious form of neo-capitalism that affects quasi-socialism while aggressively deconstructing secure and regulated industries? [1]This podcast won't answer these questions but it might help us understand their significance with a greater degree of clarity - [2]LISTEN HERE

More and more, consumers are turning to Uber to hail rides with their smartphones, or renting spare rooms from strangers online through Airbnb. These companies typify the sharing economy where everyone can be a micro-entrepreneur and provide valued services without a professional middleman. But as these peer-to-peer businesses explode in popularity, cities are dealing with major questions over how to regulate them. Following a wave of recent protests by taxi drivers across the U.S. and Europe, the debate over these services is heating up. Diane and her guests have a conversation about regulating the sharing economy, and what it means for businesses and consumers.

staff writer at The Washington Post covering urban policy.
This is a very interesting question you pose and one which I am currently fascinated by, for it speaks to the paradoxical nature of the times in which we live. Their ‘double-swordedness’. Something that starts out as an experimental, even neutral idea, (although encouragingly many new ideas and start-ups are motivated by a social good to at least some extent), threatens to be usurped by dominant agendas. The question, I think, that needs to be analyzed is: who is doing the sharing (and why)
and who is doing the taking (and why)? The answer seems to often be that those who are sharing are those who want to initiate change in the status quo and disrupt otherwise harmful hegemonies (although not always and completely - one must make a living after all), while those doing the taking are both those who benefit from its original intentions and those who it threatens (by copying or subverting). Of course, then the even bigger question is who (or what) is controlling the sharing economy itself - that is, the communication channels and infrastructure, policies, etc? As so much of what the internet and the sharing economy offers us is easily corrupted, the final questions that then need to be answered are what has the internet and increased accessibility to services really done on a societal level in terms of equality and social benefits and where to from here? What other means of social exchange are on the horizon, since the very ubiquity of the internet increasingly seems to be a threat to itself and its potential for fundamental change. The deep web, of what little I know about it, is interesting in this regard, for it seems that we cannot, and I don’t think should necessarily look to, escape the medium of technology in its entirety.

Sociological Imagination (2014-08-01 09:37:34)
I agree! It’s that ‘double-swordedness’ which makes it so interesting - I flip between extreme cynicism and benign interest without being able to reconcile the two views of the ‘sharing economy’

Call for contributions: An Alternative History of Sociology (2014-08-01 10:02)

This open and web based project aims to contribute to a rethinking of the sociological canon and debates about the past and future of the discipline. Would you like to contribute to An Alternative History of Sociology? There’s more information here about the project and its aims. Though it’s still in an early stage, we’d be interested in receiving:

1. Biographical accounts of historical figures
2. Narrative summaries of historical figures and their work
3. Narrative summaries of contemporary figures and their work
4. Personal accounts of the constraints of the sociological canon and the broadening of intellectual horizons
5. Analysis of the broader methodological and historical questions entailed by the project

There is no deadline for submissions. The idea is to create a living resource which grows over time, highlighting sociologists who haven’t received the recognition you believe they deserve and encouraging debate about the history of the discipline and what it means to have made a contribution to it.

All submissions should be 1000-3000 words and include a suggested image that is licensed for reuse. References should be included at the end of each post in a briefly annotated form, with the intention of sign posting an interested reader keen to navigate a body of work they had previously been unfamiliar with. Please include a 100 word first-person personal biography with submissions.

E-mail mark@markcarrigan.net to contribute an article or discuss a potential contribution.

All articles will be licensed under CC BY-NC-ND 4.0. This permits attributed reproduction for non-commercial purposes but precludes modification.

What does Wikipedia sound like? It probably never occurred to you to ask that question. But this website provides an answer. There's a description below the image of the meanings of the sounds used. I really like this project. What can initially seem like an interesting curiosity is actually something much more interesting, using sounds to visually communicate the quantity and quality of a dynamic system:

Listen to the sound of Wikipedia's recent changes feed. Bells indicate additions and string plucks indicate subtractions. Pitch changes according to the size of the edit; the larger the edit, the deeper the note. Green circles show edits from unregistered contributors, and purple circles mark edits performed by automated bots. You may see announcements for new users as they join the site, punctuated by a string swell. You can welcome him or her by clicking the blue banner and adding a note on their talk page.
The emotional wellbeing of non-tenure track faculty (2014-08-03 08:00)

The [1]Academe blog has an interesting post reporting on a new research paper which explores the emotional impact of the academic "caste system" that afflicts American higher education (and is present elsewhere in a less explicitly codified form). It seems like a quantitative and US-focused supplement to Ros Gill’s qualitative and UK-focused [2]Breaking the Silence: The hidden injuries of neo-liberal academia.

A recently released research article in the July issue of Frontiers in Psychology, authored by Gretchen M. Reevy and Grace Deason, finds that the very stigma of non-tenure track employment—now a reality for some 70 % of higher education faculty members in the U.S.—brings with it an increase in stress, depression, and anxiety.

 Appropriately titled “[3]Predictors of depression, stress, and anxiety among non-tenure track faculty,” the article derides the widespread faculty "caste system" that separates contingent faculty from their tenure-track colleagues for leading to an increase in the emotional and psychological stressors experienced by non-tenure track faculty.

 "Results indicate that NTT faculty perceive unique stressors at work that are related to their contingent positions," the article stated. “Specific demographic characteristics and coping strategies, inability to find a permanent faculty position, and commitment to one’s organization predispose NTT faculty to perceive greater harm and more sources of stress in their workplaces. Demographic characteristics, lower income, inability to find a permanent faculty position, disengagement coping mechanisms (e.g., giving up, denial), and organizational commitment were associated with the potential for negative outcomes, particularly depression, anxiety, and stress.”

The big data brain drain (2014-08-04 08:00)

This [1]provocative post by Jake VanderPlas argues that "the skills required to be a successful scientific researcher are increasingly indistinguishable from the skills required to be successful in industry" and that important implications follow from this for the future of higher education. There is a "new breed of scientist" that the academic world increasingly struggles to retain:

The increasing data-centeredness of science, however, is already leading to new approaches to problems: in the era of the LHC and LSST, the most exciting research is being driven by those who have the expertise to apply high-performance data-parallel statistical algorithms to ask interesting questions of huge, community-generated datasets. It is driven by the application of new statistical approaches, of new machine learning algorithms, and of new and faster codes to repeat classic analyses at a previously unattainable scale. In short, the new breed of scientist must be a broadly-trained expert in statistics, in computing, in algorithm-building, in software design, and (perhaps as an afterthought) in domain knowledge as well. From particle physics to genomics to biochemistry to neuroscience to oceanography to atmospheric physics and everywhere in-between, research is increasingly data-driven, and the pace of data collection shows no sign of abating.

The development of specialised software is becoming ever more integral to the cumulative progress of scientific inquiry. So too is the openness of that software, with privatised development processes intensifying a broader crisis of reproducibility that afflicts contemporary science. The problem is that not only does higher education not incentivise researchers to spend time and energy on these increasingly important pursuits, it actively disincentivizes them from doing so:

This brings us to Academia’s core problem: despite the centrality of well-documented, well-written software to the current paradigm of scientific research, academia has been singularly successful at discouraging these very practices that would contribute to its success. In the "publish-or-perish" model which dominates most research universities, any time spent building and documenting software tools is time spent not writing research papers, which are the primary currency of the academic reward structure. As a result, except in certain exceptional circumstances, those who focus on reproducible and open software are less likely to build the resume required for promotion within the academic system. And those poor souls whose gifts lie in scientific software development rather than the writing of research papers will mostly find themselves on the margins of the academic community.

To an extent, disconnects like this have always existed. The academic system has always rewarded some skills at the expense of others: teaching is a classic example of an essential skill which is perennially marginalized. But there are two main differences that make the current discussion more worrying:

1. As I’ve mentioned, the skills now slipping through the cracks of the academic reward structure are the very skills required for the success of modern research.
2. With virtually the entire world utilizing the tools of data-intensive discovery, the same skills academia now ignores and devalues are precisely the skills which are most valued and rewarded within industry.
The result of this perfect storm is that skilled researchers feel an insidious gradient out of research and into industry jobs. While software-focused jobs do exist within academia, they tend to be lower-paid positions without the prestige and opportunity for advancement found in the tenure track. Industry is highly attractive: it is addressing interesting and pressing problems; it offers good pay and benefits; it offers a path out of the migratory rat-wheel of temporary postdoctoral positions, and often even encourages research and publication in fundamental topics. Most importantly, perhaps, industry offers positions with a real possibility for prestige and career advancement. It's really a wonder that any of us stay in the academy at all.

What do you think of this argument? We'd love to hear responses, particularly from the perspective of the more qualitatively orientated social sciences. Get in touch if you'd be interested in writing something.

3. mailto:mark@markcarrigan.net

Michael (2014-08-05 02:51:38)
The question which seems to be absent, or implicitly answered in the positive, is what are the real benefits of big-data, or more important still, who does big-data serve? This seems to be glossed over in part due to the author’s field in which he is experiencing big data (astrophysics), which naturally has a different agenda in comparison with corporations in terms of why they are interested in big data. For example, big-data is an increasingly utilized tool in supermarkets, having both the effect of ensuring the consumers demands are satisfied (e.g. keeping track of floor stock and ensuring it is efficiently replaced) but also the more pernicious effect of CREATING, arguably unhealthy, demand in consumers (e.g. strategic positioning/supply of items in relation to weather conditions). One must then ask where does the consumers’ conscious decision-making end and the unconscious process begin. Or, in other words, when is big data serving to make its customers happy by meeting their premeditated demands and when is it manipulating its customers? Of course, marketing is all about manipulation, so this may be considered a moot point. The point I wish to raise is really: is big-data a status-quo perpetuating wolf, posing as the innovative, making-life-easier-for-all sheep? More data in certain fields may allow more effective decision-making, yet it also has the effect of making us complacent and overly reliant of numbers to give us the illusion of certainty. We may thus be making signal out of noise, whilst overlooking other, more important factors. It is here that the more qualitative oriented modes of research and inquiry seem to be at risk of being marginalised, as big-data serves to put quantitative research on an even higher pedestal, making qualitative research the progressively uglier step child. On a less related note, I think another interesting sociological dimension of the big-data argument (or reflex, for it seems the concept has its own momentum) is how it essentially can be read as the shifting from humans creating inert, passive forms of technology to serve our needs and make life easier and more productive (beginning in the stone age) to a time when technology becomes used, if not to create our needs, at least to predict our needs and in turn allow us to be more productive in other non-related areas (or so the argument goes). But is it not closer to the truth that certain applications of big-data makes us unnecessarily more consumptive and less in control of our lives? One the one hand, it could be said that the control is handed over to large corporations and marketers. However, more interestingly, if for no other reason than its conspiratorial connotations, is what the potential power of big data says about our relationship to technology - the power ascribed to big data hints at the idea of singularity - the time when technology attains greater than human intelligence. With so much data on ourselves and our behaviour, which is used to in
turn predict, modify and inform subsequent behaviour, we do in a very real sense become slaves to technology, albeit in a
more benign way. When everything runs so smoothly that we have little more to do than enjoy the ride and little need to think,
what does that make us and what does that make the ‘machines’?

**The possible convergence of social movement theory and organisational theory (2014-08-05 08:00)**

There’s a very interesting post on Org Theory which discusses the converging trajectories of Organisational Theory
and Social Movement Theory. As Brayden King argues, the similarities in these fields of study were obscured by the
different theoretical starting points within both subfields:

Both literatures are, after all, primarily concerned with group behavior, problems of collective action
and coordination, and dynamics of stability and change. Why did it take so long for the two theoretical
areas to engage one another? (I should note that social movement theory has for some time borrowed
ideas from org. theory, but this doesn’t really amount to full engagement in my mind.)

We argue that in the early years of American sociology, social movements and formal organizations
were viewed as very distinct phenomena – social movements are irrational and disruptive and formal
organizations are rational and stability-inducing – and that this characterization prevented scholars from
seeing potential empirical overlap.

Book Review by Pallavi Mittra
Concepts of the Self (3rd edition) by Professor Anthony Elliott, is as the title suggests a comprehensive presentation of the varied perspectives on the formation of selfhood. The author has structured the book in accordance with the disciplines. In the introduction the author classifies this book as an attempt to “make various social, cultural, political and psychological aspects of the self in our changing world intelligible to a wide readership” (pp.4). The book does that and significantly more by integrating these theoretical positions on subjectivity with a common sense understanding of the self.

The first chapter presents a sociologically informed discussion of the self by drawing on Mead’s symbolic interactionism, Gidden’s reflexivity and Goffman’s varied presentation of the self. This is followed by a psychoanalytical perspective of the repressed self, drawing largely on Freud, Lacan and Winnicott. The other chapters focus on Foucault’s concept of power and bureaucracy and on the deconstruction of the self with the emergence of feminism and homosexuality.

Towards a perspective of selfhood: The discussions of these varied theories are far from descriptive and are critically appraised in relation to other schools of thought. This is instrumental in outlining the similarities between these traditions. For instance, in the course of discussing Butler’s concept of performativity in relation to gender, the author aptly refers back to Foucault, Lacan and even Goffman. Though it could be difficult for a layman reader to go back and forth, an understanding of where these traditions come together and at what points they diverge is pivotal. It is for this reason that a preliminary understanding of these theories will help the reader make the most of the discussion and critique.

The book ties the discussion into a reinvention of the concept of self in the new-age lifestyles. It is in this penultimate section that the book shifts from a theoretical discussion to a somewhat simplified application of the popularly identifiable concepts with the commonly found prototypes of identity in the present generation. Furthermore, the chapters are intercepted with brief sketches of characters that one can identify with in today’s world, in the act of getting on with life. This is primarily done with the objective of positioning this theoretically driven discussion in the context of our everyday lives surrounded by a fast paced and dynamic world of social media, which is a catalyst to the formation of self. This also serves to emphasise the split of the self into the private and
the social. Such illustrations of common place instances are characteristic of Elliott’s style and are applied more extensively in Contemporary Social Theory (2009). The impact of this style for a wide readership is that it would be almost impossible to get on with work, write emails, follow up on world affairs or even listen to music without being reminded of and reflecting on how this shapes one’s identity. It is due to these factors that the book goes beyond introducing the concepts of self and identity to developing a perspective towards selfhood.

Discipline over paradigm: In structuring the book according to disciplines, the book relegates the importance of structuralist and post-structuralist traditions in the formation of self. As a result the significance of semiotics and language in subjectivity is barely included in the text. Moreover, missing here is the argument that identity is too stable a concept to represent the self and hence present an alternative view of identification (cf. Bracher et al., 1994; Lacan, 2006). A few other concepts that are treated as footnotes in the discussion are deconstructionism and object relations theory. Since both of these theoretical traditions relate closely to the postmodern conceptions of self in the debates on feminism (cf. Kristeva, 1986), it can be argued that these needed to be set up before delving into a discussion of gender, homosexuality and feminism. These exclusions are an outcome of the tough choice of discipline over philosophical paradigm in structuring the book and are understandable to an extent.

On the whole, the depth and extent of discussion in the book deserves the description of a critical introduction to the concept of self, with an inclination towards identity theories. It is a good book to start with if the reader is looking to get a critically presented overview of the theoretical traditions and could further deepen the reading by exploring the extensive citations made by the author.

[Pallavi Mittra is a first year PhD student at Strathclyde Business School and her research is focused on the psychoanalytical studies of employees in a strategic change context.]

Self-tracking and data sensibilities (2014-08-06 08:00)

I recently blogged about the idea of the ‘qualified self’ and why I’m drawn to this phrase. As sometimes happens, I wasn’t being enormously serious when I started writing the post but had argued myself into a new position by the end of it. I like the ‘qualified self’ because it draws attention to the aspects of self-tracking, broadly construed, which can tend to be obscured if we focus in an overly narrow way on the Quantified Self. I use capitals here in allusion to a distinction offered by Whitney Erin Boesel between the Quantified Self and quantified self: as an organised movement of sorts, the QS encompasses a very particular relationship between personal and social reflexivity: “QSers” don’t just self-track; they also interrogate the experiences, methods, and meanings of their self-tracking practices, and of self-tracking practices generally” as Boesel puts it.

However I think the ‘big tent’ strategy she discusses as characterising the movement, if indeed we can call it that, can obscure how specific these reflexive practices are because it’s easy to mistake inclusivity for commonality. To be clear I really don’t mean this as a criticism of the Quantified Self. I think this is a very valuable thing for them to have done on a number of levels. I say this as someone who has thought about ‘big tent policies’ a lot in terms of another social movement of sorts that can be found in asexuality activism. But as with the asexual community, ‘big tents’ can obscure the differences of those within the tent. The notion of the Qualified Self appeals to me as a way of articulating certain motivations for self-tracking, techniques and attendant technologies which I worry are being subsumed under the rhetoric of the QS. Perhaps I’m even talking about an entirely different sensibility with which
people engage in self-tracking? This interesting post by Deborah Lupton observes the trends in google search terms relating to these practices:

As part of my research for the book I made a Google Trends graph comparing the major terms that are used to denote the practices of voluntarily monitoring aspects of the self: self-tracking, the quantified self, life logging and personal analytics. As the resultant graph demonstrates, it was not until mid-2007 that any of these terms began to show up in Google searches. Self-tracking led the way, followed by life logging, then personal analytics. The quantified self is the newest term. It began to appear in searches in January 2010 and rose quickly in popularity, beginning to overtake self-tracking by April 2012 (although just recently self-tracking has caught up again). The quantified self, therefore, has become a well-used term, at least among people using Google Search. In another study of news coverage of the quantified self I found that the term has become increasingly used in these accounts as well.

But is it time to rethink or even relinquish the term ‘the quantified self’? For my book I prefer to use ‘self-tracking’ over the alternatives, as this term is broader and more inclusive of a range of practices (and I refer to ‘self-tracking cultures’ to denote the various social, cultural and political contexts in which self-tracking practices are carried out).

This doesn't confirm my sense of ‘quantified self’ swallowing up the broader discursive field out of which it emerged by any means. But it is suggestive of a trend. While I agree with Deborah that “Self-tracking is not simply about quantified (or quantifiable) information”, I'm not sure it follows from this that we can detach self-tracking practices from the kinds of data that inform them in the way I perhaps wrongly read her as saying. I think epistemologies are encoded into practices and the appeal of those practices in turn must be understood in terms of personal biography. Certain types of people are led to practices under certain conditions and then contribute to the reproduction or transformation of those practices (and the broader conditions) in virtue of what they bring to them.

What intrigues me about the QS is how closely entwined the ethos and the epistemology seem to be. On a personal level, it just doesn't make sense to me to think of my own life in terms of what I take to be the prevailing concepts within the Quantified Self. But I can easily see why it would for others and it's these questions of biographical differentiation that interest me e.g. how does one come to be someone who participates in quantified self practices? How does one come to be someone who participates in QS events? How does one come to be someone who engages in the kinds of practices I was describing in terms of ‘qualitative self-tracking’?

This is why I think the distinction draw by Margaret Archer between different modes of reflexivity is so important to understanding this. My hunch is that the QS community is filled with autonomous reflexives. In a later post, I'll map out my reasons for thinking this and explain the concepts I'm using properly. But my broader claim is that there's often a contingent complementarity between particular styles of internal life and particular practices of self-tracking. I'd like to understand this at an empirical level much more than I do and I think doing so would help illuminate at a theoretical level a lot of issues about the relationship between personal reflexivity and technology which interest me.

Perhaps this is all a long winded way of saying that I think the kinds of information that a person comes to think of as salient to their selves is a very interesting issue. So I think numbers are important to people whose self-tracking
practices revolve around quantifiable data and my inclination as a biographically orientated sociologist is to ask how did this come to be so? Addressing this question properly entails consideration of structure, agency, culture and the relationships between them. This is far too big a question to address in a blog post but I can see the outline of a potential paper beginning to take shape.

Tweeting Gluten Free: Quantified Self, Qualified Self, or Both? | Digital Coeliac (2014-08-06 17:47:50)

Book Review by Bradley Williams

How do the experiences of leaders and members of a medical humanitarian aid organization structure the organization’s principles and practices and enlighten us to the meaning and purpose of their work? Médecins Sans Frontières (MSF), (Doctors Without Borders in English), is “an international medical humanitarian organization created by a small group of French doctors and journalists in 1971 (p. 1). Throughout the book, Doctors Without Borders: Humanitarian Quests, Impossible Dreams of Médecins Sans Frontières, sociologist Renée C. Fox succinctly makes perceptible MSF’s complex existence, including maintaining transnational autonomy while operating within the borders of various democratic and authoritarian polities. Drawing from her extensive field research, the author reviews the history of MSF, the goals that they have set as an “international movement”, their organization and mobilization efforts and how they affect the prioritization and execution of these goals (p. 2).
The first three parts of the book, a little under half in length, offer analyses of MSF’s origin, history, and some of the earlier crises that tested MSF’s core principles. The first chapter in particular presents weblogs of members’ personal accounts of their service “in the field” (13-40). Web entries reflect such thoughts as members’ appreciation and pride for serving distressed populations, “culture shock” or “existential transformation” from their experiences, and disappointment with organizational, political, and resource limitations (p. 39). The fourth and fifth parts detail thoroughly the author’s studies using her ethnographic data drawn from the experiences of MSF workers in South Africa combating HIV/AIDS and in Post socialist Russia fighting Tuberculosis in Siberian prisons. The book contains a handful of photographs featuring significant events during the MSF missions in South Africa and Siberia, which were the subject of Fox’s analysis. There are also several sociopolitical cartoons from creator Samuel “Brax” Hanryon that offer a critique of the various core concerns of MSF, including organizational growth, gendered violence, and “the limits of humanitarian action” (p. 98). These illustrations added a playful form of conscience which acted as a barometer of the most impactful concerns of the movement’s present. Added to all of this, the book contains the insight-filled notes, placed before the index and after the text, one might expect from a leading sociologist.

A central theme examined throughout the book is the relationship between MSF’s principle of témoignage, or “bearing witness” in English, to threats to human rights and its political neutrality. This is primarily illustrated through cases of events in which humanitarian needs, political influence, social environmental factors, and internal dynamics shaped transformations in MSF’s organizational structure. For example, the project aiding the resistance to HIV/AIDS in Khayelitsha, Cape Town, South Africa ultimately culminated in the creation of a South African section of MSF (p. 193). The author’s greatest accomplishment is bringing the history of MSF’s organizational evolution to life. Doctors Without Borders feels semi-biographical, even a little autobiographical upon reading. This will most likely set it apart from other contributions to literature on MSF and international medical NGOs. The author acknowledges that she feels personally invested in the mission of MSF, noting that her experiences conducting sociological research in the Democratic Republic of the Congo was the inspiration for her work on MSF. She underscores early in the book that her ethnography required that she navigate the “culture of debate” that pervades the organization (p. 5). Reading this book makes apparent the personal care she took to understand this culture and translate her experiences. Books about MSF have tended to focus primarily on pragmatic analyses of the movement’s contributions to the populations it aids; one notable exception being Life in Crisis: The Ethical Journey of Doctors Without Borders by Peter Redfield, an example of recent ethnographic research.

The author provides a well written ethnographic account of the often conflictual internal dynamics of inclusion and exclusion among various factions within MSF. This book is original in its scope, taking seriously the opinions and personal history of past and current MSF members, from the more prominent and infamous leaders to veterans of humanitarian aid and newcomers alike. The photographs are highly welcome and the caricaturist illustrations are particularly elucidative; the “Brax” illustrations include short descriptions of their depictions as they relate to specific events and concerns relevant to MSF. The author makes an excellent contribution to sociological ethnography while demystifying the important role played by NGOs in international relations. I would recommend this book particularly to researchers interested in the meanings that members of NGOs place on their work. Readers will have no problem jumping into this book without prior knowledge of NGOs. I think this book would make a good additional reader for a course in medical sociology or a similar course concerning the work of medical NGOs.

His research is located within the intersection of sociology and international relations, specializing in the study of religion, social movements, and Islamic peace processes. [/notice]

Last year saw the Justice Secretary Chris Grayling introduce a new prison regime that included a [1]vindictive ban on prisoners being sent books. The ban has been widely condemned and [2]legally challenged. In this post Les Back from Goldsmiths College shares the letter he has written to Grayling criticising the ban. He included a copy of [3]Escape Attempts with the letter, as part of the Howard League’s project to send books to the conservative politician with the request that they be passed on to [4]prison libraries.

Dear Chris Grayling,

I am very pleased to send you a copy of Stan Cohen and Laurie Taylor’s Escape Attempts and request that you sent it on to a prison so that prisoners will be able to read it.
The book is not actually as impudent a choice as the title suggests. It is not literally a 'how to' guide for scaling the prison walls. Rather, what Cohen and Taylor document in this classic study in sociology is the deadening nature of prison routines and the importance of the life of the mind in imagining an alternative future into existence. I have worked in prisoner education initiatives for over ten years through a scheme at Goldsmiths, University of London called Open Book. It is an aptly titled initiative in my view. I am merely an academic volunteer and visit potential students inside prison, many of whom gain access to higher education through their involvement. In the last year I have also visited one of our students who was recalled to Wormwood Scrubs, so I have some direct experience of what reading means for prisoners behind bars.

For more than a decade it has become progressively difficult to get books into prison. I have documented this here in an on-line book called Academic Diary if you are interested (see [5]http://www.academic-diary.co.uk/page.php?entryID=18). As a result of government policy several books I have posted to students have been impounded. This has been documented in a series of podcasts which you can listen to for free on Goldsmiths website [6]http://magiclantern.gold.ac.uk/podcasts/sociology/sonicpostcards/postcard4done.mp3.

As you know the ban on sending books was introduced a year ago as part of the incentives and earned privileges changes. I have witnessed the transformative power of reading and education for prisoners and former prisoners. We know from our experience at Open Book – but also from existing research – that learning reduces reoffending and helps animate dead time into something that can be productive, not just for prisoners, but also for society as a whole.

You have said that books are a security concern because they can be used to smuggle drugs into a prison. You must know that this is utter nonsense. As the Howard League has pointed out there is no evidence that drugs have ever been smuggled into a prison through the pages of a book. The Prison Governors Association and the Prison Officers Association have both dismissed the idea that books constitute a security issue.

It is my experience that reading offers students an imaginative escape but it also provides an opportunity to envision a different future. Isn't this precisely what you – as the Minister of Justice – should be seeking i.e. that people who have a history of offending embrace a different kind of future when they leave prison. There are very low incidents of re-offending amongst students on the Open Book Project. Higher Education quite simply works for them because it creates a structure not only for learning but also within which a better life can be made.

Your book ban is making it harder for prisoners to access education's transformative power. I have witnessed this at close quarters and urge you to review this policy and once again allow the magic of books back into prisons.

Professor Les Back

Anon (2014-08-11 20:30:10)
Your otherwise excellent letter is weakened by the statement about books never having been used to smuggle drugs into a prison. I don't know how the Howard League did their research but, as someone who works in a prison the statement is utterly false. The POA and PGA are correct in saying that books are not a security risk - but that is because they were searched thoroughly not because they weren't used as smuggling devices.

Les Back (2014-08-14 18:04:07)
I take your point and stand corrected as you've witnessed this first hand. However, during the period when I was sending books to students through the post and they were getting through it seemed the security vetting procedure was actually very tough. Is this a matter of resources in a time of financial cuts in the prison service? The band on books just seems vindictive to me. You might be interested to listen to a interview with one of our students that has just been posted on the Goldsmiths website. http://magiclantern.gold.ac.uk/podcasts/sociology/sonicpostcards/lifeofthemind.mp3 Thanks for taking the time to comment. Les Back

Time is always running out (2014-08-07 08:00)

I got briefly obsessed last year by [1]the observation that at a rate of one book a week between the ages of 5 and 80, it will only be possible to read 3,900 books in a lifetime. This is a little over one tenth of one percent of all the books currently in print – obviously an overall figure that continues to grow at an astonishing rate. Around the same time, I came across this odd little insight into the understanding AC Grayling has of the finitude of his own life:

As a shake-up, the philosopher AC Grayling is fond of reminding people that the average span of human life is less than 1,000 months. “If a third of them you are asleep and a third you’re in Tesco’s,” he says, “the other third, about 25 years, is left to you to live well.”

Much as I despise the man, it’s an orientation towards life which resonates with me. The reason that quantifying the number of books it will likely be possible to read in a lifetime struck such a chord with me (apart from the fact that I don't naturally tend to think quantitatively and it just hadn't occurred to me to place a number on it) was because I’d long noticed that my ‘to read’ list was becoming ever more problematic. At first it was a list. Then it was a stack. Now it’s a heap. This is a photo I took around last Christmas:

[3]
Six months on and the heap is twice the size. Or perhaps it's two heaps – I'm foregoing the impulse to make a geeky philosophers joke about the sorites paradox... my point is that it keeps growing and that this invites explanation. It may just be that I have a 'book problem'. In some ways I clearly do, both in terms of my continuing to acquire them at a rate faster than I can read them and the problem of determining the 'right' thing to be reading when there's so much from which to choose e.g. I recently found myself obsessively reading a 600 page biography unrelated to any research work at a point where I was in the final stages of writing a paper and should have been focusing my reading upon that task. Prioritisation is hard and so too is committing to reading a particular book when there's always a further pile waiting for me that I've already selected from a much broader pool of cultural variety.

However I think this example from my own life reflects a broader process. As soon as I try and write about my 'book problem' seriously I inevitably start using words like 'prioritisation', 'commitment', 'selection' and 'variety' – invoking social theoretical concepts that have been integral to my PhD research. Part of the problem is that my capacity to identify potential reading material and my inclination to select it both tend to increase with my reading and associated practices. I become more attuned to following references. As I read more, I read more literary publications (like the LRB and the culture bit of the New Statesman which I tended to skip in my early 20s) and identify more books to read, in turn inclining me to attend further to these sources of information about new books to read. The frame of reference I bring to books expands and so too does the range of what I extract from the books I read, broadening the range of things I might read in future and what I might take from them.

This is all taking place against the background of a necessarily finite lifespan. Time is literally running out. However our awareness of this finitude is always conceptually and culturally mediated. This might be a statement of the obvious but I think it's very interesting to consider the implications of this for the variable ways in which we
understand that finitude at different points in our life. One interesting way of looking at this is to consider ways in which it can be represented. This illustration from [5]Wait But Why represents this in a way I find very powerful:

My point is that there is an *existential challenge* objectively encountered in the finitude of the human lifespan but that philosophical approaches to understanding this can often be insufficiently sensitive to the social and cultural factors shaping the ways in which people within a given social setting actually attempt to elude or build upon these inherent constraints. I think the mundane challenges of ‘time running out’ offer a very interesting way in which we can connect the *everyday dimension* to temporal finitude to the *biographical dimension* inherent in the limitation of the lifespan. I’ve talked about my ‘books problem’ simply because it’s familiar to me rather than it necessarily being
a particularly typical or interesting example of what I'm suggesting is a broader trend.

However the lifespan itself is not fixed. Beyond the social and cultural factors shaping how it is understood, we have the similarly social and cultural factors shaping its temporal extension. Social institutions, relations, practices and ideas all contribute to conditioning the extent of the lifespan in complex and interconnected ways. So too does technology, though I’d suggest never in a way that can be abstracted from the relational framework within which technological interventions are enacted (the closest I can think of in relation to this is a nuclear destruction launched by one person accidentally pressing a button).

The social theorist Harmut Rosa distinguishes between the time structures of everyday life, life time and that of the epoch in which they live. He argues that all persons continually struggle towards a degree of synchrony between these three dimensions to temporal experience. I think this is a really helpful perspective through which to address these issues. It’s from this perspective that I find the analysis of things like my ‘book problem’ so interesting – in identifying the mechanisms which lead to the intensification of the problem rather than its abatement, we get a fine-grained perspective on the temporal dynamics of the broader social system.

It also helps us understand what goes on in people’s lives when the struggle for synchrony backfires. A sudden awareness of mortality at the biographical level inculcates hedonism (live faster, live more) that proves destabilising at the level of everyday life. Or a concern to do work that matters leads to a day-to-day routines deprived of pleasures and so proves unsustainable. The strategies people adopt in the face of this central question (“my life is short, how do I make the most of it?”) necessarily play out in the three dimensions that Rosa delineates even if the person themselves does not recognise them. In fact many of the interesting unintended consequences emerge from the frequent disjuncture between the objectivity of these temporal dimensions and their subjective (mis)recognition. Things like productivity culture and self-help books can also be analysed in relation to a struggle for synchrony, as can their many failings. So too can religious practices which regiment time and social institutions which provide temporal structures that negate the existential pangs provoked by the absence of synchrony. Our attempts to get out of the mess of life are more temporally complex than we tend to realise.

Realist evaluation, mechanisms and theoretical minimalism (2014-08-08 08:00)

At IACR earlier today I heard two interesting talks about [1]Realist Evaluation. I had previously had a vague idea about what this involved, largely through encountering citations from Pawson in other texts, without ever having really grasped what it was in a concrete sense. Now I have, I’m very interested. All the more so because of the number of people who have told me today about the excitement that realist evaluation has generated in environments that one would have expected to be utterly hostile to critical realism more broadly. So there’s an interesting question about how realist evaluation has proved so amenable to circulation outside of its initial domain. Certainly, some of this must be a matter of networks, in terms of the original generation of those advocating this approach and the patterns
of work stemming from their own engagements. I imagine it’s also a matter of analytical value – I was particularly interested to hear how realist evaluation appears to those from an applied background working within a positivistic intellectual culture. It sounds like the conceptual distinctions it draws are crucial – realist evaluation critiques what positivist empiricism does but also explains how its own function corrects these mistakes by going deeper into the case.

However the aspect that interested me most were the questions about intellectual self-presentation. Firstly, in terms of the limitations upon the acceptability of realist evaluation that some people encounter e.g. the approach is becoming fashionable but the results may still be somewhat alien on an intellectual level to funders. Secondly, in terms of what strikes me as the terminological minimalism which characterises the approach and its proponents. Take this extract about mechanism in a [2] paper I just found by Pawson and Tilley:

The concept is best grasped through an illustration. The ‘primary school breakfast club’ is a very popular measure used to boost early education performance, often included within community regeneration initiatives. The key point here is that ‘the measure’ is not the basic unit of analysis for understanding causation. A measure may work in different ways or, in realist parlance, they may trigger different mechanisms (M1, … , Mn). A breakfast club may aid classroom attentiveness by offering the kids a ‘nutritious kick-start’ (M1) to the day, which they might not otherwise get. And/or it may act as a ‘summoning point’ (M2) to prevent kids loafing or absconding or misbehaving in the chaotic period before school. And/or it may act as an ‘energy diffuser’ (M3) to soak up gossip and boisterousness before formalities commence.

And/or it may enable to school to present a more ‘informal face’ (M4) to those uninspired by classroom and book learning. And/or it may act as a ‘pre-assembly’ (M5) enabling teachers to troubleshoot potential problems and seed the day’s schedules. And/or it might give parents and school staff an ‘informal conduit’ (M6) to mix and offer mutual support. Mechanisms also explain a programme’s failure, of course, so to this list we might add some adverse processes. It may act as an opportunity for ‘messing about’ (M7) if only ancillary staff are on duty; it might provide an unintended ‘den of iniquity’ (M8) for planning the day’s misdeeds: or it might prove a ‘cultural barrier’ (M9) because inappropriate food is served, and so on.

I’ve long thought that mechanism is a powerful concept. In fact encountering the notion of a generative mechanism, in virtue of the operation of which events unfold in the way that they do, played a crucial role in winning me over to critical realism in spite of my initial scepticism. Even the more instrumental conception of mechanism found in analytical sociology appeals to me because once you start to think in terms of mechanisms, it’s hard to understand how anyone could be satisfied by a form of social inquiry entirely absent of them, even if you may disagree with the way in which other people conceptualise them.

But it can also be a hard concept to explain to those who don’t think in these terms. They are also often not written about clearly and, in spite of what I’m suggesting is their analytical pay off, I can understand why this is the case. In my own work I’ve tended to use ‘mechanism’ as a vague concept I employ in my provisional analysis but then articulate in other terms at the point of writing. The reason for this is partly because I don’t have the confidence that I can write clearly in terms of mechanisms while also being accurate. Or sometimes, if I’m honest, it’s because what
I'm bestowing the 'mechanism' title to actually just reflects a causal hunch. Or my own thinking is much vaguer than I would like it to be.

It's in terms of this experience that I find the clarity of Pawson and Tilley's writing about mechanisms so striking. What I see as problematic, using it to designate the fact that I think I've identified operative causal power of some form, seems utterly fine when I encounter it in their writing. I find it problematic in my own because of the vast meta-theoretical edifice in virtue of which the concept is meaningful to me. But perhaps this is a feature of my own intellectual biography rather than anything that should exercise normative power in relation to my own writing? Could this be a more general mistake i.e. assuming that the theoretical considerations that led you to come to have accepted a concept should figure into your applications of that concept?

I look forward to reading more of Pawson and Tilley's writing and I'm interested to develop my understanding of the style they write in. The small amount I've looked through in the last hour or so certainly fits with the effusive complements I heard about their style during the conference today. I'm also intuitively of the opinion that this style is, in a very particular way, part of the reason for the success their work has enjoyed. I'm not making the rather trite claim that 'theory would be more popular if theorists wrote more clearly'. I'm suggesting there's something very specific about their particular kind of clarity which lends to their work a wider popularity than would otherwise be the case.

My suggestion is that it uses the minimum of terminology necessary to convey the conceptual distinctions which have practical implications. It's stylistic parsimony. Or at least it tends towards this. Are there many other theorists this is true of? I'm not convinced that there are. I'd like to be one of them though.

Stephen (2014-08-12 08:57:50)

Do mechanisms have simplicity or relative autonomy? Within critical realism, mechanisms belong to the real intransitive domain. But one can postulate that mechanisms belong to all three levels of stratified reality: the intransitive, the actual and the observer (empirical). One is then free to create mechanisms to observe the real as others are free to both create and evaluate their mechanisms. Mechanisms that become widely adopted and institutionalized then become part of the intransitive domain. Simplicity is then not an attribute of mechanisms, as they can become complex and embedded, but (more importantly) simplicity is an attribute of elementary human action that can be explained is clear and simple terms but this can get lost in an overemphasis on the intransitive domain. The key feature of mechanisms is their relative and initial autonomy from the intransitive domain.

The origins of methodological genocide: "all science is becoming data science" (2014-08-09 06:36)

All science is becoming data science. Therefore data scientists have a lot of power in this regime [stifles a laugh] It's a great time to be a data geek.

This is an interesting aside made by Bill Howe of Washington University in an early lecture on Coursera’s Introduction 2840
to Data Science MOOC. I take this to be the point that Emma Uprichard was making when she wrote about 'methodological genocide' last year in [1]Discover Society:

At the risk of sounding a bit melodramatic, the big data hype is generating, for want of a better term, a methodological genocide. To my mind, it even has a flavour of being a disciplinary genocide. It is fierce and it is violent, and social scientists – and especially sociologists – need to fight back. Certainly, if we are going to meaningfully interrogate the social systems and structures that make up the social world, we will need to improve our quantitative skills. I know, I'm sorry to say it, I know this doesn't always go down well among many social scientists, especially among those in the UK. But whilst I do think that one of the ways we will need to fight back is to increase our quantitative skills – we need to be clear about the kind of social science we move forward to [....]

Many new statistical techniques used to crunch through big data involve 'shrinking' the data. This not only 'dilutes' the importance of extreme cases – the outliers – within large datasets, but also focuses the analysis on the masses in the middle. One of the key strengths of social research and sociological research in particular is a sensibility to social divisions, minority groups, oppressed and silenced voices. In order to remain strong in these areas, we must absolutely remain attentive to the methodological techniques that go some way to erase extreme cases, pockets of extreme difference. Another big way of organising data is through data mining, machine learning and pattern recognition. At the core of those approaches, there are issues such as classification – who or what goes into which group and how are units of analysis measured as 'similar' or 'different'? How should we count in a way that allows for meaningful counts over time? How we shape the social through our counting and classifying are highly political and ethical issues.

The only difference is that Howe thinks this is great. ‘Soft sciences’ are becoming ‘hard sciences’. Intellectual life is transforming and he finds himself at the centre of it. There are different ways in which the emerging field can be understood in intellectual terms. I find the emergence of data science in this context, within the university and outside of it, extremely interesting. It partly represents an interdisciplinary point of convergence driven by socio-technical innovation, the opportunities for inquiry facilitated by it and the technical challenges posed by them:

[3]
I honestly think it’s hard to overstate the significance of this for the Social Sciences as a whole. Much of their future development will hinge on the dynamics underlying the second venn diagram. I find it easy to imagine a future where computational social science becomes established as the vanguard of the social sciences, with disciplinary boundaries between them a thing of the past, buttressed by entrenched pockets of more discipline bound enquiry which nonetheless are implicitly and explicitly supportive of the computational social science project on an epistemic and methodological level. Meanwhile qualitative sociologists, anthropologists and other hold outs become less part of the diagram and more a circle on to themselves, hopefully doing sustained research in an interesting way but with the risk that they become preoccupied by hurling critique at the shiny and well-funded convergent project over the road from them. Hopefully I’m wrong because this seems like it would be a suboptimal state of affairs on many levels.

Another interesting thing about data science is the emergence of the ‘data scientist’ as an aspirational category. Not to worry though because [4]You can be a Data Scientist too!
Again there is socio-technical innovation, the opportunities they provide (for business) and the technical challenges posed by their exploitation. It builds upon the existing occupational role of the business analyst, adds additional skills and valorises 'curiosity'. It is the sexiest job of the 21st century:

Goldman is a good example of a new key player in organizations: the "data scientist." It's a high-ranking professional with the training and curiosity to make discoveries in the world of big data. The title has been around for only a few years. (It was coined in 2008 by one of us, D.J. Patil, and Jeff Hammerbacher, then the respective leads of data and analytics efforts at LinkedIn and Facebook.) But thousands of data scientists are already working at both start-ups and well-established companies. Their sudden appearance on the business scene reflects the fact that companies are now wrestling with information that comes in varieties and volumes never encountered before. If your organization stores multiple petabytes of data, if the information most critical to your business resides in forms other than rows and columns of numbers, or if answering your biggest question would involve a "mashup" of several analytical efforts, you've got a big data opportunity.

The corporate demand for data science has led some to bemoan a 'big data brain drain' in higher education. In so far as there's lots of money to be made in corporate data science and relatively little within the universities, with even the massive funding provision for data science research encouraging academic entrepreneurism but having little impact upon the academic career structure, it can't be separated from the broader trajectory of the labour market in an age of austerity. Nor too can we adequately understand the emergence of data science if we don't consider it in the light of the cultural ascendancy of quants and the entrenchment of the quants within the finance
industry and beyond.

I’m also intrigued about what drives these interdisciplinary trends at the level of intellectual biography. For instance physics is well represented within data science, as well as often being invoked in the discourse surrounding it as an illustration of the scientific rigour characterising data science. There has been a sharp increase in Physics PhDs since 2000 in the US ([9]source) - to what extent is this being driven by newly graduated post-doctoral physicists who, either out of curiosity or necessity, go marauding into other areas of inquiry because advancement in their own field is either unlikely or undesirable?

Stretching the Sociological Imagination: A Conference in Honour of John Eldridge (2014-08-09 08:00)

Glasgow University will be hosting a conference in honour of John Eldridge on 16th-17th September. Entitled ‘Stretching the Sociological Imagination’ it will include papers inspired by John’s work in the fields of social theory, work and industry and the media. The event is free to attend.

Confirmed speakers include John MacInnes (Edinburgh), Kevin Williams (Swansea), Tim Strangleman (Kent), Tony Elger (Warwick), David Miller (Bath), Greg Philo (Glasgow), Bridget Fowler (Glasgow), Howard Davis (Bangor) and Robert Moore (Liverpool).

For details on how to register and the conference programme, see our conference website: [1] https://eldridgeconference2014.wordpress.com/.

We hope to see you there. Please feel free to pass on details of the conference to anyone who may be interested.

Given the increasing pressure to demonstrate the impact of social research, it is inevitable that researchers are looking towards the opportunities offered by social media. This one day course offers an accessible introduction to the use of blogging and twitter, encompassing the possibilities they offer for social researchers and walking you through best practice.

You will learn through a combination of presentations, informal discussions and practical sessions, including pre-course reading.

Course content covers:

- An introduction to blogging
- An introduction to twitter
- Making an impact with blogging and twitter
- Integrating blogging and twitter into your working life

Who is it aimed at?

This is an entry level course, which assumes no familiarity with blogging or twitter.

You will find this course useful if you:

- conduct social research
- have responsibility for impact and public engagement
- communicate findings to policymakers and practitioners
Learning outcomes:

By the end of the programme you will be able to:

- understand the characteristics of blogging and micro-blogging
- get started in a practical and engaged way with Twitter and Wordpress formulate your own strategic plan to use these services effectively
- connect effectively with others online in a way which serves these ends measure the impact of your online engagement
- participate enjoyably in the emerging academic blogosphere and twittersphere

Call for Contributions – Special Issue on Sexism (2014-08-10 08:00)

This special issue of New Formations will explore sexism: a problem with a name.

Sexism is a term that feminists have used to explain how social inequalities between men and women are reinforced or upheld through norms, values and attitudes. To use the term 'sexism' is, however, always to be involved in a political struggle or contestation. Marilyn Frye begins her important essay 'Sexism' with the following observation: ‘like most women coming to a feminist perception of themselves and the world, I was seeing sexism everywhere and trying to make it perceptible to others’ (1984: 17). Frye suggests that making sexism ‘perceptible to others’ becomes a project because many ‘would not see that what I declared to be sexist was sexist.’ In this special issue we hope to explore why making sexism ‘perceptible to others’ remains an important and difficult feminist project. How does sexism get reproduced? How are sexist attitudes or values institutionalised? To what extent are we witnessing new forms of sexism, for example, 'retro-sexism' (Judith Williamson), 'hipster or ironic sexism' (Alissa Quart), 'enlightened sexism' (Susan J. Douglas), or ‘critical sexism’ (Sara Ahmed)? What role does the media...
have in reinforcing or challenging sexism? In asking these questions, we hope for contributions that explore how sexism intersects with racism, homophobia, transphobia, ageism, ableism as well as class inequalities. We anticipate consideration of how feminists can intervene in the reproduction of sexism with bell hooks’ affirmation of feminism as ‘the movement to end sexism, sexist exploitation and oppression’ (2000: viii, emphasis added), kept firmly in mind.

Why sexism, why now? On the one hand, we have witnessed an increasing attention to the problem of sexism from feminist activists and journalists as we can witness, for example, in the Everyday Sexism project. On the other hand, although critiques of sexism as structural to disciplines were central to early feminist work in the academy, the concern with sexism, or the use of the vocabulary of sexism seems to have, if anything, receded within feminist theories. In this special issue we invite and enact a redirection of feminist theory towards the question of sexism. We also welcome contributions that question as well as show the utility of sexism as a name or framework; that ask how sexism might relate to other terms that feminists have used to explain gender inequalities (such as patriarchy, masculinism or phallocentrism); and that explore how sexism manifests in relation to heterosexism as well as cissexism.

The special issue is premised on the claim that thinking about sexism is a way of generating new feminist knowledge and understanding.

Contributions could cover the following issues:

- Institutional Sexism
- Sexism and Language
- Academic Sexism
- Sexism and Science
- Sexism and Intersectionality
- Phenomenologies of Sexism
- Everyday Sexism
- Sexism and the Media (including Social Media)
- Sexism as/and Technology
- Reproducing Sexism

Deadline for papers (maximum 8000 words) March 16 2015.

Please email your paper as a word document to Sara Ahmed (s.ahmed@gold.ac.uk) who is the editor of this special issue and on the editorial board for New Formations. You are welcome to get in touch with Sara before the deadline to discuss your contribution.

**Self-tracking, governmentality and social control (2014-08-11 08:00)**

This post on [1]Org Theory, which makes reference to a superb [2]New Yorker article about the Fitbit, nicely captures an ambivalence about self-tracking which I share:

In fact, there is a whole [3]Quantified Self movement, complete with conferences and meet-up groups.
One obvious take on this is that we’re all becoming perfect neoliberal subjects, rational, entrepreneurial and self-disciplined.

For me, though, what is fun and appealing as a choice — and I do think it’s a choice — becomes repellent and dehumanizing when someone pushes it on me. So while I’ll happily track my work hours and tally my steps just because I like to — and yes, I realize that’s kind of weird – I hate the idea of judging tenure cases based on points for various kinds of publications, and am uneasy with UPS’s use of data [4] to ding drivers who back up too frequently.

It’s possible that I’m being inconsistent here. But really, I think it’s authority I have the problem with, not quantification.

I’m theoretically resistant to attempts to reduce self-tracking to neoliberal governmentality. Partly this is because I’m increasingly [6] unsure what this actually means beyond saying that the technology socialises people into forms of self-management conducive to the demands of the socio-economic system – sounds weirdly functionalist when you rephrase it like this, no? I’m also aware of the role self-monitoring plays in my own life, using apps like [7] Goalstreaks, [8] iDoneThis, Day One Journal and my Nike Fuel Band. Though with the exception of the latter there’s a predominately qualitative aspect to this practice, even if Goalstreaks is superficially a matter of counting.

This obviously constitutes a form of self-work. What I object to is the fundamentally crypto-functionalist interpretation of this self-work that I increasingly see the notion of governmentality as entailing. However the widespread diffusion of digital self-tracking practices – I use the qualifier ‘digital’ because self-tracking practices are obviously not new – throughout the populace clearly has political, social and cultural implications which it would be hard to make sense of adequately without considering the power relationships contributing to them and ensuing from them.

This is why I’m ambivalent about self-tracking. Like the author of the Org Theory post quoted above, it’s authority I have the problem with, not quantification (or tracking). But when you consider the trajectory of self-tracking (and gamification for that matter) it looks likely to become increasingly difficult to separate one from the other. I’m particularly interested in how self-tracking might be introduced in workplaces, in the form of socio-technical systems of (pseudo-) participatory tracking and ranking, with the intention of mobilising [9] ‘discretionary effort’:

Discretionary effort is the level of effort people could give if they wanted to, but above and beyond the minimum required. Many organizations manage performance in such a way that motivates employees to do only enough to get by and avoid getting in trouble (negative reinforcement). Typically, these organizations manage by exception, providing consequences for worker’s performance only when it falls below the standard or minimum required. This approach gets immediate results, but just enough behavior to stop the threats and the potential for other negative consequences in the near future. It suppresses discretionary effort because there’s nothing in it for people to do more than the minimum required.

In this sense, it’s easy to see the appeal of self-tracking as technologies of motivation that can be deployed in the workplace. I’m (slowly) working my way through some of the literature on digital labour and it’s proving useful to begin to think through the implications of this.

Thoughtful post Mark! I would be very interested in discovering more about apps that people use and map these onto the classification provided by Deb.

Bloggers blogging about blogging (2014-08-11 18:24)

An interesting post on patter’s site reflects upon the tendency of bloggers to blog about blogging. This is something I do a lot and I’m not alone in this. Why is it so common? A useful answer to that question can be pursued by considering the recurrent themes which patter identifies in blogs about blogging:

I’ve also noticed that a lot of blogging about blogging has common themes:

(1) advocacy blogging about blogging – readers are encouraged to think about blogging and given reasons why it is a Good Thing
(2) instructional blogging about blogging – readers are provided with a set of handy hints about how to start and manage a blog
(3) reflective blogging about blogging – writers consider their own blogging habits, be they fast/slow, regular/irregular, diary-like, linked to impact, absolutely unlike other forms of academic writing, career building, testing out of ideas, a way of improving other forms of academic writing and so on …

It’s a thoughtful post, as is everything else on the site. Pat’s argument is that blogging has “somehow legitimated,
promoted and extended an interest in academic writing”. This reflects the qualities of the medium itself, with its tendency to inculcate a greater sense of agency about writing, as well as the lack of gatekeepers to control who blogs about blogging. It’s an interesting piece and it’s made me think more deeply about something I’d noticed myself gravitating towards without always been entirely clear why.

__________________________

I try to only blog about blogging when someone else asks me to blog about blogging on their blog. Example: http://artsontelevision.wordpress.com/ There are some people, strangely enough, out there who have no idea what blogging is or why we do it. For them, I try to answer some of the questions.

**Weirdly ethnomethodological magic tricks with dogs (2014-08-11 18:43)**

These are very amusing and very cute but does anyone else find the bewilderment of the animals utterly fascinating? I find it hard not to read these as almost akin to a [1]breaching experiment - the dog reveals its understanding of how the world functions by the chain of reactions which ensue from its expectations having been disrupted: "where's the treat? is it down here? is it back here? omg, what's going on!? it just vanished!"

IFRAME: [2]//www.youtube.com/embed/VEQXeLjY9ak
Perhaps unsurprisingly cats seem less willing to participate in these experiments:

The Bullshit Machine (2014-08-12 08:00)

The digital management guru [1]Umair Haque seems to be having something of a nihilistic turn. At least until you get to the end of [2]this essay, posted on his medium blog, which somewhat undermines the effect of a piece of writing I actually rather liked:
I’m bored, in short, of what I’d call a cycle of perpetual bullshit. A bullshit machine. The bullshit machine turns life into waste.

The bullshit machine looks something like this. Narcissism about who you are leads to cynicism about who you could be leads to mediocrity in what you do...leads to narcissism about who you are. Narcissism leads to cynicism leads to mediocrity...leads to narcissism.

Let me simplify that tiny model of the stalemate the human heart can reach with life.

The bullshit machine is the work we do only to live lives we don’t want, need, love, or deserve.

Everything’s work now. Relationships; hobbies; exercise. Even love. Gruelling; tedious; unrelenting; formulaic; passionless; calculated; repetitive; predictable; analysed; mined; timed; performed.

Work is bullshit. You know it, I know it; mankind has always known it. Sure; you have to work at what you want to accomplish. But that’s not the point. It is the flash of genius; the glimmer of intuition; the afterglow of achievement; the savoring of experience; the incandescence of meaning; all these make life worthwhile, pregnant, impossible, aching with purpose. These are the ends. Work is merely the means.

Our lives are confused like that. They are means without ends; model homes; acts which we perform, but do not fully experience.

Remember when I mentioned puritanical Calvinism? The idea that being bored is itself a sign of a lack of virtue—and that is, itself, the most boring idea in the world?

That’s the battery that powers the bullshit machine. We’re not allowed to admit it: that we’re bored. We’ve always got to be doing something. Always always always. Tapping, clicking, meeting, partying, exercising, networking, “friending”. Work hard, play hard, live hard. Improve. Gain. Benefit. Realize.

Hold on. Let me turn on crotchety Grandpa mode. Click.

Remember when cafes used to be full of people...thinking? Now I defy you to find one not full of people Tinder—Twitter—Facebook—App-of-the-nanosecond-ing; furiously. Like true believers hunched over the glow of a spiritualized Eden they can never truly enter; which is precisely why they’re mesmerized by it. The chance at a perfect life; full of pleasure; the perfect partner, relationship, audience, job, secret, home, career; it’s a tap away. It’s something like a slot-machine of the human soul, this culture we’re building. The jackpot’s just another coin away...forever. Who wouldn’t be seduced by that?

Winners of a million followers, fans, friends, lovers, dollars...after all, a billion people tweeting, updating, flicking, swiping, tapping into the void a thousand times a minute can’t be wrong. Can they?

And therein is the paradox of the bullshit machine. We do more than humans have ever done before. But we are not accomplishing much; and we are, it seems to me, becoming even less than that.

I recently had dinner with a close friend at the Strada restaurant in Cheltenham Spa. The dinner was fine, as was the waitress. At the end of the meal, the waitress presented me with the bill and then directed my attention to a survey that with my participation would put her in a competition for an hour’s extra wages. She didn’t say whether that ‘extra hour’s wages’ would simply be for one hour or for an extra hour applied to each day of a week, a month – for the rest of her employment? Suppose we’re talking about the simplest option – which would mean at most an extra
20 pounds? In that case, wouldn't it be more honest to have the following printed on the bill:

1. If you don't fill out the indicated survey, the waitress stays at her lowly wages

2. If you fill out this survey, the waitress gets put in a competition to raise her wages.

3. If you don't want to fill out this survey, and you don't want waitress to stay at her lowly wages, add X to your tip.

If I were provided with these options, I would probably go for (3) and justify it in my own mind as a form of charity, regarding the waitress as engaged in Strada-vetted begging, which means that my regard for the waitress reflects my regard for the restaurant's quality control. Others may judge the matter differently, and neo-liberalism invites us to explore these differences, which end up being direct judgements of the waitress and not the restaurant.

As for the restaurant, when speaking to my close friend I have referred to the survey as a 'quiz' because the restaurant 'always already' knows the right answers - at least from the standpoint of marketing. In any case, I doubt the results will be made publicly available for others to draw their own conclusions. Nevertheless, waiters and waitresses who fail to appear by name in this survey will become eligible for the chopping zone. I thus acted accordingly to keep one waitress employed – however lamely.

----------

Using Archives to Teach Gender (2014-08-13 08:00)

The University of Warwick's Maria do Mar and colleagues from the University of Leeds have put together this great resource on [1] using archives to teach gender. It includes an extensive collection of [2] artefacts and documents relating to gender, as well as [3] practical suggestions about how to incorporate these materials into teaching gender:

**Using archives is a fantastic way of enhancing undergraduate and postgraduate teaching on gender.** Integrating archival materials in lectures, seminars and coursework, or conducting study trips to archives, not only helps bring theories, concepts and facts to life for our students, but is also a way of supporting the extraordinary work done in feminist archives throughout the world.

And yet, in the busy-ness of everyday life in contemporary universities, it is often very hard for lecturers (and students) to find the time to explore archives and to design new learning activities using archival materials.

That is why we have created the website Using Archives to Teach Gender, which is now available at [4]http://gender-archives.leeds.ac.uk/

This website offers a resource database with **images and descriptions of over 150 artefacts and documents** that relate to gender and feminism, and belong to the collections of the [5]Feminist Archive North and the [6]Marks & Spencer Company Archive.
This website was designed to serve as a **useful resource for lecturers and teachers who teach sessions or modules on gender and feminism**, at all levels of study, and also for **students** working on these topics. Here you can find a range of materials that will both enhance your teaching and learning, and save you time.

This includes:

- a fully searchable [7][database of images](http://gender-archives.leeds.ac.uk/images/) that you can download to use in lectures, seminars, research and coursework
- [8][practical suggestions](http://gender-archives.leeds.ac.uk/suggestions/) on how to draw on these materials and on archival collections more broadly to create **innovative classroom exercises, engaging assessment activities, and ideas for undergraduate and postgraduate dissertation projects**
- links to [9][other websites](http://www.feministarchivenorth.org.uk/north.htm) where you can find additional audiovisual and textual archive material relating to gender and feminism
- [10][recordings and material](http://alpha.marksintime.marksandspencer.com/) from our events, including presentations and discussions on the potential and challenges of using archives to teach gender

This website is one of the outcomes of a University of Leeds Student Education Fellowship-funded project **Using Archives to Teach Gender**, coordinated by Maria do Mar Pereira. Working with her on the project was a team of extraordinary student research assistants: **Eleanor Broadbent, Anna Colgan** and **Freya Potter**.

To find out more about the project, click [11][here](http://gender-archives.leeds.ac.uk/about/). To contact the research team, email Maria do Mar Pereira on [12][m.d.m.pereira@warwick.ac.uk](mailto:m.d.m.pereira@warwick.ac.uk).

*If you have suggestions of links to add to our [13][Other Useful Resources](http://gender-archives.leeds.ac.uk/otherresources/) page, or teaching activities to include in the [14][Suggestions for Teaching](http://gender-archives.leeds.ac.uk/suggestions/) page, we would be delighted to receive them and add them to the website.* Please send them to **Maria do Mar Pereira** on [15][m.d.m.pereira@warwick.ac.uk](mailto:m.d.m.pereira@warwick.ac.uk).

A Conversation with Benjamin Zephaniah on Britishness (2014-08-13 08:11)

In January 2014, I interviewed the writer and Professor of Poetry and Creative Writing Benjamin Zephaniah about his thoughts on British identity and belonging to Britain. I began by informing him of my research on students’ perceptions of Britishness. My research commenced in response to calls for the teaching of Britishness by the previous Labour government in 2007/8. These calls are being echoed once again by the current coalition government requiring all schools to actively promote “British values” from September 2014.

I was keen to learn about Benjamin Zephaniah’s ideas on Britishness and British values, as I was a big fan of his poetry and writings on multicultural Britain. I had read his novel Refugee Boy with my Year Eight Class and collated their responses to learning about a young boy from Ethiopia/Eritrea, Alem Kelo. The students had been deeply moved by Alem’s story as they reflected upon the life of a refugee child in Britain.

Sadia Habib: What inspired you to write your poem The British?

Benjamin Zephaniah: People would talk about Britishness, and you had real extreme racists saying that we have got to protect this country from people who are not British, and I just thought who really is British. Everybody in these islands came from somewhere, even the early tribes, so I just thought let me have a bit of fun.

At the time it was when cookery shows were becoming really popular, and I thought I am going to use that format of a recipe. I knew that I am not going to be able to put everyone in it, yet sometimes people come up to me and say: "You missed out Trinidad or somewhere!" I had somebody say to me the other day, attacked me in the newspaper and said: "He did all that, and he never mentioned the Jews". I wrote back that in that poem I never mentioned any religion, there’s no religions mentioned at all. There’s Jews in England, there’s Jews in Jamaica, so Jews are mentioned but not their religion! It’s just one of those people who think anyone who doesn’t mention Jews is being anti-Semitic.
It was a simple need to put in a very simple way, direct way, and very fun way. You get kids at school, and teachers tell me, they get them to do their own recipe of the British, and they come up with a completely different group of nationalities.

[youtube http://www.youtube.com/watch?v=Aq13dvtZjP4 &w=560 &h=315]

Sadía Habib: Can you tell me about what Britishness actually means to you personally?

Benjamin Zephaniah: For me Britishness is being a part of these islands. I say that very carefully because I also respect Scottish people if they want to go separate. I'd be happy just to have England, and not have Britain actually. While we have this concept of Britishness, it’s being a part of these islands, and if you really want to be a part of these islands, I think by definition you have to accept multiculturalism. Not just diversity. Diversity can mean all kinds of things. Multiculturalism is what it says on the tin: Multi. Many cultures. Living together. As I alluded to before, the Celts, the Jutes, and all these people were different cultures. I come from Birmingham which was started by a tribe called the Beorma tribe, and they were seen as a very odd tribe, and they came and they settled they used to keep cows and bulls, and they had this place where they kept bulls, and that became The Bull Ring, and today it is a shopping centre.

That’s multiculturalism.

I don’t know if it’s still true now, but certainly a few years ago they were saying that the most popular food in Britain was an Indian curry. And some people thought it was a very British thing to have a curry. There are lots of other things which people think of as really British that came from somewhere. I mean what could be more British than living out in the countryside in a beautiful bungalow with a thatched roof? But where did the word ‘bungalow’ come from? Bengal, yeah. The English language also borrows from other cultures. So it’s being a part of that, that I think is Britishness. I actually think that in a very odd way, actually I don’t think it’s that odd at all, but when you hear racists saying "Britain is a white country", I think that is anti-British. Because Britain has never been fixed. Britain is like its weather – you know it’s the weather but you don’t know where it is going from one time to another. We know we are British.

I just made a film in Sheffield a few weeks ago about people complaining about Romany Gypsies, I don’t know if you saw it. People are saying "They are coming in our country, they are taking our jobs". And they are all Asian and black people. It’s actually quite British in a sense. They have settled down. I think it is negative. I’m looking at them and I am saying "People were saying that about you just ten years ago or so, and now you’ve settled and you are seeing the new immigrants coming in and you want to blame them." In a few years’ time, Romanys and Poles will be complaining about the Azerbaijanis coming in or something. It’s always happened, and we have always got over it actually. That’s why any final solution kind of sounds like Hitler stuff, anybody that thinks they can step in and do something about it is wrong, and that’s when it becomes kind of totalitarian. People start killing each other in a really big way. People come here, they settle and start complaining about the new people coming, who make friends with the old people and then they start complaining about the new people coming in. There are issues of course about services and schools, and overcrowding and other things, but there have always been those issues.

Sadía Habib: What do you think about the government’s proposals that schools should teach Britishness?

Benjamin Zephaniah: I don’t like the idea. You can teach things about Britain, and that should be just a gen-
eral part of education, but to teach British-ness... Now some people say a great symbol of Britishness is the Queen. I
don't. I think a great symbol of Britishness is all the people who have fought against monarchy... the Levellers... the
people who fought for freedom... the suffragettes. That's the tradition that fascinates me. I don't say to the other
people that your one is less important, if that is what you want to do, then let me do my one as well. So what version
of Britishness are you teaching? If you are going to teach it, you have to pick a version of Britishness.

If you are the government, and you are telling people how to teach it in schools, you are going to teach one
that suits the status quo. As part of your Britishness, are you going to teach about the British people that went to
Amritsar and massacred innocent people? I guess most likely not. Are you going to romanticise that? Are your going
to teach the real details of slavery? I know you may mention it, but as part of Britishness, as part of where we got
where we got today?

Liverpool is part of Britain. Why are certain roads in Liverpool named after slave-drivers or slave-masters?
Why have we got banks in this country that were started off during the slave trade and are a part of the great British
establishment? Are you going to teach that? I think not. In their version of Britishness, they are probably going to
teach that great comedy comes out of Liverpool, and there are banks, maybe on now and then they get it wrong, but
on the whole they are alright as they will give you a mortgage eventually! They are going to teach a very sanitised
version of the British institutions. So I don't think you can teach Britishness. And all this stuff where foreigners are
expected to swear allegiance to the Queen and all, I think it is bullshit! (Sorry for using such words!)

Some people are against state multiculturalism. I am as well, oddly enough, because the kind of multicultural-
isim I am talking about happens organically. I look at my band of musicians: I've got an Indian girl on percussion, I've
got a Chinese guy in guitar, Jamaican, an African, and two English people. I just went out and looked for the best
talent. That's what I got. I remember the first time I met the Chinese guy, and I said to him play a lead piece for me,
and he played the guitar, and it sounded kind of Chinese-y. And it was a lead. I said: "God! That's really good!" One
of the other people said: "Oh no, you are getting the tones wrong." And I said "No, he's getting them right. That's
working." That's what makes our music interesting. That's what makes our culture interesting. That's what makes
our food interesting. So the kind of multiculturalism I am interested in is the one that happens organically, happens
naturally.

Look how many black people are in America. Look how many white people are in America. And did you
know that we have more inter-racial marriages than them? Because they're separated over there. They live in their
here, I mean you can go to Bradford and see parts that are basically very Pakistani, and go to other parts and see parts
that a little more Jamaican. But on the whole, we inter-marry and we mix a lot more than most other people. Now
that's not state-sanctioned. The government doesn't say that we want so many black men to marry so many Indian
girls this year. It happens naturally. We just fall in love with each other. That's the kind of multiculturalism I'm talking
about. You know you come around to my house and you show me how to cook something, and I say let me just
dash a bit of this curry into it or whatever, and we make something new! That's different from state multiculturalism.

And so our ideas of what it is to be British should also happen organically. We should just teach the history
of these islands, real and honest history of these islands, what the British have done and achieved etc, and some-
times failed to achieve. And then let the students decide what is their idea of Britishness. I don't mind that question
being asked, but I just don't like when it is answered by the government and dictated to children. If the government
decide what it is, and this is the version we have got to teach, we just get a sanitised government-approved version.
Britishness may mean different things to different people.

Sadia Habib: If students did explore Britishness, rather than be taught a government-sanctioned sanitised ver-
Benjamin Zephaniah: Yes, that's exactly what I would promote. Let's look at some facts of what's happened in Britain. Look at the people that have come here. Let's look at the struggles of people. I mean, this is a really important question. I have raised it before but this is not really taught in schools. Because it is sometimes not in the interest of the powers-that-be to talk about it. I mean people will now talk about the suffragettes, and you'll get a bit of that somewhere in the curriculum, won't you? Because it just seems so right that women should have the vote. The interesting thing is that, and you probably know, that although the suffragette movement started in Britain, the first people to actually get the vote were in New Zealand. Do you know Shelley the poet? He wrote a poem called Mask of Anarchy...I remember when I was in school and the teacher put this poem in front of me and said to me: “Can you read it and tell me what it means?” And I remember reading a couple of lines of it and... And she gave me this verse and said: “Read a little bit of it and tell me what it means”. The bit I had to read was... I will read it very quickly:

As I lay asleep in Italy
There came a voice from over the Sea,
And with great power it forth led me
To walk in the visions of Poesy.

I met Murder on the way—
He had a mask like Castlereagh—
Very smooth he looked, yet grim;
Seven blood-hounds followed him:

All were fat; and well they might
Be in admirable plight,
For one by one, and two by two,
He tossed them human hearts to chew

Now it goes on... I remember reading it because I wanted to understand what this means. Shelley was talking about I met Murder on the Way/He had a mask like Castlereagh... Castlereagh was a British Minister at the time. Very smooth he looked, yet grim/Seven blood-hounds followed him. He had just signed a deal with seven other European countries to continue slavery. All were fat; and well they might/ Be in admirable plight. They were all looking to Britain because there was the leader, slavery country. For one by one, and two by two/ He tossed them human hearts to chew. He's talking about black people and the suffering of black people. When I learnt it years later, I thought: "My God, why didn't my teacher tell me that? Why didn't he put it in context?" Now to me this is a great British poet, at a time when if you were teaching mainstream Britishness you would say, “Britain was involved with slavery. Full stop”.

I have just been making a programme with women in Birmingham whose husbands were making the shackles for slaves, they used to make a lot of metal things in Birmingham. And they refused to sleep with their husbands until they stopped making shackles for slaves. These are women who had started to discover tea from India, and sugar from the Caribbean, you know taking tea from India and sugar from the Caribbean and making a nice British drink! But they refused to use sugar because they said it was from slavery... are they going to teach that version? That's the kind of things I want them to explore, as well as Henry the Eight and his wives and all that kind of stuff, that tells me there is a tradition in Britain of connecting with people around the world that has very little to do with government. Here is Shelley saying: "Never mind the government, the government looks like murder. The government is dealing with slavery. We are all human beings, and we want to connect with other human beings".

So my history of Britain would talk about the poets and what they really stood for. You see when those people talk about the history, they talk about the Kings and Queens, and who had sex with who, and what baby they had.
And this King and this Queen went to war with another King in Europe and they called it a World War, just because the Europeans were having wars, they called it the World War! There were parts of the world that didn't have any war. But they are so important, that when they have wars they call it a World War. But if it’s a war with Iraq, they just call it the Iraq War. Or a war with Afghanistan, they call it the Afghan war. A war with Korea, they call it the Korean war. But if it’s the Europeans at war, it’s the world! That’s just self-importance. That’s like thinking Europe is the centre of the world, and that they are so important here, and everybody else are just second class citizens of the world.

Sadia Habib: How do you think Britishness is generally portrayed currently through popular culture and media?

Benjamin Zephaniah: I think the mainstream are trying to portray Britain as civilised, as opposed to those Muslims and those other people who have really negative views on women and so on. I don’t say women are living the best of situations in some parts of the world, I know there are issues, but the idea that the western woman is completely liberated, especially the British woman, and so we need to go out there and civilise these people. Not in the war way… I know most wouldn’t say it’s colonisation again, but it is colonisation in a cultural way, although there are sometimes aspects of militarism. But most of all I would say, if you are watching mainstream media and you are not thinking too deeply about wars, you would think that British culture is obsessed with celebrity. You would think the Royal family represent us, and Kate and those others… what are their names? I can never remember their names… And you would also think England is London, or Britain is London really, if you were an outsider. It saddens me sometimes when tourists come, and they just go to London, and say: “I’ve been to England!” So the sanitised one is where the government is so democratic, and everyone is so free, and the women are so liberated, and the Royal family is so good! They wouldn’t want to mention that all over this country now we have soup kitchens, it’s one of the growing industries, and on most high streets now shops are closing down. And one shop that is not closing down, but are growing more and more are charity shops.

Sadia Habib: Charity shops and pound shops.

Benjamin Zephaniah: Yes, and pound shops. And also many money-lending shops and Wonga and so on. But they would like to tell you the City is doing well and the bankers need really big bonuses. It sounds terrible when you put them both together, doesn’t it? We know the reality of it, but the media can completely control it so that people don’t really understand how bad it is for some people. I mean it really is. I mean you live up North, I know Manchester has got its nice parts. But sometimes when you go to the smaller towns and you see the poverty there. Even in London actually. I went to Tipton the other day, just outside Birmingham, I looked at the place and I thought I would love to drag up some of the people from London and show them this place, because they would swear there is nothing like this in England. It looked like it had gone back in time…

Sadia Habib: In what way?

Benjamin Zephaniah: When I was growing up there were areas that had been bombed during the war that had never been built up, and they were still there, areas where there are no houses, just like wasteland, and closed down factories… it really makes me angry, and I do know that some people in London just don’t see it. I remember I was doing a film shoot in Stratford once, I was doing a poem about urban life or something….this was many years ago....and we found this wall that had this graffiti, anti-government graffiti and about unemployment, and we decided we would film against this backdrop. And we went away, and we came back the next day to film me and somebody had painted over the wall. Somebody made some enquiries as to why this wall was painted over, why now, when it has not been painted over for so long... Oh! The Queen was going to be driving past there! For years that wall has been there, and if the Queen drove past there, if she would have glimpsed that wall, she would have glimpsed it for
a split-second, but for that reason it was cleaned up. Not because the people needed it cleaned up. But because the Queen was driving past. And I think that’s very symbolic of the idea of Britain that some people want to feed you... a very white-washed version of Britain. But I love Britain.

Sadia Habib: You love Britain! In spite of all that? So tell me why you love Britain?

Benjamin Zephaniah: Because, as bad as it is, when I go to bed, I don’t think when I wake up there’s going to be a coup in the morning! Because, on the whole, if I fell in love with somebody and if somebody fell in love with me (that doesn’t really happen!), but if it was to happen, it wouldn’t really matter what race she was, I may there may be some family issues, but that’s got nothing to do with the culture of the country. I came from a family that was poor, very working-class, uneducated, but I am a Professor of Poetry and Creative Writing now. It’s actually unfair of people like me to go on and say this country is horrible and rotten, and there are no opportunities here... there is opportunity, and we just want better and more. And we don’t want the government to take it away from us. That’s the main point. I think a lot of our hard won freedoms and things that we fought for, that other people have fought for before us, some people want to take it away from us now.

I’ll tell you a story... can I tell you something really personal? There’s this man right... he raised me like a son. I call him “Dad”, sometimes it confuses people, they ask me how many dads have you got? Well, I’ve got two. This one was really important, because when I was a teenager going through all the teenage things he was there for me. And he looked after me all the time. He worked in Britain all his life, all his other kids... all born in Britain. He worked here... worked most of his life. I can’t think of him ever going on the dole... I can’t think of him going in hospital.... And he went over to America to retire, and while in America, he was getting old now and he got ill, and they have somebody that comes over to look after him, kind of home help, and she was robbing him of his money. She was taking his money. And in America you can get a grant and it goes directly to the home help, and she was taking the money and partying and leaving him there. As soon as we found out we went and got him, we couldn’t believe how ill he was, we brought him back here. When he arrived at Heathrow... he had to go straight to hospital. He got better, he came out, he got ill, he went in and a few days ago he died. Do you know they said he is not a British citizen? So you are going to have to pay for his hospital care. We said that he paid all his taxes here! He went to America and retired. And somebody said to him while he was there that if you need help you would need to drop your British citizenship. So he dropped his British citizenship when he was eighty or something. And they were literally holding the body and saying that we are not going to give you the dead body back until you pay! The only thing that managed to help us was because me being a well-known person went in there and said: “Shame upon you, the Health Service!” My mother worked in the Health Service since she was young! They knew that I could go public with it and they said that they were going to try and sort something out, and promised we would get the body back now, and we are going to be able to bury the body next week. You know that’s the government doing that... my dad didn’t say I am going to England because I want to die in a hospital in England. He paid into this Health Service, and all his kids were here. I genuinely can’t remember a time he went into hospital. I mean ninety-four... you have got to be strong to live to ninety-four. Over two weeks ago they turned off the machinery... they called us in and said that we have to turn off the machinery, and he will die within hours. He lived for another two weeks. The doctors were confused that he had no liver and kidneys left and he wasn’t dead. We said to the doctor that he has never been to a hospital, and he just lives, he just goes on and goes on. But because of the politicians... actually the nurses and the doctors were a little embarrassed. They knew who I was and at the moment I am being employed to try and help Black and Asian people in the West Midlands area who have HIV but who are not getting checked because of stigma in their communities... they are using me, they don’t know how, they are just talking to me at the moment, they are using me to try and reach these people. And I am looking at them and thinking you are using me, but look at what you are doing to us...(laughs).

I don’t know why I went onto that. Oh I know why, because these are the things the government wants to take away from us. This is the kind of government the country wants us to have. You see, Britishness, to me, is the
National Health Service. That’s really British. What can I say? That’s really British. When I walk down the street, if I see you, and I don’t know you, I can look at you and say to I am going to give a little of my money to your healthcare. I don’t know who you are, but I’ll put a little bit in the kitty so if anything happens to you we can take care of you. We all put a bit in... I think that is really British. That’s one institution that I think kind of represents us. But the government... well a long time ago Thatcher was saying more or less that she wanted to privatise it, I mean she never actually said she wanted to disband it but we know that’s what she wanted to do originally. When she saw the outcry from the people, she started talking about privatising parts of it... No, I think that belongs to us. We all put our money in that and it belongs to us. And they can’t come on the street and say that my dad because he retired in America, he can’t die here. Holding his body? It sounds primitive: I am going to hold your dad’s body until you give us some money! And we all pay into that. My dad paid into that. And we all benefit from it. Sorry I personalised it too much.

Sadia Habib: How do you think Britishness is perceived from a global perspective?

Benjamin Zephaniah: Well, you know I work for the British Council a lot? When I used to go around working for them, there used to be a real sense of pride. We used to go into countries that were quite totalitarian and they would hear my poetry and say: “Wow, you can say that in England!” You know, you have come in with the British Council and you have just said “Up the British government!” Yeah, we can say that, you know! Now, if you are working for the British Council, in a lot of countries you have to have protection. Yeah, we are seen like war-mongers... there has to be a level of risk assessment... even have to have a bodyguard over there. We used to...I remember working in Libya, when the politicians weren’t talking, the poets were talking...talking culturally... a long time before. A lot of the time you saw relationships were falling in this country between the British government and the Libyan government or whoever, you knew that the poets were in there working first, you know we were making the ground ready... we were building up some understanding through arts and art exchange... bringing an artist over from Libya to Britain, and sending a painter back over there, doing a poetry festival where we all got together. I call it cultural intercourse. But now you go to these countries and it’s like: “What are you guys doing? Why are you attacking these people? Why are you saying you are so good? Why are you saying you are better than us? Why is your civilisation better than us? Our civilisation goes back hundreds and hundreds of years but you just want to bomb it. And I can understand why they say that.

It’s a real shame. We used to be so proud sometimes to go to some places and represent Britain. And it’s really weird that it’s Tony Blair that went down this track of following America. I remember once in Russia this guy, as I was walking past him, this guy shouted something in Russian, and he was very aggressive, and I asked the people who were with me about what he had said. They said that he had said: “Piss off home, Americans!” (laughs) So I said: "Hold on, let me go back...". And we went back and I said to the translator: “Tell him I’m not American, I am British.” (laughs) And they told him I was British, and he called: “Oh yeah, Maaanchester Uniteddddd! Yeah! Yeah!” And he tried to put his hand around me you know. I mean this is some time back. “Shakespeare! Yeah yeah! Manchester United! Shake-es-peare! Reggae!” Completely different! And those were the main themes: America were the big aggressors, and now we are just seen as America’s poodle.

Sadia Habib: How do you see the relationship between whiteness and Britishness that certain factions like the EDL try to promote?

Benjamin Zephaniah: I like to say to them: “What is your idea of whiteness?” Go and get your DNA checked. I did propose it once as a television programme, but somebody told me that there is something similar where they checked a racist’s DNA and they found out he has Algerian blood in him or something. Like I said, their idea of Britishness is anti-British because it is anti-change, it is anti-progressive, and it is anti-compassion. It is inward-looking.
It's not creative. And it's racist. Now when the Celts came here, they came with a culture, when the Jutes came here, they came with a culture, when the Beorma tribe came here, they came with a culture. They tolerate them because they think they were all white, but they weren't all white. Romans had black people with them. I know Romans were conquerors as opposed to settlers, but they had black people with them. And there were black people here a long time before the Windrush. In a way I feel sorry for them because they are denying themselves the true history of this country and they are limiting their possibilities. There was a crazy wonderful story the other day on the internet, you might have seen it, this guy was a BNP member and he had BNP tattooed on his forehead, then he fell in love with a black girl. You saw him go and get the tattoo removed, and it was really quite moving, and he talked about when you love somebody, you just love somebody and what he has done in the past is just rubbish. And he said he realised how shallow he had been. You could see him really opening up.

I was on radio once a long time ago talking about when I was fighting skinheads in the streets of East London, then a couple of days later I got a handwritten letter, four sheets of A4 on both sides, from a Buddhist monk who said that he was one of the racist skinheads that used to fight me. Now he was a Buddhist monk, and he said his eyes had opened. I could almost feel the tears on the page. Because he was very open with me, and explained to me why he got involved with that crowd, and what was going on at the time.

So the sad thing is what are they doing to themselves, and what are they doing to their children, with this idea of whiteness, this idea of pure, this idea of what it is to be British is so ... I mean there's lots of nasty words you could call it... but ... it's just so limiting, it's not setting themselves free. That's the crazy thing. It's setting themselves up in a prison of their own making.

[nbox type="notice"] Sadia Habib is a doctoral candidate currently researching British identity at Goldsmiths, University of London. Prior to this she taught English at Key Stages 3, 4 and 5 in Manchester and London.[/nbox]

Shaista Khan (2014-08-13 11:04:09)
An excellent interview the government can try to control and dictate what should be taught and how it should be taught but to what lengths.

Affy (2014-08-14 22:19:07)
I found this interview really fascinating, it makes you think so deeply about what it means to be "British". Thank you!

Angela Kennedy (2014-11-29 12:57:40)
This was a most interesting interview, full of nuanced insights by Benjamin: to the point I personally would use this as a teaching aid for students at undergraduate level (though I'd argue that it would be an effective resource as part of any 'learning about Britishness' in school). I do feel, however, that there were possible problems in how he categorizes gender inequalities and stratification generally, but perhaps especially in Britain. There sadly remains the myth that gender inequality and, crucially, 'jeopardies' from gender stratification, are at most minor in the UK, that women here are 'liberated'. But feminisation of poverty; violence against women; sexual 'colonisation'; unequal pay and career opportunities; and devaluing
of the caring labour women in which women are most often engaged are just some of the major ways in which women's lives, health, well-being and opportunities are endangered, every day, in the UK, whatever their age, class, race or ethnicity, health/impairment status, sexuality, body size, whether cis/trans/queer, or other form of stratification to which they are subject. It wasn't clear to me that Benjamin understood this, but this may have been an effect of a informal conversation where he had a lot of interesting and useful comments to make and that particular point got lost. On the other hand, I am often dismayed at how many men fail to check their male privilege, and I would hope this wasn't the case with Benjamin.

Hi Angela, Thank you for taking the time to read and comment. I would not use all the interview with school students, perhaps only some sections. I love the idea of using at undergraduate level. Regarding Benjamin’s comments on gender inequalities/stratification, I too hope (and think) he was not neglecting the importance of it, I think like you said in the conversation, his mind was probably consumed by so many different angles/aspects of Britishness, that sometimes some points were not fully elaborated upon. I would like to think he does check his male privilege. Would you be able to let me know which particular statement(s) struck you as problematic, and maybe if I am able to, I can ask him to clarify. Thank you again.

Angela Kennedy (2014-11-30 16:56:37)
Hi Sadia, thank you very much indeed for discussing this with me. The comments I was concerned about are these: "I think the mainstream are trying to portray Britain as civilised, as opposed to those Muslims and those other people who have really negative views on women and so on. I don’t say women are living the best of situations in some parts of the world, I know there are issues, but the idea that the western woman is completely liberated, especially the British woman, and so we need to go out there and civilise these people." Obviously this was part of an oral conversation - where syntax and sentence construction is a lot different from written, so it may very well be that what I’ve tentatively interpreted is not what Benjamin meant. It looked to me that he was (possibly) accepting the notion that ‘the western woman is completely liberated, especially the British woman’ and that his problem was with a notion that British women’s liberation needed to be ‘spread’ towards the ‘uncivilised’. But I do accept (and hope) that it is completely possible he was problematizing the whole notion that British women are somehow ‘completely liberated’ and living in ‘the best of situations’. It would be good to get that clarified.

[...] A Conversation with Benjamin Zephaniah on Britishness [...]
There is no deadline for submissions. The idea is to create a living resource which grows over time, highlighting sociologists who haven’t received the recognition you believe they deserve and encouraging debate about the history of the discipline and what it means to have made a contribution to it.

All submissions should be 1000-3000 words and include a suggested image that is licensed for reuse. References should be included at the end of each post in a briefly annotated form, with the intention of sign posting an interested reader keen to navigate a body of work they had previously been unfamiliar with. Please include a 100 word first-person personal biography with submissions.

E-mail mark@markcarrigan.net to contribute an article or discuss a potential contribution.

Big Data and the Future of the Social Sciences (2014-08-15 08:00)

In this podcast, [1]Professor Patrick Dunleavy talks about how big data will affect the future of the social sciences. Say goodbye to academic siloes as we enter into a new age of cross/multi/and inter-disciplinary research. In this changing landscape, the old boundaries between physical, social and data science disintegrate. Here Professor Dunleavy talks about the Social Science of Human-Dominated and Human-Influenced Systems given as part of the Annual Lecture series at the Academy of Social Sciences.
An introduction to blogging and twitter for social researchers (2014-08-16 08:00)
Given the increasing pressure to demonstrate the impact of social research, it is inevitable that researchers are looking towards the opportunities offered by social media. This one day course offers an accessible introduction to the use of blogging and twitter, encompassing the possibilities they offer for social researchers and walking you through best practice.

You will learn through a combination of presentations, informal discussions and practical sessions, including pre-course reading.

Course content covers:

- An introduction to blogging
- An introduction to twitter
- Making an impact with blogging and twitter
- Integrating blogging and twitter into your working life

Who is it aimed at?

This is an entry level course, which assumes no familiarity with blogging or twitter.

You will find this course useful if you:

- conduct social research
- have responsibility for impact and public engagement
- communicate findings to policymakers and practitioners

Learning outcomes:

By the end of the programme you will be able to:

- understand the characteristics of blogging and micro-blogging
• get started in a practical and engaged way with Twitter and WordPress formulate your own strategic plan to use these services effectively

• connect effectively with others online in a way which serves these ends measure the impact of your online engagement

• participate enjoyably in the emerging academic blogosphere and twittersphere

Call for contributions: An Alternative History of Sociology (2014-08-17 08:00)

This [1]open and web based project aims to contribute to a rethinking of the sociological canon and debates about the past and future of the discipline. Would you like to contribute to An Alternative History of Sociology? There’s more information [2]here about the project and its aims. Though it’s still in an early stage, we’d be interested in receiving:

1. Biographical accounts of historical figures
2. Narrative summaries of historical figures and their work
3. Narrative summaries of contemporary figures and their work
4. Personal accounts of the constraints of the sociological canon and the broadening of intellectual horizons
5. Analysis of the broader methodological and historical questions entailed by the project

There is no deadline for submissions. The idea is to create a living resource which grows over time, highlighting sociologists who haven’t received the recognition you believe they deserve and encouraging debate about the history of the discipline and what it means to have made a contribution to it.
All submissions should be 1000-3000 words and include a suggested image that is licensed for reuse. References should be included at the end of each post in a briefly annotated form, with the intention of sign posting an interested reader keen to navigate a body of work they had previously been unfamiliar with. Please include a 100 word first-person personal biography with submissions.

The Philosophy of Data Science (2014-08-18 08:00)

This is a series of interviews I’m conducting for the LSE Impact blog:

[1]

[2]Rob Kitchin: “Big data should complement small data, not replace them.”
In this first interview, Rob Kitchin elaborates on the specific characteristics of big data, the hype and hubris surrounding its advent, and the distinction between data-driven science and empiricism.

[3]

[4]Evelyn Ruppert: “Social consequences of Big Data are not being attended to”
For the second interview, Evelyn Ruppert discusses creating an interdisciplinary forum to analyse the major changes
in our relations to data, as subjects, citizens and researchers.

[5] Deborah Lupton: Liquid metaphors for Big Data seek to familiarise technology
Deborah Lupton talks about how sociologists are involved in making sense of and positioning big data. Also of interest to social researchers are the nature metaphors used to discuss data, such as ‘flows’ and ‘flood’

[6]

[7] Susan Halford: “Semantic web innovations are likely to have implications for us all”
Co-director of the Web Science Institute, Susan Halford underlines the necessity of broad interdisciplinarity as well as further technical training to engage in depth with the web as it evolves in different ways.

More to follow soon!

Self-tracking and social control: what would techno-fascism look like? (2014-08-19 08:00)

Earlier this week I finally bought the Jawbone Up24 after weeks of deliberation. I’d got bored with the Nike Fuel Band, losing interest in the opaque ‘fuel points’ measurement and increasingly finding it to be an unwelcome presence on my wrist. I’d also been ever more aware of how weird my sleep patterns have become in the past couple of years,
cycling between rising early and staying up late, with little discernible rhyme or reason. The idea of tracking my sleep in a reasonably accurate fashion, using degree of bodily movement as a cipher for the depth of sleep, appealed to me on a reflexive level. Somewhat more practically, the Jawbone’s silent alarm sounded great: it gently wakes you by vibrating on your wrist at the period within a defined interval at which it detects you are in the lightest state of sleep. It’s only been a few days but it really seems to work. I’ve woken up refreshed in a way that feels oddly natural given the rather novel consumer technology that’s bringing it about.

So thus far I’m rather pleased with this purchase. It also looks so much better than the Fuel band. It wasn’t a major factor in my decision by any means but it’s still nice. However there is something that bothers me about it. The Jawbone Up24 has an “idle alert”. This is how the company describes the feature:

What is an Idle Alert and how does it work?The UP Idle Alert is a great way to remind you to get up and move. You can set an Idle Alert within the app, so the band will gently vibrate if you’ve been inactive for a period of time.

This sounds innocuous, right? I spend far too many hours sitting down each week. I’m either working on a computer and sitting in a chair or I’m sitting reading sociology books and papers on my sofa. It has really started to bother me and the idle alert initially struck me as a great way to help ameliorate this problematic trend in my lifestyle. I spent yesterday afternoon working my way through various bits of social theory at home, with the Jawbone gently vibrating
every 15 minutes to remind me that I’d been sedentary for that length of time. I stood up, walking around the room while continuing to read and sat down again. It’s only one occasion so it would be a mistake to overgeneralise but I was struck by how much less lethargic I felt than I often would have after spending an afternoon reading at home on my own. Oddly I also forgot to drink coffee, though it’s entirely possible that was a coincidence.

However I spent this morning struggling to copy edit and format an upcoming book when I really wasn’t in the mood for it. I was trying to decipher the superficially helpful instructions provided by the publisher which were, in practice, anything other than helpful. A task that had seemed simple, albeit dull, suddenly acquired an unexpected complexity. I spent the morning getting increasingly stressed out and the Jawbone would not stop fucking vibrating…. oddly it didn’t occur to me to just turn the feature off until after lunch. The constant buzzing on my wrist, as the little device grappled for my attention in a manner that felt creepily agentive, only served to intensify my general state of irritation at the world and frustration with my lack of progress at the task at hand.

I set the ‘idle alert’. I did so because I found it an appealing idea. It was an expression of my own agency. But it left me with a sense of quite how intrusive and aggressive this technology could be if it were ever mandated. How hard is it to imagine a situation where Amazon factory workers are expected to wear similar bands, programmed to issue a vibrating warning after 15 minutes of idleness and to alert the supervisor if the worker is still idle a few minutes later? Is it at all challenging to imagine a comparable band with an RFID chip being used to track and sanction a call centre operator who spends too long in a toilet? The social arrangements invoked here are not a matter of dystopian science fiction. They already exist. My suggestion is that this technology very likely will be rolled out in such settings, at least in the absence of legislative intervention which seems unlikely. How far could it go? What will a debate about its implications look like? What role will voluntary self-trackers and the quantified self play in these debates?

As Emmanuel Lazega has argued, ironically in one of the chapters I was editing this morning, the *conditionality of welfare* is likely to be an important vector of diffusion for these techniques of control. Earlier this morning, enjoying a relaxed start to the day at the crack of dawn thanks to the silent alarm on my magical band, I listened to a radio discussion of ‘sobriety tags’:

People who repeatedly commit alcohol-related crime will be forced to wear ankle tags that monitor whether they are still drinking, under a year-long pilot scheme.

The “sobriety tags”, to be worn around the clock, will enforce abstinence by measuring a person’s perspiration every 30 minutes and testing whether it contains alcohol.

If any trace is found, an alert will be sent to the offender’s probation officer and they can then be recalled to court, where they may be resentenced or face sanctions such as a fine. The tags register alcohol consumption but do not monitor movement or where people are.

The scheme is being trialled for 12 months in four London boroughs – Croydon, Lambeth, Southwark and Sutton. It is anticipated that up to 150 offenders will be fitted with the tags. They will be banned from drinking alcohol for up to 120 days.

Offenders will be screened before being tagged, and the scheme will not be used on people who are alcohol-dependent and require specialist support.

The scheme, being introduced by the mayor of London, Boris Johnson, builds on a similar scheme in the US and aims to reduce alcohol-related reoffending and ease pressure on the police and courts.
Consumer self-tracking devices and schemes like this serve to normalise tracking of this sort. What comes next? How hard is it to imagine a situation where a Conservative government, eager to separate 'strivers' from 'skivers' demands that welfare recipients submit to monitoring of their alcohol and nicotine intake? How hard is it to imagine a situation where recipients of weight related interventions on the NHS are made to wear activity tracking bands with the threat of withdrawn rights to healthcare in the case of unhealthy eating or sedentary lifestyles? What comes next? Part of me wants to research this stuff, looking at the subjective meanings attached to self-tracking as the devices become mainstream and analysing the assumptions loading into the emerging discourse surrounding the application of this technology for social policy. Part of me wants to write a dystopian science fiction novel about the coming techno-fascism. Part of me just wants to despair about a likely future in which the iron cage becomes an iron straight jacket.

Deborah Lupton (2014-08-19 09:47:38)
You’re right, Mark, these coercive uses of self-tracking devices are already in place. Heart-rate monitors are being introduced into school physical education to ensure that students don’t slack off when they should be reaching a certain exertion level. Corporate wellness programs in the US encourage workers to be physically active or face higher health insurance premiums, while car insurers are installing devices in customers’ cars to measure their driving practices and customise their insurance premiums accordingly. Virgin Pulse offers a package to employers of tracking devices that monitor not only employees' progress towards achieving a certain fitness level or losing weight but also their sleep patterns, because well-rested and fit workers are productive workers (according to their website). The list goes on ...

Sociological Imagination (2014-08-21 11:52:20)
Look forward to talking to you about this in person in January - I’d love to commit to looking at as many case studies as I can find at the moment, unfortunately I’ve committed myself to a load of stuff I need to get out of the way first. It seems there’s a lot of important work to be done simply in mapping the proliferation of these cases, let alone working out their theoretical and political implications.

Danal Estes (2014-09-09 17:06:57)
State enforced, or employer enforced, use of tracking technologies deserves much debate. However, Mark, you may have picked a very poor example by involving Alcohol, and particularly when the device is applied to people who have been convicted of alcohol related crime, multiple times. It is quite simple: Alcohol abusers are a hazard to society. Alcohol abusers kill random
human beings on a regular basis. Once again, I support your basic premise, tracking/monitoring/surveillance deserves a great deal of discussion. Therefore, please consider restricting yourself to examples that are more clearly invasive toward the broad spectrum of 'baseline' society. Attempting to garner sympathy for multiply convicted criminals, who are clearly a hazard to society at large, weakens your case. Thanks for the consideration, Danal

Sociological Imagination (2014-09-10 13:50:57)
"Attempting to garner sympathy for multiply convicted criminals, who are clearly a hazard to society at large, weakens your case" Not what I was doing! It was just the most recent example I'd heard. Feel free to ignore...

Danal Estes (2014-09-09 17:08:07)
"oddly it didn't occur to me to just turn the feature off until after lunch." Even more odd that you didn’t just take the annoying thing off! :-)

In Defence of Obama’s Handling of Ferguson (2014-08-19 09:32)

I have been struck by the on-line antagonism to US President Obama’s relatively muted response to the civil unrest in Ferguson, a suburb of St Louis, Missouri, which followed the shooting of a black youth by a white police officer. [1]Some people on the Left who rightly believe that the Civil Rights Act (celebrating its 50th anniversary this year) hasn’t completely succeeded in healing racial tensions, also seem to believe that Obama should leverage his Blackness into the situation – as if this were the sort of thing promised by the election (twice) of Obama as the first Black president of the United States.

As it stands, Obama has been quite understated – indeed, more understated than his response to the ongoing crisis in northern Iraq, which as of this writing has been scaled up from humanitarian to military aid. Obama’s most direction action in the Ferguson case has been to dispatch the US Attorney General (also Black) to sort out the legalities of the situation, especially after the state governor questioned the judgement of the local police force in releasing CCTV footage of the shot youth robbing a convenience store earlier.

The negative response by some on the Left to Obama’s approach strikes me as borderline racist, however well-meaning. Whatever one wishes to say about the United States, its Constitution is very explicitly constructed to be a government of ‘laws not men’. Moreover, the Constitution’s design delegates considerable authority to locally elected and appointed officials. That’s what ‘federalism’ means. Indeed, the Constitution enables the President to intervene more easily in foreign affairs (in defence of the nation’s interests) than in local affairs (where the President has no presumptive authority unless the Constitution is explicitly violated). While it’s understandable that non-Americans might not get what Obama is up to here, it’s not clear why well-educated people on the Left don’t get it.

But I think it would be doing Obama a further injustice to think that he doesn’t care about what’s going on in Ferguson. Rather, my guess is that he doesn’t want to dignify historically entrenched symbolism of standoffs between white police and Black residents. Obama may be Black but he is not a Black leader, unlike Al Sharpton and Jesse Jackson, who have quite justifiably come to Ferguson to stand up for the community. Obama’s role is quite different and he knows it very well: He stands for a standard of justice upheld by the US Constitution. The laws are already on the books protecting the rights of Black people. The problem is whether they have been enforced properly in this situation. The presence of a President who happens to be Black in the situation would effectively cast aspersions on the validity of the laws themselves, rather than particular people who may have broken them, who of course should be brought to justice.

Alistair Duff (2014-08-19 14:25:16)
Interesting remarks. But I beg to differ. It is a national situation and demands a presidential lead. Cf. Kennedy in the ’60s. My own view is that Obama is generally weak. He did not have the guts to deal with the torturers of the previous administration; and he has not responded firmly enough to Putin’s Hitler-style conduct in Ukraine, the biggest political challenge of this generation, bigger than Iraq, and the one by which, I fancy, history books will judge him, Cameron, the Dutch prime minister, Merkel, etc, etc.

What will neo-neoliberal ideology look like? (2014-08-20 08:00)

Do you remember compassionate conservatism? It seemed vacuous when promulgated by George Bush pre-9/11 and even more so when David Cameron was going through his ‘hug a husky’ phase pre-crisis. It still seems vacuous now, at the point of its purported resurgence, though much more interestingly so given the broader ideological context within which an increasing number of influential figures within the Republican party are advocating its embrace as a solution to their growing electoral woes. In essence, it still seems to amount to a matter of ‘how do we get people to like us?’ but I think this question takes on an epochal significance in our current situation. Rather than solely being a matter of professional politics, with conservative modernisers seeking to catch up to their third-way predecessors on the centre-left, it comes to encompass an ideological project to rebuild a constituency for neoliberalism as the old one is coming to shatter (particularly demographically in the US), the spectre of populism looms and the prevailing ethical motif of the Thatcher-Reagan settlement (“a rising tide lifts all boats”) comes to seem like a hollow joke.

In this interesting podcast Bill Moyers debates compassionate conservatism with [1]Arthur Brooks, president of the American Enterprise Institute. Leaving aside the noxious absurdity of hearing the president of a hugely influential think tank backed by the richest people and most powerful corporations in America complain about corporate power in Washington, it’s actually quite interesting to hear what he has to say and to use this as a basis to consider the future contours of ideological debate in the US. The think tank system in effect takes responsibility for road testing ideological constructs and providing the intellectual infrastructure for class politics in the country. So I think it’s important to take seriously what this man has to say, without slipping into a lazy conspiratorial mindset which assumes that just because he says it, it’ll be taken up as an organising motif by the Republican party for the next election. But he’s putting forward an ideational construct and seeking material sponsorship for it.
It’s partly a critique of the left, accusing it of monopolising the debate surrounding poverty while offering non-solutions that only serve to harm the people they purport to help. It’s partly a critique of the right, repudiating the quasi-technocratic discourse of the free market right that his own organisation did more than most to promote in American politics. It’s partly a reiteration of tired and familiar themes that serve to illustrate the intellectual vacuity of contemporary conservatism. However I was struck by how coherently it combined the tropes of compassionate conservatism (we need to take hard working families out of the tax system, enthusiastically supporting the safety net for the ‘truly poor’, invocation of a renewed philanthropy and public spiritedness) with the influential notion of Austrian origin that the problem is that contemporary capitalism is not capitalist enough. It’s not convincing because the coherency is only superficial, necessitating the suppression of the obvious structural link between how capitalist contemporary capitalism actually is and the communitarian values that are being sought, as Moyers astutely observes in the case of the Walton family. But I find it hard to see another strategy that can sustain a constituency for the Republican party in the medium to long term and voter suppression can only go so far in the face of a changing country in which angry white men are an increasingly particular demographic group. The worrying thing is that the Democratic political machine is sufficiently spineless that, in the absence of someone like Elizabeth Warren running, it’s easy to see how the disciplined advocacy of this neo-neoliberalism could actually rob the opposition of any critical standpoint from which to make a case for even minute social change.

There’s a lot of nice responses to this which have been posted on the Bill Moyers website but this is my favourite. You can read the rest of them [3]here. It probably goes without saying that I disagree with everything Arthur Brooks says, not least of all his appropriation of the Dalai Lama as a free market capitalist. But I’m sufficiently interested to read further. I guess my fear is that the glaring holes in his argument are ones which can only be pointed out on the basis of causal inference e.g. clientism and rent seeking are consequences of the principles he embraces rather than exceptions to them, unemployment is generated in part by the accumulated power he gets paid $700k per year to defend etc. The contemporary media environment makes it hard to make arguments of this sort in a sustained way.
“Pure Chutzpah”

People, like Arthur Brooks, who proclaim that money can’t buy happiness usually have both. In 2012, Brooks earned $716,908 in total compensation from his American Enterprise Institute position alone. It’s nice that Brooks says that US poverty and inequality are too high, but, in this interview, he again indicates that he opposes every policy that actually reduces them. His claim that minimum wage increases kill jobs has been factually disproven repeatedly. It would be bad enough if he admitted that he opposes wage hikes because they harm his corporate funders, but it’s pure chutzpah to claim that they harm the people who get higher wages.

I also wonder about the potential alliance between a mainstream compassionate conservatism of this form and a populist radical right. Could the ‘moral reformation’ that Brooks calls for be invoked rhetorically against the radical right at opportune moments while nonetheless serving to solidify a ‘small government’ alliance? Would the Tea Party accept this way of talking? I suspect so if the distinction between welfare dependents and the ‘truly poor’ is drawn carefully enough and the proposed solutions to the plight of the latter are presented as a matter of working towards the remission of state intervention rather than entrenching it. The problem is how you sustain this given the inevitable need for some intervention. Compassionate conservatism would come to look a little implausible if support is withdrawn entirely, with all the social consequences that would ensue from this.
The artistic opportunities afforded by self-tracking technology (2014-08-21 08:00)

A lot of work went into these – [1]running drawing. (HT Kirsty Lohman)

Another long run completed. Photograph: Running Drawing/Claire Wyckoff

by Patrick Ainley
When Eric Hobsbawm asked in 1978 whether the forward march of labour had halted, he was calling attention to a possible political reversal, not bidding Farewell to the Working Class as Andre Gorz did two years later. More recently, drawing heavily on Gorz, Guy Standing in 2011 proposed the birth of The Precariat, a 'dangerous new class' growing alongside the dwindling proletariat, while in the same year Owen Jones suggested that the entire English working class had been turned into Chavs (2011). Both books reviewed [2]here on SI.

The subtitle of Selina Todd’s history poses the same existential question which she pursues as a personal quest: 'It began as my attempt to find out about the history of one family – my own’ (p.2) and she revisits the classmates of ‘her large, socially-mixed comprehensive school’ in Newcastle-upon-Tyne ‘as they prepared to turn forty’ (p.356) to include their experiences among the many oral histories and other testimonies and sources expertly crafted into her collective narrative. All these witnesses are bound together by episodes in the life of ‘rags to riches and back again’ pools winner, Viv Nicholson, as ‘a fable for her generation’ (p.316): ‘Back in the 1960s, it had seemed like working-class life was on an upward trajectory... But by 1977 that certainty had been replaced with insecurity, fear and bewilderment about the future...’ (p.317)

Where Selina Todd takes this argument makes her very full history a real page turner. Her thesis is ‘The years between 1910 and 2010 were the working-class century [when]... most Britons came to understand themselves to be working class... specifically during and after the Second World War the working class became “the people”’ (p.1). Consequently, ‘as factory work eclipsed domestic service as the country’s largest employer... working people came to see themselves as a collective force – a class’ (p.121) and were recognised by politicians and the press as being ‘the backbone of the nation, on whose labour Britain depended.’ (p.121) In addition, ‘A growing number of people called themselves working class, or saw their interests as being synonymous with those of working-class people. They included many first-generation white-collar workers, and many public sector employees like teachers, who benefitted from the post-war welfare state.’ (p.361) The 1939-45 People’s War ‘marked one of two major turning points in the twentieth century, heralding a period of full employment and comprehensive welfare provision that was only brought to an end by the second turning point: the election of Margaret Thatcher to government in 1979.’ (p.120)

The chapter titles ‘New Jerusalems’ and ‘Communities’ emphasise the varieties rather than the equality of this experience for ‘Most politicians had little interest in making Britain a more equal society.’ (p.120) Instead, Attlee’s government pursued meritocracy through ‘equal opportunities’, a slogan that Thatcher was to translate into ‘opportunities to be unequal’. Politicians of all parties ‘accepted that profit-making and the people’s welfare were ultimately irreconcilable... Faced with the choice, they chose loyalty to industrialists, businessmen and financiers...
united in viewing working-class power as a threat to democracy rather than being a prerequisite of it.' (p.314) So the working class were ‘the beneficiaries but not the architects, of social welfare.’ (p.120-1)

Labour’s ‘social contract’ offered welfare for labour (p.158). When this contract began to deteriorate, ‘Rising unemployment and economic insecurity had exacerbated people’s desire to exert more control over their lives, but the collective approach to achieving this – through trade unionism, women’s groups and tenants’ campaigns – had apparently failed.’ (p.314) Thatcher ‘promised to give voters the control over their own lives that Labour had failed to deliver… predicated on the myth that everyone could exercise equal choice in a free market.’ (ibid) Economic and political rights became attached to individuals rather than to groups but ‘This did not address the economic and political subordination that working-class people shared as a result of their relationship to production: their need to labour for a living.’ (p.295) ‘Like Labour in 1945, Margaret Thatcher presented a vision of a society where class background did not matter. Unlike Attlee’s Labour Party, she proposed that this would be created by the free market and competition, rather than through cooperation.’ (p.319)

It is now clear where Selina Todd’s quest is leading; the working class has never gone away. ‘Superficially my classmates epitomized Britain’s transformation into a middle-class, if not classless, society.’ (p.346) But ‘their non-manual occupations could not disguise a shared sense of powerlessness’ (p.349). This because, again, ‘Class is not determined by a person’s level of income’ or whether or not they work with their hands or their brain, ‘but by their power – primarily their economic power.’ (p.358)

The middle class also lack economic power but ‘The top-down nature of Labour’s reforms... emphasized a distinct role for the educated middle class,... reinforcing the notion that the middle class was a distinct social group entitled to special treatment’ (p.168) and fraying the alliance of ‘workers by hand and by brain’. There is a nod here to Bourdieu’s Distinction, especially when Todd adds ‘class implicates and confines everyone, and the middle class was, then as now, largely preoccupied with the hard work, effort and self-interest that maintaining and reproducing... privilege in a class society requires.’ (p.364) But for Bourdieu the middle class rely on cultural capital because they lack economic capital. This makes education crucial, especially for the limited upward social mobility from the manually working class to the expanding non-manual middle class during ‘The Golden Age of the Grammar Schools’ as Todd ironically heads her chapter ten.

Now that limited upward social mobility has been reversed into general downward social mobility, widening participation – to higher education this time – again ‘symbolizes a better life tantalizingly out of reach.’ (p.361) Only now there is no floor for the class of professionals and administrators to stand on as new technology is applied further up the employment hierarchy proletarianising the professions while promising to professionalise the proletariat. This leaves those in the middle desperately running up a down-escalator of inflating qualifications to avoid falling into the structural insecurity beneath because, especially since 2008, numbers in low-paid, insecure and often part-time jobs have ratcheted up to include perhaps half of new entrants to employment.

No wonder that ‘by 2010, people were less likely to see class and inequality as a means of making sense of their circumstances.’ (p.355) So much so that ‘race and immigration have become the only acceptable frames within which white working-class people can talk about inequality.’ (p.354) ‘Some people blame “scroungers” or immigrants for their difficult circumstances, some blame their middle-class neighbours – but more blame themselves.’ (p.356) ‘Others viewed “working class” as a socially stigmatized term that was increasingly interchangeable with “underclass”’. (p.358)

Nevertheless, in epilogue Selina Todd recognizes: ‘being working class has come to matter once more because of the return of massive insecurity, for professionals as well as waged workers, and for home owners as well as tenants.’ (p.365) ‘The existence of class always testified to pervasive inequality. But it also suggests that some things have been lost: primarily, a vision of life based on co-operation and camaraderie, rather than on fighting your way to the top. In learning from their history, we can begin to imagine a different future.’ (p.366)
Patrick Ainley’s latest publication with Martin Allen is *Another Great Training Robbery or a Real Alternative for Young People? Apprenticeships at the start of the 21st century* available as a free download from the [3]radicaledbks website!

The need for a sociology of thinking (2014-08-23 08:00)

How much time do you spend talking to yourself? If you put the question this way, it often makes people uncomfortable. An alternative phrasing: how much time do you spend engaged in “directed conscious thought”? This is what Tim Wilson et al investigated in a [1]new paper published in Science. It’s exactly the sort of work I’m looking forward to engaging with when I start my sociology of thinking project later in the year:

The ability to engage in directed conscious thought is an integral part—perhaps even a defining part—of what makes us human. Unique among the species, we have the ability to sit and mentally detach ourselves from our surroundings and travel inward, recalling the past, envisioning the future, and imagining worlds that have never existed. Neural activity during such inward-directed thought, called default-mode processing, has been the focus of a great deal of attention in recent years, and researchers have speculated about its possible functions ([2]1–[3]5). Two related questions, however, have been overlooked: Do people choose to put themselves in default mode by disengaging from the external world? And when they are in this mode, is it a pleasing experience?

Recent survey results suggest that the answer to the first question is “not very often.” Ninety-five percent of American adults reported that they did at least one leisure activity in the past 24 hours, such as watching television, socializing, or reading for pleasure, but 83% reported they spent no time whatsoever “relaxing or thinking” ([4]6). Is this because people do not enjoy having nothing to do but think? [5]http://www.sciencemag.org/content/345/6192/75.full

Much psychological research has tended to investigate the role of external distractions in interrupting introspective activity. However Wilson et al contest that "it is surprisingly difficult to think in enjoyable ways even in the absence of competing external demands". My problem with time use surveys as a method for investigating this is that it conflates internal conversation with making the time for internal conversation. The former is so ubiquitous that it often escapes our notice and failing to make time for it doesn’t mean that we don’t do it. In fact I’d suggest making time for internal conversation reflects a certain mode of orientation towards one’s inner life that is much more strongly evidenced in some people than others. Furthermore, considering the social conditions propitious towards time for reflection immediately places us within the sphere of sociological questions of autonomy, power and labour that represents one of the main contributions that Sociology can make to the study of thinking. Unless we sustain
a strong distinction between internal conversation as a ubiquitous activity and the recognition & valuation of one’s
own internal conversation (so as to attempt to make time for it etc) these important ‘internal’ and ‘external’ issues
start to look a lot murkier and less susceptible to investigation. This is by no means a dismissal of their empirical
value, rather a simple note of caution about how they are interpreted.

That said I like the way the two questions are articulated:

Do people choose to put themselves in default mode by disengaging from the external world?

And when they are in this mode, is it a pleasing experience?

I just think there’s a sociological complexity to them which the authors, entirely understandably, don’t acknowledge
in this paper. My favourite representation of the pleasure of ‘disengagement’ comes from the Simpsons. Here it
is presented as a soothing retreat from the world, tuning out external demands as Homer becomes mesmerised
by the monkey ‘in’ his head. Eventually his reflexivity kicks in and the monkey tells him to attend to his circumstances:

However what happens if the monkey isn’t willing to offer direction? I do think that there are many forms of retreat
which constitute escapism, with soothing rituals or incantations (or narcotics) serving to dull the incessant demands
of our circumstances and offer us temporary relief from the necessity of responding to them. However it’s the
necessity of responding, the fact that daily life throws up continual challenges about what to do and how to do it,
which is what makes internal conversation so charged and so challenging. It’s draining to make decisions all the time (and this is another area that’s spawned a vast psychological literature I want to engage with properly) and the intensity of this imperative to make decisions is historically variable and sociologically complex. This is the second major contribution that Sociology makes to the study of thinking – the (re)introduction of historical change and the macroscopic context and, with this, an awareness of the divergent forms of agency which have emerged within that context, been shaped by it and contributed to shaping it. That said, I found the experimental results really interesting:

To address these questions, we conducted studies in which college-student participants spent time by themselves in an unadorned room (for 6 to 15 min, depending on the study) after storing all of their belongings, including cell phones and writing implements. They were typically asked to spend the time entertaining themselves with their thoughts, with the only rules being that they should remain in their seats and stay awake. After this “thinking period,” participants answered questions about how enjoyable the experience was, how hard it was to concentrate, etc.

[7] Table 1 summarizes the results of six studies that followed this procedure. Most participants reported that it was difficult to concentrate (57.5% responded at or above the midpoint of the point scale) and that their mind wandered (89.0% responded at or above the midpoint of the scale), even though there was nothing competing for their attention. And on average, participants did not enjoy the experience very much: 49.3% reported enjoyment that was at or below the midpoint of the scale.

[8] http://www.sciencemag.org/content/345/6192/75.full

I was initially very sceptical about Margaret Archer’s argument that portable music, so as to effectively provide a soundtrack to your life, reduces the time available for internal conversation. Until I persistently interrogated my own experience & realising that I could see her point – music often intensifies my inner experience but erodes its directedness, I think and feel more but I don’t tend to have sustained internal conversations in the way I often do when I’m not listening to music on headphones. She makes a similar argument about social networking. Again, I’ve been initially sceptical but I’m gradually proving more open to the idea, largely because I can see using these sites can be compulsive (”I’ll just quickly check Twitter”) and that compulsions can often serve the same purpose as the monkey in Homer’s head, helping us tune out the demands the world is placing upon us and the intensity of our relation to them. However the findings of this study don’t support this and they also challenge the broader theoretical claim about the social diversity of human reflexivity:

To see whether the difficulty with "just thinking" is distinctive to college students, in study 9 we recruited community participants at a farmer’s market and a local church. The participants ranged in age from 18 to 77 (median age = 48.0 years). As in study 7, they completed the study online in their own homes, after receiving instructions to do so when they were alone and free of any external distractions. The results were similar to those found with college students. There was no evidence that enjoyment of the thinking period was related to participants’ age, education, income, or the frequency with which they used smart phones or social media (table S2).

[9] http://www.sciencemag.org/content/345/6192/75.full
Teresa Culverwell (2014-10-18 11:15:07)
Question is - what about over thinkers (like me)? Or those who have information overload? It's like hoarding on a grand scale. Why does this happen, and why does it happen to some while not to others who seem to sift out a lot and leave just the bare bones - I need it all!!! Does OCD influence this overloading, even if that OCD relates to other things (but mostly information and paperwork in my case) And why can it finally reduce some to nervous wrecks unable to work out how and where to file "F"?

Could you see over thinking as an inability to bring internal conversations to a close? There's lots of things in your life which prompt you to start thinking but you've not developed triggers which get you to stop?

CfP: The Sociological Craft Project (2014-08-24 08:00)
In this new feature the Sociological Imagination invites short (2500 word max) contributions reflecting on any aspect of sociological craft. We use the term 'craft' in the broad sense conveyed by Richard Sennett:

Craftsmanship names an enduring, basic human impulse, the desire to do a job well for its own sake. Craftsmanship cuts a far wider swath than skilled manual labour; it serves the computer programmer, the doctor, and the artist; parenting improves when it is practiced as a skilled craft, as does citizenship. In all these domains, craftsmanship focuses on objective standards, on the thing in itself. Social and economic conditions, however, often stand in the way of the craftsman's discipline and commitment; schools may fail to provide the tools to do good work, and workplaces may not truly value the aspiration for quality. And though craftsmanship can reward an individual with a sense of pride in work, this reward is not simple. The craftsman often faces conflicting objective standards of excellence; the desire to do something well for its own sake can be impaired by competitive pressures, by frustration, or by obsession.

We envision a number of forms such contributions might take:
• Reflections on particular academic roles (e.g. [1] review editor).
• Reflection on the process of writing for particular forms of publication (e.g. journals, monographs, logs)
• Reflections on the craft of research (the tools utilised, your relationship with them, the messiness of the process)
• Reflections on where you work, the devices you use, how the ambiance shapes your writing
• Reflections on undertaking research, managing time, negotiating conflicting demands.
• Reflections on routines and writing practices which are integral to your craft
• If you were brave enough to send us a picture of your workspace we’d love to include it!

However these are only examples. We’re keen not to get posts of the style “10 Tips for Writing Good Journal Articles”. We have nothing against these posts – we often feature them! But this project aims to generate a discussion of the craft of sociological work, the practices which sustain it and the emotional life and personal concern which are irrevocably bound up with it. We are particularly interested in contributions that explore the constraints that contemporary academic structures place upon the creative exercise of sociological craft and how we can, hopefully, work towards ameliorating these circumstances.

If you want to submit a contribution for the project then please e-mail it to mark@markcarrigan.net attached as word document (with any multimedia files attached separately) along with a short 2 line bio to accompany your post.

Rikke Toft Noergaard (2014-08-25 16:44:55)
Dear Sociological Imagination This looks really great and just down my alley - I would love to write a piece :-) However, I cannot see the deadline for contributions? Nor can I see wether contributions are peer-reviewed / published and other such practical matters Kind regards, Rikke Toft Noergaard Assistant professor, PhD, Aarhus University, Denmark

Sociological Imagination (2014-08-25 18:46:34)
Hi Rikke, there's no deadline for contributions and they're not sent out for peer review. I'm not sure what you mean by 'published'? To be clear: the call for papers is for the blog, not for a journal issue. I should probably stop writing 'cfp' to avoid confusion in future.

Creative Methods in Gender, Sex and Relating (2014-08-24 14:56)
This upcoming event at Coventry University looks great. It's the latest instalment in a series so I think there will be more to come even if you can't make this one.

Following on from the amazing Creative Methods in Gender, Sex, and Relating, held at the Open University and Manchester University, we are pleased to announce the next instalment at Coventry
Do you want to explore beyond well-used methods that reproduce established stories about sex, gender, sexuality and relating? Fancy yourself doing performance, bad sex writing or as a deep thinker, visual artist or ‘craftivist’?

Creative research methods can yield narratives different from and phenomenologically richer than interviews, focus groups and surveys. When doing public engagement and dissemination, creative methods can help people think differently about sex, gender, sexuality and relations/relating to challenge popular/media representations.

This free half-day event will encourage sharing of knowledge and experiences. It will explore among a host of other issues:

- creative writing around intimacy, desire, and sex;
- arts-based and performance practices;
- craft, activism and creative play to present narratives;
- tools for collaborative production.

Also starring the ‘bad sex media’ bingo card as a way of challenging problematic media depictions.

Booking for this event can be done here: [1]https://www.eventbrite.com/e/creative-methods-workshops-tickets-12634651583

The USA’s main Arab ally Saudi Arabia has created a monster in Isis (2014-08-25 08:00)

For anyone confused by the rise of the Islamic State of Iraq and the Levant and keen to learn more about the origins of the group, this short essay on Organised Rage is a good place to start:

The jihadists of IS and its antecedent groups initially rose to prominence in the vacuum left by the US-led invasion and occupation of Iraq. When the US toppled Saddam Hussein in 2003, they did not only purge the state apparatus of his Baathist allies, but they purged it of the entire Sunni minority of which Saddam himself had been a part. Most dramatically, large parts of the majority-Sunni army were disbanded, leaving tens of thousands of combat-savvy and frustrated young men without pay and without any meaningful influence on the new Shia dominated and US-backed political establishment in the country.

As was already obvious to many observers back then, the US invasion thus set the stage for a disastrous backlash. Many of Saddam’s former Sunni soldiers ended up joining the jihadist insurgency against the US occupation, giving Al Qaeda a new foothold in Iraq — a country where it had previously had no real influence to speak of. The bloody sectarian strife that subsequently broke out, killing hundreds of thousands of Iraqis and preparing the ground for further radicalization, was not the cause but the outcome of the destabilization of the Iraqi state at the hands of the occupying forces.

Meanwhile, as it brandished its anti-Shia credentials, ISIS received lavish financial support from one of the United States’ main allies in the region: Saudi Arabia. The other Gulf states, Qatar, Kuwait, the United Arab Emirates, are also implicated in directly or indirectly financing various extremist groups in Syria, including Jabhat al-Nusra, the official Al Qaeda affiliate in the country and second biggest faction after ISIS. But as one senior Qatari official affirms, “ISIS has been a Saudi project.” Patrick Cockburn, a long-term Middle East correspondent, notes that “Saudi Arabia has created a Frankenstein’s monster over which it is rapidly losing control.”

Given the United States’ historical support for extremist groups, most notably its sponsoring of the mujahideen in their struggle against communism in Afghanistan, which directly paved the way for the rise of the Taliban and Al Qaeda, it should not come as a surprise that, this time around, the US has also been directly involved in enabling the rise of ISIS. In fact, it turns out that leading US lawmakers, including Republican Senator John McCain, have been actively pressing their allies to support the Syrian opposition and oust Assad. “Thank God for the Saudis and Prince Bandar, and for our Qatari friends,” McCain exclaimed as as recently as February 2014. (Prince Bandar is alleged to be the Saudi point man behind the funding of ISIS.)

At the same time, another important US ally in the region, Turkey, a NATO member, has been a crucial hub for ISIS by deliberately opening its 500-mile border to allow Syrian rebels to fall back onto Turkish territory and to permit Western jihadists, alienated young Muslim men from Europe, Australia and the US, to join their comrades in Syria. Consistent rumors have been doing the rounds that the head of Turkey’s intelligence services, Hakan Fidan, a key confidante of Prime Minister Erdogan, was personally responsible for the country’s covert support for ISIS.

What’s particularly galling about this is how those now dominating the debate so shamelessly ignore the recent geopolitical context and their own role within it. Consider this video of John McCain, until recently so vocal in calling for support for the Syrian resistance out of which Isis emerged, lacerating Obama for a failure to understand
the 'nature of the enemy'. Having been told a decade ago that Iraq must be invaded because of the clear and present danger posed by Iraq, many of the same figures are now calling for a third invasion of Iraq in three decades to counter this [13]"apocalyptic" threat.

---

by Jim Kemeny

I still remember the large number of personnel needed to input and analyse data in the 1950s:

"Computers were giant mechanical assemblages, big enough to take up an entire warehouse, programmed in advance with punch cards. In 1961 the most powerful computer in the world was the mighty 36-bit IBM 7090, one of the new 'transistorised' mainframe computers that set back the owners to the tune of 2.9 million dollars and cost a thousand dollars an hour to run." Astronomy Now (Vol. 27 No. 5 p. 23 May 2013).

I worked with these at the time. These gigantic computers were housed in air-conditioned security. To use punch cards demanded two types of labour-power in what was a much more gender-segregated specialisation: a small group of (male) systems managers using pen and paper to write the programmes and a much larger (female) force for punching and inputing the Hollerith cards.

This type of data processing was, I felt, far too distanced from the research act, the collecting and sorting the data into simple yes-no answers using a knitting needle to shake out the number of cards with different combinations of responses. The more advanced this became the more alienating I felt it to be from "gathering" data. This, more than anything else, made me feel that the research process was potentially corruptible, just as Mills warned. He wrote about this in The Sociological Imagination, the appendix On Intellectual Craftsmanship (1970 Edition, Pelican pp. 217-218):
"One of the very worst things that happens to social scientists is that they feel the need to write of their 'plans' on only one occasion: when they are going to ask for money for a specific piece of research or 'a project'. It is as a request for funds that most 'planning' is done, or at least carefully written about. However standard the practice, I think this very bad: it is bound in some degree to be salesmanship, and given prevailing explanations, very likely to result in painstaking pretensions; the project is likely to be 'presented', rounded out in some arbitrary manner long before it ought to be; it is often a contrived thing, aimed at getting money for ulterior purposes, however valuable, as well as for the research presented."

From my own experiences in research this advice was very telling. It has become even worse as competition for funding becomes a factor in "grant capture".

Indeed, for me the most important part of The Sociological Imagination is the appendix: "On Intellectual Craftsmanship". In this, Mills conveys the sense of discovery and excitement that accompany the research process. He argues that sociological research is not an exact science but rather a craft in which a number of skills need to be deployed. He argues that the researcher’s personal life is an important mirror to enhancing research.

He goes on to make a number of very practical suggestions on how research can be made self-reflexive, using the sociological imagination in a two-step process. The first is using files of notes on books you have read (to both record the contents and reflect on them). Mills illustrates how this can be done with concrete examples from his own notes on Mosca. He then shows how such voluminous files can be drawn on to first explore then develop concepts and ideas to be taken further, cross-referencing between books, personal experiences, theories, concepts, ideas etc.

Mills illustrates this in an extended study of Mosca with his own research on elites, showing how he explored a range of ideas, experimenting with a number of conceptual frameworks and approaches, drawing on his files of notes and developing them.

The sociological imagination can be stimulated by rearranging the files in order to relate concepts and approaches in novel and unusual ways. This can lead to new classifications, polar types, reviews of previous books in a new light, and other innovative mental experimentations. In the pre-computer age that Mills was part of this involved using filing cards, but the technique is of course even more powerful using data technology.

The sense of adventure, enthusiasm and inventiveness Mills was able to convey for the maximum exercise of the sociological imagination together with his moral and political commitment, his comparative and historical perspective and his concern with contemporary issues and their relationship to individual life-worlds profoundly influenced the generation of sociologists who were students of his work.

This was a model for my own development as sociologist. Wright Mills died in 1962 while I was a first year sociology student. I began to keep records of ideas and references to what I felt was stimulating research as soon as I realised I might become a researcher. Mills begins with some very practical advice on keeping a folder containing detailed notes on important books. So I began to do just that, though I quickly realised that I would need several folders so I went over to index cards. computerisation came later, and so my collection of references and notes changed form as the years passed.

It also changed as a result of the simple fact of the passing of time. Mills’ advice on intellectual craftsmanship was written as guide to the young new generation of researchers, not as an attempt to set in concrete the methods of continual intellectual stimulation.

So my sets of index cards covering different subjects that interested me transmogrified into a number of com-
puter files using a word processor. The earliest data file was on “Accounts”. This is a list of publications in alphabetic order by author. The oldest entry in this file was the article published by C. Wright Mills "Situated Actions and Vocabularies of Motive" in the American Sociological Review 1941. The earliest symbolic interactionist entry was the article published by Marvin Scott and Stamford Lyman "Accounts" in the American Sociological Review 1968.

The most recent entry is an article by Cheryl Cook in Sociological Perspectives in 2009, which is the only one with an abstract, though ideally the abstract as a form of summary would today be almost universal.

So my experience has been that over the last 50 years since Mills died technology has changed and this is reflected in my research notes that also changed, resulting in an incomplete mixture of technologies that reflected computerisation. I still have some hand written index cards but also abstracts of articles copied from the internet. Since retiring ten years ago this mixture of index cards and copy-and-paste abstracts has slowed down in development, so I can see the result in growing gaps in my collections.

But I still read the appendix On Intellectual Craftsmanship for inspiration and for the sheer enjoyment of reading what for me remains the wisdom of the appendix of The Sociological Imagination.

Book Review: The Sacred Project of American Sociology (2014-08-26 07:51)

I approached this book with a certain degree of ambivalence, curious as to the hostility one of my favourite sociologists has seemingly provoked in many of its readers. As someone fascinated by the sociology of sociology, it was exciting to hear that Christian Smith had written a book of this sort, even if it sounded incongruously polemical and had led to some strongly critical reviews. For those not familiar with him, Smith has been a prolific sociologist in recent years, working on the sociology of religion and social theory: his recent work includes Moral Believing Animals: Human Personhood and Culture, What is a Person? and Lost In Transition: The Dark Side of Emerging Adulthood. He’s also become a leading advocate of critical realism in US sociology, alongside Phil Gorski, a position which came to the fore in a very public dispute on Org Theory last year.

His recent work represents an important and forceful contribution to the sociological dimension of critical realism, offering a philosophically sophisticated defence of the category of the person as integral to sociological inquiry.
I found What is a Person? to be an inspiring work, both in terms of its arguments but also the scope and ambition of the book. One of the best aspects of the book was the way in which it situated his argument in terms of the dominant strands within US sociology, fairly but forcefully critiquing them in a way which showed Smith to be deeply conversant with intellectual tendencies within the discipline. So a book entirely about those tendencies was an appealing prospect for me. However it’s a very different sort of book and I feel much more ambivalent about it than his other work.

His argument in the book is that American sociology is dominated by a ‘sacred project’, in the Durkheimian sense of sacred, orientated towards the amelioration of social problems and the ultimate transformation of society. Many diverse strands have contributed to this project, in a cumulative and uneven way, eventually leading to what he claims dominates US sociology at present: a “liberal-Enlightenment-sexually liberated-civil rights-feminist-GLBTQ-social constructionist-poststructuralist/postmodernist” complex. This cumbersome phrase is intended to indicate that this ‘sacred project’ “does not embody one single ideology or program” but rather constitutes “an unstable amalgam of variously accumulated historical and contemporary ideas and movements” (p. 8) with conflicts and compatibilities obtaining between them. Broadly speaking his point concerns the ‘moral unconscious’ of American sociology, to use Phil Gorski’s phrase from an endorsement blurb. There’s a rich and diverse history of American sociology which has complex and, in Smith’s view ambivalent, consequences for the contemporary state of the discipline that are rarely acknowledged. These sources don’t figure into the self-definition of sociology or of sociologists. These identities usually relate to what sociology does or how sociologists do this rather than why this activity is pursued. It is the animating force of the sacred that Smith believes accounts for the ‘why’ and he’s interested in recovering this and framing it in terms of the intellectual politics of contemporary sociology. But what is the sacred project? This is the most direct statement Smith makes about it:

American sociology as a collective enterprise is at heart committed to the visionary project of realising the emancipation, equality, and moral affirmation of all human beings as autonomous, self-directing, individual agents (who should be) out to live their lives as they personally so desire, by constructing their own favoured identities, entering and exiting relationships as they choose, and equally enjoying the gratification of experiential, material, and bodily pleasures. (p. 8)

Already the specificity of Smith’s claims about the sacred project seem to sit uneasily with his repeated caveats about the heterogeneity of both its origins and present condition. I found his argument most plausible when it takes a counter-factual form, asking what American sociology would be like in the absence of a sacred project: “Without this Durkheimian sacred project powerfully animating the soul of American sociology, the discipline would be a far smaller, drabber, less significant endeavour - perhaps it would not even have survived as an academic venture to this day.” (p. 8).

However I don’t think this establishes the character of the sacred project suggested by Smith. I think it highlights the existence of a moral unconscious, in the sense of animating purposes and commitments underlying the elaboration of a discipline, without which it would not and could not exhibit its developed characteristics. This is an important thing for us to discuss: why does sociology matter to people and how does this concern shape the discipline? But would anyone deny this category out of hand? It may be overlooked and there may be systematic social and intellectual factors accounting for this occlusion but I suspect most sociologists would accept the category of ‘personal motivation’ in principle, even if their methodological commitments lead them to circumscribe it in practice. Obviously Smith means much more than this in his invocation of the ‘sacred’ but I think you could minimally restate his core thesis without losing much of consequence: it’s about the structuring of personal concerns in the (re)production of disciplines, with the notion of a ‘moral unconscious’ (I think Gorski hit the nail on the head with this) being a potentially powerful way to make sense of both the motivation and the way it is structured.
Much criticism related to the alleged lack of rigour in the book, with one comment on [2]this hostile review calling it "a 200 page blog post". I think this is actually quite an apt description and, as I’m sure anyone who knows me can guess, I don’t think this is necessarily a bad thing. I think there’s a time and a place for broad brush strokes and that under certain circumstances impressionistic judgements shouldn’t be excluded a priori from discussions about ‘big’ issues of the sort that necessarily elude empirical resolution. But it’s more problematic when this gives rise to a tendency to overlook obvious objections, proceeding with such confidence and verve that the gaps in an argument are not so much swept under the rug as left abandoned and forgotten in the author’s wake. Furthermore, the book isn’t brief, at least not to the extent of the ‘mini-book’ format that is becoming increasingly popular amongst academic presses and that I’m enthusiastic about precisely because it provides a forum for the kinds of discussions that are too deep for a research paper but too diffuse for a research monograph. I couldn’t help but contrast The Sacred Project of American Sociology to Stephen Turner’s [3]American Sociology: From Pre-Disciplinary to Post-Normal that was recently released as a Palgrave Pivot, with the former being I think somewhat longer than the latter. My intellectual congruence with the theoretical thought of Smith contrasts to my continued inability to confidently ‘get’ where Turner is coming from (which I guess amounts to me saying I can’t pigeonhole him, surely a virtue now I think about it) but I nonetheless felt that the former’s book lacks the degree of rigour and detail we see in the latter’s, in spite of their arguably similar scope.

In an important way I think Smith is too defensive about his argument and this compounds the more contentious aspects of how he makes it. Consider this passage from Michael Burawoy’s [4] 2004 Presidential Address for the American Sociological Association

in which he talks of the normalising pressures encountered in the pursuit of an academic career and their implications for the ‘sociological spirit’:

The original passion for social justice, economic equality, human rights, sustainable environment, political freedom or simply a better world, that drew so many of us to sociology, is channeled into the pursuit of academic credentials. Progress becomes a battery of disciplinary techniques—standardized courses, validated reading lists, bureaucratic ranking intensive examinations, literature reviews, tailored dissertations, refereed publications, the all-mighty CV, the job search, the tenure file, and then policing one’s colleagues and successors to make sure we all march in step. Still, despite the normalizing pressures of careers, the originating moral impetus is rarely vanquished, the sociological spirit cannot be extinguished so easily.

I may be wrong but I read ‘spirit’ here in largely the sense that Smith intends it. His defensiveness results perhaps from an awareness that a sociologist of religion who (correctly in my view) makes no effort to privatise his own Catholicism and exclude it from the scope of his professional activities might provoke misunderstanding by talking about ‘spirit’. So he over defines his terminology in a way that sets up the notion of ‘spirit’ as a point of contention in a way that it just isn’t in the sense in which Burawoy uses it. For all the points in the book where Smith falls short of his customary rigour, I don’t find his notion of the ‘sacred project’ conceptually problematic given the qualifications he attaches to it. He is not claiming the existence of a mono-thought clique but rather suggesting a dominant tendency within the discipline, constituted by a number of more or less conflictual intellectual strands, with the ‘sacred project’ being the underlying structure of feeling (Burawoy’s ‘sociological spirit’) which animates activity that contributes towards the enactment of the project. He recognises the "variance" with which "American sociologists" pursue it: unfortunately in doing so the "liberal-Enlightenment-sexually liberated-civil rights-feminist-GLBTQ-social constructionist-poststructuralist/postmodernist" complex comes to seem so comically diffuse that it’s hard not to wonder if we might be better off just saying the ‘sociological spirit’ and leaving it at that. Smith’s point though is that this quietism would contribute to a widespread inarticulacy in sociology about its own meaning and motivation - it’s a form of argument that will be familiar to anyone acquainted with the work of Charles Taylor. In effect Smith is saying that sociology needs to retrieve its moral sources and, through doing so, we can strengthen the discipline.
think the most convincing argument is a thought-experiment:

Imagine this (if possible): What if sociology really and truly was nothing but a purely scientific, objectively neutral, spiritually disinterested, just-the-facts-and-theory study of society? Would most current-day sociologists really want to be a part of it? How would it be different than it is now? For one thing, sociology departments would have far fewer undergraduate majors and graduate students than they currently have. Sociology of that kind just wouldn’t be that attractive to as many students. For another thing, the undergraduate and graduate students that sociology would attract would be a very different bunch of people than they are now, ideologically, culturally, and politically. The composition of its practitioners would be more blandly mainstream, facts-orientated and technocratic. Furthermore, the subject matter of the journal articles and the content and tone of the books that such a spiritually blank sociology would produce would also be very different than they are now ... Sociologists would generally be less impassioned about their work, and they would enter their classrooms with less of an agenda to convince and transform their students. (Pg 22)

I find this a compelling argument and I think one that can be detached from pretty much the rest of the book. If we accept the argument and sociology isn’t just a “purely scientific, objectively neutral, spiritually disinterested, just-the-facts-and-theory study of society” then what is the additional element? This is what Smith is suggesting we are inarticulate about and this is what The Sacred Project of American Sociology attempts to retrieve. The problem is that this immensely important question gets somewhat lost in the detail of his argument, as well as the rushed and polemical way it is made. This is compounded by the fact that Smith seemingly does have an axe to grind, further provoking the critics. The overriding impression this leaves me with is akin to watching two people you were having an interesting conversation with breaking into a tedious argument, seeing them talk past each other and wishing you could go back to the fascinating point you’d seen them hit upon just before the shouting started.

However I don’t think the book’s problems are purely rhetorical. Leaving aside the invocation of a ‘stroll’ through the ASA book displays (might it not have been better to just introduce this informally and not subsume it under the category of ‘evidence’?) and the similarly impressionistic perusal of book reviews and journal abstracts, what I found really problematic was his lack of attention to the way in which his own situation might shape his perspective on the ‘sacred project’. He begins his section laying out the evidence, in so far as it exists, with an appeal to first person experience. He has “learned and taught sociology in a small liberal arts college, at a major private Ivy League university, in a major public research university, and at another elite, private university” yet has also “always felt some distance from and marginality in relation to American sociology” (pg 28). I can only speculate based on familiarity with his more theoretical works as to what explains this feeling of distance and marginality (to be fair he qualifies it as ‘some’) and, in keeping with the broader tenants that draw me to his work, I’m reluctant to dissolve these feelings into third person sociological concepts. Even so, how marginal can he really think he is? As the hostile comment on the review I mentioned earlier points out, “The fact that Christian has a named chair at a research university and can publish a 200 page blog post on Oxford University Press belies his thesis that sociology is controlled by decadent communists.” I don’t think this is what Smith argues and I’m far from hostile to either the book or its author but this point still stands. What marginality Smith might experience is of a very particular sort, such that from the outside he can’t help but look like an enormously prolific, widely recognised, award winning tenured professor who has won over $15 million dollars worth of funding in his career. None of these factors constitute a reason to either dismiss his argument or affirm but it seems axiomatic to me that this positioning should be held in mind when meditating upon his arguments about the ‘dominant trends’ within American sociology.

This issue occurred to me again later in the book when Smith decries the ‘secret club’ at the heart of American Sociology, the invitation only Sociological Research Association which meets at the same time as the American Sociological Association. He invokes this to make a point about the tendency towards perpetuating inequity of those
committed to the sacred project. But the existence of the SRA surely indicates something else: the centre of power in American sociology is hostile to the sacred project, if indeed such a project exists. Consider [8]this extract from the after dinner speech made by Andrew Abbott at the SRA which Smith himself cites:

Many people in the SRA dissent from this strong politicization and indeed there has been talk about activating the SRA as a possible alternative organization to the ASA, an organization focused on sociology as an intellectual enterprise rather than a political one. I am of two minds about this project. I am also, as it happens, of two minds about after dinner speeches. It is one thing to give them, it is quite another to attempt to listen to them. Much, then, as I hate to disappoint those of you who have come to hear me say something blunt and outrageous about the follies of the ASA, and much, indeed, as I would like to say something blunt and outrageous about the follies of the ASA, I have chosen instead a milder course, and that is to argue that we have taken the ASA's political shenanigans far too seriously.

We have therefore missed the fact that the spectacle of a bunch of reasonably well-heeled, sinecured academics parading around a pair of fancy hotels and talking about Oppression, domination, and liberation is fundamentally and delightfully silly. Here we are trading students and manuscripts like so many yard-sale fanatics while we bustle importantly from the oppression of women here to the oppression of Puerto Ricans there and the oppression of short people somewhere else. Can anyone in the world take this seriously as political action? Is it not the very epitome of absurdity? If we ask what would be the response of the oppressed masses to a typical sociological paper about oppression, a moment’s reflection gives the answer: The oppressed masses would tell us at once, that like them, the sociologists are just trying to get by and feel good. Getting by in a fancy hotel is great, if you can manage. Beats working...

Now if one recognizes that the ASA is, prima facie, an absurd organization, one can hardly then exonerate this august body before which I now appear. When I tell people I’m a member of the SRA, they say "whazzat?" – I should know I’m in trouble, right there..... Well, I tell them, it’s kind of a secret handshake society of the movers and shakers in sociology. They ask, "what does it do?" And I say, Well, it has a dinner once a year at which people drink and eat and sleep through a talk. When I look at people’s reaction to this explanation I begin realize that listing the SRA in the honors and awards section of my vita may not be too bright an idea. Maybe I should list it in the obscure achievements section, or even the why exactly do I do this section or even the administrative service section. Like the ASA, the SRA is, in fact, a largely silly organization.

I’ve included the third paragraph because it would seem disingenuous not to, as it manifestly qualifies the strident tone of the first two. However I was struck by recognition of the seemingly casual contempt of Abbott’s initial paragraphs ("look at those left-wing idiots! morons! who could take them seriously?") and how closely it resembled Smith’s own at various points in the book. The latter, it goes without saying, makes little effort to qualify his hostility, though he does at one point reveal that he has heretofore in the book been showing ‘restraint’ in his comments upon others in the discipline. Leaving aside how little evidence of this I could see, it surely reveals something about the mindset with which Smith has written the book.

I’m focusing so much on the tone of the book because I think much of what’s wrong with it stems from this.
think the book is flawed, particularly the 'evidence' section. So too though are many of the critiques it has attracted and an awareness of this likely line of attack perhaps goes some way to explaining the odd tone that permeates the book, above and beyond it feeling rushed, which I found sharply in contrast to the confidently pleasant erudition I associate with his other writing. It was also jarring to realise that many bibliographical details seem to be missing from the book, with references like Smith (2015) - and nothing else - to be expected in a blog post but not in a book published by OUP. It feels like it wasn’t subject to any editorial feedback and I’d be interested to know the timescale of its publication. The near constant scare quotes, coupled with an attack on others for doing the same thing about "reality", lend the text the feel of a rant at times. The fact that Smith repeatedly addresses the difficulty of "proving" his case with empirical data makes him seem defensive in a way that just wouldn't be the case if he just used the word proving without the scare quotes.

There seem to be sections of the book that serve no purpose other than to antagonise those who will already be sceptical about the book's argument, adding literally nothing to the substantive case Smith is trying to make. The four page chapter on 'spiritual practices', an ill advised 'comedy' diversion, only adds to the sense of this being a 200 page blog post. This is a real shame because the subsequent chapter is probably the strongest in the book, a concise and panoramic thesis about the mechanisms driving change in the intellectual makeup of sociology. He makes a simple though compelling argument about the confluence of circumstances that led to an initial radicalisation of sociology (expansion of higher education in response to the demographic demands of the baby boomers, social and political upheaval in wider American society and the disintegration of the Parsonian consensus) later entrenched by self-selection mechanisms that lead those amenable to radicalism to be more likely to enter university and then more likely to choose sociology as an undergraduate major. The problem is that making this argument compels him to suggest that sociology undergraduates are often intellectually inferior to their peers (it might very well be true but the repeated assertions, irrelevant to his argument as far as I can see, have a nasty tone to them) and he again lapses into the argument that sociologists are effectively indoctrinating their students (with the graduate students representing indoctrinators-to-be). Unless I have completely misunderstood Smith's theoretical work on personhood, which alongside Margaret Archer and Andrew Sayer has been a big influence on my own work, I don't understand how he can support these at times quasi-conspiratorial claims reducing the emergence of a series of value commitments into a hierarchical power relationship within an institutional setting. Again, the way the book is written undermines what the book is arguing.

The following chapter is also much stronger than the early sections of the book, with Smith explaining how he sees the effective 'peace treaty' that emerged out of the 'paradigm wars' as engendering a sclerotic tendency, in some ways as destructive as the internecine intellectual warfare which proceeded it. Everyone is left to do as they wish, provided they respect the sacred project, with the consequence that:

In sum, most of American sociology has becoming [sic] disciplinarily isolated and parochial, sectarian, internally fragmented, boringly homogenous, reticently conflict-averse, philosophically ignorant, and intellectually torpid. Sociology lacks the kinds of sustained, fruitful, and intellectually meaningful clashes, struggles and clarifications needed for a discipline such as itself to regenerate important scholarship and education. (p. 144)

This might be correct. To address this in terms of the moral unconscious of the discipline is a line of inquiry I find intellectually exciting. It’s precisely what I’m interested in exploring in my upcoming project on the Social Life of Theory and I’ve taken illuminating ideas from Smith’s book which I intend to apply in this project. I’d recommend this book to anyone interested in the history of sociology, its contemporary circumstance or critical realist theory. But it’s a book to be read charitably and, even as someone with immense respect for Smith as a person and scholar, I had to read charitably to cut through the incivility which pervades the book. I’ve largely ignored the book’s ‘evidence’ section in this review and the personal anecdotes that seem to be as much about score settling as illustrating his
underlying argument. I’ve ignored them because I simply couldn’t find any value in them, in spite of my inclination to read the book as charitably as possible. However it’s provocative and thought-provoking in spite of its flaws. While I wish it had been produced as a 10,000 word paper rather than a diminutive 200 page book, it nonetheless has enough of intellectual value within it to be worth reading. Smith’s prolific writing shows no signs of slowing down and this represents an intriguing, if slightly confusing, precursor to his next big work of theory that will be released next year.

etseq97 (2014-09-04 11:27:21)
How could you fail to mention Smith’s involvement with Mark Regnerus and the palpable religiously inspired homophobia that animates many of his rants? It takes quite a bit of privilege as a reviewer to avoid the politics of the book, especially his conspiratorial tone when it comes to gay rights, and praise his insights into social theory. For all his post-modern pretensions, his rejection of methodological naturalism is part of a larger political project to smuggle in supernatural theism back into social science, similar to the efforts of the Discovery Institute’s attack on evolution under the guise of “intelligent design” Smith is part of a network of right wing christian “scholars” that have colonized sociology of religion funded by conservative foundations and think tanks. Brad Wilcox and Mark Regnerus almost got away with scientific fraud in hopes of smearing gay parents as some sort of danger to their own children solely for the purpose of slowing down or stopping political and judicial efforts to secure same sex marriage. Smith was a vocal defender of Regnerus and lied about his association with him (he chaired his dissertation committee but denied even knowing Regnerus). As much as you would like to defend Smith and claim some sort of middle ground between him and his critics, you seem to mistaken Smith for a sophisticated thinker rather than a run of the mill reactionary catholic that yearns for the authoritarianism of pre-modernity.

Sociological Imagination (2014-09-05 10:15:15)
"How could you fail to mention Smith’s involvement with Mark Regnerus and the palpable religiously inspired homophobia that animates many of his rants?" Quite obviously because my desire to get dragged into this tedious dispute is absolutely non-existent.

etseq (2014-09-18 21:45:47)
Tedious dispute? That’s a very revealing statement...By bracketing out such "tedious disputes" from your analysis, you miss the forest for the trees. Smith’s interest in social theory is a transparently cynical move to resuscitate the Science Wars of the 90s, an internecine dispute amongst the academic Left, and retool many of the losing arguments for the ultimate conservative goal - thwarting or reversing modernity. PS - Homophobia, especially when wrapped in the guise of academic respectability, may be tedious to you but it has deadly consequences in the real world. Warwick once was known for fostering a radical, socially engaged faculty, especially in Sociology. I fear that debates over arcane social theory is what passes for radical these...
Sociological Imagination (2014-09-19 08:16:14)
You’re on my website berating me because I’ve been insufficiently hostile to a social theorist in an academic book review. That’s what is tedious. More than happy to keep approving your blog comments in the interest of openness but I have no interest in getting drawn into this.

etseq (2014-09-18 21:52:05)
I just noticed Steve Fuller (leftist Intelligent Design anti-evolutionist) association with this website. Does the author of this review similarly share his affection for reactionary religion as some sort of radical engine for “reforming” the sciences? Such cynicism reminds me of the worst of marxist theories of false consciousness and vanguard Leninism...

Social Theory as Optometry (2014-08-27 08:00)
The notion of philosophical under-labouring has been integral to the development of critical realism. It is, as Roy Bhaskar puts it, what critical realist philosophy most characteristically does. The metaphor comes from John Locke but it is deployed in a way that criticises Locke’s philosophical legacy, reframing it in terms of a much more substantive understanding of what under labouring entails as an activity. This concerns the relationship between theory and practice, something which philosophy has tended to violently misconstrue. Instead critical realist philosophy seeks to provide us with a deeper understanding of practices that are adequate and to contribute towards the transformation of practices which are inadequate. Doing this involves the development of a philosophical ontology but it is one which, at least in principle, should be orientated towards the practical activity of scientific investigation, with the caveat that being useful in this way necessitates a degree of congruence with the nature of things that means that truth cannot be collapsed into utility.

Given that ontological claims are continually secreted by statements about the social world, it seems obvious to me that there’s a value to be found in philosophical ontology. At the very least, this is a matter of rejecting quietism with regards to ontological matters – only by opening up the space of ontological questions can we serve to identify our assumptions and locate them within the range of logical possibilities in a way that facilitates critical distance. The problem is that ontological reasoning, with its complex relation to practice and reality, can sometimes spiral in a way that can ultimately lead to a scholastic abstraction that can prove deeply off putting to those with a less theoretical inclination. I think Jamie Morgan gives a really useful account of some of the dynamics that can take hold here:

Though realism in particular is sensitive to epistemic fallibility and to the potential for an epistemic fallacy – and ultimately ontology is theory so one is careful to never assert a definite identity between ontology and reality – the originating point of the exercise is to under-labour for more adequate accounts of reality. As such, one can ask in what sense the development has actually enhanced one’s understanding.
of or capacity to undertake further explanatory investigations of reality ... 'Adequacy' can be directed towards internal projects of social theory addressing aspects of social theory for purposes other than demonstrated adequacy for accounts of reality. They can be about finding difference or reformulating what is actually similar, where both may perhaps be in some sense a non-problem. Furthermore, they can involve the pursuit of categorizations or taxonomies that are then justified as no more than 'consistent with the existing realist ontology'. The development may then focus on placing an existing alternative framework over the same conceptual terrain – the matter of dispute can then become difference among the positions and where one set of potential weaknesses is traded for another in terms of conceptual critique. (116-117)

It occurs to me that part of the problem may be with the metaphor itself. Perhaps rather than *underlabouring* we should think of optometry. This is how Wikipedia describes optometry:

**Optometry** is a [1] healthcare profession concerned with the [2] eyes and related structures, as well as [3] vision, [4] visual systems, and [5] vision information processing in humans. Optometrists[6][1] (also known as *ophthalmic opticians*[7][2] outside the United States and Canada or optometric physicians in some states [8][3][9][4][10][5][11][6][12][7]) are trained to prescribe and fit lenses to improve vision, and in some countries are trained to diagnose and treat various eye diseases.

The term "optometry" comes from the Greek words [13]*ὀπτής* (opsis; "view") and[14]*μέτρον* (metron; "something used to measure", "measure", "rule"). The root word opto is a shortened form derived from the Greek word *ophthalmos* meaning, "eye." Like most healthcare professions, the education and certification of optometrists is regulated in most countries. Optometrists and optometry-related organizations interact with governmental agencies, other healthcare professionals, and the community to deliver eye- and vision-care.

The history of optometry can be traced back to the early studies on optics and image formation by the eye. The origins of optometric science (optics, as taught in a basic physics class) date back a few thousand years BC as evidence of the existence of lenses for [15] decoration has been found. It is unknown when the first[16] spectacles were made. The [17] British[18] scientist and [19] historian [20] Sir Joseph Needham stated in his "Science and Civilization in China" vol 4.1, that although it sometimes has been claimed that spectacles were invented in China, that belief may have been based on uses of a source that had addition to them from the Ming dynasty (14th – 17th century) and that the original document had no references to eye glasses, and that the references that were there stated the eyeglasses were imported.

The optometrist assesses a person's needs, drawing on elaborated diagnostic techniques to prescribe lenses which enhance vision. What counts as an enhancement is relative to a particular kind of need (e.g. close reading) and the success of the enhancement is dependent upon finding the right apparatus for that person, given the present state of their vision and the character of the aforementioned need. Needs are dynamic and the interventions facilitated
by optometry need to be similarly dynamic if they are going to help rather than hinder the person in question. After all the intervention is intended to enhance or ameliorate, as opposed to creating a capacity where there was not one previously.

I’m being slightly factitious in suggesting that we see social theory as optometry. Though I do think there’s a usefully epistemological aspect to it (measuring perception) as well as an ontological one (an understanding of the nature of the perceptual system, the world being perceived and the process of perception). But I like the idea as a way of drawing out a few beliefs which I hold strongly.

1. Social research is not dependent upon social theory and can proceed without it.
2. Social research can be enhanced by social theory because at least tacit theoretical assumptions are unavoidable in the practice of social research.
3. Social research often isn’t enhanced by social theory because the practical relationship between the two is generally quite poorly attended to.
4. Social research could be enhanced by social theory if more attention were paid to the specific ways in which different aspects of social theory play a practical role in the practice of social research.

Steve Fuller (@ProfSteveFuller) (2014-09-07 10:28:14)
Bhaskar and his followers missed the point of Locke's original appeal to 'underlabouring', at least as far as critical realism's own demonstrated practice is concerned. Locke was actually declaring to be an underlabourer for Newton's world-view. A less polite way of putting it: 'ideological mouthpiece'. In more polite terms: Locke's philosophy should be seen as providing the philosophical implications of Newtonian mechanics. The point is that you underlabour for particular substantive theories. Underlabouring doesn't make sense as a second-order activity, which is pretty much where critical realism exists. This is not to say that critical realists haven't done empirical work, but usually that ends up challenging the established paradigms. (Although merely the godfather of critical realism, Rom Harre is probably truest exemplar of this approach.) Whatever else this might be, it is not 'underlabouring' in Locke's sense. This misunderstanding of the term may go some way to explaining why many see critical realism as toadying to the natural sciences, when of course in fact it's not.

Sociological Imagination (2014-09-10 13:59:05)
Well that's an argument I wasn't expecting and you've made me realise that my sense of what Locke said amounts to little more than regurgitating Bhaskar and some vaguely remembered undergraduate philosophy lectures. However going off quotes selected from the former, I don't see how what you're saying holds but I recognise my flimsy textual basis for this - the difference between "providing the philosophical implications of X" and "being the ideological mouthpiece for X" is massive IF you're operating under the assumption that there's more to advocacy of X than a power-relationship. I think critical realists do far too little empirical work but I can't think of instances of these 'challenging the established paradigms'. I think the problem is that the established paradigms are over-elaborated, kind of scholastic in a way that irritates me and dominated by philosophers - the under-labouring should stop somewhere and there's little conversation about where and how that point should be reached. I mean at the end of day in practice under-labouring amounts to developing philosophical ontologies and domain specific ontologies. I can see why this could be seen as of limited or zero use but I'm puzzled by the idea that it doesn't make sense. perhaps I've misread what you mean by 'second-order activity' though.

Mike Agar (2014-12-21 16:26:57)
I don't know the critical realism lit, but I like the optometry metaphor. Few years back I participated on an ESRC sponsored panel at their "methods fair" on "methodological innovation in the social sciences," argued that innovation in soc sci wasn't method so much as conceptual, a different way to "see" the world, used Zadeh, Goffman, Bartlett, and Glaser/Strauss as examples. A German colleague said it was "objective hermeneutics" of Oevremann, that most people didn't understand that he meant "objective" as in lens, like this third definition in my computer dictionary, " (also objective lens)the lens in a telescope or microscope nearest to the object observed." I never followed up on that. The article is displayed on a page I never heard of, https://www.yumpu.com/en/document/view/19533426/a-method-to-my-madness-michael-agar-ethknoworks-llc. If anyone wants a copy glad to send the PDF of the published version. Probably all came out of independent work for the last couple of decades--people in orgs contact me because I "see" things differently.

Sociological Imagination (2014-12-29 09:36:22)
oh that's interesting, thanks - that way of looking at it makes a lot of sense to me

Mike Agar (2014-12-21 16:29:49)
That last line should be people in "orgs" as in "organization." I didn't catch the automatic correction. None of my work has been interplanetary.

Escher Girls: bodies don't work that way.... (2014-08-28 08:00)
This [1]great Tumblr blog collates and critiques the frequently absurd representations of women in comics. This is an issue which seems to have come to new-found prominence partly through social media, with the much shared Avengers graphic below only the tip of the iceberg as far as online critique and parody is concerned. However Escher Girls (subtitle: "float like a buttefly, sting like a WTF?") addresses the more extreme aspects of this beyond 2906
the sexualisation that is disturbing in its ubiquity. It's quite shocking to see these representations of anatomically impossible women, with figures that would require a complete lack of internal organs, presented adjacent to one another. They seem much more mundane, less pronounced in their sinister absurdity, when embedded in the comic itself - or so I write as a 29 year old male who's been reading comics like this for two decades... read the blog [2]here and see what you think - also marvel at the nastiness of the legal threats directed towards the author by one of the artists whose work she is critiquing.

Dan Fairbrother (2014-09-11 16:50:58)
Good point - but, writing as an 11 stone knock-kneed book-reader who regularly risks both lycra (cycling) and neoprene (kayaking), doesn't it cut both ways (so to speak)? The male characters seem equally impossible and ridiculous (and, taken as ideals, unattainable) on both sides. I know little of this academically, but don't the stereotypes come in pairs?

Sociological Imagination (2014-09-12 09:51:17)
I think it's hard to recognise that point without slipping into politically tone deaf "but men are oppressed too" rhetoric, which I suspect is why some people (including myself) get uncomfortable with it being pointed out...

Dan Fairbrother (2014-09-12 14:38:06)
Yes, I can see that - in one way. Representations of women as in the above are much more likely to be related to inappropriate sexualisation and sexual violence against women than the representations of men are to be related to sexual harm of men. So
one major harm will weight down mainly on women. But isn't it more complicated than that? Firstly, men - at least some men - really are "oppressed", have life destroying body issues, etc., and suffer all the stress associated with this. Right through from primates to us, competition among males is horribly destructive for most males. Secondly, and perhaps even more importantly, the idea that gender stereotypes come in pairs can still be an important point effecting women directly: aren't big, muscly, aggressive or controlling men the logical "counterpart" of passive women who are seen to be "asking for it"? You've got to have both, at least implicitly, to make one or the other dangerous.

Mark (2014-09-13 08:55:00)
I see what you're saying about the pairing but I think it risks overstating the case - I think there are some modes of representation which are paired in this way and they're certainly obvious in comics but that contemporary body norms are shifting and multiplying in a way which resists easy 'pairing' e.g. if you accept that 'metrosexuality' (horrible word but useful short hand for a complex trend) has become normative, at least in some social spheres, then what does this pair with? Also you put the point I was trying to make really effectively - men obviously are oppressed in some ways but, at the risk of sounding obnoxiously blunt, I think this oppression is much less important (and circumscribed) than that of women for precisely this reason: "Representations of women as in the above are much more likely to be related to inappropriate sexualisation and sexual violence against women than the representations of men are to be related to sexual harm of men"

Dan Fairbrother (2014-09-15 17:52:41)
I don't think that's too blunt, I take the point. The "metrosexuality" thing (which as a poor village boy I thought "this must have something to do with trains", the first time I heard it...) definitely complicates it. But I think I still disagree with the relevance of the moral point in two ways. Firstly, sexual harm is not the only kind of harm, so on what grounds are we comparing sexual harm with, say, the harm involved in male suicides based on body image or sexuality, or the harm involved in male genetic predispositions to lower life expectancies? The other concern is that even if we accept that sexual harm of women has moral priority, this doesn't mean that it has explanatory priority, even in an explanation of itself. It could be (and I suspect this is the case) that sexual violence against women is a consequence of other more complicated sorts of social relationship. And these two points may be connected: if it turns out that sexual violence against women is the consequence of a social dynamic which also includes other, terrible harms against men and women, then I'm not sure I see what the point is in treating the different harms as competing moral claims - the social dynamic is bad all-round. One might even see the potential for a certain kind of solidarity in this.

Sociological Imagination (2014-09-17 17:50:09)
Weirdly, given our recent debates, my problem with what you're saying is with the politics not the theory - I don't think they're competing moral claims and it seems obviously possible to me to advocate on these issues without framing it like this. But I think responding to a discussion of female body representation by replying that "men have these issues too!" gives succour to a men's rights movement that is, on the most charitable interpretation, deeply reactionary. I guess this claim is ultimately an empirical one. I like the idea of solidarity in this but I just don't see it as possible given the actually existing state of gender politics.

Dan Fairbrother (2014-09-15 17:57:52)
(I have no doubt I just reinvented multiple wheels, by the way!)

Dan Fairbrother (2014-09-18 10:45:19)
I'm sure what you say about the rhetorical state of the gender issue in certain quarters is entirely accurate. But I don't think I can be held to account for what the reactionary male-ists would say if they were to misread my point. (Which isn't to say that they aren't interesting as an object for social science.) As for solidarity, don't plenty of politically active feminists, and politically active women, actually strive for it? In the Green movement, in the socialist movement, etc.

Sociological Imagination (2014-09-18 15:04:10)
Well if I'm being really pedantic to make a point, I'd suggest you obviously can be held to account in this way but I'd agree with your suggestion that you shouldn't be - I guess I'm making a suggestion about how, in this instance, analysis of political
context enters into discussion about the moral equivalence of two similar social trends.

Dan Fairbrother (2014-09-18 17:12:52)
I'm not sure I follow the argument now.

Sociological Imagination (2014-09-18 17:14:59)
You're treating it like a moral issue, I'm treating it as a political one.

Dan Fairbrother (2014-09-22 14:52:07)
I'm not sure how I'm treating it as a moral issue. I'm happy to ignore "morality" (a la Bernard Williams) and talk only about politics. (There is of course an old problem with moralistic as opposed to realistic politics...) But both "moral" and political positions which are trying to be critical should be based on good sociological explanations - otherwise they are just insubstantial "intentions".

I'm not sure what we're arguing about! I don't disagree with your initial claim that ludicrous representations of male bodies cause problems for men. You don't seem to disagree with mine that this oppression is in a way less important and more circumscribed.

Dan Fairbrother (2014-09-23 14:15:53)
I'm not clear about what your criteria are for *comparing* oppression of men and women - which is necessary if you're going to say something about their relative "importance" or "circumscription". If your criteria are moral or political (including legal) criteria, I think this is irrelevant to sociology. If they are sociological criteria, then I doubt that oppression of women is more causally important than oppression of men, because I don't think it's possible to abstract them from each other, or from the set of underlying social processes and mechanisms of which they are (in abstraction) effects and which (taken together) they are partly constitutive. This is *not* "holism", but you don't have to be a holist to think we need to pay attention to causal complexity in social science. (Michael Mann is good on this...) If we give up on rigorous, causally complex explanations, there is no point doing sociology. There ought to be more to it than the moral outrage of memes, otherwise we're just the other side of the Daily Mail coin. I also think it's pointless to have moral or political views that do not pay this same attention, but this is a separate point - which perhaps I didn't separate enough above.

Sociological Imagination (2014-09-23 14:24:48)
You're the one who introduced the comparison! In fact this entire conversation is a response to you making that comparison. My original response to your comment: "I think it's hard to recognise that point without slipping into politically tone deaf "but men are oppressed too" rhetoric, which I suspect is why some people (including myself) get uncomfortable with it being pointed out...." I haven't disagreed with the content of your claim, I've only said that (a) it's not an issue I see as a political priority (b) advocating for the claim risks inadvertently lending support to groups, opposition to whom I do see as a political priority. Beyond disagreeing with how I draw conclusions about which political issues I see as a priority I'm not really sure what your point is. Being a sociologist doesn't exhaust either my social or personal identity. It doesn't even exhaust my identity as a blogger, though I could see how the fact we're having this conversation on a blog called 'the sociological imagination' might suggest otherwise.

Dan Fairbrother (2014-09-24 11:57:01)
My original comparison was between the representations of men and women on offer, which I then tried to suggest might be best analysed together sociologically. This isn't the same as me comparing - and favouring, as you do - one or the other morally or politically. This is a very important distinction. Of course you are free to prioritize by whatever criteria suit you, but 'advocating' in whatever direction is a shot in the dark, with likely minimal effects, without its being informed by the kind of sociological analysis I've suggested. Why do you think ignoring part of the sociological picture is more likely to have good effects than including it? Don't reactionary male-ists like a good, fully adversarial scrap - and wouldn't confuse them if we were
to be painfully fair-minded about it all? Finally, politically speaking, not all feminists have felt the need to prioritize as harshly as you seem to want to: perhaps we’re repeating the middle class feminist (you) versus socialist/Marxian/Marxist feminist (me) debate - ? (Maybe some of this is for the coffee we've never got round to having?...)

Dan Fairbrother (2014-09-24 11:57:15)

(Maybe some of this is for the coffee we've never got round to having?...)

Sociological Imagination (2014-09-24 12:17:37)
Sure, will give me time to think about what do I actually believe here qua sociologist - what sociological content there has been to my claim (which I’ve basically just been restating) concerns the empirical growth of the men’s rights movement, as a social movement, as well as theoretical claim about how discursive agenda setting can escape the intentions of agents party to it (e.g. liberal critics of Islam inadvertently contributing to Islamophobia or 'liberal' interventionists strengthening the conservative agenda after 9/11). If you’re talking very specifically about the origins and operation of gender based harm via cultural representations, I honestly have no idea, I’ve never really thought about it in any serious way or read any relevant literature, beyond an MA feminist theory module I took years ago. If you read back to the opening post, it was a plug for an interesting blog and a brief statement of what I took to be the 'sinister absurdity' of these representations when presented side-by-side, not a considered contribution to the sociology of gender.

Dan Fairbrother (2014-09-25 12:11:57)
Ok. Apologies for hitting "post" twice.

The Life of the Mind Behind Bars (2014-08-29 08:00)
A few weeks ago we hosted an [1]open letter by Les Back to the UK Justice Secretary Chris Grayling. In this podcast he talks to Simon Williams, a Goldsmiths student Les corresponded with during the student’s time in prison:

Les Back talks to Simon Williams about his experience of prison life, his involvement in Goldsmiths' Open Book programme and the value of education. This discussion is structured around the letters exchanged between Simon and Les during 2013-14 when Simon was an inmate in Wormwood Scrubs. Amongst other things they talk about the current ban on sending books to prisoners, the impact of pubic sector cuts on prison life and what Simon hopes for as he contemplates start the 3rd year of his degree in Sociology.

You can listen to the podcast [2]here. It’s part of a broader series, Postcards from a sabbatical, produced by Les during his sabbatical (surprisingly enough).

The Doorways Project (2014-08-30 08:00)

A couple of months the Idle Ethnographer wrote about the war on public space unfolding across Europe. However, recognising this trend leaves us with the obvious question of who is being excluded from this space and how do they see it? This is what The Doorways Project seeks to illuminate:

Rough sleeping is an "absolute form of exclusion" (Mills, 2005) and is a social issue that is widely misunderstood. Public attitude surveys suggest that one of the biggest misconceptions is that people living on the streets are there by choice, assuming that complex issues such as mental health, drug and alcohol misuse, debt or relationship breakdown are the fault of the person concerned, rather than understanding the complexity of these situations.

However, homelessness is rarely a choice and prior to becoming homeless people do everything they can to prevent ending up on the streets. Yet, it has been recognized by those working with homeless people that those sleeping rough for a period of time "acclimatise" to the streets and become part of what Academic Megan Ravenhill calls Homeless culture.

"any serious attempt at resettling long-term rough sleepers needs to consider what it is that the homeless culture offers and whether or how this can be replicated within housed society" (Ravenhill, 2008)

The Doorways Project aims to raise awareness of the complexity of the issue and explore the notion of a homeless culture in a non-judgmental, yet unsentimental way. Offering homeless people a voice within mainstream culture will offer a range of audiences the opportunity to engage with the issues which, on the whole, remain – or are kept – invisible. The project is an ambitious attempt to explore the subject of homelessness, in a non-judgemental and honest exploration telling the stories of homeless people, which differs from the 'deficit model' where homeless people are portrayed as victims. The project reverses this model by giving homeless people a voice and focusing on the realities of street life through personal experience. The intention behind collecting everyday stories about life on the streets is to humanize a situation that many people often find threatening and uncomfortable, and to challenge the notions of blame and victimisation. The direct voice, apart from asserting its human presence, enables listeners to connect on a personal level and enter the speaker’s world of experience.

This past project by the artist explores their own experience of sleeping rough in London for a few years. I found it extremely powerful and wish I could see the full body of work:
I spent several years homeless in Central London. I remember wandering aimlessly around the streets in the rain, feeling so cold and alone, looking down because I never had the confidence to look up. I was always fascinated by the reflections of London in the puddles, the beauty in the darkness of the water and the shapes and patterns jumping back at me. So I decided to re-trace those aimless walks and photograph the puddles – it made sense to me to photograph the streets and the beauty there that is so easy to walk by.

On 'Secular Humanism' (2014-08-31 15:21)

This post is written largely as a reflection on our times. Yesterday I had the honour of addressing the European Society for the Philosophy of Religion in a plenary session. I was glad to learn that one can believe in God without believing in religion – which is basically my own position. I gained a renewed respect for theologians who are very alive to theirs being quite literally a 'science of God' and not simply a science of religious experience, whatever the source.

I am a self-declared 'secular humanist'. I am also a 'theist' in the sense that I believe that God is an entity worthy of sustained inquiry, whose existence would effectively rationalize how humans have conducted themselves over the past couple of millennia, if not more. Here I am alluding to the Abrahamic belief that humans are created in the image and likeness of God, which has led to ideas that we might get into the mind of God (a la physics) or even play God (a la biology). But this general line of thought has nothing to do with 'religion' in the conventional institutionalised sense. In this respect, my belief in God should be treated as a theoretical commitment, or 'hypothesis', subject to scientific investigation. For this reason, I believe that theology should be counted as a 'science' in the proper sense, Wissenschaft.

My empirically considered view – of course, subject to revision – is that we act as if we are on the road to merging with, if not outright becoming, just such a deity. Although it is still fashionable to follow Voltaire's derisory portrayal of theodicy (i.e. the justification of divine agency in human terms) in Candide, as a matter of fact our species has followed the advice of Dr Pangloss and treated even the worst of human atrocities – say, the Nazi genocide of Jews – as learning experiences from which we come out stronger. After all, research into genetics could have been stopped altogether, if our overriding concern were to prevent any version of racism from arising in the future. But in fact such a precautionary policy was not adopted. Instead particular individuals were punished for documented atrocities – but the science was left unscathed.

The history of genetics research in the second half of the 20th century and beyond has vindicated such a restrained approach toward dealing with mass human error on the scale perpetrated by the Nazis. But wherein does this wisdom lie? The answer is complicated. After all, the constraints imposed by what academics routinely experience as 'institutional review boards' were products of the 'never again' mentality generated in the wake of the discovery of the atrocities that the Nazis committed in the name of medical research. To be sure, they have hobbled the progress of science in ways that astute commentators have already noticed. Nevertheless, these constraints have functioned more as an irritation than a discouragement. We are still on the road to divinity – and movements like 'transhumanism' represent very adventurous, and perhaps even adolescent, steps in that direction.

Given all of the above, there is no natural place for either atheism or religion in my sense of 'secular humanism'. Atheism doesn't make sense because the chequered history of humanity reveals us to be a being who is primarily focussed not in the here and now but in some much greater expanse of space and time, on behalf of which we have been willing to undergo considerable risks and sacrifices along the way. More importantly, the strategy seems to have worked. But at the same time, the strategy leaves no obvious place for 'religion', understood as a specific set of dogmas and rituals. The sense of 'faith' that is relevant to secular humanism is that, whatever we do, we remain in contact with the source of all being. But the bottom line is that what goes on in a lab is more likely to provide a secure route to this ontological connectedness than what goes on in a church.
Dan Fairbrother (2014-09-11 14:21:22)

"Atheism doesn’t make sense because the chequered history of humanity reveals us to be a being who is primarily focussed not
in the here and now but in some much greater expanse of space and time, on behalf of which we have been willing to undergo
considerable risks and sacrifices along the way." I’m not sure I follow this at all, but why doesn’t the claim I’ve quoted amount
to saying this: "atheism doesn’t make sense because people have illusions"? Why anyone would accept this as valid is hard to
fathom. ('Illusions' would be another way of putting the bit about people having a purview beyond the here and now for which
they are willing to take risks and costs. I know this isn’t what Fuller intends - but that’s my point.) There is, of course, a problem
with people who think that once they’ve joined the Dawkins club, presumably by expressing confused outrage 3 or 5 times a
day, they get full rationality honours by default and can claim not to have any illusions themselves. In this way, having a fixation
on atheism does *not* make sense as a positive world view. But woe betide those who forget the Greek privative in 'atheism';
who says we need a positive world view? I might find many, unconnected ways of orienting a life, but find the God-people (Wis-
senshaftlich or otherwise) so consistently annoying and obstructive that it makes a great deal of sense, in a context I can’t escape
from, to maintain a constant guard. Finally, I might in fact regret this apparent necessity, because it might seem like a waste
of effort compared to what I might otherwise do with my time. Just like sitting in traffic on the A46, waylaid by the common herd.

Steve Fuller (2014-09-11 17:02:54)

I think you’ve addressed your own point, and I agree with your conclusion. The real battle is not between Dawkins and the
theists. It is between, on the one hand, Dawkins and the theists and, on the other, the Greek sceptics (including you and, I
believe, Darwin himself). The former are obsessed with what you call 'illusions' but tell different stories about how to justify
them, whereas guys like you just recognise them as illusions and carry on in what George Santayana called 'animal faith'. But
then the burden is on you to explain why we think humans are special and, in particular, why the most abstract science is the
most special thing that humans do.... that is, unless all of that is an illusion too....

To the extent to which people do think humans are special, isn’t it because we’ve managed to build-up 6-8 million years’ worth
of self-serving self-importance? And don’t most of us very often forget the specialness of humans, and replace it with the
specialness of myself, or my family, etc., whenever a sufficiently scarce resource is present? Wouldn’t all of this be more of an
explanatory challenge - and provide more support for your theism - if *another* load of fairly highly cognitively capable animals,
perhaps from another planet, were to commonly think that humans were special? As for abstract science, presumably the
people who think it is the most special thing humans do feel it shows-off our exceptional (but not evenly distributed) cognitive
abilities - and then get a bit excited about it. These abilities have been a real advantage in material life, so the excitement
isn’t exactly inexplicable. Naturalists always travel with an appropriate beast to carry the burden of proof: adventavit asinus,
pulcher et fortissimus...i.e. self-interest. Not the Greeks, Pragmatists, or Darwin, I’m actually with Marx (a la The German
Ideology) on all of this: any shopkeeper can tell you the difference between what people say they are and what they actually
are. Taking people’s various God-sounding aspirations as any kind of evidence at all for the existence of such a thing sounds
like repeating the error of failing to be as discriminating as a shopkeeper - which he nailed in the historians of mid-nineteenth
century Germany. (Feuerbach in particular.) Marx’s own aspirations, of course, turned out to be equally pretend; once more,
thought and action went their separate ways...the one to Paris and the other to Russia?

Steve Fuller (2014-09-12 08:32:04)

I think you’re arguing with yourself. We’re in agreement. You are indeed a sceptic. Marx, by your own account, was on the side
of illusory self-importance. Marx, after all, actually believed that humans were special, and this led him to retain the medieval
idea (also in Locke) of ‘labour’ as a source of value. In Marx, horses do work but do not engage in labour. Economists more
comfortable with the replacement of human labour by technology have differed with him on this point, since they are more
concerned with the ‘done’ than the ‘doer’. So Marx is an irrelevance to your argument.
I’m not sure what we agree on! Just because Marx got his predictions and thinly veiled prescriptions wrong, as I suggested, doesn’t imply his criticisms of the German historians in The German Ideology were wrong too - the only part of Marx I was relying on. He nowhere in the Ideology (or the Pre-Capitalist Economic Formations part of the Grundrisse) takes the specialness of humans as a focus - presumably getting him to say this involves digging for presuppositions with an interest different to Marx’s in mind. But your theistic argument, as I understand it, is that people believing in God and acting in ways that register this belief can be ‘rationalized’ by taking God actually to exist (presumably “actually transcendentally”). Not only is this as horribly circular as the original ontological argument on one hand and anthropologically doubtful on the other, there are also better, more sociologically mundane explanations, like those I summarized above. As with Marx, I think there are good materialist explanations for why particular beliefs proliferate and why people are inclined to think in certain ways; unlike Marx, I don’t think things are as simple as base and ideological superstructure. If I’m a Greek anything it’s a materialist rather than a skeptic - I’m only sceptical about things that don’t exist!

Big/Bad Pharma Recruiting Trail Participants in Homeless Shelters (2014-09-01 08:00)

This is a disturbing but unsurprising trend. Read the full article [1]here - it’s wonderfully written:

We arrived at the shelter, where a security guard was patting down residents for weapons. It didn’t take long for the shelter employees to confirm that some of the people living there were taking part in research studies. They said that the studies are advertised in local newspapers, and that recruiters visit the shelter. “They’ll give you a sheet this big filled with pills,” a resident in the shelter’s day room told me the next day, holding up a large notebook. He had volunteered for two studies. He pointed out a stack of business cards on a desk next to us; they had been left by a local study recruiter. As we spoke, I noticed that an ad for a study of a new ADHD drug was running on a television across the room.

If you’re looking for poor people who have been paid to test experimental drugs, Philadelphia is a good place to start. The city is home to five medical schools, and pharmaceutical and drug-testing companies line a corridor that stretches northeast into New Jersey. It also has one of the most visible homeless populations in the country. In Philly, homeless people seem to be everywhere: sleeping in Love Park, slumped on benches in Suburban Station, or gathered along the Benjamin Franklin Parkway, waiting for the free meals that a local church gives out on Saturdays.

Do not despise your inner world. That is the first and most general piece of advice I would offer... Our society is very outward-looking, very taken up with the latest new object, the latest piece of gossip, the latest opportunity for self-assertion and status. But we all begin our lives as helpless babies, dependent on others for comfort, food, and survival itself. And even though we develop a degree of mastery and independence, we always remain alarmingly weak and incomplete, dependent on others and on an uncertain world for whatever we are able to achieve. As we grow, we all develop a wide range of emotions responding to this predicament: fear that bad things will happen and that we will be powerless to ward them off; love for those who help and support us; grief when a loved one is lost; hope for good things in the future; anger when someone else damages something we care about. Our emotional life maps our incompleteness: A creature without any needs would never have reasons for fear, or grief, or hope, or anger. But for that very reason we are often ashamed of our emotions, and of the relations of need and dependency bound up with them. Perhaps males, in our society, are especially likely to be ashamed of being incomplete and dependent, because a dominant image of masculinity tells them that they should be self-sufficient and dominant. So people flee from their inner world of feeling, and from articulate mastery of their own emotional experiences. The current psychological literature on the life of boys in America indicates that a large proportion of boys are quite unable to talk about how they feel and how others feel — because they have learned to be ashamed of feelings and needs, and to push them underground. But that means that they don’t know how to deal with their own emotions, or to communicate them to others. When they are frightened, they don’t know how to say it, or even to become fully aware of it. Often they turn their own fear into aggression. Often, too, this lack of a rich inner life catapults them into depression in later life. We are all going to encounter illness, loss, and aging, and we’re not well prepared for these inevitable events by a culture that directs us to think of externals only, and to measure ourselves in terms of our possessions of externals.

What is the remedy of these ills? A kind of self-love that does not shrink from the needy and incomplete parts of the self, but accepts those with interest and curiosity, and tries to develop a language with which to talk about needs and feelings. Storytelling plays a big role in the process of development. As we tell stories about the lives of others, we learn how to imagine what another creature might feel in response to various events. At the same time, we identify with the other creature and learn something about ourselves. As we grow older, we encounter more and more complex stories — in literature, film, visual art, music — that give us a richer and more subtle grasp of human emotions and of our own inner world. So my second piece of advice, closely related to the first, is: Read a lot of stories, listen to a lot of music, and think about what the stories you encounter mean for your own life and lives of those you love. In that way, you will not be alone with an empty self; you will have a newly rich life with yourself, and enhanced possibilities of real communication with others.

Asexuality in Japan (2014-09-02 15:46)

The Asexual Agenda has an interesting interview with a Japanese asexual activist:

*I recently had the opportunity to chat with harris-hijiri. harris-hijiri is a native of Japan, and has been involved in asexual activism for about 14 years. She has been a member of AVEN since 2007, and you can also find her [1]on tumblr. Although she was involved in managing several Japanese-language asexual communities from 2005 to 2008, she stepped down from an administrative role for a variety of reasons (some of which we discuss below). She has also participated in a number of Japanese LGBT communities, and is currently active in Toyohashi City.*

You can read the full interview [2]here. There's some very interesting stuff in it:

**Q:** Does the Japanese community borrow asexuality-related words and concepts from English? Or does it mostly use words and concepts created within the community?

Well, I suppose English doesn't have the division between asexuality and nonsexuality, but aside from that are there any big differences?

**H:** I don't think there are any big differences.

Of course, there are people who tried to create the concept “unsexual” (性無),[3][5] but that is definitely not common.

**Q:** But the definition is slightly different, right? Asexuality and nonsexuality is defined as “not having sexual desire,” but in English it's defined as, “An asexual person is a person who does not experience sexual attraction.”

**H:** [The Japanese definition] is mixing “sex-revulsion” (性嫌), “I don't want to do sexual things,” and “not having sexual impulses.”

**Q:** In English it's slightly different, isn't it? In English we're always saying, “attraction is not behavior,” but the definition you just gave is half about behavior, isn't it?

**H:** Ah, I'm sorry. “Sexual desire” is a good approximate [translation] for “seiyoku” (性欲; sexual desire). I was confusing it with [the feelings of] people in the nonsexual community. Sorry.

**Q:** In other words, is sexual desire the feeling of wanting to have sex?

**H:** It probably is. (We don’t really talk about sexual desire much, so.)

**Q:** Is the definition of nonsexuality different from the definition of asexuality other than romantic love (愛愛)?

**H:** Probably, falling in love and wanting a partner [would fall under] nonsexuality.

---

Andrew Collier, 1944–2014 (2014-09-02 15:49)

There’s a lovely obituary for Andrew Collier, the critical realist philosopher, in Radical Philosophy:

Andrew Collier’s contribution to realist philosophy and social theory can perhaps best be summed up in the title of one of his chapters in the collection *Critical Realism: Essential Readings*, edited by Andrew himself along with Margaret Archer, Roy Bhaskar, Tony Lawson and Alan Norrie and published in 1998. The title is ‘Explanation and Emancipation’, and it can be argued that Andrew gave a unique focus to both, and of course to their conjunction. First, there was his stress on the natural world and environmental issues, shared with Ted Benton. It was brought to bear by both of them in their conversations with Roy Bhaskar in the late 1980s, as described by Bhaskar in his chapter in the Festschrift for Andrew, *Defending Objectivity*, edited by Margaret Archer and myself (2004) – hastily assembled after he was given only six months to live in 2003. Bhaskar had emphasized ontological depth and the stratification of reality in his earlier work, but Andrew and Ted opened up what, at least for me, and possibly also for Roy, were new dimensions of the analysis of the interrelations of (to put it simplistically) the natural and the social.

A realist conception of explanation, in other words, had not only to be philosophically persuasive and to include a broadly Marxist, or, more loosely, pragmatist conception of the place of philosophy in human practice, but also to take full account of the world as it is in itself and not only ‘for humans’. For Andrew, though we were not aware of it at the time, there was also a religious dimension, present in our conversations in his impressively wide knowledge of medieval Christian philosophy.

His introductory Critical Realism book is sadly out of print but it’s the best introduction to the subject that exists. His work as a whole seems somewhat under appreciated which is a shame.

The teaching and learning of Britishness is once again on the educational agenda. Governmental proposals for schools to teach Britishness arrive on the doorsteps of educational establishments cyclically: In [1]2007, it was the Labour government calling for the teaching of Britishness in schools, and now [2]in 2014, the current coalition government have re-invigorated these calls by insisting that this is not optional, but that schools must actively promote British values.

My research with two GCSE Art classes and their respective teachers, Ms Anderson and Mr Martin, pointed
towards the urgent need to explore student identity by critically interrogating identity issues affecting young people. For their GCSE coursework, the students created self-portraits about their personal sense of British identity. When interviewed, the two teachers highlighted the emotional engagement of the students, for instance the cathartic and meaningful process of exploring identity for some of the students who openly revealed how they experienced local place, social class, race and ethnicity in their exploration of belonging to Britain. The teachers pointed out that the students were very excited to explore Britishness in relation to their personal perceptions, and to discuss notions of British identity with their peers, teachers, and even with their families at home. My research on the teaching and learning of Britishness with two art classes in a south London school highlighted the importance of teachers employing a critical pedagogical approach when exploring Britishness. Students, the teachers recognised, rarely have the opportunity to express aspects of their identity creatively and in a safe space. The two teachers who explored Britishness with their students found that this experience of identity exploration provided students with the perfect platform to express what they had learned about themselves and others, and embrace the chance to have their voices heard. The research showed how the teaching and learning of Britishness in the classroom setting can be approached through a critical pedagogical approach, as this style of educational philosophy and activity is the most appropriate in allowing students to project their ideas and voices. [3]

The Critical Pedagogy Reader edited by Antonia Darder et al highlights the importance of understanding how hegemonic social structures and institutions perpetuate positions of power and powerlessness, thereby advocating students and teachers to engage in theories and practices of education that will help rid society of inequalities and injustices.

Schools can be improved if student’ stories and concerns are heard and their ideas implemented in the school policies and practices (Carlile, 2012). A key finding in my research was that the students were enthused about discussing their sense of local place and how their belonging to London impacted upon their sense of British identity. In this case, the school would do well to heed this matter of importance to students and their lives by providing more opportunities in the classroom and the curriculum to engage with issues of place, as well as the intricate connections with social class and ethnicity. The students’ stories imparted concerns about white working class identity being caricatured by wider society through representation of Bermondsey as a “chav” place, as well as about issues of race/racism that they encountered in their daily lives. Students were open and honest about how they experienced identity issues from their positioning as young Londoners. Their teachers had given them a wide berth, with guidelines about respectfulness towards peers, so that the students were able to have a safe space to express their stories and ideas on Britishness and hear their culturally different peers’ voices at the same time.

The students were able to freely express themselves to the extent that some were brutally honest about their identities and influences. The Head of Art, Ms Anderson, in the interview, pointed out how one of her students in his artwork revealed a pointed gun at his head, which she felt was a recurring symbol for some of the students reflecting a sense of feeling threatened:

Ms Anderson: And then in the background he had the territories of South East London marked out by colour and roads, and he knows exactly which territories belong to which geographical area... which was an eye-opener for me...but yeah...that seemed to be quite controversial in a way... because he was really saying something about himself...and where he stood within it all.

The teacher was able to learn something quite profound about her students’ lives and the reality of their lived experiences as young Londoners in modern Britain. It was staggering what the students felt able to reveal once they understood this was genuinely about their experiences of Britain. Ms Anderson also highlighted how knife and gun crime was a popular topic with some of the students, perhaps because it was topical, but she was surprised that “an equal number almost of girls attempted a piece that had that sort of message within it...I suppose I was expecting that sort of issue to actually come up with young men...but it actually seems to resonate with girls too”. Ms Anderson’ observation is important in highlighting how students, of both genders, are keen to discuss the impact of living in a
Mr Martin, who taught the other Art class, explained how most of the artwork created by the students revolved around urban London. Mr Martin explained how such revelation about identity is very “powerful” in terms of the "sophisticated" message being communicated by the students independently, as they had not been instructed on what to put in their artwork, but instead they had chosen to communicate their experiences of identity with gentle encouragement. Teachers are not infallible and may make assumptions about their students, but a project on identity challenges teachers’ pre-judgements by giving students the platform to express themselves how they wish to be perceived. Ms Anderson pointed out how she found it interesting that one of the Turkish students, Almas, had not included much reference to Turkey in her self-portrait. Any exploration of identity grants the teacher greater insight into what matters to their students, instead of simply judging students with our assumptions because of how we perceive them to be because we read them as coming from a certain culture. Mr Martin explained that he would like to advise teachers to “really to get to know your students”, as he has found the project “illuminating” from the perspective of their teacher. Further, he emphasised the student-teacher relations that developed through the process of identity work:

Mr Martin: …you really look at them and you think... you know we have a different relationship to when we first started off because I was the scary Art teacher that basically... you know was determined to get them their marks... and they sort of felt “I know him... I've had him before... I might be able to get away with this and get away with that…… but we sort of know each other now slightly differently..

The personal nature of the project on identity impacted upon teacher-student relations, as the students responded to the teacher’s keen interest in getting to know their dreams and ambitions. Mr Martin explained that the project provided the perfect opening for the teacher to really get to know his students as the students shared “their ideas, their aspirations, their loves, their hates...”. Mr Martin gained in-depth knowledge of “their abilities and what they are scared of...”. All of the aforementioned factors resulted in the project being poignant and powerful for the teacher and the students, as well as laying down the foundations for the year ahead. Another major success of the project was that teacher assumptions about students’ cultural backgrounds became invalid:

Mr Martin: I think the point is that it actually helped me not to know about my kids make-up.... it helped me just to ignore everything I know... such as their religious and cultural background... it’s quite important as a teacher that you sort of stand objectively and you say “Well, you tell me about it. You tell me what it is... if your day involves praying... if your day involves picking up your brother, okay, you tell me about it... because I haven't got enough information about you..." And that sort of thing... sharing... is a big thing...

Students need guidance, support and regular reassurance that their voices matter. Some students have internalised the idea that the teacher is right and the teacher holds all answers. Mr Martin found that sometimes the freedom granted to the students resulted in their worrying about what the teacher would think and what the teacher wanted:

Mr Martin:... but I think they always found it a bit difficult because they thought “He's going to mark it... but isn't he going to mark it from his perspective?... Isn't he going to say that's wrong?”... because they were waiting for me to say “You can't do that! It has to have a flag in it... or it has to have some bit of culture in it...” They were waiting for me to say that... but what I did was... I moved in my approach and I sort of said “You do it. There's a reason why you are doing it”...
The exploration of Britishness took careful thought and flexibility, as when students wanted to be dictated to, the teachers had to keep changing the lesson in order to challenge and remind the students, sometimes to their frustration, that this was not a project about what the teacher wanted. At times, for example, Mr Martin felt that the students wanted him to tell them what was the right thing to do, for instance to "draw a portrait of themselves with a union jack in the background... a nice cup of tea... and a nice red phone box...". He found himself having to regularly remind them "No, it's not what I want you to do". Mr Martin explained that the project was "an uncovering" both for the students and for himself as he had to continually mull over what to show them and how to challenge them to think beyond simple stereotypes, particularly when some of the students may have wanted very simplistic notions of Britishness to be approved by their teacher:

Mr Martin: ... they wanted me to tell them that you know... you've got to be White, you've got to speak English...

Critical Pedagogy provides the students and the teachers with an educational philosophy that embraces and values student voice, whilst at the same time allows teachers and students to critically interrogate dominant assumptions about social ways of being, in this case about the notion of Britishness. According to the teachers, the students felt empowered to reveal more and more about themselves, about how they felt about belonging to Bermondsey, to London, and to Britain. Students responded enthusiastically to the project on identity because essentially they were being given a chance to communicate identity issues that aren't elicited often enough in our education system. Both teachers, in my research, had taken a chance on exploring identity in an open and direct manner to challenge the restraints of the curriculum where students do not normally have many opportunities to express themselves, and Ms Anderson stated this behind her rationale of developing the scheme of work on Britishness:

Ms Anderson: I think what interests me about it is how maybe the children don’t get enough chance to... in the educational system to actually express their own opinions, maybe through the fear of the school or the curriculum lighting the blue touch paper and not raising issues that become difficult to manage in the classroom...

She concluded that it was possible to successfully manage a potentially controversial topic in the classroom, as they had done, and were willing to do with the future GCSE classes:

Ms Anderson: ...we have experienced is that it isn’t that difficult to manage and that actually allowing them to do a piece of work about it almost gives it a voice and softens it all, and hopefully builds an understanding between the students as well.

Careful and sensitive handling of the potentially controversial and sensitive elements to identity exploration was successful in this case. The teachers enjoyed exploring Britishness with their classes, and found that students gained new perspectives on Britishness by sharing perceptions with their peers. The uncovering of identity issues enabled students to recognise that their voices and views were respected and required. Further the students gained in confidence and independence, as they learned that this exploration of Britishness concentrated on their journey, and it was not an exercise in spoon-feeding them with what to include in their GCSE coursework.

Critical and engaged pedagogy is the way forward to encourage schools, and teachers, to explore notions of
belonging and identity with their students. Exploring notions of belonging and identity with students must entail this idea of critical consciousness advocated by hooks (1991, 1994), who was heavily influenced by the writings of Freire (2000). Critical consciousness refers to the awareness we have about how we are products of a society that is prejudiced against many groups (hooks, 1994). Any exploration of Britishness must stay true to the spirit of engaged pedagogy, for “engaged pedagogy necessarily values student expression” (hooks, 1994:20). Students who explore their identity may encounter such critical consciousness as they become aware of how societal values and norms affect their sense of belonging. Education that is liberating is a core concern of Freire and hooks, and my research on identity highlights how exploring identity is significantly liberating for the students and teachers alike, once the initial cautions, about potentially sensitive and controversial topics being raised, have been overcome. An exploration of Britishness need not be a hegemonic act where teachers uncritically impose a dominant discourse of Britishness on their students; instead teachers can work on ways to give students a safe space to express their identity.

The government’s promotion of British identity is often received warily by those working in education, as we suspect that whichever government is in power at the time has its own agenda at play. Some would challenge the government’s focus on discourses of Britishness as blindsiding social inequalities that they should be tackling to make Britain better. It is easy for governments to place blame on scapegoated communities who are seen as not integrating or seen as disaffected, when in reality there are countless inequalities that urgently need addressing and resolving. It is important, therefore, to provide these scapegoated communities and other oppressed groups in society with a voice to express what matters to them as members of society. Critical pedagogy advocates the liberation of these oppressed communities through giving students and teachers a space to develop a critical consciousness and to critically interrogate the relationships between culture, economics, ideology and power (Darder et al., 2009). The impact of employing critical pedagogy in the classroom is powerful as it gives students a platform to present to the world what life is like for young people in London. Generally, when over-worked teachers are focused on getting students through the exams, they may not get to hear about what matters to their students, yet opportunities to explore identity issues gives students that important avenue to express their voice on issues they deem serious and significant. This research project made me ponder over whether we teachers know enough about our students, and whether we have scratched beyond superficial assumptions we may hold about our students due to their gender, ethnicity or religion. If students are given more opportunities to express their identity issues within the curriculum, this will have two worthwhile outcomes: firstly, it will give students an urgently needed voice, and secondly it will allow the student-teacher relationship to flourish.

Sadia Habib is a doctoral candidate currently researching British identity at Goldsmiths, University of London. Prior to this she taught English at Key Stages 3, 4 and 5 in Manchester and London.

### Stephen Harper on (not) committing sociology (2014-09-03 08:00)

Last year the Canadian Prime Minister Stephen Harper announced in the wake of a foiled terrorist attack in Canada that "this is not a time to [1]commit sociology". I’m sure we’re not the only sociologists who immediately fell in love with the phrase. It seems he’s been in at it again, this time arguing that there’s no need for an inquiry into missing indigenous women because this is not a "sociological phenomenon". Clearly, it is - as this [2]fact sheet observes "Aboriginal women and girls represented approximately 10 % of all female homicides in Canada" while "Aboriginal women make up only 3 % of the female population". Once you look through the data, it’s obvious that not only is this a "sociological phenomenon", it’s manifestly an example of something that you can’t adequately understand non-sociologically, as this author makes clear:

Of course, not only is [3]all crime a sociological phenomenon, but also without a broader sociological analysis we can’t begin to understand why the rates of missing and murdered indigenous women are tragically high compared to non-indigenous women. Furthermore, it’s clear that if rates of violence against non-indigenous women climbed as high as those of indigenous women, this government (even with its woeful record on women’s issues) would be more likely to announce not only a public inquiry but a full-scale national strategy. (This double-standard in how we value human lives is what sociologists call "racism.")

However rather than simply repudiating Harper’s comments as stupid and harmful, which they certainly are given the longstanding inaction on this issue in Canada, it’s interesting to consider what they reveal about the politics of social explanation:

Harper’s two disparaging comments about sociology, however, also need to be understood alongside his gutting of the long-form census in 2010. It is widely accepted that this action fundamentally undermined Canada’s ability to understand its own demographics, long-term social trends, and inequalities — in short, its sociology.
So what does Harper have against sociology? First, Harper is clearly trumpeting a standard component of neo-liberal ideology: that there are no social phenomena, only individual incidents. (This ideology traces back to Margaret Thatcher’s famous claim that “there is no such thing as society.”) Neo-liberalism paints all social problems as individual problems. The benefit of this for those who share Harper’s agenda, of course, is that if there are no social problems or solutions, then there is little need for government. Individuals are solely responsible for the problems they face.

This ideology is so seductive not only because it radically simplifies our world, but also because it mirrors the two social institutions neo-liberals actually believe in — the “free” market and law and order. Everything is reduced to either a simplistic market transaction or a criminal case. In the former, you either have the money to buy stuff, or you don’t and it’s up to you to get more. In the latter, a lone individual is personally responsible for a crime and is punished for it. Easy peasy. No sociology needed.

A modest proposal for postmodernists who decide to write plain English (2014-09-03 13:54)

Many of you will have seen the [1]Postmodernism Generator, which for nearly twenty years has been spitting out algorithmically designed sentences, paragraphs and even entire essays in the style of postmodernist academic
discourse. Much of its charm and authenticity comes from the wide range of references and sophisticated jargon that it can mobilize at a moment’s notice.

But in a way that’s too easy. Much harder would be to capture the much more prevalent mode of discourse that occurs when postmodernists descend to the levels of plain English. Once I show you an example, you’ll know exactly what I mean. I call it the **Higher Dithering**. Lots of words are taken up hovering around vaguely defined alternatives, resulting in the author saying exactly nothing. It’s the intellectual equivalent of that nightmare plane that endlessly circles Heathrow with no touchdown in sight.

This is not Carnap’s complaint against Heidegger: There’s nothing obscure here that pretends to be meaningful but really isn’t. Rather, it is a quite brazen attempt to drag out the failure of thought in prose out of some perceived obligation to reach an intellectually satisfying conclusion. It is the sort of thing that in pre-postmodern days would have been struck out by an editor as ‘filler’. In any case, it is certainly the replacement of thought.

Here is my example, kept anonymous to protect the guilty:

I have refrained from offering a settled version of how STS should do anthropology or how anthropology should influence STS. Instead, my aim has been to illustrate some of the productive discussions and tensions among scholars. I have done so because I believe that they can inspire a continued conceptual-empirical innovation across STS and anthropology.... More than anything, they illustrate that questions regarding the relationship between researcher and interlocutors, and also the empirical and the conceptual, are far from resolved. ....keeping these tensions alive may be the most important resources we have for posing questions anew about how (scientific) worlds are made, how to analyze this making, and how we allow analysis to be a proxy for questioning our own conceptual repertoires.

Now, why can’t we simply let a computer programme generate this mechanical prose and spare the author the burden of having to generate it for herself? It might even leave her more time and space for thought itself!

__Nigel Grant (2014-09-08 17:07:55)__

Excellent! This is why the well-known basic plain English criteria of everyday words, few acronyms/initialisms, active voice verbs, short sentences, personal pronouns, and minimal nominalisation only scratch the surface of good communication. Having something useful to say is the main point.

__Ron Wohl (2014-09-18 15:27:10)__

I am, I say shudderingly, an anthropologist. I wish I understood the paragraph produced, whether post, pre, or plain old modernist. I would like to understand it, I would like to delve into it further to see its plainativity or even its plainousness. However, I have no idea of whether it is mechanically produced or human. I know it clearly makes no sense to me. Does it have a deeper meaning? One which uncovers the pre-meanings of modern literature or is it merely tension producing or perhaps it
is meant as pre-tension or, having been writ, past-tension, or maybe just pretentious.

Steve Fuller (@ProfSteveFuller) (2015-04-05 15:32:15)

Ernest Hemingway on Solitude and Writing (2014-09-03 14:29)

Privacy in a Digital Age (2014-09-04 08:00)

In this interesting debate from the [1]iai.tv the “outspoken philosopher of science” Steve Fuller (also SI blogger and Warwick sociologist) debates Cory Doctorow and Kate Russell on the meaning of privacy in contemporary society. I’m pretty hostile to Fuller’s argument here but there’s some wonderful points in it (e.g. “transparency is just a euphemism for surveillance opportunities”, a general tendency towards privacy as a domain of litigation needing to be understood against the background of a weakened state) that I found extremely thought-provoking. The highlight
though was Doctorow’s dismissal of big data evangelicalism: “The idea that bigger haystacks have more needles on them is dumb on its face”. Though I’ve read some of his blog posts, I’d never heard him speak before and hadn’t realised quite how interesting a thinker he is. His fiction seems to be informed by his information activism and online work - [2] this sounds very interesting for instance.

Alistair Duff (2014-09-04 10:52:01)

I enjoyed this lively debate. The fight against technocracy is one of the biggest challenges of this century, so it’s good to see more and more people talking about privacy. Sorry to come out with a mere platitude.
The Scandinavian noir film adaptation of Danish author Jussi Adler-Olsen's gripping book The Keeper of Lost Causes hit our British art-house cinema screens this week. The original book, which was first published in Danish as Kvinden i buret in 2008, was translated into English by Lisa Hartford in 2011 with a new title Mercy. 

The Hollywood film industry could do very well to take note of something remarkable about the film adaptation of The Keeper of Lost Causes which should not be remarkable at all, but unfortunately in the socio-political climate we live in, I was surprised and pleased by the representation of the Muslim character. There is a subtle reference in the film itself to the way that the media presents Muslims, when Assad's partner tells him to stay quiet as the old lady has only seen his type on the television, but generally the character’s Muslim-ness is not overly focused upon. Assad (played by [1]Fares Fares) is a regular guy, as the film portrays, but he isn't a terrorist as we have come to expect of Hollywood blockbusters, where typically in an Orientalist tradition the Muslims are caricatures and stereotypes of villains and "others" (as was the case even before 9/11).

[youtube http://www.youtube.com/watch?v=ZNSm4MW3sic &w=560 &h=315]
Jack Shaheen’s famous 2001 [2] book and [3] film (Reel Bad Arabs: How Hollywood Vilifies a People) documented how 900 American movies (from the year 1896 until 2001) vilified Arabs males and females through ugly characterisation: the Arabs were portrayed as savage, uncivilised, aggressive and evil. Reel Bad Arabs also explains how Israel has in the past succeeded in garnering support in America because the American audiences, journalists and soldiers have always been bombarded with images and ideas about the “bad Arab” and the “good Israeli”. Shaheen has made an analogy between the anti-Semitic films made by the Nazis (that are now banned from German cinemas) and the image of the Arab in Hollywood. Schools need to explore the findings of Shaheen’s study of the Hollywood film industry, in Sociology, English, History and Media Studies, to begin to understand how prejudice against a people is amplified through negative representation, seeping into the consciousness of people, and eventually leading to widespread discrimination and racism in other areas of society. It is telling that Shaheen came to see that the distorted representations of Arabs were [4] not due to sheer ignorance, but was a purposeful ploy to demonise the “other”.

Watching The Keeper of Lost Causes made me appreciate the intentions of the writer to include the character of a Syrian Refugee whose humanity is at the forefront. Assad is Muslim, this is clear, but he is seen by the audience as more than that. Other aspects of his identity and his personality shine through to the audience who come to like him for who he is. There are scenes throughout the film that could be missed with a blink of the eye that hint at Assad’s faith: he has experienced hard times throughout his life too, he says, but it is implied that his faith in God has got him through testing times, particularly in a final scene. It will take years and years to combat the terrible harm that the Hollywood film industry has caused to Muslims in the US and worldwide, but films like The Keeper of Lost Causes are a positive step in the right direction. It makes a welcome change to not be disappointed by representation of Muslims in media texts. The Keeper of Lost Causes is the first in a trilogy of books/films about Department Q. I hope the sequels that follow continue to impress with positive representation of Assad.

2. http://books.google.co.uk/books/about/Reel_Bad_Arabs.html?id=nWXp59GVNgIC
Something very odd happened at the end of 2011. Time Magazine nominated ‘The Protestor’ as their Person of the Year. How did such a once reviled and satirised figure come to receive this mainstream acclamation? The magazine themselves invoked the End of History thesis, suggesting that the protesters who had shaped liberal democracies in the '60s and '70s had become passé with the fall of the Berlin wall and the ascendency of capitalism to untrammelled status across the globe. But with this era drawing to a close and finance capitalism seemingly struggling for survival, the “protestor once again became a maker of history”.

The Arab Spring protests that inspired this choice have since led somewhere altogether darker than was hoped by commentators in the upswell of breathless optimism that accompanied them. The Occupy movement, towards which liberal opinion was decidedly more ambivalent, no longer enjoys the prominence it briefly did. It would be silly to suggest that Time’s endorsement had any role in the subsequent perceived decline of these movements, if indeed this is the correct term for them, but I nonetheless found it hard not to ponder the correlation. It seemed to indicate something interesting about the significance of contemporary social movements but also the contradictory nature of their relationship with the media, in part seeking the publicity the media afforded but also at risk of being pacified by it.

Against this backdrop Social Movement Studies comes to seem one of the most significant areas of interdisciplinary research within the social sciences. Developing alongside the social movements which have been its object, contemporary social movement studies has become a vast and multifaceted tradition of inquiry. Speaking as someone who has been making a concerted effort to familiarise myself with the area over the last six months, the sheer size of this detailed and interconnected literature can be a barrier to new readers, whether they are aspiring social movements researchers or those with a more casual interest in the field. It is for this reason that [1]Hank Johnston’s book *What is a Social Movement?* is so valuable, offering a broad and accessible overview of this field by someone who has been at the centre of it through both his own research and position as founding editor of the journal Mobilization.
The weakest chapter comes at the end of the book. This is a shame because it is in this chapter that Johnston tries to
draw out the contemporary relevance of Social Movement Studies. The chapter feels somewhat rushed, lacking the
measured pace which plays such an important role in ensuring the clarity of his exposition elsewhere in the book. He
addresses topics like digital mobilisation and tactical occupations but does so rather briefly, in a way which makes it
hard not to wonder if he secretly wanted to write a longer book than this. The final chapter simply doesn’t cohere as
well as those that preceded it. It’s difficult to choose particular chapters to focus upon from this book, reflecting both
its consistent excellence and its affable brevity. I found the second chapter particularly useful, offering a perspicuous
overview of this expansive literature. It identifies a series of influential approaches and explains them clearly while
nonetheless avoiding the sort of irritating simplification that routinely afflicts textbooks about theory. Beginning
from Gustave Le Bon’s now largely rejected social psychological account of crowd behaviour, Johnston adroitly
demonstrates how the social movements literature has been recurrently structured around a conflict between
those researchers who, like Le Bon, conceive collective action as exceptional and irrational and those who see it
as a rational extension of ‘normal’ politics. The clarity with which Johnston draws out these tendencies across the
literature reflects the depth of his own engagements over his career. I found this immensely useful, almost equivalent
to having a jovial senior academic volunteer to sit down and talk you through a literature you’re unfamiliar with.

What makes this book so useful is how thoroughly it maps the topography of social movement research. It not only
summarizes particular approaches and tendencies within the literature, but also draws out the points of contention
between them and illuminates the fault lines upon which social movements research has grown and changed over
the previous century. The relative brevity of the book makes this achievement all the more impressive. It is a short
book, well under 200 pages, which nonetheless offers an admirably panoramic perspective upon a complex and
detailed field of research. What is a Social Movement? is an invaluable book, signposting a vast literature in an
accessible way likely to appeal to students and academics alike. While some of the contents may be challenging to
those without a social scientific background, Johnston’s prose is nonetheless clear enough that the book could be of
interest to a more general reader seeking to better understand the ways in which social movements have shaped the
world in which we live and are currently reshaping our collective futures.

Should graduate school be producing technicians or public intellectuals? (2014-09-07 08:00)

In his [1]rather contentious book about the current state of American sociology, Christian Smith makes an important
argument about graduate training in sociology and the kinds of scholars US graduate schools will tend to produce. It
echoes an argument I’ve read Steve Fuller [2]making in the past:
Increasingly, sociology graduate programs are turning out not intellectuals, but specialized technicians. After a perfunctory sprint through some of the classics, most graduate students are drilled on methods and statistics, pushed through some seminar classes that review major debates in certain fields, run up and down the MA-thesis staircase, given doctoral qualifying exams that summarise and criticise relevant literature in a few fields, and finally are pushed to write "doable" (read: narrow, unambitious, publishable) dissertations in order to prevent extended strays in their programs. Lately, dissertations often consist merely of three somewhat-related empirical papers intended to become journal articles, with an introduction and conclusion serving as bookends. Specific techniques are taught to graduate students in workshops about how to write an article that "land" well (again, the Holy Grail being in ASR or AJS), which only a few are capable of doing. Time for sociology graduate students to read, think, and converse deeply is minimal, sometimes nonexistence. Professionalization and career development trump grad students' intellectual formation in what would be truly interesting and important questions. So, such a system does not produce many broadly read, thoughtful, intellectually interesting scholars and teachers. It produces technicians, as I said, who have learned more or less well how to play the faculty-career publishing game.

The Sacred Project of American Sociology, p. 143

Leaving aside the obvious criticism that there are many factors other than programme design likely to be responsible for a squeeze on the time of graduate students, it's interesting to see these aspects of graduate education in the US which I'd always seen as positive instead described in such negative terms. I've often thought my own graduate education, with the exception of my excellent supervision, would have gained massively from being much more structured (though, to be fair, I think I resisted what attempts were made by the institution to try and ensure it was structured). Perhaps the relevant absence of professional socialisation in the UK, though this is changing rapidly, should be seen as a virtue? Particularly when it's coupled with [3]DIY doctoral pedagogy of a sort that has become increasingly common. Fabio Rojas touches on these questions in an interesting way in a post about 'Foucault kids', a group I'd understand as overlapping with but not being reducible to public intellectuals in Smith's sense i.e. all 'Foucault kids' are public intellectuals but not all public intellectuals are 'Foucault kids':

First, let's start with a discussion of the Foucault kids. In the way that I used it, I roughly mean ambitious graduate students who are doing work that crosses or combines various areas of study. Foucault, of course, was a Foucault kid. His training was in philosophy, but worked with George Canguilhem, who did work on the philosophy of science. In his career, Foucault did this mutant form of work that combined philosophy, history of ideas, and other stuff. Similarly, the Foucault kid is the young scholar who sees himself as some awesome sui generis scholar that breaks boundaries.

Who is a Foucault kid? Not you, probably. In fact, during my graduate career in Chicago, I only met two genuine Foucault kids, [4] this guy (who combined anthropology, ethnography, and hermeneutics) and, I think, one of his students. Later, I've seen them here and there, mainly at other elite programs in sociology. You also see them in idiosyncratic programs, like the [5] Committee on Social Thought . But still, overall, they're rare. I've met lots of brilliant people, but they exist mainly within the confines of sociology or some other discipline.

So, what sort of training does such a person need? It is unclear to me since we have little data. Many Foucault kids end up flailing, they can't complete their dissertations, and you never hear from them. The license to "be great" is often interpreted as a demand for perfectionism, or endless procrastination, or
being so weird that no one will take them seriously.

I can offer two hypotheses about what might work for a Foucault kid: (a) no training, just let them wander and demand a dissertation at the end, or (b) demand high quality training but allow weird or unusual combinations of fields.

Though Smith and Rojas are making different arguments, both seem to concern the extent to which the disciplinary mainstream is reproduced in graduate education. I suspect sociology in the UK would benefit from moving more in the US direction but Smith offers an important caution against this trajectory going too far.

Teaching philosophy through games: 8-Bit Philosophy (2014-09-08 08:00)

Our new favourite thing on Youtube: "Combining your favorite retro video games with legit philosophy knowledge, 8-Bit Philosophy will have you philosophizin’ like a BOSS". There are more [1]here but these are some of our favourites:
Sociology as the Science of Human Uplift: The Sacred Project of UK Sociology? (2014-09-08 14:35)

In this keynote talk from the 2014 British Sociological Association conference, Steve Fuller talks about "Sociology as the Science of Human Uplift". I was struck when listening to his discussion of the early history of the discipline in the UK, particularly the notion of sociology as a synthetic discipline orientated towards social change, by the parallels to what Chris Smith has recently written about as the [1]Sacred Project of American Sociology. Is Steve Fuller talking about the sacred project of UK sociology? I think his historical claims could be usefully articulated in terms of Smith’s notion and the exercise would be more historiographically plausible when applied to pre-disciplinary and early disciplinary currents in UK Sociology than it was with American sociology. In this case, it seems that the project was lost and that Fuller is arguing for its (cautious) retrieval.

Unfortunately it seems the BSA have disabled embedding so you’ll have to watch the video of Steve’s talk [2]here.

etseq (2014-12-20 18:55:50)
I had never thought to associate Steve Fuller and Christian Smith before but upon reflection, the comparison does illustrate an odd convergence of the extreme social constructionist Left and the theocratic revanchist Right in opposition to modernity, particularly the exclusion of the supernatural from the Academy. Fuller is one of the few on the Left that is still fighting the Science Wars of 90s - he reminds me of the Japanese Holdouts who refused to accept the surrender of the Emperor long after the end of the battles in the pacific theatre - who makes common cause with anti-secular religious fundamentalists and carlist roman catholics in opposition to well settled evolutionary theory. Christian Smith embraces a similar epistemological attack on science, methodological naturalism is the villain in his narrative, and laments the loss of Christian social and political hegemony, which he sees as the only bulwark against the "evils" of feminism, gay rights, atheism, etc. So far both Fuller and Smith have been unsuccessful in their attempted interventions in the academy and politics. Fuller’s testimony in the Kitzmiller trial on behalf of the intelligent design creationists seemed to validate the worst fears of his opponents in the Science Wars, Norman Levitt would be smiling from above if there was a heaven, while Smith comes off a bitter cultural conservative whose hypocrisy was exposed in his embarrassing homophobic "defense" of Mark Regnerus. If this is the state of critical social theory, the project needs serious reevaluation if it ever wants to exert influence beyond a small niche of ivory tower academics.
Without wishing to endorse the comparison, I can see why you lump me together with Christian Smith, in that we both maintain strong normative visions for sociology. I can even see why you compare me to a Japanese holdouts after the Second World War because, indeed, I do believe that the social constructivists (starting with Latour) blinked during the Science Wars and suddenly took an ‘ontological’ turn that implicitly ceded the epistemological ground to guys like Levitt. I call it surrender. However, where I disagree with you is in your conclusion – namely, that critical social theory needs to ‘re-evaluate’ itself in order to exert extra-mural influence. No, that’s the last thing that critical social theory needs to do, mainly because it’s the only thing that critical social theory ever does: i.e. reflect on itself (aka navel gazing). What critical social theory needs to do is to make more public interventions of the sort that Smith and I have done. Of course, there is no guarantee of success, but you might learn something from these failed experiments (if they are indeed failures) to do better in the future. But there is no formula hidden in the writings of Bourdieu or anyone else that will guarantee that a theorist can make a positive difference to the world. You just need to try harder.

As it turns out, this Christmas message of mine to the Social Epistemology collective may be of interest in the context of this discussion: http://social-epistemology.com/2014/12/25/christmas-greetings-2014-steve-fuller/

I am amazed that Fuller is still taken seriously in the UK - his reputation was destroyed in the US because of his creationism. If you want sociology taken seriously, I’d suggest not having him speak at your annual BSA meeting!

Smith’s public interventions include promoting right wing think tank funded “science” that smears gay parents as child molesters. I’m sure you can justify this as some sort of reverse affirmative action for straight, white christian homophobes but at that point you should just drop your pretense at being a leftists, liberal, etc.

Pro-wrestling, unionisation and American capitalism

This fascinating article on Jacobin offers an historical perspective on professional wrestling, a sport that "with its screaming neon lunatics, potbellied big daddies, and tasseled 'ring rats', has been considered too absurd to be taken seriously". Yet the dominant World Wrestling Entertainment trades on the New York Stock Exchange with a capitalisation of over $856 million and professional wrestling has a long history which intertwines in complex ways with that of the United States itself:

Nothing is more real — and more obscured by the smoke and mirrors of the mat — than a simple fact: the billion dollar spectacle of pro wrestling relies entirely on the ruthless economic, mental, and physical exploitation of its performers. In that world, of lingering physical ailments, screwjob employment contracts, and chugalug drug abuse, Hulk Hogan is a millionaire named Terry Bollea, a favorite of WWF management, poached from a Minneapolis wrestling promotion and transformed into the star of "Hulkamania." In that world, in 1986, Bollea ratted out his fellow wrestlers to crush a nascent unionization drive ahead of Wrestlemania II. In that world, wrestlers are exploited and injured and thrown away — their final contribution to the world, a mortality rate on par with day one of Antietam.

For a fake sport, pro wrestling sure has a lot of real casualties. Its only business model is fear.
Yet it wasn’t until recent decades that wrestling would grow unbelievably profitable, just as control of the entire industry came to rest with one corporation. On New Year’s Day, 2014, WWE CEO and Chairman Vince McMahon could claim to be a billionaire in almost full control of the industry.

But these machinations are the stuff of rich men. Most wrestlers are not rich men.

It’s a wonderful piece, even by the high standards of Jacobin Magazine. Read the full essay [5]here.

_______________

Book Review: A Critical Pedagogy of Resistance: 34 Pedagogues We Need to Know (2014-09-09 12:09)
Those passionate about social justice issues will enjoy reading an edited collection that illuminates the lives and works of the brilliant people who have dedicated their lives to fighting social injustices, and aims to inspire the reader to think about and act upon ways to engage in social transformation. The book, edited by James D Kirylo, highlights how social inequalities in the last decade (class, race/ethnic) have been steadily increasing globally. Poverty amongst children is ever increasing; in the USA, there are more black males in the criminal justice system than students in college; among the youth of Spain the percentage unemployed is more than 54%. According to Kirylo, neoliberalism has given rise to a validation of individualism, privatisation, competition and profit, resulting in decline of the public. Education is seen in terms of economics, students are commodities and teachers are mere machines. Henry Giroux et al in their new book, Neoliberalism, Education and Terrorism, have also discussed the threat of neoliberalism on contemporary progressive education: “Neoliberal approaches to educational practice shun innovation because these teaching practices attempt to foster autonomous, critically engaged citizens, rather than non-autonomous, fundamentally structured state subjects”. Therefore, it is clear that we urgently need critical pedagogues and their philosophies of education: the argument for the relatively new concept of critical pedagogy, influenced by Paulo Freire, is that it is “ethically responsible to scrutinize, challenge, and oppose people, structures, and systems that oppress and dehumanize”, and to resist/challenge mechanisms of oppression in order to demand equal opportunities to participate in the world.

The introduction of the book neatly defines the core characteristics of transformative social justice. We learn that critical pedagogy is an ongoing project simultaneously located in pain/struggle and hope/joy. Critical pedagogy is evolving and empowering as the social world changes, new problems and new conflicts arise, that need interrogating and resolving. Critical pedagogy, allows us to be honourably angry about injustice, and is never about staying in a neutral position, but always about being decisive and active. Critical pedagogues are humanizing agents. We are shown that critical pedagogues are concerned with resistance, courage and action. There are commonalities that bind together these specific pedagogues the editor has chosen to focus upon: he explains that they all are driven by conviction to transform society, they all possess love and care for humanity, and most have them have a link with Paulo Freire and his ideas. Critical pedagogy is therefore about promoting social justice, democratic spaces, and love and hope for humanity.

Some of the more well-known critical pedagogues included in the book are Michael Apple, Judith Butler, Noam Chomsky, Antonio Darder, John Dewey, bell hooks, Henry Giroux Antonio Gramsci, Joe Kincheloe, Donaldo Macedo, Ira Shor, Edward Said, Cornel West, W E B DuBois, as well as a number of other inspiring educationalists (not educationalists in a conventional sense) from diverse backgrounds. The book places emphasis on the autobiographical experiences of each of these pedagogues, and how their powerful, diverse and complex socio-political histories impacted upon their critical consciousness and their desires to transform the world into a just place. Some of these pedagogues have personally experienced oppression and danger, whilst the other pedagogues are have been in dangers of losing their jobs because of their challenging oppressive institutions and practices. Kirylo explains that these pedagogues he has included in his edited collection have shown vast commitment to social justice through visits to oppressed and marginalised communities, through research, teaching and writing about oppression, and through becoming beacons of hope serving humanity.

The audience for this book is students interested in critical pedagogy and social justice issues (education, race, ethnicity, gender, theology, language, power, justice and so on), as well as teachers and other educationalists who are keen on widening their knowledge base on key thinkers and writers in the field of critical pedagogy. The book is extremely useful for those wanting to get to know a range of critical pedagogues, and then use this as a springboard to further research those particular pedagogues who appeal. The book aims to accompany the reader on a journey out of his/her comfort zone, so that s/he reflects upon the social world. A Critical Pedagogy of Resistance: 34 Pedagogues We Need to Know is one of a great number of important books in a contemporary series entitled Transgressions: Cultural Studies and Education, aiming to explore how the intersection of cultural studies and education brings forth fresh new emancipatory and transformative ideas and practices.
Sadia Habib is a doctoral candidate currently researching British identity at Goldsmiths, University of London. Prior to this she taught English at Key Stages 3,4 and 5 in Manchester and London.

Foucault—The Lost Interview (2014-09-10 08:00)

This is a very interesting companion to the well known debate between [1]Chomsky and Foucault. It also has an unintentionally hilarious opening scene with retro music and an action close up on Foucault's scalp.

IFRAME: [2]//www.youtube.com/embed/qzoOhhh4aJg

Unusually for a youtube video there's an extensive and informative note accompanying the video. Read the full thing [3]here:
This until now rarely seen 15-minute footage is of an interview that was conducted by the Dutch philosopher Fons Elders in preparation for the debate between Noam Chomsky and Michel Foucault, which was broadcasted on Dutch television on Sunday, Nov. 28, 1971. The whole interview was essentially lost for decades and was published in the winter of 2012 for the first time. It is now available as a book under the title of "Freedom and Knowledge." An excerpt is available for free online on Elder’s own website where people can also purchase the actual book (only available there):

The interview in its book form as "Freedom and Knowledge" includes a few more topics and has both an excellent introduction by author of "Mad for Foucault," Lynne Huffer, as well as an answer to her, a preface, and a retrospective appendix, each by Fons Elders.

Ecological privilege and the ugly underside of airborne conference-going (2014-09-10 13:42)

by Joseph Nevins

Hardly a week seems to pass when an announcement or a “call for papers” for a conference, seminar, or workshop enters my inbox, or I hear a colleague mention a recently undertaken or soon-to-happen trip to some far-flung locale for an academic gathering. Among other things, they are a manifestation of the growth in what Karl Høyer and Petter Næss call “[1]conference tourism”—a phenomenon that typically involves air travel for the vast majority of participants.

Airborne academic conference-going is often undertaken with a certain glee given the opportunity to meet up with old friends and make new ones, to travel to interesting destinations, and to exchange ideas with engaged colleagues. Although the individual benefits are clear, rarely, if ever, are the considerable socio-ecological costs raised, costs typically incurred by the already vulnerable, the global majority who live on the world’s socio-economic margins.

The failure to do so is especially striking in a time of climate change, one that now demands immediate, [2]radical reductions in the ecological footprints of (especially) the [3]twenty percent of the world’s population responsible for more than 80 percent of greenhouse gas emissions. In the face of such demands, the effective response of academics has been to jump on the next flight to yet another conference city, growing what are typically already grossly oversized, individual and collective carbon footprints in the process.

It is a behavior that flows from and serves to exacerbate the unjust "isms" associated with race, class, nation, and empire, ones constructed in part by the extraordinary spatial mobility enjoyed by Western academics as a whole: (Flying is an activity of the planet’s privileged classes: according to the World Watch Institute, [4]less than 10 percent
of humanity has ever flown.) The costs also emanate from and reproduce [5] ecological privilege—which allows for the appropriation of a disproportionate amount of the planet’s resources, the privatization of the benefits and the socialization of the detrimental impacts—and its flipside, ecological disadvantage.

To get a sense of how big the footprint is of professional academic gatherings, I [6] measured the impact of attendee flights to and from Seattle, the host city of the major conference of the Association of American Geographers in 2011. An estimated 7,300 people attended with the vast majority coming from throughout the United States and Canada and 20 percent from outside of North America.

Total conference-related air travel resulted in roughly 5,351 metric tons of carbon emissions. (By way of visualization, one ton of carbon emissions at standard atmospheric pressure would fill [7] a cube, each of whose sides would be more than eight meters by eight meters.) The actual impact on the climate system was far greater, however. The height at which planes fly, the mixture of emitted gases and particles, and the contrails and other forms of cloudiness that aviation produces mean that air travel contributes to the warming of the climate approximately 3 times more than that of its carbon emissions. Given this, the meeting’s effective aviation-related footprint was approximately 2.2 metric tons of CO2 emissions per attendee—regardless of mode of travel (an estimated 7.66 percent of attendees were already in the Seattle area or traveled there via ground transport). In other words, the impact of conference flights per attendee was, by itself, [8] greater than what would be allowable were carbon emissions allocated equitably and sustainably among the planet’s denizens. As for the conference as a whole, its total aviation-related warming effect on the climate system is that of about 16,053 metric tons of CO2—equal to the annual emissions of 76,443 Haitians (based on 2006 figures from the U.S. Department of Energy).

One might contend that in a world of more than seven billion people, a population that produced [9] 36 billion tons of carbon emissions in 2013, the impact of any individual conference, even one involving thousands of people, is too small to be of concern, and that scrutinizing it is a diversion from the need to focus on the big picture, or structural matters. But just as “everyday” sexism flows from and helps to reproduce patriarchy, so, too, does individual consumption relate to systemic ecological injustice—that is, there is a dynamic interrelationship between agency and structure. Moreover, as Kevin Anderson, deputy director of the [10] Tyndall Center for Climate Change Research, states, such a contention can serve as an excuse for personal inaction and a way of avoiding putting one’s proverbial house in order. “Divide the world into a sufficient number of small parts,” he [11] writes—say, California, Beijing, or London—and everything fits into the “classification of ‘miniscule’, i.e. so small as to be irrelevant.”

The “miniscule” matters not only for the biosphere, but also for human well-being and issues of social justice as climate change disproportionately impacts [12] people of color and [13] low-income populations and countries—due to their already existing vulnerability and the accidents of geography (as climate change-related detriments spread unevenly across global space and concentrate in particular regions). In terms of individual bodies, increasing carbon emissions, and air pollution more broadly, contribute to respiratory illness and asthma, and large numbers deaths annually. (The World Health Organization [14] approximates that outdoor air pollution caused 3.7 million premature deaths in 2012. Climate change, according to [15] one estimate, contributes to the deaths of another 400,000 annually) Hence, conference-going of the jet-setting variety helps to kill—and typically the most vulnerable among us.

Admittedly, one could make the same argument about any consumptive practice based on industrially-produced goods in a world of gross inequalities embedded in unjust systems. But what makes flying stand out is the size of its impact, one that dwarfs all other acts of individual consumption and hence its injurious effects. Furthermore, by allowing for fast travel, flying “saves” time that [16] allows for additional acts of consumption (such as more trips).

There are alternatives, of course to conference jet-setting. These include: choosing the sites of meetings on the basis of limiting the total amount of miles travelled; reducing the frequency of meetings (changing them from annual to quadrennial, for instance); holding smaller conferences that draw on spatially limited areas; requiring that attendees take ground transport; and instituting ways of disseminating research and networking that do not require
in-person meetings.

Beyond such innovations, more far-reaching changes are needed, ones entailing slowing down, doing and consuming considerably less, and sharing the Earth’s resources in a far more equitable fashion than is the case currently. These changes have implications not only for the individual choices of academics, but also for our collective professional practices that involve, among other matters broadly related to consumption, long-distance travel—ranging from job interviews, to guest lectures and academic conferences (and the pressures on graduate students and non-tenured faculty to participate in them). While the neoliberalization of the university and the growing emphasis on quantifiable forms of professional academic output help to shape these practices and to limit alternatives, this does not at all mean that academics don’t have agency—or responsibility.

What allows us, the ecologically privileged, to ignore responsibility is our social position. Even if we are aware of how our practices relate to injustice, we do harm-inducing things (among other reasons) because we are structurally allowed to do so, because we don’t want to inconvenience or to deny ourselves, because we can pass off the costs to unseen and seemingly distant others, and because we are rarely, if ever, compelled to account for our profligate ways.

A more just world necessitates such an accounting—in addition to new sociological imaginaries and practices, and new ecological ones to which they are inextricably tied. Putting an end to the high-flying ways of academic conference tourism is one of many good places to start.

Joseph Nevins is an associate professor of geography at Vassar College in Poughkeepsie, New York. His research interests include socioterritorial boundaries and mobility, violence and inequality, and political ecology. Among his books are A Not-so-Distant Horror: Mass Violence in East Timor (Cornell University Press); Dying to Live: A Story of U.S. Immigration in an Age of Global Apartheid (City Lights) and Operation Gatekeeper and Beyond: The War on “Illegals” and the Remaking of the U.S.-Mexico Boundary (Routledge).
Joseph Nevins is an inspiration on this topic. No exaggeration – a conversation with him a couple years ago persuaded me to undertake a year without flying for either pleasure or work, despite being an active academic. I made it only 11 months (sigh), from May 2013 to April 2014, but I’m trying again now. Why should we be hypocrites? If we tackle this issue with courage, we will have greater integrity in our research and somewhat rarer conferencing on environmental issues, “and” quite probably we will have some extra time left over to spend with loved ones.

» On the Future of Face-to-Face Academic Interaction, or Why We Need to Talk about Gemeinschaft The Sociological Imagination (2014-12-30 11:46:55)

[...] usual academic narcissism, this question is periodically posed in terms of conference attendance, with the Pharisees amongst us in full flow about how much harm is caused by flying. To be sure, I am the first to admit that the performance of most academic conference speakers does [...]

Research ‘Ignite’ CFP – Being Human in a Digital Age (2014-09-13 08:00)

The event is aimed at early career researchers in the humanities (who may be also working across disciplinary divides such as in the arts and sciences) whose research connects to the theme of ‘being human in a digital age’. Ignite events challenge researchers to make their case in a short, succinct way by giving them five minutes only to make their case. For this event, which will be held in the University of London’s Senate House on the 15th November 2014, we are also challenging applicants to make their research accessible to a non-academic audience.

The event forms part of [1]Too Much Information – a day of public events hosted by the School of Advanced Study, University of London exploring what it means to be human in a digital age. Contributors to the day include the Mass Observation Archive, the Centre for Advanced Spatial Analysis (UCL), the British Library and the Oxford Internet Institute. Confirmed keynote speakers include Professor Sir Nigel Shadbolt and technology writer Ben Hammersley.

We are particularly (but not exclusively) interested in hearing from people whose research may touch upon some of the following areas working on some of the following topics:

- the history and future of ‘big-data' in the humanities – from paper archives to digital repositories
- surveillance, online privacy, the ‘right to be forgotten’ and the politics of the internet
- new technologies and their impact on human consciousness, memories, emotions
- historical, literary or artistic explorations of ‘information overload’
For the full call, and details of how to apply, visit the [2]Being Human festival website. The deadline for applications in 1 October, 2014.

Please feel free to circulate this amongst colleagues/PhD candidates who may be interested.

Wellcome Trust Symposium and The Curious Museum of Personal Medical Devices (2014-09-14 08:00)

Wellcome Trust Symposium on New Conceptual Approaches to Personal Medical Devices

18th-19th September 2014
Post-doctoral Suite, 16 Mill Lane, University of Cambridge, Cambridge

Fuelled by the accelerating pace of technological development and a general shift to personalised, patient-led medicine alongside the growing Quantified Self and Big Data movements, the emerging field of personal medical devices is one which is advancing rapidly across multiple domains and disciplines – so rapidly that conceptual and empirical understandings of personal medical devices, and their clinical, social and philosophical implications, often lag behind new developments and interventions. Personal medical devices – devices that are attached to, worn by, interacted with, or carried by individuals for the purposes of generating biomedical data and/or carrying out medical interventions with/on the person concerned – have become increasingly significant in clinical and extra-clinical contexts owing to a range of factors including the growth of multimorbidity and chronic disease in ageing populations and the increasing sophistication and miniaturisation of personal devices themselves.

The aim of this symposium is to consider recent theoretical developments in the humanities and social sciences in relation to personal medical devices, and to address important gaps in understanding such as the differences between wearable and non-wearable devices, the ontological implications of personal devices for concepts of the body, the self, and technology, and the extent to which such questions may arise with particular force owing to ‘new’ technologies.

The symposium takes place at the University of Cambridge over two days, with the first day consisting of papers and keynote presentations, and with the second day consisting of further discussion and a concluding panel of invited discussants from a range of backgrounds including computing science, clinical medicine, technology, and philosophy. The symposium combines invited and submitted papers from established and emerging scholars to consider how recent theoretical literature can shed light on current debates surrounding personal medical devices these and other important issues.

Some of the questions that papers may address include:
• How ‘personal’ are personal medical devices?
• How new are ‘new’ medical technologies?
• What are the implications of personal medical devices for enduring philosophical dualities such as mind/body and
CONTRIBUTIONS INVITED FOR THE CURIOUS MUSEUM OF PERSONAL MEDICAL DEVICES

As part of the Symposium, we are hosting a multidisciplinary panel discussion inspired by Radio 4’s Museum of Curiosity – i.e. we are asking panellists to suggest technologies that they believe merit inclusion in a virtual museum, in this case of personal medical devices. The idea is to encourage interdisciplinary discussion in an interesting and fun manner.

We wanted to open an invitation to members of the Quantified Self network who might be interested in putting forward their own suggestions of personal medical devices that have somehow defined a particular medical (or related) field or which they see as of particular significance. As long as they are attached to, carried by, worn on, or otherwise interact with individuals, the devices can be of any kind whatsoever – past or present (or future!), small or large (within reason), automated or ‘dumb’, simple or complex. They don’t even have to be ostensibly ‘medical’ devices as long as a rationale can be made for their serving medical ends – i.e. Jawbones, Fitbits, Garmin all welcome!

We would be very grateful if you would consider contributing. If possible, we would like suggestions to be passed on by 8th September, accompanied by a short piece of text (e.g. up to 300 words) making a case for the device’s inclusion. Suggestions would be displayed at the symposium, online, and in future events. In order to illustrate the kind of thing we are looking for, I have included below the suggestion received from Professor Simon Griffin of the Primary Care Unit, University of Cambridge.

We hope you will consider being involved in this way in what promises to be a very interesting and stimulating event.

Best wishes,
Conor Farrington and Rebecca Lynch

What would happen if an evil scientist wiped the memories of everyone within a workplace? (2014-09-15 08:00)

In a recent paper [1]Tero Piirainen suggests that “if we all just suddenly lost our memories and other relevant neural dispositions—if no one was able to remember his or her own name, let alone relatives, friends, possessions,
occupation, place of residence, and so on—there would be nothing left of social relations and structures”. This is a science fiction scenario I actually find extremely interesting. Consider that one day, as a result of a natural disaster or fiendish scheme by an evil scientist, “memory and neural dispositions” were suddenly erased at one moment in time. What would the world look like afterwards? I think it would briefly look very similar to the world before the event. For instance the spatial positioning of people within a workplace would be structurally conditioned, likewise how they were co-located (or not), how they were dressed, the length of time they had been present at the workplace that day and what they had been doing up until the memory wipe. It’s certainly unlikely that these structural features of the workplace would be reproduced after the memory wipe but this simply reflects the activity-dependence of social structure i.e. they rely on agential doings for their reproduction or transformation. The enduring causal power of past structures is precisely the point that social realists are making against the central conflation that Piiroinen espouses. I’d maintain that you couldn’t explain the unfolding of events in this scenario without reference to the causal power of past structures i.e. the responses would be patterned rather than atomistically chaotic.

But a lot also depends upon precisely how many “relevant neural dispositions” have been lost in the mind wipe. In a workplace that has card based access systems, the physical possession of the card and its power to enable access to certain locations within the workplace would be unaffected by the mind wipe. People would still have credit cards, mobile phones and personal computers which with sufficient remaining ‘neural dispositions’ could be leveraged to make sense of the undoubtedly confusing situation in which they now found themselves. In fact if the memory wipe were not worldwide but rather something localised to a particular region, or even a workplace, it’s not difficult to imagine how aggregated individual actions of those subject to the mind wipe would provoke collective intervention by authorities that could in turn lead to the reproduction of those structures Piiroinen suggests would be ‘lost’. In short I think there would be something left of social relations and structures. We wouldn’t be able to see it directly but we would be able to see its effects.

**An introduction to curation tools** (2014-09-16 08:00)

For all that digital technology offers the academy, it also presents new problems. The instant availability of information from all over the world poses the inevitable challenge of how to collect, sort, evaluate and share this information. These are tasks which those working in universities, across the full range of roles, have always performed. However the sheer abundance which characterizes our modern knowledge environment too often results in information overload for those whose professional and personal interests give them no choice but to engage with this torrent. It is for this reason that curation tools, often ‘seen as the next big thing’ of social media, offer the potential for such enormously gainful use by university staff.

Curation is the broader concept behind Pinterest, by far the most well known of these tools. The service operates as a virtual ‘pinboard’, allowing the user to explore the internet, collecting images they find through the use of a convenient browser button (in a similar way to creating new browser bookmarks) and make these titled pinboards available online. However Pinterest is just one tool amongst many and, with its central focus being on images, in many ways it is less versatile than some of the others. Here are three of my favorites:

**Storify** allows users to search multiple social networks and knit together items they find into sequential stories. I’ve personally found this useful for preserving Twitter debates that I’ve found particularly intellectually stimulating. However this only represents part of what the tool is capable of if you combine a sufficiently diverse range of elements,
whereas my uses have been merely been reconstructing conversations on one medium that I was actively involved in. The most impressive uses I have seen have tended to revolve around covering events, either live or retrospectively.

**Bundlr** is my personal favorite and I can’t recommend it enough. As with the others, you use a browser button to 'bundle' content. When you’re on a web page which you want to curate, press the button and either choose an existing bundle or make a new one. What’s most impressive about Bundlr is how it combines the ability to handle many types of content (e.g. youtube videos, images, tweets, presentations, web pages) with effortlessly making the finished product look aesthetically appealing. It’s also incredibly easy to pick up and use. Within a few hours of signing up to Bundlr I had multiple bundles which had collectively received hundreds of hits.

**Scoop.It** allows you to publish 'magazines' based on content you 'scoop' through a browser bookmark. Whereas some of the other tools focus more on collating items, Scoop.it offers more room for curation in the strict sense of the term: it gives you more opportunity than the other tools to control what aspects of your 'scooped' items are highlighted and what commentary you offer about them. It also has an interesting, though in my experience not quite perfected, tool which automatically offers you ideas about things to 'scoop'.

If the concept of curation interests you then I would advise experimenting with a few tools to see which one is right for you. While there are undoubtedly objective differences between them, there is also a large aspect of subjective fit: each of them rests on some underlying embodied metaphor (e.g. pinning on your pinboard, putting items in a bundle, scooping up items for your scrapbook newspaper) and what works for one person might not necessarily work for another. Furthermore, it is worth bearing in mind that there is no 'right' or 'wrong' way to use these tools. Here are some of the things I have used them for: making resource packs for social media training, inventoring journal articles I use in my research, producing a portfolio of projects I have been involved in, pulling materials together to help prepare for projects I have yet to start and collecting materials about my favourite authors. But there are many other ways in which they can be used. Curation tools will enhance any task that involves collecting, sorting, evaluating and sharing digital material.

**Social Acceleration and Musical Innovation** (2014-09-17 08:00)

I just came across a lovely point in Harmut Rosa's book about the relationship between social change and musical innovation. Certain forms of music come to be seen as emblematic of the age but, as that age changes so too does the sensibility which is brought to bear upon that music:

> today certain forms of jazz music that, at the time of their emergence in the first half of the twentieth century, were experienced as breathless, hectic, exceedingly fast, machine-like, and stupefyingly chaotic - and thus as fitting reflections of their era - are touted as "music for tranquil hours" or "jazz for peaceful afternoon."

Harmut Rosa, Social Acceleration, p. 82

If I'm in the right mood, I love music that is "stupefyingly chaotic". I wonder if digital hardcore, gabba and breakcore
will come to seem quaintly relaxing in future years? Or are there inherent limits upon musical innovation which entail an upper limit on elaboration of this very particular sort?

**How To Keep Your Sociological Imagination Alive (2014-09-17 17:40)**

In this podcast recorded for Sociological Imagination, Les Back discusses the craft of sociology with Howard Becker. As anyone familiar with his [1]Art of Listening will realise, Les has long been concerned with the role of attentiveness in the practice of sociology, striving to "document and understand social life without assassinating it" and helping younger scholars learn to do the same. This is an approach to sociology both inspired by and building upon the lifelong craft which Howie, as he's known to his friends, has expressed in far more than a plethora of books and papers (including the [2]most inspiring book about academic writing that anyone is ever likely to write) - as Les put it to me in an e-mail, Howie has tried throughout his career to show how it's possible to do sociology differently. So too has Les and in this fascinating discussion he invites Howard to reflect on how to keep your sociological imagination alive in a context that too often mitigates against it. In the process they present a vision of sociology in which creativity co-exists with rigour and a sociological sensibility is something one cultivates by looking beyond the academy. I found the resulting interview hugely inspiring and I hope you will too:

Trailblazing Sociologist Receives Special Achievement Award: An Interview with Dr. Patricia Leavy
(2014-09-17 23:13)
Patricia Leavy, Ph.D. is an independent scholar and novelist (formerly Associate Professor of Sociology, Founding Director of Gender Studies and Chairperson of Sociology & Criminology at Stonehill College). She has published sixteen books including Method Meets Art: Arts-Based Research Practice (Guilford Press, 2009, 2015) and research-informed novels American Circumstance (Sense Publishers, 2013) and Low-Fat Love (Sense Publishers, 2011). She is the editor for five book series with Oxford University Press and Sense Publishers. She has appeared on national television, radio, is regularly quoted by the news media, publishes op-eds and is a blogger for The Huffington Post and The Creativity Post. The New England Sociological Association named her the 2010 New England Sociologist of the Year. She just received the prestigious 2014 Special Achievement Award given by the American Creativity Association for her work advancing arts-based research and for the ground-breaking Social Fictions book series.

Congrats on your ACA Award which recognizes your “special and extraordinary advancement of arts-based research and the ground-breaking Social Fictions book series.”

Thank you!

The ACA recognizes creativity in any field and they have honored some of the world’s most famous astronauts, scientists, inventors, surgeons, and humanitarians. You’re the first sociologist to receive this honor.

Well, that’s what I’ve heard. I think it goes back to the hard science versus soft science artificial divide that privileges some ways of knowing over others. The social sciences, and sociology in particular, have historically been undervalued. We continue to see this built into funding structures and the like. It’s absolutely the case. However, I am increasingly hopeful that the tide is turning. As the global work economy continues to stress the importance of innovation, creativity and critical thinking, the perspectives and tools of sociology will have their chance to shine. We can’t put it all on the structure of funding agencies and the like though. I think we need to take some responsibility too. There is a marketing issue. Sociologists need to find creative and effective ways to market what it is that we do, so that others know the tools we have in our arsenal.
The award honors your work advancing arts-based research. Can you explain that and how it is connected to public sociology and the sociological imagination?

Arts-based research merges the creative arts and scholarly research across the disciplines. For example, one might write up their focus group research as a play. Arts-based research practices offer us new ways to ask and answer research questions, they may allow us to tap into issues that are otherwise out of reach, they can help us forge micro-macro connections and they allow us to engage broader public audiences with social research.

Expanding on those two last points, first arts-based research provides one set of tools for public sociology. I think most sociologists accept that traditional academic journal articles are totally inaccessible to the public because both they are jargon-laden and they circulate in out of reach journals. Arts-based research facilitates public sociology by making the products of our research accessible in every sense of the word. What’s more, the work has a chance at being engaging and memorable so that audiences are more likely to be affected and moved to reflection, re-evaluation of previously held ideas, or even social action.

With respect to micro-macro connections, the heart of the sociological imagination, arts-based research is enormously useful for crystalizing these connections through the process of showing instead of telling. For example, by taking interview research and writing it up as a short story or novel we can use tools such as interior dialogue to show how characters are internally impacted by their environment, such as a conversation or interaction or when they are consuming the services of an institution or consuming cultural objects like pop culture. The possibilities are unlimited for illustrating micro-macro connections in ways that include the reader in the process.

You’re specifically being recognized for the Social Fictions book series which is being called “ground-breaking,” “a watershed moment in the academy” and “a landmark achievement.” Please describe the series.

We publish books that are written entirely in literary forms including novels, plays, short story and poetry collections, but the books are authored by scholars and informed by their teaching and research. In other words, the series publishes the products of arts-based research. The series represents a new way to communicate information. I began the series after wrote my first novel, Low-Fat Love. Low-Fat Love explores low self-esteem, the psychology negative relationships, attraction to those who withhold their support and female identity construction. That book was loosely based on nearly a decade of interview research with young women about their relationships, identity and self-esteem issues.

The real idea behind the series is to change the way we share research outside of the academy and to change the way we teach within the academy. The books are read by both lay people and are adopted by college professors as springboards for class reflection and discussion on the themes in the books. In an age dominated by standardized testing and the like I think it is vital we create more ways to foster engagement, critical thinking and active learning. That is the intent behind our series. For my own novels in the series part of my hope is to share a sociology of daily life and help readers to forge micro-macro connections, through their own analytical process. For instance, in Low-Fat Love characters are engaged in consuming pop culture and readers have access to descriptions of that pop culture as well as how the character is affected by it. Readers have that access through internal dialogue and third person narration.

As someone who has repeatedly taught introduction to sociology with your novel American Circumstance, I can see exactly what you are talking about. Students love reading the book because it’s not dry the way typical course texts are but they are also given the chance to interpret the text in multiple ways, and their assumptions are challenged along the way which then becomes grounds for discussion.

That’s fantastic because it has been the hope. That book explores how social class impacts identity and relationships
which is something that is often difficult to talk about. I was particularly committed to exploring the back-stage of the 1% given the events and social climate of the past few years. So much of sociology considers patterns of interaction, cultural norms and values, and I wanted a way to show some of that in action. American Circumstance is actually my favorite of my own books. One of my heroes, sociologist Laurel Richardson, said that the book offered a “sociology of everyday life” and challenged her cultural assumptions. I hope it does the same for students and others.

In the field of sociology we often recognize people for their theoretical contributions. I believe you consider yourself a methodologist. How important is it that we recognize methodological contributions?

Methodology is all about building effective research practices, designing plans for carrying out research and even considering new structures for building research and research reports. So there's no question methods and methodologies are integral to our field and all fields. The privileging of theory over methods is sort of nonsensical because in fact in methodology theory and methods merge. In other words, they are inextricably bound to each other. It's the chicken or the egg question of sociology, but honestly, instead of asking that question isn't it best to support and honor both?

Finally, people credit you with being a leader in your field, particularly through the book series you have created. But knowing you personally, I’m not quite sure if you see it that way. Any comment?

In some ways I think of myself as very much following others who are doing amazing, ground-breaking work. I learned that sometimes if you want to hang out with the cool kids you need to invite them to a party.

How to become a superstar economist (2014-09-18 08:00)

http://gty.im/120947010

This was an interesting little section in a thought-provoking article about Alan Greenspan's ambivalent relationship to the economics profession:

Step 1 is to attend an elite college, like Harvard (Bernanke), M.I.T. (Summers) or Brown (Yellen), followed by a top Ph.D. program at a place like M.I.T. (Bernanke), Harvard (Summers) or Yale (Yellen). Next, establish yourself as one of the smartest kids on campus, though not necessarily one of the most popular.

While in graduate school, find a prominent mentor. For Bernanke, it was Stanley Fischer (later governor of the Bank of Israel). For Summers, it was Martin Feldstein (later Ronald Reagan's chief economist). For Yellen, it was James Tobin (a former adviser to John F. Kennedy).

If your dissertation is good enough, you get to become an assistant professor at yet another elite institution, like Stanford (Bernanke), M.I.T. (Summers) or Harvard (Yellen). There you spend your time teaching and, more important for your future career, writing scholarly papers. These papers may be unintelligible to mere Muggles, but that's O.K. Your goal is to impress your fellow economists.

If your articles are sufficiently numerous, well published and widely cited, you are eventually awarded a tenured sinecure in a top economics department or business school, like Princeton's (Bernanke), Harvard's (Summers) or Berkeley's (Yellen). Having achieved this rung of success, you are on your way to becoming an economist's economist.

At this point, paths diverge. Most economics professors are content spending their careers at universities. Some temporarily depart from academia to make a small contribution to the policy world. (Full disclosure: From 2003 to 2005, when I left Harvard to serve as chairman of George W. Bush's Council of Economic Advisers, I regularly interacted with Greenspan, who was then chairman of the Federal Reserve.) But most of these professors-on-leave soon return to the comforts of the ivory tower.

Yet a few tenured economists become restless with the obscurity, slow pace and petty politics of academia. They yearn for the fame, fast pace and petty politics of Washington. With the help of political benefactors, they find themselves in positions of real authority. Bernanke, Summers and Yellen are examples.

Would it even be possible to write a similar article about becoming a superstar sociologist? Perhaps this is a very good thing.
The weight of economic output (2014-09-19 08:00)

Loathe though I am to say something positive about Alan Greenspan, I'm rather taken with [1]this way of thinking about economic output:

Mr. Greenspan, one of the nation's most astute economic observers, has a rare talent for framing economic trends. He writes, for example, that as the value of the nation's economic output has increased since the 1970s, the weight has not. He means this literally: If everything "Made in the U.S.A." in 2013 was placed on a giant scale, it would weigh about as much as everything "Made in the U.S.A." in 1977. It's hard to imagine a more vivid illustration of what it means to say that the United States has shifted toward a "knowledge economy."

Crisis and Social Change: Towards Alternative Horizons (2014-09-19 17:56)

Cambridge Sociology Conference
Crisis and Social Change: Towards Alternative Horizons Friday Sep 26 – Saturday Sep 27 2014 Department of Sociology, Free School Lane

Hi everyone,

You are all hereby invited to attend the Crisis and Social Change conference next week at the Department of Sociology. With 36 presenters from the UK and abroad, two plenary panels and four keynote speakers it is set to be a stimulating and memorable event.

Our keynote speakers are:
The politics of mindfulness (2014-09-20 08:00)

Sceptical about the current fashionableness of mindfulness meditation? So are we. The problem is not mindfulness practice itself but rather the vulgarised form in which it is presented as a panacea to social problems. It strips it of its philosophical and existential underpinnings in a way that seems questionable in most cases (with notable exception such as [1]this) but the politics of its ascendancy are also rather worrying. Suzanne Moore makes this point well:

For mindfulness is [2]Buddhism without the awkward Buddhist bits. A complex philosophy is rendered as self-help. What does freedom from attachment and desire mean in this self-centred world? What is radical acceptance? Why practise non-judgment? Those who have practised meditation all their lives may not say it’s to get a promotion or be less stressed. There is a whole history of thought here.

But no, once Arianna Huffington is on the case, you know there is money to be made in commodifying blankness. Indeed, the whole of Silicon Valley has hugged mindfulness close, as have the US marines, who use it as part of "mind fitness" to help soldiers relax and learn "emotional intelligence".

These are basic meditation techniques being sold as a way to function better in an over-connected world. Thus, in the finance sector, companies where bankers are super-stressed – unlike poor people – arrange
for their staff to have 10-minute daily meditations. It’s all scienced-up with names such as Mind Lab to shake off the hippyish/religious/psychic-adventurer connotations. Keep fit for the brain.

[...]

Much of the cult of mindfulness is a reaction to technology. It speaks the language of detox, of decluttering. There is too much information. We need to clear our minds. Be and not do. The new ascetic is someone who goes for a walk without their phone or takes a week off Twitter to cleanse themselves. This version of meditation requires no more than the faith that we can all be self-improving part-time gurus. It requires no commitment to a community, and it’s cheap.

The corporate world sees that it can make its workers more self-reliant, balanced and focused. What could be better? Take your medicine, because the mindfulness movement is symptomatic of what late capitalism requires of us. A contemplative space opens up where religion used to be. We learn techniques to make us more efficient. This neutered, apolitical approach is to help us personally – it has nothing to say on the structural difficulties that we live with. It lets go of the idea that we can change the world; it merely helps us function better in it.

The term McMindfulness, which is rapidly spreading, seems to have been coined in this Huffington Post article by a Professor of Management and a Zen teacher. You can read the full thing [5]here, it’s very good:

The booming popularity of the mindfulness movement has also turned it into a lucrative cottage industry. Business savvy consultants pushing mindfulness training promise that it will improve work efficiency, reduce absenteeism, and enhance the "soft skills" that are crucial to career success. Some even assert that mindfulness training can act as a "disruptive technology," reforming even the most dysfunctional companies into kinder, more compassionate and sustainable organizations. So far, however, no empirical studies have been published that support these claims.

Žižek as a player of paradoxes (2014-09-21 08:00)

Thanks to [1]
Colin Wight
for pointing out [2] this great analysis of the formulaic tendencies in Žižek's writing style:

Žižek arranges his book like a piece of music with different movements, with chapter subheadings such as "allegro moderato". This is fitting, because Žižek is something of a virtuoso, but as a player of paradoxes. His great riffs take one of a finite number of forms. There is the simple psychoanalytic trope of claiming that however something seems, its true nature is the precise opposite. Then you have the repeated claim that a certain position entails its opposite, but that both sides of the paradox are equally real. Then again, there is the reversal of common sense, in which, whatever the received wisdom is, Žižek postulates the opposite.

And that really is it: Žižek simply repeats these intellectual manoeuvres again and again, albeit brilliantly, supplementing them with Lacanian embellishments such as the objet petit, the Other and the Real.

If you think I’m exaggerating, try doing what I’m about to do now: open any page at random and you’ll almost certainly find the play of paradoxes in some form. The book falls open at page 40 and I read: "One thing that never ceases to surprise the native ethical consciousness is how the very same people who commit terrible acts of violence towards their enemies can display warm humanity and gentle care for the members of their own group." On page 166, we only have to read until line two to find mention of Lacan’s interest in the "paradoxical reversal". Try page 87: "In the much celebrated free-circulation opened up by global capitalism, it is 'things' (commodities) which freely circulate, while the circulation of 'persons' is more and more controlled." Four lines into page 122, we find "the paradox of universal singularity".

This game of seeming contradictions is not at all pointless: very often it leads Žižek to turn up real gems. His analysis of the suspect motivations of what he calls "liberal communists" - the educated, liberal middle classes - is a wonderful piece of satire: "Liberal communists also love the student protests which shattered France in May 1968: what an explosion of youthful energy and creativity!" He’s also good on tolerance: "My duty to be tolerant towards the Other effectively means that I should not get too close him, intrude on his space. In other words, I should respect his intolerance of my over-proximity."

My own views on Žižek have hardened recently after I stupidly purchased his 800 page Hegel book with the intention of clarifying once and for all how seriously I’m inclined to take him as a philosopher. After 50 pages, it returned to my shelf, to be surreptitiously deposited in the Warwick Philosophy common room at some point, or some other venue where I suspect it will be likely to find a new owner able to identify charm amidst what I could see only as
tediousness. I also realised quite how much he publishes (see [4]this list, which I know to be missing at least one recent entry) and quite how frequently he self-plagiarises. I discussed the one example I was able to place from memory [5]here but I'd long suspected it was a continual feature of his books that becomes obvious if you read both his essays and his books. It seems his proclivity for this is [6]much more pronounced than I'd realised myself:

In Iraq: The Borrowed Kettle, the Guardian, the London Review of Books, the Australian Broadcast Corporation's Religion & Ethics site, and The Year of Dreaming Dangerously, Žižek's words run around in circles, endlessly quoting himself without attribution, adaptation, or citation. And these instances stand in stark contrast to the ones in which Žižek's re-appropriations were noted correctly, as in [7]his April 24, 2012 article for the Guardian, which noted at the end: "This article is based on remarks Slavoj Žižek will be making at an event at the New York Public Library on 25 April, ahead of publication of The Year of Dreaming Dangerously (2012)."

Self-plagiarism is something of an ambiguous crime, but it is a far different matter when committed across separate publishers who, presumably, assumed they were receiving original pieces of writing. I could have cited even more examples of Žižek's self-plagiarism from various works (for example, that was not the only London Review of Books essay he would later re-appropriate), but I think the general picture is already quite clear. And given Žižek's extensive bibliography, it is quite possible that the extent of the recycling is far greater than I have so far discovered.

I have nothing against Žižek personally and the little I know about his motivations suggests that he [9]hates teaching, likes travelling and has discovered that churning out four books or more a year allows him to avoid teaching and travel lots, presumably while making rather a lot of money and enjoying a jet-setting lifestyle that sits uneasily with his avowed communism. On this level, I think he's merely inconsistent at worst - almost all of us are and those who aren't tend to be incredibly irritating. But I also increasingly see him as emblematic of everything that is wrong with modern academia: the superstar professor able to float free of any limiting norms of collegiality or professionalism, the cult of personality which dominates an intellectual space and erodes it vitality and the tendency towards an obscurely theoretical radicalism accessible only to those versed in contemporary continental philosophy. The final paragraph in the post quoted above expresses my own view very effectively:

Slavoj Žižek's sin is not in reformulating long-held ideas into new books, something many authors do. It is in copying (nearly without modification) large sections of other works of his without attribution, and while simultaneously presenting each work as an original piece of writing. The extraordinary pressure on today's writers, ranging from promising young journalists such as Jonah Lehrer to world-renowned...
philosophers such as Slavoj Žižek, to maintain prolificacy in the age of shortened attention spans is surely to blame for the graying hairs of many an aspiring writer. But it is no excuse for repackaging something old as something brand-new.

I agree with Mark Carrigan in several aspects and hope to discuss this topic further with another text. There are a couple of questions to be asked on Zizek and after that he can be located much more properly to his place in intellectual history.

Why does the iPhone matter to us? (2014-09-21 11:50)

My initial impressions of Bernard Stiegler were far from positive, largely ensuing from the [1]sheer incomprehensibility of his writing. However [2]this essay by Mark Featherstone (HT Emma Head) has reminded me why I bought Stiegler’s books in the first place after a few people explained the themes he addresses in his work. Featherstone is concerned with Stiegler’s work as a resource to help illuminate a way out of our being “lost in a hyper-functional technological world” in which “the masturbatory logic that supports, for example, the Apple universe” leads me to “become my own other”. His point here concerns the deliberate eroticisation of these products, coupled with the designed inevitability of their obsolesce. The iPhone, so sleek and seductive, encourages us to invest ourselves in it while the commercial system upon which we depend to attain it strenuously works to preclude the sustainability of that investment:

The effect of this reliance is that we escape our lack through the object. Of course, the additional problem of the technological object today is that, unlike the transitional object — such as the ageing teddy or the old blanket, which grow with us — the evolution of the modern technological object is organised around planned obsolescence. Where we are meant to outgrow the transitional object, the technological gadget outgrows us. It moves on — the iPhone 3 becomes the 3G, the 4, 4S, 5, 5S, 5C. As
Steve Jobs famously said before the unveiling of Apple's latest gadget, “one more thing.” Following the logic of Marxist commodity fetishism, there is always “one more thing . . .” that indicates to us that we always lack.

His argument makes me think back to an exhibition I saw at the Tate Modern earlier in the summer. It involved a dark room, into which people entered and were assailed by fleeting apparitions projected onto the walls. But the contents of the exhibition itself were largely irrelevant. What struck me was how utterly the efficacy of it depended upon the jarring impact of entering a pitch black space and how manifestly this failed because the majority of those entering the room immediately reached for a smart phone to pierce the darkness, in many cases subsequently clutching it protectively even after they had ceased to depend upon the reassurance of its light to acclimatise themselves to the installation. My initial reaction to this was irritation, followed by curiosity and then paroxysms of reflexive doubt when I realised that the immediate expression of my internal realisation (“isn’t it weird and interesting that people do this with their iPhones?”) was to reach for my own iPhone and open Twitter.

To a cynic this might sound like an awfully long winded way of saying that our consumer objects bring us comfort. I think there’s more to it though. Featherstone’s point in contrasting ‘my smartphone’ to a transitional object is that we come to outgrow the latter. It serves to facilitate a transition from the unmediated dependency of early natality through to our individuation within a network of relations in which we gradually come to negotiate this need without ever entirely overcoming it: it’s the consistency of this dependency throughout the life course, depending on others throughout even if dependency on a particular other is fleeting, which is repudiated within the culture of late capitalism. Others recognise us in a way that disowns our dependency, with ‘co-dependency’ widely seen as pathological, in turn encouraging us to disown it in others. Where dependency is acknowledged it is sequestered in specialised institutions, constituting a way in which modernity itself mitigates against our learning to live with dependency. If it is acknowledged, it is framed as something which is overcome through childhood and which cannot be overcome in old age. This confusion becomes particularly pronounced if we consider that one way of reading the findings of the emerging adulthood literature is that the extent of dependency in late adolescence is expanding rather than shrinking, at least in the industrial west.

Against this background the iPhone becomes a strangely overloaded object. As the people in the Tate Modern installation showed, it is literally a torch we can use to pierce the darkness. It allows us to absent ourselves from social situations, escaping from others and their recalcitrant disinclination to cater to the dispositions we are often only dimly aware we possess. It leaves the knowledge system at our fingers, in the process allowing us to evade the limitations of our capacity to remember and our willingness to even try. It is our entire network, all those we know and all those we might wish to know, compressed into the palm of our hands. The latent capacity of the object is bewildering and overwhelming: in allowing us to say whatever we want to whomever we want to, it obscures the question of why we would want to do these things. Stripped of the horizons imposed by scarcity, we struggle to orientate ourselves to the endless possibilities it affords. The iPhone comes to represent everything we could do and could be but are not. It helps us repudiate our dependency (“I don’t need them, there’s no end to the things I could do”) without making us independent – in fact it undermines this because the simultaneous expansion of possibility and contraction of grounds upon which to choose can easily engender compulsivity (i.e. never exhausting the novelty in my hand and having no grounds upon which to choose between novelties leads to mindless repetition and inertia).

In this sense, we can see the iPhone as an object both reassuring and destabilising. It induces a sense of autonomy but at a cost of undercutting our capacity to sustain meaningful commitments in a life structured around its omnipresence. It helps us symbolically overcome our dependence but detracts from our capacity to meaningfully enter into new relations with all the capacity for dependency they herald: why commit to these people when I can
so easily meet those people? What I’m trying to get at is the relationship between a technological artefact like the iPhone and our capacity to live with what Ian Craib calls ‘disappointment’:

Why disappointment? In common usage, and in the dictionary, we talk about disappointment as what happens, what we feel, when something we expect, intend, or hope for or desire does not materialise. One of the difficulties of living in our world is that it is perhaps increasingly less clear exactly what we might expect or hope for or desire. In fact, these words mean different things. The most basic is desire: it carries connotations of needing urgently, yearning, to the point almost of trying to will something into existence. Sometimes we desire something so completely that we revert to our infant selves and scream, metaphorically or in reality, in the hope that our desire may be realised – just as, if we were lucky, the milk used to appear in response to our screams from the cot.

Ian Craib, The Importance of Disappointment, Pg 3

In fact I’d go as far as to venture that the iPhone is the most potent artefact ever constructed for escaping disappointment. Our desire to [4]get out of the mess of life finds expression in this shiny implement for which we pay so much and from which we expect so much. It serves this practical function (distraction, connection, escape) but it also comes to represent our capacity to float free of others, wriggling free of the bonds of dependency in which we are all irrevocably entwined. However it is a fleeting object, soon to be obsolete, offering a chimerical sense of autonomy generative more of compulsion than purposiveness.

Improving the relationship between academics and journalists (2014-09-22 08:00)

Having spent a lot of time working with journalists, I’m very aware of the difficult questions contrasting world views can pose and the lack of support for negotiating them in many areas of higher education. At various points in the last few years, I’ve found myself agonising about decisions (usually erring on the side of caution and often kicking myself for it later) without knowing where to go for advice. Hopefully this will change but, until it does, the internet is a useful source of advice and insight. So too is experience - my disastrous attempt to once explain the philosophical concept of ontological emergence in response to the question ‘is asexuality nature or nurture?’ taught me the importance of being simplified without being simplistic. It’s a hard balance to strike and it does often feel like you’re being pushed to oversimplify in order to fit into someone else’s narrative structure or, if you don’t oversimplify, you’ll be oversimplified by the journalist anyway. These experiences seem to be quite common as this [1]great article in the Times Higher Education suggests:
Academics and journalists share a common mission: to create and disseminate knowledge. But their wildly contrasting approaches have given rise to a relationship that, when not characterised by mutual neglect, can be awkward and strained.

The growing pressure on academics to throw themselves into public debates and demonstrate the societal impact of their work, however, is demanding closer and more frequent interactions with journalists. So it is vital that we properly understand the underlying causes of the mutual frustrations.

A survey I recently conducted into the nature of interactions between scholars and journalists within my own field of China studies revealed that, for academics, the biggest source of irritation is receiving requests for interviews at very short notice; one respondent likened such requests to "late-night booty calls". These leave the academics feeling like simply "space-fillers" for hard-pressed news researchers desperate to secure an academic, any academic, before deadline.

Academics' other main complaint was being asked questions outside their area of expertise. If journalists do value scholarly contributions, they wondered, why do they apparently expend little effort to identify appropriate experts?

Further bugbears included being misquoted and pushed to oversimplify and give strong opinions. The journalists, on the other hand, emphasised the value they place on academics’ responsiveness. "Understanding the immediacy of media", one said, "is fundamental for good cooperation between journalists and academics." If messages are not promptly answered, journalists move on.

Journalists’ other significant gripe concerned clarity. One correspondent stressed the need to avoid "jargon or academese", while another said stilted writing styles have a tendency to "bleed over into conversation". Column inches are limited, so academics need to be able to sum up their point succinctly.

The discussion about motivations later in the article is interesting as well. I see my media work on asexuality as a form of visibility activism. However I tend not to talk about the media work I do ‘offline’ - I’m not sure if I’m correct but I often feel there’s something suspect about actively pursuing engagement with the media as a sociologist. I thought I was being paranoid about this until I overheard someone at a conference being described, with what sounded like genuine hostility, as a "media whore". Is this a widespread opinion? If so then it’s surely deleterious to sociology as a discipline. Does it reflect an underlying lack of professional self-confidence, a defensive reaction to an environment within which sociology is marginalised? Perhaps it’s rude to do pop-psychoanalysis on people who happen to disagree with me but I do wonder sometimes. It’s a shame more sociologists aren’t engaging in this way because of the exciting opportunities for collaborative work that this growing tendency towards engagement with the media is opening up. For instance interview I did with Tim Newburn, Professor of Social Policy at LSE, discusses his experiences working with the Guardian on the Reading the Riots project:

Rose Bowl 263, City Campus, Leeds Beckett University (formally Leeds Metropolitan University) 29 October, 2014, 12:00-16:30

The British Sociological Association Medical Sociology group for Yorkshire was launched in February 2014 with an event that brought together researchers from across the region to discuss stimulating work conducted by well-established and more junior colleagues. To build on this successful first meeting the second event will take place in Leeds where attendees will hear about exciting work from a plenary speaker from outside the region (Professor Maggie Mort) and early career researchers based in Yorkshire. There will also be lots of time for networking with other researchers and to discuss the broad future direction of the group and more specific potential projects. This will be a great opportunity to meet with others with an interest in sociology of health and illness/medical sociology,
to share ideas and help to build the local research community.

**Who should attend?**

The meeting is open to postgraduate students, academics and researchers. But we would also welcome anyone who has an interest in the sociology of health and illness.

**Cost of attendance**

Lunch and refreshments will be provided on arrival. In order to cover our costs and to help with future meetings the following charges will apply:

£15 for BSA Members, £20 for Non-members, £10 for BSA Concessionary members and £15 for Non-member students.

Please follow this link to register:

**The Psychology of Writing (2014-09-23 08:00)**

This typically fascinating post on BrainPickings reflects on the psychology of writing and its implications for the notion that a fixed writing routine is most conducive to creativity and productivity. The argument certainly seems plausible yet I remain ambivalent about too much fixity in relation to writing, without really being able to articulate why. Read the full post [1]here.

Reflecting on the ritualization of creativity, Bukowski famously scoffed that [2]“air and light and time and space have nothing to do with.” Samuel Johnson similarly contended that [3]“a man may write at any time, if he will set himself doggedly to it.” And yet some of history’s most successful and prolific writers were women and men of [4]religious daily routines and [5]odd creative rituals. (Even Buk himself ended up sticking to a [6]peculiar daily routine.)

[..]
Location and physical environment also play a role in maintaining a sustained and productive workflow. Bob Dylan, for instance, extolled the virtues of being able to "put yourself in an environment where you can completely accept all the unconscious stuff that comes to you from your inner workings of your mind." Reviewing the research, Kellogg echoes Faulkner's memorable assertion that "the only environment the artist needs is whatever peace, whatever solitude, and whatever pleasure he can get at not too high a cost" and notes that writers' dedicated workspaces tend to involve solitude and quiet, although "during the apprenticeship phase of a writer's career, almost any environment is workable" — most likely a hybrid function of youth's high tolerance for distraction and the necessity of sharing space earlier in life when the luxury of privacy is unaffordable.

But the key psychological function of such dedicated environments isn't so much superstitious ritualization — an effort to summon the muse through the elaborate juju of putting everything in its right place — as cognitive cueing. Kellogg considers the usefulness of a special space used solely for writing, which cultivates an "environment that cues the desired behavior"
attempts to answer these questions by tracking a handful of millennial recruits to Wall Street as they navigate a post-crash environment that has changed in some ways yet stubbornly remains the same in others. This immensely readable book is something akin to longitudinal quantitative research, albeit in an obviously journalistic mode, recurrently interviewing these recent graduates as they attempt to cope with the 18 hour working days considered the norm for new analysts. It’s a fascinating read in many respects, not least of all because of its counter-intuitive insights into how graduates are drawn to Wall Street and how they come to remain there:

As strange as it sounds, a big paycheck may not in fact be central to Wall Street’s allure for a certain cohort of young people. This possibility was explained to me several weeks before my Penn trip by a second-year Goldman Sachs analyst, who stopped me short when I posited that college students flock to Wall Street in order to cash in. “Money is part of it,” he said. “But mostly, they do it because it’s easy.” He proceeded to explain that by coming onto campus to recruit, by blitzing students with information and making the application process as simple as dropping a résumé into a box, by following up relentlessly and promising to inform applicants about job offers in the fall of their senior year—months before firms in most other industries—Wall Street banks had made themselves the obvious destinations for students at top-tier colleges who are confused about their careers, don’t want to lock themselves in to a narrow preprofessional track by going to law or medical school, and are looking to put off the big decisions for two years while they figure things out. Banks, in other words, have become extremely skilled at appealing to the anxieties of overachieving young people and inserting themselves as the solution to those worries. And the irony is that although we think of Wall Street as a risk-loving business, the recruiting process often appeals most to the terrified and insecure.

I think this argument coheres with many of the insights that can be found within the emerging adulthoods literature. Immediate material rewards in a climate of endemic insecurity and the promise of postponing difficult decisions by a number of years would inevitably seem tempting to many who might have been profoundly unlikely to be drawn into the orbit of finance in the 1980s or 1990s (not least of all because of the radically different climate greeting new graduates in those decades). However this isn’t true of all, with the author recognising the likelihood that those young financiers willing to risk their jobs by sharing their anxieties with him are likely to be atypical. What I found particularly compelling though was his insight into what it is like day-to-day to live with the demands placed upon the young analysts:

Today, as before the financial crisis, it’s not uncommon for a first-year IBD analyst to work one hundred hours a week—the equivalent of sixteen hours a day during the week, then a mere ten hours on each weekend day. Which is not to say that these twenty-two-year-olds are actively doing one hundred hours’ worth of work every week. In fact, many sit around idly for hours a day, listening to music or reading their favorite blogs while they wait for a more senior banker to assign them work. (These drop-offs are never pleasant, but they’re worst when they happen at 6:30 or 7:00 p.m. as the senior banker is leaving for the day, giving the analyst a graveyard shift’s worth of work before he or she can go home and sleep.)

In an important sense they forego personal responsibility to choose how to spend their time, with the challenges this poses for synchronising everyday routine with longer term plans and aspirations. They are cut off from the non-financial world, with social media blocked within the offices where they spend 18 hours each day and on site services designed to minimise the need for errands and their attendant human contact outside the firm. They are encouraged to socialise together, within specific venues that graduate in cost and prestige as the analysts work their way through the clearly delineated hierarchy. Rigid sartorial norms are enforced aggressively: don’t over-dress but don’t under-dress. Certainly don’t out-dress the boss. The whole thing generates something the author describes as
cognitive triage, with everyday demands blotting out reflexivity about the medium and the long term:

The compartmentalization phenomenon turned out to be bigger than Jeremy and Samson, and bigger even than Goldman Sachs. As I interviewed dozens of young analysts at firms across the financial sector, I heard the same kinds of answers to my questions about morality and ethics: “I don’t know, I never really think about it.” “I’m just trying not to fuck up.” “Dude, I’m so far away from anything like that...” Entry-level analysts, it seemed, were so routinely exhausted, and so minutely focused on their day-to-day tasks—on pleasing their bosses, nailing every page of their pitch books, and avoiding getting in trouble—that they often avoided thinking about the big picture. It was a sort of cognitive triage, and daily concerns always took priority over long-term, large-scale worries. Still, there was no doubt that these worries existe

I love this phrase. I think ‘cognitive triage’ is something by no means restricted to those working in finance. However what the author skilfully demonstrates is how cognitive triage can work to render these frantic actors uniquely susceptible to professional socialisation, accumulating habits of manner and outlook because the intensity of daily precludes the time for withdrawal and consideration, making it impossible to reflect in a consistent way upon whether this is really what they want to do and who they want to be. This is great book - highly recommended.

The role of metaphors in framing Data Science (2014-09-25 08:00)

This is [1]very interesting. The author argues that “Data carpentry” is “not a single process but a thousand little skills and techniques”. He takes issue with the manner in which other ways of framing this dimension of what data scientists do obscure the craft inherent in it. I think this argument has important implications for the rapid expansion of data science courses and the risk that speed and modularisation lead ‘data carpentry’ to be rendered peripheral:

The New York Times has an article titled [2]For Big-Data Scientists, ‘Janitor Work’ Is Key Hurdle to Insights. Mostly I really like it. The fact that raw data is rarely usable for analysis without significant work is a point I try hard to make with my students. I told them “do not underestimate the difficulty of data preparation”. When they turned in their projects, many of them reported that they had underestimated the difficulty of data preparation. Recognizing this as a hard problem is great.

What I’m less thrilled about is calling this “janitor work”. For one thing, it’s not particularly respectful of custodians, whose work I really appreciate. But it also mis-characterizes what this type of work is about. I’d like to propose a different analogy that I think fits a lot better: data carpentry. (Note: [3]data carpentry seems to already be a thing).

Why is woodworking a better analogy? The article uses a few other terms, like data wrangling (data as unruly beasts to be tamed?) and munging (what is that, anyway?), neither of which mean

2970
much to me. I also like data curation but that's also a bit vague. Data carpentry probably has something
to do with wishing I could make things like [4]Carrie Roy, but I should start by saying what I don't like
about the "data cleaning" or "janitor work" terms. To me these imply that there is some kind of pure
or clean data buried in a thin layer of non-clean data, and that one need only hose the dataset off to
reveal the hard porcelain underneath the muck. In reality, the process is more like deciding how to cut
into a piece of material, or how much to plane down a surface. It's not that there's any real distinction
between good and bad, it's more that some parts are softer or knottier than others. Judgement is critical.

I'm interested in the rapidity with which the role of 'data scientist' is emerging, the interests expressed within it
and their conjunction in the institutionalisation of 'data science': what implications does the hype surrounding data
science have for how data science courses are designed and marketed?
Why are modern pianists so boring? (2014-09-26 08:00)

Why are pianists today so boring? The stilted way they often dress, the seriousness of performance, and even the way the whole pianist community or subculture works, is out of date. Why are pianists no longer the stars of the art scene - why does it even sound odd to suggest that they once were? What has changed? Here is an old, but [1]great article by Martin Kettle in the Guardian, recently unearthed by my classical pianist sister who now spends more and more time on experimental music, exasperated by her own "tribe":

"The days in which every middle-class home, and many working-class ones too, contained an upright piano - and at least one person people who could play it a little - have not been completely erased from memory. But they are fading fast. The gramophone, the radio and above all the television long ago replaced the piano as the focus and main source of home entertainment. It will never reclaim that place.

The piano's fall from eminence has been accompanied by a falling-off in the replenishment of the piano repertoire. As in all other music, composers have gone in other directions. Who, since, let's say, Shostakovich (and even this is stretching a point), has written piano music that genuinely holds its place in the recital repertoire? Certainly, few composers any longer write music that amateurs are able to play (not that many amateurs could ever play much Chopin); or (more importantly) that amateurs want to play, even in simplified editions.

In this context, it is hardly surprising that the piano recital itself should have begun to wither too. The recital has undoubtedly become a less mainstream part of musical life. There are fewer of them. They are not such big events in either box-office or artistic terms. Of course, there are exceptions. There always are. But we are kidding ourselves if we pretend that nothing has changed."

1. http://www.theguardian.com/music/2002/sep/05/classicalmusicandopera.artsfeatures

Benjamin Geer (2014-09-26 08:42:42)
"Who, since, let's say, Shostakovich (and even this is stretching a point), has written piano music that genuinely holds its place in the recital repertoire?" There's György Ligeti, whose Études for piano are frequently played at piano competitions and have been recorded several times.

Benjamin Geer (2014-09-26 08:53:27)
Also, how relevant are recitals at a time when most people listen only to recorded music? And aren't, say, Keith Jarrett and Michael Wollny pianists? Perhaps the issue here isn't piano per se, but the whole social structure known as classical music.

Being a sociologist means never having to be bored (2014-09-27 08:00)

The social theorist Randall Collins offers a lovely account of Sociology's distinctive worth in this short article from Contemporary Sociology. There's a PDF of the article available online [1]here:
Sociology, like everything else, is a product of particular historical conditions. But I also believe we have hit upon a distinctive intellectual activity. Its appeal is strong enough to keep it alive, whatever its name will be in the future and whatever happens to the surrounding institutional forms. The lure of this activity is what drew many of us into sociology. One becomes hooked on being a sociologist. The activity is this: It is looking at the world around us, the immediate world you and I live in, through the sociological eye.

There is a sociology of everything. You can turn on your sociological eye no matter where you are or what you are doing. Stuck in a boring committee meeting (for that matter, a sociology department meeting), you can check the pattern of who is sitting next to whom, who gets the floor, who makes eye contact, and what is the rhythm of laughter (forced or spontaneous) or of pompous speechmaking. Walking down the street, or out for a run, you can scan the class and ethnic pattern of the neighborhood, look for lines of age segregation, or for little pockets of solidarity. Waiting for a medical appointment, you can read the professions and the bureaucracy instead of old copies of National Geographic. Caught in a traffic jam, you can study the correlation of car models with bumper stickers or with the types of music blaring from radios. There is literally nothing you can't see in a fresh way if you turn your sociological eye to it. Being a sociologist means never having to be bored.

Rosemary Crompton’s Journey to Sociology (2014-09-28 08:00)

[1] Rosemary Crompton (1942-2011) was a famous British sociologist of work who researched white-collar work, women’s employment, organisational careers and class, cross-national variations in gender relations and related policies and their impacts on employment and family life. Yet, she was - as I found out today - also, like many of us, an accidental sociologist. Here is how she described her own journey to sociology (Source: BSA, [3]www.britsoc.co.uk):

“It would be nice to be able to tell a heroic tale about my 'journey to sociology' but unfortunately this isn’t possible. At my Hampshire grammar school, we had to choose between continuing with physics and chemistry, or starting Latin, at the age of thirteen. I chose physics and chemistry, not realising that I would need Latin 'O' level in order to study English (my best subject) at university. So I went up to London University in 1960 to do a degree in biology. I swiftly realised that I had made a terrible mistake, but wasn’t qualified to switch to English. In desperation I persuaded the sociology department to take me on,
as they didn’t require Latin. After an undistinguished undergraduate career, I moved to Cambridge, getting a short-term job as a junior researcher on the Affluent Worker project. In the pre-computer era, my main task was to prepare tables, using punched cards and a Hollerith machine (located in the basement of the Marshall library). I became an expert in getting the tattiest cards through the machine, and doing six-way cross-tabulations that were then percentaged (by me) using a fearsome (and noisy) adding machine.

You could say that my journey to sociology began in the basement of the Marshall library. I was fascinated by the data, and the relationships between the variables that emerged from my cross-tabs. Goldthorpe and Lockwood, who directed the Affluent Worker project, were highly critical of both Parsonian functionalism, and ideas about ‘industrial convergence’ that were the dominant orthodoxies of the sixties – although my undergraduate years hadn’t included Parsons as my theory lecturer at university had a thing about Herbert Spencer. A further research job at Cambridge drew me into the ‘sociology of work’, and indeed, I have been talking to people about their work ever since. After a move to East Anglia and another research job I got a junior lectureship. At the end of the sixties, sociology became immensely popular and for a number of years I did nothing but teach. I did read, though, and the books that influenced me most were C Wright Mills’ Sociological Imagination and R K Merton on Social Theory and Social Structure. From there it seemed but a short step to Marx. In the radical atmosphere of the politics of the time (and books such as Baran and Sweezy’s Monopoly Capital), Capital volume 1 seemed to me to reveal the underlying processes that were shaping employment in the 1960s, leading to my first book on class (Economy and Class Structure, with Jon Gubbay). This impression was more than confirmed by Braverman’s Labor and Monopoly Capital.

When the teaching receded a bit, I turned again to empirical research and (with Gareth Jones) carried out an ESRC funded study of clerical workers (White-Collar Proletariat). Doing the research in the 1970s uncovered a lot of furious women who realised they were never going to make it up the organisational hierarchy. This led to research on women’s employment in the 1980s (Gendered Jobs and Social Change, with Kay Sanderson). I had tried to keep up with debates on social class, and in the 1990s it seemed there was a lot of confusion about, so I wrote Class and Stratification. I also began doing comparative cross-national research (Restructuring Gender Relations and Employment), which has become something of a passion, as it facilitates the causal unravelling of topics that have long been of interest to me. Why do women in some societies do so much better in employment than in others, for example? My current research has a focus on how employment and family life are being reconfigured in contemporary societies, and how class processes are inter-twined with this reconfiguration.

In conclusion, although my beginnings in sociology were accidental, I don’t consider that my journey is over yet. I have always felt that sociology is like detective work, a combination of different kinds of reasonings, and different methods, in order to arrive at a satisfactory explanation of a particular phenomenon – at least for the time being. Luckily (or perhaps unluckily) there will always be things that need explaining, and that is what sociologists do.”

The Physics of Productivity: Newton’s Laws of Getting Stuff Done (2014-09-29 08:00)

The Newtonian analogy may vex any physicists reading this but there's some great productivity advice in this article:

Newton’s First Law of Productivity

First Law of Motion: An object either remains at rest or continues to move at a constant velocity, unless acted upon by an external force. (i.e. Objects in motion tend to stay in motion. Objects at rest tend to stay at rest.)

In many ways procrastination is a fundamental law of the universe. It’s Newton’s first law applied to productivity. Objects at rest tend to stay at rest.

The good news? It works the other way too. Objects in motion tend to stay in motion. When it comes to being productive, this means one thing: the most important thing is to find a way to get started. Once you get started, it is much easier to stay in motion.

So, what’s the best way to get started when you are stuck procrastinating?

In my experience, the best rule of thumb for getting started is the 2-Minute Rule.

Here’s the 2-Minute Rule adjusted for productivity: To overcome procrastination, find a way to start your task in less than two minutes.

Read the full article [5] here for the other two 'laws' of productivity. I thought the final one was probably the best. It's certainly true in my own experience, though unfortunately rather difficult to implement in practice.

______________

Book Review by Bradley Williams

To begin, I chose to review this book with no prior knowledge of the author or his academic work, nor about the book's thesis. I have a general interest in the history of American sociology and welcome any book that claims to be a sociologist's take on the field of sociology. This book is not a history of American sociology, nor the kind of examination of the profession that I have read in other books such as Turner and Turner's Impossible Science. Though the author does not wish to explicitly proclaim it, this book is an argument against the tradition of activism within the sociology profession.

Christian Smith's book The Sacred Project of American Sociology explores an undercurrent moral imperative that has structured American sociology since its inception. By "sacred project", Smith means a moral mission within American sociology that is implicit and largely visible only through the habitus of sociologists and sociology students. Smith applies the term "sacred" to those collectively held beliefs that the majority of sociologists adhere to unwaveringly and innately learn to defend throughout the professional socialization process. Basically, the sacred project is the animating drive in American sociology to decrease all forms of social, economic, and political inequality and generally transform the whole of society toward maximizing the freedom of individuals. Smith claims that the profession has fostered this implicit desire to transform the whole of society through its various schools of thought while still explicitly claiming to be an objective and systematic study of society. Smith further concludes that along with relegating the serious study of religion to other fields, American sociologists have trained themselves to uphold secular, scientific inquiry as categorically as a religious belief. The tradition of scientific enlightenment has given the profession of sociology the dual identity of claiming to be objective, while obsessing about social revolution.
While there is a multitude of various sub-disciplines within sociology, Smith contends that most (almost all, excluding methodology and rational choice perspectives) are "vanguards" of the sacred project. Referring to the dominance of these "sacred" sub-disciplines within sociology, he satirically notes that the current state of the sacred project is within a "liberal-Enlightenment-sexually liberated-civil rights-feminist-GLBTQ-social constructionist-postructuralist/postmodernist 'tradition'" (p. 11). This immediately narrows the focus of the book which might have been helpful if it hadn't set a condescending tone that continues throughout most of the book. Smith repeatedly states that he does not personally dislike the "sacred project" that he has identified, even explaining that its overall affect is one that makes American sociology as vital and interesting as it is. His tone and use of short and pointed jabs make his distaste of most sociologists evident, as they are framed as opponents (defenders of the sacred project) rather than colleagues with a different perspective.

In the second chapter titled 'evidence', Smith provides a non-comprehensive, but thesis-validating content analysis of books and articles that he found "randomly" while taking a "stroll" at an ASA meeting. He also surveyed the various ASA sections and some random review articles he received in the mail, noting examples of the sacred project. First, none of the data selection is treated seriously, because we are told that sociology's sacred project is so ubiquitous that a "systematic" analysis is not possible. Whether this is true or not, he notes that his personal experience as an academic sociologist, renowned in his field and included in the highest ranks of sociology's professional strata is enough to trust his thoroughness and objective standards. Smith's arguments are fairly straightforward, offering examples one by one, showing indeed that a majority of articles and books from top publishers are focused on some form of inequality. I never found this surprising, nor do I think most sociologists will either. We are repeatedly prepared for the outcry that will follow the publication of this book. If the points made in this book are going to actually produce some rupture within the field that incites meaningful dialogue, it will most likely come from another writer. Unfortunately, Smith continuously wavers between making a serious call for reform and an overly defensive and sardonic criticism of elite tendencies within the field.

To contrast, in one surprisingly illustrative point, Smith asked what sociology might be like without this animating drive for utopian ideals, in which he admitted a disinterest in seeing this become a reality. This portion, more than the other "evidence" in the chapter seemed to belie an interest in cultivating an honesty within the profession that would be healthier and more constructive. Unfortunately, this tone does not hold and remains the only part of the book that seems true to the stated intent of an honest dialogue within sociology, where most of the book makes more pointed criticisms at individuals and research areas.

One of the more convincing arguments made in the book is that by reinforcing the implicit mission of sociology to assuage inequality, sociologists might effectively limit the kinds of research they commit themselves. Another consequence of this is that field pushes away great sociologists by showing an unwillingness to accept any findings that do not support the general thesis of inequality ad societal transformation. He states that sociologists might support claims that inequality is rampant throughout societies and a fundamental restructuring of society is the solution because this will keep sociologists in business. In a sense this argument is the same one held against the proliferation of the modern terrorism analysis industry after September 11, 2001. Sociologists elaborate perceived threats to society in order to maintain job security, though this relationship would contradict and undermine the overall sacred project by perpetuating inequality if it were true. Smith makes one of his strongest points when offering a short critique of textbooks, particularly Macionis's Society: The Basics, which is in my opinion a poor barometer of the field. He makes the case that the text produces an ahistorical account of the three supposedly equally dominant paradigms in sociology: conflict, structuralism, and interactionism. Smith also takes time in a later chapter to emphasize real negative consequences of the sacred project, though he chooses to omit what he sees as obvious positive impacts on the profession. By brushing aside any explanation of the positive consequences of the sacred project, he merely reinforces his already evident distaste of activism and further narrows his own argument similar to the way he imagines the sacred project to narrow the creativity and perspective of other sociologists.
Smith makes a direct case that sociology is hostile to Christianity, including restricting the hiring of Christian sociologists in prominent positions within the professional hierarchy. Part of his chapter on ‘evidence’ includes a comparative case of two sociologists that have produced significantly inaccurate research, one of which produced research compatible with sociology’s sacred project and the other did not. The one that did not, the infamous case of Mark Regnerus, was treated with footnotes so inappropriately thick that they took up almost the entire page in some cases. Smith makes this now very infamous case his prime example of sociologists banning together against an author whose findings (that couples where one parent has had a previous homosexual relationship raised children with lower socioeconomic outcomes than otherwise heterosexual couples) do not conform to the ideals of the sacred project. His championing of Mark Regnerus as a victim of institutionalized bias based on his Christian beliefs from within the sociology community is interesting given his main thesis about the activist mission of the field. While a secular bias may very well exist within the field at large (a trait found in any social science), the study of religion in sociology is actually quite fruitful, if not still uncomfortable asking many questions.

In what little history that is offered, Smith details the linear progression of the sacred project from the first sociology textbooks by Lester Ward and Albion Small and others to the current proliferation of sub-disciplines championing various, yet apparently ideologically similar, causes. He dismisses structuralism as a mere break from the progressive and cumulative hegemony of the sacred project. This, unlike his critique of the sociology textbook discussed above, is treated as ahistorically as possible, despite his argument against the shortsightedness of sociologists and their works.

Smith named a few sociologists that, like him, are marginalized by the secular and activist-utopian sacred project. I found his list of marginalized sociologists interesting because it included Peter Berger and James Hunter, both of who have temporarily joined the same sociology department at Baylor University in recent years. I am sort of curious to know if Baylor’s prominent focus on statistical analyses of religious experience or openly Christian mission are the kinds of things Smith thinks of when imagining a healthy sociology research program.

The arguments in this book are lessened by the tone the author uses to speak to his prospective audiences. He conceives of this debate, or lack of debate, as a conflict against opponents instead of a possible dialogue. He dismisses the power of challengers to oppose this apparently very old and uniform hegemony by presenting sociology students as mere constructs of the sacred project. Students that do not wish to conform or admit to being Christian will be immediately marginalized by their instructors and peers. The author’s contempt or distaste for the majority of professional sociologists makes this a poor opening for dialogue.

Toward the end of the book, Smith makes the claim that sociology blogs (left unspecified in the book) are a symptom of what he sees as a breakdown of the peer review system. He uses an extremely crude blog entry by a sociologist known for his vitriolic language, which criticizes openly Christian sociologists. I really don’t think this was a representative example of any kind of academic blog. His view that the peer review process should be held to high standards is laudable, but he could have made a more substantial argument for or against sociology blogs. Neither the writing nor the "evidence" presented here needed a nicely bound book from Oxford University Press to state. The types of arguments and the way they are written in this book will be easily familiar to readers of niche and opinionated, as well as academic blogs.

[nbox type="notice"]Bradley W. Williams is a graduate student in sociology beginning his PhD studies at George Mason University in 2015. His research is located within the intersection of sociology and international relations, specializing in the study of religion, social movements, and Islamic peace processes.[/nbox]
Rebooting Robbins in The Second Machine Age (2014-09-30 00:16)

Review by Patrick Ainley

Brynjolfsson and McAfee is one of those admirably readable US business books, academically well supported by a range of reference across the various disciplines that modern Business Studies brings together if not integrates, whether at MIT - where the authors work - or in the wider arena of global Business Study. It is predominantly upbeat and optimistic in the way those supportive of global business have to be but still draws attention to drawbacks that need to be overcome if - as the authors recognize - that business model is to survive.

Their prospectus therefore is a simple one we have heard before: The Second Machine Age follows the first industrial revolution, automating mental rather than manual labour. It is still in its early stages of bringing together and standardising various aspects of the new digitising technology in dynamic synergies. The book relates how fast this is occurring, particularly as sensors are attached to various machines causing a veritable Cambrian explosion of diverse developments. The authors are particularly taken with the Googlecar that carries them driverlessly through the traffic of a Californian freeway. This seems the paradigm case for them of an activity that can be digitally automated.

Brynjolfsson and McAfee are however hip to the potential downsides of such developments. They recognise the dangers of being 'Alone Together' in a mediated world that cuts humanity off from its real experiences but imply that these are no different in kind to the distancing of consciousness that comes with the use of tools and symbolic speech. Besides, they have a solution to bring together the routinized mental performances of machines with the human imagination machines lack. Predictably it is to be found in education.

Like nearly everyone – except perhaps the teacher unions, who seem to think a teacher in front of a class of 30 kids for five or six hours a day makes all right with the world – Brynjolfsson and McAfee acknowledge that we cannot continue with the mass schooling that was created as a consequence of the first machine age. So they dedicate schools to catching up with Singapore and South Korea in the PISA rankings of test performances that they take as indicative of scholastic success with 'longer hours, additional school days and a no-excuses philosophy that tests students and, implicitly, their teachers' (p.212).

This familiar prescription is to be achieved through a Goveist-Murdochite NewsCorp-Pearson diet of MOOCs and teaching machines, whilst not forgetting to boost 'hard-to-measure skills [that ubiquitous word] like creativity [not a skill, by the way] and unstructured problem solving [that] are increasingly important as machines handle more routine work' (213). This will produce the entrepreneurs of the future, assembling the latest applications of new technologies, shared freely across the world wide web in a blaze of Schumpeterian creative destruction. This is clearly what Naomi Klein calls 'magical thinking'.

Is anything to be made of it in relation to higher education? Labour’s HE Shadow, Liam Byrne, clearly thinks so. Written in riposte to Robbins Revisited, David Willetts’ contribution to the fiftieth anniversary of the Robbins'
Report on higher education, Robbins Rebooted sees universities as ‘the power stations of the knowledge economy’ (p.9). ‘The knowledge economy’ replays ‘the white heat of the technological revolution’ that Harold Wilson promised in 1964 would ‘harness science to Socialism and Socialism to science’.

Education at all levels was crucial to this promise and Robbins’ endorsement of the expansion of higher education initiated a period of progressive reform as local education authorities were invited to junk 11+ IQ-testing and go comprehensive. This freed primary schools for child-centred education and prepared the way for expansion of F &HE, including the polytechnic experiment. As Byrne sees it ‘The result was the creation of millions of opportunities for a new middle class.’ (p.20)

This is topsy-turvy: it was the expansion of professional and technical employment sustained by a growing economy that allowed for the limited upward social mobility which ended in the 1970s. That ‘a grammar school education for all’, as Gove echoed Wilson, could restart this limited upward mobility in face of the general downward social mobility that has succeeded it, is more magical thinking. As if ‘skills’ (actually qualifications) can conjure up jobs!

The same goes for the ‘apprenticeships’ both Labour and Tories have lately promised to revive. Recreating a pale version of them will not transform the English into a German economy, no matter how lavishly they are advertised. But Byrne misidentifies a UK mittelstand of small- to medium-size interconnected companies waiting to be serviced with research by our ‘brilliant universities’ (p.11), while also offering ‘real choice’ to the bottom 50 % of school leavers. But, unless related to economic reform to end austerity and the continued slide into low-wage, low-skill employment, this risks repeating the failures to rebuild a vocational route to replace the industrial apprenticeships lost in the 1970s but this time at a tertiary level of learning.

However, Shadow Education Minister, Tristram Hunt backs Byrne with plans for a Technical Baccalaureate for the half of 14+ school students who don’t do A-levels. Rebranding FE colleges as ‘Institutes of Technical Education’, they could go on to new part-time, two-year ‘Technical Degrees’, reinventing Foundation degrees to bring back secondary technical schools and polytechnics, while making everyone 18-21 either a student or apprentice – both paying fees!?!

Byrne at least offers HE a possibility of recovering itself in connection with FE by replacing market-driven expansion with regional partnerships to end the ‘ferocious competition’ (p.69) between universities, colleges and private providers. He connects this to the need for devolution of the centralised market state revealed to all Parties by the Scottish referendum. Apart from Scotland and Wales though, which are national regions, there are no natural regions in England like those in mainland Europe and they will not be constituted by Cameron rushing through ‘US-style directly-elected mayors with cabinets’ that are the optimal internal management arrangement for privatised local government services.

Instead, Byrne affirms that ‘an integrated system is possible’ (p.74) and gives examples based on the Universities of Herts, Staffs, Oxford Brookes and Birmingham City – all former-polytechnics with the exception of Sheffield’s arms-length Advanced Manufacturing Research Centre. For other universities perhaps, he advocates ‘expanding post-graduate research and teaching... to ensure that post-graduate learning does not become the new barrier to access’ (p.82), while boosting MOOCs through the Open University’s Future Learn partnership.

The ‘unplanned explosion in provision at private colleges, including allegations of fraud’ (p.71) that resulted from Willetts' ‘free-market experiment gone wild’ (p.46) is ‘indefensible’ but it is not clear what Byrne would do about it – or fees! If the Conservatives return to government and lift the current £9,000 cap on fees, Oxford, Cambridge and a handful of other English universities will seek to charge more, leaving less strong institutions in an impossible position and fragmenting what remains of a coherent system of F &HE provision.

Already, unlike the other 24 self-styled ‘Russell Group’ universities, Oxbridge restrict their entrants to heighten demand for their places. Meanwhile they maintain their staff’s research and scholarship to further enhance their
quality, simultaneously investing in bursaries and other widening participation efforts to ‘skim the cream’ of state school applicants. Caroline Benn’s solution of turning them into research institutes alongside adult residential colleges looks tempting! Not that Byrne entertains anything like this or even mentions the private schools; any more than Hunt does, despite 23 % of British school spending going to just 7 % of pupils with their close Oxbridge links epitomised by Cameron and his pals.

The problem remains however that, while schools, colleges and universities claim to make their graduates ‘employable’, education cannot guarantee employment. So, the perception of ‘the problem’ needs to change: from being one where young people are seen as having to be prepared for ‘employability’ by earlier and earlier specialization for vocations that may not exist in The Second Machine Age. Instead, the starting point should be a common general but not academic schooling to 18 giving entitlement to progression for citizens ‘fit for a variety of labours’, as Marx says in Capital.

This implies confronting the possibilities of flexibility but avoiding the current situation in which there are more people in the workforce but many are paid little for unregulated employment. This would require an alternative economic framework but not necessarily ‘the right to work’ with which the orthodox left continues to operate in a post-war collectivised model of the labour market. Instead, a general schools education to graduation linked to the assumption of citizenship at 18 means learning about work and not just learning to work. Paradoxically, for universities this means rediscovering the vocational nature of the higher education preserved by the most prestigious subjects at the most elite institutions, as in the ‘original vocations’ of law and medicine. Importantly, this includes an academic vocation dedicated to learning critically from the past with research and scholarship enabling change in the future. Undergraduates can contribute to that continuing cultural conversation, giving them a sense that many have lost of what higher education is supposed to be about.

Patrick Ainley is Professor of Training and Education at the University of Greenwich School of Education and Training.

Rethinking empirical social science (2014-09-30 08:00)

In this paper in Dialogues in Human Geography, [1]Evelyn Ruppert from Goldsmiths College makes a case for the need to rethink empirical social science in the face of the epistemological and methodological challenge of ‘big data’:
While Big Data – the vast amounts of digital information generated, accumulated and stored in myriad databases and repositories, both online and offline – does present specific challenges to the geography discipline, I would suggest that it also calls for interdisciplinary approaches perhaps more than ever. There are of course many different rationales for interdisciplinarity but in the case of Big Data I will attend to two. First, the distributed relations and entanglements of ownership and expertise that make up Big Data call not only for interdisciplinary approaches but also cross-sectoral engagements between the social sciences, industry, government and business. And second, the ontological and epistemological consequences of methods that take up Big Data cut across disciplines and provide an opportunity for collaboration on the underlying theoretical propositions as well as the vexed political questions of data privacy, rights, ethics and ownership.

[...]

All of these arguments for interdisciplinarity and collaboration are not a call for turning social scientists into statisticians or computer scientists, but for ‘socialising’ what could otherwise become a positivist science of individuals and societies or lead to re-inscribing a division between quantitative and qualitative methods. Retreating and engaging in internal debates within social science disciplines cannot achieve this, as Savage and Burrows (2007) also warn. Instead, it means to explore methods of doing immersive interdisciplinary data work by innovatively, critically and reflexively engaging with new forms of data. This calls for experimenting with various data sources and techniques, innovating methods, and working with researchers in computing and other sciences.

Dialogues in Human Geography. November 2013
vol. 3
no. 3
268-273

There's a pre-print available [2]here. I don't agree with how Evelyn theorises the underlying questions but I'm convinced she's correct about how the social sciences can and should respond to these technological innovations.

Call for Proposals: Sociological Review monograph series (2014-10-01 08:00)

The Sociological Review, the UK’s oldest sociology journal, publishes a series of monographs encompassing a diverse range of topics. They’re now seeking proposals for the next round of monographs:

The key international journal *The Sociological Review* is home to a prestigious Monograph Series that publishes collections of outstanding and original scholarly articles on issues of general sociological interest.*

Dedicated to showcasing the very best and most innovative sociologically informed work, and to promoting emerging as well as established academics, the series has for over fifty years produced intellectually stimulating, coherent volumes of the highest quality. The books are available to buy separately, but are also included as part of [1]*The Sociological Review* journal subscription price.

If you would like more information about the history, or aims and scope of *The Sociological Review Monograph Series*, or perhaps you are thinking about submitting a book proposal and would like some advice, then please click on the link below where Dara Blumenthal interviews Series Editor, Chris Shilling.

[2]Interview with Series Editor, Chris Shilling

We are always interested in proposals for new books in the series and you may email your proposal for consideration to the Book Series Editor, Professor Chris Shilling, at [3]C.Shilling@kent.ac.uk.

**CALL FOR PROPOSALS: 2017 MONOGRAPHS!** We are currently seeking proposals for two monographs to be published in January/February 2017 (deadline for completed ms = beginning of March 2016).

**THE DEADLINE FOR PROPOSALS** is Monday 1st December 2014. Completed proposals should be emailed to the series editor, Professor Chris Shilling at [4]C.Shilling@kent.ac.uk. All decisions should be made by
An introduction to analytical sociology (2014-10-02 08:00)

One of the most intellectually vibrant movements in contemporary social theory is *analytical sociology*. This is how the International Network of Analytical Sociologists describe it on their[1] (shiny) website:

Analytical sociology is a strategy for understanding the social world. It is concerned with explaining important macro-level facts such as the diffusion of various social practices, patterns of segregation, network structures, typical beliefs, and common ways of acting. It explains such facts not merely by relating them to other macro-level facts, but by detailing in clear and precise ways the mechanisms through which they were brought about. This is accomplished by a detailed focus on individuals’ actions and interactions, and the use of state-of-the-art simulation techniques to derive the macro-level outcomes that such actions and interactions are likely to bring about. Analytical sociology can be seen as contemporary incarnation of Robert K. Merton's well-known notion of middle-range theory.

The analytical approach is founded on the premise that proper explanations detail the "cogs and wheels" through which social outcomes are brought about, and it is driven by a commitment to realism. Empirically false assumptions about human motivation, cognitive processes, access to information, or social relations cannot bear the explanatory burden in a mechanistic explanation no matter how well they predict the outcome to be explained.

With its focus on the macro-level outcomes that individuals in interaction with one another bring about, analytical sociology is part of the "complexity turn" within sociology. Until very recently sociologists did not have the tools needed for analyzing the dynamics of complex systems, but powerful computers and simulation software have changed the picture considerably. So-called agent-based computer simulations are transforming important parts of sociology (as well as many other parts of the social and natural sciences) because they allow for rigorous theoretical analyses of large complex systems. The basic idea behind such analyses is to perform virtual experiments reflecting the analyst's theoretical ideas and empirically-based knowledge about the social mechanisms influencing the action and interaction of the individuals. The key is to identify the core mechanisms at work, assemble them into a simulation model, and establish the macro-level outcomes the individuals bring about when acting and interacting in accordance with these mechanisms.

There’s an excellent critical introduction to Analytical Sociology in [3]this paper by Daniel Little. His perspective on it is quite similar to my own: rejection of its 'methodological monism' (i.e. the notion that there's only one correct way to do social research), scepticism about its reductive focus on ‘aggregation dynamics’ but supportive of the sophisticated manner in which it seeks to bring the individual back into sociological thought in a serious way. In fact some have suggested we might think of Analytical Sociology as little more than methodological individualism 2.0 - I've not read enough to be sure how fair this is. I guess it depends in part on whether the accusation is that it's a cynical rebranding (seemingly unfair) or that it's a development of methodological individualism (seemingly accurate). I'm also interested in how readily analytical sociologists embrace computational techniques - there's an obvious affinity between Analytical Sociology and agent based modelling in particular, as well as computational approaches more broadly, which will surely have an impact upon the intellectual viability of the position as Sociology is increasingly reshaped by 'big data' over coming years. In fact Analytical Sociology could prove influential as a post-positivist philosophy for Computational Social Science.

Though I love the term and since I started reading this stuff, I've found phrases like 'analytic decomposition' creeping into my thinking, even though my other theoretical commitments mean the term takes on a different meaning when I use it.

Mike Agar (2014-12-25 17:44:29)
This is interesting. I've done a few ABMs over the last several years but didn't know there was a home for ABM socsci in the U.S. I've oriented towards the European network around Nigel Gilbert at Surrey, who runs CRESS, Centre for Research in Social Simulation http://cress.soc.surrey.ac.uk/web/home, and founded and until just recently edited JASSS, Journal of Artificial Societies and Social Simulation http://jasss.soc.surrey.ac.uk/JASSS.html. It’s not meth individualism, though, has its roots in anti-reductionist nonlinear dynamic systems i.e. complexity theory. Thanks for the comment and the linked article. I'll take a look. Maybe it'd be worth trying on their meeting, in Cambridge U.S. next year.

Sociological Imagination (2014-12-29 09:41:16)
I wasn’t suggesting there’s anything intrinsically methodologically individualist about the method but the philosophical work I've encountered certainly seems to lean in that direction - I've still not read anywhere near as much as I'd like to but I'm really interested in how collective agency is modelled within ABMs, with emergent characteristics and the capacity for downwards causation.

Mapping the Philosophy of Social Science (2014-10-03 08:00)
How would you map the current state of the philosophy of social science? I really like how Daniel Little does this [1]here - it’s a very informative post which deserves to be read in full:

There is a traditional lineup of topics that has guided courses and books in the philosophy of social science. But a shorter list of topics have generated a great deal of debate and discussion in the field
today. Here is a sketch:

- Reduction and emergence; microfoundations and meso causation
- Actor centered sociology
- Microfoundations
- Social ontology; heterogeneity and plasticity; assemblage; actor-network theory
- Analytical sociology
- Causal mechanisms
- Critical realism
- The status of social structures

In each of these areas there are well defined debates underway, and in some cases there are interesting cross-references across these areas of theorizing. If we were drawing a graph of these debates, we might consider several major poles – analytical sociology, critical realism, and ANT – and arrange the other topics according to their interconnectedness with the claims of one or the other of these poles.

[2]

I think these maps are important because of what Omar Lizardo identifies as the changing place of theory in the intellectual field of contemporary Sociology. I don’t think the trends he identifies are as true in the UK as in the US but the former is definitely heading in the direction of the latter. Lizardo’s argument is that theory is being de-institutionalised (i.e. gradually marginalised in graduate education) and de-valued (theory papers are worth less and less) with an ensuing fragmentation of the field undermining any consensus about its means and end - how theory
should be 'done', how theory should be evaluated, what issues are important etc. His arguments leads to an important recommendation:

The main point is that theory and theorizing is just not a single thing. Yet, the problem is that this is not just a definitional or “lexicographic” issue, or even an issue of the fundamental polysemy of all meanings; it is a reality, an objective fact that there are multiple modes of doing theory and that these modes entail a different set of initial dispositions, a different history of acquisition, and ultimately the mastery of distinct (and possibly conflicting) sets of skills. I think that the proper metaphor is that there exist different “genres” of theory, and that we can all become proficient (realistically) in one, two, or at most three of these genres. As theory becomes devalued, and the field becomes increasingly heteronomous, the basic danger is to rush into thinking that our salvation entails the privileging of any one of these genres (e.g. the one preferred by so-called “Analytical Sociologists”) to the denigration of all others (e.g. theory in the classical mode, or theory in the meta-methodological mode). This (essentially retrogressive) temptation must be fought at all costs.

I think mapping in Little’s sense can be an important antidote to this tendency. It can help us get a sense of
the theoretical landscape as a whole, encouraging debate about the key issues and how different approaches
relate to them. I don’t think it can ‘fix’ theoretical fragmentation but I think it can ameliorate some of the negative
tendencies which flow from it.

Manchester : Sites of Sociology, Politics, History and Art (2014-10-03 15:41)

On Wednesday I went to visit the [1]People’s History Museum in Manchester and attended the Museums and
Academics Research Network’s first meeting in their light and bright reading room. The purpose was to learn
about how the Museum’s collections can be accessed by academics interested in the study of British Social History,
particularly the history of the working people. Walking up to the Museum, I took a couple of pictures of this excellent
space. I have walked past the building many times and given it a cursory glance hoping to visit one day. Today though
was my first visit. And I will definitely be back!

How can researchers use the archives? A meeting for those interested [2]@PHMMcr
[3]pic.twitter.com/GKCrh61IPU

— Education Researcher (@educ_research) [4]October 1, 2014

[5]
It was an eye-opening and useful meeting attended by many lecturers and students from the University of Manch-ester and Manchester Metropolitan University, giving me insight into the vast collection that can be accessed at the Museum that I hadn't previously given much thought to: political posters, banners, badges; central executive and sub-committee papers and minutes from the Labour Party and the British Communist Party. Within these papers there are all matter of references to British Social History of the past 200 years: anything that was talked about in political circle will be in these documents.

I also learned more about other great places for academics to use in Manchester.

Sadly on the same day, after getting to know the brilliant resource that is the People's History Museum, I later read [6]an article in The Guardian referring to funding cuts that will affect the Museum greatly:

“There is also something quite spiteful about this government too: a vengeful, nasty streak seems to underpin almost everything they do. Take its decision to slash funding to the only museum in England dedicated to celebrating the history of working people. The People's History Museum in Manchester is facing a £200,000 shortfall in funding after the government slashed its grant.

According to the museum’s deputy director, Cath Birchall, part of the reason is because their present exhibition graphically tells the story of working people and their role in the first world war, including some who were conscientious objectors. Birchall has said: “They don't see the importance of a national museum that shows the effects of the war on ordinary people.” This was a war that saw an estimated three-quarters of a million people die in combat and over a million injured. It produced domestic casualties too. Research suggests that while the battles raged on the western front, as many as 100,000 people died of malnutrition and disease at home.

The proposed funding cut for the museum is a blatant attempt by the Tory party to rewrite history in its own image, to stop future generations from learning what their great-grandfathers sacrificed in the name of their country. In Tory history, brigadiers and colonels are worth more than barrow boys and coalminers.
It is one museum out of approximately 2,500 in the country. If your thing is the history of lawn-mowers then you're well catered for, with several dedicated to the machinery. If you're a bit of a mustard aficionado then there are multiple museums devoted to telling you the difference between Dijon, English and wholegrain. Yet, when it comes to the history of working people, England boasts just one – and the government wants to shut it down.

History is not just about those who write it, but about those who live it. Working people and the labour movement have been at the forefront of all social and political changes this country has undergone over the past three centuries. We must defend the People’s Museum from the Tory-led government’s malicious and politically motivated attack, and safeguard the one museum dedicated to telling the story of us all.”

People's History Museum

Left Bank, Spinningfields, Manchester, Lancashire M3 3ER
0161 838 9190

The Museum is the only one in the UK that focuses on British democracy over the last 200 years. The collections span from the late eighteenth century up until today as the Museum continues to collect contemporary material. The complete holdings of the Labour Party and Communist Party of Great Britain, as well as Conservative Party and early Liberal Party material is strongly represented as are other organisations including the Department for Work and Pensions, the Trades Union Congress and The Co-operative Group.

The Museum’s collection of trade union and political banners is the largest and most important of its type in the world. There are over 2,000 posters covering elections and issue campaigns. Satire forms a strong part of our holdings, with over 300 18th, 19th and 20th century political cartoons, including Steve Bell’s cartoons of the Falklands War. There are 7,000 badges and tokens from the late 19th century to the present day, and over 95,000 photographic images and 17,000 pamphlets covering social and political history. People’s struggles to gain the vote and workers’ rights to unionise are some of the topics covered in the collections. The Museum is actively working to amass collections concerning anti-fracking protests, Scottish Independence and LGBTQ history. The papers from the 2015 Election campaign should be coming to the Museum too.

As well as the object collection and archival collection, there is an off-site store on Princess Street that can also be visited. The political posters contained in the Museum probably amount to the largest collection in the UK, and interest not only historians and sociologists, but also art and design students and others. Much of the collection is catalogued, but if it isn’t searchable online or at the Museum itself, the very friendly team including Chris Burgess (Curator), Darren Treadwell (Learning Assistant) and Heather Roberts (Archivist) will no doubt be able to point anyone needing specialist help in the right direction. Educationalists who are keen to bring in their students – ranging from Early Years, primary and high school, sixth form or adult community groups – can arrange projects with Kirsty Mairs (Learning Manager) who has been at the Museum for over ten years. School students of History, Art and Design, English, Drama, Sociology and Citizenship are able to take part in some of the projects organised to inspire young people: Living History where trained actors perform for the students who are in turn inspired to create a response, pARTicipate covers the Art of Protest, printing power, build a banner and protest pottery amongst other activities, City Centre trails to inspire students to respond creatively, and an introduction to archives amongst other projects that the Museum can work on in conjunction with schools and community groups.
Representatives from other organisations and institutes also attended the meeting, and gave insight into how their resources can benefit academics. Here are the details of other great sites of sociology for you to visit:

**Working Class Movement Library**

**51 Crescent, Salford M5 4WX**  
**0161 736 3601**

A representative from the Working Class Movement Library also highlighted how they have a useful collection for academics and researchers to use which follow similar themes to the People’s History Museum. Although they are closed access, we can call and arrange a time to visit and they can bring out the relevant material.

"The Working Class Movement Library started life in the 1950s as the personal collection of Edmund and Ruth Frow. It became a Charitable Trust in 1971 and moved to its present home in 1987.

Edmund and Ruth Frow were proud that their love of books had created a unique and valuable resource for people wanting to know more about working people’s lives and political beliefs."

"Working people have always struggled to get their voices heard. The Working Class Movement Library records over 200 years of organising and campaigning by ordinary men and women. Our collection provides a rich insight into working people’s daily lives as well as their thoughts, hopes, fears and the roles they played in the significant events of their time."

"Our collection contains:
- books
- pamphlets
- archives
- photographs
- plays
- poetry
- songs
- banners
- posters
- badges
- cartoons
- journals
- biographies
- reports

We have information on:
- The trades and lives of people who worked in the past - brushmakers, silk workers, tailors, boilermakers and others
- Trade unions, where people have banded together to improve their working conditions
- Politics and campaigns, from Chartism to the General Strike and more recent protests
- Creativity and culture - drama, literature, music, art and leisure
- Important people who have led activist lives
- International events such as the Spanish Civil War, and aspects of Irish history

Much of this information is held in books, pamphlets or leaflets. Many more stories are told by our photos, banners and tape recordings.

Our collection captures many points of view to tell the story of Britain’s working classes from the beginning of industrialisation to the present day."
Our oldest items date from the 1760s. From the 1820s we have some of the earliest trade union documents to have survived.

We have material on politics of all shades and come right up to date with the archive of Jim Allen, the Manchester-born screenwriter who worked on Coronation Street and collaborated with film director Ken Loach."

Ahmed Ullah Iqbal Race Relations Resource Centre

Central Library, St Peter’s Square
Manchester, M2 5PD

0161 275 2920

Hannah Niblett from the Ahmed Ullah Iqbal Race Relations Resource Centre which is an open access library specialising in the study of race, ethnicity and migration came to tell us a little about how we can use the resources they hold in our work. The Centre is based in the beautiful newly-refurbished Central Library, and I have found this to also be a great bright space to sit and study. The specialist Centre has approximately 15,000 books on the shelves and another 6000 or so in their archive storage.

- Works with community groups to collect life histories, photographs and documents so that the community histories are not lost to the future.
- Supports teachers and student teachers to develop an anti-racist curriculum.
- Lends books and teaching materials that reflect the diversity in schools.
- Creates and publishes Black history resources for use in school and community settings.
- Publishes multicultural stories and biographies of Black British heroes that are written and illustrated by school-children.
- Organises events, exhibitions and activities to share knowledge of the contributions of BME communities to British history.

Manchester Metropolitan University (MMU) Special Collections

Sir Kenneth Green Library
All Saints, Manchester, M15 6BH

0161 247 6107
Louise Clennell, Education and Outreach Officer, informed us of the vast collections they hold at MMU which are available to all. There is a Reading Room, an Education Room for teaching groups, and a Gallery. It is an accredited museum so it is open to the public.

"The collections are central to the artistic culture and teaching of the faculty and have been since its foundation as the Manchester School of Art in 1853.

The collections include:

Artists' Books: a great range of creative experimentations with the book form

20th century international poster collections

The Manchester School of Art Collection including fine and decorative art and the work of past and present students and staff

The Schmoller Collection of Decorated Papers

Children's Book Collection: featuring 19th and 20th century children's book illustration

Book collections exploring aspects of the book as an artifact

Archive collections including artists' working drawings and correspondence

Manchester Society of Architects Library

Victorian ephemera featuring 19th century albums and scrapbooks

Mary Butcher collection of Baxter prints"

In the first Centre for Social Ontology seminar of 2014/15, Daniel Chernilo (Reader in Social and Political Thought at [1] Loughborough University) discusses his work on philosophical sociology. This was the basis for a [2] recent paper in the British Journal of Sociology.

[3] In this presentation, I introduce the idea of philosophical sociology as an enquiry into the relationships between implicit notions of human nature and explicit conceptualizations of social life within sociology. Philosophical sociology is also an invitation to reflect on the role of the normative in social life by looking at it sociologically and philosophically at the same: normative self-reflection is a fundamental aspect of sociology’s scientific tasks because key sociological questions are, in the last instance, also philosophical ones. The idea of philosophical sociology is then sustained on three main pillars and I use them to structure this article: (1) a revalorization of the relationships between sociology and philosophy; (2) a universalistic principle of humanity that works as a major regulative idea of sociological research, and; (3) an argument on the social and pre-social sources of social life. As invitations to embrace posthuman cyborgs, non-human actants and material cultures proliferate, philosophical sociology offers the reminder that we still have to understand more fully who are the human beings that populate the social world.

Big Data and the “Book of Society” (2014-10-05 08:00)

An important point from the paper [1]Big Data, social physics, and spatial analysis: The early years by Trevor J Barnes and Matthew W Wilson:

The most immediate invocation of monism by Big Data is its assumption that the social world can be mathematized in the same way as the natural world. Just as Galileo thought that the Book of Nature is written in the language of mathematics, there is a parallel belief within Big Data about the “Book of Society.” Without the supposition that the social world can be fully made over as numbers, Big Data would have no purchase. We also suggest that monism is invoked by Big Data in a second form, at least implicitly. When Big Data deploys models of spatial analysis monism is presumed, because those models partly rest on a social physics that makes monism foundational.

What’s the difference between ‘public intellectualism’ and being unusually willing to talk about stuff in public? (2014-10-06 08:00)

In the last year I’ve had a selection of requests from the media to talk on an eclectic range of issues: contemporary sexual culture, the quantified self, dystopic social change, the limits of liberal tolerance and hipster hatred. I’m fairly confident in dealing with the media and I enjoy the challenge of condensing ideas in the way necessary to communicate them effectively. However apart from a couple of occasions where people asked me to talk about open access and scholarly publishing, all these interactions have been concerned with asexuality. This is a subject I obviously do know a lot about and have felt confident discussing because I don’t doubt that I have genuine authority to speak: I’ve conducted one of the largest empirical studies, I’ve written widely about it and I’d like to think I’ve become reasonably effective at contributing to asexual visibility. I don’t say this to boast but only to illustrate that on this topic, any reservations I have about engaging with the media are entirely extrinsic to the subject. In terms of stuff I’ve been asked about recently, I’d actually really like to have said ‘yes’ in almost every case but I lack confidence in bringing any genuine expertise to the issue in questions.

However I also wonder if my notion of ‘genuine expertise’ is rather restrictive, suggesting as it does that the category of ‘public intellectual’ amounts to little more than someone unusually willing to speak in public on a range of topics far beyond those they have academic warrant to do so on. I have no qualms whatsoever about expressing my ideas on any subject when it’s on my blog but this feels different – it’s obviously not private but it’s also not public in the same way as speaking to a journalist writing an article for a national paper is. Perhaps if academics aren’t willing to speak beyond the range of their research topics then ‘public intellectuals’ come to be replaced by ‘social commentators’ who have no such qualms and, in many cases, lack the genuine expertise the former group has in a certain set of topics. Maybe it’s a case of primary and secondary knowledge? So I should feel uncomfortable with speaking on issues where I have no real academic grounding but should be willing
to speak on those where I have a familiarity with the academic literature even if I haven't undertaken research myself.

Or maybe I do want to be one of the 'social commentators' I just invoked so derisively and that my problem here is not with 'public intellectualism' but is rather with my commitment to 'being an academic'.

________________________

Patrick Ainley (2014-10-13 11:22:00)
Looking at recent 'conversations', it seems to me a lot of our self-styled academic 'public intellectuals' just publish on blogs as well as in journals to raise their profile and not because they have anything to say consistent with the issue to hand or indeed anything worthwhile to say at all!

On Jacques Lacan (2014-10-07 08:00)

Why politics needs arts & crafts (2014-10-08 08:00)

By [1]Dr Anna Feigenbaum, lecturer in Media & Politics and contributor to the 'Disobedient Objects' exhibition at the Victoria & Albert Museum.

Inflatable cobblestones, book blocs, musical pot lids. This week these objects joined the Victoria & Albert Museum's collection, taking their place in design history alongside Grecian pottery and fashion couture. Curated by Gavin Grindon and Catherine Flood, the V &A's Disobedient Objects show serves as much as an intervention than as an exhibition. Its 99 objects from social movements around the world ask us to rethink what counts both as art and as politics.

From brightly coloured, hand-woven tapestries to a rice sacks with head and armhole cut-outs, the show's disobedient objects range from refashioned rubbish to intricate craftwork. While everyday items like tea cups or water bottles may not be inherently ‘disobedient’, repurposed here as objects of solidarity and makeshift tear gas masks, they take up status as ‘disobedient.’

Other objects showcased in the exhibition were intentionally designed for disobedience. The shields adorned with images of climate refugees used to transport pop-up tents at Climate Camp in 2007 are an excellent example of how spectacular art created spectacular media images, and swayed public opinion. Similarly, the ‘dragon’ concrete lock-ons made infamous in the anti-roads actions of the 1990s show how protest sites often become innovative centres of disobedient design.

There is as much variety in these objects as there is in the people who made them. Artistic credits for the show include professional architects, sculptors trained in world-leading art schools, gardeners, electricians, prisoners, students and anonymous collective assemblies of all kinds of people. These objects are neither art of the institution, nor art simply made outside of the institution. Rather, they are blends of both, the products of imagination as it travels between cultures and countries.
Just as our conception of art is disrupted by this exhibition of disobedient design, so too are our ideas of politics. Normally, when we think about what makes up politics, talking comes to mind. Politics is debates and speeches. It is dealing with campaign donations and soliciting support at gala dinners. It is the fighting, the demanding, and, all too often, the lying of our political leaders.

But these disobedient objects open up a different kind of politics. They give way to a politics of the senses. They showcase campaigners' sensibility of political norms that enables them to anticipate and out-design their opponents. This politics can manifest as sound; the sing-song banging in unison of cacerolazo pan lids. Other times it is found in acts of collective sleeping – a politics shared through open-source designs for winterising protest camp tents. Often this different kind of politics is expressed in signs, flavoured with humour and pop culture savvy, as in the hanging hand-painted cardboard: 'I wish my boyfriend was as dirty as your policies' that now adorns the V &A (and its gift shop rack of postcards).

These are just some of the crafted politics of everyday people that arise when voices go unheard. Marred by low voter turnout and growing distrust, traditional politics is desperate for creativity. It is begging for new ideas to get beyond its self-perpetuating bureaucracies and stale public school styles. But to carry on, politics needs innovation from below. It needs to learn to better craft possibilities and policies from the perspective of the people. AsDisobedient Objects shows, real change can only come when the imagination challenges the institution—and wins.

Atmospheres Conference, 1-2 July 2015, CALL FOR ABSTRACTS (2014-10-09 08:00)

Atmospheres, 1-2 July 2015, Call for Abstracts

Atmospheres play a significant role in, and add an important quality to, our intimate, domestic and public lives, yet
are often overlooked in social research, not least because of the methodological challenges involved in 'capturing’ them.

In this major conference celebrating the 10th Anniversary of the Morgan Centre, we will be using the theme of 'atmospheres' as our starting point for interdisciplinary dialogue. Abstracts will be invited in the following kinds of areas. These are intended to stimulate ideas and are not prescriptive.

- Atmospheres in intimate, domestic and emotional life
- Belonging, place and atmosphere
- Smell, sight, sound, touch and taste
- Political and socio-cultural atmospheres
- Atmosphere, public events and crowds
- Online/virtual atmospheres
- How atmospheres can be 'captured' methodologically
- What makes an atmosphere

**Submitting an abstract** For more information on how to submit an abstract and to download the submission form, please visit our website[1]http://www.manchester.ac.uk/morgancentre/events/atmospheres/call/

1. http://www.manchester.ac.uk/morgancentre/events/atmospheres/call/

**David Tyfield and John Urry on Energy and Society (2014-10-10 08:00)**

This fascinating (and impressively produced) video introduces a [1]special issue of Theory, Culture and Society on the neglected role of energy within sociological accounts of modernity:
1. http://tcs.sagepub.com/content/31/5.toc
2. file://www.youtube.com/embed/T7kvxigHRGA
7 ways to use a blog as a research journal (2014-10-12 08:00)

1. **Recording particularly powerful extracts of texts to which I might wish to refer later.** This can serve a practical purpose, constituting a form of reference management which both indexes a source amongst a heterogeneous range of other materials and foregrounds a particular extract of the text. This transforms the status of the archived source and, in my experience, increases the ease with which one is able to later connect it with other ideas and artifacts. It also serves a communicative process which can, if the extracts are posted 'in real time', constitute a form of live-blogging. This form of post can help others navigate the academic knowledge system, with quoted extracts constituting an alternative to abstracts. The context provided by the author of a blog having chosen to share an extract from a source can, presuming knowledge of their interests and work, help elucidate connections between disparate literatures and disciplines which might otherwise go unrecognized e.g. a sociologist of personal life introducing other sociologists to work within human geography that has a similar focus through posting extracts on a blog.

2. **Capturing ideas and insights which occur, usually when engaging with the ideas of others.** What I would have once written down in a notebook or scrawled in the margins of a book I instead record on my blog. The knowledge that others will read the ideas inculcates a desire to fully explicate it so as to leave it at least potentially
comprehensible to others. My note taking otherwise tends to take the contracted and personalized form of inner speech. This limits the utility of these notes when it comes to academic writing, leaving a gap between the analogue record of the thought and the mode of articulation required in academic writing. In contrast the digital record on my blog avoids this gap by already being articulated in something approaching the manner which would be required to include the thought in an article or chapter. Furthermore, such indexed, tagged and searchable posts usually include an extract from the text which sparked the idea in question. Most of the posts that fall into this category result from an engagement with literature but by no means all. Blogging can also provide an outlet for ideas sparked by face-to-face conversation and can, in many cases, extend those conversations across contingent barriers of time and space.

3. **Brainstorming sessions in response to particular ideas or around particular themes.** The articulation of a whole sequence of connected ideas, usually in bullet point form, which have begun to emerge in my mind as a potential cluster. This has often been a result of particularly stimulating conferences or public engagement events and the blog, as an immediately available public forum to record ideas, provides a unique and valuable outlet for the sort of creative 'buzz' which can ensue. To use a personal example: I gave a TEDx talk a number of years ago at the University of Warwick. This is a format structured around "ideas worth spreading", necessitating the distillation of a research agenda into the core elements that excite and concern, with the caveat that the audience members are unlikely to be familiar with either your discipline or the topic in question. This process of 'translation' from my own sociological language of talking and thinking about my research area of asexuality and sexual culture already proved extremely thought-provoking, allowing me to step back and detach myself from an area in which I have been deeply immersed. The talk itself and subsequent questions and post-event discussion were enormously enriching, with the effect of detaching a number of lines of inquiry from the disciplinary structures within and through which I had been habitually approach the underlying questions. The result was to leave the 'familiar seeming strange' in a way which inculcated a newfound and enriching energy into my interest in the topic area. However it was the capacity the blog afforded to subsequently go home and spend an hour capturing each and every one of the thoughts now bubbling through my mind in a document ("11 random thoughts about asexuality studies") which allowed this creative energy to find an expression which it would not have otherwise had.

My contention is not that such moments of creative 'flow' are rare in academic life or that blogging is the only productive outlet for them. Instead I am arguing that the particular characteristics of a blog (e.g. freedom from institutional structures, stylistic informality and its accessibility via tablets and smart phones) render it a particular congenial medium for the expression of such creative energies, given they tend to occur in an intensely situational and contingent manner. Furthermore, the indexing function of the blog then allows these ideas to function as an open archive. Permitting easy and instant reacquaintance has obvious practical benefit for the research process but these ideas also have a life of their own. They provoke reactions in others, stimulate dialogues and occasionally impinge upon the author’s own life via the reactions they provoke in other people. This action takes place while such notes are either 'in storage' waiting for further use by the author or, as often may be the case, entirely forgotten by the author. This autonomy has always been a characteristic possessed by books and journal articles, which both circulate and retain the capacity to be understood independently from their author. However blogging as 'continuous publishing' generalises this status from the finished 'products' of the research process to the continual outputs ensuing from iterative processes of knowledge production.

4. **Longer form reflections on particular topics.** These often take the form of reflections on practice (e.g. "reflections on editing books and journals") but can sometimes be explorations of particular substantive issues. In such cases the post then sits nearer to the formal presentation of these thoughts. In this sense it could be thought of as sitting 'between' brainstorming or capturing ideas on the blog and formal academic writing. This might pose complications because of a potential tension between writing of a style that might be deemed suitable for more traditional forms of scholarly publishing and the question of how, if at all, it is directly reproduced in journal articles or book chapters. Does this constitute a form of 'wasting' the writing on a 'mere' blog? In a discussion of book reviews David Beer offers the interesting suggestion that the lack of any "describable or measurable
“payoff” means that the time spent on such forms of production almost constitutes a form of resistance “against the constraints and expectations of contemporary higher education”. If this point can be sustained with reference to book reviews then it is difficult to see how it could not also be extended to other forms of writing: those approached with equivalent care and exhibiting equivalent quality to that which the author might otherwise submit to a journal, which are nonetheless intended solely for a blog and will not be directly reproduced. It constitutes a form of performatively grappling with the internalised values of the audit culture which could, perhaps, be seen as a form of proto-therapy (i.e. learning to take pleasure in ‘wasting’ work on a blog) for those who feel pathologically affected by the instrumentalizing malaise of the contemporary academy.

5. **Sharing ‘homeless’ bits of academic work that have been cut from papers.** My own tendency to desire that I ‘save’ bits of writing that have been cut from papers and chapters by posting them on my blog sits uneasily with my comments in the previous section as to the subversive value of ‘wasting’ academic work through publishing outside the remit of processes of credentialisation and auditing. However I suspect a dual meaning characterises the term ‘waste’ here. On the one hand, one could ‘waste’ through self-publishing on a blog a piece of writing that could form a sizable portion of a journal article which one could leverage for instrumental gain. On the other hand, one could ‘waste’ a piece of writing that was formerly intended for public consumption by extracting it from a manuscript and saving it in a private file or, indeed, deleting it altogether. This later sense of waste seems less problematic, in so far as that it expresses an attentiveness to the autonomy of our cultural creations and a desire to let them ‘out in the world’ to take what action they may.

6. **Developing conference presentations.** Increasingly my habitual form of preparation for conference presentations or longer talks is to produce a brainstorming blog post of the sort described above and then use this as a basis upon which to develop a set of slides. I then upload the slides via the Slideshare service and embed them into the original blog post. Having done this, I often choose not to use the slides on an OHP but instead draw on them as notes. My experience has been that the iterative method (blog post → slides → presentation) helps collate ideas in my mind in a way which is inherently structured rather than, as was my previous experience, using the format of powerpoint slides as a framework into which I attempted to ‘squeeze’ a relatively disparate and unstructured cluster of ideas.

7. **Planning forthcoming writing projects.** This is the aspect of my blogging which I suspect many would find most questionable and I have grappled with it myself. As part of a commitment to ‘openness’ I plan my future projects out in the open. I oscillate between a worry that I am being deeply naive by doing this and a belief that processes of metrification have inculcated a deep sense of incipient paranoia within contemporary academic life. The truth likely lies somewhere between the two polarised views. I recognise the affordances which my own position entails for such a practice, in that I work in two relatively obscure areas which likely curtails the ability or willingness of anyone to ‘steal’ ideas from my blog. Nonetheless, I remain sceptical about the origin of such fears, at least assuming we exclude work that is commercially sensitive in some way. This may be a function of some underlying naivete on my own part but, equally, it seems important to consider the possibility of latent conflicts between academic habitus and the culture of openness.

Nam Tran (2014-10-14 20:00:51)

Great article! Who would’ve thought to turn notes or highlights from books into blog posts.
Žižek is an actor of the spectacle (2014-10-12 14:53)

There is a lot to say and discuss about Slavoj Žižek, however here I’d like to limit the discussion to what I’ve witnessed in my experience of the last year, observations through media and the points raised by Mark Carrigan’s critique of Žižek.

First of all, we should all recognize that Žižek is not an academic or scholar in a conventional sense. Of course, to be an academic in this sense is not an obligation for intellectual, sociological, philosophical or theoretical production more broadly; for instance, the late Jean Baudrillard also refrained from working in this way. However nobody seriously disputed his being an academic or scholar. Baudrillard’s philosophical line has taken its place in the main roads of Western Philosophy.

It seems that, for Slavoj Žižek, the corpus of his work emerges in TV shows, interviews, news and that what exists in between (books, articles, serious conferences, Etc.) are just like a net, connections making these essential components (short and flashy) reach each other. As Mark Carrigan explained: Slavoj Žižek became “the superstar professor able to float free of any limiting norms of collegiality or professionalism.” The main orientation of his intellectual praxis has less in common with Hegel, Marx, Freud, Lacan than with Lady Gaga and other celebrities of global popular culture, stars of Hollywood and MTV. This reminds me Pierre Bourdieu’s “fast-thinker” concept and we can even go a little bit further and call him as a “fast sayer”. Because with any breaking events Žižek’s short, “striking” comments and talks are emerge almost automatically.

If somebody (he, his followers or criticizers) define him as "Marxist", then there would be a real misunderstanding of Marx’s ideas. Žižek is a popular and compatible part of the puzzle that global authorities (and also their opponents) can put wherever there is a need. Žižek is an actor of the spectacle. Guy Debord (a Marxist for sure) [1]said: “The spectacle, considered as the reigning society’s method for paralyzing history and memory and for suppressing any history based on historical time, represents a false consciousness of time.” Žižek’s analyses of social, political, historical issues hinder the possibility for a comprehensive and profound history of humanity. I am really curious what a scholar of philosophy, psychology, political sciences or history who spends their life in libraries for decades, thinks when they see Slavoj Žižek talks about the field of their specialization with a few sentences in a TV show or newspaper. Many of them would keep calm, some of them maybe just smile, however I’m pretty sure that some would get really angry.

Slavoj Žižek’s works have become an attainable and accessible reverse Objet Petit A, which you can reach through a Google search if you have limited time and with more detailed readings if you have more time and a professional purpose. It is a widely consumable form of Lacanian thought. You read his “magical words” and get enlightened quickly! Everything is clear to you now: Lacan, Marx, Middle Eastern politics, Hitchcock or Lynch films. A theory cover everything without being a system; playing a part in the global spectacle yet remaining ‘critical’. The more Žižek embraces a place in the global media of late capitalism the less he becomes a part of those theoretical lines moving through Marx, Freud, Lacan etc. Žižek is moving beyond the legitimate borders of academia.

Kubilay Akman is a sociologist and academic teacher at the University of Bingol, Turkey. He graduated in sociology and completed his PhD at Mimar Sinan Fine Arts University, Istanbul. His research interests are Sociology of Arts, Sociological Theory, Sociology of Literature and Mysticism. He has focused on Sociotherapy recently. [nbox type="notice"]
Mick Stupp (2016-09-14 10:19:09)

"I am really curious what a scholar of philosophy, psychology, political sciences or history who spends their life in libraries for decades, thinks when they see Slavoj Žižek talks about the field of their specialization with a few sentences in a TV show or newspaper" I am really curious what a scholar of philosophy, psychology, political sciences or history who spends their life in libraries for decades, thinks when they see that reality has diverged from the dream theatres that seemed so perfect in the library. I am no advocate of Žižek but he does seem to try and confront the spectacle on its own terms, perhaps a foolish strategy but one that circulates the ideas of Marx, Freud, Lacan, etc far more effectively than a ‘conventional scholar’ shut away in a nice, safe library.

How not to use twitter as an academic (2014-10-13 08:00)

I usually tend towards the view that there’s no right or wrong way to use social media. These evaluations only make sense relative to some prior purpose and so I’m sceptical when blog posts pronounce on the right way to use Twitter or parallel claims with other platforms. However I realise there are a few things which I do see as intrinsically negative things to do on twitter, at least if you want to build positive connections with others working in your field:

1. Don’t tweet everything you blog at people. It’s hard to build an audience as a blogger and a sense that no one is reading what you write can erode the enjoyment of blogging. But repeatedly tweeting links to new posts at people (i.e. “@soc_imagination my new blog post http://www.myblog.com”) is the digital equivalent of looking up phone numbers of people in your field and cold calling them to announce that you’ve done some writing. If there’s some particularly pressing reason why this one post needs to gain an audience then that’s fair enough but before you send it directly to scores of people, it’s worth thinking about whether you’d do this ‘offline’.

2. Don’t tweet requests for people to follow you back once you follow them. Much as with the first point, I’m surprised at how frequently I see people do this and more so they’ve done it with scores of people in quick succession. I understand the impulse to do it in some cases but again consider the ‘offline’ equivalent to this. I can’t quite work out what it would be but I’m sure it would be slightly creepy.

3. There’s no need to thank people for retweeting you. If you remark something in conversation and someone says “that’s interesting” would you say “thank you for finding my remark interesting”? Retweeting is usually some variant upon affirming that a tweet was interesting or valuable in some way. Thanking people for retweeting (or following for that matter) makes a momentary interaction feel creepily transactional to me.

What would you add to the list? If a certain number of people share an antipathy towards a way of acting on twitter then at what point should we start talking about these as norms?
Harmut Rosa on the inescapable logic of growth (2014-10-14 08:00)

Harmut Rosa on Public Spaces The Sociological Imagination (2016-05-29 08:00:50)

[...] A really interesting interview by Harmut Rosa, whose groundbreaking work on acceleration has been developed in recent years into a theory of 'resonance': [...]

The internal conversation of James Bond (2014-10-15 08:00)

Earlier this week I read [1]Solo by William Boyd. The idea of a new James Bond novel wouldn’t have appealed to me if it had been written by anyone other than Boyd and it lived up to my expectations. One curious aspect of it which I wasn’t expecting was the prominence of James Bond’s internal conversation in the narrative:

Bond lay in bed thinking about the plans for the following night – the crossing of the lagoon and trusting this man, Kojo, to deliver him safely. And what then? He supposed he would make his way to Port Dunbar and introduce himself as a friendly journalist, provide himself with new accreditation, and say he was keen to report the war from the Dahumian side – show the world the rebels’ perspective on events. Again, it all seemed very improvised and ad hoc. (pg 84)
Bond forced himself to think about his options for a while, kicking at bits of the shattered road surface. (pg 99)

To be honest, Bond had to admit that he hadn’t thought much about what he was doing once the urgency of the situation was apparent and the beautiful clarity of his plan had seized him. All that had concerned him was how best to execute it. (pg 146)

Bond paced slowly to and fro, affecting unconcern, but his mind was hyperactive. Something must have gone very wrong – but what? No clever strategy suggested itself. (pg 173)

He stopped. It had come to him like a revelation. All you had to do was give your brain enough time to work. A solution always presented itself. (pg 200)

There was nothing so invigorating as clear and absolute purpose. There was only one objective now. James Bond would kill Kobus Breed. (pg 272)

Bond’s mind was working fast – sensing opportunities, weighing up options, minimising risk. (pg 282)

Bond turned the Interceptor on to the London road and put his foot on the accelerator, concentrating on the pleasures of driving a powerful car like this, trying not to think of Bryce and whatever dangers had been lurking out there in the darkness of her garden. (pg 321)

I use the phrase ‘internal conversation’ because I think Boyd is doing something more here than simply describing the contents of Bond’s mind. These ‘contents’ enter into the narrative because they represent the basis for action rather than solely being a subjective response to the protagonist’s circumstances.

A Radical’s Guide to Long-Term Reputation Management (2014-10-15 08:50)

1. Begin by having a reputation for something conventionally positive, which enables you to speak your mind in risky ways beyond your remit.
2. It follows that you will eventually offend a significant swathe of the population, but be sure that you explicitly signal those in whose name you claim to speak. In other words, strategically polarize the audience to your advantage.
3. But be sure that over time you adapt your message to attitude change, so that you continue to polarize in just the right way. This invariably involves massaging the original meanings of crucial terms in your message to create just the right level of dissatisfaction with the status quo, as the occasion demands.
4. It helps to write a lot so as to present this shift as seamlessly as possible. A diary is especially good at portraying self-consistency and a sense of purpose across the vicissitudes of events, over which one has no substantial control.

Paradigm case? UK Labour politician, [1]Tony Benn. Over a political career that spanned more than a half-century, he was always just ‘radical’ enough to keep self-affirmed radicals of the time engaged but never too radical that he dropped off the political radar entirely. The presence of a continuous self-narrative throughout created the appearance of a ‘man of principle’.

Others may wish to reach other judgements about this life strategy, but in Benn’s case it resulted in a soft landing at death, so that the obituaries waxed nostalgic about what might have been rather than focusing on what in retrospect look like a bull-headed refusal to see the political possibilities that were opened up by admitting error.

And that’s the point of my calling this post a ‘radical’s guide to long-term reputation management’. Benn was dead wrong on so many things, yet his reputation survives.

(I am writing this partly because the [2]Blue Labour’ people who track UKIP’s ‘Little England’ policies with inordinate interest may be tempted to revive the spectre of Tony Benn.)

Geek is Chic, but still the same Capitalism? (2014-10-15 10:19)

By Christopher Vito

One of my fondest memories as a child was when my father would take me to the comic book store on his days off from work. I remember picking out X-Men and Spider-Man comic books, and being enthralled with the storylines and artwork. After school I would go to the park with my friends and we would all pretend to be superheroes ready to take on the world with our make-believe super powers. During my youth, my father would also save up money to take me to Comic-Con International: San Diego. In the mid-1990’s I remember this event being predominantly occupied by a subculture of local comic book shops, upcoming artists and writers, and smaller comic book companies. But what would become of this event as I grew older?

Many long time Comic-Con attendees have mentioned a paradigm shift in the culture of Comic-Con itself. With the rise in popularity of “geek culture,” Comic Con International: San Diego has become a massive event unlike my experiences in the mid 1990s. According to its website, it has topped 130,000 attendees in recent years, and has
expanded outward to include satellite locations, local hotels, and outdoor parks. It has been harder to obtain tickets, has become more crowded, and consists of longer waits in line for panels and autograph signings. There is also a noticeable shift from smaller comic book stores and companies to major corporations taking up most of the event. Signs from Fox, Warner Bros., NBC, and Sony suffocate you with their bright lights and overbearing advertisements.

[1]

The paradigm shift is concordant with my experiences as an employee at Comic-Con. For the past five years I have switched roles from attendee to employee. As a worker for a marketing company that promotes major corporations at Comic-Con, I have seen that the days of small comic book stores controlling their own stands are now over. Instead major corporations have erected extravagant monuments usually over thirty feet tall and spanning hundreds of feet wide. In addition, my experiences during my youth consisted of leisurely discussions of comic book characters with local artists and store owners. Many comic enthusiasts had time to rummage through boxes of comic books, while toy collectors had a chance to admire their favorite pieces. Now underneath those thirty foot monuments are hustling employees trying to push you along the crowded walkways if you are not attracting attention to or purchasing their product.

In particular, two instances exemplify the experiences I have had as an employee at Comic-Con. My first year job consisted of heat pressing logos of major films onto t-shirts. The process was quite tedious, as we had to print them quickly but correctly. The first task was to determine which size shirt the customer wanted. Next, the customer determined which logo they wanted on the shirt and where they wanted it placed. Finally, the logo was heat pressed on the shirt and quickly dried by fanning it. The t-shirt making process occurred so quickly that I found myself pressing a new shirt almost every minute. Thus, the whole transaction between the customer and employee was brief, if not impersonal. The primary motivation for doing my job properly came from the solidarity I built with my co-workers, as my interaction with Comic-Con customers in this instance was minimal.

[2]
My third year job consisted of opening and closing the lines for free giveaways. The primary concern was to regulate the length of the line so the booth would not get shut down by the Fire Marshall. This meant that I had the ability to let people in the line and deny them when there was not enough space. The job was quite stressful as many Comic-Con attendees would become highly agitated by this and would consistently try to ignore my instructions. At one point, it became such a problem that I almost engaged in an altercation with a male attendee. By the third day I developed a system to avoid attendees altogether. I created a cardboard sign that read "the line is now closed" that I would put in front of my face whenever someone would try to get in line. In contrast to my first year job, the only motivation for doing my job properly came from the attendees who understood my position and respected the job I had to do. Oftentimes I found that these attendees were ones that came to Comic-Con in the 1990s, as we would reminisce about when Comic-Con used to be a close-knit event.

As a sociologist, I cannot help but think that capitalism needs to expand into new markets. I ask myself: has an event such as Comic-Con, which previously catered to a sub-culture of comic book enthusiasts, become a mainstreamed and corporatized event predicated on the commodification of "geek culture"? Even more importantly, is this shift only going to be further exacerbated both by the corporations' desire for profit and the growing consumption of "geek culture" by the masses? Time will tell, but it surely is a place of sociological analysis.

Speaking ... Truce to Power Reflections of a “guilty” bystander to the Israel-Palestine conflict (Part One)  
(2014-10-15 10:37)

by Dr Lambros Fatsis

Having borne witness to seven weeks of fighting in Gaza which resulted to a multilateral ceasefire and a relative media silence ever since, anyone armed with a basic, cosmopolitan civic conscience, cannot help but feel helpless and hapless even, despite or rather because of the geographical distance which shields a lot of “us” from the immediate effects of the Israel-Palestine conflict.

We can indeed feel helpless for not being able to fully understand or contribute in any direct way to fruitful discussions, and authoritative decision-making processes that could influence peaceful outcomes in the West Bank, but we cannot fully justify to ourselves remaining hapless bystanders to such a deep and longstanding political and humanitarian crisis.

In a similar way, acknowledging both a sense of vulnerability and indirect responsibility for the recent events in the Gaza Strip, involves spelling out what exactly one can do as a geographically distant spectator to respond to images and realities that have surrounded our daily lives so pervasively in the last month or so. Following a recent correspondence with a former lecturer of mine, who voiced similar concerns with characteristic sharpness and brevity, I felt that it should be vital to give even the slightest indication of what academic discourse could possibly have to say, show or come up with in response to such events, especially given its deafening silence so far.

Momentarily restoring my belief in the power of “uttering” as a necessary pre-condition, if not a synonym, of “altering”, but without harbouring any illusions of “speaking truth to power” as the intellectualist cliché has it (Benda 1928, Jacoby 1987, Said, 1994), much of what follows serves as a confession of a “guilty” bystander who has only his scholarship to offer as an antidote to war, motivated by a desire to speak ... truce to power.

Leaving heartfelt declarations of civic virtue aside, it seems rather urgent to immediately introduce the contents of this article, starting with some obligatory caveats and provisos that eventually pave the way to some predicaments of and responses to the Israel-Palestine conflict, as can be identified not only in the relevant academic scholarship on the subject, but in our collective understanding of it too.

For convenience’s sake, the article is divided into three main sections, the first of which describes two caveats which serve as warnings about what this article is not, as well as about what it actually is, followed by a necessary proviso which spells out what the article attempts to show, say and “do”. The second section of the article recognises two striking predicaments of the Israel-Palestine conflict that hint at its complexity and difficulty, while the third and last section focuses on two potential responses to such a crisis, drawing on scholarly work in sociology and sociolinguistics.

Section I: Caveats and Provisos

1.1 What this article is not

Contrary to the almost built-in ambition of political commentaries, this article does not proffer the pretence of being the product of some authority in the Israel-Palestine conflict, nor does it reflect the musings of a seasoned expert with valuable experience in international relations, international diplomacy and foreign policy. In that sense, it is not a recipe for policy, or an authoritative alternative, a convincing proposal, or a firm (re)solution, much less a rousing call to arms. To make matters worse, much of the above, at least to my mind, might be suspected of committing analytical, moral, and political hubris, oscillating between “omniscient” puffed-up self-importance and ideological posturing, and saturated with irresponsible rhetorical grandstanding that shows little regard for the
actual, and very real, sensitivities affected.

1.2 What this article actually is

Having spelled out what the present article is not, it is fundamentally important to establish what it actually is, or may be. Conceived as a modest attempt to fill gaps in the discussion, as observed in the recent coverage of and commentary on the Israel-Palestine dispute, this article aims at:

- Highlighting hitherto unnoticed, routinely by-passed, or deliberately marginalised issues that demand our immediate attention as cosmopolitan citizens witnessing an ongoing crisis of tragic proportions
- Offering a different vocabulary, ideas and interpretations with which to make sense of an unavoidably divisive political issue
- Attempting to break the silence of academic discourse by showing its potential relevance through a discussion of some themes, issues, perspectives and debates that help us understand some rarely remarked upon dimensions of the conflict, and
- Refusing to treat the issue as a bureaucratic turf struggle, or a merely technical, legal, diplomatic matter, thus opposing any discourse which may prioritise (state) interests to (human) rights, or disregard moral and political imperatives in favour of dispassionate diplomatic solutions drafted by professional policy-makers abroad

What is attempted instead is an invitation to:

- Acknowledge the complexity and sensitivity of the matter by describing, albeit passingly, the emotional, psychological, cultural, political and moral dimensions that make this conflict so difficult to (re)solve without taking into account these factors
- Stress the need for a dispute settlement that involves and makes demands on both sides by creating a negotiating space where both sides can meet equally, with the presence of disinterested, balanced, unbiased international negotiating mediators who will host, convene, and "police" discussions, without ambitions to hatch abstract proposals or offer indecent capitulations, like the existing ones.
- Appoint such a neutral international agent with the aim of (a) conducting discussions towards reaching a non-belligerent agreement, (b) to achieve mutually desirable aims, while (c) guaranteeing fair terms, freedom, equality and full protection for both sides.

To do so however, another set of pre-conditions need to be met, which involve:

- Understanding the Israel-Palestine dispute as an international human rights issue, rather than a localised tussle over land
- A publicly announced, official international recognition of the existence and traumatic history of Palestine, which even today appears "not to exist", 'except as a memory or, more importantly, as an idea, a political and human experience, and an act of sustained popular will' (Said, 1992: 5)
- Bringing together perpetrators (the state of Israel), victims (Palestinians), and international by-standers to the same negotiating table, asking the perpetrators to publicly acknowledge and regret the harm that is done, the victims to forgive, both sides to reconcile, while pressing the international community to assume responsibility for its role as a major player in the lopsided and imbalanced pseudo-agreements that have so far been signed, from the callous Balfour Declaration of 1917 to the largely defective Oslo accord of 1995, so memorably criticised by Edward W. Said (1995) in Peace and its Discontents.
- Demanding, funding and supporting a mutual history project and similar educative incentives with the aim of healing existing historical traumas, and turning sentiments of enmity into seeds of and for reconciliation. Fanciful though such a proposition may initially sound, it is only by radically "undoing" the deeply ingrained hatred that both sides feel about each other, that a transition from 'apartheid' (Said, 1995: 62) to democracy can be achieved, provided of course that a sustainable peace agreement has been achieved first, in the manner suggested above. Promoting stereotypical falsehoods that intend to demean one side while glorifying the other (see Jiryis, 1976) can hardly be thought as an acceptable state of affairs. Therefore, the teaching of traumatic (hi)stories with a view of co-operatively overcoming them by acknowledging such events and trying to understand them, enriches both national histories, while creating a novel, mutual history that can pave the way towards a more harmonious
relationship, providing people on both sides with a new script of learning and "doing" history and politics in a manner that does not fence the 'Other' in, or out.

1.3 What it tries to say, show or do

Recognising that the two caveats, or warnings issued above might be suspected of stipulating terms and conditions for a bilateral agreement between Israel and Palestine, it seems incumbent upon the scope of the article to re-emphasize their intended role a mere side-notes towards stimulating a jump in our political consciousness, when discussing one of global history's most provocative disputes. In doing so, I plead for the reader's patience, while I qualify what has been said by spelling out my intentions and my intellectual rationale for thinking about and discussing the matter in question, the way I currently do.

To offer any attempt at a discussion of the Israel-Palestine conflict, at least in my mind, automatically means recognising that:

• It is an intricate, emotive, contentious and immensely complicated matter whose discussion, analysis, interpretation and understanding is held hostage to decades of misapprehension and misrepresentation, psychological barriers and cross-cultural misunderstandings (Ellis and Maoz, 2002, Griefat and Katriel, 1989, Cohen, 1990), as well as political status issues (minority, majority, dominance, oppression), therefore making it both a real, material problem of acute political urgency, as well as an issue of inter-cultural miscommunication that underscores much of the "deadlocking" of so many negotiations.

• It cannot be solved by realpolitik alone, although 'real principle and real justice have to be implemented before there can be true dialogue' (Said, 1995: 36)

• Peace does not come by one-state, two-state or bilateral, federal state solutions alone, but requires a vocabulary of truce and reconciliation to undo the rhetorical habit of power, defined by Corsini (1984: 63) as a 'capacity to influence other while resisting the influence of others'. Instead, 'real dialogue' and 'real justice' is achieved 'between equals not between subordinate and dominant partners' (Said, 1995: 36-37).

In the light of such necessary pre-conditions, or provisos for discussing the Israel-Palestine conflict in any responsible way, the argument here proposed is that there exists a body of sensitive, humane, and sensible scholarship on various aspects of the dispute that can contribute to a positive and reconstructive change of outlook that remains committed to replacing intolerance with debate, killing with dialogue, paranoia with real politics, in a manner reminiscent of the wise words of a Palestinian laundry worker who confiding in social anthropologist Rosemary Sayigh (2007: 200), painfully acknowledged that: 'We know that Israel exists, we don't want to throw the Jews into the sea. We don't want to die, we want to live. We want to live, and we want others [i.e. Israelis] to live. But we don't want others to live, and us to die'.

Section II: Predicaments

2.1 Exiles Making a Home By Means of Exile

Paraphrasing the subtitle of Richard Sennett's (2011: 3-44) essay on exile, this section starts with an ambitious attempt to understand the ferocity and unshakable conviction with which the modern Jewish State was planted on the ruins of Palestinian land. Whilst it is common, and quite undeniable, to describe the foundation of Israel as a flagrant case of irredentism, it is also extremely vital to understand the reasons why such sentiments have had such a firm grip on the Jewish consciousness, political imagination and policy.

A fundamental aspect of the Zionist movement's sheer force, tenacity and appeal relates to the historical experience of Jews as exiles. From the Roman siege of Masada and the ghettoization of Jews in Renaissance Venice, to the expulsion of Jews from Spain in 1492 and the Holocaust (Shoah), experiences of segregation, persecution, displacement, and extermination have played a fundamental role in the self-definition, self-understanding and
self-identification of Jews throughout history. It is therefore within that historical, cultural and psychoanalytical context that, what Israel Shahak (1998) called, 'Jewish fundamentalism' needs to be understood if any clear picture of Israel's militancy is to emerge.

Such experiences of centuries-old anti-Semitic persecution do not of course justify the uprooting of Palestinians in the War of 1948, but they hold the key to unlocking the paradox of how one people, as Said (1992: xxi) observed, ‘in their new nation [have] become the victimisers of another people, who have become, therefore, the victims of the victims’, thereby extending the tragedy of the Shoah to the Palestinian suffering of alienation, dispossession, marginalisation and exile, (ghourba in Arabic).

Founded on the trauma of dislocation, aided and abetted by the Zionist movement’s colonialisland zeal (see Herzl, 2007), Israel came to impose itself as a state on ‘[a] land without a people, for a people without a land’, as Zionist leader Max Nordau’s cynical dictum had it (Sayigh, 2007: 198). This disturbing combination of a ruptured past with the fundamentalism of a dogma of imperialist intent and colonialisland tactics, constituted Israel’s "origin myth" forgetting and often openly denying Palestine's existence, reaching its apogee in post-1948 Occupation where, in Hannah Arendt’s (1973: 290) words, 'the solution of the Jewish question merely produced a new category of refugees, the Arabs, thereby increasing the number of the stateless by another 700,000 to 800,000 people'. It is in that context of purging a traumatic past, that the subsequent purge of Palestinians was orchestrated with Golda Meir’s ‘flat assertion in 1969 that the Palestinians did not exist’ (Said, 1992: 5), epitomising the whitewashing of history by denying the continuous Palestinian presence on the land of Filastin or Falasteen since the end of the 7th century, despite successive waves of Roman, Byzantine, Ottoman, British and Israeli occupation (see, Said 1992: 8-11, and Sayigh, 2007: 1-61 for a historical overview).

What is imperative then is not merely to condemn the long-lasting oppressive and authoritarian settler colonialisland of Israel, but to also come to realise that what feeds such fanaticism is the desire to consolidate a spatially fixed national identity in order to heal the injuries of dispersal by engineering, and imposing, a return to a perceived ancestral home, even at the cost of expelling others (Palestinians) from their place of origin. In other words, it is not enough for the international community to merely point the finger at Israel's aggressive tactics without recognising the deep insecurities that nourish such absolutism, as it is not enough to do just the absolute minimum in intervening to help Palestinians regain their self-respect by simply granting them observer status in the UN. Recognising and allowing Palestine to exist as an autonomous and independent nation is what is at stake, and it is international parties within the UN that need to do that by mounting an opposition to the hypocritical reservations of the US, as evidenced in the [1]General UN Assembly vote of 2012. While it is indeed true that [2]‘negotiation is the only way to achieve peace’, as Israel’s former ambassador to the UN, Ron Prosor recognised, it cannot happen in a vacuum without openly discussing the source of Israel and Palestine’s embittered relations. One the one hand we have the indiscriminate, wholesale endorsement of a totalitarian dogma (Zionism), which provides a historically transplanted population with the comfort and security of a territorial identity, while on the other hand we have the continuous marginalisation, uprooting and oppression of another people (the Palestinians) in a vicious circle which transforms both sides into warring groups that neither were or needed to be, before the experience of Holocaust which fuelled Zionism, and before the Uprooting which in turn invited armed struggle as a vehicle for revolutionary change. Fighting the root cause of this seemingly interminable conflict does not simply mean doing so rhetorically by drafting UN resolutions as a technical solution to a real, political problem of international significance, but by making decisions that will make such hatred irrelevant in time to come. This can only emerge if the international community commits itself to securing ongoing peaceful negotiations and creating initiatives for educational, cultural and political change that will urge more dialogue and more sociability between Israel and Palestine therefore heralding a long-term period of reconciliation as a pathway to transition from violence to democracy (see Section III of this article).

2.2 Proximity and Distance

Another predicament that is often papered over in discussions of the Israel-Palestine conflict is the paradox of
the two parties’ geographical proximity and cultural distance and its negative impact on negotiation(s). Despite ‘overwhelming evidence for the salience of intercultural incompatibility in the deadlocking of talks, formal and informal’ (Cohen, 1990: 152, 136-7), this ‘intercultural dimension’ of the conflict is passed over ‘in silence’ when it should be taken into account seriously, given that cross-cultural antinomies can and indeed do lead to communicational dissonances which soon turn into political discord, thereby hindering the prospect of resolution because of contrasting assumptions about negotiation and bargaining. Sociolinguists such as Cohen (1990), Casmir (1990), Ellis and Maoz (2002), Katriel (1986), and Griefat and Katriel (1989) have produced impressive scholarship on the subject showing the differential emphasis, meaning and understanding that Israeli-Jews and Palestinians place on bargaining. While Palestinian-Arabs act in accordance with the elaborately dialogic, contractual ethos of musayra (or musayara), Israeli-Jews adhere to the dugri code of speech which emphasizes “straight talk”. Whilst this may sound like a version of cultural relativism, if not cultural determinism, what the work of such scholars tries to show is not the impermeability and unchangeability of these communicational codes and cultural traditions, but that such socio-linguistic and cultural differences need to be acknowledged, recognised and wrestled with for any attempt towards establishing peace by dialogue, given the emphasis placed on specificity, preclusive detail, semantic accuracy, precision, and explicitness in the Israeli dugri ethos of speech, contrasted by preference for constructive ambiguity, social contract, deliberate obscurity, and implicitness in the Arabic folk-linguistic habit of musayra.

Although such cross-cultural differences may at first glance appear purely aesthetic, if not entirely decorative, they shed light on a gravely problematic relationship between two spatially adjacent, yet culturally remote parties. If we are to consider peaceful negotiation as a viable solution to longstanding political conflicts such as this, cultural misunderstandings of this kind need to be thought as having serious political implications, rather than be easily dismissed as irrelevant trivialities.

Understanding the contrasting assumptions of Palestinians and Israeli Jews regarding negotiation and bargaining is important for realising why dialogue between the two groups often comes at a standstill. In the ‘other-oriented’, ‘humoring’, ‘conciliatory’, and often exhaustingly long-winded, interational ethos of musayra (Griefat and Katriel, 1989: 121), bargaining is praised as a value in its own right, and seen positively as ‘a forum for human relationships' and ‘social integration’ (Cohen, 1990: 138). From an Israeli standpoint however, bargaining has negative connotations and is associated with the ‘rejected and despised’ practices of the Jews’ mercantile past when they first arrived in Palestine as traders; an experience that is seen as ‘part of a struggle for survival in a hostile environment’, if not an ‘aberration’ (Cohen, 1990: 139). Set against this background of conflicting ideas about the virtues and vices of negotiation, any meaningful dialogue cannot but take into account this socio-linguistic and cultural dimension of political exchange, recognising that ‘to be a person […] is to be a person-in-a-culture’ (Griefat and Katriel, 1989: 136). And while it is certainly the divergent political aims, objectives and demands of such debates that make disagreements between Palestinians and Israelis so flammable, the cultural gulf between them can hardly be by-passed when the influence of such factors largely determines the binding powers of contracts. ‘Peace comes from understanding, not agreement’, claims an Arabic proverb (Cohen, 1990: 148), and if it is at all true, political agreement without cultural understanding between Palestinians and Israelis is bound to continue to be difficult to arrive at.

Section III: Responses

3.1 Negotiation, not a dialogue of the deaf

Having already attempted to show some neglected or even hidden layers that lurk behind a sensitive and volatile political debate, this section endeavours to introduce the idea, notion and practice of negotiation as a fundamental political act, thereby elevating it as a necessary practice for political change rather than reducing it to a mere linguistic or cultural device. This is an important acknowledgement to make, not just to ward off accusations of committing “policy by Freud”, but to stress and highlight the significance of negotiation in the resolution of political conflict as a crucial rather than a naïve plan of action, that is as difficult to implement as it is vital.

Despite the immense complexities and difficulties of negotiation, described by Henry Kissinger as an ‘ordeal by exegesis’ (Cohen, 1990: 146), it is here contended that treating negotiation as a key process in reaching a consensual agreement as well as helping in winding down the fighting is important on a number of counts.

Firstly, negotiation helps in breaking the mould, if not the patterns and habit of the existing dialogue of mutual exclusion, by turning interminable disputes into potentially sustainable negotiations that stress communication in pursuit of peace, rather than as a proxy for a performance of dramatic confrontation.

Secondly, negotiation recognises the dependence on others to achieve one’s own independence; a process which requires building trust given the ‘intrinsic contradiction between conflict and the need for joint action’ (Casmir, 1990: 43). Besides, as Casmir (1990: 43) notes, ‘[i]t is the resolution of that conflict which is the primary purpose’ of the negotiation process, and given that what we ‘need to remember’ is that when two parties are in dispute ‘they want different things and they want them from each other’, it is apprehension and mistrust, not co-operation and negotiation that act at the expense of each side’s own interests.

Thirdly, negotiation offers a much more well-rounded approach to conflict-resolution, than continued violence or indifference does because, as Casmir (1990: 40) states:

‘Negotiations, especially on the international level, are a complex process that requires consideration not only of the factors contributing to them at the moment, but also cultural and other interrelationships that precede and follow the readily apparent procedures. All negotiations are concerned with power; that is they are the result of power relationships between negotiation partners. Furthermore, they must take into account factors that have caused trust or mistrust to develop in the past because of perceptions related to the use of power by one or more of the negotiation partners’.

3.1 Reconciliation, not alienation: A sustainable alternative?
Having so far discussed the historical, linguistic and cultural dimensions of the Israel-Palestine conflict, without in any way wishing to reduce it to those factors alone, this section of the article hopes to reveal its author’s orientation to the issue by sharing a few reflections as notes towards re-thinking the whole debate as well as offering some alternative responses to it, with the intention of proposing reconciliation via peaceful negotiation as a viable linguistic, cultural and political mode for speaking truce to power.

Reconciliation is therefore seen here as a serious and important process of political deliberation seeking to ‘repair damages of the past through a new mode of justice, often called ‘restorative’ justice, which can be understood as an attempt to establish and legitimate an emotional ‘regime’ that is markedly different from the regime that typically underpins the retributive justice of ordinary democracies’ (Ure, 2008: 284-5). The aim of such a proposition for a shift from "retributive" to "restorative" justice, is to try and imagine a sustainable alternative to violence and enmity which ‘acknowledges the legitimacy of ‘past grievances’, but also attempts to ‘find ways to overcome victims’ anger and resentment for the sake of creating a viable social future’ by means of '[r]espect[ing] the victims and survivors of atrocity-yet broker their participation’ (Ure, 2008: 285).

Ambitious and ambivalent though such a proposition might be, it will dominate the argument of this article which is organised in four themes; (a) Avenging Revenge, (b) Taking Emotions Seriously, (c) Healing, not Killing, and (d) Arresting Violence

Avenging Revenge
Revisiting an argument that was initially defended at a [2]previous article for the [3]Sociologists of Crisis series, albeit set at a different context altogether, my call to avenge revenge by entirely abandoning the idea and the practice serves as an invitation to fashion a different image, and inspire a different interpretation of justice that moves away from automatically, spontaneously and lazily equating it with retribution and revenge.

Despite literary, legal and cultural evidence that defines revenge as synonymous to justice, from Homer’s (18: 127) depiction of it, via Achilles, as ‘sweeter than dripping streams of honey’, and Hesiod’s scathing description of Thebans’ whose ‘justice is violence’ (Lane, 2014: 29), to Judith Shklar’s (1990: 94) emphatic observation that ‘for most people, retributive justice is justice’, it is here argued that considering the ‘exhilaration of revenge’ (Shklar, 1990: 97) as justice is immensely problematic, if not erroneous, intellectually, morally, culturally and politically alike.

Re-defining justice instead in a way that opens up a space, a middle ground, a mean between anger (thymos) and compassion (eleos) seems more sensible and durable, bearing in mind Plato’s resounding claim that ‘the just city is based on an education that carefully calibrates its citizens’ anger (thymos) and extinguishes their sense of tragic grief or compassion (eleos)’ (Ure, 2008: 283). Such an alternative definition of justice moves away from revenge as a rightful or even righteous response to harm, and directs our energies instead towards what, South African psychologist and esteemed participant in the third [4]Russell Tribunal on Palestine, Gobodo-Madzikela (2008: 331) calls ‘empathetic repair’. Substituting violence and aggression, with empathetic repair however requires a leap in political consciousness, and the guiding assumption behind such a logic is that ‘building or re-establishing a sense of shared humanity’, as Ure (2008: 285) puts it, needs the emergence, if not creation, of a ‘political community based on equality of respect and civic trust’, with the aim of encouraging ‘victims, perpetrators and beneficiaries to undergo an emotional catharsis’; a consideration that is entirely over-looked by conventional criminal and civil laws and practices. ‘Compared with retributive justice’, Ure (2008: 285) adds, ‘the restorative mode of justice pioneered by traditional societies demands the application of a greater range of emotional responses to injuries and violations and, in some cases, a challenge to the norms of reasonableness in emotions that applies in established democracies’.

Changing the mode of justice as a result of political will however largely depends on making past enemies regard one another as fellow human beings, an imperative identified by Trudy Govier (2002: 144), in Forgiveness and
Revenge, as follows:

‘People cannot come together in a lasting way and cooperate as they will need to in a jointly run society if they remain angry, vengeful, suspicious, and insecure. The need for forgiveness lies in its relevance to two very practical aspects of reconciliation: cooperation and sustainability.

Removing ‘resentment and anger’, Govier (2002: 144) suggests, is important because they undermine the trust that sustains social cooperation, and need to be replaced instead with a different emotional education, or rather, re-education that equips citizens with the confidence of nurturing and defending more lasting political emotions, by taking them as seriously as they would act of retribution and violence.

Taking Emotions Seriously

Avenging revenge with compassion, apart from a magnanimous display of political will, also involves a reconciliation with emotions as a rich lexicon in and of political life, urging us to mine our psyche for solutions beyond anger in order to effect a transition from authoritarianism to democracy by confronting a bully without becoming thugs ourselves. Vague and hopelessly naive though such a suggestion for resolving political issues may sound, it is not without its proponents, and the figures I have in mind as I type do not come from the insular, ivy-clad world of academia, but from the realm of direct, traumatic experience. Nelson Mandela was one such figure and, as Muldoon (2008: 307) observes, he was one to see a ‘strong connection’ between the ‘(external) transition from authoritarianism to democracy and the (internal) transition from anger to forgiveness’. Desmond Tutu, another South African candidate, had a similar philosophy in mind when encouraging the Truth and Reconciliation Committees with the aim of seeing forgiveness as a lasting remedy rather than a quick fix for those choking upon their anger and resentment.

Last but not least, comes Phan Thị Kim Phúc, now a UNESCO Goodwill Ambassador campaigning for peace, and a nine-year old child in the Vietnam War when she witnessed and suffered severe injuries and underwent numerous operations as a result of the napalm bomb shower that devastated her village in South Vietnam. The ‘Napalm Girl’, as she came to be known after photographer Nick Ut’s iconic photo ‘The Terror of War’, made the following appeal during a ceremony in Washington, DC: ‘If I could talk face to face with the pilot who dropped the bombs, I would tell him that we cannot change history, but at least we can try to work together in the future to promote peace’.

Upon delivering her speech, Gobodo-Madzikela (2008: 345) recalls, ‘John Plummer, the man responsible for dropping the napalm bomb was present in the audience. He wrote a note with the words: ‘I am that man’. The note was passed on to Kim and at the end of her talk they approached each other’, where Kim Phúc opened her arms to Plummer, and upon accepting his sobbing apology said: ‘It’s alright’, ‘I forgive. I forgive’.

What this incident portrays, is not, as Gobodo-Madzikela (2008: 345) puts it, a ‘misguided sentimentality’ at the expense of “real politics” but an encounter which is ‘illuminative of the development of emphatic identification between a perpetrator of an atrocity and a survivor who bears emotional and physical scars from the atrocity’. In political terms, such examples address the need to introduce forgiveness, empathy and compassion as a trinity of emotions that form and inform a new kind of political ethic, ‘an ethic for enemies’, as Donald Shriver (1995) called it. For forgiveness to matter however, escaping its stigmatisation as a rose-tinted abstraction with little relevance to pragmatic reality, its ‘proper function’ needs to be understood in terms of its capacity to ‘forgive the inexcusable and incomprehensible’. ‘Without the gravity of an atrocity’, Jankélevich (2005: 106) argues, forgiveness would be ‘superfluous’, a mere formality and an ‘empty protocol’ devoid of meaning or purpose. Elaborating on his argument Jankélevich (2005: 106) adds that:

‘When a crime can neither be justified, not explained, nor even understood, when, with everything that could be explain having been explained, the atrocity of this crime and the overwhelming evidence of this responsibility are obvious before everyone’s eyes, when the atrocity has neither mitigating circumstances, nor excuses of any sort, and when hope of regeneration has to be abandoned, then there is no longer anything else to do but to forgive’. Such a process of forgiveness however, involves, as Horwitz (2005: 485) notes, ‘significant intrapsychic work,
conscious and unconscious working through one’s anger, and putting the offence into the context of an integrated view of the whole person of the offender, thus neither forgetting one’s trauma, nor denying the humanity of the perpetrator by means of exterminating her, but urging “villains” and victims to start conversing in the common idiom of humanity, rather than the enraged babble of violence.

Healing, Not Killing
Building on the previous argument, before we reach the conclusion to this article in the next and final section, forgiveness is here praised as a psychically and politically transformative process which turns killing into healing or at least aspires to do so. In that context, forgiveness is not equated to forgetfulness, selective memory or total amnesia, but rather to a process of learning to live with a trauma with a wish to heal rather than avenge the violence that has been inflicted. Woundedness is therefore seen as what Gobodo-Madzikela (2008: 344) describes as ‘an ethical responsibility towards the other’, urging us to converse responsibly with the realm of what Arendt (1998) called ‘radical evil’, which is neither punishable or forgivable.

Radical evil, according to Arendt, is “unpunishable” because no amount of punishment can restore a proper sense of justice, and unforgivable because such evil deeds are impossible to forgive. Yet it is in this battle between two impossibilities that Arendt (1998: 237) paradoxically offers forgiveness as a possible solution, arguing that forgiving ‘serves to undo the deeds of the past, whose “sins” hang like Damocles’ sword over every new generation’. In doing so, Arendt, who knows a thing or two about violence, totalitarianism and evil, is being neither vague, nor utopian, but bravely puts her argument against the rhetoric of revenge, punishment and persecution, defending instead an ‘enduring vision of democracy and action in political life; bringing victims, perpetrators and beneficiaries of oppressive regimes together for sustained dialogue about the past’, believing that it is ‘the only action that holds promise for the repair of brokenness in post-conflict societies’ (Gobodo-Madzikela, 2008: 335). Thus, replacing vengefulness with forgiveness and killing with healing also means resisting the teleology of violence, urging instead the possibility of peace, which will be neither punitive (towards the perpetrators), nor humiliating (for the victims), but negotiated in pursuit of rationally defined interests, and policies, thereby substituting the degrading effect of violence and aggression with the restorative effect of forgiveness as the basis of and for politics in post-traumatic societies with a view to prompt self-examination and revision of cherished values, ideals and beliefs.

Arresting Violence and Speaking Truce to Power
In concluding this article it seems important to offer a generalised view of the argument here espoused as one that aims to “arrest violence” in favour of “speaking truce to power”, thus arguing for a shift from a rhetoric of conflict towards establishing a culture of healing and reconciliation aimed at peace through negotiation.

Unlike most politicised responses to the Israel-Palestine conflict, what is argued here is a fundamentally political alternative response, which does not treat the resolution of the issue as a state-building exercise alone, but as a task of overcoming betrayal and trauma in an enduring and sustainable manner which takes into account the emotional, cultural and political dimensions of conflict that are often neglected, if not despised, in the fear of de-politicising the issue in favour of psychoanalytic interpretations. In defence of the argument here proposed however, a distinction should be made between the “politicised” and the “political”, given that the former is served by acclamation and assertiveness while the latter is characterised by extermination of hatred and attentiveness. It is therefore argued that any self-respecting “political” response to the Israel-Palestine conflict cannot afford to ignore the complexity, the parallels, the paradoxes and the painful contradictions that the issue engenders in favour of taking just one stance, defending just one position, at the expense of considering what makes it such a complicated and divisive matter in the first place.

The use of scholarly work on cross-cultural conflicts, borrowed from linguistics and on reconciliation and trauma, borrowed from social theory, tries to negotiate that gap by furnishing imaginative solutions to the deadlocking of talks and the continuation of violence, in the hope that they might at least enrich our thinking and our public
pronouncements about such deeply divisive political debates; thereby hinting at the possibility of replacing excitable babble with careful, empathetic consideration of the various aspects of a conflict that is so often charged by polarisation, division, and a disturbing amount of fanaticism that culminates into hatred, as witnessed in a worrying re-surfacing of anti-Semitic rhetoric during the recent events in Gaza.

To be pro-Palestinian does not mean being anti-Semitic, as the slogan goes, yet adopting a one-sided stance to a multi-layered problem only makes sense in cloistered ideological terms, not in the open court of politics. The subtle, yet hopefully powerful, alternative here proposed then has a twofold aim; to invite us to think of the Israel-Palestine conflict differently, as well as to infuse hard-line realpolitik with a sense of soft power, by considering, as the UN-sponsored Durban Declaration of 2001 did, truth commissions, special legislation mandating reparations, formal acts of apology, judicial tribunals, state trials, and other international action on behalf of political reconciliation as important initiatives in a politics of social repair to replace peddling simplistic and divisive one-state, or two-state solutions to a problem that is bigger than a mere territorial dispute, and requires more than an exchange of land for its resolution in any sustainable way. To undo the harm of long-standing traumas one cannot simply issue calls to arms, propose divisive policies, or erect walls and borders that separate, but rather offer the space, the time, the security, the guarantees and the chance for rival sides to non-defensively engage the world by negotiating a desirable outcome together, leaving the politics of reversion behind.

Paraphrasing Édouard Glissant (1989: 16) who, as a Martinican, knew only too well what colonialism and oppression meant, ‘to revert is to consecrate permanence and negate cont(r)act’, and in the Israel-Palestine conflict choosing to revert would simply re-stir past and existing animosities rather than alter the current state of affairs by giving political love, not enmity a try.

Is American higher education as horrible as 'advice' posts make it sound? (2014-10-16 08:00)

I read a lot of higher education blogs. One genre that you encounter from time to time is the 'tough but fair advice to grad students' post. This often offers advice on conferences or career planning. It tends to be slightly facetious and adopts a tone of demythologisation. These posts irritate me because they often appear to be perpetuating things I suspect are myths while purporting to be doing the opposite.

They also make American higher education sound horrible. They leave me with a mental image of American conferences as filled with hoards of angst-ridden grad students, desperately surrounding established academics, projecting fixed smiles and simultaneously doing their 'elevator pitches' while trying to shake hands en masse. My point is not that I think conferences in the US are actually like this. But these advice columns implicitly suggest that conferences should be like this.

I'm also wondering to what extent these notions are projected by people with a vested interest in graduate students being anxious: the growing class of freelance PhD advisors. I'm thinking about things like [1]this. Some of the advice might be accurate and there might be people who will benefit from it. But something about the tone of it really bothers me when it’s conjoined with taking money from the most anxious amongst the group described.
Emma Uprichard on Complex Temporal Ontologies and Method - October 28th @SocioWarwick
(2014-10-16 12:25)

In the second [1]Centre for Social Ontology seminar of 2014/15, [2]Emma Uprichard (Associate Professor at the Centre for Interdisciplinary Methodologies) discusses **Complex Temporal Ontologies and Method**:

This paper reflects on the methodological challenge of applying complexity theory to study social systems. More specifically, the focus is on the problem of capturing complex patterns of time and temporality empirically. The onus of the talk will be: a) to problematize existing longitudinal qualitative and quantitative social research approaches, which fail to capture complex temporal ontologies, and b) to suggest some tentative methodological alternatives which focus on capturing temporal patterns of change and continuity from a complex systems perspective. A particular concern throughout the discussion is how to study complex change and continuity empirically, whilst also ensuring that notions of agency and the reflexive ageing actor remain central.

All welcome! The seminar will take place on **October 28th, from 5pm to 6:30pm in R1.15 (Ramphal Building)** on the University of Warwick campus. See [3]here for help getting to the campus. Feel free to contact [4]Mark Carrigan with any questions.

Shaking up the social sciences (2014-10-17 08:00)

Ahead of the visit by Nicholas Christakis to the UK next month, the Times Higher Education has run an interesting article by Amanda Goodall and Andrew Oswald. I wrote a [1]response to the original article by Christakis that sparked this debate (in fairness he didn’t choose the title) arguing that the problem with this argument is political rather than intellectual. I actually have a lot of sympathy for the intellectual case he’s making but I worry that his argument inadvertently lends support to a concerted attack on the social sciences (particularly in the case of political science in the US) and a broader attempt to restructure the university system in the UK. Goodall and Oswald succinctly convey what for me is the root of the problem:
The first thing to have in mind, as background, is the astonishing size of the social science literature. Few people appreciate this. The Thomson Reuters Web of Science database (which is by no means exhaustive of the entire global academic output) lists more than 3,000 social science journals. The journals classified as economics alone contained approximately 20,000 articles last year. This implies that one new journal article on economics is published every 25 minutes – even on Christmas Day. This iceberg-like immensity of the modern social sciences means that it is going to be difficult to say anything coherent and truly general across them. Nobody walking the planet has read more than 1 per cent of their published output. Most of us have not read 0.1 per cent. Such facts should give all of us – whether or not we agree with Christakis – pause for modesty in our assertions.

This situation seems obviously untenable to me. Add to it the low citation rates across the social sciences and we’re left with an utterly depressing picture of an ever growing quantity of [unread and unloved] publications that should surely leave us asking what on earth is this work for? What are the social sciences supposed to do? What purposes do they serve? What purposes should they serve? I’m intuitively inclined towards a pluralistic view of social inquiry in spite of having firm theoretical commitments. This leaves me frustrated when encountering responses to these questions that affirm the validity of one approach and denigrate all others. But I’m equally firm in my conviction that these questions need to have an answer, even if the purpose might be some oblique matter of edification rather than anything even approximating instrumental standards of utility. In other words, I think it has to be for something and when considering the output of the social sciences as a whole, in contrast to any particular example of research I might choose to examine, it’s far from clear to me that this is the case. Furthermore, I think the proliferating piles of unread (and in some cases unreadable) literature mitigates against it serving some purpose. The problem is getting worse, not better.

I agree. The problem will get worse until there is some convergence that manages not to mask or minimise the specificities and mechanisms of singular actual societies.

The question about purposes can interpreted as a question about interests. We’re all aware of how research can serve the interests of the researchers who need to improve their CVs. Can it serve anyone else’s interests? Social theories can and do have huge social effects far beyond academia: just look at the effects of neoliberal economics and of Marxist economics before it. As those examples suggest, such effects can be aimed at serving the interests of the haves or of the have-nots. People who argue for strengthening the autonomy of the field (myself included) argue that sociology should not aim to serve non-scientific interests, and that it should be protected from the harmful influence of those interests, because even good politics often makes for bad science. Instead, they suggest that only an autonomous social science, which is able to ask questions and think thoughts that cannot be asked or thought in everyday discourse, can produce understanding of society that would be accurate enough to be of any real use to social movements aimed at serving the interests of the have-nots. Aside from the pressure of publish-or-perish, I think there is also pressure to do research that is seen as ‘relevant’, either to state policy-making or to
the contestation of state policies. Perhaps this helps explain why so much research seems obsessed with social minutiae and utterly lacking in intellectual ambition. If sociologists were expected to tackle deeper questions, perhaps they would publish less.

I find that very plausible. You give grounds for thinking that the call to relevance might inadvertently entrench the problems lead people to call for relevance.

Resonance and subjectivity on twitter (2014-10-18 08:00)

In four years of using Twitter regularly, I've often found others tweeting things that resonate with me and vice versa. In fact one could plausibly suggest that these experiences play an important role in making continued use of the service appealing. What do I mean by ‘resonate’? I mean knowing where someone is coming from, understanding the reaction they're expressing and sharing it to some extent. I would argue that resonance is an important factor to consider in understanding subjectivity within a changing social world – to understand where someone is coming from necessitates some degree of converging experience and circumstances. If everyone's experience and circumstances are entirely particularistic then resonance becomes impossible. If everyone’s experience and circumstances tend towards homogeneity then resonance in interaction fades into the background and ceases to become a distinguishable phenomenon.

In this sense, I'd see resonance as an important micro-social mechanism engendering social integration: it helps translate objective commonalities into subjective commonalities. Experiences of resonance leave us with a sense that others understand where we are coming from and vice versa. The new forms of interaction facilitated by social media enable new ways in which objective commonalities can be translated into subjective commonalities. Things that previously couldn’t be a basis for subjective commonalities – because they rarely, if ever, entered into interaction – now can be and this has important social consequences. It would be easy to overlook the way in which something like Twitter can contribute to social integration because it is so empirically different to what we're used to but I'd argue the same underlying mechanism is at work. It tends to increase the degree to which people feel a sense of commonality with a range of others with whom they interact and it does so because there are real underlying commonalities which facilitate this.

An introduction to blogging and twitter for social researchers (2014-10-18 13:22)

My course at Nat Cen has been moved to December. You can book online [1]here.

Given the increasing pressure to demonstrate the impact of social research, it is inevitable that researchers are looking towards the opportunities offered by social media. This one day course offers an accessible introduction to the use of blogging and twitter, encompassing the possibilities they offer for social researchers and walking you through best practice.

You will learn through a combination of presentations, informal discussions and practical sessions, including pre-course reading.

3028
Course content covers:

- An introduction to blogging
- An introduction to twitter
- Making an impact with blogging and twitter
- Integrating blogging and twitter into your working life

Who is it aimed at?

This is an entry level course, which assumes no familiarity with blogging or twitter.

You will find this course useful if you:

- conduct social research
- have responsibility for impact and public engagement
- communicate findings to policymakers and practitioners

Learning outcomes:

By the end of the programme you will be able to:

- understand the characteristics of blogging and micro-blogging
- get started in a practical and engaged way with Twitter and WordPress formulate your own strategic plan to use these services effectively
- connect effectively with others online in a way which serves these ends measure the impact of your online engagement
- participate enjoyably in the emerging academic blogosphere and twittersphere

The exciting future of governance (2014-10-19 08:00)

Background to the video [1]here. I have to admit that I’d assumed this sort of thing was at least a decade away. What’s so creepy about this (beyond “because of this your feeling of safety increased”) is how ‘joined up’ the proposed monitoring is. Rather than piecemeal monitoring that gradually gets joined up in response to instrumental concerns, this company is proposing total monitoring from the outset because of the kinds of interventions it can facilitate.

How did the Goldsmiths MA/MSc in digital sociology come about?

[audio http://markcarrigan.files.wordpress.com/2013/04/ds1.mp3]

Is it difficult to unify the disciplines that are represented on the course?

[audio http://markcarrigan.files.wordpress.com/2013/04/ds2.mp3]

How would you describe the aims of the course?

[audio http://markcarrigan.files.wordpress.com/2013/04/ds3.mp3]

What sort of students are attracted to the course?

[audio http://markcarrigan.files.wordpress.com/2013/04/ds4.mp3]

Do you think digital sociology courses like this will become more common over time?

[audio http://markcarrigan.files.wordpress.com/2013/04/ds5.mp3]

You can find out more about the MA/MSc in Digital Sociology [2]here. You can find out more about Noortje’s work [3]here.

“I have no idea what to tweet about!” (2014-10-20 08:00)

Are you a social researcher who feels this way? Here are some ideas which might help:
• Have you read any interesting papers recently? Link to them and briefly explain why you liked them.

• Are you going to any conferences soon? Tweet that you’re going and ask if anyone else is.

• Are there any new stories which connect to issues you address in your research? Link to them and explain why

• Working on a presentation or a paper? Take one idea, try and express it succinctly then throw it on to twitter to see what reaction you get.

• Have you read anything good recently that isn’t related to your research? Tweet about it and explain why.

• Try to find other people working on similar issues to you. Tweet and ask! (e.g. “Does anyone know other people working on x, y, z?”)

• Are there any blogs or other websites you follow that are connected to your research? Tweet and tell other people why you like them.

• Are there policy or political conclusions which follow from your research findings? Explain what they are.

• For that matter, what are your research findings? Tell people.

• The most obvious one: link to your publications. Tell people what they’re about and why the work mattered to you.

Call for contributions: Power, Acceleration and Metrics in Academic Life (2014-10-20 17:30)

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim ‘patent and prosper’ (Schachman) supplements the traditional ‘publish or perish’). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This workshop will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:
• empirical and theoretical engagements with the acceleration of higher education
• the origins of metrification of higher education
• metrification as a form of social control
• the challenges of self-management posed by metrification and/or acceleration
• common strategic responses to these challenges
• the relationship between metrification and acceleration
• how metrification and acceleration relate to a broader social crisis

The workshop will take place in December 2015 in Prague. At present, we’re seeking to clarify the level of interest before determining the length of the event, fixing a date and inviting keynote speakers. Please send expressions of interest – a biographical note and brief description of interest in the topic – to mark@markcarrigan.net and filip.vostal@gmail.com - deadline January 31st 2015.

Venue

Hosted by Institute of Philosophy of the Academy of Sciences of the Czech Republic the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic (http://www.vila-lanna.cz/index.html)

Travel

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.

Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.

Gurminder K Bhambra on Connected Sociologies (2014-10-20 17:44)

The discussion of Connected Sociologies as theoretical methodology around the 13 minute mark is particularly interesting:
Limits of democratization. Two roots of the current political misery (2014-10-20 20:53)

by Ralf Wetzel

Rwanda. Somalia. Iraq. Afghanistan. Libya. Egypt. And Syria. And Iraq again. The number of failed modern political interventions is legion. Successful examples are the rare exceptions. There are few worth mentioning, except certainly post-war Germany or post-Apartheid South Africa. How come? People trying to understand malfunctioning or even [1]‘failing’ states tend to make two fundamental mistakes, mostly by ignoring the conditions of societal intervention in the modern world.

The three forms of societal evolution
It would be moot to state that societal conditions and the level of development around the globe differ considerably. The fundamental difference, beyond differences in commercial wealth, political participation, or educational inclusion, is the state of societal evolution. This term is understood here in the way the German sociologist [2]Niklas Luhmann developed it in the second half of the 20th century. According to his extensive work on societal evolution and [3]differentiation, we know three distinct forms of societal differentiation: a.) a peripheral society which distinguishes between a centre and its periphery, b.) between above and below, forming a stratified order, and c.) between different functional domains, like the economy, politics, or education in modern society. Such
centre|periphery-based societies arose in the very early days of social evolution, when different tribes began operating in limited spatial conditions, fully reliant on physical co-presence and interaction. Ancient Greece or medieval Europe can figure as examples of above|below-centered societies, in which different social strata (slaves|craftsmen|nobility), the parallel hierarchy of religion, and the overall dominance of a religion (the temporal expression of a presumed divine will) determined the social world. Latest with the 18th century in Europe and North America especially, a new form of societal differentiation occurred, which is the so-called functionally differentiated society. Here, the ranking of different social strata has been replaced by the appearance of different societal domains, such as the economy, politics, education, or science. Religion stepped down from its eminent place as a primary and distinguished observer of society and became one amongst many functional milieus. Since then, Western modern society has lost its foundations of a hierarchical nature.

**Functionalism as the precondition of modern democracy**
The current political ambition that modern democracy could hold sway as the governing principle of today’s world results from a terrible overestimation of its applicability. Originally born under highly specific and improbable conditions in one specific stratum of ancient Greek society, its first manifestation disappeared alongside the political and societal context that gave birth to it. It reoccurred as the political outcome of the Renaissance ending the medieval order in Europe, when Europe’s societies shifted their constituent principle from stratification to functionalization. Both economic and political communication separated from and challenged the religious primary, visible in the tectonic shifts in the political landscape between the 15th and 17th century. Religion lost substantial societal impact and parties and enterprises appeared independent from any religious roots. Democracy became a core program for the system of politics in the first impactful modern nations in Europe, like England or France, later on the ascendant in North American state building ventures. The success of democracy was grounded in its ability to adapt to the call for broad participation of individuals in these societies. If there had not been society-wide political communication, resting on the call for participation and inclusion, there would have been no democracy. Democracy became the modus vivendi of modern societal politics.

**The modern relevance of organizations**
With the functionalization of society, another social system launched its extraordinarily successful career: the formal organization. Already used to great effect in local projects such as dam construction, in armies, and in religious orders, the sheer number of organizations exploded while the stratified society of yore disappeared. Since the general stability of stratified societies was replaced by modern ambiguity and individual uncertainty resulting from the heterogenization of modern society, organizations stepped in to fill its place. The temporal hierarchy of organizations could serve the need of stability and provide clarity, temporal goals, and individual inclusion. Formal administration became the backbone of nation building, and formal procedures guaranteed the application of democratic principles. Furthermore, organizations have become the core and almost single means of modern society to intervene in itself. Political and economic intervention is basically less about the injection of materiel, overwhelming numbers of soldiers, or developmental aids. It is about an organization (government, enterprise, army, NGO, United Nations, whatever) intervening in another organization (government, army, company, school) or another social system (economy, education politics, or quasi-systems like nations or networks). There is nothing left to use but organizations. We have ‘unlearned’ other means. Accordingly, the form of democracy we know today is fate-bound to the principal conditions of modern Western societies, which are functionalization and organizationalization.

**The pre-modernity of intervened nations**
A quick look at the constitution of the ‘nations’ that form the targets of modern intervention reveals that these pre-conditions of modern democracy do not hold true there. Without any exception, we find stratified or even peripheral societies in which the implementation of a Western kind of democracy lacks all prerequisites and, in very generic terms, is not meaningful. The cognitive horizon of these societies is bound to their form of societal differentiation as much as modern Western society is bound to its own. Literally, implementing democracy does not make sense for pre-modern societies, since the general notion of and emphasis on heteronomy, equality, and individuality is simply not given and has no anchor in the societies’ constitution (as the implementation of pre-modern regulatory
means would not hold under modern conditions). Democracy, in short, is unusable, and the attempt to implement such a political and highly organized program [4] astonishingly naïve. Furthermore, the organization-based style of intervention is inappropriate as well. Different societal constitutions are based on different forms of intervention, and intervening by means of organizations in a society unused to organizations cannot hope to lead to the intended effects.

And now? About functional equivalences
Clearly, the West has been too self-assured in assuming that a modern technology to produce collectively binding decisions could be applied under circumstances which lack the essential preconditions. And it has been astonishingly ignorant to the point that political interventions by means of organizations will not take hold, since there are almost no organizations to intervene in. The agenda now has to be to look for functional equivalences of democracy, which could stabilize the societies in question and which could provide a link to modern conditions of decision-making and participation. An equivalent stand for a program which could create collectively binding decisions (like democracy does to modern nations), however, must acknowledge the different societal constitution. This search will be painful, since Western values and myths like equality and individualism will not be mirrored by whatever it reveals. To bring these values by modern, Western means to pre-modern societies is a vain illusion. There is no other way than to acknowledge the fundamental difference of pre-modern societies first, to accept a fundamental distinction in terms of the values and aspirations on the other side, and to check what is possible in the development of both (arrogant) modern and (ignorant) pre-modern societies in their co-evolution. Local wars will certainly be a constant and almost unavoidable part of this pain. Let’s face it, this pain won’t go away easily.

Ralf Wetzel began his career as an electrician. He joined Vlerick Business School as a Professor of Organization and Management after extensive work experience in management and organization research and after being a head of a joint research and consulting group. His career path led him from Germany to the UK, via Switzerland to Belgium. He applies art-based research like improvisation principles and theatre play in his work, especially for inquiring into topics like organization theory & behaviour, change management, consulting, leadership, organization & society. Aside of his academic writing, he loves to turn research results into art-based forms like fiction, accessible for non-academic readers. Twitter: @RalfWetzel

Why don’t more early career researchers produce podcasts? (2014-10-21 08:00)

I've never understood why more PhD students and Early Career Researchers don’t produce podcasts. I’ve wondered this for a long time and the question came back to me when reading [1] this post on LSE Impact. I think she overstates
the case slightly (both in terms of the degree to which social media reproduces existing hierarchies and the extent to which podcasts level them) but it’s an important argument nonetheless:

I’m extremely optimistic about the use of podcasts because academia is a slow ‘industry’ and often only a few people hear about your work. With a podcast the focus is on your research topic and you can quickly share your results. Findings are also made more accessible and engaging for people outside of the academic bubble, and who are often directly applicable to the results. In addition, social science research can become sanitised when researchers are left to summarise their findings in a few lines. By literally giving researchers a voice, findings become more exciting as people are allowed to animate their findings and bring character to their research, which I think does more justice to the research that they carry out.

"Invisible Lives": Romanian Night Workers in London (2014-10-22 08:00)
Global cities like London have an incessant rhythm of consumption that needs to be maintained around-the-clock. This short film shines a light on the invisible lives of people working at night whilst the majority sleep or enjoy the nocturnal life. *Invisible Lives* is a short documentary that explores the experiences of Romanians working at night in London.

This film, made by Tim Marrinan and Iulius-Cezar Macarie, features night workers in the construction and hotelier industries, a sex worker on the street and a market trader. They share their stories that encapsulate the highs and lows of night work, from moments of danger to moments of tranquillity when night meets day.

These people’s lives are hardened by threats from pimps and punters or from tiring 12-hour night shifts. The night workers’ experiences are revealed in snapshots through audio stories combined with a visual portrait of nocturnal London—a city that never sleeps.

Through a mix of visually artistic frames and in somewhat poetic manner, the film documents through images and words, the pulse of the nocturnal London, and how and in what ways the precariousness affects the lives of Romanian migrant night workers in this global city. Uncertainties and risks taken by workers on short-term contracts or working illegally (sex worker and market trader), flexibility demands, and no welfare benefits available to protect them reveal the presumed precarious livelihoods. What sets *Invisible Lives* aside from other films is that it allows the protagonists to portray their lives as they are, without much interference through commentaries or analysis.

As SI’s visual sociology editor, I was very excited to find such a great recent example of visual ethnography/sociology (which is why we included it both in the Visual Sociology and the Sociological Craft categories). The carefully dovetailed image-and-narrative work together to explore a number of important sociological issues—migration, gender, labour, sleep, precarity. *Invisible Lives* makes great use of thick description—both in the traditional, narrative sense, and a more modern visual ethnographic sense. While it does guide the viewer towards a certain standpoint of analysis (critical of the precarious life-paths of the invisible night workers, reproachful of society’s lack of engagement with the night workers’ plight), it does so in a gentle, non-prescriptive, and all the more convincing way, allowing for multiple interpretations, and letting through the authentic voices of the research participants.

It comes as no surprise, then, that the film is the brainchild of a sociologist—[2]Iulius-Cezar Macarie, junior research fellow at the Centre for Political Studies at the Central European University, and a documentary filmmaker with some great projects in his portfolio—[3]Tim Marrinan.

[4]Tim Marrinan is a freelance documentary filmmaker based in London working primarily on films addressing issues related to art, culture and society. He is currently working on his first feature length documentary and his previous short film, [5]Beam Drop was screened internationally at film festivals and was aired on television in the UK (Sky Arts), the US (Plum TV).

Macarie’s PhD research investigates who is up at night, why and for what purpose. It seeks to explore if an anthropologically informed qualitative inquiry could reveal differences and similarities amongst Romanian and Turkish night workers’ access to a decent human life in global cities like London with an acute need for migrant labour to maintain its 24-hour economy. The central theme of solidarity against competition amongst migrant night workers provides the conceptual framework for his in-depth comparative research to investigate these two communities living and working the nightshift in London. Macarie grew up in Romania and collaborates with [6]Nightlaboratory. Since September 2013, he is an ‘INTEGRIM’ Marie Curie Junior Research Fellow affiliated to the Center for Policy Studies, and in parallel a PhD student in Sociology and Social Anthropology, at the Central European University.

3038
Budapest.

The film co-directors, sociologist Iulius-Cezar Macarie (left) and documentary filmmaker Tim Marrinan.

The film is part of Roundtable Projects 2013 – an open platform for cultural projects developed in partnership with the members of the Romanian community in the UK. If you liked it, here you can check out the film’s [7]Facebook page.

Emma Uprichard on Complex Temporal Ontologies and Method - October 28th @SocioWarwick (2014-10-23 12:26)

In the second [1]Centre for Social Ontology seminar of 2014/15, [2]Emma Uprichard (Associate Professor at the Centre for Interdisciplinary Methodologies) discusses Complex Temporal Ontologies and Method:

This paper reflects on the methodological challenge of applying complexity theory to study social systems. More specifically, the focus is on the problem of capturing complex patterns of time and temporality em-
pirically. The onus of the talk will be: a) to problematize existing longitudinal qualitative and quantitative social research approaches, which fail to capture complex temporal ontologies, and b) to suggest some tentative methodological alternatives which focus on capturing temporal patterns of change and continuity from a complex systems perspective. A particular concern throughout the discussion is how to study complex change and continuity empirically, whilst also ensuring that notions of agency and the reflexive ageing actor remain central.

All welcome! The seminar will take place on October 28th, from 5pm to 6:30pm in R1.1S (Ramphal Building) on the University of Warwick campus. See [3]here for help getting to the campus. Feel free to contact [4]Mark Carrigan with any questions.

Four concepts of social structure (2014-10-24 08:00)

The concept of ‘social structure’ is central to sociological inquiry yet there is little agreement about what it means. This matters because social explanation hinges on what we take ‘structure’ to be and a lack of ubiquity about the term helps fuel the disagreements and confusions which are already rife within sociological theory. In a [1]paper from 1989 Doug Porpora identifies the four most prominent uses of the concept:

1. Patterns of aggregate behavior that are stable over time
2. Lawlike regularities that govern the behavior of social facts
3. Systems of human relationships among social positions
4. Collective rules and resources that structure behavior

The first use tends to be associated with individualists concerned to explain how social patterns arise aggregatively from individual behaviour. The second use tends to be associated with holists concerned with social facts and the properties of collectivities. The third use is most frequently associated with Marxism and network theorists (for different reasons) with their respective concerns for the causal power of social relations. The fourth use has often been associated with symbolic interactionists, as well as the structurationist theory of Anthony Giddens.

Another way of considering the different uses of ‘social structure’ is [3]offered by Dave Elder-Vass. He argues that a notion of structure as an emergent feature of social wholes can contribute to existing understandings of structure within sociological theory:
This paper engages with the long running debate on social structure, using Lopez and Scott’s typology of social structure as a starting point (Lopez and Scott 2000). In their useful summary of this debate, they have portrayed the history of this concept as a dialogue between two different concepts or facets of structure, both with roots in Durkheim. On the one hand, institutional structure is comprised by the cultural or normative expectations that guide agents’ relations with each other. On the other, relational structure is composed of the social relations themselves – causal interconnections and interdependences between agents. More recently, a third facet has come to the fore: embodied structure, and Lopez and Scott suggest that embodied structure can play a key role in reconciling and integrating the earlier institutional and relational views.

Institutional structure include macro phenomena (e.g. property, employment, marriage) and micro phenomena (e.g. queuing, turn taking, gift giving). In both cases, institutions serve to regulate interaction by conditioning the reciprocal expectations of actors. Relational structure encompass the relations between roles (e.g. teacher/students, employer/employee) and between concrete individuals. With regards to the latter, we can find a weak sense of relation found in someone like Crossley (a relation is a past history and expectation of future interaction between A and B) and a strong sense found in Donati and Archer (a relation is an emergent property of interaction, producing relational goods/evils, which can only be experienced through participation in that relation). I think Crossley’s sense is congruent with network theory but I’m not certain. Embodied structure is a notion found in theorists like Giddens, Bourdieu and Foucault (in different ways) and concerns the way in which structure ‘gets inside’ actors. It sees social conditions as inculcating behavioural dispositions with consequences for those conditions. In someone like Bourdieu there’s an extremely sophisticated sense of those conditions, which leaves embodied structure as a mechanism through which relational structure gets transformed or reproduced.
In his paper Dave Elder-Vass in concerned to integrate these notions of structure into an account of social wholes. The idea here is that wholes have powers in virtue of the arrangement of their parts:

Let me illustrate the point with one simple example from the natural world. Dogs usually have the emergent power to bark (the property of being able to bark). The dog’s vocal cords, windpipe, lungs, mouth, and brain are all required to make this happen, but none of these parts, or even all of them linked together, would have the power to bark if they were not organized (along with its other parts) into the anatomical relations required to form them into a living dog. We could explain how these parts, combined in this way, generate the power to bark, but this does not take away the fact that this power can only be possessed by a whole living dog, and not by the parts as such.

However understanding how this can be so necessitates that we address the underlying ambiguity in the word structure, as a feature of lay discourse, which compounds the higher level confusions surrounding it as a concept in sociological theory:
These arise from the 'persistent ambiguity' in the meaning of structure identified by Raymond Williams (Crothers 2002: 7; Williams 1976: 253). As Williams explains, the word originally referred to the process of building, but:

The word was notably developed in C17, in two main directions: (i) towards the whole product of building, as still in 'a wooden structure'; (ii) towards the manner of construction, not only in buildings but in extended and figurative applications. (Williams 1976: 253)

It is clear from the history of structure and structural that the words can be used with either emphasis: to include the actual construction with special reference to its mode of construction; or to isolate the mode of construction in such a way as to exclude both ends of the process – the producers . . . and the product, in its substantive sense. (Williams 1976: 257)

In other words, the label structure can be used to refer to different structural elements. It can, for example, refer to a whole entity that is structured by the relations between its parts ((i) in Williams), which I shall call structure-as-whole, or it can refer to the way that a group of things (generally the parts of a whole) is related to each other ((ii) in Williams), which I shall call structure-as-relations.

It's in this sense of structure-as-whole that we can conceive of wholes as having powers in virtue of the arrangement of their parts.
Call for Papers: Feminism, Activism, Education (2014-10-25 08:00)

Call for Papers

If not now, when? Feminism in contemporary activist, social and educational contexts

Political and socio-economic developments in recent years have created new opportunities and new battle-grounds for feminism, with women taking to the streets and demonstrating against the status quo, corruption, sexism, austerity and capitalism. On February 13th, 2011, demonstrations took place in various Italian cities, with over a million participants in total. They were coordinated by the feminist coalition Se Non Ora Quando? (If not now, when?). The demonstrations voiced the urgent need to reassert women's dignity and renewed faith in the effectiveness of a popular feminist movement. There seems to be a pervasive optimism that feminism is now entering a new era, as evidence from different countries seems to suggest. At the same time, it is said that the advance of neoliberalism and the indisputable gains of feminism in the last thirty years have resulted in de-politicisation and a decline of interest in feminism. The mainstreaming of feminism has also raised concerns about its independent and autonomous existence. ‘If not now, when?’ invites potential contributors to consider the present moment of feminism and the presence of feminism on the streets and in mainstream society. It is seeking both theoretically informed and more empirical contributions on feminist endeavours, the strategies they employ and the values they uphold, the lessons learnt, and the new or emerging debates and challenges. In the context of a broadly defined feminist education, ‘If not now, when?’ also wishes to explore the pedagogical aspect of contemporary feminism, as well as testimonies of politicisation and mobilisation relevant to the formation of a feminist consciousness, especially in higher education. Further, and focusing on the present, it invites contributions on the theoretical ideas that are most relevant for feminism today. We are particularly interested in the notion of timeliness or kairos, the right time...
for something to happen as opposed to *chronos* or linear time. This temporal aspect of the contemporary feminism needs to be analysed and fully understood in the light of debates over the future of democracy, the welfare state, neoliberalism and globalisation. As evidence from the ‘periphery’ of Europe and the Mediterranean show that feminists decide to take to the streets again, we particularly welcome contributions that speak about the present and recent past of feminism in that part of the world, especially in the light of the significant political, social and economic changes in the region. Contributions might address the following topics:

- Feminist alternatives to patriarchy and neoliberalism: contemporary strategies, theoretical ideas and practices;
- Feminism in the academia and beyond: reflections on the past, emerging issues in the present, pedagogical prospects;
- Contemporary feminist activism in the South of Europe and beyond: what do know, what do we learn?
- Feminism, ethical values and the role of the individual;
- Feminism and the idea time and timeliness (*Kairos*);
- Is feminism still transformative or has it become too mainstream and confluent with dominant politics?
- How could the insight, issues and strategies of popular movements be transformed into permanent advantages for feminism?
- How does academic feminism respond to ideological, political and cultural demands outside the academia?

350-500 word abstracts are due by 1st December 2014. Proposals should be for original works not previously published (including in conference proceedings) and that are not currently under consideration for another journal or edited collection. If your proposal is accepted for the special issue, a full draft (5000-7000 words) will be required by June 2015. Editors are happy to discuss ideas prior to the deadline. Proposals should be sent to: Olivia Guaraldo, University of Verona, Italy [1]olivia.guaraldo@univr.it and Angela Voela, University of East London, UK [2]a.voela@uel.ac.uk

---

**The Mobile Apps in Research Summit 2014 (2014-10-26 08:00)**

On December 4th 2014 The University of Birmingham will be hosting the second Mobile Apps in Research Summit. We are excited to announce that delegate registration is now open.

This year’s Summit includes some discussion-based workshop sessions, by popular demand, as well as presentations, panels and networking.

**Programme**

**Welcome**

**Panel: Supporting apps in research – what UK universities need to do**
Workshop Sessions: delegates may attend either A or B

- **Session A:** When is an app the right thing for your research?
- **Session B:** Designing data gathering apps

Workshop Sessions: delegates may attend either C or D

- **Session C:** Can research apps be commercialised?
- **Session D:** Make an impact – evaluating your app in the real world

Panel: The Future of Mobile Apps: Ubiquitous apps, appcessories, and the Internet of Things

Closing session: shaping the Mobile Apps in Research Summit 2015

There will also be a networking lunch with the chance to meet developers who have experience in creating mobile apps based in academic research. There’s an increased focus on outputs this year, including responses and solutions from the workshops, partnerships for collaboration, and consultation on the future of the Summit for 2015.

For the full programme and to register visit our website [1]www.appsinresearchsummit.com. Tickets cost £15 including lunch. Follow us on Twitter for updates @appsinresearch.

The unavoidability of sociological theory (2014-10-27 08:00)

There's an important way in which sociological theory is unavoidable. I mean this in the sense in which Alexander describes the problems of action and order as non-optional: “every theory takes some position on both” ([1]Alexander 1987: 12). This is an empirical statement about sociological practice as much as anything else. Against those who dismiss 'general theory' as unnecessary, I'd argue that the sorts of questions encompassed by it inevitably emerge in any kind of sociological reasoning – to talk of a general problem of order is simply to affirm the (potential) value of our treating those questions we can’t avoid in a reflective and systematic way.

If we assume there are patterns to social life susceptible to explanation then we are necessarily committed, however inchoately, to a view of these patterns as having some ontological status. The possibility of a pattern presumes a distinction between identifiable regularities and some broader sum of activity in relation to which the regularity is (potentially) identifiable. This distinction in turn invites questions of the relationship between the former and the latter: how does (identifiable) order emerge out of (observable) activity? Once we ask this question, we're effectively talking about structure and agency. This doesn't commit us to any one understanding of 'structure', 'agency' or the relationship between them. But it does leave us within the space of questions which the discourse of structure and agency attempts to treat systematically. The notion of a 'space of questions' I'm invoking doesn't imply deterministic constraints. It creates openings to escape the space of questions by seeking to transcend the dichotomies encountered e.g. both Bourdieu and Giddens seek to do this in different ways. We
can find alternative ways to characterize the space of questions. What I think of as structure and agency seems to be seen by Jeffrey Alexander in the 1980s as two related questions: the problem of order and the problem of action.

On my understanding, sociological theory should be concerned with the systematic elaboration of this space of questions with a view to the amelioration of problems that impede empirical research and the construction of conceptual tools which contribute to it. This entails ‘translation’ work in order to bring divergent perspectives into dialogue with each other. It invites empirical work looking at how theoretical ideas are applied in practice and their contributions (or lack thereof) to empirical research. It invites conceptual work to establish meta-evaluative criteria upon which to establish what constitutes a contribution to sociological theory and what does not.

In essence I’m arguing for the unavoidability of sociological theory on praxeological grounds. I’m suggesting that certain presuppositional categories are intrinsic to sociological practice as a purposive activity orientated towards particular classes of objects. As Alexander puts it, “the real world puts terribly strict limits on our theorizing” (Alexander 1987: 5). We encounter these ‘limits’ through purposive activity of a very particular sort and I’m interested in how the activities which I’m subsuming under the category of ‘sociological practice’ mediate our encounter with these limits on theorizing. I share Alexander’s view that theoretical reasoning has “relative autonomy” in relation to the real world but I want to understand in a much more substantive way how relative it is. My underlying claim is that the theoretical constructs I’m invoking (‘structure and agency’, ‘the problem of order’, ‘the problem of action’ etc) are systematic articulations of issues raised by a practical engagement with the social world motivated by specific purposes. We are drawn to take positions and/or make assumptions on these issues as a necessary condition of sociological practice. So why not try to do this systematically?

CfP: On the Politics of Ugliness (2014-10-28 08:00)

Anthology — Call for Submissions – On the Politics of Ugliness – deadline 15 January 2015

Ugliness is a pejorative marker for bodies, things, and feelings that fall beyond or outside the limits of acceptability. Ugliness has long been indirectly deployed in order to mark, collect, and exclude that which is determined to be aesthetically intolerable (Garland-Thomson; Grealy; Schweik), disgusting (Meagher), dirty (Douglas), abject (Kristeva), monstrous (Braidotti; Haraway; Rai & Puar; Schildrick; Sharpe), revolting (Lebescos), grotesque (Russo), or even simply plain and unaltered (Bartky; Bordo; Morgan; Wolf). While aesthetically ugliness has been positioned both against beauty and as a distinct category for art and art-making (Adorno; Ranciere), there has been little sustained engagement with the ways that ugliness operates alongside identities, bodies, intimacies, practices, and spaces (exceptions include Danticat; Kincaid; Athanassoglou-Kallmyer). Part of the reason for this absence might be that ugliness is at once too broad and too diffuse, serving, as art historian Nina Athanassoglou-Kallmyer has pointed out, as “an all-purpose repository for everything that [does] not quite fit,” a marker of “mundane reality, the irrational, evil, disorder, dissonance, irregularity, excess, deformity, the marginal” (281).

A repository for many socio-cultural feelings and attitudes, ugliness operates in ways that have dangerous and deadly consequences for bodies and those who inhabit them. When a body is labeled or understood as “ugly,” it is subsequently positioned as up for expunging, destruction, and affectively motivated terror (Fanon). For example, the “ugly laws” of late nineteenth and early twentieth century America demonstrate the visceral discomfort that
“ugly” bodies evoke, justifying their exclusion from public spaces on account of their “polluting” effects (Schweik). This demarcation of ugliness is inextricably bound with taken-for-granted ethical, epistemological, and ontological assumptions about the value of bodies. Further, ugliness is infused with dominant discourses of ability, race, heterosexuality, gender, body size, health, and age. At the level of ideas, relations and institutions, deployments of ugliness can have lethal effects on a body’s horizons and the possibilities for visibility, intimacy, and thick life.

On the Politics of Ugliness seeks to provide the first anthology that centralizes ugliness as a political category. It explores the various ways in which ugliness is deployed against those whose bodies, habits, gestures, feelings, expressions, or ways of being deviate from social norms. It argues that ugliness is political in at least two ways: (1) it denotes inequalities and hierarchies, often serving as a repository for all that is “other;” and (2) it is contingent and relational, taking shape through the comparison and evaluation of bodies. This collection asserts that it is only in facing ugliness as a political category that we can agitate routinely harmful ways of seeing, understanding and relating.

We are seeking an array of contributions that will center the politics of ugliness as it relates to bodies, feelings, gestures, habits, things, spaces, sounds, intimacies and their operations alongside ability, race, gender, class, sexuality, body size, age, health, or animality. Specifically, we invite submissions of academic papers; however, we will also consider art-based work, memoirs, cultural commentaries, and creative pieces (short stories, poetry, photo essays) from scholars, writers, and artists. We welcome approaches informed by (but not limited to) critical disability studies, critical race and postcolonial studies, feminist theory, literary theory, art history, cultural studies, queer and sexuality studies, science and technology studies, critical psychology, environmental studies, musicology, and performance studies.

Submissions should engage with the politics of ugliness. Topics of inquiry may include:

- interrogations of ugliness as violence against bodies
- the ethics of engaging with ugliness
- feminist explorations of ugliness, “ugly” engagements with feminism
- ugly methodologies, reading practices, and modes of inquiry
- representations of ugliness, “ugly” bodies, body parts, and “ugly” behaviors
- phenomenological encounters with ugliness: feeling ugly, being “ugly,” embodying ugliness
- ugly intimacies, feelings, and dispositions (e.g., Ngai; Sharpe)
- genealogies, archives, temporalities, and histories of ugliness
- the fashionizing of ugliness, ugly fashion
- ugly development practices, environmental ugliness
- visual, sensorial, and tactile pollution in relation to spaces and geographies
- theoretical considerations of ugliness as a political category
- reclamations and tactical repositionings of ugliness (e.g., Eileraas)
The deadline for chapter proposals (maximum of 500 words) is 15 January 2015. Please forward proposals or questions to Ela Przybylo ([1]przybylo@yorku.ca) and Sara Rodrigues ([2]sararod@yorku.ca) with the subject heading "On the Politics of Ugliness."

1. mailto:przybylo@yorku.ca
2. mailto:sararod@yorku.ca

The issues surrounding boys ‘underachievement’ and raising standards have been at the centre of public debate in education over the last two decades. As part of the Routledge Research in Educational Equality and Diversity series, Identity, Neoliberalism and Aspiration: Educating White Working-class Boys (2015) by Dr Garth Stahl explores the phenomenon of boys' disengagement and challenges the pathologization of working-class boys, both in the education system and in wider society. The research raises important questions around why this low-performing ethnic group continually underperforms? How do current educational practices contribute to their underperformance? What shapes their aspiration?

Identity, Neoliberalism and Aspiration: Educating White Working-class Boys will be of international relevance as the moral panic regarding the education of boys is a globalised one. While the boys’ crisis in education has been a priority in the last decade there have been few examples of careful investigative and research. The research is distinguished by close scrutiny of original empirical evidence and the focus on a highly vulnerable population. Qualitative research was conducted with 23 white working-class boys in their final years of compulsory schooling and explores their identities within school environments where quality education is rationed. In understanding aspirations, the work explores how the boys constitute themselves as valuable in schooling practices which consistently devalue them.

Key questions explored in the book:

What shapes the aspirations of these young men?

How do these young men comprehend their own disadvantage?

How do these boys make sense of expectations surrounding social mobility?

What factors contribute to them ‘buying into’ education or ‘buying out’ of education?

How does the system set them up to fail?

How is white working-class disaffection symptomatic of much larger issues in British education?

About the Author:

Dr Garth Stahl is a Lecturer in Literacy Education at University of South Australia and a researcher with the Hawke Research Institute. Previously, Garth lived and worked in London as a Teacher of English, Head of Sociology
Department and consultant for nine years. Garth’s main research interests are: masculinities, Bourdieu, ethnography, urban education, educational inequalities (race, class, gender, etc), and applied sociology.

https://twitter.com/educ_research/status/526729131971837952

In October 2006, I interviewed a White British female Year 11 student who had researched Islam for eight months and then decided to convert to Islam. Alice’s parents were devout Christians, and she explained that they were not too pleased with her conversion to Islam, hoping it was merely a phase that teenagers go through. She had become interested in Islam as she had Muslim friends whose way of life she found intriguing, and thus, she began to read up about their religion. As she learned more about Islam, she felt a connection and found that many previously unanswered questions were being resolved. Therefore, she decided to convert to Islam. She decided to wear the hijab, which was a significant marker of her new identity. One of the reasons, she explained, was that because she was not born into the religion, she felt she had to prove her commitment to everyone around her. She found that her white non-Muslim school friends were supportive of her decision. Interestingly, none of her school teachers had directly asked her about her decision to convert to Islam. Since becoming a Muslim, she loved her Monday morning Religious Education (RE) lessons, as there were many devout Christian students in the class and she could argue her position with them in a “friendly debate”. Moreover, she enjoyed researching and learning about Islam in preparation for RE lessons.

Alice highlighted how her conversion to Islam gave her a sense of belonging, but at the same time she had become very aware of the ethnic and cultural heritage that other Muslims (born into Islam) can rely on. This act of converting to Islam had provided her with a symbolic space to belong, but it also made Alice aware of how sometimes she did not belong: “It puts a smile on my face when I see another white Muslim. I haven’t seen many of us”. She discussed changes since adopting this new identity:

“I’m thinking about every little thing I do…every little step I take. Is that haram or halaal? Before when I do good things, I’ll do someone a favour or I’ll go out of my way to do something and I’ll be like “Yeah, that was alright”. But now I’ll be blessed for doing it as well. It’s more encouraging. I’ve been concentrating on doing a lot of better things. I used to get a joy out of threatening people…I used to feel my power…I wasn’t a bully, but I would talk harshly to people who were smaller than me. Whereas now I don’t. I feel like that’s not the way to do it”.

It is fascinating to learn about the complexities and nuances of such reflective identity work, and how it impacts upon Alice’s everyday life. She explains how she has essentially adopted a new internal framework of reference that values strong family bonds, modest dress and education.

[1]Grayson Perry’s new exhibition at the National Portrait Gallery also presents a White British female convert
to Islam. [2] *Who are you?* depicts 14 modern day Britons and their complex identities. Kayleigh Khosravi, the subject of a silk screenprint with the title *The Ashford Hijab*, spent time with Grayson Perry in order for him to better understand her identity as a White Muslim convert.

https://twitter.com/educ_research/status/526730895798337536

Political and media rhetoric almost always focuses on how Islam is incompatible with Britishness, and how Muslims must work harder to *integrate* (often code for *assimilate*). What about White British Muslims? With the emergence of new identities of White British Muslims, more research is needed into the stories of converts to understand how they are able to position themselves as both British and Muslim, in order for us to develop discussions on what this means for modern multicultural Britain and the discourse of integration/assimilation.

fantastic piece

**Between interaction and intra-action (2014-10-29 08:00)**

The notion of ‘interaction’ is well understood. Interactions are part of our everyday life. Sometimes these interactions leave us thinking about them afterwards (“what did he mean when he said that?”, “why is she always like that?” etc) and sometimes this leaves us thinking about interaction in a *second-order* way (“why do I always feel so uncomfortable in situations like that?”). In this sense, I’d argue that interaction and intra-action are intrinsically linked. Each impacts upon the other in manifold ways. We intra-act in response to our interactions and this shapes what we bring to subsequent interactions. However sociological conceptions of intra-action have tended to be rather deficient. Unfortunately these failings tend to be most pronounced amongst those who most acutely analyse *interaction*. For instance as Nicos Mouzelis writes in his critique of Hans Joas,

If actors do not operate on the basis of rigidly set means-end schematic, if interactive situations constitute and constantly reformulate both means and ends, what sort of conceptual tools can make this obvious, and how are such tools linked to each other and to broader macro-sociological conceptualisations joas does not give us any answers here. Neither does he show how interaction is linked to intra-action – i.e. to the reflexive process, the internal conversations that constantly take place within the actor’s mind. In order to understand how interactions shape means and ends, it is necessary to see how an actor deals not only with other actors in interactive contexts but also with himself/herself.
The risk in critiquing a deficient account of intra-action is that we lose the insights into situated interaction that theorists like Joas offer. I’m interested in the interface between interaction and intra-action: how situated encounters both shape and are shaped by the exercise of our reflexivity. In my PhD I’ve argued that if we compress interaction and intra-action too closely together, such that we fail to recognise the relative independence of actors from the situations in which they are (inter)acting, we will struggle to gain traction upon how interaction is related to inter-action and vice versa. I’m suggesting that theorists of the interaction situation focus on the T2-T3 shown in the diagram below – in doing so, they fail to account for how situated interaction has variable consequences for those party to it and how these ensuing changes effect what actors bring to subsequent situated interactions. Rather than being concerned solely with situations, we should be interested in pathways into and out of situations and how interacting actors change in the process.
Using your blog as a research journal (2014-10-30 08:00)

1. http://prezi.com/embed/5souwydttbd/?bgcolor=ffffff&lock_to_path=1&autoplay=0&autohideCtrls=0

claudia vallve (2014-11-18 11:26:39)

Hi Mark, Thanks for sharing your ideas!! They are inspiring and encouraging, as usual. I’ve written a post in my blog to research online journals linking to your blog (though it’s in spanish) –> http://claudiavallve.com/2014/11/18/utilizar-el-blog-como-diario-de-investigacion-el-archivo-sociologico-de-wright-mills-en-version-digital/ I would like to ask you if you know any examples of blogs used as research online journals for a particular investigation. I’m starting a new project to investigate different models of individual financing of training (from pre-compulsory to long life learning) and, apart of assessing the different existing models and analysing strengths and weaknesses of each one, I’ve been asked to create a community and generate debate with relevant stakeholders in this area (families, public agents, students, NGOs,...). I had the idea of creating either a blog or a wiki, and seeing your post has confirmed that I’m in the good direction. I’m now preparing the architecture of the whole project, and it would be really inspiring to see examples of similar experiences around!!! Thanks again for your posts. I love reading them (not all of them, since it’s impossible to keep up with your pace!!!) and I always find interesting thoughts.
Graham Scambler on an interdisciplinary approach to the ‘structuring of agency’ – November 11th @SocioWarwick (2014-10-30 13:40)

In the third [1]Centre for Social Ontology seminar of 2014/15, [2]Graham Scambler (Emeritus Professor of Medical Sociology at UCL) discusses reflexivity and an interdisciplinary approach to the ‘structuring of agency’:

Margaret Archer’s recent contributions to our understanding of reflexivity in late capitalist society provide useful resources for theorizing across the substantive domains of sociology. Using illustrations from my own work on the sociology health inequalities in general, and my ideal type of the ‘vulnerable fractured reflexive’ in particular, I examine some of the pros and cons of adopting an interdisciplinary approach to the structuring of agency. I conclude with a skeletal research programme involving interdisciplinary collaboration.

All welcome! The seminar will take place on November 11th, from 5pm to 6:30pm in S0.13 (Social Science Building) on the University of Warwick campus. See [3]here for help getting to the campus. Feel free to contact [4]Mark Carrigan with any questions.

Human/animal cognition and the attribution of causal powers (2014-10-31 08:00)

Walking home in the rain earlier today, I encountered a very fluffy and very wet cat sitting unhappily outside someone's front door. Upon getting my attention, the cat insistently tried to lead me towards the front door in the hope that I would open it. It’s not the first time I’ve noticed cats doing this and I think it shows something interesting about cognition. Cats have come to recognise the capacity of human beings to remove the obstacles that impede fulfilment of their wishes. However they fail to recognise that particular people have the capacity to open particular doors. That cat was convinced I had the capacity to open its front door. They presumably have the understanding they do on an inductive basis, inferring a capacity from the recurrent interventions of human beings in relation to once closed doors that are subsequently opened. To differentiate within the ensuing category, recognising the connections between particular people and particular contexts within which they can (and should) intervene, presupposes a complex web of further categories which could not in themselves be derived inductively.

It wanted you to ring the doorbell.
The Dark Side of Chocolate (2014-10-31 17:09)

Chocolate comes from cocoa beans, and about 70% of coco beans come from Ghana and the Ivory Coast in Africa. Coco bean plantations where it is grown and harvested have historically relied on child, slave labor to harvest those coco beans so that you and I can eat a product many of them have never tasted. As told by Food Is Power, the reality of human trafficking and modern slavery to produce chocolate is a true evil of our time:

“Every research study ever conducted in [Western Africa] shows that there is human trafficking going on, particularly in the Ivory Coast.” While the term “slavery” has a variety of historical contexts, slavery in the cocoa industry involves the same core human rights violations as other forms of slavery throughout the world. Cases often involve acts of physical violence, such as being whipped for working slowly or trying to escape. Reporters have also documented cases where children and adults were locked in at night to prevent them from escaping. Former cocoa slave Aly Diabate told reporters, “The beatings were a part of my life. I had seen others who tried to escape. When they tried, they were severely beaten.” Drissa, a recently freed slave who had never even tasted chocolate, experienced similar circumstances. When asked what he would tell people who eat chocolate made from slave labor, he replied that they enjoyed something that he suffered to make, adding, “When people eat chocolate, they are eating my flesh.”

(From [1]The Evil Part of Halloween You Probably Didn’t Think Of, by B.J.Corey)

Happy Halloween.
5.11 November

An introduction to blogging and twitter for social researchers (2014-11-01 08:00)

My course at Nat Cen has been moved to December. You can book online [1]here.

Given the increasing pressure to demonstrate the impact of social research, it is inevitable that researchers are looking towards the opportunities offered by social media. This one day course offers an accessible introduction to the use of blogging and twitter, encompassing the possibilities they offer for social researchers and walking you through best practice.

You will learn through a combination of presentations, informal discussions and practical sessions, including pre-course reading.
Course content covers:

- An introduction to blogging
- An introduction to twitter
- Making an impact with blogging and twitter
- Integrating blogging and twitter into your working life

Who is it aimed at?

This is an entry level course, which assumes no familiarity with blogging or twitter.

You will find this course useful if you:

- conduct social research
- have responsibility for impact and public engagement
- communicate findings to policymakers and practitioners

Learning outcomes:

By the end of the programme you will be able to:

- understand the characteristics of blogging and micro-blogging
- get started in a practical and engaged way with Twitter and WordPress formulate your own strategic plan to use these services effectively
- connect effectively with others online in a way which serves these ends measure the impact of your online engagement
- participate enjoyably in the emerging academic blogosphere and twittersphere

The Overton Window (2014-11-02 08:00)

From Owen Jones’s The Establishment, Location 774. According to [1]this biography of George Osborne, which I’m amazed at myself for having read, the window of political acceptability is a key factor in Osborne’s strategic thinking:

What the corporate-backed outriders have achieved is this. They have helped shift the goalposts of debate in Britain, making ideas that were once ludicrous, absurd and wacky become the new common sense. In the terminology of right-wing political thinkers, they have shifted the 'Overton Window'. The Overton Window is a cherished concept of the US right, coined in homage to Joseph P. Overton, the late vice-president of the right-wing think tank the Mackinac Center for Public Policy. It describes what is seen as politically possible or reasonable at any given time while remaining within the political mainstream. But the very nature of outriders is that they can float ideas or policies that a politician would not dare mention. In doing so, they shift the Window.

Why we need a sociology of the dark side (2014-11-03 08:00)

This intriguing talk makes a case for a sociology of evil given the ubiquity of othering processes:
The price of a citation, or How did King Abdulaziz University get in the world's top 10? (2014-11-03 12:00)

[reblogged from [1]Matters Mathematical]

According to a great [2]recent blogpost by Berkeley academic Lior Pachter, there is something very fishy about university rankings. In last week's global university [3]ranking published by the US News and World Report (USNWR), the top 10 universities listed in mathematics are:

1. Berkeley
2. Stanford
3. Princeton
4. UCLA
5. University of Oxford
6. Harvard
7. King Abdulaziz University
8. Pierre and Marie Curie – Paris 6
9. University of Hong Kong
10. University of Cambridge

The USNWR rankings are based on 8 attributes:

- global research reputation
- regional research reputation
- publications
- normalized citation impact
- total citations
- number of highly cited papers
- percentage of highly cited papers
- international collaboration

Now, how did KAU end up in the top 10? Its chair received his PhD in 2005 and has zero publications. Its own PhD programme is only two-years old. It has separate campuses for men and women. The author, and probably many other mathematicians, have never heard about KAU. Apparently, the secret of the ranking success lies in the fact that,

"[a]lthough KAU's full time faculty are not very highly cited, it has amassed a large adjunct faculty that helped them greatly in these categories. In fact, in “normalized citation impact” KAU's math department is the top ranked in the world. This amazing statistic is due to the fact that KAU employs (as adjunct faculty) more than a quarter of the [4]highly cited mathematicians at Thomson Reuters."
The article goes on with a very interesting and evidence-supported discussion of the ranking system, and of the particular approach taken by KAU in order to put itself on the world's mathematical map. There are also comments by various academics, a few of whom work for KAU. Well worth a read if you have time to be scared about the future of global academia.

Pachter’s blogpost raises some very interesting questions about the future of global academia. First of all, it is not at all surprising that universities from the periphery (the "global south", as we sociologists like to call it) are trying to gain prestige and put themselves out there. It is also not surprising that some, which are very affluent, will attempt to buy their way in the global academic system. In fact, by doing so, they are merely using loopholes and bugs - which to them are "features" - in the ranking and prestige system created by old-world academia. Our indignation at this, while justified, is also somewhat hypocritical: after all, they are simply taking the "money makes research go round" principle that bit further. Academics and administrators in US and European universities should take this as a warning - a mirror held up to our own academic institutional practices which may be less blatant and aggressive, but are nevertheless often the same in their nature. UK universities in particular - more so than in the rest of Europe, but still less so than in the US - are also doing their best to hire highly-cited academics. I'm not at all worried about universities from other places taking the lead in research, and no doubt many of the names on the list are doing just that. What is really worrying is the increasing overreliance on numeric indicators of academic quality as a substitute for much more detailed, more qualitative indicators. I think that we... or someone? but who? well, we - vice-chancellors, academics and administrators - should take the hint from KAU's success on paper and change the system of science quality assessment not just by tightening existing loopholes, but by not relying on simplified indicators at all.

What are research methods for? (2014-11-04 08:00)

From [1]Paradigm wars: Some thoughts on a personal and public trajectory by Ann Oakley:
It is because doctors, teachers, social workers and others are so prone to launch interventions without knowing their effects that social science is obliged to use the best tools at its disposal to scrutinize such activities. Method here is (as Wright Mills advised) properly harnessed to the service of the social problem itself, rather than the other way around.

[...]

What are research methods for? In an era dominated by postmodernism, postfeminism and a general acceptance of multiple meanings, it is obviously unfashionable to suggest that the aim of research methods is to provide some sort of approximation to what is ‘really’ going on. Yet this is, I think, what drives and should drive most social scientists, just as most of us live our everyday lives as though reality exists and can be known about. Put the other way round, this concern becomes one about the extent to which different research methods offer protection against bias, against the possibility that we will end up with misleading answers. Much 'qualitative' research is simply too unsystematic, too masonic in nature, too cavalier about appeals to ‘triangulation’ and/or analysis using computerized software packages, to establish serious credentials for being trustworthy. (p. 251-252)
I find it hard to disagree with her argument here. Part of me nonetheless wants to assert some fuzzy sense of the intrinsic value of qualitative research but another (much less fuzzy) part of me thinks this is just the residual influence of the politicised commitment to qualitative research described by Oakley that I once shared yet no longer do.

The ‘Bro’ and the ‘Lad’: The Identity and Subculture of Default Man’s sons? (2014-11-05 08:00)

In a recent [1]New Statesman article, Grayson Perry reflected on what he termed ‘Default Man’ ("white, middle-class, heterosexual men, usually middle-aged") and the power he wields within our putatively meritocratic social order. Perry makes the important point about how ‘identity’ tends to be seen as something marginal, in contrast to the individualism of Default Man:

When we talk of identity, we often think of groups such as black Muslim lesbians in wheelchairs. This is because identity only seems to become an issue when it is challenged or under threat. Our classic Default Man is rarely under existential threat; consequently, his identity remains unexamined. It ambles along blithely, never having to stand up for its rights or to defend its homeland.

When talking about identity groups, the word “community” often crops up. The working class, gay people, black people or Muslims are always represented by a “community leader”. We rarely, if ever, hear of the white middle-class community. “Communities” are defined in the eye of Default Man. Community seems to be a euphemism for the vulnerable lower orders. Community is “other”. Communities usually seem to be embattled, separate from society. “Society” is what Default Man belongs to.
I think it would be interesting to address 'Bro' and 'Lad’ culture in these terms. Could we be talking about the subculture and identity of Default Man? Or rather the sons of Default Man?

Digital Sociologist: Garry Crawford (@CultSociologist) (2014-11-06 08:00)

[1]

In this series of interviews, I ask Digital Sociologists about their work and the background to it. You can find [2]Garry on Twitter here. See [3]here for the previous interviews in the series.

How did digital technology first begin to enter into your research? It seems to have flowed naturally from the broader topic at hand.

[4]Audio: [https://markcarrigan.files.wordpress.com/2014/10/zoom0001.mp3](https://markcarrigan.files.wordpress.com/2014/10/zoom0001.mp3)

How have your engagements with it changed over time?
What direction is your research heading in? How has digital technology featured in this?

Lots of podcasts on methods and methodology (2014-11-07 08:00)

The National Centre for Research Methods has a fantastic selection of podcasts on their website. Here are some of the ones we thought looked most interesting:

- [1] Using Social Media in Research
- [2] The potential of crowdsourcing for research and funding in academia
- [3] The 'Thing-ness' problem of mixed methods research
- [4] Narrative imagination and everyday life

Carol Smart: "ideas come about through the process of writing" (2014-11-08 08:00)

In this [1]videocast released by the Morgan Centre, Carol Smart discusses the emotional challenge of writing. It's a wonderful discussion, encompassing everything from the pains of writing to the origins of creativity in engaging with those difficulties. Smart suggests writing is not discussed because it's generally assumed that we can all do it. Yet so much is at stake for academics in their writing. Another key point made is the need to find your own rhythm: Smart recounts how she used to criticise her own habits surrounding writing before learning to accept them as the approach to writing that was natural for her. This advice echoes what Gurminder K. Bhambra says [2]here about recognising recurrent frustrations in the writing process as being important parts of that very process.

Or rather that’s one way ideas come about. More important tho is whether they are good ideas or not!

"Footnotes in History: Being Anglo Indian" (2014-11-10 08:00)

[3]

From Karan Kapoor’s Anglo-Indians, first exhibited 1990. (Photograph from www.tasveerjournal.com/ai)

http://www.tasveerjournal.com/ai/

Smyth’s and Santoro’s exciting new edited collection is aimed at educationalists researching diverse cultural contexts from a critical perspective. The selected papers, with underlying themes of social justice and educational equity, together point towards an increasingly globalised world where educationalists (trainee teachers, established teachers working on professional development and researchers of education) can enhance their critical awareness about working with diasporic communities and settings.

One major concern in social research is that researchers mainly tend to come from the “hegemonic cultural mainstream” (pxii), which requires that as researchers we refine our reflexive approach to methodologies and ethics of research. The book, therefore, usefully includes accounts from researchers about how they work to ensure that research methodologies they employ are ethically and methodologically sound and appropriate to culturally diverse communities.

Distinctive methodologies are advocated to achieve the important goals of social justice and social equality: Dewilde, for instance, discusses how she used ‘Discursive Shadowing’ which involves “the study of individuals over a period of time by means of participant observation and audio recordings” (p1) in order to learn about an under-researched group with low status – bilingual teachers - in the Norwegian educational system. She came to realise that ‘discursive shadowing’ worked effectively if she was “moving around the school with them, instead of trying to pin down collaboration through the formal meetings and joint lessons” when collecting data (p10).

Critical participatory action is shown to be a democratic methodology in Schmidt’s account of researching immigrant teachers in Canada’s education system. Teachers in Manitoba, Canada were involved in "co-operative
inquiry” (p15) - research, thus, involved “actively engaging them in designing, co-constructing, and carrying out the research” (p17). Post-structural ethnography, in this case in rural Australia, is shown to be an excellent tool to empower research participants and to provide rich detailed description about issues of difference and exclusion in schooling: Edgeworth outlines ways in which post-structural ethnographies can “construct counter-narratives of belonging” (p38). Research in Pakistan by Shah demonstrates the complexities of insider and outsider research: "Who does the research has effects on data collection and analysis” (p44).

Smyth’s chapter outlines research in Scotland to empower diverse research participants through collaborative pedagogies which "give voice to the researched while also offering strategies to develop their skills or social networks” (p58). Santoro investigated indigenous teachers in Australia using a longitudinal case study and the methodology of Situational Analysis: “...useful for researchers working in culturally diverse contexts because it makes visible” (p88) what researchers may have missed.

Students, taking an active role in the research process, as action researchers investigating immigration and integration, within a critical pedagogy framework, are discussed by Gagne and Gordon who outline the advantages of this methodology: student-researchers improved their language and communication skills, and developed confidence and friendships. Fassetta also considers how school students can be actively involved in collecting data through the popular mode of photography: child-led photography focuses on issues of whose eyes we are seeing things through, as well as matters of power and agency.

The collection of chapters in this book beautifully illustrates the importance of considering how we can become more open, more democratic, and more just in how we seek to present the voices of culturally diverse and often silenced students and teachers. To work hard to become ethically sound and methodologically adventurous may be the goals of many qualitative researchers, like me, as we become involved in new projects within culturally diverse contexts.

This important book helps early career researchers, like myself, in working through issues of how to ensure students and teachers are not mere research participants, but directly active in the research process, thereby fulfilling the conditions of ethically sound research.

---

By John Smyth, Barry Down, Peter McInerney, and Robert Hattam
This book discusses in great detail the internationally recognised collaborative and critical nature of the educational research conducted by Australian Professor of Education, John Smyth. At a time when we may be disheartened because “rampant individualism, competition and commodification” (pxiii) are impacting upon global educational systems and thereby resulting in unpredictable policies and practices for students and teachers, this book comes as a timely and crucial reminder of how we can be inspired and inspire others to create a more “humane, democratic and socially just” (pxiii) system of schooling.

The authors state from the outset that this is not another ‘how-to-do-educational-research’ book, instead they have presented us with key pedagogical and political issues affecting contemporary educational research for us to better understand the richness and complexity of critical research in making sense of the social world. Furthermore, (like our sociological writings on The Sociological Imagination) Smyth has also been stimulated by the legendary C W Mills and his key anchor points regarding the intellectual craft of doing Sociology. As a result, we learn about the key ‘critical’ anchor points that Smyth deems important when doing critical pedagogy: active listening, advocacy, challenging power, representing with respect, committed praxis, and activism (p8).

The chapters contain in-depth analysis of what critical educational research looks like in contemporary society, for example how the politicization and de-humanization of teachers’ work due to “broader contextual, historical and structural forces” (p37) creates certain challenges we need to work towards resolving through employing critical consciousness and critical reflexivity. We also learn about the lives of students in neoliberal times, and how this affects how we do critical research: “the political imperative for researchers and educators is to create the conditions for dialogue and practice” (p74) to interact with students and represent their voices and experiences.

Community engagement and public sociology are advocated as very necessary to critical educational research – “taking an activist stance with/for excluded groups whose viewpoints are diminished, silenced or ridden-over by so called ‘experts’ whose technocratic knowledge is deemed to be superior” (p81). Thus, contemporary critical educational research involves collaborative journeys, examination of power/powerlessness, working towards social change, and engagement with communities. Educational policy and leadership are explored to highlight the need to move away from neoliberal policies and practices, and instead to promote a “socially critical approach” to enable educational reform (p107). The authors argue that educational policy and leadership need to be reinvigorated by working critically to “reassert the moral purpose of education and to restore ‘educational’ values and norms to the
The book perfectly and vividly captures the importance of doing critical pedagogy and critical educational research in neoliberal times by presenting the challenges faced by teachers, students and school management, and also by providing the readers with a real sense of hope and possibility (in the spirit of Freire), so that we can consider the various solutions and practices that will open up sites of schooling to be democratic and fair places for students, teachers, managers and researchers. The strengths of the book are that the detailed vision of John Smyth's critical pedagogy is impressed upon the reader examples from his life and works, but also that these examples are explained in a concrete and engaged way so that we can take these on board in our work in education and research.

An introduction to blogging and twitter for social researchers (2014-11-11 08:00)

My course at Nat Cen has been moved to December. You can book online [1]here.

Given the increasing pressure to demonstrate the impact of social research, it is inevitable that researchers are looking towards the opportunities offered by social media. This one day course offers an accessible introduction to the use of blogging and twitter, encompassing the possibilities they offer for social researchers and walking you through best practice.

You will learn through a combination of presentations, informal discussions and practical sessions, including pre-course reading.

Course content covers:

- An introduction to blogging
- An introduction to twitter
- Making an impact with blogging and twitter
- Integrating blogging and twitter into your working life

Who is it aimed at?
This is an entry level course, which assumes no familiarity with blogging or twitter.

You will find this course useful if you:

- conduct social research
- have responsibility for impact and public engagement
- communicate findings to policymakers and practitioners

Learning outcomes:

By the end of the programme you will be able to:

- understand the characteristics of blogging and micro-blogging
- get started in a practical and engaged way with Twitter and WordPress formulate your own strategic plan to use these services effectively
- connect effectively with others online in a way which serves these ends measure the impact of your online engagement
- participate enjoyably in the emerging academic blogosphere and twittersphere

**Towards a sociology of endings (2014-11-12 08:00)**

There’s a particular kind of sociological theorising which I’ve always been drawn to that concerns itself with the identification of epochal shifts in social life. When I was an intellectually frustrated philosophy student, the work of Giddens on Late Modernity and Bauman on Liquid Modernity seemed to hold the promise of intellectual work that addressed something far greater than the technical problems of philosophy: *what is it like to be a person now?* I tried to argue in my PhD thesis that this aspect of their work, simultaneously profound yet also slightly asinine, surely accounts for part of the appeal which a sprawling body of work has held for many in spite of its many defects. I wondered recently if it could be seen as a kind of (historicised) *sociological anthropology*, inquiring into the phenomenology of the person in a way that refuses the possibility of abstracting the core questions from the particular time and place in which they are being asked. However I do think this work is deeply flawed and one of the most incisive ways to analyse these flaws is to consider the claims about transitions from ‘old’ to ‘new’ which are made within it. This is how Paul Heelas describes the transitions that are implicitly and explicitly asserted within the literature on detraditionalization:
Once you set things up in this way, it’s hard not to see radical change everywhere. The underlying dichotomies operate as an interpretive framework which highlights discontinuities and obscures continuities. This is why, as Graham Crow [2] puts it, a “more nuanced account of the processes involved in beginnings and endings needs to be developed”. He identifies a large number of phenomena of which it has been declared that we are witnessing the end:

- family relationships
- community relationships
- politics
- poverty
- capitalism
- slavery
- masculinity
- privacy
- work
- unemployment
- the nation-state
- organised capitalism
- socialism
The identification of ‘endings’ is more methodologically complex than someone like Giddens seems willing to admit:

Endings, and the opportunities for new beginnings for which they open the way, thus merit some attention because they are so frequently a point of reference. Claims to have identified the emergence of a new social phenomenon and the end of an existing one are rhetorically powerful, but assessing them is by no means straightforward. To begin with, there are varying interests at stake in the promotion of certain social phenomena as ‘new’ and others as ‘dead’ or ‘dying’. Most social transformations have ‘losers’ as well as ‘winners’ ([3]Crow and Rees 1999), even though the voices of the former tend to be drowned out by the latter. Secondly, the momentousness of social changes is not always apparent to the people living through them and, as a result, interpretation of their perceptions of continuity needs to be undertaken with caution. Conversely, developments that can seem momentous as they unfold can come to be regarded as less so with the passage of time

In fact it’s very easy to relativise the account offered by Giddens in terms of both his own life and the unfolding of history. He was (anecdotally) going through major changes in his personal life and, it seems with hindsight, moving away from social theory and towards politics. His main three books on this subject were published after the fall of the Berlin Wall, as either history itself or at least one era seemed to be falling away, with market capitalism triumphant and the key question facing the centre-left seemingly being one of how to tame capitalism from within. Given his subsequent trajectory and reinvention as a political guru for New Labour, it’s hard not to see a potentially self-interested dimension to this as well: in identifying the end of the old he positioned himself as an interpreter of the new. This sense of new times, to which we must adapt through ‘modernising’ or risk becoming antiquated, should be understood as crucial to the cultural politics of New Labour as well: in recognising the 'new', we claim a temporal identity for ourselves, one superior to that we impose on the 'old'. Furthermore, as Crow notes, it’s difficult to find empirical grounds for these considerations in everyday life. People often don’t recognise momentous change (for reasons I describe here as the [5]epistemology of collapse) or they experience as momentous things that later come to seem much less so.

The risk is that, as Crow puts it, we lose sight of “underlying continuities by focusing only on those elements in a situation that have changed". If we develop concepts of social change (e.g. detraditionalization, individualization, globalization) that foreground those elements in a situation that have changed and fail to contextualise them in terms of those elements that have not, we’re led to pronounce epochal shifts (with all their rhetorical and political temptations). In [6]his paper he offers ten propositions concerning the sociology of endings. His point is that if we come to understanding endings better then we’ll be less inclined towards “the premature identification of endings and new beginnings”:

Processes of decline are responded to in various ways.
Long-term decline is not necessarily perceived as such by those living through it, because of imperfect information, self-persuasion, denial, nostalgia, or addiction.

People may be persuaded to remain loyal to existing arrangements even when they are undeniably in decline because they are convinced by one or more strands of *The Rhetoric of Reaction*, the argument that efforts to change a situation are bound to fail or to bring even more undesirable consequences.

The sociology of emotions and rational choice theory both provide plausible starting points for the analysis of the decision to cut one’s losses by ending involvement in existing relations that are in decline, if and when it is taken.

The social context of decision-making concerning endings is crucial.

The process of moving towards and beyond endings is rarely a smooth, linear progression through a succession of stages.

Accounts of change after the event are vulnerable to *post-hoc* rationalizations in which the confusion and indeterminacy of events as they unfolded is played down and inevitability emphasised.

The popular metaphors through which ideas about endings are expressed have a bearing on how people respond to them.

Sociological analysis is weakened when framed in terms of over-arching processes of social change that are presented as irresistible at the level of individuals, communities, or wider societies and socio-economic systems.

The analytical problems presented by the processes whereby social arrangements come to an end have very wide relevance.

Many of these points concern *agency*. People respond differently to endings. People often fail to recognise endings or refuse to recognise them. People may continue to invest themselves in something that is ending because they’re scared of what might come next. People are influenced by each other and by their wider context in how they respond to endings. These factors mean that we should avoid conceiving of endings in a way that treats them as the irresistible force of social change. If we fail to do this, we tend to see a linear transition from ‘old’ to ‘new’, in the process missing the complexity of social change and how its unfolding was shaped by the variable responses of the people on the ground.

It’s a very interesting paper. I find it hard to see how anyone could disagree with Crow’s recommendation that “the temptation to tell an attention-grabbing story should be resisted in favour of a more balanced assessment of change and continuity”. This is his closing statement:

Finally, we might note that sociologists have a mixed record in relation to realising this potential in the analysis of change, not least in terms of the premature identification of endings and new beginnings. Much is lost when complex analyses are reduced to the stark opposition of change or continuity, as is demonstrated in those more subtle analyses that highlight the ways in which change in one facet of a
social phenomenon can contribute to the reproduction of other aspects. But caution about oversimplification regarding social change reinforces the case for a sociological approach to the study of endings. This is not least because there is so much more to be said than economists’ focus on the moment when profit turns to loss, and psychologists’ focus on motivation and individual adjustment. People’s perceptions about whether they stand to gain or lose from the substitution of a new social arrangement for an old one are more complex than the former and more volatile than the latter, and this has major implications for the prediction of their individual and collective behaviour and of longer-term social change.

Social Acceleration (2014-11-13 08:00)

It is a common sentiment that life is getting faster. However is it accurate and, if so, what does it mean? To talk of life, or social life, speeding up necessitates some working definition of ‘social life’ and what it would be for it to accelerate. Unfortunately these notions are more elusive than they may otherwise appear. Do we mean that things feel faster or that they are actually becoming faster? Whether we intend the former subjective sense or the latter objective sense, we face the problem of how to measure this putative acceleration – this is an empirical challenge of measurement but also a conceptual one concerning the units of measurement. In his Social Acceleration (source of all quotes in this post) Harmut Rosa addresses such questions in a sweeping and impressive way, offering answers to these methodological challenges and using them as a basis upon which to build a comprehensive theory of social acceleration. His account has two aspects: the circle of acceleration and the external ‘motors’ which drive it. These internal mechanisms of social acceleration are mutually reinforcing but this ‘circle’ is set into motion by external mechanisms which initiate the process and contribute to its progressive, though uneven, escalation through their respective impact on each of the three processes of acceleration within the circle. In his notion of the ‘circle’ of acceleration Rosa distinguishes between three distinct processes: technical acceleration, the acceleration of social change and the acceleration of the pace of life. Social acceleration becomes self-propelling because each of these processes contributes to the escalation of the others.

Technical acceleration changes the way in which human beings are in the world, their relations to each other and to their environment, with ensuing implications for how their respective spatio-temporal situations are subjectively understood. There are three types of technical acceleration considered by Rosa: the acceleration of transport, the acceleration of communication and the acceleration of production. This encompasses the “faster movement
of humans, goods, messages, and ... military projectiles across the earth, but also the more rapid production of
goods, the speedier conversation of matter and energy, and, though in lesser measure, the acceleration of services." (pg. 73). He also considers this to include "processes of organisation, decision, administration, and control – for example, in modern bureaucracies and ministries" because these are examples of the "intentional acceleration of goal-directed processes through innovative techniques" (pg. 74).

Our perception of time is a function of our perception of space because, as Rosa puts it, "a feeling for time develops because spatial qualities in our vicinity change; it becomes light as day and dark as night, warm as summer and cold as winter." (pg. 98) It follows from this that well into the nineteenth century, the time of day differed from place to place because day time was defined by the relative position of the sun. The expansion of the rail network necessitated standardisation (there’s a fascinating discussion of this in a US context [1]here) which was enacted temporally – the possibility of traversing previously vast distances as a regular part of day-to-day life newly demanded that these disparate regions be incorporated within a shared temporal frame of reference in order to make movement between them consistently comprehensible i.e. how do you systematically move around goods and people without a reliable sense of departure and arrival times? This serves to detach time from space, abstracting the former from the contextual specificity of the latter, in a way which also compresses space – our movement through space comes to be seen in terms of standardised time rather than time as bound within the specificity of place. This process of compression is compounded by the car and the airplane over the course of the twentieth century, with the result that space has shrunk to a sixtieth of its former size since the eighteenth century, with an average speed of transportation by ship and sailing vessel of 10 miles per hour before 1830 coming to be replaced by an average speed of transportation by jet plane of 600 miles per hour by 1965 (pg. 100). The latter innovation definitively frees people from the "topographical space of life and the surface of the earth". Alongside this revolution in human mobility, the entrenchment of digital communications within social systems leads to an epochal change in how human beings orientate themselves within their environment where “human beings and goods are moving through space not only virtually but also really in historically unprecedented numbers and with great speeds” (pg. 102).

The trend described above concerns our relationship to space but Rosa argues that similar transformations can be discerned in our relationship to human beings and in our relationship to things. In each case, technical acceleration can be seen as the mechanism bringing about a substantive transformation: the acceleration of transportation transforms our relationship to space, the acceleration of communication transforms our relation to human beings and the acceleration of (re)production transforms our relationship to things. With regards to the acceleration of communication, "patterns of association and relationship are no longer or to a lesser extent bound to one common geographical space" and there is an "increase and rapid turnover of communication partners": both are facilitated by a transformation in communications media (pg. 104). With regards to the acceleration of production, we see an increase in the speed of commoditization ("conversation of matter into useful commodities") mandated by the imperative to accelerate "the turnover speed of capital": the result is that "everyday objects that surround us and the material structures of our lifeworld as a whole become contingent and transitory" (pg. 105). I think Rosa’s point here is basically that the normalisation of planned obsolesce becomes more significant than it might otherwise seem when we consider it phenomenologically: the things in which we are moved to take comfort (to paraphrase Danny Miller) are more disposable than ever and we are more inclined to replace them than ever. What then of the comfort we hope they may bring? As Rosa puts it, "identity-constituting processes of adapting to and growing accustomed to things become increasingly improbable" (pg. 105).

1. http://books.google.co.uk/books/about/Pig_and_the_Skyscraper.html?id=7o_tsZf-_x4C
The obsolescence of things (2014-11-14 08:00)

I love this old Ikea advert. It illustrates the point that Harmut Rosa is making about the acceleration of production and the implications of intensified disposability for our sense of security and continuity. It also shows what I dislike about Rosa's account: *specific groups with vested interests* deliberately sought to inculcate dispositions towards disposability in the population. It wasn't the inexorable unfolding of an historical process. People made it happen. I don't doubt that Rosa accepts this but he sets up his theoretical framework in a way which marginalises the specific questions *(who did what, when and why)* that I'd see as integral to sociological inquiry. Queerly Theorising Higher Education & Academia: Symposium Registratio (2014-11-15 08:00)

Queerly Theorising Higher Education & Academia: Interdisciplinary Conversations

Half-day International Symposium

Monday 8th December 2014, 12 noon – 7:30pm, followed by a drinks reception

Room 802, Institute of Education (IOE), 20 Bedford Way, London WC1H 0AL

This half-day international symposium brings together queer theorisations of higher education and academia that are currently developing within discipline-specific contexts. At this symposium, we will explore the ways that academia and higher education are being queerly theorised, and discuss how these theorisations are situated within and yet pushing against disciplinary settings. With an emphasis on conversation and discussion, the event will provide a platform for the collaborative development of ideas over the course of the day. Contributors to the round table and discussion-presentations range from established scholars to doctoral students, and are from a variety of disciplinary locations and institutional settings.

**Round table participants:**

Oliver Davis – University of Warwick

Michael O'Rourke – ISSH, Macedonia & Global Center for Advanced Studies

Nick Rumens – Middlesex University

Yvette Taylor – Weeks Centre, London South Bank University

Kathryn Medien – University of Warwick (Chair)

**Presenters:**

James Burford – University of Auckland, New Zealand/Aotearoa
Jennifer Fraser – Birkbeck

Vicky Gunn – University of Glasgow

Emily F. Henderson – Institute of Education

Genine Hook – Monash University, Australia

Z Nicolazzo – Miami University, Ohio, US

Sean Curran – Institute of Education (Chair)

Emma Jones – Institute of Education (Chair)

Discussants:

Elliot Evans – King’s College London

TBC

The event will be hosted by CHES (Centre for Higher Education Studies) and is funded by the Bloomsbury ESRC Doctoral Training Centre.

Registration is free, but places are limited so booking is essential.

To book, or for further information, contact Emily Henderson:[1]ehenderson01@ioe.ac.uk

1. mailto:ehenderson01@ioe.ac.uk

Call for contributions: Power, Acceleration and Metrics in Academic Life (2014-11-16 08:00)

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim ‘patent and prosper’ (Schachman) supplements the traditional ‘publish or perish’). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.
This workshop will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis

The workshop will take place in December 2015 in Prague. At present, we’re seeking to clarify the level of interest before determining the length of the event, fixing a date and inviting keynote speakers. Please send expressions of interest – a biographical note and brief description of interest in the topic – to mark@markcarrigan.net and filip.vostal@gmail.com – deadline January 31st 2015.

Venue

Hosted by Institute of Philosophy of the Academy of Sciences of the Czech Republic the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic ([1]http://www.vila-lanna.cz/index.html)

Travel

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.

Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.

An existential analytics of speed (2014-11-17 08:00)

[youtube https://www.youtube.com/watch?v=UH4xhhFJ6qQ]

Integral to Harmut Rosa’s [1]Social Acceleration (all references are to this book) is an understanding of cultural responses to acceleration and the role they play in intensifying the acceleration of the pace of life. This is not simply a matter of the valorisation of speed; in fact being satisfied with the identification of such a sentiment would be to restrict our analysis to the most superficial level. Instead what makes social acceleration so culturally loaded is the implications it has for the temporal horizons of human existence. Rosa is concerned with the “motives of action and cultural development”, specifically that of fear and promise, which Weber identified with the Protestant ethic: while he sees these motives as universal, in that they instantiate basic motivational categories of pain and pleasure, he
nonetheless holds that "the characteristic feature of modern culture is the connection of those motives with the principles of time efficiency and the related expectations of acceleration" (pg. 178). He identifies what he takes to be a *basic fear* in modernity:

> The generalised unease ... namely, that of standing in all realms of existence, as it were, on slipping slopes, i.e., of being irrevocably suspended in a world of growing contingencies, of missing decisive opportunities, or of falling hopelessly behind, operates as the *basic fear* in the dynamized, mobile society of modernity. Time thus remains existentially scarce even after specifically religious foundations of meaning "die off". (pg. 178)

The "strict, fastidious time discipline" identified by Weber as the "innerworldly asceticism" of the Protestant ethic was preoccupied by "the imperative of time efficiency, of the intensive usage and valorisation of every minute" (pg 176). To waste time risked one's possible salvation, a fear that responded to the "torturous question of whether one was chosen and in a state of grace" - given the impossibility of knowing if one was predestined for salvation, particularly given the absence of reassurance from religious authority, arduous time discipline embodied in lifestyle came to function as a proxy for the identification of the elect. Time discipline came to function as a way of dissipating the fear of damnation. But it also held the *promise* of salvation, with the imperative to trust in one's own virtue (coupled with the growing belief in lifestyle as a proxy for virtue) functioning to bridge the gap between a putative predestination and a sense of moral agency in one's own life.

Under present circumstances, notes Rosa, "there is no longer a promise of peace of mind in the turn to a powerful, reassuring God who is ready to intervene with respect to the contingencies of life" (pg. 178). However he argues that wealth serves as a *functional equivalent*. Much as the turn to God was motivated by fear of contingencies, the unavoidably uncertain horizons that emerge with the intensification of social change, so too does money come to be seen as a means through which to equip oneself for a future which we by definition cannot know: "In the form of capital, money has taken on the task of transforming indeterminable into determinable complexity" (pg. 179). Money holds out the promise of helping us *master contingency*. As Rosa puts it, we see the rise of a belief that "having the largest possible amount of money, and hence options, will allow one to appropriately react to future contingencies" (pg. 178).

What has changed is that this newer sense of salvation is imminent rather than transcendent. It promises a mastery of contingency *within* earthly time rather than a salvation that lies beyond it. This emphasises the continuity of the earth beyond the point of our own death: social life continues after we are gone. This can be responded to in a variety of ways. We might seek to cultivate a stoical equanimity such that we live our lives without attachment and thus lose nothing when we meet our end. We can identify with some greater continuity, seeing ourselves as connected to our broader movement through history as a consequence of our participation in something greater than ourselves: "individual life takes meaning and consolation from conceiving of itself as a link in a long chain that, even if does not amount to a new form of sacral time, at least bridges the gap between a lifetime and the time of the world" (pg. 181). We might also seek to immortalise ourselves through the production of works that survive us: "to leave behind a trace that extends the span of effects one's own life has far beyond its own duration" (pg. 181). However the response that Rosa sees as coming to predominate with the transition to late modern times is that of
salvation through acceleration:

the idea that an accelerated enjoyment of worldly options, a "faster life," will once again allow the chasm between the time of life and the time of the world to be reduced. In order to understand this thought one has to keep in mind that the question concerning the meaning of death is indissolubly tied to the question of the right or "good life." Thus the idea of the good life corresponding to this answer, which historically became the culturally dominant idea, is to conceive of life as the last opportunity, i.e., to use the earthy time span allotted to humans as intensively and comprehensively as possible before death puts a definitive end to it (pg. 181)

On this view the good life is the full life. To live well is to live maximally in relation to social and cultural variety: doing as many things, with as many people, in as many places as we can. This can take a more humanistic form in which "the good life consists first and foremost in the most comprehensive possible development of the talents and potentials of a subject" (pg. 182). However I think there's a further dimension to this which Rosa oddly seems to ignore in this section despite recognising it in other parts of his analysis: the embrace of speed as a response to a collapse of horizons, the fulfilment that can come from movement without any belief in where we are going, not concerned with self-cultivation or with maximisation but simply with embracing the present and grasping the moment. I think Atari Teenage Riot express this incredibly forcefully in the track I included at the start of this post:

Tomorrow, tomorrow, always tomorrow
There is no future in the weastern dreamin'!
We feel it, we must beat'em!
It's too late to create a new world!
Alternative living it must be given a chance!
Water the problem's solution! No solution if you can't use it!
And then I heard the siren of the police!
My blood went up to 90 degrees!
You can't see white cats in the snow
Oh human being, how low can you go?
Risin', risin' to the top
the pills are ready to be dropped
1, 2, 3 and 4
Got the joker shoot the score!
Speed! Just wouldn't believe it!
Speed! Just wouldn't believe it!
Speed! Just wouldn't believe it! Speed!
Speed! Just wouldn't believe it!
Speed! Just wouldn't believe it!
Speed! Just wouldn't believe it!
Another example of this ethos can be found in the film Spring Breakers. As I wrote about it at the time, "the private catharsis of drinks, drugs and sex is made public during ‘spring break’ and the film portrays the nihilistic collapse into a perpetual present which ensues when these are pursued as ends in themselves". Atari Teenage Riot present an escape from a world they disdain through drugs and movement. Spring Breakers presents an embrace of that world through drugs and movement. What both have in common is an exploration of the perpetual present which ensues when people respond to social acceleration with neither an orientation to self-cultivation (in order to maximise possibilities) or to seek to maximise possibilities in order evade the damage to the self that would be seen to ensue from missing out.

[youtube https://www.youtube.com/watch?v=oaevPDsVkyA]

Rosa’s important point about the limitations to self-cultivation and self-maximisation is that the options we forego will tend to increase faster than the ones we choose. As he puts it, "the very same inventions, techniques and methods that permit the accelerated realisation of worldly possibility and hence the increase of the total sum of options realised in a life also multiply the number and variety of realisable options" (pg. 185). In other words, the opportunity costs multiply with the opportunities: in selecting from our available choices, we miss out on the things we do not choose. However where I think Rosa goes wrong is in the assumption that an ethos of maximisation demands mastery - it doesn’t follow that a concern to live maximally necessitates an inability to tolerate the fact that the possibilities we seek to master always grow faster than our actualisation of them. This is where the notion of self-cultivation could be key: could we not conceive of a way of living maximally which seeks to cultivate equanimity in the face of the logic of escalation that Rosa identifies? We might strive to live more richly rather than fully, concerned with the poise which allows us to weave together a maximally diverse life from the endless threads available to (some of) us, not orientated towards a final resolution but instead seeking to let the process unfold more artfully and more dextrously with time.

Joseph Sylvester Pampliega (2014-12-17 15:39:06)
I’d like to say that this article covers much of my anxiety nowadays. Time and the context of where I am now (Toronto, Canada), in contrast to where I used to be (Iloilo City, Philippines). What I do also contributes to this since a great part of “social life” here has to do with work. “Good life is the full life” is also my principle in life and self-cultivation and self-maximisation is also my driving force or my objective all the time. Other than that, I also share much of these, principle and driving force, to others given the chance. I used to be a teacher in the Philippines and this gave me the opportunity to help others. Here, because of the pace of life, no matter how relatively affluent you are, a lot of things are that are even essential and necessary to human life are set aside, are wasted. It is not even something that are up to personal choice. The structure of society forces it upon people to the point that they don’t see what they have set aside and wasted early on. And with the pace of society, with the changes that happened with those things that were not chosen, that they have set aside or wasted, stress, regrets are so common people easily lose their minds. No wonder depression is so common. I can see a lot of factors that contribute to these. These are but my troubles at the moment but I know, given the chance to sit down, take a pause from work, when I can see the patterns and make sense of it, that these troubles of mine are definitely issues worth studying. Thanks for this article. It awakens me to do just what I have to do. Sometimes anxiety or to Soren Kierkegaard, angst are but the only power than can
I question the universality of the base motives. Luhmann covers the development of this being the Protestant Ethic via the construction of reality by the mass media. The pace is how modernity threatens itself anew to compel individuals forward which is essential for capitalism with its growth fetish to survive.

**Internal Conversation in Gone Girl (2014-11-18 08:00)**

I was surprised how much I liked Gone Girl. I liked the film so much I went out and bought the book. I’ve been ever more surprised by how interesting I’ve found the contrast between the two. One interesting difference between the film and the book were the different ways in which Nick’s perceived obnoxiousness were narrated. The latter lacked the first person narration which was so prominent in the former and we missed something crucial as a consequence: Nick was concerned about his perpetual failure to translate *internal conversation* into *external communication*. In the book he describes how “I carry on an inner monologue, but the words often don’t reach my lips … *She looks nice today*, I’d think, but somehow it wouldn’t occur to me to say it out loud”. We see this tendency through the eyes of others in both the book and the film:

> 'I still remember that very first night: Amy’s missing, you come in here, we park you in this very room for forty-five minutes, and you look bored. We watched you on surveillance, you practically fell asleep.' ...

> 'I was trying to stay calm.'

> 'You looked very, very calm,' Boney said. ‘All along, you've acted ... inappropriately. Unemotional, flippant.'

But in the film Nick’s awareness of this tendency can only be expressed in *external speech*. We don’t see that it’s something that concerns him, something he recognises as an issue and provokes anxiety in him. He only voices an awareness of his behaviour when challenged by others and the circumstances under which he raises it make his replies seem evasive and unreliable. This entails constraints and enablements for the narrative structure – both film and book play with ambiguity but the former does so on the basis of the unreadability of Nick while the latter does so on the basis of the unreliability of his narration. Unreadability induces doubt about what will happen (if we don’t understand his motives then how do we know what he’ll do next?) whereas unreliability induces doubt about what has happened (if the narrator is unreliable then how can we trust their account of the events thus far?) – each is grounded in a certain strategy of representing *internal conversation*. These can be seen even more emphatically in the case of Amy, as this interesting article from Think Progress makes clear:

> Out of structural necessity, we begin our story on Nick’s side. We only know what he knows, and often even less. To reveal more of Amy’s inner life early on would render the big twist untwisted. But even in the scenes that are lifted from “her” chapters in the book feel like they’re being narrated by somebody else. When it is revealed, in the film, that Amy is alive, it doesn’t really feel like anything in Amy has changed. We never get that great, punchy shift in tone. We don’t get those stellar lines of Amy talking about the character of the diary in the third person: “I hope you liked Diary Amy. She was meant to be likeable. Meant for someone like you to like her. She’s easy to like. I’ve never understood why that’s considered a compliment—that just anyone could like you.” Real Amy has total disdain for Diary Amy and
everyone who adores her. Everyone is the cops. Everyone is the reader. In the movie, everyone would be the viewer. But in the movie, you just don’t feel it. The voiceover of Diary Amy and the voiceover of Real, Sociopathic Amy sound exactly the same. The real Amy, the character who is the engine of this story, is as elusive to us as she is to Nick.

One of the more disturbing (and one of the saddest) elements of Amy’s story is gone, too: that her parents had been trying and failing to have a child over and over before they had her. Amy only arrived after a series of miscarriages and stillbirths; all these angels were named Hope, and she was haunted by those ghosts who possessed the perfection only afforded to those who die before they can live. Amy was so named because it was a popular girls’ name at the time, as if this would save her from notice by God. Amy's original plan—depicted in the movie by her “Kill Self” post-its on the calendar—is to hide out just long enough to enjoy watching Nick’s life crumble. To observe the trial, to see him sentenced to life in prison, or maybe, as is legal in Missouri, the death penalty. And then she wants to kill herself. "To join the Hopes." She is a woman with no will to live.

We see external traces of her inner life but Amy herself remains unknowable in the film. This leaves us with a sharp juxtaposition between Diary Amy and 'real Amy' which is absent from the book: it’s presented as a transition from fiction to reality, whereas the book itself is much more ambiguous.

Do we need to shake up the social sciences? (2014-11-19 08:00)

In July 2013 Nicholas Christakis, sociologist and physician, published a [1]provocative opinion piece in the New York Times arguing for the need to shake up the social sciences. We’ve [2]blogged about it in the past and Christakis
certainly provoked a lot of discussion with the case he made. The LSE recently ran a panel discussion exploring these themes when he visited the UK ([3]link) and we’ve attached the podcast and information about the event below:

**EMBED**

**Speaker(s):** Professor Nicholas Christakis, Professor Patrick Dunleavy, Dr Amanda Goodall, Professor Andrew Oswald  
**Chair:** Siobhan Benita

'Yes', according to Nicholas Christakis. He wrote, in the New York Times, 'Taking a page from Darwin, the natural sciences are evolving with the times. In contrast, the social sciences have stagnated. They offer essentially the same set of academic departments ... This is not only boring but also counter-productive ...' Is Christakis right? In this event, physician and sociologist Nicholas Christakis, political scientist Patrick Dunleavy, management scientist Amanda Goodall and economist Andrew Oswald will debate this question, and then join a discussion on the issue with policy and strategy officer Siobhan Benita.

Nicholas Christakis (@NAChristakis) is the Sol Goldman Family Professor of Social and Natural Science at Yale University.

Patrick Dunleavy (@PJDunleavy) is Professor of Political Science and Public Policy at LSE.

Amanda Goodall (@AmandaGoodall1) is a Senior Lecturer in the Department of Management at the Cass Business School.

Andrew Oswald is Professor of Economics at the University of Warwick.

Siobhan Benita (@SiobhanBenita) is Chief Policy and Strategy Officer in the Department of Economics at the University of Warwick and Co-director of Warwick Policy Lab (WPL).

The Forum for European Philosophy (@LSEPhilosophy) is an educational charity which organises and runs a full and varied programme of philosophy and interdisciplinary events in the UK.

"Every white girl's father's worse nightmare or nah?" (2014-11-19 11:16)

School students at Book T Washington High School in Norfolk, Virginia (USA) walked out of school in protest after nothing was done when they reported a racist retweet by a staff member at the school.

**Powerful song by UK Hip Hop artist Swiss** *(2014-11-19 11:42)*

**UK Hip Hop artist Swiss interrogating the widespread use of "Nigger".**

Powerful messages:
I don’t change colour, but they call me a coloured man!

The language of Black: blackmail, black-hearted, black sheep, blacklist, black magic!
Skin-bleach because wanting to be white.

Let me do you a favour, I am going to teach you mysteries...
House nigger, Field nigger.

Now everybody use the word like we weren't "niggers",
Like they never kidnap and hurt niggers...
stripped naked, burnt and castrate niggers,
Had them swinging from a tree..

Racism don't exist, oh really?

Why are some interactions energising while others are not? (2014-11-20 08:00)

We subsume such a wide array of phenomena under the category of 'interaction' that we sometimes risk obscuring the diversity within this category. One important way in which interactions differ is in how energising, or otherwise, they are to the participating actors. Some interactions can be draining and tedious. Others can have a negligible impact upon us. Others still leave us energised and focused. We can leave some interaction situations and feel marginal and diminished while others leave us feeling fuller and more congruent. These experiences are probably peripheral in the scheme of our lives as a whole but they’re nonetheless sociologically important. For the kind of actor-centred sociology I advocate, in which individual lives are taken as a basic unit of analysis and analytically distinguished from the relationships in which they are always embedded, it’s also a challenging one – it’s necessary to account for these seemingly intersubjective aspects of experience in terms of individual trajectories into, through and out of interaction situations in which “reside the energy of movement and change, the glue of solidarity, and the conservatism of stasis” as Randall Collins [1] puts it. For the position I’m advocating to be tenable, it needs to account for the experience of these situations in a way that resists the (effective) dissolution of the individual that is advocated by Collins:

This is not to say that the individual does not exist. But an individual is not simply a body, even though a body is an ingredient that individuals get constructed out of. My analytical strategy (and that of the founder of interaction ritual analysis, Erving Goffman), is to start with the dynamics of situations; from this we can derive almost everything that we want to know about individuals, as a moving precipitate across situations.

Here we might pause for a counterargument. Do we not know that the individual is unique, precisely because we can follow him or her across situations, and precisely because he or she acts in a familiar, distinctively recognizable pattern even as circumstances change? Let us disentangle what is valid from what is misleading in this statement. The argument assumes a hypothetical fact, that individuals are constant even as situations change; to what extent this is true remains to be shown. We are prone to accept it, without further examination, as “something everybody knows,” because it is drummed into us as a moral principle: everyone is unique, be yourself, don’t give in to social pressure, to your own self be true—these are slogans trumpeted by every mouthpiece from preachers’ homilies to
advertising campaigns, echoing everywhere from popular culture to the avant-garde marching-orders of modernist and hypermodernist artists and intellectuals. As sociologists, our task is not to go with the flow of taken-for-granted belief—(although doing just this is what makes a successful popular writer)—but to view it in a sociological light, to see what social circumstances created this moral belief and this hegemony of social categories at this particular historical juncture. The problem, in Goffman's terms, is to discover the social sources of the cult of the individual.

It’s strange to only really discover Collins after I’ve finished my PhD. In a very real way, his project is the mirror image of my own: to develop situational micro-foundations for macro-sociology i.e. how can the analysis of everyday life be made most amenable to drawing out the connections between micro and macro? However Collins argues that the situation rather than the individual should be the starting point while I argue that we should understand situations as composed emergently of individuals in movement - the crucial factor conditioning a situation, as well as the situated and structured milieu* in which it unfolds, being what the individuals bring to that situation - the propensities and liabilities, the expectations and concerns, originating through the personal changes they have undergone as a consequence of past situations and analytically distinct from the present situation. While Collins says that “A situation is not merely the result of the individual who comes into it, nor even of a combination of individuals” because “Situations have laws or processes of their own” I’d agree but I see the causality differently: I see any number of people P(n) with distinct characteristics at a ‘moment of entry’ to a situated milieu with distinct characteristics M - one of the characteristics of P(n) are the existing relations obtaining between them R(n). So we have (Pn) + R(n) entering M. The situation S unfolds because of how P(n) interact with each other, conditioned by the characteristics of R(n) and M(n), while they contribute to the reproduction or transformation of P(n), R(n) and M as a result of their situated interaction - everything (potentially) changes in the interaction situation, include those party to it. There are a finite number of true statements that can be made about P(n) at the start of any interaction situation and the truth of those statements can be analysed in terms of the consequences of past interaction situations. It’s only through analytically distinguishing between these changes that we can gain traction on the links between situations i.e. how what P(n) bring to future situations was shaped by their experience of past situations.

One thing I find particular problematic about the account given by Collins is how he conceives of structure and agency:

Am I proclaiming, on the micro-level, the primacy of structure over agency? Is the structure of the interaction all-determining, bringing to naught the possibility of active agency? Not at all. The agency / structure rhetoric is a conceptual morass, entangling several distinctions and modes of rhetorical force. Agency / structure confuses the distinction of micro / macro, which is the local here-and-now vis-à-vis the interconnections among local situations into a larger swath of time and space, with the distinction between what is active and what is not. The latter distinction leads us to questions about energy and action; but energy and action are always local, always processes of real human beings doing something in a situation. It is also true that the action of one locality can spill over into another, that one situation can be carried over into other situations elsewhere. The extent of that spillover is part of what we mean by macro-patterns. It is acceptable, as a way of speaking, to refer to the action of a mass of investors in creating a run on the stock market, or of the breakdown of an army’s logistics in setting off a revolutionary crisis, but this is a shorthand for the observable realities (i.e., what would be witnessed by a micro-sociologist on the spot). This way of speaking makes it seem as if there is agency on the macro-level, but that is inaccurate, because we are taken in by a figure of speech. Agency, if we are going to use that term, is always micro; structure concatenates it into macro.
My account offers a micro-sociology of collective action. In fact Tom Brock and I have a paper coming out soon in the Journal for Theory of Social Behaviour in which we analyse political demonstrations in these terms. If agency is predominantly micro-sociological then how do we explain the capacity to organise together for common purposes? Tom and I argue that demonstrations are important situations in which collective participation in a situated milieu helps solidify relational bonds that are experienced as solidarity – I see so many others who have converged on this situation for the same purpose as myself and I recognise converging motivations, facilitating a translation from the relational characteristics of my existing bonds to the crowd at large – solidified in turn by the performative aspect of protest (“you say cut back, we say fight back!” etc). The language I’m prone to using (motivations, concerns, solidarity, collectives) would be anathema to Collins who sees agency as “the energy appearing in human bodies and emotions and as the intensity and focus of human consciousness”. My reasons for rejecting this language could easily constitute a a second PhD thesis. But I’m engaging with his work because I recognise that, with the partial substantive exception of what Tom and I have written about demonstrations, I can’t account for something which his theoretical framework can: energy. I need to develop an alternative explanation, probably predicated on the social psychology of what Pierpaolo Donati calls relational goods, if I want to seriously advocate that the social world can be fruitfully understood through the micro-situational realism I’ve been trying to develop over the last six years. I like how Collins describes this, I just don’t like how he explains it:

Perhaps the best we might say is that the local structure of interaction is what generates and shapes the energy of the situation. That energy can leave traces, carrying over to further situations because individuals bodily resonate with emotions, which trail off in time but may linger long enough to charge up a subsequent encounter, bringing yet further chains of consequences. Another drawback of the term “agency” is that it carries the rhetorical burden of connoting moral responsibility; it brings us back to the glorification (and condemnation) of the individual, just the moralizing gestalt that we need to break out from if we are to advance an explanatory microsociology. We need to see this from a different angle. Instead of agency, I will devote theoretical attention to emotions and emotional energy, as changing intensities heated up or cooled down by the pressure-cooker of interaction rituals.

The central mechanism of interaction ritual theory is that occasions that combine a high degree of mutual focus of attention, that is, a high degree of intersubjectivity, together with a high degree of emotional entrainment–through bodily synchronization, mutual stimulation / arousal of participants’ nervous systems–result in feelings of membership that are attached to cognitive symbols; and result also in the emotional energy of individual participants, giving them feelings of confidence, enthusiasm, and desire for action in what they consider a morally proper path. These moments of high degree of ritual intensity are high points of experience. They are high points of collective experience, the key moments of history, the times when significant things happen. These are moments that tear up old social structures or leave them behind, and shape new social structures. As Durkheim notes, these are moments like the French Revolution in the summer of 1789. We could add, they are moments like the key events of the Civil Rights movement in the 1960s; like the collapse of communist regimes in 1989 and 1991; and to a degree of significance that can be ascertained only in the future, as in the national mobilization in the United States following September 11, 2001. These examples are drawn from large-scale ritual mobilizations, and examples of a smaller scale could be drawn as we narrow our attention to smaller arenas of social action.
IR theory provides a theory of individual motivation from one situation to the next. Emotional energy is what individuals seek; situations are attractive or unattractive to them to the extent that the interaction ritual is successful in providing emotional energy. This gives us a dynamic microsociology, in which we trace situations and their pull or push for individuals who come into them. Note the emphasis: the analytical starting point is the situation, and how it shapes individuals; situations generate and regenerate the emotions and the symbolism that charge up individuals and send them from one situation to another.

Because there is structural conditioning that transcends the situation even if this, in turn, can be understood in micro-sociological terms. For instance when students interact in a Student Union bar, the accumulated consequences of a panoply of past situations operate causally in relation to the character of the SU bar, the roles they play within it and the consequent expectations they bring to bear upon the interaction. All these factors have their own history of emergence which can be analysed micro-sociologically but they operate concurrently i.e. statements about their situational origins are ontologically past tense rather than present tense.

Creating an 'idea index' (2014-11-21 08:00)

In a recent interview Maria Popova, curator of the wonderful Brain Pickings blog, explained how she reads books. Cal Newport summarises on [1]his blog:

Around thirty-one minutes into the interview, Popova explains how she takes notes on books:

1. As she reads, she creates an index at the front of the book that lists its most interesting ideas.
2. Every time she encounters a passage relevant to one of these ideas she adds the page to the relevant line in the index. If its a new idea, she creates a new line for it.
3. As she reads more, the index grows.

Here’s what’s great about this idea index method: When you pick up a book read long ago, you can quickly recall what it has to offer by glancing at the index. Then, if you want to grab some quotes about one of these ideas, the index tells you exactly where to look (no more reading every annotation!).

I also find this a really appealing idea. I tend to underline & scribble notes & fold corners for particularly important pages (in my books) or use mini post (in library books) to mark parts of the text to come back to. However the only structure between the notes tends to be how they are sequences so it leaves me running back through a text in a very linear way. Popova’s method seems a lot better in that respect. Particularly when I use a Kindle, my approach to reading sometimes feel like mining for ideas in a way I’m unhappy with. If I’m enjoying the book then it’s not a problem. But if I’m a little bored or the author writes badly, I sometimes slip into something that’s far closer to skim reading to ‘extract’ useful bits then I’m happy with.

How to ensure the democratic dividend of academic capitalism (2014-11-21 12:53)

I recently tweeted that the Anglo-Indian welfare economist Amartya Sen has received 90+ honorary degrees. Speaking as someone who sees Sen as a net positive influence on contemporary political economy, I have nothing against the idea that some academics may acquire a disproportionate level of attention vis-à-vis their colleagues. However, if this fact is supposed to empirically ground normative judgements about specifically institutional recognition, then universities should only give honorary degrees or comparable honours to people who are willing to acknowledge the significance of the honour in material terms. This means that the recipient should absorb some of the cost of receiving the honour, which involves endorsing the institution bestowing the honour. There needs to be something more than just a ‘thank you’, even if that alone seems to generate a transient ‘feel good’ factor in the granting institution. On the contrary, any prospective recipient of such an honour should absorb the cost of transport to the relevant university, which in return would agree cover the ground costs. Only under such conditions would capitalism coincide with democracy because there would be a formal acknowledgement of the academic’s need to receive external honours in a way that is commensurate with the price that the institution is willing to pay.

Thomas Piketty: New thoughts on capital in the twenty-first century (2014-11-22 08:00)

TED have come to the rescue of those who, like me, only got 50 pages into Piketty’s Capital before getting distracted:

French economist Thomas Piketty caused a sensation in early 2014 with his book on a simple, brutal formula explaining economic inequality: $r > g$ (meaning that return on capital is generally higher than economic growth). Here, he talks through the massive data set that led him to conclude: Economic inequality is not new, but it is getting worse, with radical possible impacts.
The psychology of your future self (2014-11-22 18:52)

This talk by Daniel Gilbert is excellent. He argues that human beings exhibit a pervasive tendency to see their present selves as the culmination of a process of becoming who they are. In doing so they tend to vastly underestimate the amount of change they will undergo over the coming ten years. This has important consequences because the decisions we make now have implications for our future selves - we overestimate the stability of our current preferences and assume a fixity to the basis upon which we make our decisions instead of factoring in the likelihood of our continued change. As Gilbert poignantly phrases it: "Human beings are works in progress that mistakenly think they are finished".

One of my favourite academic blogs is [1]Understanding Society. Written by the philosopher Daniel Little, it covers a diverse range of topics across the social sciences while continually coming back to a number of core theoretical questions that fascinate me. Reflecting on its seventh anniversary, Little offers some interesting thoughts on the role that academic blogging plays in his own intellectual life:

This week marks the seventh anniversary of Understanding Society. That’s 954 posts, almost a million words, and about a hundred posts in the past twelve months. The blog continues to serve as an enormously important part of my own intellectual life, permitting me to spend a few hours several times a week on topics of continuing interest to me, without needing to find the time within my administrative life to try to move a more orderly book manuscript forward. And truthfully, I don’t feel that it is *faut de mieux* or second-best. I like the notion that it’s a kind of “open source philosophy” — ideas in motion. In my view, this is an entirely legitimate primary way of contributing to philosophy and sociology.

He also makes some interesting suggestions about the future of academic blogging that are informed by his own experience. In the last couple of years I’ve been settling into a view of my blog as my main outlet for developing my ideas, feeding into formal publications as occupational necessity and/or personal passion dictate – in fact the blog has helped me come to terms with the fact that the former and the latter may not always coincide. It’s interesting to see how Daniel Little experiences his blogging because it contrasts in some ways with my own – I share the experience of it being often ‘more creative and less laboured’ but I’m certain it’s much less rigorous, at least in the narrow sense of being carefully constructed. What I do on my blog often amounts to a form of free writing – I’m interested to see if this will change over time. I think Little offers a compelling account of the intellectual legitimacy of blogging and it’s actually left me wondering if I should try and be more careful and selective about my own writing online:

What I would really like to see in the future is a more porous membrane between academic blogging and academic publishing. There is no reason why the arguments and debates that are presented within an academic blog should not enter directly into engagement with formal publication — specialists writing about mechanisms, explanation, or historiography might well want to engage in their published work with the ideas and arguments that are developing in the online world of academic blogging. For example, I think the series of exchanges among Kaidesoja, Elder-Vass, Hartwig, Cruickshank, and Ruth Groff in Understanding Society in December and January make a substantive addition to debates within the field of critical realism. It would make sense for other specialists to take these sources into account in their published work.

I suppose many scholars would look at blog entries as “working notes” and published articles as “archival” and final, more authoritative and therefore more suitable for citation and further discussion. But I’m not sure that’s the right way of thinking about the situation. When I compare the intellectual work process I undertook in writing [3]Varieties of Social Explanation or[4]Understanding Peasant China: Case Studies in the Philosophy of Social Science with the care and concentration I give a blog post, I would say that the latter is just as rigorous and often more creative; less labored, more willing to lay out a new idea quickly. So speaking as a focus group of one, I would say I’m more satisfied with the quality of thinking and presentation I’ve conveyed in the blog than in the books I’ve published.

Lou Bloom is a petty thief, prowling Los Angeles by night while seeking some purpose in his life. He exists on the fringes of society, stealing to survive while also offering himself as an employee prepared to work under any conditions. We see the rejection he must have faced on many occasions, in spite of his ostentatious subservience ("my motto is if you want to win the lottery, you have to make the money to buy the ticket") and genuine acceptance of the dogma that demands this of him as a precondition for employment. However a chance encounter on the roadside introduces Lou to the world of LA’s stringers, the freelance video journalists chasing ambulances and assaults, striving for the most lurid footage ("if it bleeds, it leads!") to buy their way into a local news media concerned for crime reporting above all else. Lou is captivated by what they do, the urgency and action which defines
it, leading him to take his first fumbling steps into this occupational world. He rapidly advances, soon revealing himself to lack scruples – putting it mildly – with the film closing at what we can only assume is the beginning of his ascendency to power within the seedy world of TV journalism in LA. In the interests of avoiding spoilers, I won't say precisely what he does but it's not pleasant.

Jake Gyllenhaal is superb throughout (incidentally, wouldn't he make the perfect Patrick Bateman if American Psycho was ever remade?) and much of the film depends upon the consistency with which his performance sustains the balance between calm self-mastery and the rage we know exists beneath the surface. Too much of either would have detracted from the sheer creepiness of Lou Bloom, a man equally unblinking when blackmailing his employer into sex as when filming a corpse. The only time Lou's mask slips is when his ambitions are thwarted, with this experience of denial prompting an outburst of rage as disturbing as it is understated. Other than this, the only emotion we see from him is delight, with involuntary smiles only becoming sinister because of context.

It's this quality that renders the homilies which he delivers throughout the film quite so unsettling – he regurgitates nuggets of wisdom from the online business courses he consumes autodidactically, advising those around him on their negotiating positions and reflecting on the status of his transactions. However in an important way Nightcrawler isn't about Lou Bloom's sociopathy, it's about his calling: he genuinely loves his newfound profession, exhibiting a natural flair and impulse towards self-improvement that combine to facilitate a rapid ascent into TV journalism and an escape from the precarity that had defined his existence heretofore. We only see hints at his previous life, most pointedly in the certainty with which he recognises that his newfound assistant was leaving sex work behind to work for him, but it seems to have been one that left him driven towards 'bettering himself' and with a very particular idea of what 'better' entails. He is an American success story, as Henry Barnes [2] puts it in the Guardian, with the satire of this being constructed through the careful arrangements of parts rather than simply holding up Lou's vacuity as an indictment of the America that produced him. Many aspects contribute to the force with which this critique is conveyed, not least of all the incisive assessment of TV journalism and the endemic insecurity which drives a race to the bottom, however without Lou's fundamental earnestness I don't think it would work. He seeks self-improvement, to embrace his newly discovered calling and earnestly strives to make a success of himself through it. The moral bankruptcy is contextual, expressed through Lou but not originating in him – satirising the American dream in terms of the immorality it licenses is far from a novel project but I found Nightcrawler a peculiarly gripping and elegantly constructed example of it.

Junior Theorist Symposium August 2015, Chicago, IL CFP (2014-11-25 08:00)

SUBMISSION DEADLINE: FEBRUARY 13, 2015

We invite submissions for extended abstracts for the 9th Junior Theorists Symposium (JTS), to be held in Chicago, IL on August 21st, 2015, the day before the annual meeting of the American Sociological Association (ASA). The JTS is a one-day conference featuring the work of up-and-coming theorists, sponsored in part by the Theory Section of the ASA. Since 2005, the conference has brought together early career-stage sociologists who engage in theoretical work.

We are pleased to announce that Patricia Hill Collins (University of Maryland), Gary Alan Fine (Northwestern University), and George Steinmetz (University of Michigan) will serve as discussants for this year’s symposium.
In addition, we are pleased to announce an after-panel on "abstraction" featuring Kieran Healy (Duke), Virag Molnar (The New School), Andrew Perrin (UNC-Chapel Hill), and Kristen Schilt (University of Chicago). The panel will examine theory-making as a process of abstraction, focusing on the particular challenge of reconciling abstract "theory" with the concrete complexities of human embodiment and the specificity of historical events.

We invite all ABD graduate students, postdocs, and assistant professors who received their PhDs from 2011 onwards to submit a three-page précis (800-1000 words). The précis should include the key theoretical contribution of the paper and a general outline of the argument. Be sure also to include (i) a paper title, (ii) author’s name, title and contact information, and (iii) three or more descriptive keywords. As in previous years, in order to encourage a wide range of submissions we do not have a pre-specified theme for the conference. Instead, papers will be grouped into sessions based on emergent themes and discussants’ areas of interest and expertise.

Please send submissions to the organizers, Hillary Angelo (New York University) and Ellis Monk (University of Chicago), at juniortheorists@gmail.com with the phrase "JTS submission" in the subject line. The deadline is February 13, 2014. We will extend up to 12 invitations to present by March 13. Please plan to share a full paper by July 27, 2015.

by Gwen Redmond

An interest in the methodological debate between qualitative and quantitative research methods, as well as an inclination to read methodological approaches with a feminist perspective, drew me to reading Ann Oakley’s Experiments in Knowing. Published in 2000, it still has relevance to anyone with an interest in the history of research methods in social sciences.
in the social sciences, and will resonate with anyone looking to challenge their own thinking on methodologies. It is a tome of heavily referenced reflections on the origins of research in the field of science, in particular health science which, in its early history influenced by philosophy, was eager to distance itself from abstract theory and so began providing quantifiable evidence. I expected to read a resounding affirmation for the qualitative method, instead I found an explanation for how qualitative research found itself in the feminist realm and why quantitative research was, and still is, seen as the patriarchal, distanced and clinical method.

The book is divided into four parts. Part One looks at the origins of what Oakley calls 'The Paradigm Wars' claiming that the hierarchal debate between the two methods did not exist prior to the 1960s, when the feminist movement 'infiltrated academia' and began to question methodology. This in turn influenced the first feminist social science texts published in the 1970s querying the absence of women's voices in research. Good feminism, she purports, became synonymous with qualitative methods. Feminist researchers rallied against the 'three p's', positivism, power and p values. At this point she traces the change in language around research, subjects became participants, research was for participants not about and democratic values espoused. She goes further in arguing against experimental methods claiming they were seen as masculine and patriarchal in that they pillaged, plundered and then abandoned participants. Feminist research was arguing for inclusive equal participation with full disclosure on part of the researcher.

Part Two delves further back into the history of methodologies, sociology and gender. Making references to some of the great 'fathers', (founding or otherwise) Descartes, Bacon and Galileo, Oakley unearths the 16th and 17th century views that nature was herself feminine and in need of 'dissection' by the sciences in order to control her. This pervading discourse, she feels, led to women being seen as naturally inferior to men. She goes on to trace how social science became equated with numbers and refers to the work of Hobbs in the 1600s and Condorcet in the 1700s. She reveals the origins of the terms 'normative distribution' and 'the average man' (who was in fact your average army conscript!) as coined by Quetelet in the 1800s, as well as the father of statistics John Graunt. Making reference to women using statistics also, Florence Nightingale's empirical work offers a surprising juxtaposition with her historical image. In chapter six, Oakley again revisits the background methodology of social sciences through the 'penetration' of nature by male scientists in order to understand evolutionary biology. She again refers to the influence of more 'founding fathers' such as Herbert Spencer and Charles Booth and their influence on another surprising researcher, Beatrix Potter. Oakley traces new sociological thinking when she talks about Durkheim (1895) reflecting Mills' (1843) view that experimentation was not the ideal sociological tool of discovery, but that only the observation of society and its social phenomena (or absence thereof) can provide a truth unmitigated by the researcher. The latter part of the 1800s, she says, was the birthing of the new social science, different and separate from its roots in natural science and philosophy. The era recognised the emerging tensions between 'hard' empirical data and 'soft' experiential data (often in the form of art and literature, especially the novels of the era) and Oakley sees this clash as a seed for the future paradigm wars between the quantitative and qualitative methods.

The RCT is introduced in the final chapter of Part Two, however Part Three of the book in the main concerns itself with the continuation of the history of the development of the field of social science, and shifts now from Europe to North America to recount the 'full-blown' use of RCTs in social and health experimentation. Early models of experimentation (by McCall in education for example) used the idea of chance, or random selection, as a control, however it was not until the 1946 streptomycin trial was the design officially applied. Oakley makes her way through a dense history of RCT experimentation in order to remind the continued post-positivist defence of the qualitative method, that the 'frontiersmen' in sociology used experimentation and statistics as a means to take the field into the domain of public policy. The golden age of experimentation in the US led to policy reform in areas of social concern; unemployment, drug misuse, crime and poverty. Oakley argues that although there were disagreements in how to interpret these findings they did however lead to reform, undermining the continued argument against positivist methodology as an impossibility within the field of sociology. In Chapter eleven, Oakley explains some of the resistance towards experimentation lies with its history of unethical methods, for example on animals or without full disclosure and therefore uninformed consent. She queries, with the recent shift to qualitative methods,
whether the public will be better informed without RCTs. This question reflects a recurring practice of Oakley's (in this book) where she queries but often leaves us without answers, or even a direction in which to find those answers.

Part Four aims to conclude the strands Oakley has weaved throughout the book, with her aim being to free social science of the divide between patriarchal quantitative and feminist qualitative ways of knowing and reclaim both as ‘people’s ways of knowing’ free of their gendered past. Oakley advocates a ‘reconstruction’ of the field of social science built on ‘new fundamentals’. She argues that reality exists and experimental methods have a role to play in the social sciences, and that freeing the method of its ‘baggage’ and association with patriarchy will enable its rejuvenation.

Returning to my initial reasons for being drawn to the book, I have to admit some disappointment. I struggled with Oakley’s constant referrals to ‘founding fathers’, ‘frontiersmen’ and ‘master’s tools’ when referring to male historical figures and methods but not ‘founding mothers’ or even ‘sisters’ in reference to female researchers. I felt deference is given to the empirical positivist researchers, and rightly so historically, but that the ‘paradigm wars’ are not wholly served by the retrospective elevation of these methods currently. I agree with Oakley that the quantitative remains a valuable method but only to shine a light on sociological issues rather than possibly being ‘the right tools for the job’ (in some instances) as she claims. However, this is an excellent book on the history of the field and I imagine anyone with an interest in broadening their knowledge would do well to find a more complete reference book.

Gwen Redmond is studying for a Master of Education degree in The Department of Adult and Community Education at Maynooth University, Kildare, Ireland. Working in the field of Adult Literacy education for ten years, her studies and practice are informed by Critical Theorists.

How to get started on a sociological essay (2014-11-26 08:00)

1. Are you clear about what the question is asking? If you're uncertain about what the terms mean or how they fit together then it'll be difficult to know how to start writing. Try and clarify issues like these before you start planning the essay.

2. Try getting everything you think about the topic down on paper before you start working on the essay. Don’t self-censor, just write down everything that comes to mind in relation to the question. Try doing this with pen and paper or with a whiteboard if you have access to one. Afterwards think about how these points fit together & hopefully the structure of the essay will become a little clearer.

3. If you're struggling with expressing yourself in writing, find someone else from the module to discuss the question with. If you're able to discuss the topic then you're able to write about it, even if talking about it comes more easily than writing. You could even try recording the conversation to play back when you're planning the essay.
4. Is there a particular point you want to make? Even if it’s just one small thing, finding an argument you’re committed to making can help give you a route into writing the essay.

5. Don’t feel you need to write in a linear way from start to finish. If there are particular points you want to make then try writing these as individual fragments. It’s probably easier to start with the aspects of the essay that are clearest to you. If you are able to write a few hundred words each for two or three points that you want to make then you’ll have made a good start on the essay. Try combining the fragments at this stage and then start thinking about the essay as a whole piece of writing.

6. Writing introductions can be hard! If you’re struggling with this then just move straight on to the main body of the essay and go back to write the introduction once you’ve got a big chunk of the essay written. This makes it easier to know what you’re introducing exactly.

What tips would you add to the list?

_____________________

Emmanuelle Tulle (2015-08-09 11:42:20)
Write the conclusion after the intro, so that you know where you’re going. But be prepared to adjust it.

Exploring Gender: Man Meets Woman by Yang Liu (2014-11-26 17:29)

[1]
A beautifully presented book with bold and binary pictograms illustrating gender issues of contemporary times is the perfect stimulus to use for discussion with undergraduates interested in issues of sociology, sociolinguistics, and particularly gender roles and relationships. Some of the depictions would also be useful for teachers of A level Sociology, Psychology, Media Studies or English Language to use with their students when studying gender stereotypes and sexism in modern societies.

[2]
Yang Liu:

"We are living in an age of constant social change, in which the subject of the sexes ... is rapidly evolving in people’s consciousness. Each generation re-assesses and questions the role models currently in place...

It is interesting to see how Man/Woman clichés have indeed changed in our daily lives and to what extent the attributes that were assigned to the sexes in the past, often centuries ago, are still relevant in today's society. And to consider which desirable role models are already rooted in our thinking but are still in the process of transformation".

[6] The artist: Yang Liu was born in 1976 in Beijing. After studying at the University of Arts Berlin (UdK), she worked as a designer in Singapore, London, Berlin and New York. In 2004 she founded her own design studio, which she continues to run today. In 2010 she was appointed a professor at the BTK University of Applied Sciences in Berlin. Her works have won numerous prizes in international competitions and can be found in museums and collections all over the world. East meets West, a series of infographics drawing on her personal bicultural experience has been exhibited worldwide, the corresponding book has become an instant bestseller. Yang Liu lives and works in Berlin.

Critical Realism, Gender and Feminism (2014-11-27 08:00)

Special Issue of the Journal of Critical Realism (15:5, 2016)
An increasing number of gender scholars have become familiar with critical realism, finding it a robust alternative to the poststructuralist perspectives that currently dominate gender studies and feminism. This trend has coincided with an increased interest among feminist theorists in the issues of ontology, materiality and nature, which have always been at the heart of critical realist interventions. However, despite these thematic alignments, and despite the fact that both critical realism and feminist theory are inherently critical-emancipatory, the critical realist approach continues to occupy a marginal role within both feminist and gender studies debates. Concurrently, the field of critical realism is decidedly ‘masculine’ in nature, both in the sense that men dominate the field, and in terms of the issues with which critical realists have most commonly concerned themselves. Recent critical realist feminist work, the International Association of Critical Realism’s adoption of a proactive policy to enhance the representation of women in its organs and activities, and the growing critical realist preoccupation (particularly in Bhaskar’s philosophy of metaReality) with historically ‘feminine’ topics such as love, mark a potential shift away from these unfortunate trends.

In order to encourage the development of this emerging field of critical realist feminism and gender studies, as well as critical exchanges between the respective branches of critical realism (including dialectical critical realism and metaRealism) and feminist theory/gender studies, we are happy to invite submissions for a special issue of *Journal of Critical Realism* on Critical Realism, Gender and Feminism. We welcome not only contributions that draw on critical realism in studying gender relations and/or engaging with feminist concerns but also critiques of critical realism from feminist or gender-based points of view.

Topics of interest include, but are by no means limited to, the following:

- Critical realism and poststructuralist feminism/gender studies
- Critical realism and socialist/eco/radical/black/postcolonial feminism
- Critical realism and the ontological/materialist/naturalistic turn in feminist theory
- Critical realism and intersectionality
- Critical realism, metaRealism, love and gender
- Critiques/auto-critiques of existing critical realist work from a feminist/gender studies perspective
- Feminist epistemology, standpoint theory and critical realism
- Critical realism and feminist critiques of (social) science
- Examinations/critiques of feminist taboos on realism, nature and causality
- Critical realism and post-feminist culture
- Critical realism, dialectics and feminist deconstruction
- Revitalizing the explanatory feminist tradition: what is patriarchy?
- Critical realism and sexuality
- Critical realism and queer studies
• Critical realism and men/masculinity studies
• Critical realism, sex and gender identity
• Critical realism and gendered/sexual violence
• Critical realism, feminism, gender studies and war/conflict
• Critical realism and feminist ethics
• Critical realism and pornography
• Critical realism and feminist methods/methodology
• Agency, gender and critical realism
• Critical realism and feminist activism/politics
• Feminism, gender studies, critical realism and other realisms (Barad’s agential realism, post-positivist realism etc.)
• Critical realism as underlabourer for applied work in feminism/gender studies
• Critical realism, interdisciplinarity, gender and feminism
• Feminist spirituality and metaRealism
• Critical realism and feminist economics

Instructions for authors

Papers should be no more than 8,000 words (not inclusive of references). In all other respects, our instructions for authors apply. Please consult these at www.maneyonline.com/ifa/rea or use one of our recently published articles as a guide in setting out your work. Articles (as distinct from pieces for our Perspective and Debate sections) will be subject to external peer review.

Submissions need not be exclusively concerned with critical realism or its critique, but should relate their arguments in some significant way to critical realism. For instance, the main focus of an article could be Karen Barad’s feminist appropriation of Bohr’s agential realism, but it should include consideration of critical realism.

Important dates

October 1, 2015: deadline for first drafts
February 26, 2016: reviewers’ reports and editors’ decision provided
May 23, 2016: deadline for final drafts
June 30, 2016: final copy due with the publisher
October 2016: publication of the special issue online and print

Enquiries and submissions
Please send any enquiries to lena.gunnarsson@oru.se Please upload articles for peer review to our online system, http://www.editorialmanager.com/rea/default.asp. When uploading you will be asked if your paper is for a themed issue. Please answer ‘Yes, the special issue on Critical Realism, Gender and Feminism’. If your paper is accepted but not included in the special issue, it will appear in a subsequent issue. Please send any other material for the special issue to lena.gunnarsson@oru.se.

About the Journal

*Journal of Critical Realism* is the journal of the International Association for Critical Realism (IACR), established in 1997 to foster the discussion, propagation and development of critical realist approaches to understanding and changing the world. It provides a forum for scholars wishing to promote realist emancipatory philosophy, social theory and science on an interdisciplinary and international basis, and for those who wish to engage with such an approach.

Critical Realism, Gender and Feminism

---

Book Review: *Liminality and the Modern, Living Through the In-Between* by Bjørn Thomassen

(2014-11-27 12:55)

Book Review by Bradley Williams

[1]

3106
With Liminality and the Modern, Bjørn Thomassen has provided an invaluable resource for researchers of all types of ritualistic processes in different social settings. As Thomassen notes, the concept of liminality is under-utilized in anthropology and completely ignored by sociologists. Liminality within anthropology has been most closely associated Victor Turner’s writings on tribal rituals practiced within a Ndembu village in Zambia, where he lived and collected field data. Indeed much of the book is devoted to understanding some of the standard and lesser known works of Turner. Thomassen also discusses the history of the lesser known social theorist, Arnold van Gennep, who unarguably pioneered the concept of liminality, and provided a thickly rich though concise analysis in his book Les Rites de Passage (The Rites of Passage).

The greatest contribution that van Gennep proposed was a universal three part structure characteristic of all ritual processes. All initiates or participants undergoing rituals undergo an initial separation from the bounded norms, social repertoires, and general order represented by their pre-ritual ontology. Secondly, they enter into a liminal state characterized by a supreme normlessness that can produce either positive or negative affects (though this last distinction was only established after the concept of liminality had reached its maturity, which came after Victor Turner’s singularly positive appraisal of liminality had been thoroughly considered). Liminality characterizes all in-between social spaces, where individuals, groups, and even whole societies enter into a disestablishment of social order and individual and collective identity. Finally, the participant undergoes a process of re-integration in which a new social order, orientation or identity is accepted. Much of the first half of the book gives a history of van Gennep’s unfortunate, failed attempts at launching an academic career. The thrust of the history involves van Gennep’s fundamental disagreement with the over-socialized structural functionalism of Emile Durkheim. According to van Gennep, and others who found fault in Durkheim’s theories, Durkheim’s theory could not account for reality because it could not account for individual agency within periods of social transformation or transition.
The account of van Gennep's attempts at integrating himself into the French academic community is very interesting. Thomassen writes that van Gennep remains the most cited social scientist in the history of French academia to have never been appointed a professor. It's an intellectual biography that really sheds light on a whole range of famous social theorists, not just van Gennep. The second half of the book attempts to bring the concept of liminality into a twenty-first century context. Taking a lead from Victor Turner, Thomassen infers from the broad conception of liminality in tribal rituals accounted for by Turner, that the concept could and should be applied to all kinds of other social phenomena that adhere to the universal tripartite structure of ritualistic social transformation. As the name of the book implies, much of the second half of the book concerns the application of liminality to our current dominant form of modernity in the West.

Part Two of the book opens with a lengthy discussion of the primacy of the self within the thought of Descartes and the primacy of the state within Hobbes. Thomassen intricately plays the ideas of Descartes and Hobbes off of one another to show how both theorists reacted to an overall sense of unease within Europe. Together these theorists provided the individual and collective conceptions that largely structured the broader modern social context, the underpinnings of our modern celebration of contemporaneity. Thomassen then dedicates a chapter each to the role of the ritual process and liminality in three social phenomena: games and gambling, bungee jumping, and political revolutions. The essay on Gambling draws a comparison between the emergence of casinos in Italy and the "trickster" role played by the infamous Casanova and the modern question of living within a broader risk society. The next chapter proceeds from a discussion of ceremonial precursors to modern bungee jumping to illustrate a particular form of liminality that the author refers to as limivoid. While phenomena such as bungee jumping incorporate the 'going to the limit', dangerous aspect of the liminal phase of ritual processes, the final transformative phase found in actual rituals is missing. This makes the "ritual" of bungee jumping merely a form of simulacra or an incomplete ritual. The penultimate chapter on political revolutions was perhaps my favorite discussion in the book. Thomassen incorporates Victor Turner's meaning-filled descriptions of the liminal atmosphere that permeates large-scale crises to discuss the liminal and transformative aspects of political revolutions. Revolutions, as forms of collective behavior, seem to embody the process-structure of rituals. He identifies some of the emotional aspects of revolutions which account for phenomena such as mass adherence to the whims of charismatic leaders.

The concluding chapter concerns the themes of home and being-at-home as they relate to the transition "out of liminality" for modernity (p 215). In the end, Thomassen posits an understanding of the agency/structure argument that is neither characterized by rational-positivism or social constructivism. Ultimately, van Gennep's work highlights the detachment that both theories have toward 'nature'. Rather than trying to 'tame' and compartmentalize the irrational sensibilities within the world, social science should seek to understand the natural "rhythms" of the social.

This book is a remarkable contribution to sociology and anthropology. Thomassen offers insights valuable to anyone interested in a sociology that can account for transitional periods within human existence. This book is worth reading and re-reading for its illuminating perspective.

---

Bradley W. Williams is a graduate student in sociology beginning his PhD studies at George Mason University in 2015. His research is located within the intersection of sociology and international relations, specializing in the study of religion, social movements, and Islamic peace processes.

Seven reasons why blogging is academically valuable (2014-11-28 08:00)

This is a good list by [1]John Danaher. Read it in full [2]here:

1. It helps to build the habit of writing:

2. It helps to generate writing flow states:

3. It helps you to really understand your area of research:

4. It allows you to systematically develop the elements of a research article

5. It enables you to acquire serendipitous research interests

6. It helps with networking and developing contacts

7. And yes, it also helps with teaching

1. http://philosophicaldisquisitions.blogspot.ca/
I am increasingly being asked to reflect on my self-development. This is neither as boring nor self-aggrandizing as it might first sound. You may actually learn something about yourself in the process. I was someone who read philosophy from quite an early age – certainly by high school I was able to distinguish the major philosophers and some of them I had actually read in excerpt form. For my high school newspaper, I compiled a list of the 100 greatest people (I think it was ‘people’ – not ‘thinkers’) of all time. All I remember clearly was that Jesus headed the list, with Moses, Muhammad, Confucius, Buddha, Socrates, Newton and Kant close to the top. Karl Jaspers’ account of the great thinkers made a strong impression at the time – though I always recoiled at the word ‘wisdom’ he used to characterise them as a group. For me ‘wisdom’ suggests old age, and while we should always learn from the past, we should never venerate it. I believed this at age 15 and at age 55.

I always strongly identified with the Enlightenment as a movement. People who know my work mainly through my critics – especially in the scientific establishment – may find this surprising. However, I’ve been very consistent on this point. But what I value in the Enlightenment is its spirit, not any dogmas that may trace their legitimacy to what some 18th century thinkers said. The Enlightenment was, in the first instance, an anti-authoritarian movement that basically set out to finish the job started by the Protestant Reformation, the denominations of which had begun to coalesce into mini-Vaticans of their own. (If you want to understand the soul of an intellectual movement, don’t take its actual content too literally; rather, take that content as indicative of a certain change in attitude toward what has come before – a kind of re-branding or re-spinning. This is Hegel’s take-home lesson for today.)

In the 1970s, when I first become engaged with these things, the Enlightenment and Romanticism were seen as two complementary movements that pivoted around the Industrial and French Revolutions. (If the reader does not find this framing intuitively clear, then the world really has changed.) Because I remember a time before academics had any clear sense of what ‘postmodern’ might mean, a young person from today transported back to my youth would probably recognize the distinction between Enlightenment and Romanticism in terms of ‘modern’ versus ‘postmodern’ – and then wonder why couldn’t these primitives state the obvious! However, the key difference was that back in the 1970s, much of the discussion focussed on the psychology of the individual that was privileged by Enlightenment vis-à-vis Romanticism. These discussions, very rich in detail, were often reduced to ‘reason’ versus ‘emotion’ in popular forums. (Richard Sennett’s *The Fall of Public Man* is a sociological artefact from that era.) From that standpoint, the more recent wranglings over ‘modern’ versus ‘postmodern’ look very abstract and detached from these original concerns with personal self-understanding.

Of course, what intervened was the French ‘death of the subject’ movement associated with Barthes, Foucault and Derrida, the English translations of which only started to be integrated into humanities and social science curricula when I started university in 1976. Initially Derrida’s *Of Grammatology* made the biggest impression on me but Foucault’s *The Order of Things* has stuck the longest.

I say all this because my sense of the Enlightenment was always coloured by the psychology of the Enlightenment figures – perhaps even more than by the content of their views. In particular, having read Will Durant’s popular biographies of Voltaire and Rousseau, I was drawn to these very brilliant, dynamic and volatile figures, who operated in many media and always presented the assertion of reason as an endless struggle against stupidity, superstition, depravity and incapacity – in both oneself and others. It requires eternal vigilance – comparable to what only God himself provides in keeping the cosmos in operation! If you recall Goya’s famous painting about ‘the sleep of reason’, you get the message. I don’t deny that this image of the Enlightenment was very compatible with the Cold War’s ‘permanent state of emergency’ (Daniel Bell’s phrase) mentality, but at the same time it reached out to the Romantic sensibility by suggesting that even ‘reason’ needs to be somehow ‘inhabited’. (I see Bourdieu’s *habitus* as largely a sociologically relativized and objectivized take on this point.) In any case, I always found that more recent self-avowed defenders of the Enlightenment, whose scholasticism would even make Kant blush (e.g. Juergen Habermas), have lost sight of what made that period so inspiring for many generations of thinkers throughout the world – and still animates my own way of thinking.
We are experiencing a “pre-” that we can’t name yet (2014-11-29 08:00)

This is the claim made by Matthew Barzun, US ambassador to the UK, in an intriguing piece for the New Statesman. He attacks the view that the world is sliding into anarchy, offering a counter-narrative that is every bit as sweeping and accentuates the positive:

- **It is a time of levelling.** The world has reduced extreme poverty by half since 1990. Global primary education for boys and girls is now equal.

- **It is a time of enduring.** The number of deaths among children under five has been cut in half since 1990, meaning about 17,000 fewer children die each day. And mothers are surviving at a nearly equal rate.

- **It is a time of flourishing.** Deaths from malaria dropped by 42 per cent between 2000 and 2012. HIV infections are declining in most regions.

- **It is a time of strengthening.** Africa is above the poverty line for the first time. Tens of millions have been lifted out of poverty in China. The debt burden on developing countries has dropped 75 per cent since 2000.

- **It is a time of healing.** The ozone layer is showing signs of recovery thanks to global action. And all the while, the technological and communications revolution is making more people better informed than at any time in history.

I’m not sure I’m convinced by this. But I agree that “We are experiencing a “pre-” that we can’t name yet” and his article suggests that this widespread sense plays an increasingly important part in the political psychology of our age.

Time and Reflexivity (2014-11-30 08:00)

In Margaret Archer’s work on Reflexivity, this faculty is seen as mediating between structure and agency. Our capacity to ‘bend back’ upon ourselves, considering our circumstances in light of our commitments and vice versa,
constitutes the point at which structural powers operate upon individual lives. On this view, structures don’t operate automatically, they only exercise causal power vis-a-vis the attempting doings of agents, even if the implications of the former for the latter are utterly opaque for the people concerned. In contrast Harmut Rosa sees time structures as the mediating factor, providing "action with normatively binding force, largely stable expectations, and an orientating frame this is experienced as if it were a natural fact" (pg. 225). His argument is basically a functionalist one, with the structuring of time horizons constituting the process through which “systemic requirements” are ‘translated” into “individual action orientations”:

our sense of who we are (hence of our identity) is virtually a function of our relationship to space, time, fellow human beings, and the objects of our environment (or to our action and experience). (pg. 224)

The phrase ‘virtually a function’ is rather ambiguous to say the least*. Clearly, he wishes to recognise some independent variability to identity in relation to what may otherwise be convergent circumstances. However he also dismisses this variability, describing it as ‘virtually a function’, such that this variability comes to be seen as peripheral to the subject matter of our investigation. In essence Rosa treats this as if it were not variable, continually describing uniform responses to social change. He occasionally acknowledges that these claims are empirically questionable but this is seen as something secondary to the theoretical inquiry, as opposed to an important matter that should be incorporated into its terms of reference. Unfortunately this variability matters because if we believe action has (any) efficacy vis-a-vis structure then variable individual responses feed back into the social changes that are reshaping time horizons. If we don’t recognise this variable component of feedback then acceleration comes to seem entirely systemic, revolutionising social life but unfolding by its own logic independent of the actions of individuals or groups.

It’s for this reason that I feel the need to very cautious when engaging with Rosa. The critical theory he espouses is close enough to my own theoretical position (probably because of the legacy of Marxism feeding into both critical realism and critical theory) that much of what he says immediately resonates with me. But there are also these massive points of disagreement that can seem rather small until I stop and think about them. However he does have rather a lot to say about time which fascinates me. What’s particularly relevant for my own work is his account of structural changes to biography:

the predominance of individualization in the transformation of relationships to self and world in classical modernity leads to a temporalization of life, i.e., to a perspective on one’s own life as a project to be given shape in time, while the same process of dynamization in the late modern phase of its development effects a "detemporalized," situational definition of identity. (pg. 226)

His point concerns the temporal dimension to “socially dominant forms of self-relation” (pg. 224). Though she’s retreated slightly on this point, Archer’s early work on reflexivity was concerned with the spatial dimension of dominant forms of self-relation. In Making Our Way Through The World in particular, there was a focus on the way in which patterns of mobility in early life have implications for the forms of self-relation upon which individuals can come to rely as they go through adolescence. Rosa’s quasi-functionalism notwithstanding, I don’t see any reason why we can’t sustain an interest in both: the spatial and temporal dimensions to socially dominant forms of self-relation, as well as the relational dimension to personally dominant forms of self-relation (with the macro operation of the former being mediated through the micro operation of the latter).

Rosa sees a mode of biography as “the directed movement of life along alternative development paths” operating in modernity, dependent upon “the liquefaction of forms of life and community, which reached epoch-making
levels during the industrial revolution” being “steered onto relatively fixed, institutional rails in the increasingly ‘organized modernity’ of the welfare state” (pg. 228) He cites Martin Kohli’s work here, who argues that

a life course divided into temporal sequences has a double function: on the one hand, it undergirds the institutional order of the welfare state (the educational system, the social insurance system, the pension system, etc.) and conversely becomes a socially obligatory standard through this system of institutions; but, on the other hand, it establishes an identity-guiding, orientating schema in the concept of the ‘normal biography,” which allows of respective three-stage ‘schedules’ in professional life (education, gainful employment, retirement) and the familial structuring of life (childhood in the ancestral family, own family with kids, older phase after the kids move out) (pg. 228)

The transition from tradition to modernity is seen as one from a static and situational identity to one that is dynamic and trans-situational. In late modernity this in turn becomes dynamic and situational. This renewed status of being situationally bound is not a function of spatio-temporal immobility as in traditional society but rather a consequence of the breakdown of stable temporal horizons. Identity implies evaluative and action orientations towards our circumstances. Rosa’s claim is that social acceleration creates a tendency to compress those orientations ever further into the boundaries of situations because the context in relation to which we evaluative and act increasingly changes with such speed that our orientations towards it have no trans-situational durability.

He contrast this to the tempo of modernity in which “the horizons of expectations remains stable enough to allow long-run, time-resistant life perspectives to develop, the gratification of needs to be systematically postponed, and the completion of the biographical pattern to be patiently awaited.” (pg 230). On his view, the identity-constituting task facing adults in modernity was to “find your own place in the world”: “choose a career, start a family, decide on a religious community, and find a political orientation.” (pg 229). While people did revise these choices, these revisions were relatively marginal and incorporated into a life narrative in terms of progress towards authenticity i.e. my previous choice was wrong, I realised and thus I revised it. In the absence of these stable time horizons, Rosa argues that this orientation towards biography becomes untenable and thus far we are left with a situational identity. This means that chronological phases of life are losing their internal coherence and external interrelatedness: the ‘building blocks’ out of which biographies are built become less clearly distinguishable and the sequential relationships between them become less linear

Key to Rosa’s analysis is the notion that we’ve moved from an intergenerational to an intra-generational rate of social change. This entails an “escalation of contingency and instability” which serves to render identities relative to situations: “it is not one is a baker, rather one works as one (for two years now); not that one is the husband of X, rather one lives with X; not that one is a New Yorker and conservative, rather one lives in New York (for the next few years) and votes for Conservatives (pg. 147). His argument rests on the sense in which “self-relations have an insolubly temporal structure in which the past, present, and future of a subject are connected”: "Who one is always also defined by how one became it, what one was and could have been, and what one will be and wants to be" (pg. 146). It is through this situatedness vis-a-vis temporality that social change exercises causal power in relation to individual lives. While Rosa systematically underemphasises the role of reflexivity in mediating this process, making universal claims about the consequences for individuals while ignoring the variability of responses by individuals, he is surely correct that intra-generational social change “will have far-ranging consequences for the possibilities and forms of social integration and cultural reproduction” (pg. 114).

Another important aspect of Rosa’s analysis is his account of how “the temporal regulation and deinstitutionalization of numerous fields of activity in late modernity society has massively heightened the cost of planning and thus the time required to coordinate and synchronise everyday sequences of action” (pg 126). As the rapidity of social change leads to the progressive dissolution of collective time structures, as well as a recognition of how fleeting
those that remain must be, cultural synchronisation devices that could once be taken for granted instead “have to be repeatedly planned, negotiated, and agreed upon with cooperation partners all over again” (pg. 126). We can’t take for granted when others will do things or the order in which they will do them and hence there’s an additional cognitive burden involved in day-to-day social life. This also leads to a situation in which we come to be expected to justify our temporal decision making, as socially accepted standards of temporal rationality break down and the consequence for each individual of other’s temporal decisions become more pronounced: the range of ways in which my, say, failing to send an e-mail in time may impact upon a colleague increase because the significance of that e-mail vis-a-vis their own sequence of work commitments has become less standardised. Standards and expectations diverge when collaborative work is no longer embedded within shared horizons and converging circumstances.

This is partly a consequence of the diversification of system environments, “Since, from the internal perspective of a given system or interaction context, all other activities represent only disruptive delays and eliminable empty times” (pg. 191). This leaves conflicts over time occurring between people when operating across system boundaries (e.g. when I am preparing for teaching, the demands of a research commitment made by a collaborator seem secondary and vice versa) but also within the context of an individual’s life as they’re forced to negotiate the competing demands of divergent contexts. Rosa identifies a trend towards time management as “microtemporal oscillation between the demands of distinct functional spheres that are all running as ‘non-stop’ enterprise” (pg. 192) (which incidentally is a fantastic description of how and why Omnifocus works so effectively once you get the hang of it) – the disjunction between spheres becomes too rigid for time managements, sometimes leaving too little time for ‘home’ commitments when at ‘work’ (and vice versa) but also sometimes leaving too much time, confining one to working commitments in absence of impending deadlines or anything approaching real urgency.

These circumstances pose a profound challenge to our capacity to direct our "energy towards a fixed, constant, subjectively worthwhile goal and to express it in action" (pg. 249). In other words, commitment becomes difficult when the things to which we might commit ourselves change so rapidly. This is the part of Rosa’s argument that really fascinates me and I think he gets more directly to the heart of this issue then any of the other authors who address it. I’m interested in empirical detail about the life strategy through which people negotiate the moral logic of this situation. Where Rosa’s account fails dramatically, surprisingly so given his deep conversance with the thought of Charles Taylor, stems from his lack of appreciation for how ultimate concerns can function as meta-commitments: fleeting things in our lives take on mean relative to higher commitments which can transcend situational change. Certainly, this is not true of all commitments and I agree that sustaining commitments becomes much harder when social change reaches an intra-generational tempo. But I nonetheless think Rosa’s point is a dramatic overstatement and that the reasons for this hyperbole stem directly from his inadequate concept of reflexivity.

It’s possible this may be an issue with the otherwise excellent translation, as Rosa is a wordy but precise author.

Benjamin Franklin’s "club of mutual improvement" (2014-12-01 08:00)

What a lovely idea found as an aside in a post on [1]Brainpickings - are there other examples of such "clubs"? It would be interesting to compare the rhetoric found to surround them with that found in contemporary ‘productivity’ culture:
At age twenty-one, he formed a “club of mutual improvement” called the Junto. It was a grand scheme to gobble up knowledge. He invited working-class polymaths like him to have the chance to pool together their books and trade thoughts and knowledge of the world on a regular basis. They wrote and recited essays, held debates, and devised ways to acquire currency. Franklin used the Junto as a private consulting firm, a think tank, and he bounced ideas off the other members so he could write and print better pamphlets. Franklin eventually founded the first subscription library in America, writing that it would make “the common tradesman and farmers as intelligent as most gentlemen from other countries,” not to mention give him access to whatever books he wanted to buy.

**Actor centred sociology (2014-12-02 08:00)**

In the last couple of years, I’ve occasionally wondered whether I’m a methodological individualist. The term carries intensely negative connotations within the areas of sociology in which I spend my time. I’m certainly not an individualist in an ontological sense: I think the social world is made up of many kinds of entities and that we can only understand their composition by recognising their plurality and the stratified relations that obtain between them. I also don’t think we can adequately understand individuals as individuals, in the sense that, to use R.D. Laing’s description, “our relatedness to others is an essential part of our being”. However, as he goes on to say, “any particular person is not a necessary part of our being”: while “I” always exist in relation to a “We”, this does not entail that the identity of the former can be subsumed into the latter. Unless we recognise the independent variability of the “I”, it’s impossible to make sense of the pattern of the development of the “We”: the trajectory “I” take can only be understood in terms of the shifting constellation of constraints and enablements entailed by a “We” that is reconstituted through my actions but nonetheless retains a relative autonomy from me.

In this sense, my approach to studying individuals without being an individualist understands people as temporarily extended and always in motion. In other words, I’m concerned with biography. In his account of “actor centred sociology”, Daniel Little talks about the “actor-in-formation”: this is the meta-theoretical function of my notion of personal morphogenesis. I’m suggesting we can best understand the role of the individual within social processes by analysing other social entities in relation to how people change and how people stay the same: personal change and personal stasis then contribute to the reproduction or transformation of other social entities (and in turn engender tendencies towards personal morphogenesis or personal morphostasis etc). This is an argument about biographical microfoundations. This is how Daniel Little describes the notion of microfoundations:

This means that sociological theory need to recognize and incorporate the idea that all social facts and structures supervene on the activities and interactions of socially constructed individual actors. It is meta-theoretically improper to bring forward hypotheses about social structures that cannot be appropriately related to the actions and interactions of individuals. Or in other words, it means that claims about social structures require microfoundations.
I think I differ with Little on what it means to say that we have “appropriately related” structure and agency. I also think there are problems with the notion of supervenience – as far as I can see, it locks us into an ‘aggregation dynamics’ view and precludes top-down causation. However I otherwise like this way of thinking. I’m suggesting that a biographical approach orientated to personal change is a useful way in which we can bridge the gap between micro-sociology and macro-sociology. In essence, I’m suggesting that we think in terms of biographical microfoundations and see the social world as constituted through the unfolding of biographies and their entanglement within situated milieux.

At present I’m leaning towards publishing my PhD as individuals papers rather than as a monograph. However these would be a contribution to a long term project, Becoming Who We Are, which will eventually be a monograph. My PhD has left me with an understanding of my project but I don’t feel intellectually capable of writing it yet. I would use the theory of personal morphogenesis developed in my thesis as a basis for (a) a theory of biographical microfoundations (b) a methodology for studying the lifecourse (c) a theory of the actor (d) a framework for actor centred sociology.

The last phrase is one I’ve encountered through Little and I find it a very helpful way of framing what it is I want to do. Though I don’t think she’d accept the terminology, I’d now understand Margaret Archer’s work on reflexivity (including Being Human, as well as the trilogy of books on reflexivity) as developing a theory of the actor and a framework for studying actors. I think it’s very strong in many respects but that there are elements of it which need to developed further. These are the questions that Little suggests a theory of the actor needs to address:

1. How does the actor represent the world of action — the physical and social environment? Here we need a vocabulary of mental frameworks, representational schemes, stereotypes, and paradigms.
2. How do these schemes become actualized within the actor’s mental system? This is the developmental and socialization question.
3. What motivates the actor? What sorts of things does the actor seek to accomplish through action?
4. Here too there is a developmental question: how are these motives instilled in the actor through a social process of learning?
5. What mental forces lead to action? Here we are considering things like deliberative processes, heuristic reasoning, emotional attachments, habits, and internally realized practices.
6. How do the results of action get incorporated into the actor’s mental system? Here we are thinking about memory, representation of the meanings of outcomes, regret, satisfaction, or happiness.
7. How do the results of past experiences inform the mental processes leading to subsequent actions? Here we are considering the ways that memory and emotional representations of the past may motivate different patterns of action in the future.
Philosophical Perspectives on Why Haters Hate (2014-12-03 08:00)

[6]

Kierkegaard writes:

There is a form of envy of which I frequently have seen examples, in which an individual tries to obtain something by bullying. If, for instance, I enter a place where many are
gathered, it often happens that one or another right away takes up arms against me by beginning to laugh; presumably he feels that he is being a tool of public opinion. But lo and behold, if I then make a casual remark to him, that same person becomes infinitely pliable and obliging. Essentially it shows that he regards me as something great, maybe even greater than I am: but if he can't be admitted as a participant in my greatness, at least he will laugh at me. But as soon as he becomes a participant, as it were, he brags about my greatness. That is what comes of living in a petty community.

Now if this were to become a series of posts, the obvious place to look next would be Nietzsche.

The Social Life of Methods (2014-12-04 08:00)

[1]The Social Life of Methods is an interesting programme of research undertaken by Evelyn Ruppert, Mike Savage and John Law. This is orientated towards what the authors term the ‘methodological complex’: a dominant way of understanding method, tangled up in a particular division of labour, which precludes the investigation of methods as objects in their own right. In contrast to the ensuing view of methods as neutral tools for producing knowledge about the social world, they want to study the ‘social life’ of these methods and consider how this has shaped their emergence. In [2]this paper they talk about the dual sense in which methods can be said to have a social life:

Methods are shaped by the social world

Methods don’t come into being without a purpose and methods don’t come to prominence without advocates. In this sense, we can link techniques of map-making and surveying to the needs of nascent nation states to map their territory. The census came about as a result of the need to constitute a governable national population, measurable and therefore susceptible to intervention. For instance, Servius Tullius, the sixth king of Rome prior to the republic, instituted a census and divided the common people (plebs) into social classes: these were defined hierarchically, with rights and responsibilities ensuing from what they could contribute to the city. All the sixth class were seen to be able to contribute was their children ([3]source). The UK census began in 1801 and, with the exception of 1939 and 1966, has been undertaken every ten years since. The present government has discussed [4]replacing the census: “There are, I believe, ways of doing this which will provide better, quicker information, more frequently and cheaper” opined Cabinet Office Minister Francis Maude in 2010. The technology used to
conduct the census has changed radically, with a move towards handheld computers and online completion perhaps giving rise to an entirely online census supplemented by existing data or even its complete abandonment. The classifications used in the census change, existing classifications change, for instance ‘pensionable age’ increases, and new classifications are introduced, such as ‘ethnic group’. In fact this [5] didn’t appear in the census until 1991, with Margaret Thatcher having dismissed its proposed introduction in the 1981 census, seeing it as a left-wing dogma incompatible with her planned direction for the UK (weirdly placing her in alignment with some on the radical left who were suspicious of the government collecting such data at a time of racial tensions and with a rising far-right). The purposes underlying the census change, both in terms of the intentions of the government but also the uses to which groups like academics and charities make of the census data, leaving different groups with vested interests who help shape its future direction. The vast majority of the population of England and Wales completed the census form and, while there are legal sanctions for a refusal to complete it, this degree of compliance necessitates an extensive public engagement operation and makes [6] winning public support crucial. In this sense, the logistics of the census itself are of interest, given how all this activity is compressed into the space of a few weeks.

What Ruppert, Savage and Law are arguing is that we miss all the complexity if we simply treat the census as a neutral tool to study an object. It also helps constitute that object, ‘chopping up’ a population in various ways according to political needs and social contingencies, though the ensuing data cannot be dismissed as simply a product of the exercise. The census helps constitute a ‘population’ susceptible to intervention. We confront similar questions when considering the UK government social surveys, which began in 1941 during the second world war.

while the census made people inhabiting a territory into a national population, subsequently that population reality could be further calibrated through the technique of sample statistics in the mid-twentieth century. So there’s a history of method to be told here. In the US, for instance, sample surveys grew up with the Gallup polls of the late 1930s, and then with agencies such as the Department of Agriculture during the Second World War. Mike Savage traces their analogous though later rise in the UK. He shows, for instance, how during the Second World War, the Government Social Survey became a key instrument in generating knowledge of the circumstances and concerns of the British population. It proved popular in part because its methods of anonymous sampling avoided relying on known informants, in a way that had attracted popular opprobrium. The government proved a key player in promoting survey research into the 1960s, seeing it as part of a modernising form of government that no longer needed to rely on the views of the ‘good and the great’. It proved important in shaping educational reform in the 1960s, with surveys being used to explain the social selectivity of grammar schools. As Hilton and Savage have shown, these methods were thus embraced by a technocratic middle class, seeking to distinguish themselves from older gentlemanly intellectuals.

To talk of the social life of methods entails inquiry into the purposes underlying methods and advocates for particular methods, as well as how these change over time. These purposes might not be lofty or consequential ones. The focus group was largely absent from the academy until the 1980s but had been developed and refined as a tool for market research. Likewise corporations have led the way in the analysis of consumer transactional data obtained through mechanisms such as store cards. Considering the social life of such method entails looking at the origins of these methods, their purposes and advocates, as well as how they have changed as they moved out of the commercial sphere and into the academic one. What assumptions are loaded into their use? How are their operations understood by those who use them? What status is ascribed to the data that is produced using them?

Method contribute to shaping the social world
The notion that methods are shaped by their context is relatively straightforward. It might be under-theorised and understudied but it’s unlikely to be a contentious claim. However the authors argue that methods also contribute to shaping that world. This notion of the performativity of method can be slightly harder to grasp. They offer the sample survey as an example:

Take an example: the sample survey. This is not any example, because the sample survey is one of the most legitimated methods in use today. In the UK University teaching is assessed by the scores academic departments achieve in the National Student Survey. Our measures of crime are dependent on the British Crime Survey, which ‘corrects’ for the under-reporting of much crime to the police. The inflation rate is determined by responses to the Family Expenditure Survey, and so on.

The survey works by first sampling people. And then it works by asking them questions about matters of fact (like age, gender, income bracket, religious affiliation, lifestyle choices) and matters of opinion (such as the performance of the government, attitudes to abortion, or meat-eating). We might think of a survey as a bit like a methodological package deal. Like all package deals it has great virtues. It tells those who advocate it something about how people are planning to vote, or, say about their attitudes to global climate change. It’s also exceedingly useful because the basic methodological thinking doesn’t have to be done again. Surveying, after all, is a bog-standard method that has been industrialised and routinised. Its standards of quality control have been set, are widely agreed, and ethical guidelines are in place to police them.

At the same time, like all package deals, it is indeed standardised. You get to see parts of social reality in particular ways, while you don’t see things that escape the package. Or more strongly (and now we’re getting to the point we want to make about constituting), it may be that you get to perform certain kinds of social realities whilst not performing others. You’re actually bringing realities into being while you’re shutting down others

I think the framing here is confusing. But the underlying point is an interesting one. On the most basic level, people (sometimes) act on the basis of research and so what the methods open up and what they close down shapes the ensuing action. In so far as research methods helps shape how people see the social world then methods have consequences, including the oversights and blind spots latent to any particular method. As Einstein (allegedly) put it, "Everything that can be counted does not necessarily count; everything that counts cannot necessarily be counted". Things that matter may not show up and, conversely, things that don't matter may show up. However the authors are making a much deeper point than this. Research methods construct individuals as having capacities and properties. To ask someone about their choices presupposes their capacity to choose. To ask someone about their attitudes presupposes that their reported attitudes at one moment can tell us something about their real attitudes at another i.e. it assumes their relative stability. Methods also construct collectives as having certain properties:

Individuals are abstracted from a place and then taken as representatives of that spatially delimited place. A particularly important example is the modern nation. There is no independent nation which does not appropriate to itself the ability to conduct censuses and surveys on its national population delimited by its sovereign boundaries. It is not incidental that new and developing states see the capacity to conduct national censuses and surveys as central parts of their 'statehood'.
This process of abstraction constructs a ‘population’ composed of individuals. In measuring this (newly constituted) population, they become susceptible to intervention. Who needs what? Who can contribute what? The answers to these questions may have become far more complex but the questions themselves are still rather similar to the ones addressed by Servius in pre-Republic Rome. These abstractions enter into the lives of individuals in terms of the expectations placed upon them, the facilities offered to them and the interventions they are subject to. Consider for instance, the vast auditing apparatus involved in the tax system. Methods address subjects as beings with particular sorts of competencies and encourage them to respond as such: for example a life history interview makes a whole range of assumptions about the coherency of an individual’s trajectory and their capacity to recall it. These ontological assumptions may be explicit but they’re often implicit. The latter case makes it even more imperative that we analyse methods and extract these latent claims.

The point the authors are making is that research methods have to “pick and choose between different individual and collective realities”. Methods assume the stability of their object but they also contribute to the reproduction or transformation of that object by foreground certain aspects and backgrounding others. They offer this as an argument about all methods, as opposed to quantitative or qualitative ones. We discover things about the world through methods but we also act in and on that world in way that contributes to changes in the objects we study.

First we’re saying that they make discoveries about the world, and that those discoveries may surprise us. That’s why we conduct interviews and surveys and all the rest. But also, and counterintuitively, we’re saying that they also make more or less self-fulfilling assumptions about the character of the social world. And that in so doing they tend to constitute it, so to speak, below the radar in ways that we scarcely notice. In short, that they tend to produce what John Law calls collateral realities: that is, realities that we don’t think about very much but that we’re all busy reproducing as we go about the daily methodological work of gathering and analysing data ‘about’ the social

This suggests that studying methods as objects in their own right encompasses theory: what theoretical assumptions are loaded into methods, how do they condition the enactment of the method and the status ascribed to the results? It encompasses history, in so far as that studying the emergence of the methods, its advocates and purposes, helps us understand how that method came to be constituted in the way we find it. It involves technique, in the sense that we must attend to the operation of the method but without bracketing it off in the manner implicit in the 'methodological complex'.

The suggestion that research methods have a double social life seems uncontentious to me. The claims being made are that (1) methods are shaped by the social contexts in which they emerge and (2) methods in turn help shape those contexts. So research methods should not be understood as neutral tools developed in isolation from the social world they are orientated towards. Instead, we need to recognise the manner in which methods are shaped by that world and in turn contribute to its shaping. This involves rejecting what [11] Law, Savage and Ruppert describe as the 'methodological complex':

It assumes that methods are tools for learning about the social world. That this is what they are. End of story. We see this in methods courses. Juxtaposed and differentiated both from theory, and from substantive courses, these tell us about techniques for knowing the world. Which to choose. How to use them. How to analyse data. And how to present it.

There’s nothing wrong with this in certain senses: in social research indeed we need methods, and it’s not a bad idea to use those methods properly. But to think of methods in this way – simply as appropriate tools – involves consequences, some of them unanticipated, which create a baggage which can be heavy, even burdensome. We can distil this as ‘the methodological complex.’

This 'methodological complex' entails a particular division of labour for empirical research and a particular conception of how research can be undertaken. Theory, methods and substance are construed as distinct spheres of activity. Research questions are derived from theory, inviting the use of methods to address them in relation to distinct areas of substance. They also argue that this involves the ontological presupposition of a stable world, with definitive features that can be reported and turned into data:

We’re distinguishing between the world on the one hand, and representations of that world on the other. In this way of thinking it’s methods that bridge the gap. If we get those methods right then our representations will match the realities of the world. Tools have a better or worse capacity to do the job at hand. They will, as the philosophers of science say correspond to it; or at least (this is what the pragmatists say) they will describe it sufficiently well to be treated as accurate. This means that they are tools for handling the world. If we get them wrong then our accounts of reality, our data, will be flawed.
I'm hostile to any attempt to refute naturalism on this basis, arising from the obviousness with which these points can be reconciled to a critical naturalism (see Roy Bhaskar's Possibility of Naturalism). But I think it's important to explore them because the analysis seems entirely plausible to me, even if I'm sceptical about the prescriptions many would draw on the basis of them. I also agree that, as the authors put it, "oscillates between an objectivist concern with 'bias' and a humanist response which seeks refuge in an 'ineffable' human moment which somehow lies outside this purview of representational methods". Roy Bhaskar makes a similar point when he argues that positivism and hermeneutics share a view of natural science, framing reality in terms of a schism between matter and meanings with the former being the domain of the natural sciences and the latter the domain of the (hermeneutical) social sciences. In fact I find their analysis congruent with Bhaskar's, complementing it productively as a result of a slightly different focus:

By reducing issues to questions of technique, it allows different parties to come together around some kind of shared project, whatever their goals, values, orientations and identities. If we need to create random samples, then this is because it is important to avoid undistorted samples. If it is dangerous to avoid recruiting so-called professional participants to our focus groups, then this is because we're looking for people who are naïve and untutored in appropriate ways. If the ethnographer needs to avoid the outsiders who flock to talk with her when she first arrives in the field, then this is because she's on the lookout for gatekeepers or people at the core of the community rather than people with grudges on the periphery. We learn all these things in a million different versions in the hope of reducing bias; in the hope of knowing and describing the world accurately. This search to avoid bias and to use our 'tools' more effectively is pervasive, indeed ubiquitous. We share it. But it then also leads to an automatic response, from even the most positivistic researcher, about 'what is left out' by any specific method.

Their point is not that a concern to use tools effectively is wrong but rather that an exhaustive treatment of methods in these terms serves to preclude consideration of others aspects of methods that are salient to the practice of social research. Their project seeks to recognise that "methods are fully of the social world that they research; that they are fully imbued with theoretical renderings of the social world" and to think through the implications of this for how we understand them. These are the questions that we lose sight of if we focus on using tools effectively. As I understand their point, they accept that tools are used in the production of knowledge but argue that to understand these 'tools' we need to stop and consider them as objects in their own right. Their point is not a trivial constructionist one, such as to assert that 'methods are socially constructed' (well of course they are, would anyone argue that methods are natural kinds?) because to do so would enact precisely the oscillation between objectivism (there is a world out there with fixed properties which we use neutral methods to investigate with a greater or lesser degree of efficacy) and subjectivism (there are first-person human realities which are intrinsically beyond the purview of objective representation using neutral methods) – in critical realist jargon, I think they're proposing a systematic framework for investigating the transitive dimension of social science.

Tales From the Millennials’ Sexual Revolution (2014-12-05 08:00)

This intriguing but somewhat overstated [1]article in Rolling Stone Magazine contests that there’s a distinctively generational dimension to changing relationship practices, with millennials constituting “a generation that has been raised with the concept of sexual freedom and without solid guidelines for how to make monogamy work” leading some amongst them to embrace what’s been called ”The New Monogamy”:

Certainly, open heterosexual relationships are nothing new. Even the term “open relationship” seems like a throwback, uncomfortably reminiscent of free-love hippies, greasy swingers and a general loucheness so overt as to seem almost kitsch. But Leah and Ryan, 32 and 38, respectively, don’t fit these preconceived ideas. They’re both young professional types. She wears pretty skirts; he wears jeans and trendy glasses. They have a large, downtown apartment with a sweeping view and are possessed of the type of hip hyperawareness that lets them head off any assumptions as to what their arrangement might entail. Moreover, they see themselves as part of a growing trend of folks who do not view monogamy as any type of ideal. “There’s this huge group of younger people that are involved in these things,” says Ryan – an observation that seemed borne out of a monthly event called “Poly Cocktails,” held at an upstairs bar on the Lower East Side a few weeks later, in which one would have been hard-pressed to realize that this wasn’t your run-of-the-mill mixer (a guy who’d wandered in accidentally must have eventually figured it out; he was later seen by the bar grinning widely as he chatted up two women).

In fact, Leah and Ryan are noticing a trend that’s been on the radar of therapists and psychologists for several years now. Termed “The New Monogamy” in the journal Psychotherapy Networker, it’s a type of polyamory in which the goal is to have one long-standing relationship and a willingness to openly acknowledge that the long-standing relationship might not meet each partner’s emotional and sexual needs for all time. Or, more specifically, that going outside the partnership for sex does not necessitate a forfeiture of it. “I was at a practice where we would meet every week, six to eight therapists in a room for teaching purposes and to bring up new things coming into therapy that weren't there before,” says Lair Torrent, a New York-based marriage and family therapist. One of the things all the therapists had noticed over the past few years was “that couples – and these are younger people, twentysomethings, maybe early thirties – are negotiating what their brand of monogamy can be. They are opening up to having an open relationship, either in totality or for periods of time. I have couples that have closed relationships or open relationships depending on how they feel about the relative health of their relationship. It’s not so dogmatic.”

Cats are our captive domesticated aliens (2014-12-06 08:00)

This [1]wonderful article in Wired seeks to explain how, to their cats, any human being is "a huge, unpredictable ape". They are "our captives, domesticated aliens with no way of explaining their customs, or of interpreting ours"
and we don’t know how to listen to them:

You hear the unmistakable sound of claws on couch. You snap, shout, squirt water, and maybe even throw a pillow. It’s all futile, because eventually he’s at it again. Your cat isn’t ignoring you, Buffington says. He just doesn’t know how to connect your negative reinforcement with his behavior. This is because cats evolved as solitary hunters with little need for reading social cues, especially those for behavior modification.

“How the hell is your cat supposed to know that you’re yelling at him because you want him to stop scratching the couch?” Buffington says. Without the cognitive ability to connect your outburst to their scratching, cats see only chaotic aggression. “To the cat, you’re this crazy primate who is attacking him for no reason,” he says.

Instead of discouraging the act, you become an object of fear. What’s more, your cat becomes frustrated, and eventually stressed, because you constantly interrupt natural feline activities like raking his claws or jumping on something high. “Cats get sick when they want to express their natural behaviors and they can’t,” he said, and will continue to do the thing when you aren’t around.

Roy Bhaskar explains critical realism, dialectical critical realism, and metareality in less than 6 minutes (2014-12-07 08:00)

Sociology and, of and in Web 2.0 (2014-12-08 08:00)

In [1]this 2007 paper [2]David Beer and Roger Burrows suggest that "by the time you get to read this paper in its published form, even in the hypertextual pages of Sociological Research Online, what it describes may well have become part of the cultural mainstream". Seven years later, the paper certainly seems prescient, even if the eponymous term 'Web 2.0' has fallen out of use and the now ubiquitous phrase 'social media' fails to feature anywhere in the paper. There are many suggestions they made which can now be seen in much of the work increasingly conducted under the category of 'digital sociology':

3128
There are two issues here. First, we need to be inside of the networks, online communities, and collaborative movements to be able to see what is going on and describe it. If we take Facebook for instance, it is not possible to enter into and observe the network without becoming a member, providing an institutional email, entering some personal details and generating a profile. Therefore, in order to get some idea of users and their practices it is necessary to become a ‘wikizen’. The social researcher will need to be immersed, they will need to be participatory, and they will need to ‘get inside’ and make some ‘friends’. We will have to become part of the collaborative cultures of Web 2.0, we will need to build our own profiles, make some flickering friendships, expose our own choices, preferences and views, and make ethical decisions about what we reveal and the information we filter out of these communities and into our findings. Our ability to carry out virtual ethnographies will – by necessity – involve moving from the role of observer to that of participant observer.

4.4 A second issue is that once inside these networks we may explore the possibilities of using Web 2.0 applications, and particularly the interactive potentials of SNS, as research tools or research technologies (this is not necessarily limited to research into Web 2.0, SNS could be used to conduct research on any topic). Interviews and even focus groups could comfortably be conducted through SNS, either privately or in the open. Of course, there are a range of alternatives here. We can imagine the construction of virtual ethnographies accounting for these communities of users and their practices. Perhaps, more significantly, what we have, particularly with SNS, are vast archives on the everyday lives of individuals - a sort of ongoing codification of habitus - their preferences, choices, views, gender, physical attributes, geographical location, background, employment and educational history, photographs of them in different places, with different people and different things. These are open and accessible archives of (what was once thought of as sensitive) information that may be used to develop understandings of these people and to track out communities or networks of friends. These archives could be used to track preferences, connections, personal histories, views, friendships that may be data-mined, mapped, network analysed, discourse analysed and so on. There are possibilities then for tailoring innovative research strategies that take advantage of the interactive potentials of these new media and of the data that they hold.

However I wonder how widely social media has influenced the practice of those teaching sociology? There are certainly examples of using services like [4]twitter and [5]youtube for pedagogical experimentation and innovation. But how widespread are these? Beer and Burrows offer a few suggestions towards the end of their paper:

As a final note, once we have entered into these Web 2.0 applications it may also be worth giving some thought as to how they may be used to teach sociology. We can imagine here students building their own sociologically motivated mashups, collaborating to put together wiki’s on sociological topics, running seminars online through SNS, continuing to use SNS groups and profiles to informally discuss sociology or using folksonomies to tag and collate sociology content online (allowing students to create their own reading lists, or perhaps even using SNS as archived data sources on which to draw for short term research projects and dissertations). Of course, this may already be happening.

Does sociological teaching lag behind sociological research in its embrace of the possibilities which social media affords? Or are those utilising social media in their teaching practice not receiving the recognition they deserve? Are innovations failing to diffuse because they’re lodged within existing departments and networks rather than feeding into a more pervasive shift in our understanding of what it is to learn sociology and how sociology can be taught? Is this a matter of teaching repertoires which needed to be expended to take account of these new possibilities? We’d love to know what you think and are particularly keen to feature any experimental uses of social media in teaching that you’d like to tell our readers about.

2. [http://www.socresonline.org.uk/12/5/17/beer.html](http://www.socresonline.org.uk/12/5/17/beer.html)

There’s a whole emerging world of [1](also networked learning) that incorporates a good deal of social media use. It’s not specific to sociology but sociologists have certainly been involved, myself included as part of our [2]efforts.

The myth of ‘us’ in a digital age (2014-12-09 08:00)

In his [1]A necessary disenchantment: myth, agency and injustice in a digital world, Nick Couldry argues that transitions in media infrastructure are facilitating the emergence of a new myth of collectivity:

A new myth about the collectivities we form when we use platforms such as Facebook. An emerging myth of natural collectivity that is particularly seductive, because here traditional media institutions seem to drop out altogether from the picture: the story is focused entirely on what ‘we’ do naturally, when we have the chance to keep in touch with each other, as of course we want to do.

This is coming to replace an older sense of media as the point of access to the centre of society. The reliance on media organisations to access flows of content helped constitute an understanding of centre and periphery, with the media facilitating access to the (mythical) centre of value, knowledge and meaning for the majority who experienced themselves as peripheral to it. The rapid diffusion of the internet, mobile computing and social networking engenders a new form of mediation, by ‘us’ rather than content producing media organisations, which helps shatter this previous myth of the ‘mediated centre’ and substitute it with a vision of human networks, animated by natural
sociability, dispersed across national boundaries. As I understand Couldry’s argument, the power of this new myth derives in part from its displacement of the old: once our reliance on the old media organisations is seen to be shattered, our sociability is unbound, revealing a naturally co-operative inclination towards discussion, creation and sharing (see for example Clay Shirky’s theory of ‘cognitive surplus’). Obviously, the perception is erroneous and it serves vested interests: media organisations haven’t ceased to be party to communication, either in the sphere of content-production or facilitating communication, it’s only that their role has shifted with a change in the logic of their competition. This obfuscation serves the interests of platform providers in particular, as they drift towards being seen solely in terms of the provision of infrastructure rather than as corporate actors with increasingly vast lobbying operations.

Couldry’s concern is that “we must be wary when our most important moments of ‘coming together’ seem to be captured in what people happen to do on platforms whose economic value is based on generating just such an idea of natural collectivity”. Social media platforms present themselves as providing new enablements for and eliminating old constraints upon ‘natural collectivity’: their business model simultaneously relies upon monetizing the crowd which they have encouraged to gather, profiling behaviour in a manner susceptible to inference and allowing the growing data mining industry to do further work to this end. Their concern becomes less a matter of reaching as many people with adverts as possible (on occasions of mass attention driven by shared spectacle) but reaching the right people all the time. This is why ‘big’ data analytics are so tied up in the broader transformation of the media: the process itself demands innovation in order to extract the value it promises to generate. However this genuine computational challenge, as well as the economic interests which partly drive it, stand obscured behind the ‘myth of big data’ which Couldry takes aim at:

Myth works, as I’ve often argued following Maurice Bloch (1989) and Roland Barthes (1972), through ambiguity: through sometimes claiming to offer ‘truth’ and at other times to be merely playful, providing what, in the George W. Bush era, was called ‘plausible deniability’, but here at the level of claims about knowledge claims! So Mayer-Schonberger and Cukier, on the one hand, say big data bring ‘an essential enrichment in human comprehension’ (2013: 96). They go further, proposing a large project of ‘datafication’ that involves quantifying every aspect of everyday phenomena to enable big data analysts to find its hidden order: the result will be ‘a great infrastructure project’ like Diderot’s 18th-century encyclopaedia: ‘this enormous treasure chest of datafied information . . . once analysed, will shed light on social dynamics at all levels, from the individual to society at large’ (2013: 93–94, emphasis added). The world too will look different: ‘we will no longer regard our world as a string of happenings that we explain as a natural or social phenomenon, but as a universe comprised essentially of information’ (2013: 96, emphasis added). On the other hand, when the moral consequences of acting on the basis of ‘big data’ arises – for example, arresting people for offences they are predicted to commit but haven’t yet – they back off and say that big data only provide probabilities, not actualities, and worry about ‘fetishizing the output of our [data] analysis’ (2013: 151)

It’s the final points which will be so crucial to understanding the trajectory of ‘big data’ in a social world rapidly acclimatising itself to these forms of intervention. The mythical sociability of ‘us’ stands in sharp contrast to the quantity and quality of the interventions we are potentially susceptible to in virtue of our participation in (digitised) social life: we stand exposed, fragmented and scrutinised before a diffuse and inscrutable power. Under these circumstances might we come to cling to the myth more tightly than ever for the security it provides? As Couldry points out in relation to big data, “we too are involved in its reproduction, supplying information (to government and countless other collectors, including social media platforms) about what we do, as we do it, allowing that information to supplant other possible types of information about ourselves, what we say, and how we reflect”. He
goes on to call for an ethical engagement with these questions and the implications that they have for the social order:

The CEO of a big-data-based sentiment analysis company, sounds reasonable when he says that ‘if we’re right 75 % to 80 % of the time, we don’t care about any single story’ (quoted Andrejevic, 2013: 56). But if the big data model works by equating our only forms of social knowledge with such probabilities, then we have already started organizing things so that the single story – your story, my story – really doesn’t matter. That raises fundamental questions about individual voice, and the way voice is valued in our societies.

He doesn’t develop the point but it strikes me there’s a contradiction between the myth of ‘us’ and the myth of big data which could provide a focal point for resistance. In reality, the networked ‘us’ makes ‘big data’ possible. However symbolically, the reality of big data serves to negate the imagined promise of the ‘us’: can we reclaim an impulse towards networked sociality and co-operation in a way that resists corporate capture? Could the very force of the myth of ‘us’ be something that can be drawn upon to mobilise resistance to a world in which, as Couldry puts it, “corporate interests and the state seek to know us through big data”?

Linky Friday 189: Tattooed Introversion | Ordinary Times (2016-10-21 14:59:59)
[...] When is the concept of us a fiction created by Big [...]
Any new media is first experienced as an additional and problematic mediation to our lives. We can’t help but contrast it with some imagined conversation between two people standing in a field as representing the original, unmediated and natural form of communication. A technology, by contrast, is always regarded as something artificial that imposes itself between the conversationalists and mediates that conversation. (pg. 5)

This licenses the nostalgia and despair for what’s lost that can be seen in the work of someone like Sherry Turkle, in which the (unmediated) world of face-to-face relationships has been replaced by the (mediated) world of digital connections. From an anthropological standpoint however “there are no unmediated, pure relationships” (pg. 3) to be dissolved by digital communications. There has always been material culture and, it follows from this, human relationships have never been exhausted by other human beings. Nonetheless, they seek to acknowledge that people do change in relation to technology but not in a way that can be described as becoming ‘more or less human’ (with the weirdly zero-sum relation between humanity and technology which that implies). Their concern is “to find a means of understanding the impact of new technologies that allows us to consider these as radical changes in consciousness and other basic modes of life, but without this being seen as either an increase or decrease in our essential humanity” (pg. 11).

Their theory of attainment seeks to do this by accounting for ”how technology becomes an ordinary aspect of being routinely human” (pg. 13). They begin from the observation that “people who have access to a new media are at first usually concerned to use this technology to facilitate things they already had been trying to do, but had up to then been thwarted by the lack of means” (pg. 11); their focus is on ‘latency’, the situational frustrations, which can be found within any group. Technological innovation should be understood in terms of the “situation of incompleteness with respect to what we want to be or do” which invariably characterises the human condition (pg. 11). New technologies initially facilitate things people wanted to do but couldn’t – or perhaps couldn’t easily due to constraints entailed by prior analogues – with these inclinations predating the utilisation of the technology for things people didn’t know they wanted to do. Their interest is in when these technologies cease to be seen as innovations, facilitating frustrated desires before offering unimagined possibilities, instead becoming part of our background understanding of what it is to be human:

It is the next phase, when this facility becomes the merely taken-for-granted condition of what people simply assume as an integral aspect of who they are, which is the realisation of what we are calling attainment. The ability to write is a mark of attainment because we now tend to view those without that ability as though they lacked some fundamental property of being an ordinary human. Originally writing was an achievement, but by now it is considered a necessary condition. For many people, being able to type on a computer, or to drive a car, or speak on a telephone has become a similar mark of attainment. Webcam will serve as an example of this process because of the sheer speed with which it passes from an ideal we had aspired to, to a mundane technology we taken for granted. (pg. 12)

This account conceives of technology as facilitating latent capacities of human beings. As I understand it, they offer the notion of ‘an attainment’ as a way to conceptualise those capacities which rely upon a technological apparatus that we now take for granted: our technological innovations realise latent capacities and, in doing so, change what it is to be human but in a way that recognises this capacity for change as something intrinsic to humanity. This implies “a kind of latency in the human condition, but not merely a litany of pre-given imagined abilities planted in evolutionary time and then coming into being with new technology” (pg. 14):

There was no gene for writing that was frozen until the invention of the pen. Technology in and of itself transforms capacity and changes what human beings can do or can be envisaged as doing. The last of the
four stages defined by Miller and Slater in examining technological change, which was called the expansive potential, concerns those aspirations that can only now be imagined thanks to these developments. Technology creates as well as realises latency. (pg. 15)

This theory of attainment offers a framework for analysing the trajectories through which technological innovations are adopted and how the adopters change in the process. It can be usefully applied to the study of individual cases or to much wider social units. This is a view of humanity “that incorporates its own potential for change” (pg. 12) and I think this is crucial: it avoids a view of infinite plasticity, where we are reshaped by technical tools, but also one of inert quiddity, where we remain stubbornly resistant to technologically induced change. It recognises the properties of technology, without leading us into the trap of either seeing the uses to which a technology is put as intrinsic to the technology or as irrelevant to the technology.

Devouring your data (2014-12-11 08:00)

As someone who only a year ago was drowning in the mountains of interview transcripts that I was (stupidly) somewhat surprised to find that longitudinal qualitative interviewing had produced, this post by patter offering advice on ‘devouring your data’ really struck a chord. Read the full post in full [1]here:

You’ve read hundreds of books. You’ve waded through archival material. You’ve got mountains of surveys, folders full of transcripts, notebooks stuffed with barely legible field notes, and rather more photographs than you initially intended. Now what? How is it going to be possible to convert all of this material into something sensible? Where do you start? What is it you don’t know about data analysis?

It’s not at all uncommon to feel deeply worried about getting started on analysing all your material. Thinking about what it might take to make something out of the pantechnicon of paper and digital documents produces deep chasms of doubt, a fug of anxiety and/or a crisis in self-belief.

Getting through this stage can be really, really tough. They don’t often say that in the methods books. It all looks rather simple and straightforward on the written page. Well, I’m here to tell you that too many of the books gloss over the messy reality that is beginning to make something out of your research stuff. It’s daunting.

The Sociology of Living and Dying Optimally: Towards a Transhuman Necropolitics (2014-12-11 08:16)

[This post is inspired by a twitter exchange with Mark Carrigan over[1] this post, which reveals Foucault’s latent neo-liberal sympathies. Emilie Whitaker and I then had an exchange over this exchange, in which she coined ‘transhuman necropolitics’, capturing what I’m talking about here.]

Ever since I became interested in ‘Humanity 2.0’, it was clear that in the future the life/death distinction would be up for grabs. As a participant-observer in many events involving self-described ‘post-’ and ‘trans-’ humanist thinkers, what the US anthropologist Ernest Becker 40+ years ago dubbed ‘the denial of death’ is very much a bone of contention. Both biologists and sociologists have remarked that humans are striking in the fanfare attached to the birth and death of individual members of its species. The Abrahamic religions raised this species tendency to a fevered pitch, the secular legacy of which is canonized in the meaning of the word ‘humane’ (which Jeremy Bentham extended to animals).

At the same time, there remains the pagan legacy of the Greco-Roman world that treats life and death in a more generally resigned fashion. Their punchline is that we shouldn’t invest too much emotional energy in matters that, in the final analysis, are simply ‘natural’, in the sense of indifferent to whatever we might think or wish. Thus, the ‘good life’ and the ‘good death’ are about avoiding extremes in behaviour that can lead to needless suffering in oneself and others. Here personal experience is accorded an overriding role in ethical judgement: If you or others feel pain as a result of what you do, then it’s probably wrong.

But, for better or worse, we still live in a more Abrahamic world, notwithstanding the best efforts of atheists. In this world, life is treated as a project of self-realization – to be sure, just as much in matter as in spirit. Life and death are, at least in principle, voluntary and rational. Life is not something into which we are thrown – ‘abjection’, as those touched by Heidegger and Lacan like to put it. Now, why should anyone take literally the idea that life and death are in our own hands? Our having been created ‘in the image and likeness of God’ remains the most straightforward justification. Everything else either tries to replace the deity or deny the validity of the question.

Accordingly, our lives can be seen as sites for doing in small form what God does in ultimate form – namely, create the best possible world. The ethic of efficiency and productivity to which Max Weber drew attention in The Protestant Ethic and the Spirit of Capitalism is the most influential outgrowth of this sensibility. In this context, life is seen as an ‘inheritance’ in both economic and biological terms, out of which the heir is supposed to make something greater. If you fail, then it is your fault and the law – both positive and natural – will deal with you accordingly.

In light of the actual history of capitalism, we are prone to understand Weber’s thesis as justifying an ethic of productivity, where ‘productivity’ is equated with ‘endless production’. But ‘productivity’ is ultimately about doing the most with the least – i.e. our attempt to simulate God’s creatio ex nihilo. In that case, productivity may be achieved by knowing when to stop producing, which is to say, when we’re likely to get diminishing returns on each additional investment of effort. Of course, this can apply to living itself. Once we take this prospect seriously, then we can start talking about an optimal life and death. To strengthen such ‘optimality’ intuitions, we might consider how what one does later in life has the potential to detract value from what one did earlier.

To be sure, we already do something like this when we pass post-mortem judgements on the lives of ‘creative’ people. The paradigm case is the English Romantic poets, some of whom died at 30 and others at 80. The reputations of the longer-lived poets (Coleridge, Wordsworth) suffered, whereas those of the shorter-lived poets (Keats, Shelley) benefitted. The former are stigmatized for having become more reactionary, whereas the latter are presumed to have possessed unfulfilled promise – even though with age they too might have become reactionary. Closer to home, Max Weber was spared the reputational fate of his rival [2] Werner Sombart, who lived twenty years longer than Weber, just in time to endorse the Nazi regime. In our own time, the radical glow that continues to surround Michel Foucault is abetted by his death in 1984, just before the neo-liberalism toward which he was already inching came...
to acquire a hegemonic grip on the world-order. Had he lived another twenty years, Foucault might have come to be known as the French Nikolas Rose, an unabashed theorist of the neo-liberal self.

What is social policy? (2014-12-12 08:00)

That’s the question answered in this excellent video from the [1]Social Policy Association.

IFrame: [2]//player.vimeo.com/video/85823294

There’s another two that have been produced as part of this series:
Why is my curriculum white? (2014-12-13 08:00)

This powerful video was produced by the UCL student union. They explain the background to the project [2]here:

In the NUS Black Students Campaign National Students Survey, it was found that, '42 per cent did not believe their curriculum reflected issues of diversity, equality and discrimination.'

In addition, it found that, '34 per cent stated they felt unable to bring their perspective as a Black [BME] student to lectures and tutor meetings. A running theme through both the survey and focus group data was a frustration that courses were designed and taught by non-Black teachers, and often did not take into account diverse backgrounds and views'.

As a result, the NUS proposed a set of recommendations, including the notion that, 'institutions must strive to minimise Euro-centric bias in curriculum design, content and delivery and to establish mechanisms to ensure this happens. Universities Scotland has published an excellent example of why and how this can be done in their race equality toolkit, Embedding Race Equality into the Curriculum'.
Social Theory Re-Wired (2014-12-14 08:00)

We just discovered this interesting resource produced by Routledge: [1]Social Theory Re-Wired.

A rich collection of web-based materials—including interactive versions of key texts, open spaces to write and reflect on readings, biographical sketches of authors, and dozens of supplementary sources—that transports social theory from its classic period to the vibrant and complex world of now.

It’s worth signing up to have a proper look around. Upon closer inspection, it doesn't quite live up to its initial promise - for instance the 'interactive readings' aren’t all that interactive. But they deserve credit for exploring the potential forms that a project like this could take and there’s certainly things of value on the site.

London in data maps (2014-12-15 08:00)

This great feature on the BBC News website collects 12 data maps which represent different characteristics of London. See the full feature [1]here to explore the maps (the one embedded below shows commuter routes into London)

A new collection of data maps of London reveals a city heaving with information. A quick quiz question for you. How many football pitches could fit inside the Greater London boundary? Well, 220,000 of them would fill the space between Cockfosters and Croydon, Heathrow and Hornchurch.

That statistic is just one of thousands of facts and figures contained in a new book about London, which according to its creators is the most data-heavy capital of the world.

---

**Sociological Science and the future of the qualitative sociology (2014-12-16 08:00)**

This interesting reflection on Org Theory asks what the success of the innovative open access journal [1]Sociological Science, which leans heavily towards quantitative sociology, means for the future of qualitative research within the intellectual landscape of the discipline. Read it in full [2]here:

So I should start this post by first saying that I’m thrilled that Sociological Science exists. It is terrific that a group of folks did the hard work — and I imagine it’s been a lot — of putting together a high quality, open access journal that sidesteps the protracted review process we all love to hate, that evaluates quality rather than importance, and that values replication as a scientific contribution. I’ve been impressed by the caliber of the articles and love that they’re getting covered in places like [3]Salon and [4]Daily Kos.

In fact, it’s only because Soc Science has clearly been successful, and I think will become even more so in the future, that this is even worth bringing up: What does it mean for qualitative sociology?
Although the editorial board of Soc Science leans heavily quantitative, the journal explicitly states that it "does not privilege any particular theoretical or methodological approach." And it has indeed published a qualitative article, the interview-based "[5]So You Think You Can Dance? Lessons from the U.S. Private Equity Bubble," by Catherine Turco and Ezra Zuckerman. But that's one of 27 articles published to date. (Apologies if I’m missing any.)

For those not familiar with the journal, it takes a proactive approach to addressing some of the many difficulties which plague academic publishing. In this sense, it’s an incredibly exciting project and should be celebrated. But for those who work at an intellectual distance from Sociological Science, it’s hard not to share the concerns that Elizabeth Popp Berman outlines in the Org Theory article.

_Sociological Science_ is an open-access, online, peer-reviewed, international journal for social scientists committed to advancing a general understanding of social processes. _Sociological Science_ welcomes original research and commentary from all subfields of sociology, and does not privilege any particular theoretical or methodological approach. It is:

- Open access: Accepted works are freely available, and authors retain copyright
- Timely: _Sociological Science_ will make editorial decisions within 30 days; accepted works appear online immediately upon receipt of final version
- Evaluative, not developmental: Rather than focus on identifying potential areas for improvement in a submission, editors focus on judging whether the submission as written makes a rigorous and thoughtful contribution to sociological knowledge
- Concise: _Sociological Science_ encourages a high ratio of novel ideas and insights to written words
- A community: The journal’s online presence is intended as a forum for commentary and debate aimed at advancing sociological knowledge and bringing into the open conversations that usually occur behind the scenes between authors and reviewers

_Sociological Science_ is published by the Society for Sociological Science, a non-profit organization.

Last week [1]The Telegraph newspaper reported that a college in Brighton were planning a field trip to observe “working class culture” in action at a football match:

“To anyone else, a trip to a football match would merely be a chance to see some sport played.

But for sociology students at one sixth form college, it has been billed as an educational opportunity to see racism, homophobia, hyper masculinity and working class culture in action.

Varndean College in Brighton is offering AS-level sociology students the chance to watch Brighton and Hove Albion take on the “notorious” Millwall Football Club at their home team’s American Express Community Stadium.

A poster for the trip on Friday says those involved will be able to see “gender performance” in action, including types such as “the new lad” on show.

There will also be a chance to observe “issues around sexuality, race and ethnicity,” “women challenging gender norms” and to “even talk to football fans,” it promises.
Former students familiar with the local area having attended school and sixth form near to Millwall FC criticised this proposed trip:

Edwin Magombe:

...This is ridiculous, I really hope a group of Millwall fans turn up to the Sociology class in Brighton unannounced to observe the natural habitat of the misguided hipster and snobbish lecturer who could never quite make it beyond lower middle class... seriously what’s wrong with people?

Frank Frost:

"Seems like the Varndean College still hold onto their past grammar school mentality. I'm a Millwall season ticket holder, Black, in the middle class, no criminal record, never experienced racism in or around the stadium, and I go with my sister. The course director should apologise. This approach is just breeding the next wave snobbery to wash over Brick Lane and Camden.

Dr Garth Stahl, currently lecturer at University of South Australia's School of Education, but who previously taught at a 11 to 18 school in southeast London where many of the students were Millwall fans:

"Brighton's Varndean College offering students the chance to observe the crowds of the "notorious" Millwall Football Club where they may possibly observe "racism" and "homophobia" certainly presents an interesting venture into experiential learning. Unfortunately such a venture - depending on how the pedagogy is delivered - runs the risk of pathologizing white working-class culture further for these AS-level sociology students. Students are already exposed to a ubiquitous pathologization of the white working-class which is ever-present in UK culture. This is partially fueled by a morose pop culture fascination with social class and "poor" behaviour as seen in the popularity of recent television shows such as Channel 4's Educating Essex. Varndean College's efforts are reminiscent of the 2007 controversies concerning Glenalmond College in Perthshire where students from privileged backgrounds made mock videos of Etolians 'chav hunting' young men in sporting apparel. While Varndean College students may gain a more nuanced study of "lad culture" and gender performativity upon their trip to Millwall, I would also hope their teachers push them to examine such behaviours with a certain criticality. Considering working-class culture as both highly contextual and historically constituted is essential when considering why certain behaviours are validated through social collectiveness and why they continue to be of fascination to certain outsiders".
Oliver (2014-12-16 17:04:40)
The poster was very clumsy but the idea of taking young sociologists to a football match (or an opera house, or anywhere they might not usually go) is pretty good one - the problem is that it seems they've been prepped on what to expect to see when they get there.

Zuleyka Zevallos (2014-12-17 13:29:55)
This is an interesting critique. The sociology of "doing gender" certainly requires direct observation. This collection of responses raise an interesting point about access to participants in field research and participant observation. Working class events are more public and accessible (free or relatively inexpensive for a field trip or to carry out field research). Sociology mostly studies working and middle classes mostly because of our discipline's concern with socio-economic disadvantage, and yet there's something to be said about access and power. As researchers we often have a higher level of education than the people we study, or we otherwise have a relatively greater socio-economic status than our interviewees. Studying the upper classes through ethnography is harder. We don't have easy access. It would be harder to organise a group to study a private school soccer match or it would be more expensive to go to the opera or some other cultural event associated with elites. Professor Michael Gilding made this point in his book "Secrets of the Super Rich." He felt the power imbalance shifted in trying to organise interviews with people on the Business Review Weekly "Rich List." It was tough to get them to agree to be interviewed for sociological research, mostly because they're not used to it and as he found, because they are distrustful of academia. The interviews were hard to manage as a result (though data were interesting).

Why your mind is not a computer (2014-12-17 08:00)

This is an engaging exploration of an idea that has endured for decades: the notion that we can understand the mind as a particular sort of computer. It’s an intriguing mix of panelists and one of many great discussions that are being produced by ia.tv - Dreyfus’s contribution is particularly illuminating, arguing that Artificial Intelligence is a research programme founded on a philosophical mistake that goes back to Kant’s philosophy. Philosophers have long since given up on the notion that the mind could be understood as a computer.
40 years on from the film 2001 many of its predictions have come to pass - videophones, flat screens, permanent space stations. Yet we have no equivalent to HAL, the intelligent machine, or anything close. Is it possible that the human mind is a radically different thing from a computer?

**The Panel**

Behavioural scientist Paul Dolan, artificial intelligence expert Margaret Boden and, live from Paris, philosopher Hubert Dreyfus join forces to confront the mind’s greatest metaphor.
Translating the Social Sciences (2014-12-18 08:00)

This episode of the Office Hour’s podcast interviews Emily Bazelon about the challenges of translating the social sciences:

In this episode we speak to Emily Bazelon. Emily is former senior editor at Slate, a New York Times Magazine staff writer, and the Truman Capote Fellow for Creative Writing and Law at Yale Law School. We asked Emily to join us today as she is one of the most visible translators and disseminators of social science research.

Listen to the [2]podcast here. It’s interesting that Bazelon accepts jargon (“it’s a form of short hand”) in academic writing, seeing it as an inevitable feature of the genre. The task of ‘translation’ would likely be approached rather differently if she saw jargon as unnecessary affectation that could be dispensed with if only academics would deign to write properly. She offers lots of other interesting insights about how this translation works: the difficulty of evaluating methodology, the value of finding ‘good explainers’ to act as gatekeepers and the way in which conflicts can help clarify the terms of a complex debate.

See [3]this post is an exploration of translation from a different perspective. What role will the expanding academic blogosphere have in mediating this process of translation? It argues that academics can contribute to success of this translation by participating in the blogosphere and producing writing which mediates between the academic world and the media.

Cognitive triage in higher education (2014-12-19 08:00)

A few months ago I wrote about the notion of ‘cognitive triage’ put forward in [1]Kevin Roose’s book about young recruits on Wall Street. He suggests that the intensity of the situational demands placed upon them necessitates attending only to the most immediate and concrete concerns, pushing out all other considerations which might lead them to reflect upon their current circumstances:

Today, as before the financial crisis, it’s not uncommon for a first-year IBD analyst to work one hundred hours a week—the equivalent of sixteen hours a day during the week, then a mere ten hours on each weekend day. Which is not to say that these twenty-two-year-olds are actively doing one hundred hours’ worth of work every week. In fact, many sit around idly for hours a day, listening to music or reading their favorite blogs while they wait for a more senior banker to assign them work. (These drop-offs are never pleasant, but they’re worst when they happen at 6:30 or 7:00 p.m. as the senior banker is leaving for the day, giving the analyst a graveyard shift’s worth of work before he or she can go home and sleep.)
The compartmentalization phenomenon turned out to be bigger than Jeremy and Samson, and bigger even than Goldman Sachs. As I interviewed dozens of young analysts at firms across the financial sector, I heard the same kinds of answers to my questions about morality and ethics: “I don’t know, I never really think about it.” “I’m just trying not to fuck up.” “Dude, I’m so far away from anything like that...” Entry-level analysts, it seemed, were so routinely exhausted, and so minutely focused on their day-to-day tasks—on pleasing their bosses, nailing every page of their pitch books, and avoiding getting in trouble—that they often avoided thinking about the big picture. It was a sort of cognitive triage, and daily concerns always took priority over long-term, large-scale worries. Still, there was no doubt that these worries existed.

What I’m curious about is whether we can see cognitive triage of this sort within higher education. As people rush through an academic term, struggling to keep on top of their commitments, how do their time horizons change? If your focus goes no further than tomorrow’s deadline (or the one after that) then what are the implications of this for your capacity for serious scholarship and considered reflection? What about the quality of your life?

The ‘boardroom liberalism’ of Barack Obama (2014-12-20 08:00)

It can seem as if American politics is significantly far to the right of party politics in the UK. But is this an accurate description? It seems to convey a linear political spectrum in which party politics in the USA is simply shunted to the right of that in the UK. This [1]New Republic article discussing the senior Whitehouse advisor Valeria Jarrett offers an interesting insight into the complexity underlying this apparently simple difference:

They emanate from the worldview that Jarrett and Obama share — call it “boardroom liberalism.” It’s a worldview that’s steeped in social progressivism, in the values of tolerance and diversity. It takes as a given that government has a role to play in building infrastructure, regulating business, training workers, smoothing out the boom-bust cycles of the economy, providing for the poor and disadvantaged. But it is a view from on high — one that presumes a dominant role for large institutions like corporations and a wisdom on the part of elites. It believes that the world works best when these elites use their power magnanimously, not when they’re forced to share it. The picture of the boardroom liberal is a corporate CEO handing a refrigerator-sized check to the head of a charity at a
celebrity golf tournament. All the better if they’re surrounded by minority children and struggling moms.

Notwithstanding his early career as a community organizer, Obama, like Jarrett, is fundamentally a man of the inside. It’s why he put a former Citigroup executive and Robert Rubin chief of staff named Michael Froman in charge of assembling his economic team in 2008, why he avoided a deep restructuring of Wall Street, why he abruptly junked the public option during the health care debate, why he so ruthlessly pursues leakers and the journalists who cultivate them. It explains why so many of his policy ideas — from jobs for the long-term unemployed to mentoring minority youth — rely on the largesse of corporations.

It’s the boardroom liberal in Obama who gets bent out of shape over criticism from outsiders, despite having once urged progressives to press him the way civil rights activists like A. Philip Randolph pressured Franklin Roosevelt. He is a president profoundly uncomfortable with populist rhetoric. He prefers to negotiate behind closed doors, as he did on the stimulus, health care, and deficit reduction, rather than wage a state-by-state political campaign to force concessions. Except for a handful of moments over the last six years — like when the administration tried to pass a second stimulus bill known as the American Jobs Act — Obama has rarely tried to mobilize public opinion in any sustained fashion. He has been consistently slow and half-hearted about taking unilateral action.

The agency moment (2014-12-21 08:00)

This [1]thoughtful New York Times column by David Brooks reflects on what he terms “the agency moment”:

I’ve been thinking about moments of agency of this sort because often you see people who lack full agency. Sometimes you see lack of agency among the disadvantaged. Their lives can be so blown about by economic disruption, arbitrary bosses and general disorder that they lose faith in the idea that input leads to predictable output. You can offer job training programs, but they may not take full advantage because they don’t have confidence they can control their own destinies.
Among the privileged, especially the privileged young, you see people who have been raised to be approval-seeking machines. They act active, busy and sleepless, but inside they often feel passive and not in control. Their lives are directed by other people’s expectations, external criteria and definitions of success that don't actually fit them.

So many people are struggling for agency. They are searching for the solid criteria that will help them make their own judgments. They are hoping to light an inner fire that will fuel relentless action in the same direction.

[...]

Agency is not automatic. It has to be given birth to, with pushing and effort. It’s not just the confidence and drive to act. It’s having engraved inner criteria to guide action. The agency moment can happen at any age, or never. I guess that’s when adulthood starts.

It’s easy to see why sociologists are cautious about this sort of language - it can easily entail a simplistic individualism in which structural constraints are obscured and ‘agency’ is moralised. However there’s no reason why this needs to be the case and there’s nothing intrinsic about this issue which means it should be treated as the sole domain of psychologists. In fact there’s a strong case to be made that we misrepresent “the agency moment” if we abstract if from its social context.

Steve Fuller (2014-12-21 08:13:52)
It’s good to see that David Brooks has reinvented Kant’s essay on Enlightenment for the 21st century! Enlightenment = the state of intellectual adulthood, thinking for yourself, in the sense that you are happy to own what you think, regardless of the consequences.

Cyber athletics (2014-12-22 08:00)

The US government now grants “athlete visas” to gamers and competitive gaming is shown on the ESPN channel. This fascinating New Yorker article explores the rise of the ‘cyber athlete’ - read it in full [1]here:

“It's not a sport,” John Skipper, the president of ESPN and, by extension, the emperor of contemporary sports, has declared, referring to gaming in general. “It's a competition.” He added, “Mostly, I'm interested in doing real sports.” That "mostly" was an acknowledgment that the network has nonetheless begun hedging its bet against a cyber-athlete insurgency. In July, ESPN2 aired a half-hour program previewing an annual tournament for a game called Defense of the Ancients 2, or Dota 2, thereby enraging football and basketball fans who would have preferred round-the-clock speculation about off-season roster moves, and who vented on Twitter: "None of these people are anywhere near athletic,” “Wtf man. This is our society now,” "WHAT THE HELL IS HAPPENING ON ESPN? . " and so on. Meanwhile, the winners of the Dota 2 tournament took home a total of five million dollars.
A month earlier, in June, I had my own first exposure to gaming-as-sport, at an ESPN event: the X Games, in Austin. It was an inadvertent discovery. I had gone to see the skateboarders and BMXers, so-called action-sports stars, and found that many of them were incredulous at being asked to keep company with joystick jockeys. For the first time, X Games medals were being awarded for Xbox proficiency. There was a pleasing irony in the circularity of the kvetching. Here were traditional outsiders, some of them outspoken victims of childhood bullying, who, twenty years ago, were dismissed by the jock establishment for bringing their alternative fashion sense and disaffected miens to an Olympic-style competition. And now, secure with their corporate sponsors and honorary square jaws, they, in turn, were sneering at a new breed of outsider arrivistes: nerds!

The cultural politics of brunch (2014-12-23 08:00)

This is rather interesting if you can get past the grumpiness with which it’s written. It’s worth reading the article in full [1] here:

But now that I have a young daughter, brunch is completely impractical. By noon I’ve been up for hours and am ready for an actual lunch — although that meal is an increasingly endangered species on the weekend. For most restaurant owners, serving brunch is mandatory. It’s a revenue stream that also exposes restaurants to diners who might become regular customers. Even our local Thai restaurant insists on topping every dish with a poached egg on weekends and offering an ambiguously Asian mimosa.

There’s something more malevolent at work than simply the proliferation of Hollandaise sauce that I suspect comes from a packet. Brunch has become the most visible symptom of a demographic shift that has taken place in our neighborhood and others like it. As rents have gone up, our area has become unaffordable to much of the middle class, and to young families who want more than two bedrooms — or can’t even afford one.

This leaves an increasing number of well-off young professionals who are unencumbered by children — exactly the kind of people who can fritter away Saturday, Sunday or both over a boozy brunch. Our once diverse neighborhood now brims with the homogeneity of an elite university. (Julian Casablancas, I imagine, will be disappointed to discover the same crowd of white people brunching in Phoenicia, Hudson or Beacon upstate.)

“Brunch,” said Mr. Micallef, the author, over the phone, “is a visible sign of the changes that sometimes feel out of our control.”

For me, having a child — and perhaps the introspection that comes with turning 40 — made me realize what most vexes me about brunch: Once the domain of Easter Sunday, it has become a twice-weekly symbol of our culture’s increasing desire to reject adulthood. It’s about throwing out not only the established schedule but also the social conventions of our parents’ generation. It’s about reveling in the naughtiness of waking up late, having cocktails at breakfast and eggs all day. It’s the mealtime equivalent of a Jeff Koons sculpture.

The wisdom of sociology (2014-12-24 08:00)

Can Sociology be life changing? That’s what Sam Richards argues in this thought provoking TED talk which explores how the discipline can lead us to reimagine our circumstances and see those connections which we otherwise miss - it reveals hidden commonalities and the vast network of relations within which we are all embedded:

IFRAME: [1]//www.youtube.com/embed/gWD6g9CV_sc

How can an academic discipline like Sociology be life changing? This talk suggests one way by exploring how sociologists teach us to re-imagine our personal problems and ourselves. In the end, we learn that even in our most private and seemingly isolated moments, we may be more connected to others than we realize.

The sociology of christmas cards (2014-12-25 08:00)

In this article from Trans-action (now published as Society) Sheila K. Johnson reflects on the practice of sending and receiving christmas cards, arguing that it is an archetypical case of a phenomenon susceptible to sociological explanation:

Anyone who has ever composed a Christmas card list has pondered the inclusion and exclusion of names on the basis of a variety of fairly explicit considerations. Shall I send so-and-so a card this year, since he didn't send me one last year? Or, I must send so-and-so a card this year, even though he probably won't send me one, because I want to be remembered by him. Like the decisions we make about whom to vote for, we like to think of these choices as purely individual, rational matters. Nevertheless, sociologists have demonstrated that, regardless of how and why we choose a candidate, voting behavior can be analyzed as a function of one's socioeconomic status, mobility aspirations, ethnicity and religious affiliation. Similarly, it seems likely that the patterns in which people send and receive Christmas cards can also be explained in terms of certain social characteristics, especially their social status and mobility aspirations.

Reflecting upon her own christmas cards, Johnson observes a clear pattern where those cards that are reliably reciprocated tend to be sent to those with whom she and her husband were on equal social footing with (family members, professional friends) whereas those that weren't reciprocated had an aspirational dimension to them, as was the case with cards the couple received but did not themselves reciprocate:
People with regard to whom we were, in sociological terms, "upwardly mobile," such as professional acquaintances who might someday prove useful or important or social acquaintances whom we wished we knew better. By the same token, the cards we received and to which we did not reply came from individuals who wanted to cultivate us—some of my husband’s graduate students and office employees, the liquor store, the hairdresser and foreign scholars who obviously expected to visit the United States at some time in the future.

Her suggestion is that the percentage of cards sent and received by an individual function as an index of their present status and future "mobility aspirations": to what extent are people ‘below’ you trying to cultivate you as a future social relation and to what extent are you trying to do the same thing with people 'above' you? However Johnson goes on to observe that sending cards is a practice which in itself tends to mark someone as middle class, with "high managerial and professional people" in particular being "the Christmas card senders par excellence". She makes a plausible case as to the structural reasons for this, as a combination of the geographical dispersion of friendship networks that are inflected through each party’s respective trajectory up their various occupational ladders.

Intriguingly, she recounts the negative reactions from her friends while undertaking the small piece of work with which she explored this practice. Rejecting claims from others that there "is no upward sending or downward receiving in our family: it’s strictly reciprocal", she points to the feeling of obligation as in itself socially structured: in so far as there are people to whom they felt they must send christmas cards (regardless of whether they are reciprocated) then hierarchal relations likely obtain. Conversely, receiving cards that were not reciprocated reveals one’s own status in relation to (likely) subordinates - a fact that is often occluded by the panicked response it provokes in some people:

As for people who receive cards they were not expecting—that is, cards being sent upwards to them—and who then shamefacedly rush out on Christmas Eve to mail the forgotten sender one of theirs, they are simply insecure in their status position. Imagine the president of Chase Manhattan Bank receiving a Christmas card from the janitor and saying remorsefully, "Oh, my God, and I didn’t send him one." Yet thousands of people do roughly the same thing when they receive a card from someone who looks up to them.

It’s a fascinating (and short) article and you should read it. Though maybe not today, I say writing this on the 23rd November... we’re very organised here. Happy Christmas!
Three ways to speed write (2014-12-26 08:00)

This [1]typically helpful post by patter suggests three ways to speed write - it suggests that the relationship between speed and slowness in academia isn't necessarily zero sum. Slow planning can facilitate fast writing:

The usual way to write fast is to 'speed write'. This often requires the use of timed sessions where the goal is to write as much as possible in the allotted minutes. Another approach to producing a fast first draft is to just literally empty your thoughts onto the page – sometimes referred to as vomiting words, a term I don’t much like for obvious reasons. Barbara and I are using a third approach – fast writing on the basis of a slow-cooked plan and a lot of pre-preparation. […]

The plan we have for our chapters might seem to someone else to just be a relatively short, numbered bullet point list. Two mere pages of bullet points. However, the bullets must be understood as a
set of reminders of the very lengthy conversations we've already had about what is to be covered and what should go where. Our two pages are the framework that now guides what we do. While we might change the order of a few points, or add, remove or shift the odd one here or there, this numbered list is basically a road map to our book.

Transhumanism as the Heir of Ethical Modernism – or Against Virtue (2014-12-26 13:47)

Anyone who takes transhumanism seriously is almost by default an 'ethical modernist'. The position is easiest to state in terms of the history of philosophy. It is someone who believes that Kant and Bentham in the late 18th century set the framework for constructing a theory of ethics. To be sure, they are associated with quite different, typically opposed positions: 'deontology' and 'utilitarianism'. However, they share a few salient features:

1. Morality is not something that one acquires from others and then reproduces; rather it is something that one legislates for oneself and others, and ethics is its rationalization.
2. 'Rationalization' is understood as akin to the process that science performs on our empirical understanding of the world.
3. Armed with the right ethics, the moral agent acquires powers that had been previously reserved to God.
4. The fact that ethics contradicts ordinary morality is at most a public relations problem and quite possibly a mark of its validity and hence an inspiration to self-discipline.

When I first studied ethics in the 1970s, the Cold War was very much in the air. Perhaps unsurprisingly, ethical modernism was the only game in town – and Existentialism was its irreverent popular front. (Anyone who sees Existentialism as opposed to Kant and Bentham fail to appreciate their massive common ground.) Back then, it was all about taking sides, taking responsibility and hoping for the best but expecting the worst. But this was before 1989, when the USSR demonstrated that it was incapable of holding up its side of the world-historic tension.

Since this historical backdrop remains strangely muted in the academic literature, I need to resort to more familiar academic benchmarks. From this perspective, Alasdair MacIntyre's conversion to Roman Catholicism was the tipping point that unleashed the revanchiste movement against ethical modernism known as 'virtue ethics' (and its sidekick, 'virtue epistemology'), with branch offices in the left-of-centre world, courtesy of Martha Nussbaum and Michael Sandel. This movement, which is arguably the dominant trend in moral philosophy today, involves a systematic denial of the above four theses in the name of what it advertises as a more 'humane' and even 'humanistic' approach to our moral life, typically rooted in some conception of a species-wide 'human nature', which has been given a slightly less essentialist spin in recent years under the rubrics of 'capacities' and 'capabilities'.

Virtue theory takes human life as it already is – understood in light of our 'natural history' – to have arrived at largely satisfactory norms of conduct. From that standpoint, both Kant and Bentham appear to have operated with hyperbolic standards that underestimate the strength of our sentiments, our cognitive limitations, and perhaps most importantly, the enduring nature of our traditions and institutions, which have not required the services of a Kant or
To be sure, ethical modernism always faced opponents who saw morals in more broadly ‘ontological’ terms, i.e. as intimately connection to some relatively fixed conception of human nature that can be accessed through intuition and/or biology. Indeed, Aristotle is rightly seen as the patron saint of contemporary virtue theory. For their part, ethical modernists see ‘human nature’ as no more than a platform for building an ethical life, which goes beyond the default patterns of social relations. Thus, ethics doesn’t aim merely to reflect humanity’s state of being but to improve it.

Logically speaking, virtue theory collapses a distinction that ethical modernists uphold, namely, between the ‘is’ and the ‘ought’. However, I don’t mean to accuse virtue theorists of fallacious reasoning. On the contrary, their view harks back to the pre-modern period, when people believed that a moral life was led by discovering one’s place in the natural order (a la ‘natural law’), what the great historian of modern ethics Jerome Schneewind gamely called the ‘divine corporation’. It followed that people tailored their aspirations to their capacities, secure in the knowledge that their capacities – however meagre on their face – did indeed serve a larger purpose. In this respect, life was about figuring out your job description before you’re retired and sent to Heaven.

Ethical modernism is not about dissolving the divine corporation but about replacing God with humanity as its CEO. In that case, the corporation may be due for a structural overhaul, both in terms of its overall ends and the means by which they are achieved. Thus, biologically given capacities may be enhanced or diminished, depending on the corporate strategy – and, in principle at least, any human should be able to make such a judgement and all should be able to agree to it. Indeed, this principle is present – in somewhat different guises – in both Kant’s and Bentham’s accounts of rationality. And while both acknowledge that our epistemic and practical powers fall short of the divine, nevertheless the ethical character of our actions is located specifically in our willingness to own those actions, i.e. take responsibility for them, regardless of the consequences.

The step from Kant and Bentham to transhumanism can be seen in their common attitudes, which can be in turn contrasted to that of the virtue theorist, in at least two respects:

1. The meaning of ‘ought implies can’: This Kantian slogan is usually read to mean that people can’t be obliged to do things that they are incapable of doing. To a virtue theorist, it refutes the superhuman feats of will and calculation that ethical modernists would require of us. In other words, we need to downsize our moral aspirations. However, the correct way to read this slogan, which pushes Kant toward transhumanism, is that we need to become the sort of people who can live up to the correct ethical principles. Kant was not only the philosopher of human dignity but also of species-level moral progress, a theme further developed by Hegel and Marx. For their part, Bentham and his followers have been happy to offload the utility calculations to mechanical procedures if they prove too taxing to ordinary human minds. These are the precursors of today’s transhumanist talk about ‘moral enhancement’ via the right neurochemical cocktail or gene therapy.

2. The role of science in ethics: Virtue theory is often presented as part of the general ‘naturalistic’ turn that has been slowly taking place in philosophy over the past 50 years. However, the exact relationship between ‘naturalism’ and science is rarely made explicit. In the case of virtue theory, the emphasis seems to be placed on the actual content of, say, social or biological science, especially as a check on the more outlandish aspirations of the ethical modernists. In terms of evolutionary theory, virtue theorists are more partial to Darwin’s natural historical approach than the lab-based molecular genetics approach that has dominated in the post-war period and fuels transhumanist imaginaries of a ‘Humanity 2.0’. This latter position locates the ethical modernists, who are ultimately more aligned with the rational and experimental character of science than the actual findings of science. Thus, they stress the reversibility of facts under changing conditions and the need to harvest untapped potential: To simply let the past dictate the future is to abdicate moral responsibility and thereby behave unethically. In that case, perhaps the
Kantian slogan should read instead: ‘can implies ought’?

A good genealogy – or perhaps better an autopsy! – of virtue theory will no doubt cover many cases – like that of MacIntyre himself – in which someone starting from the hard left becomes disillusioned with Stalinism’s efforts to shoehorn people into ideology and then gradually loses faith in human beings, either individually or collectively, to determine their own destiny. In the end, they end up as neo-conservative Neo-Thomists, often in spite of themselves. I have called these people [1]’down-wingers’, and I’m afraid they’re not going away soon. In fact, my guess is that self-avowed people of the left who rest content with criticizing the current neo-liberal order without proposing a positive alternative are likely to be lured by the siren call of virtue theory.

The Sociology of Civilizational Collapse (2014-12-27 08:00)

How do we envisage our future? To ask this question usually invites reflections upon personal biography. More rarely does it address ‘our’ in a civilizational sense - I use the term loosely here to refer to the totality of organised human social life which, in contemporary circumstances I would take to be unitary (in the sense of global capitalism rather than an underlying species bond) but would not assume this has always been true. In this sense, speaking of ‘civilizational collapse’ does not entail the extinction of the human species (though neither does it rule this out) but rather the unravelling of the existing social order: not a change in its state but the collapse of its capacity to change states. I’m using a processual term because in the absence of a discrete event bringing about the extinction of the species this collapse would inevitably be a process and potentially an extremely slow one. I’m very interested in the constraints upon our capacity to envisage such a collapse and suggested a few points in a [1]blog post earlier this year:

• We tend towards a generic assumption of the durability of social structures.
• We tend even more strongly towards a generic assumption of the durability of social formations (i.e. assemblages of social structures)
• We tend to miss the origins of social formations in the intended and unintended consequences of deliberate action, as well as the interactions between them.
• We tend to reason inductively and, in doing so, miss the possibility that the future will be radically distinct from the past.
• Even if we deny it intellectually, we tend towards exceptionalism in how we see social formations which are deeply familiar to us.

Reading Tony Benn’s diaries I was intrigued to find that he was plagued by thoughts of impending collapse towards the end of his life. As he records on the 2nd November 2011:

I happened to see a television programme, when I was having my meal in the evening, about the Maya culture in Mexico. I had absolutely no idea that the temples they built were bigger than the pyramids; 1,500 years ago there was the most tremendously civilised society in Latin America, which simply disappeared, went under the jungle, and it does make you wonder whether ours might not do the same. There’s no absolute law to say that our civilisation will survive for ever.

That final line is a very succinct statement of what I was trying to get at with the notion of ‘the epistemology of civilizational collapse’: there’s nothing certain about the sustained survival of a civilisation and yet we assume that there is. A few years from his death (20th November 2008) Tony Benn described the nightmares that plagued him:

I have nightmares every morning. I am overwhelmed by the feeling that the world - Britain and the world - is going to collapse through shortage of oil. I visualise circumstances where people at the top of tower blocks would find that the lift couldn’t be run because there was no energy; doctors couldn’t climb twenty-four flights to stairs to look after them if they were ill; and the whole of society comes to an end.

There’s something interesting about a state of affairs where these ideas are largely confined to nightmares or to fiction. I’m sure there are people studying this (I’d be fascinated to find that there aren’t) but its relative absence from public discourse is surely susceptible to both sociological and psychoanalytical explanation. To clarify, I don’t think that much of the discourse surrounding climate change reaches the level of ‘collapse discourse’ of the sort I’m proposing: it’s technocratic on the one hand and individualised on the other.

I’m interested in exploring cultural representations of collapse as a means to understand the epistemology and sociology of collapse. I think that cultural representations of collapse are often post-hoc, elaborating a vision of the rebuilding of human society after a collapse has taken place. Whereas I’m fascinated by what the process itself would be like and how it would be understood by those within the collapsing social order. In spite of its many flaws, this was what I loved about the film Interstellar:

[youtube https://www.youtube.com/watch?v=0vxOhd4qInA]

In fact I would have much preferred this film if it hadn’t had any of the science fiction and had just explored the transformed social order in which a "caretaker generation" seek to sustain the viability of an ever more inhospitable earth: I was gripped by the representations of a social order in which ascriptive identity had returned, agriculture dominated the American economy and the intellectual horizons of the society were narrowing into survival. I’m currently gripped by [3]The Massive - a sociologically rich exploration of life post-collapse:

[4]
Perhaps when I talk about 'collapse' what I really mean are the conditions leading to dystopias? In a post earlier this year, Dan Hirschman put forward the idea for a course on real dystopias as a grim parallel to Erik Olin Wright’s work on real utopias. He suggested that “Each week or sub-unit would cover a different real dystopia, ideally with a guest lecturer who could speak to the underlying science or politics of the particular kind of dystopia.” These are the topics he suggested:

1. Antibiotic resistant infections
2. Widespread droughts and massive disruptions of the food supply connected to climate change
3. The dominance of the patrimonial super-rich
4. The Player Piano dystopia (“a relatively small clique of engineers built and maintained the machines, while a large class of unemployed workers lived lives of aimless poverty”)
5. The Surveillance state dystopia
However I think it’s important to distinguish between states of collapse and dystopias. Representations of dystopias often presuppose the ecological viability of the underlying context, projecting it forward so as to conceive the future as a product of solely social processes. Representations of ecologically induced collapse often have a converse absence of substantive social content:

[youtube https://www.youtube.com/watch?v=w _1VnGp8Lls]

Whereas I’m interested in the relationship between the two. Ecological decline doesn’t necessitate collapse in the sense in which I’m using the concept but it does make it ever more likely. I’m wondering if some general philosophical propositions (the epistemology of civilizational collapse) could be explored through an analysis of fictional representations (the representation of civilizational collapse) to shed more light on the character of social processes (the sociology of civilizational collapse)?

1. file://markcarrigan.net/2014/03/20/the-epistemology-of-civilizational-collapse/
2. file://markcarrigan.net/2014/03/20/the-epistemology-of-civilizational-collapse/

A very interesting article on a topic close to my heart! Isn’t it odd how we seem pathologically incapable of imagining a collapse in our own civilisation? In spite of seeing the collapse of the Soviet Union in our own lifetime, it just never seems feasible that it could happen to us. In fact, even something as seemingly-all pervasive as global capitalism is precarious. I speculate here that we have less than 100 years left in our current system: http://kerrysmallman.wordpress.com/2014/-12/19/the-end-of-history-revisited/ I happened upon this article from 2001 about globalisation and it could have been written yesterday: https://www.globalpolicy.org/component/content/article/162/27684.html . We take it for granted that we live in a hyper-Globalised world, when in reality, it is mostly just financial institutions which are globalised. The lived reality of everyday existence is, for most people on the planet, very local. For example, only 10 % of people in the UK are foreign-born. It could be the fact that the gatekeepers of knowledge live in large metropolitan centres - and the fact that global capitalism is our economic system - that makes us believe we live in a globalised society. That's just one example, I guess, of our tendency to skew towards cosmopolitan, urban visions of reality. Many of the most likely distopian/future scenarios for us in the UK would actually involve movement away from cities (and rivers) towards the uplands. A starting point for imagining the new society would be somewhere as humdrum as Huddersfield or Barnsley, I would conjecture. The rule of law is deeply ingrained in the British psyche and the silent majority are white, lower middle-class suburbanites. Also, it's worth looking at Ethnographies of gypsies, travellers, ravers, or perhaps middle-class caravaners to see how ad-hoc societies are created and perpetuated. And perhaps remembering that those most unfashionable of institutions - the family and the village - might well make a come-back.

Sociological Imagination (2015-01-09 15:44:47)
really interesting, thanks!

That's very interesting - I think you're underestimating mobility in the UK (and elsewhere) but I agree there's a corresponding tendency to over-estimate it and assume that the situation of some groups can be generalised to the population at large. I think there's a dystopian novel waiting to be written about residual human life post-collapse in Huddersfield... many more thoughts, look forward to hopefully talking on Tuesday.
I just came across a passage by James Meek in which he describes being drawn to,

the obscure realm of events that are too fresh for history, but too old for journalism; the murky gap of popular perception that covers the period from two years ago to about twenty-five years back, in which events are well remembered but patterns not easily perceived.

I’m struck by the realisation that so much of the sociology I’ve been drawn to (Giddens on late modernity, Bauman on liquid modernity, Castells on the information age, Rosa on social acceleration etc) similarly concerns itself with this ‘murky gap’ between current affairs and historical inquiry. It’s also the domain of ‘contemporary history’ but I’m drawn to social theoretical engagements because of their concern to discern those patterns “not easily perceived” in spite of the manifold inadequacies which characterise these bodies of work. Perhaps those inadequacies stem at least in part from the ‘murkiness’ inherent in this gap?

---

From What about Me?: the struggle for identity in a market-based society by Paul Verhaeghe:

Enron, an American multinational, introduced this practice at the end of the previous century, dubbing it the ‘Rank and Yank appraisal system’. The individual performances of its staff members were continually monitored and contrasted. On the basis of the results, one-fifth of its employees were sacked each year, but not before they had first been publicly humiliated by having their name, photo, and failure posted on the company website. It wasn’t long before total paranoia reigned and almost everyone was falsifying their figures. The widespread fraud led to a court case and the bankruptcy of the corporation. Despite that failure and the criminal practices associated with it, the Enron model is still in wide use. HR managers at multinationals are expected to apply the 20/70/10 rule. Twenty out of every hundred employees are the high flyers, seventy provide the critical mass, and ten should be given the boot, even if sufficient profit and growth has been achieved. Five minutes of Googling the search terms ‘Rank and Yank’ and ‘20/70/10 rule’ throws up hundreds of hits of company documents praising this approach, invariably referring to Spencer’s ‘survival of the fittest’ and Dawkins’ ‘selfish gene’.

Within the span of a single generation, however, this situation changed dramatically, with the result that, nowadays, university staff, especially if they are young, feel that they have very little influence
over their careers. Instead, they are compelled to dance to the music of an invisible administration. They work flat out, but don’t find their jobs satisfying. They no longer identify at all with the organisation, and solidarity among colleagues has largely disappeared. This is the academic version of the Rank and Yank system, and the consequences are the same: production continues to increase on paper; an atmosphere of personal frustration, envy, fear, and paranoia is created; and creativity is effectively stifled. Anything that doesn’t fit within rigid parameters doesn’t count anymore. Thinking out of the box — that precondition for innovation and discovery — has become impossible.

Paradoxically enough, this quality-monitoring system fosters fraud, just as in the case of Enron, ranging from the Stapel affair in the Netherlands to the fraud with PhDs at German universities. (Not so long ago, a Dutch professor of social psychology, Diedrik Stapel, was an authority in his field, renowned for his extensive empirical research and numerous publications in top journals. But his career came to an abrupt end when it turned out that he had fabricated and manipulated data on a massive scale. Nearly every newspaper found an explanation for such practices in the enormous pressure to publish, and the hyper-intense competition for jobs and promotion. In Germany in August 2009, mass fraud with doctoral titles came to light, in which various universities and hundreds of professors were involved.)

My first thought when reading this was that this system hasn’t yet come to higher education and that it might still be avoided. However this evening I found myself thinking back to this case, in which David Browne, Senior Associate on the Employment Team for SGH Martineau, suggested that even “academically brilliant” staff who damage the brand through “outspoken opinion” should be disciplined in order to set an example for the rest. For ‘Rank and Yank’ in Higher Education, perhaps even the “high flyers”, those who are valuable to the institution, aren’t safe unless they conform to a narrow range of behaviour consistent with the ‘brand’.

An Agenda for Digital Sociology (2014-12-30 08:00)

I see Digital Sociology as an open-ended integrative project, concerned to assemble the disparate strands of sociological engagement with digital technology within a more or less shared intellectual space: not in the sense of striving for unanimity but rather to ensure that disagreements at least tend to play out in terms which make the basis of intellectual disagreement clear and at least in principle leave all parties aware of the methodological and theoretical consequences which hinge upon them. In this sense, I advocate the need for what Nicos Mouzelis calls a theoretical lingua franca: “a flexible vocabulary with no foundationalist pretensions, which can help sociologists establish bridges between their own and other disciplines, as well as between competing social science paradigms” (1[pg. 9]).

My belief is that the initial work towards this end can be achieved through the assembly of divergent traditions with convergent interests within spaces conducive to ‘building bridges’: face-to-face, print and digital fora in which sociologists undertaking work that seeks to describe and/or explain the ‘digital’ in the broadest sense of the term enter into dialogue with one another. In such spaces, we have dialogical rather than dialectical interaction, such that as Richard Sennett describes it “through the process of exchange people may become more aware of their own views and expand their understanding of one another” rather than seeing disagreement as an obstacle to the
achievement of common ground that must be overcome ([2]pg. 19). Digital Sociology is both what emerges from these spaces and the assembly work required to ensure their success.

The ‘theoretical lingua franca’ of Digital Sociology is something that has to be built up from within them as a hermeneutical project that seeks to elaborate upon the basis of agreement and disagreement. The point is not to overcome distinctions but rather to ensure that they “do not become dichotomtic essences” as Mouzelis puts it in his discussion of sociological theory more broadly ([3]pg. 9). Through such conceptual work, we ensure the possibility of reclaiming those points of agreement which tend to get lost because scholarly debate frequently proceeds through the articulation of disagreements. In the most mundane sense possible: what are we trying to do? What is (digital) sociology for? There are likely to be disagreements here as well – for instance between those who argue for a “renewed interest in sociological description” ([4]4.8) and those concerned to explain ‘why this is so rather than otherwise’ – but there’s an enormous amount to be gained by entering into productive dialogue about the reasons for these disagreements e.g. perhaps an explanatory project for digital sociology is reliant upon the “renewed emphasis on good – critical, distinctive and thick – sociological descriptions of emergent digital phenomena” that Beer and Burrows advocate ([5]1.1).

The understanding of Digital Sociology I’m advocating is one which rejects intellectual provincialism. I like the account Pablo Boczkowski and Ignacio Siles offer of this as “a sort of intellectual insularity (or provincialism) that privileges a certain inwards-looking commitment to a particular paradigm, set of ideas, or mode of inquiry without considering work done in other fields that might significantly enrich or transform it”. Instead they argue for an intellectual cosmopolitanism that “promotes the crossing of territorial scholarly quadrants in the study of media technologies to rethink assumptions and normalized processes” ([6]pg. 58). For Digital Sociology to be cosmopolitan in the sense would be for it to be proactively and openly engaged with the wide range of intellectual trends which could be referred to as a ‘digital turn’ (but probably shouldn’t be): digital humanities, digital anthropology, digital geography, social informatics, data studies, web science, data science, software studies, platform studies and game studies.

However what distinguishes it from the “emerging, fundamentally transdisciplinary, computational literacy” of which Lev Manovich and others claim the existence is a conviction in the continued value of the intellectual resources carried within sociology as a discipline. It should be engaged with computationally but it shouldn’t be exhausted by it. To have a theoretical lingua franca, a multifaceted conceptual vocabulary through which ‘internal’ disagreements can be translated into the same intellectual topology, helps guard against this assimilation or exhaustion – by elaborating upon a language which is often tacit, it becomes easier to translate into the language of other disciplines and sub-disciplines in a way that’s both effective and minimises semantic loss. It allows distinct, though not necessarily compatible, elements of the sociological tradition to be articulated in relation to digital phenomena (e.g. the sociological imagination, structure and agency, critical reflexivity, self and society) and for novel insights and approaches found in other disciplines to be contextualised in terms of these intellectual resources. This avoids the tendency for substitution, in which an existing element is replaced with a novel one, instead facilitating combination in which existing elements and novel ones are combined in order to produce something new and distinctive (which can then in turn be contextualised in terms of more established intellectual resources).

To advocate combination rather than substitution doesn’t entail intellectual stasis because existing intellectual resources are modified through this engagement with novelty – the point is to get beyond both substitutive and additive approaches to intellectual development. This applies as much within the discipline as beyond it. The methodological opportunities presented by digital data should be brought into dialogue with the existing theoretical resources of the discipline rather than taken as an occasion for their replacement. In doing so, we help avoid a preoccupation with (digital) technique by using an awareness of these new techniques for producing data about the social world as a basis upon which to enrich our understanding of the possibilities for description, explanation and intervention that our overall toolbox potentially affords. I see this as a case of expanding and refining the methodological repertoires of sociology rather than as anything which could be seen as a ‘new’ way of doing sociological
research (even though some very new and innovative techniques may be incorporated into the aforementioned repertoires).

One of many things I like about Deborah Lupton’s work on Digital Sociology is her appreciation of the many strands of activity woven into Sociology which have sought to engage with digital technology and its embedding in social life: ‘cyber sociology’, ‘the sociology of the internet’, ’e-sociology’, ‘the sociology of online communities’, ‘the sociology of social media’ and ‘the sociology of cyberculture’ etc ([7]loc 309). Drawing these strands together within the integrative spaces of Digital Sociology helps illuminate what are distinctively sociological approaches to these phenomena that other disciplines also attend to: digital devices and their associated infrastructures, how they are shaped by their context & contribute to shaping it, the activities transformed & facilitated by them etc. The point is not to assert the superiority of sociological understanding but to bring it into dialogue with the insights and findings of other disciplines in a mutually enriching way. Another is Lupton’s focus on the digital transformation of professional practice (as just one form of activity transformed by digital technology). The context within which sociologists work is being transformed and this entails both challenges and opportunities – I see attempts to rethink sociological practice as an integral part of Digital Sociology: for instance Live Sociology and Punk Sociology.

We need to avoid pursuing innovation for its own sake but nonetheless creatively explore the opportunities that digital devices offer for creating and communicating sociological knowledge differently (in the process overcoming the evaluation of the former as more important to the discipline than the latter). Partly this is a matter of Digital Scholarship by Sociologists but we should also be critical of the context in which these changes are being pursued, their constraints and enablements, the agendas subsumed into transformations later presented as inexorable (the ‘tsunamis’ and ‘avalanches’ of digital transformation). In this sense, I hope that Digital Scholarship by Sociologists leads to Digital Public Sociology but I think this requires work. My enthusiasm for digital engagement comes about because I think it offers opportunities to circumvent constraints of work within the academy, facilitating an open and engaged scholarship that avoids the axiomatic opposition of commitment and scholarship that was critiqued by Bourdieu, leading to greater participation within public life and collaboration with groups pursuing agendas of social amelioration outside the academy. It offers an opportunity to, as David Beer puts it, create a sociology which “will draw people into its debates, into its ideas, and into its findings, all of which are likely to provide alternative visions of the social world” and to deploy sociological knowledge in collective projects of achieving those alternative worlds.

At the risk that this post grows ever longer, here’s a summary of what I’m suggesting should be included within Digital Sociology as an intellectual project:

1. **Building an online space for digital sociology** within which debates can take place, announcements can be circulated and ideas can be shared. I suspect a group blog could serve this function, with a defined series of regular contributors and a process for applying to this contributing group to join the list, as well as an editorial process for accepting guest posts.

2. **Building a print space for digital sociology**. By which I mean an open-access journal & so ‘print’ in a figurative sense really. Ideally it would be attached to the aforementioned online space in order to overcome some of the limitations inherent in academic journals. I think a book series would also be beneficial so that future monographs on digital sociology can be drawn into dialogue with one another.

3. **Building face-to-face spaces for digital sociology**. A regular conference that brings digital sociologists together – ideally rotating internationally and digitally enhanced to the greatest possible extent given available funding. Also a regular conference that brings digital sociology into dialogue with cognate disciplines – I’m currently organising something on the ontology of digital technology (keep July 18th 2015 free!) that could provide a model for how this could work, albeit with an expanded remit. Also a regular seminar series that would incorporate both the inwards facing and outwards facing aspects suggested here – again digitally enhanced to overcome the geographical restrictions inherent in something like a seminar series.
4. **Identifying and disseminating innovations in sociological practice** including but not limited to the generation and analysis of digital data. Using digital devices in any aspect of the research process – the possibilities, challenges and questions encountered through such applications. This goal could be incorporated within any of the three points suggested above in various ways (perhaps a more informal 'show and tell' format as well as more traditional training) as well as pursued separately through the production of digital training resources and the organisation of more traditional training workshops. I’d also include coding within this category - in the sense of formal training but also informal networks of people who are training themselves in their spare time.

5. **Conceptual work elucidating the multi-faceted language of digital sociology**: the objects of digital sociology, the ontology of digital devices and infrastructures, the meta-theoretical ambitions of digital sociology. For instance the event mentioned above about the ontology of digital technology will (hopefully) serve this purpose, as is the work I’m starting on social media and social normativity that seeks to contextualise the claims made about social media in terms of existing frameworks within which sociologists have made claims about social change. These are just examples that reflect my own interests though & I think there are *many* forms this could take.

6. **Elaborating the methodological repertoires of digital sociology** through high quality research into particular substantive topics that uses new techniques and forms of digital data to address important questions relating to digital devices and their associated infrastructures, how they are shaped by their context & contribute to shaping it, the activities transformed & facilitated by them etc.

7. **Creating an infrastructure for digital public sociology**: running training, creating resources and developing networks that help us get good at doing public sociology (including though not limited to the utilisation of digital tools). Creating spaces which gather an audience (e.g. Sociological Imagination, Discover Society, The Society Pages) and facilitate interventions that are irregular yet still effective. These spaces also make it easier to get new projects off the ground.

**On the Future of Face-to-Face Academic Interaction, or Why We Need to Talk about Gemeinschaft** (2014-12-30 11:45)

Oh, how I hate *Gemeinschaft*! But as with so many things one hates, there are some deep things worth cherishing, preferably in some other form. For the benefit of non-sociologists, this German term belongs to a foundational moment in the discipline, namely Ferdinand Toennies' 1887 *Gemeinschaft und Gesellschaft*, which is normally translated as 'Community and Society'. But this is a weak translation in terms of what's at stake in the distinction.

3166
Toennies was trying to contrast the scope of social life as based on hereditary bonds and on voluntary association – i.e. can you leave your village without losing your rights? Nowadays we are likely to respond to this in terms of 'vertical' versus 'horizontal' forms of social organization. But at the time, 'determined' versus 'free' was more operative. In any case, the distinction is most obviously grounded in the law, Toennies' original discipline. Weber and other sociologists (often with much the same legal training) followed suit, resulting in the stereotypes we have today of what distinguishes 'pre-modern' and 'modern' forms of life.

I say 'stereotypes' because Toennies packed perhaps a bit too much into this distinction. In particular, I want to focus on the alleged connection between Gemeinschaft and face-to-face interaction. Toennies' original point was that sheer regular acquaintance with someone can foster many different sorts of social relations, which together stabilize society as a whole. Of course, he was talking about physical co-presence, as when people spend most of their lives in the same place. However, nowadays remote face-to-face interaction is possible via Skype and its undoubtedly improved successors in the future. From that standpoint, we seem to be heading to the sort of future that Marshall McLuhan projected fifty years ago, whereby we all live in one 'global village'. In that case, what is the added value of your being physically co-present with someone, especially if you come from far away and will have to use up scarce energy resources to get there?

Thanks to the usual academic narcissism, this question is periodically posed in terms of conference attendance,[1] with the Pharisees amongst us in full flow about how much harm is caused by flying. To be sure, I am the first to admit that the performance of most academic conference speakers does little to enhance whatever value they already provide in their writings, audios and videos. But I am more concerned about wasting people's time and money than precious environmental resources. In that spirit, we might reserve face-to-face interaction in the full sense of physical co-presence to moments where we want/allow people to act with maximum discretion in a fixed setting, with all the powers and liabilities that that entails. This is the sense of face-to-face that operates in the diplomatic and business spheres – except that those encounters are normally conducted privately and with small numbers present.

The idea here, however, would be for academics to operate in this manner in public, as staged events. In other words, the robust face-to-face character of social life that many sociologists still hanker for in the idea of Gemeinschaft would be restricted to a kind of spontaneously performed theatre, whose degree of indeterminacy would be comparable to that of a sporting event. Those unwilling or unable to operate in that mode can resort to some more formalized mode of self-presentation that reduces the uncertainty of the situation but equally reduces the need for them to be physically present. In that case, Skype and YouTube beckon.

In practice, I have in mind a talk presented as a pitch to an audience whose attendance would be based on some familiarity with the speaker's likely moves. The pitch itself would be shorter than a full talk, say, only 20 minutes, but the argument would be expected to be both developed and validated in the course of interacting with the audience over a period, say, of the same or double the length. A goal may be advertised in advance, specifying what might count as a success for the speaker – i.e. where agreement might be expected to be reached with the audience on that occasion. As with sporting matches, these events may also be recorded and scrutinized for what went right and wrong. If budding academics were encouraged to aspire to this sort of treatment, they might start spontaneously thinking of themselves as 'public intellectuals'.

Call for papers: Causal Inference and Mechanism-Based Explanation: Friends or Foes? (2014-12-31 08:00)

INTERNATIONAL NETWORK OF ANALYTICAL SOCIOLOGISTS

We are happy to announce the call for papers for the 8th Analytical Sociology Conference – June 12 and 13, 2015 in Cambridge, MA.

Theme: "Causal Inference and Mechanism-Based Explanation: Friends or Foes?"

Organizers:
Mary Brinton, Filiz Garip and Robert Sampson
Department of Sociology, Harvard University

CALL FOR PAPERS
Deadline: February 1st, 2015

Analytical sociology is a general approach to explaining the social world. It is concerned with phenomena such as social network structures, patterns of segregation, collectively shared and diffused cultural ideas, and common ways of (inter-)acting in a society. The mode of explanation is to specify in clear and precise ways the mechanisms through which social phenomena are brought about. Parts of analytical sociology focus on action and interaction as the cogs and wheels of social processes, while others consider the dynamic social processes that these actions and interactions bring about.

We are delighted to announce that Peter Bearman of Columbia University will give the keynote address at the 2015 conference.

We welcome presentations using any qualitative or quantitative methods that allow for the study of social mechanisms and the complex social dynamics they give rise to. In addition, we welcome purely theoretical papers dealing with central aspects of the explanatory approach of analytical sociology. Depending on the submissions we will organize one of more sessions around the conference theme, in addition to a concluding session that will feature a panel discussion on the topic.

Abstracts (and only abstracts) of 500-1000 words should be sent to inas2015@fas.harvard.edu no later than the 1st of February 2015 and should contain the following elements:

1) title of the paper,
2) author(s) and their affiliation and e-mail address, and
3) brief summary of the paper.

Acceptance notes will be sent out on the 1st of March 2015. Participants are encouraged to submit the final versions of the paper no later than the 15th of May 2015.

For more information on practical details such as location, hotel, etc. please visit http://hwpi.harvard.edu/inas2015 (please note: more information will be uploaded to the site soon). If you have any questions please do not hesitate to send an email to inas2015@fas.harvard.edu.

There was no 'I' to do it, because the 'I' was the result (2015-01-01 08:00)

From [1]How We Are (How to Live Trilogy 1)
by Vincent Deary (loc 247) – a beautiful and strange book:

Our first memories are of things out there, worldly happenings taking place in a world of circumstance, to this 'I' here, to this little self. Our real beginnings are veiled in darkness. Below the coherent order of the rational world, before the light of reason and reasonableness which illumines the world wherever we care to glance, beneath this familiar world, lies what? The scientists and analysts can only hint, guess or romanticize, but they seem to agree on this: that beneath the present coherence lies a time of chaos. Our sense of continuity, this coherence we rarely have cause to question, let alone notice, had to be formed, order had to be imposed, coherence grown, sense made. There was no 'I' to do it, because the 'I' was the result. At some point the 'I' that is you and me began to form the living breathing world that we now inhabit, at some point this world began to form an 'I'. This strange reciprocity gave rise to us

CFP - BSA Early Career Theorists' Symposium (29th May, 2015, Goldsmiths) (2015-01-02 08:00)

Submission DEADLINE: 27th January, 2015

We invite early-career sociologists across all research areas to submit abstracts for the 3rd Early Career Theorists’ Symposium (ECT). Submissions from advanced PhD students are also welcome.

ECT is a special one-day symposium for up-and-coming theorists, organized by the Theory Study Group of the British Sociological Association. This symposium brings together sociologists at a relatively early stage in their careers, who work on theory or are engaged in original theoretical work as part of their ongoing research.

The papers will be discussed by:

Les Back (Goldsmiths), Manali Desai (Cambridge), and Steph Lawler (York)

The abstract submission must contain:
(1) name, title, and contact information of the author; (2) a paper title; (3) a 500-word abstract of the paper; the abstract should include the key theoretical contribution of the paper and an outline of the argument. (4) three or
To encourage a wide range of submissions, there is no designated theme for the symposium. Instead, papers will be grouped into sessions based on emergent themes and discussants’ areas of interest and expertise.

A closing panel of not-so-early career theorists will comment on the day and discuss the present trends of sociological theory. This panel will be composed of:

Hannah Jones (Warwick),
Dariusz Gafijczuk (Newcastle), and
Raphael Schlembach (Sussex)

Please, send submissions to the organizers, Francisco Calafate-Faria, Goldsmiths College (f.calafate@gold.ac.uk) and Silvia Pasquetti, University of Cambridge (sp638@cam.ac.uk) with the phrase "ECT submission" in the subject line.

Invitations to present will be sent by February 10th. You should plan to share a 6,000-word paper by April 10th.

Life in the accelerated academy: how it’s possible for Žižek to publish 55 books in 14 years (2015-01-03 08:00)

I’ve long been a little bit fascinated by Žižek. I find him utterly hypnotic to watch and have consumed countless YouTube lectures by him. I genuinely enjoy his journalistic output and have read a lot of it via the Guardian, London Review of Books and the New Statesman. I find his short books immensely readable and his longer books rather tedious. I’ve never been able to work out how seriously I take him as a philosopher. I find myself simultaneously drawn to him and repelled by him. I find his politics brave yet vacuous. I find his ideas occasionally illuminating yet more frequently elusive. He’s a strange thinker who disrupts my evaluative habits, preventing me from fitting him into the categories I use with other writers and revealing the limitations of those (overly neat) categories in the process.

However the thing that intrigues me most about Žižek is his voluminous output. He is a publishing phenomenon – something attested to by the regurgitation of blurbs about him on each new book. He transcends his work, becoming a brand in a manner so knowing that his status resists easy condemnation. In an important way he is a product of the neoliberal academy: the superstar professor who uses his global brand to float free of the scholarly and collegial ties that otherwise bind. Partly this is a contradiction that can be observed in other left wing intellectual superstars – Chomsky is the most obvious example and this is why their ‘spat’ was so fascinating to many. But Žižek seems at least quantitatively different in the sheer scale of his output.

According to the Žižek bibliography on wikipedia, he has published 55 books since 2000. 55 books in less than 15 years. I was curious about whether this amounts to the sheer weight of writing that it would superficially appear to be. In assessing this I’ve excluded papers, letters, interviews, collections of his writing, things that are co-written, his joke book (!), edited collections and what is apparently a reprint of his doctoral thesis. I’ve also
excluded anything that I’m unable to categorise reliably which excludes the books published in Slovenian that haven’t been translated yet (as far as I’m aware). In other words, this is an extremely conservative figure for Žižek’s output since 2000. Not least of all because it excludes his vast journalistic writing (though obviously we know that, in an important sense, [4] it includes this).

For purposes of an exercise in procrastination, I was content to simply add up the total pages of each book (as listed on Amazon) in order to gain an overall figure of the quantity of his writing. Obviously I realise that neither publishing nor writing really works this way – there’s also the open question of how much regurgitation there is between each of these books. Here’s the full list:

- Absolute Recoil: 440 pages
- Trouble in Paradise: 240 pages
- Event: 224 pages
- Year of Dreaming Dangerously: 144 pages
- Less Than Nothing: 1046 pages
- Living In The End Times: 520 pages
- First As Tragedy, Then As Farce: 168 pages
- Violence: 224 pages
- In Defence of Lost Causes: 504 pages
- How To Read Lacan: 128 pages
- The Parallax View: 448 pages
- Iraq: 224 pages
- The Puppet and the Dwarf: 190 pages
- Organs Without Bodies: 232 pages
- Welcome to the Desert of the Real: 160 pages
- On Belief: 176 pages
- The Fright of Real Tears: 144 pages
- Did Somebody Say Totalitarianism: 288 pages
- The Fragile Absolute: 208 pages
- The Art of the Ridiculous Sublime: 46 pages

There are those I’ve read and enjoyed (First As Tragedy, Year of Dreaming Dangerously), those I’ve started and given up on (Less Than Nothing, Living In The End Times) and those I’ve read but cannot remember a single thing about (How To Read Lacan, In Defence of Lost Causes). There are also many I’ve never heard of. They come to a grand total of **5754** pages. That’s actually rather less than I expected. In a very rough way this quantity of output could be seen to amount to **411 pages per year** since 2000. To reiterate: I do realise that neither writing nor publishing actually work this way. However it could be argued that any overestimate inherent in how crudely I’ve measured this is likely offset by the vast array of material that I’ve excluded from the count.

I don’t find anything remotely inconceivable about the idea of writing 411 pages in a year. Where it becomes surprising is when considering how consistently it would be necessary to sustain this sort of rate – I assume there’s an editorial infrastructure around Žižek which takes much of the work out of the many additional publications (edited collections, interviews etc) and also that pitches books to him at least some of the time. In this sense his commercial success likely translates into institutional scaffolding that reduce the cognitive load of writing i.e. reduces the number of things he has to think about in order to move from one project to the next. It’s also hard not to wonder if some of the contents of these books are just transcriptions of the many public talks he does (not that I think there’s anything intrinsically wrong with this) and that these invitations in turn enhance the writing process by offering a constant stream of ideational prompts and regular opportunities to refine ideas.

Even so, he still writes a hell of a lot with a remarkable consistency. In spite of his self-presentation as dishev-
elled and chaotic, it seems rather unlikely that he’s a binge writer and that he instead has a very regular writing routine. The more I’ve thought about this, I’ve become really intrigued by the conditions of his working life and how they facilitate his prolific output. As part of the project me and Filip Vostal are discussing at the moment, looking at the acceleration of higher education and its implications for scholarship, I’m increasingly aware that I’d like to do a case study of Žižek as representing a mode of public intellectualism facilitated by the accelerated academy. I don’t begrudge him his success but I’d like to understand it more than I do – particularly the intersection between his commercial viability and his scholarly virtues or lack thereof. I think many trends that are reshaping academic life find their expression in the figure of Žižek and writing this post has left me with a greater degree of clarity about why I find him so intriguing.

Peter Davis (2016-03-12 19:45:09)
How much of the material in these many books is repetitive? How much is comprehensible to any but the cognoscenti? If there is little repetition, and the material is understandable, this person is indeed a phenomenal public intellectual!

amen peter davis (2016-05-28 17:06:33)
1. zizek has copied his previous work a lot and refers to some old books as "a bluff" 2. any criticism of zizek is buried in a flood of assertions that the critic has "misunderstood" zizek

Two digital sociology events @sociowarwick on January 13th (2015-01-03 17:06)

What is Digital Sociology? An evening lecture by Deborah Lupton with Mark Carrigan and Emma Urrichard responding. It will take place in S0.21 from 5pm to 7pm. This is in the Social Sciences Building on the University of Warwick campus. It would be helpful if you could register using [1]Eventbrite.

Sociological Perspectives on Digital Health: An afternoon seminar with Deborah Lupton, Conor Farrington, Sam Martin and Maz Hardy. It will take place in A0.23. This is Milburn House, the centre of the IAS which is next to University House. You can find it on the campus map [2]here by typing in A0.23. The seminar will take place from 2pm to 4pm. It would be helpful if you could register using the eventbrite page [3]here.

Feel free to contact [4]mark@markcarrigan.net with any questions. There are travel directions to the university [5]here.

4. mailto:mark@markcarrigan.net
5. http://www2.warwick.ac.uk/about/visiting/directions/
Sexual Cultures 2: Academia Meets Activism

Sexuality activists/academics – do consider submitting to this and please pass it on.

Due to the huge interest in the Sexual Cultures 2: Academia Meets Activism conference, we have extended the Call for Papers to 15 January 2015. Please circulate widely and forward to individuals/networks who might be interested.

[1]Sexual Cultures 2: Academia Meets Activism

April 8-10 2015 University of Sunderland London Campus, South Quay, London, UK

This conference, co-hosted by the [2]Centre for Research in Media and Cultural Studies, University of Sunderland, and the Onscenity Research Network will take place on April 8-10 2015 at the University of Sunderland London Campus, London, UK [3]

The conference will host several keynote panels, bringing together key academics and activists on the topics of:

- Sex and disability
- Trans* and non-binary activism
- Sex worker and stripper activism
- Youth, race and sexuality

Panellists will include: Andrea Cornwall, Kat Gupta, Kate Hardy, Laura Harvey, Alex Iantaffi, Jade Fernandez, Tuppy Owens, Emma Renold, Jessica Ringrose, Nabil Shaban, Jay Stewart.

The overriding theme of the conference is the bringing together of academia with activism. Submissions are particularly welcomed from: academics who are also activists, activists who are also academics, academic/activists on the inside and outside of conventional academia, and academics and activists who are working together on projects relating to sexual cultures.

The key themes of the conference are:

Intersecting sex

Many of the most important and current debates around sexual identities, practices and cultures in recent years have cohered around intersectionality. Sex is an area in which we particularly see intersections playing out between various forms and systems of oppression discrimination. For example, key debates concern the possibilities for consensual sex and agency within multiple intersecting structures of oppression; the ways in which ‘sexualization’
operates – and is discussed – in gendered, classed, and raced ways; which bodies and identities are considered to have the potential to be sexual or not, and which are regarded as intrinsically hypersexual or pathologically sexual. Papers in this strand will explore intersectional elements of sexual identity, practice, experience and culture, the ways in which academics and/or activists are engaging and intervening in these areas (online and offline), and the key points of tension and conflict that are emerging around these issues.

**Advising/educating sex**

Sex advice and education is a key area of concern in relation to sexual cultures. Sex advice and sex education are arenas in which cultural conceptualisations of sex are reproduced and perpetuated, as well as being potential sites for the resisting of dominant cultural understandings and offering alternative possibilities. Sex advice and education occur across various media and diverse professional contexts, including – for example – self-help books, problem pages, websites, online forums, news reporting, TV documentaries, and pornography, as well as school sex ed, youth work, sexual health clinics, sex therapy, sex coaching and sex work. Papers in this strand will explore the kinds ways in which intimacies are being mediated through various forms of sex advice and education, as well as considering the ways in which activists and/or academics are engaging and intervening in these areas (online and offline, in policy and in practice) and the forms of sex advice and education that are emerging from these engagements and interventions.

**Sex and technology**

Technologies of all kinds have been central to the ways in which sex is understood and experienced in contemporary societies. We are interested in papers that explore evolving technologies in the presentation of sex through print, photography, film and video to today’s online and mobile media; the ways that technologies are increasingly integrated into everyday sex lives; the expansion of sex technologies in toy, doll, machine and robot manufacture, the marketing of drugs such as Viagra and cosmetic technologies such as body modification and genital surgery for enhancing sex; the expansion of sex work and recreation online; sex 2.0 practices, regimes and environments such as porn tubes, sex chat rooms and worlds like Second Life; and the shifting relations between bodies and machines in the present and in predictions of future sex.

**Working sex**

In recent years sex work has become a potent site for the discussion of labour, commerce and sexual ethics, attracting increased academic attention and public concern. Papers in this strand of the conference will seek to develop our understanding of commercial sex, focus on conceptualizing emerging types of sexual labour, and explore the place of sex work of all kinds in contemporary society. They will ask how an investigation of contemporary forms of sex work and sex as work may shed new light on the study of cultural production, industry, commerce, and notions of commodification and labour. We are also seeking papers which are interested in exploring the connections between work and leisure, work and pleasure, sex work as forms of body and affective labour, and the ethics and politics of sexual labour.

**We invite proposals for the following:**

Panels, roundtable discussions, and workshops of up to four presenters/facilitators (1 hour)

Papers/interactive events (20 minutes)

Short Ignite papers (5 minutes/20 slides)

Posters
We particularly welcome proposals for non-standard types of presentation which question the academic/activist distinction, such as fish bowl discussions, pecha kucha, creative methods workshops, and interactive workshops.

All presenters are requested to make their material accessible to an audience which will include academics, activists, practitioners and community members.

**Deadline for the submission of proposals is January 15 2015.**

For all individual papers please submit a 150 word abstract and 150 word biographical note. Please indicate which key theme of the conference your paper belongs to.

For panels, workshops and roundtable sessions please submit a 600-800 overview and set of abstracts with 150 word biographical notes. Please indicate which key theme of the conference you want your panel to be considered for.

**All submissions should be addressed to sexualcultures2[at]sunderland[dot]ac[dot]uk**

**The value of blogging for part-time PhD students (2015-01-05 08:00)**

One of the more elusive benefits of blogging has been the implications for my professional identity. As a part-time PhD student, without funding but committed to an academic career trajectory (albeit at times waveringly), I found myself engaged in a diverse array of short term roles within the academy. Some of these had clear relevance to my nascent identity as a researcher but most did not, requiring competencies I already possessed by virtue of my research training or helping me develop ones which might in future be beneficial to me as a researcher; though never quite reflecting the core concerns that motivated my work while nonetheless being close enough to them that I could rarely put these questions out my mind in the way that would be expected in paid work engaged in for consistently and straight-forwardly instrumental reasons. The professional socialisation that ensues from such circumstances is inherently refractory, shaping one's professional identity in all manner of ways but without the easy unfolding of a narrative that makes sense of the occupational trajectory that is unfolding. This is far from a unique experience within the neoliberal university, as the systematic casualization of academic labour combines with the idealised notion of scholarship as a noble calling to produce an intersection of commitment and precarity with all manner of harmful consequences.

It is in this context that these new communication tools become so significant, with the possibilities afforded by them being misrepresented when conceived as something external to the everyday lives of those working within the academy. Obviously these are instruments which can function to expand the scope of dissemination activities but construing them solely in such terms misses an important set of questions concerning the implications of social media for academic identity. In my own experience personal blogging helped integrate what would have otherwise been a fragmented professional identity, perpetually divided as it has been between different roles and different institutions. Sustaining a personal blog inevitably invites reflection on one’s own experiences, though of course
such a use is not dictated by the technology itself. In doing so, it helps imbue those experiences with a coherency which they might otherwise lack, addressing the perennial question of how present commitments relate to potential futures.

The process of using the blog in this way has also led to an increasing awareness of the types of use I make of it, reflected in an initially inchoate working taxonomy which has emerged in my own psyche as to the various tasks which are involved in the development of ideas and the production of academic work. The process of sustaining the blog as an 'open notebook' has inculcated a sensitivity to workflow and craft which I had previously lacked. The claim here is a straightforward one: a change of tools can provoke a greater awareness of the uses to which such tools can be put. However this could easily be misconstrued as postulating an untenable juxtaposition of habitual analogue practice to reflexive digital practice. Instead I wish to offer a much less contentious proposition: digital tools offer a diverse range of opportunities for rethinking the practice of research and, in doing so, unavoidably raise questions in virtue of their novelty which can lead to a newfound reflexivity about the means and ends of practice. To make sense of such a claim, it is crucial that we distinguish between the tool used and the purposes to which it is put because the former may be new but the latter manifestly is not. For instance one of the most prominent explorations of the practice of journaling can be found in the explanation by C. Wright Mills of how keeping a file or a journal,

“encourages you to capture ‘fringe-thoughts’: various ideas which may be by-products of everyday life, snatches of conversation overheard on the street, or, for that matter, dreams. Once noted, these may lead to more systematic thinking, as well as lend intellectual relevance to more directed experience [...] by keeping an adequate file and thus developing self-reflective habits, you learn how to keep your inner world awake. Whenever you feel strongly about events or ideas you must try not to let them pass from your mind, but instead to formulate them for your files and in so doing draw out their implications, show yourself either how foolish these feelings or ideas are, or how they might be articulated into productive shape.”

What concerns Mills here is the cultivation of attentiveness as an aspect of intellectual craft. Through the considered adoption of specific habits of self-reflection, enacted via the medium of the ‘file’, it becomes possible to more fully and creatively engage with one’s environment and to develop the fruits of this engagement in a productive manner. On such a view, the development of ideas is seen as something which cannot be segregated into particular tracts of space and time without proving injurious to the creative faculties on which such work depends. Instead, Mills offers a view of intellectual work as dependent upon a lived engagement with the world and one which, if creativity is allowed to emerge, often overflows the conventional boundaries that society places on ‘work’. On such a view the ‘file’ cannot be adequately understood as an external record simply used to record ideas for future retrieval (though of course it does serve this purpose). Instead, it is seen as constitutive of the process through which such ideas emerge prior to being ‘recorded. For Mills the ‘file’ is the medium through which academic work becomes intellectual craft and, with this, a life encompassing academic labour becomes a life of intellectual craft which may (or may not) contingently be supported by employment within the academy.

Given that talk of 'craft' may divide sociological opinion, we might simply reframe this in terms of writing in the most encompassing sense of the term. Not just writing for publication but all the prior working through and recording of developing thoughts which runs prior to more formal writing. As Howard Becker succinctly observes, “by the time we come to write something, we have done a lot of thinking”. In highlighting the degree to which “[w]e have an investment in everything we have already worked out that commits us to a point of view and a way of handling the problem” Becker aims to help his readers overcome the anxieties which failing to recognise this so often provokes. Once we see writing as something intertwined with a broader process of intellectual engagement than the disabling perfectionism which can thrive in circumstances of ‘pluralistic ignorance’ (where the difficulties of similarly placed others are rendered invisible by their privatised working practices) begins to abate: it helps remove
the pressure otherwise attached to the writing process by repudiating the myth of ex nihilo creation.

If we accept Becker’s diagnosis of the psychology of the writing process then we can begin to see personal blogging as an important spur to reflexivity. It very literally serves to clarify where we stand in relation to our own work. Through regular blogging we come to register what Becker, in his discussion of free-writing, describes as “what you would like to say, what all your earlier work on the topic or project has already led you to believe”. Through the iteration which characterises engaged blogging, themes begin to emerge through repetition; some explicitly, as deliberate ways of formulating or categorising ideas, others less so, as repetition gradually reveals the convergence or overlap between superficially distinct interests or enthusiasms. Blogging of this form, as an engaged practice sustained over time, can be conducive to what we might think of as ‘non-linear creativity’: an open-ended creative process generative of emergent structure in often surprise and unpredictable ways. The humanistic psychologist Carl Roger conveys something of this in his account of the transformation experienced by a client in his creative work,

"It used to be that he tried to be orderly. “You begin at the beginning and you progress regularly through to the end.” Now he is aware that the process in himself is different. “When I’m working on an idea, the whole idea develops like the latent image coming out when you develop a photograph. It doesn’t start at one edge and fill in over to the other. It comes in all over. At first all you see is the hazy outline, and you wonder what it’s going to be; and then gradually something fits here and something fits there, and pretty soon it all becomes clear – all at once.”

Julie Bounford (2015-01-05 17:59:36)  
Thank you Mark Carrigan, for this eloquent post about your experience which mirrors my own in many ways.

Sociological Imagination (2015-01-09 15:44:11)  
you’re very welcome!

The sociology of sociological writing (2015-01-06 08:00)

The denial of what [1]Ben Agger calls 'authoriality' in sociological texts helps explain why concerns about the character of sociological writing have figured so prominently in recurrent anxieties about the status and future of the discipline. Its suppression involves a certain kind of self-presentation for sociology, as individual sociologists frame their work in a way which systematically occludes their involvement in it. When authoriality is suppressed we are left with little sense of how sociologists figure in sociological writing: the path which has led them to write this piece, the purposes it serves and why it matters to them. This reinforces the ‘axiological neutrality’ so integral to a certain understanding of scholarship in which [2]scholarship and commitment are understood as antipathetic. In this mode of scholarly production the objectivity and rigour of what is produced is seen to be threatened by the values which motivate that production. In this sense we can see that sociological writing is irrevocably tied up in the process of professional socialisation: learning to write in the ‘proper’ way is integral to becoming a sociologist. The corollary of this is that concerns about the purposes and ends of sociological inquiry, as well as what it means to be a sociologist, recurrently lead those who see a crisis (coming or otherwise) in sociology to contest the dominant understanding of how sociologists should write.
Sociological writing sits at the intersection between "the normalizing pressures of careers" and the "originating moral impetus" which in many cases leads people towards sociology in the first place. It is through negotiation between the two that "the original passion for social justice, economic equality, human rights, sustainable environment, political freedom or simply a better worlds" begins to be "channelled into the pursuit of academic credentials" as Michael Burawoy once put it. This is why attempts to reclaim the former so often lead to the impulse to rethink the latter: sociological careers largely advance through writing. Perhaps the most famous critique to this end comes from C. Wright Mills whose repudiation of the sociological establishment of his time went hand-in-hand with a critique of how sociologists were socialised in a way that reproduced that establishment and its relation to the broader social and political context:

In many academic circles today anyone who tries to write in a widely intelligible way is liable to be condemned as a 'mere literary man' or, worse still, 'a mere journalist.' Perhaps you have already learned that these phrases, as commonly used, only indicate the spurious inference: superficial because readable. The academic man in America is trying to carry on a serious intellectual life in a context that often seems quite set against it. His prestige must make up for many of the dominant values he has sacrificed by choosing an academic career. His claims for prestige readily become tied to his self-image as a 'scientist'. To be called a 'mere journalist' makes him feel undignified and shallow. It is this situation, I think, that is often at the bottom of the elaborate vocabulary and involved manner of speaking and writing. It is less difficult to learn this manner than not. It has become a convention – those who do not use it are subject to moral disapproval. It may be that it is the result of an academic closing of ranks on the part of the mediocre, who understandably wish to exclude those who win the attention of intelligent people, academic and otherwise.

C. Wright Mills, The Sociological Imagination, Pg 218

This conflation of readability and superficiality persists in present circumstances. Part of the difficulty which blogging poses for sociologists (and for academics more broadly) lies in this pervasive failure to distinguish between material that is accessibly simple and that which is simplistically accessible. Blogging readily lends itself to both and can often blur the boundary between them such that 'academic blogging' can seem to corrupt the 'academic' through proximity to 'blogging'. The analysis of Mills was rooted in a particular time and place, reflecting upon tendencies specific to that environment, such that it would be a mistake to simply project them on to the present contexts within which sociologists write. Its value is in reminding us of the ways that sociological writing and its (in)accessibility are woven together in the formation of professional identities: it is not simply a matter of who sociological writing is for but also of who it isn’t for.

The commitment involved in pursuing graduate education is an important biographical dimension to how these identities form and how sociologists come to write. These efforts and energies, as well as the things foregone as a result, can work to engender an investment in a self-presentation of specialisation which, often unwittingly, contributes towards the marginality of sociological contributions in the 'marketplace of ideas'. Once answer to this problem can be seen in David Beer’s notion of ‘punk sociology’. Treating punk music as a cultural resource to be drawn upon in rethinking and reinvigorating the communicative styles and strategies of sociologists, Beer points towards a broader understanding of writing which incorporates many of the possibilities which social media affords for communicating within and beyond the discipline. Beer talks of punk sociologists who “communicate widely, with various audiences, and the work they produce is direct and incisive, whilst still being lively, nuanced, and layered”. These will vary, eclectically and enthusiastically, because sociologists working in this manner will “will look to exploit the opportunities for communication that are available and will respond to these opportunities".
His point is not simply to sustain optimism in the face of Sociology’s misfortune but to respond to this broader context of retrenchment and constraint in a genuinely creative way. He paints a vivid picture of the diversity which characterises the working patterns of the punk sociologist:

“One day the punk sociologist is writing a blog post, the next they are working on an audio podcast, the next they are creating posters, the next they are making short films, the next they are curating content. They gather, uncover, and generate insights through their sociologically sensitive trawling of the social world, using the things they find to illustrate and enliven sociological topics (using anything from art, to film, to advertising, to photography, to web visualizations, to flyers they get through their front door, to guidebooks – the options are limitless). Books and journal articles will still matter; they are still likely to be the bedrock of academic communication. But the punk sociologist looks to use these traditional forms of communication in unusual and maybe even subversive ways, and then looks to build on this work through other forms of communication and through other media. The debates on open-access publication, escaping the paywalls that limit communication, create new questions for academic publishing and communication, the punk sociologist is likely to be working around the edges of what is possible and exploring the reach of their means of communication anyway.”

We don’t have to accept Beer’s notion of ‘punk sociology’ to be able to take something from the vision he’s outlining here. His case is a proposition about how sociology could thrive under present circumstances: “sociologists need to be bold, to be outspoken and daring, to take risks, and to, on occasion, be audacious”. My point is not that we should all become ‘punk sociologists’ (though I personally find the notion appealing) but rather that a turn towards digital engagement, perhaps as part of a broader move towards a Digital Sociology analogous to the Digital Humanities, must be accompanied by some explicit dialogue about the ends served by such engagements. In doing so, we effectively recast the risks social media undoubtedly poses into opportunities for us to rethink sociological craft in a way that ensures the viability and vibrancy of the discipline within a social and intellectual context likely to become ever more challenging.

1. http://books.google.co.uk/books/about/Public_Sociology.html?id=Weu4AAAAIAAJ&redir_esc=y
3. http://asr.sagepub.com/content/70/1/4.abstract

Well said. Isn’t it sad and ironic how sociological concepts and little turns of phrase become commodified in academia. They are not only irritatingly thrown in in places where they wouldn’t otherwise have been, but they also become cliched. It makes the genre so predictable.

By Gwen Redmond

Father and Daughter: Patriarchy, Gender and Social Science by Ann Oakley (Policy Press, 2014)

I am not sure how an academic like Oakley would respond to my referring to her book as 'unputdownable', but there you have it. Impossible to categorise, Father and Daughter is part autobiography, part biography of her father, part reflections on family life, class and gendered societal structures and also a dense social history on the evolution of professional social work training and social policy in Britain. It’s also about politics and power and about men and women separated and defined by gender roles. Any research on her father, Richard Titmuss, will reveal his passion for social justice and welfare through policy formation and his position at LSE (London School of Economics) as founding chair of Social Administration. That is just one story. Oakley aims to tell another, a story about her father,
the man rather than the 'saint' and the people (often women) and the structures (always patriarchal) surrounding
him.

All stories are told through a lens, and of course Oakley's is gender. Her archival research, alongside her mem-
ories of the men and women who worked with her father, reveals the work and research of the women prior to
and during the establishment of the Department. In particular, she recounts the groundbreaking work of Eileen
Younghusband who, with other women, had been working in 'settlements' (a way of doing social research and work
by immersing oneself in the community) in a largely voluntary capacity. Younghusband aspired to founding a social
work education course, attached to universities and professionally recognised. Due to her reputation, she secured
funding from the Carnegie UK Trust for a survey which led to the establishment of the 'Carnegie Experiment', a
generic course on social work training, established at the LSE in 1954. Oakley's assertion that this course was the
'material realisation' of all Younghusband's work, and the acceptance that the Department in essence 'belonged' to
her prior to Titmuss taking over, is a generous acknowledgment of the power of patriarchy to not only steal the prize
from women but also, write them and their achievements out of the annals of history. She recounts how during
the early years at the Department, her father brought home stories of 'difficult women' such as Younghusband,
Lewis, McDougall and Towle. Retrospectively, of course that's just gendered language at play. Had they been men,
they may have been described as assertive or powerful. The real difficulty was Titmuss's problem seeing women as
equals. After a successful internationally recognised career and twenty-five years work at LSE, Younghusband applied
for promotion as a Reader. Titmuss vetoed the application writing on it 'not now'. Younghusband's personal and
professional story is just one of the many told in this book.

An important sociological account is given of these women on another level. Oakley postulates networks, specifically
class networks, are a means to success. Her father is hailed retrospectively as an anomaly, in that his lack of formal
third level education and establishment links did nothing to deter his success in a world usually defined by these
connections. (Oakley's research goes someway to unravelling the myth of his background however). The interesting
networking story though belongs to the 'settlement' women. These women were networking, even transatlantically,
decades prior to the establishment of the Department. They networked not for 'self-aggrandisement' but for,
as Oakley understands her work to be also, the public good. Often these women were unmarried, financially
independent, well travelled and had lasting, loving and intimate relationships with one another. Their private and
public lives are obviously a result of first wave feminism and Oakley's own immersion in the second wave was no
doubt influenced by these women. These women were part of her private life also, they were the 'difficult' women
her father spoke of around the dinner table. Her reflections on these women's lives are in marked contrast to the
recollections of her mother's seemingly sterile existence.

There is something incredibly generous in revealing the private world, especially by the British middle class.
Oakley believes the personal and public are inseparable, that our private problems are more often a reflection or
an effect of social problems. Indeed, an obsession with class in Britain defined her parents' relationship with her.
She recounts a distanced and cold childhood, certainly a mother more interested in her father's career than herself
or her child. She occasionally discloses what could be considered family secrets; her mother's revelation that her
father dressed in women's clothes, sexual tensions between the 'titmice' (the close male colleagues of her father)
and memories revealed to her under hypnosis. I pondered the relevance of these exposures, as Oakley states but
doesn't go so far as to examine them. But then they are part of her memories, her story, and not all stories reach
conclusions. She could have easily left them untold, but maybe they go some way for her in dismantling the 'God'
Richard Titmuss and revealing the fallible man.

The structures Titmuss operated within were classist and gendered. What surprised me reading this book was
how little has changed. Oakley writes of her own journey through the academic quagmire. Her part in the women's
liberation movement, her fight to give weight to her theories on gender, her battle for promotions over the years,
watching less qualified men being promoted before her, her relegations to the attics of universities and relentless
struggles for funding. She recounts sitting at board meetings with a majority of men using gendered metaphors and
her not understanding them, stories of women who can’t get their opinions heard unless it is repeated by a man and then given credence. Depressingly, not much has changed. It certainly is a long revolution.

To assign this book neatly to a particular genre is futile, as too in trying to define its audience. The book will appeal to anyone interested in social policy, sociology, the emergence of the profession of social work, university life, gender studies, the family and the fifties. Most of all it will appeal to those readers who love a good story, well told.

Gwen Redmond is studying for a Master of Education degree in The Department of Adult and Community Education at Maynooth University, Kildare, Ireland. Working in the field of Adult Literacy education for ten years, her studies and practice are informed by Critical Theorists.

A Decade Lost: Rethinking Radicalisation and Extremism (2015-01-06 23:53)

A Decade Lost: Rethinking Radicalisation and Extremism by Professor Arun Kundnani

[1]A report released today by Professor Kundnani and Claystone (a social cohesion think tank) critiques the government’s Prevent strategy and calls on the government to end this controversial programme. Prevent has already been previously been [2]discredited by CAGE.

Professor Arun Kundnani is the author of The Muslims are Coming! Islamophobia, Extremism, and the Domestic War on Terror (Verso Books, 2014). He teaches terrorism studies at John Jay College, New York, and is an adjunct professor in the Media, Culture, and Communication department at New York University. He has been a Visiting Fellow at Leiden University, Netherlands, an Open Society Fellow, and the Editor of the journal Race and Class. His previous book is The End of Tolerance: Racism in 21st Century Britain (Pluto Books, 2007).

"An official narrative holds that terrorism is caused by the presence of extremist ideology. Extremism is defined as opposition to British values. To prevent terrorism, according to this narrative, the government should intervene to stem the expression of extremist opinions and demand allegiance to British values."
"Advocacy of the official narrative on the causes of terrorism has had a significant polarising effect on public discourse in Britain, contributing to a climate of systematic hostility to Muslims. This has happened in two main ways:
• The term "extremism" is used selectively and inconsistently to construct Muslims as a suspect community and to discourage the expression of radical opinions;
• The debate on multiculturalism is securitised so that a series of distinct issues involving Muslims in public life are interpreted through the lens of clashes over identity that can only be remedied by demands for assimilation."

"The Prevent agenda, with its near total focus on Muslims, in practice undermined the best elements of the new cohesion policies and returned local authorities to engaging with select community leaders who were seen as the best way of embedding government policy within communities. Efforts to bridge communities and overcome ethnic fragmentation tended to be neglected with Prevent’s focus solely on Muslims. As Prevent evolved under the Blair, Brown and Cameron governments, it increasingly emphasised the demand that Muslims declare their allegiance to British values. The criticism of multiculturalism embedded in the official narrative on extremism is thus quite different from that of the earlier cohesion agenda and appears more like a return to demands for cultural assimilation. Moreover, the failure to assimilate to British values is now presented as a national security threat, adding an unprecedented intensity to questions of identity".

Call for papers: Internet of You: Data Big and Small (2015-01-07 08:00)

Internet of You: Data Big and Small

Final submissions due: 1 March 2015
Publication issue: November/December 2015

Please email the guest editors a brief description of the article you plan to submit by 1 February 2015. Guest editors: Deborah Estrin and Craig Thompson ([2]ic6-2015@computer.org).

We are at a great divide. Where our ancestors left behind few records, we are creating and preserving increasingly complete digital traces and models of almost every aspect of our lives. This special issue of IEEE Internet Computing aims to explore technologies and issues from small user-centric models of individuals to real-time analytics on huge aggregations of user data. At present, some are aspiring to create immortal avatars by letting you record everything about yourself and convert it into a model that’s queriable, conversant, and possibly even active in gaining new experiences for itself. Meanwhile, others are equally concerned with stemming the tide of third-party data aggregation of individual models to mitigate risks that can evolve from this kind of near total information awareness.

This special issue seeks original articles that explore both small data (individual-scale data sources, processing, and modeling) and big data (community level aggregation and analytics). Topics include

- diverse data sources and digital traces, including email, Facebook, financial, health, location, images, sound, consumer transactions, and interests;
- methods to combine trace data into complete models; data liberation; kinds of user models, such as the physical self, memories, aspect-limited versus comprehensive models; and data quality, including managing history, change, comprehensiveness, and accuracy;
- methods to aggregate and process heterogeneous data sets, stages of life ontologies, the scope and purpose of these data collections, available public data sources;
- usage models for experience sampling — proximity, context, activity sensing, quantified self, situation-aware modeling, activities of daily living, my immortal avatar, workflows, and pattern learning;
- representation technologies such as agents, smartphones, wearable computing, personal sensing networks, pattern representation and adaptation, and natural language;
• new kinds of applications that draw insights from data analytics—including, recommendation systems, personalized health, real-time marketing, and predicting elections from twitter feeds;

• open architectures for personalization, the role of cloud computing, relevant emerging standards;

• concerns regarding privacy and surveillance, the extent of privacy erosion, taxonomy of privacy threats, and incentives and disincentives for sharing, the right to forget, and status of legal safeguards;

• privacy and security technology safeguards, including identity management, disclosure control, privacy-preserving data mining, de-identification, new security models, mechanisms that audit and control personal information flows and usage; and

• social and philosophical implications for humans’ conception of self. Is there a natural boundary between user models and world models?

Submission Guidelines

All submissions must be original manuscripts of fewer than 5,000 words, focused on Internet technologies and implementations. All manuscripts are subject to peer review on both technical merit and relevance to IC’s international readership—primarily practicing engineers and academics who are looking for material that introduces new technology and broadens familiarity with current topics. We do not accept white papers, and we discourage strictly theoretical or mathematical papers. To submit a manuscript, please log on to ScholarOne (https://mc.manuscriptcentral.com:443/ic-cs) to create or access an account, which you can use to log on to IC’s Author Center (http://www.computer.org/portal/web/peerreviewmagazines/acinternet) and upload your submission.

Does Sociology as a Discipline Have a Future in the UK after the REF? (2015-01-07 09:42)

The British Sociological Association (BSA), the main professional body for sociology as a discipline in this country, has recently called for some calm soul-searching about the results of the latest Research Excellence Framework (REF), in which the lowest ever number of submissions were returned—29, down from 67 in 1992. Moreover, some historically important departments to the discipline (including my own) were ranked low. These two facts alone suggest that sociology as a discipline may be in decline. I tend to share this assessment—for two reasons.

One reason is that REF doesn’t respect discipline-based prerogatives, which were established prior to our neo-liberal regime. Rather what seems to have happened (and I wasn’t here when it happened 30 years ago) is that academics decided that if they had to show value for public money, then these matters should be decided through
self-constituting peer review processes that tracked established disciplines. (The imagined nightmare alternative was probably some bureaucrat in Whitehall making the judgement without consulting academics.) But there were at least couple of other options available: (1) Continue resisting the impending neo-liberal regime, at least until a more favourable deal was on offer; (2) go for metrics of some sort, which the academics themselves might design, presumably to highlight their value to society.

David Willetts, the ex-Minister for Higher Education in our Tory-led government, has often observed that no government has a vested interest in funding such a labour-intensive process as the current REF. It operates on the pretence that many academics will read many pieces of work over a relatively short period, disrupting the normal course of academic life. Politicians would much prefer that we found a more efficient way of dealing with the funding issue. Indeed, it is a testimony to their respect for academics that politicians allow us to hang ourselves by such a richly brocaded noose. And why shouldn’t we be entitled at least to this?

This brings me to the second reason. The pieces that are submitted to REF for evaluation have been already peer reviewed and hence judged fit for wider consumption in the knowledge system. So what’s the point of peer reviewing them again? The most obvious answer is that, in some sense, academics don’t think that the peer review process itself provides an adequate means of judging the ultimate value of a piece of work. And I would certainly count myself among those academics.

However, only a [1]‘cargo cult’ mentality would conclude that what we need is more peer review to solve the problem. Rather, we need some orthogonal means of assessing value – and here metrics opens up opportunities, since you don’t need to assume prior disciplinary formations to see the relevance and interrelations. As a result, you can get a different and certainly more dynamic view of the overall knowledge system.

There is a general and more specific lesson here. The general lesson is that the more academics stick to peer review in administering processes like REF (i.e. evaluations at the system-level of knowledge production), the more they reveal their unwillingness or inability to think about the value of their work beyond those with whom they most comfortably share knowledge. This is something that should concern politicians and policymakers.

The specific lesson with regard to sociology is that the lack of consensus on the acceptance of the overall REF results – highlighted by the BSA’s general statement to members – may indeed be a sign of sociology’s loss of clear disciplinary identity in this country. What critics of the REF results claim to be the ‘harshness’ of the REF panel’s judgements may reflect the highly variable understanding of what counts as ‘sociology’. Yes, it may really matter who’s on the panel because there is no common understanding of the field. If so, then on what grounds can the idea of sociology as a ‘discipline’ be maintained? No doubt ‘sociology’ is a great market attractor to get students into specific degree courses – and long may it flourish! But you don’t need dedicated sociology departments or, more to the point, research units to do this. Thus, the value of having sociology continue as a ‘discipline’ should focus sociologists’ minds, given that the neo-liberal order is not designed to respect, let alone protect, the value of disciplines as such.

Carl May (2015-01-17 18:04:04) I’ve been through the process of shaping an RAE or REF return twice now, although in a different unit of assessment (Sociologists are widely distributed). I take a slightly different view. It’s worth disentangling the REF from the future of the discipline. First, the REF is a rather more holistic enterprise than is described here. In it, representatives of Units of Assessment are asked to select the best published work work (outputs) from participating academics, report on grant income and numbers
of postgraduate research students, describe the important features of the research environment, and demonstrate wider impact on society. These are then rated by senior academics in the field in a process that is designed to make it difficult for an individual (or a clique) to skew the outcome. Because the REF asks each sociology group or department to present its best work, and then to contextualise this against a number of other aspects of performance, there is a clear competitive and comparative element to this. But to give the game a twist, the rules are changed slightly each time. It’s not just about reviewing papers, and in REF 2014, the introduction of impact case studies and an impact narrative has been the innovation in competition. It’s clear that these have been a problem for departments and subject groups that are not closely engaged with shaping or supporting policy and practice beyond the academy. Those academics that are busy critiquing other people’s critiques are unlikely to do well in this process. This is not confined to sociology, it’s the case for all social and health science submissions: those units or departments that could show clear ‘impact’ effects in a narrative and describe these in accounts of specific cases. When these are published later in the month, we will have a much better understanding, I suspect, of the distribution scores. There are many things wrong with REF, not least the burden of work that falls on academic units, but the future of the discipline of Sociology might not be one of them. There are many reasons why historically important departments could have been ranked lower in the current REF. I don’t know Steve Fuller’s department and I don’t want to comment about that particular case. But historical importance and contemporary significance are not the same thing. The declining number of submissions for the discipline of sociology may well be related to poor performance in the REF, and that’s true in other disciplines too. If this is so then the long cool look that the BSA recommends might need to be about what stands for quality, and how this is defined, in the most pragmatic way.

Steve Fuller (2015-01-19 13:01:15)
Everything that Carl May says is true and in most cases obvious (and sometimes even mentioned in my post). The question is what if anything would count for him as signs of a discipline in decline. However, one can’t but admire his HEFCE-friendly brave face...

The gaps in which being human happens (2015-01-08 08:00)

I’m currently reading Vincent Deary’s [1]How We Are. It’s the first book in a planned trilogy exploring how people change. For the last few months I’ve had a vague idea that at some point I’d like to develop themes from my PhD into a book for a wider audience. My project sought to develop a framework for studying the processes through which people change in a sociological way. But I’ve realised recently that there’s a sense in which that focus was as much a reflection of the process which led me towards these questions as it was an expression of my underlying interests (not to mention the fact that I had to write something sociological in order to be awarded a PhD).

What I’m really drawn towards are these questions of stasis and change - what does it mean to say someone stays the same and what does it mean to say they’ve changed? How do our circumstances facilitate or frustrate these processes? Where do these processes originate and how do they fit together over time? How can the lives we live be our lives when they are composed of moments we so often miss? It’s this last question in relation to which Deary’s book is most illuminating. It’s a poetic reflection on the relationship between stasis and change, exploring how a life composed of fragments can nonetheless avoid fragmentation. It’s this relationship between the whole and the parts of a life which I was trying to understand in my PhD and I’m left with the impression that Deary understands it much more profoundly than I do. He’s certainly written a book which occupies the same space as the one I aspired to write, even if it occupies that space in a slightly different way than would likely have been the case with the one I imagined.

One of many things I like about his book is how carefully he treats the relationship between cognition and agency. The philosophical tradition left us with a conceptual minefield here that Deary adroitly sidesteps, avoiding the parallel temptations of affirming a deliberative faculty from which reasons-as-causes inexorably originate and dissolving that deliberation into casually determined automaticity. Our deliberation often supplies us with reasons that many times lead to action but in a way that is far from inexorable and is dependent upon a vast assemblage
of learned routines ("thousands of little rules so rigid they are no longer up for negotiation") that are folded into our capacity for both deliberation and the action to which it sometimes leads. As he puts it, deliberation is "a late arrival at the evolutionary party, a tiny mote atop the massive mountain of automatic life, of knack and gist" (loc 693). But that doesn't mean it can be dismissed as phenomenological froth, as a tendency towards higher level rationalisation of still basically automatic responses to environmental stimuli. The question then becomes one of how the two faculties operate in tandem, an issue made even more complicated by the demonstrably different temporal sequencing which characterises the operation of each. In addressing this question Deary uses the notion of the 'gap':

Between the impulse and the act, there is a gap. A gap in which imagination can picture outcomes, in which alternative impulses can compete, in which, for instance, morality (such as yours is) has time to encounter impulse (such as yours are) before it commits to act. There is time to think. (loc 704)

During that pause, our ability to remember and imagine comes into its own. Without the recourse to the gist of all our past, of who we are, without the ability to use that same faculty to imagine and construct future possibilities, there would be no space or time to think – no deliberation. (loc 713)

This is the gap in which reflexivity operates. It relies upon automaticity in the sense that as he puts it, automaticity reflects "everything you've ever thought, every place you have ever been, every action you have ever practised or mastered, every dream and wish and hope, every encounter, every place, every face and feeling, everything you know". We encounter our situation already constructed (with the viability of interventions like CBT resting on the inherent possibility that we could reconstruct it in a different way) in a way that isn't arbitrary but eludes our immediate control. The framing reflects who we are as a particular human being with these particular concerns and with this particular past that's led us to this present situation and the future possibilities we (fallibly) perceive within it. Who we are is further expressed in how these possibilities come to matter to us - are we drawn towards some and repelled by others? Therein lies our inclination to be a person who does this and avoid being a person who does that. In acting within this gap, acting on the basis of inclinations or struggling against them, we contribute to the reproduction or transformation of these deeper continuities in which our personhood inheres.

The way Deary imagines this process is as dialogical but interior. The decision-making process is a meeting in which different aspects of us come into dialogue - we talk to ourselves about ourselves (and our circumstances) and through these internal conversations we reach decisions:

The nearest I can picture it is like being a host, in most of its senses, from genteel (host of a party) to spooky (host to a possessing spirit). In these moments when we are hosts to the decision-making process, we are holding open a space for notions, routines and agents to meet, encounter and network, to deliberate - a get-together of a group who somehow manage to accomplish a common task. As host, or even more accurately, as the venue, you merely provide, you are, the material conditions where this teamwork happens.

On this view automaticity isn't a challenge to reflexivity but rather is a condition for it. Our deliberative faculty emerges out of this inner space in which inclinations, concerns, routines and ideas meet. Often it doesn't - there's much more to our inner worlds then the deliberation which sometimes emerges out of them.

The clearly calculated mass murder that occurred yesterday at the headquarters of the French satirical magazine, *Charlie Hebdo*, is an affront to basic standards of human decency. However, the ensuing outrage has been spun in terms of various diagnoses: Did the magazine go too far? Do Muslims accept Western values? Is Western intervention in the Islamic world the ultimate cause? Beyond these questions, however, an uncomfortable meta-question lurks: *If you say you're willing to die for the right of free expression, then what's wrong when someone takes you seriously and kills you?*

Of course, there's a lot wrong in such a situation – but how much of it is to do with free expression? Murder is simply illegal, whether or not you freely express your views. But clearly that's not the whole story. As several social media commentators have observed, many more than 12 are killed every day in various places in the Islamic world by extremists. However, the fact that those killed in Paris were champions of free expression elicits an especially strong form of outrage.

Journalists like those in Charlie Hebdo talk about their possessing an *unconditional* right to offend, an idea that appeals to the liberal in all of us. However, 'unconditional' may mean at least two things, both of which are in evidence in the history of free expression: (1) I can offend anyone in any way (short of physically harming them); (2) I am willing to suffer any consequence from my offence. Taken together, (1) and (2) look asymmetrical: Shouldn't there be a similar parenthesis after (2) as in (1), which ensures that I'm not physically harmed in return?

However, the modern idea and rhetoric of free expression predates the founding of the welfare state. People who believed that, as Thomas Jefferson said, 'the pen is mightier than the sword', were willing to suffer harm and even die for their right to offend. And often they did, becoming inspirations as 'martyrs'. Moreover, it is not clear that they felt themselves entitled to any greater protection than that afforded to ordinary citizens, who are left to indulge in various forms of reckless behaviour, unless they physically harm someone other than themselves. However, attitudes have clearly changed, certainly over the past hundred years. The state now appears to be committed to the unconditional *protection* of free expression.

So, not surprisingly, in the wake of the Charlie Hebdo murders, questions were asked about the adequacy of police security, with promises made to make improvements. Needless to say, the task of protecting free expression – which, again, is something above and beyond simply allowing it – is expensive. Ask the British taxpayer, who for about ten years spent millions of pounds per annum protecting Salman Rushdie from the fatwa declared on his life, following the publication of his irreverent novel, *Satanic Verses*. While providing great symbolism in the 1990s for Britain as a defender of liberal values, with the passing of time more people wonder whether the Rushdie Affair had been handled with excessive caution.

There is something quite admirable about the welfare state's protection of free expression. It almost looks principled. But it isn't quite. I say this because it is predicated on relatively few people fully exercising their right. And even in those cases, security is at least partly provided by private means, including insurance policies. If everyone who waved a 'Je Suis Charlie' banner last night in an endless sea of selfies actually lived up to the slogan, the state would go bankrupt trying to protect them – either that, or there would be a bonanza for the insurance industry!
It says a lot about our commitment to free expression that we indulge people who push the boundaries to such an extent that they regularly put their own lives at risk by the offence they cause. The welfare state would normally hospitalize people with such suicidal tendencies. But my guess is that business as usual will continue in this matter, just as long as not too many people are offending too many different groups. Protection at current levels remains affordable under the welfare state’s neo-liberal arrangements.

As a closing thought, consider why the first two amendments of the US Constitution, the Bill of Rights, are the right to free expression and the right to bear arms. Nowadays we extol the one, while loathing the other. But in fact, they were meant to be two sides of the same coin: the right to offend and the right to self-defence. As the Founding Fathers saw matters, shared by Americans today, if you wish to freely express yourself, you also need to protect yourself from the consequences – or be willing to suffer them gladly.

Charlie Hebdo: #JesuisCharlie ou Non? (2015-01-08 16:02)

[1]

Following the horrific murders of police and journalists in Paris yesterday, Muslim communities in Europe are facing the inevitable consequences. Today [2]mosques in France have been attacked. Muslims in Europe are
feeling further reverberations, evident in criticisms of their supposed contention with freedom of speech, whilst
governments continue to justify tightening measures that will ironically restrict freedom of speech amongst Muslims
who condemn foreign policy. The dominant voices in the mainstream media are focusing on perpetuating myths
about a clash of civilisations: the Western ideals of freedom of speech vs the barbaric repression of the (Muslim)
Other.

Social media is abound with calls to [4] #killallmuslims, whilst all Muslims are expected to apologise (again)
for the individual evil actions of murderers, and declare loudly #notinmyname, else their silence will be subject
to scrutiny and suspicion and branded as complicity. At such times it is the Muslims who are always expected to
apologise, a point frequently argued by Muslims and non-Muslims:

[5]“So let’s avoid religious profiling. The average Christian had nothing to apologize for when Christian
fanatics in the former Yugoslavia engaged in genocide against Muslims. Critics of Islam are not to blame
because an anti-Muslim fanatic murdered 77 people in Norway in 2011.... Let’s also acknowledge that
the most courageous, peace-loving people in the Middle East who are standing up to Muslim fanatics are
themselves often devout Muslims”.

[6]
The prevailing narrative on social media is of #JesuisCharlie understandably demonstrating how humanity feels compassionately for the victims at Charlie Hebdo. And yet there is an alternative narrative (not well publicised) of those Muslims speaking up against the atrocity without having to apologise for a crime they have not committed. Others, Muslim and non-Muslim, are voicing their
concerns with how the hegemonic narrative on Charlie Hebdo is unfolding to promote the status quo. Whilst some are highlighting how a Muslim policeman was a victim too:

"My name is Ahmed. A name I share with one of the two police officers killed in Paris today in the #CharlieHebdo attack. Ahmed Merabet who was only 42-years-old, was killed outside the building after he encountered the gunman while patrolling the 11th arrondissement. Ahmed is also one of the Prophet Mohammed’s names, derived from the Arabic root word “hamd” meaning “praise”. It can be translated as “the Highly Praised One”. There is a sick, deep, and dark irony in the fact that the men who launched the attack in Paris, claiming that they had avenged the Prophet Mohammed by murdering 12 people, killed a man who himself was named after the Prophet. Those who view the world in an us versus them paradigm are dangerous because they are obliviously ignorant to the fact that we are all the children of God - whatever or whoever you believe God to be. #JeSuisCharlie #JeSuisAhmedMerabet".

One blogger states JE NE SUIS PAS CHARLIE drawing parallels between this situation and her experiences as a black female:

"I will not stand for this magazine, I will not celebrate the privilege of “free speech” to be a disguise for hate. I am a black woman who understands how frustrated one can be as whites continue to use laws as an excuse to be abusive to who we are whether it be religion, skin color, or sexual orientation. I know France is scared, I know people are hurting. But I cannot be this newspaper’s ally. I am an ally for the people of France, I am an ally to the victims and their families but I will not stand in solidarity for this hateful newspaper."

Whilst another blogger highlights her disconnection also:
“But the simple fact is, I am not Charlie. I couldn’t be. Rather, I’m the sort of person who’d only ever get to be an ugly, rude caricature in their pages — a trans woman, a Latina, Puerto Rican but in the same community of Latinos scapegoated for various and sundry evils in the US, much as Muslims are in France. I’d never be the one wielding the pen, merely the lewd, pornographic subject and nothing more. I’d be fit for only the consumption of a privileged community, their joke, an unwilling jester. No, je ne suis pas Charlie.”

Anti-censorship bloggers are even highlighting the complexities calling #JesuisCharlie when the magazine was inciting hatred against Muslims:

“...I understand why a culture that is being systematically and individually mistreated and ignored by the privileged in power may eventually spawn some folks who resort to violence doesn’t mean I condone that violence! It means I can see why decades of hurt, fear, and institutionalized abuse may lead to a violent reaction. Understanding is not supporting, it simply means I can connect the dots. Can you not?!? What I find incredibly disappointing is that on my social media, I see a bunch of white people “standing up” for the “bravery” of a racist magazine to incite hatred against people of colour. I have seen next to nothing about the bombing of the NAACP by a white man on our own soil. I see anti-Muslim protests being started in Europe, and people calling for the genocide of Muslims on Twitter, but very little attention to the number of Muslims who condemned the violence.”

An Indian publication highlights the nuances involved in calls for rights to freedom, as Sandip Roy argues:

“And yes, we forget that even France, which has become the embattled bastion of freedom of expression today, wears its own limits on its sleeve. Its staunch defence of freedom of expression did not prevent it from passing a ban on the niqab even though it was deliberately veiled as a ban on “clothing intended to conceal the face”. “Bans like these undermine the rights of women who choose to wear the veil and do little to protect anyone compelled to do so, just as laws in other countries forcing women to dress in a particular way undermine their rights,” says Izza Leghtas at Human Rights Watch. Between April 2011 and February 2014, French law enforcement fined 594 women for wearing the niqab. A Reuters report points out that many of the cartoonists in Charlie Hebdo got their start in another satirical magazine called Hara Kiri which proclaimed its aim to be “inane and nasty”. That magazine was banned in 1970 after printing a mock death notice for General Charles de Gaulle. Its reincarnation after the ban was as Charlie Hebdo.”

Free speech is not a straightforward and uncomplicated matter.
Satire can be highly problematic as Jacob Canfield explains:

"...the editorial staff of Hebdo consistently aimed to provoke Muslims. They ascribe to the same edgy-white-guy mentality that many American cartoonists do: nothing is sacred, sacred targets are funnier, lighten up, criticism is censorship. And just like American cartoonists, they and their supporters are wrong. White men punching down is not a recipe for good satire, and needs to be called out. People getting upset does not prove that the satire was good. And, this is the hardest part, the murder of the satirists in question does not prove that their satire was good. Their satire was bad, and remains bad. Their satire was racist, and remains racist....
To simplify the attack on the Charlie Hebdo offices as “Good, Valiant Westerners vs. Evil, Savage Muslims” is not only racist, it’s dangerously overstated. Cartoonists (especially political cartoonists) generally reinforce the status quo, and they tend to be white men. Calling fellow cartoonists TO ARMS is calling other white men to arms against already marginalized people. The inevitable backlash against Muslims has begun in earnest."
Thus ideas about free speech and satire are impacted upon by who has the power to profess when free speech is acceptable and when it becomes offensive, and there will always be those who are powerless to fight back against what they deem to be offensive.

Some are highlighting how it is troubling to elevate Charlie Hebdo as a magazine representing European freedom of speech when the themes involve Islamophobic and xenophobic ideas of Muslims in cartoons. Where are the boundaries between grossly mocking the tragedies impacting upon people’s lives and freedom of speech? One example is the disturbing depiction of the girls kidnapped and raped by Boko Haram as happy recipients of welfare benefit. How would the families of the girls who are kidnapped respond to this “humour”? 

Ben White

"Freedom of speech is the core of western values. If we don’t defend this, it is the end of our civilisation," French attendee of Charlie Hebdo vigil in Rio de Janeiro.

"I am shaking with rage at the attack on Charlie Hebdo. It’s an attack on the free world. The entire free world should respond, ruthlessly," Roger Cohen, New York Times columnist.

"the war on terror offered a different glue to hold society together. liberal values - held up as the cultural basis for Western identity and the universal standard of civilisation - were taken to imply an identitarian politics of national security rather than an egalitarian politics of social security. Fighting an extremist enemy constructed as Huntingdon’s ‘ideal enemy’ - both ‘ideologically hostile’ and ‘racially and culturally different’ - required that liberalism become an identity politics, a call to recharge the batteries of belonging, to take a stand defending a way of life - militarily, intellectually, and culturally - while still claiming the mantle of a universal civilisation." from Arun Kundnani’s ‘The Muslims Are Coming’
Another example discussed on social media questioning what is sacrosanct is the cartoon about the protestors murdered in Rabaa Square in Egypt. Again, how would those impacted by the massacre in Rabaa Square feel about this “humour”? 

[16]
Would it be humorous to create satirical representations, and have a sense of humour, about the evil massacre that took place yesterday at the Charlie Hebdo offices? Would Muslim writers be allowed to satirise the tragedy of journalists and cartoonists murdered as they went about their daily lives?

Richard Seymour expresses what some Muslims have argued, that there is a distinction between showing compassion for the victims and the families of the victims and supporting a racist publication:

"...I think there’s a critical difference between solidarity with the journalists who were attacked, refusing to concede anything to the idea that journalists are somehow “legitimate targets,” and solidarity with what is frankly a racist publication.... I will not waste time arguing over this point here: I simply take it as read that — irrespective of whatever else it does, and whatever valid comment it makes — the way in which that publication represents Islam is racist. If you need to be convinced of this, then I suggest you do your research, beginning with reading Edward Said’s Orientalism, as well as some basic introductory texts on Islamophobia, and then come back to the conversation.”

No, the offices of Charlie Hebdo should not be raided by gun-wielding murderers. No, journalists are not legitimate targets for killing. But no, we also shouldn’t line up with the inevitable statist backlash against Muslims, or the ideological charge to defend a fetishized, racialized “secularism,” or concede to the blackmail which forces us into solidarity with a racist institution."

Seymour rightly emphasises the need for those who are elevating the cartoons of Charlie Hebdo research Orientalism. Twitter has also revealed many calling for the world’s newspapers to stand in solidarity with Charlie Hebdo by publishing the offensive cartoons, and yet is this a well-thought out plan to show support?

Others are arguing that the attack on Charlie Hebdo was not an attack on freedom of speech, but about foreign policy and war:
"White people don’t like to admit it, but those cartoons upheld their prejudice, their racism, their political supremacy, and cut it how you will — images like that upheld a political order built on discrimination”.

The role of foreign policy and war is as ever underplayed by political and media rhetoric. It is only the minority of voices who challenge the mainstream media’s rhetoric.

The mainstream media’s reach to the masses shows some glimmers of hope in presenting necessary alternative voices in analysis by Owen Jones and Peter Oborne. There are many opinions countering the dominant narrative of #jesuischarlie coming from Muslims and non-Muslims alike as they manifest the problematic nature of claiming oneness with a controversial publication, and show it is still possible to feel pain for those grieving after the shattering events in Paris yesterday, and condemn Islamophobic backlash:

Xavi (2015-01-08 18:08:48)
Good point. Brave. It is easier to present this in a very Occident-comfy way.

Sadia Habib (2015-01-09 17:35:39)
Thank you for commenting, you hit the nail on the head with "Occident-comfy" - that's all I keep seeing most places I look.

Angela Kennedy (@AcademicAnge) (2015-01-09 12:12:19)
Thank you very much indeed Sadia for such a well-researched and beautifully put together article, which neatly summarises key, vital points raised by many in the past few days but largely drowned out by the dominant, and often asinine, narratives: let alone the hatred/bigotry into which these are feeding. I am very happy to be able to refer to this summary now in future debates.

Sadia Habib (2015-01-09 17:34:49)
Thank you for your comment Angela. I feel heartened that you get that I was aiming to put the voices of those who are ordinarily silenced in the mainstream press out there. Thank you for reading, commenting and sharing.

Tim Mason (2015-01-09 16:14:14)
Pace Richard Seymour, I have done my research, and this includes reading both Said and occasional copies of Charlie Hebdo. It would be interesting to see a defence of the magazine by someone who knows a little bit more about it than the people cited in your text seem to do. I think that a good argument can be made that it it is/was neither racist nor islamophobic (nor indeed anti-arab, which is what the term really means). Neither was it sexist. All members of the editorial committee rejected those accusations, and several of them have a record of taking part in anti-racist, anti-arab, and anti-woman actions. Given these facts - and they are facts - you might want to look at the cartoons and ask yourselves what it was that they thought they were doing. You may in the end still disagree with the way that they attempted to do it, but that demands thought and analysis, rather than Seymour’s easy dismissal of the task. All of the cartoons incriminated are direct reactions to the political news in France, and if you don’t place them in the context of their apparition, you will be mistaken as to what they convey. The "Welfare Queen" is an American rallying cry : it has little traction in France, and even less among the CH team, all of whom were of the left, and Charb close to the Communist Party. I would like to add something other to this mix. Two of the men murdered had been household names in France for decades. Cabu’s and Wolinski’s works have accompanied the adolescence of three generations of Frenchmen and women - including those of North African origin. During those years, both men made many mistakes -Cabu’s use of children with Downes syndrome in his early years was particularly appalling - but that was not all he did. Wolinski worked his way through from sexism to feminism - a pathway that many men will have traveled over the 60s and 70s - with intelligence and humour, in a way that certainly helped many others make the same journey. As feminists, you may want to listen to what his wife had to say yesterday - the video is at the bottom of the linked page - [1]To begin with, I was myself iffy about the "IamCharlie" slogan. However, with the news that is breaking at the moment, I have to admit that it looks as if our jihadists see us all as legitimate targets for their hostage taking and their murders. So, yes - whatever you or I may conclude about the inner souls of Cabu, Wolinski, and the other men slaughtered in the CH offices - I am Charlie.

Hi Tim, Thanks for taking the time to provide your perspective. The people cited in my text, I doubt know any less than the people whose voices are aired in the mainstream media, and offer a valuable counternarrative. Islamophobia is not defined as anti Arab. There are plenty of non-Arabs who are unfortunately experiencing the rise of Islamophobia - attacks on women for wearing a headscarf, attacks on mosques etc. It is incorrect (and orientalist) of you to describe Islamophobia as "really" meaning anti-Arab.... when there are Muslims who come from all racial and ethnic backgrounds. Islamophobia is thus a fear of Islam and Muslims (who come from all walks of life, including white Muslims). Those who work for Charlie Hebdo may not have been evil Islamophobes, but nevertheless in the French context it is acceptable to satirise Muslims, but not others. Those who are arguing that CH mocked everyone are choosing to ignore facts such as CH firing one of their own staff after claims the created an anti-semitic caricature. Ask yourself, why then is Islamophobic discourse permissible? Your applauding CH's anti-racist and "anti-anti-woman" stance is akin to saying "I'm not a racist, my best friend is black". You may view CH as a remarkable leftist publication, but unfortunately the satire therein has real lived consequences in the lives of Muslims in Europe, the more the media satirise and demonise Muslims, the more attacks on mosques and hijab-wearing women. And then come tweets like #killallmuslims. Worrying. Freedom of speech comes with responsibility. Satire should make a statement about the powerful elite, not marginalise and demonise minorities. The hypocrisy and double standards are not lost on those thinking critically about the mainstream media's self-interested focus on "freedom of speech". Where was freedom of expression in 2005 in France when some argued an advert based on Leonardo Di Vinci's The Last Supper was not offensive, and yet the French court banned the advert? Where was freedom of expression in 2006 in France when rapper Makela was arrested for insulting France and Napoleon? CH may not have intended to cause attacks on mosques and the attacks on Muslim elderly folk, but you can’t get away from the fact they are white men with powerful positions who are reinforcing hegemonic social structures that already discriminate against minorities. I understand your point that Wolinski and his colleagues may have tackled sexism with humour and intelligence, it’s a shame they did not do the same with Islamophobia.

Correction - I meant anti-anti-woman actions, of course.

Sadia Habib (2015-01-09 17:20:25)

Glenn Greenwald, lawyer and journalist, states exactly what was problematic with CH: "[T]here are all sorts of ways ideas and viewpoints are suppressed in the west. When those demanding publication of these anti-Islam cartoons start demanding the affirmative publication of those ideas as well, I'll believe the sincerity of their very selective application of free speech principles. One can defend free speech without having to publish, let alone embrace, the offensive ideas being targeted. But if that's not the case, let's have equal application of this new principle....I've previously covered cases where Muslims were imprisoned for many years in the U.S. for things like translating and posting "extremist" videos to the internet, writing scholarly articles in defense of Palestinian groups and expressing harsh criticism of Israel, and even including a Hezbollah channel in a cable package. That's all well beyond the numerous cases of jobs being lost or careers destroyed for expressing criticism of Israel or (much more dangerously and rarely) Judaism. I'm hoping this week's celebration of free speech values will generate widespread opposition to all of these long-standing and growing infringements of core political rights in the west, not just some." Tim Wise, anti-racist author, who gets anti-racism unlike CH: "....historically, satire has always been about barbs aimed at those who are MORE powerful than oneself (the elite, royalty, the dominant social, economic, political or religious group), rather than being aimed down the power structure at those with less power. To satirize people who are the targets of institutionalized violence (whether for religious or racial or cultural or linguistic or sexual or gendered reasons) is not brave. It's sort of shitty, in fact. Should it be protected legally? Sure. Should those who do it be killed or punished in any way? Of course not. But should we hold them up as exemplars of who we want to be, all the while ignoring how the exercise of their freedom, without any sense of responsibility to the common good, actually feeds acrimony and violence on all sides? I think not." My last point: Tim, your viewpoint is the one dominating the media airwaves, and thus it is important that there are voices (like the ones in my text) who are given a platform to allow people to understand the complexities of the problem.
Damien (2015-01-12 01:09:24)
It is very important for dissenting voices to be heard and CH should not be exempt from criticism. It did publish many problematic cartoons during its history, and structural racism is huge problem in France, including in left-wing circles. But what bothers me is that it’s not clear that those who are denouncing CH as a hotbed of racism, sexism, homophobia, etc. had even heard of CH, let alone read an entire issue of it, before last week. The most basic requirement would be knowledge of French and of the context in which the cartoons were drawn, which I think many CH critics lack. This is the standard that we traditionally apply: we don’t take seriously those who publish Islamophobic screeds that compile poorly translated, out-of-context excerpts from the Quran, to conclude that Islam is violent. So maybe we should be equally skeptical of those who read CH cartoons with little understanding of the context in which they were drawn, and little knowledge of the larger body of work of these cartoonists? As Tim Mason rightly pointed out, this leads to people identifying in those cartoons US stereotypes that are not as salient in France, and not seeing how they often relate to domestic political events. For instance, the Boko Haram cartoon was not meant to portray these women as “happy recipients of welfare benefit” (or, worse, “welfare queens”, as some US commentators have said). It aimed to paint an absurd picture of Boko Haram abductees protesting cuts in child benefits to satirize and mock not those women but the high-income French people who were complaining about small cuts in their child benefits. Which means that, unlike what some had assumed, it did not tap into racist clichés about allegedly welfare-scrounging immigrants. It is because it makes no sense at all to think that women abducted by Boko Haram would be concerned about changes to French child benefits that the cartoon works. Of course, yours is also a legitimate criticism: this cartoon would hurt those whose lives have been destroyed by Boko Haram. Which is why I’ve never been a CH supporter, but is a different question than whether such cartoons are also racist. You noted that “those who are arguing that CH mocked everyone are choosing to ignore facts such as CH firing one of their own staff after claims the created an anti-semitic caricature. Ask yourself, why then is Islamophobic discourse permissible?”. It’s more complicated: the cartoonist Siné had published a text (not a caricature) that mocked Sarkozy’s son conversion to Judaism, which was seen as opportunistic. He was fired by the then-editor of CH, but several other cartoonists, including Tignous who was killed last week, publicly protested. This was in fact widely seen as a betrayal of the CH spirit and Philippe Val eventually resigned to be appointed director of a public radio by... Sarkozy. Apart from this single event in 2009, CH did not typically shy away from criticizing other religions. Again, I’m not saying that CH was great. I did not like how it made fun of marginalized people either.

Sadia Habib (2015-01-12 12:32:32)
Thank you Damien for your comments, appreciate what you are saying and agree with you. Just that even if the CH “satire” was more complex and nuanced than average folk realise, the problem is that Joe Public will start to become immune to caricatures of Muslims, and succumb to demonisation of Muslims. That’s how it begins. Nazi Germany began by portraying caricatures of Jewish folk in their publications and films etc which seeped into the consciousness of the German people as they dehumanised the Jewish communities. We see now in the UK that on radio shows ordinary British folk call in and demand rounding up Muslims and sending them to detention camps, as well as giving out rewards/prizes to Muslims who become spies and inform on their family and friends. Nazi state? Stasi state? How is it acceptable to have such views and air them on BBC radio? Shocking. Fox News in the US has an ever ready fan base who believe the rubbish spewed by the presenters - and now they claim Birmingham (UK) is a Muslim city only, and non-Muslims are forbidden from entering, and Muslim "officers" beat anyone who does enter the city. You could not make this up! Are Fox News viewers really critical enough to know this is utter rubbish? Are people ever looking at these caricatures in CH and thinking "Ah, yes, this is a nuanced comment against the government policies and for the Muslims!" I seriously don’t think so. Honestly, I agree with most of your commentary, but nevertheless when I see White men on social media defending CH as satire, this quote from Tim Wise’s Facebook page comes to mind: “It’s not racism, it’s satire.” – ancient white person proverb, origin unknown

Dan Fairbrother (2015-01-12 15:08:15)
Is “Je suis Charlie” supposed to connote Spartacus...or the Borg?
A nice article which makes some great points. I agree with you that JeSuisCharlie is not about free speech; it is about the notion of ‘freedom’ as conceived by the west in opposition to a real or imagined other civilisation.

Sadie Habib (2015-01-16 22:56:52)
Here we go, for those claiming CH was not a racist publication: http://www.counterfire.org/articles/opinion/17616-former-charlie-hebdo-employ ee-lambasts-its-racist-trajectory?utm _content=bufferb0cda &utm _medium=social &utm _source=twitter.com &utm _campaign=buffer

As a Muslim woman, I am faced with a dilemma. On the one hand, I dread the day Muslim law would govern my life, my thought. It would be as bad as the Stasi if not worse. A violent reaction to everything perceived offensive is not acceptable. I talk to everyday Muslims regularly and their justification of violent action by way of “persecution cannot be tolerated, the Quran says” disturbs me. What is "persecution"? Tomorrow your neighbour might cheat you, is that persecution, would you kill him? Yes, they say, "if it gets beyond tolerance". Disturbing. On the other hand, yes the backlash against the entire Muslim world is equally disturbing. The arrogance of the "intellectually superior" western world should prompt rising above the basic instinct of labelling entire communities as good or bad. Doing so discredits the minority of liberal Muslims trying desperately to 'belong'. But violence has that effect. It is unjustified without exception and has the power to bias the most compassionate, liberal mind against those engaging in violent actions, including those who do not condemn it. By condemning such acts, I do not become an apologetic Muslim. Does the liberal white world that condemns Islamophobic attitudes seen as apologetic? It is necessary to condemn violence.

Unpopular Opinion: Satire Should Punch Up. Charlie Hebdo Did Not. - Slixa Late Night (2018-11-26 02:20:00)
[...] » Charlie Hebdo: #JesuisCharlie ou Non? The Sociological Imagination [...]
Joe Sacco - On Satire (2015-01-09 18:07)

W.G. Runciman @SocioWarwick on January 22nd (2015-01-09 19:59)

The Social Theory Centre at Warwick is pleased to announce two events happening on Thursday 22nd January 2015 with W.G. Runciman (Trinity College, Cambridge; ex-President of the British Academy):

**Why So Little, Why So Much?: Change in English Society Since the Time of Defoe**

A workshop with W.G. Runciman based on his recently published book *Very Different, But Much the Same: The*
**Evolution of English Society Since 1714.** Assuming no prior reading, Runciman will elucidate his vision of English social history over the last 300 years according to his neo-Darwinian model for sociological explanation. This will prove to be a fascinating opportunity to engage with one of Britain foremost sociologists.

Location: Postgraduate Hub

Time: 3:30 pm

**Evolutionary Sociology: New Paradigm or Old Hat?**

A debate between W.G. Runciman and Steve Fuller. On one hand we have Runciman and his attempt to remodel the social sciences along evolutionary lines. On the other, Prof. Steve Fuller, who has defended "Intelligent Design" and predicted the eventual decline of Darwinism. The debate will be chaired by Dr. Charles Turner (Editor of the *European Journal of Cultural and Political Sociology*).

Location: MS.02

Time: 5:30 pm

---

ALL WELCOME - please contact Dan Fairbrother ([1]D.J.Fairbrother@warwick.ac.uk) for further details.

---

Dan Fairbrother (2015-01-12 11:35:05)

Even if you’re completely opposed to the whole idea of evolutionary theory in the social sciences, or value-freedom, or even the idea of evolution per se (!), come and put your case in the debate!

---

Some thoughts on sociological blogging (2015-01-10 08:00)

The potential value and dangers of sociological blogging arise because of an environment in which the demands of audit culture incentivise the production of 'unread' and 'unloved' publications which are too often written to be counted rather than to be read. The risk is that sociological blogging gets drawn into the pernicious logic of these metrics perhaps with 'impact' being measured through the daily visitors a blog receives or the number of times an online article is shared on social media. The temptation arises in part because of the manner in which such analytics are designed into blogging platforms themselves, with all providing numerous ways to view statistics about a blog’s popularity and many third party utilities available which can extend these modes of measurement. Given a broader trend first towards 'content factories' and then 'viral publishers', as well as the domination of 'click-bait', we need to think seriously about the potential for the the logic of the 'social web' to act back upon digital scholarship in a way
that leads to a slide towards banality. My own experience has been that these considerations can creep in almost surreptitiously, as a seamless extension of rather innocuous practical considerations. If one is investing time in a project that aims to provide a platform for sociological writing then a reliance upon the built in metrics for measuring the circulation of that writing is inevitable. The problems begin when a incipient awareness of the varying popularity of different kinds of writing begins to effect how they are valued.

For example, articles bemoaning the contemporary state of higher education are inevitably very popular (presumably because they both have a broader disciplinary remit then things which are explicitly sociological and appeal to something in the day-to-day professional lives of those reading them) but should this popularity mean that writing of this form becomes particularly valued for the blog itself? It probably should not but it is easy for this slide to happen, with a concern for the blog's popularity and reach too easily giving rise to a concern for ‘content’ that contributes to these ends. We can see a similar issue with the titles which are chosen on blogs. With even the most casual assessment of the relative ‘performance’ (my unthinking use of this term and overwhelming need to place it in scare quotes reflects the underlying ambivalence I am attempting to convey) of blog posts, it soon becomes clear that the title chosen contributes to how widely ready they are, largely through the mediating factor of how pervasively they are shared on social media. To a certain extent this can be a positive thing, encouraging the choice of informative and evocative titles, as opposed to narrowly descriptive ones. However a recognition of the sheer difference that a title can make, particularly if this is grounded in an engagement with the available data about how widely posts are shared on social media, can surely have a distorting effect. To use a recent example, I found that a post initially entitled "Gender, Reflexivity and Friendship" attracted little attention on social media but was shared extensively when given a new title "The Sociology of Friendship". Soon after, I found myself rejecting the potential title "Performance, Awkwardness and Sociability" for a similar post (a couple of thousands of words of social theory, too unstructured for an academic article but nonetheless trying to make a serious, albeit meandering, sociological point) in favour of "The Sociology of Awkwardness". Predictably enough this proved extremely popular and acted as encouragement to pursue similar naming conventions in future. The risk here is that a tendency within online publishing more broadly, in which often quite obnoxious headlines are generated quasi-algorithmically because of their demonstrable impact on the ‘virality’ of a post, creep into online scholarship as a proclivity for data analysis and an investment in the success of a project outweigh the high minded dismissal of these trends.

Perhaps this points towards the emerging need for online editorship to be taken seriously as a form of academic service. It is only in the last two years, partly as a result of editing the LSE's British Politics and Policy blog as a full time job, that I've begun to feel comfortable describing myself as such. Previously, I felt there was a degree of affectation about it, as if describing oneself as an ‘editor’ in relation to a blog was a pretence at seriousness about an inherently unserious activity, something which was occasionally reflected in judgements I received from other people (though inevitably my own insecurity led me to give more weight to their judgement that they probably intended). But given the likely continued expansion of sociological activity online then the role of the blog editor is likely to grow in importance over time, as a gatekeeper to opportunities for professional visibility but also as a mediating factor shaping the emergence of online norms.

While some normative standards are beginning to emerge concerning matters such as attribution, style and format, these are inevitably fragmented and partial. The more seriously we take the role of blog editor then the more reflexively such questions are likely to be approached by those performing this function. This is important given that such individuals are amongst the few actually able to enforce standards online, albeit in a truncated domain, with the solidification of such norms otherwise being largely a matter of mimesis, as individuals observe others in their networks (or beyond them) in order to inform their own emerging practice. If we take editorship in this sense seriously as a form of academic service then we help mitigate against the tendency for such questions to be responded to pragmatically, instead creating the possibility of a ‘third space’ between academic research and journalism occupied by those who are concerned to translate academic knowledge. Either in the sense of being writers themselves who work to popularise academic knowledge by writing about it in a form amenable to a wider readership or by working with academics, whether directly on particular pieces of writing or indirectly through
creating structures that incentivise certain forms of communication. My contention is that such a function is not straightforwardly academic but nor is it journalistic. Given the much remarked upon overproduction of PhD graduates, with too few academic jobs available for those awarded doctorates to pursue academic careers, it is intriguing to speculate about the likely implications of a potential funded expansion of group blogging for academic career trajectories.

I am personally within the first cohort for whom this is a viable occupational opportunity, albeit still in a very limited way, with blogging having contributed in an important way to sustaining myself financially through six years of a part-PhD (through working full time as an editor for some time but also through more ad hoc work such as running workshops and managing social media accounts). There is obviously a sense in which I have a vested interest in the expansion of this sphere, given I enjoy this work and, if possible, want to pursue a career path which mixes my own research and social media to the greatest extent possible. It is precisely the existence of such vested interests, as well as the significance of broader institutional trends for academic blogging and vice versa, which makes it imperative that we expand discussions of online writing, as well as other forms of social media engagement, beyond the scope of the merely technical. The communicative opportunities afforded by blogging invite us to consider the purposes of such communication. My suggestion has been that they pose tacit questions of great importance which it is valuable for the discipline as a whole to recover: what is sociology for? How do sociologists communicate? How could they communicate? How should they communicate? Many of the risks which have been discussed reflect a failure to address such questions adequately, with immediacy and novelty potentially squeezing out disciplinary craft rather than acting as an invitation to rethink that craft in light of these changing opportunities.

Two digital sociology events @sociowarwick on January 13th (2015-01-10 17:33)

What is Digital Sociology? An evening lecture by Deborah Lupton with Mark Carrigan and Emma Uprichard responding. It will take place in S0.21 from 5pm to 7pm. This is in the Social Sciences Building on the University of Warwick campus. It would be helpful if you could register using [1]Eventbrite.

Sociological Perspectives on Digital Health: An afternoon seminar with Deborah Lupton, Conor Farrington, Sam Martin and Maz Hardy. It will take place in A0.23. This is Milburn House, the centre of the IAS which is next to University House. You can find it on the campus map [2]here by typing in A0.23. The seminar will take place from 2pm to 4pm. It would be helpful if you could register using the eventbrite page [3]here.

Feel free to contact [4]mark@markcarrigan.net with any questions. There are travel directions to the university [5]here.

1. [https://www.eventbrite.com/e/what-is-digital-sociology-tickets-14901389457](https://www.eventbrite.com/e/what-is-digital-sociology-tickets-14901389457)
2. http://www2.warwick.ac.uk/about/visiting/maps/interactive/
4. mailto:mark@markcarrigan.net
5. [http://www2.warwick.ac.uk/about/visiting/directions/](http://www2.warwick.ac.uk/about/visiting/directions/)
The Board of Trustees at the University of Pennsylvania appointed Dr. William Edward Burghardt Du Bois Honorary Emeritus Professor of Sociology and Africana Studies on February 17th 2012. The day included three intellectual panels, art installation, musical tribute, and a poetic tribute. This short video captures the day's activities. Tukufu Zuberi, professor of sociology and the Lasry Family Professor of Race Relations in the School of Arts and Sciences, led the effort to recognize W.E.B. Du Bois with the professorship and facilitated this daylong conference at Penn to mark the occasion. The conference included three intellectual panels, an art installation, and musical and poetic tributes. TZ Production Company, which Zuberi helms, documented the conference in a half-hour video "Honoring W.E.B. Du Bois 2012"

Call for Papers – International Social Theory Consortium 2015

INTERNATIONAL SOCIAL THEORY CONSORTIUM 2015

14th Annual Conference of the International Social Theory Consortium
Cambridge, UK, June 18-19, 2015

RECONSTRUCTING SOCIAL THEORY, HISTORY AND PRACTICE

CALL FOR PAPERS

With regard to developments in social theory, the past 30 years can be characterized as an Age of Deconstruction. Inspired by post-structuralism, post-modernism, critical theory, and science studies, as well as combinations of related approaches, theorists have endeavoured to shatter historical meta-narratives and struggled to include previously excluded standpoints in social thought. This important trend no doubt has informed our understanding of the role of discourse, difference and expertise in determining relations of power and inequality.

The central theme of the 2015 annual meeting of the International Social Theory Consortium (ISTC) will be "Reconstruction", dedicated to taking account of and interrogating the possibility of picking up the pieces. Are there limits to the deconstruction project, and have these limits been reached? What are the possibilities for the 'reconstruction' of narratives of long-term historical change? Is it possible to include and integrate the insights and contribution of various critiques of knowledge, while at the same time developing new forms of knowledge? Can we submit the project of deconstruction itself to deconstruction?

Essential to such a project of "deconstructing deconstruction" would be a return to history—acknowledging its continuing importance as a social-theoretical category and frame, considering its persistent utility after decades of sobering realizations, and accepting the fact that, by most accounts, history has not reached its end. How would social science disciplines – e.g. economics – benefit from new perspectives on understanding long-term change? What might, could and should a new philosophy of history – subsequent to so many ‘turns’ – look like? What are the possibilities for practice in addressing social justice and democracy, with the benefit or in the absence of long-term historical consciousness?

While conference continues the ISTC’s tradition of encouraging...
Submission of abstract proposals on the entire range of topics under the general heading of social theory...

...and we especially look forward to receiving submissions that...

Frame contributions in terms of Reconstruction
Relate existing research agendas and projects to Reconstruction
Directly address the theme of Reconstruction

...including:

> Philosophy of History in an Age of Deconstruction
> Reconstructing Theories of the State and Politics
> The Limits, Horizons and Possibilities of Critique
> Knowledge, Authority and Expertise
> Historicizing Social Theory
> Reconstructing the (His)Story of Modern Societies
> Social Theory as the Link between the Past and the Future
> Social Theory after/beyond the Human

Please email abstracts to istc2015@socialtheory.org no later than 15 March 2015.
Organizers:
Eric R. Lybeck, Department of Sociology, Cambridge University
Harry F. Dahms, Department of Sociology, University of Tennessee-Knoxville

Please feel free to address any questions or concerns to Eric Lybeck (erl37@cam.ac.uk) or Harry Dahms (hdahms@utk.edu)

Universal Credit: a quiet revolution in the Welfare State (2015-01-13 08:00)

Universal Credit: a quiet revolution in the Welfare State

23 January 2015

Reichel Hall, Bangor University

The introduction of Universal Credit is the most significant and wide-ranging change to the benefits system since its establishment in 1948.

The Credit will co-ordinate aspects of State support with the aim of ensuring that no claimant will be financially worse off by accepting work than they would be by claiming benefits. It will replace the following benefits:

- Income-based Jobseeker’s Allowance
- Income-related Employment and Support Allowance
- Income Support
- Child Tax Credit
- Working Tax Credit
- Housing Benefit and some aspects of the Social Fund

The Conference will bring academics and professional workers in the field to discuss and try and foresee the impact this change will have on some of the most disadvantaged people in Society.

The Conference will be particularly informative and important to those whose decisions affect families on low incomes, children and the housing sector and will be of interest to workers in the third sector, policy directors and officers as well as local and national elected representatives and students of social policy.

The Conference will be held in Welsh but with translation available.
Key Note Speech: Hywel Williams MP

Conference Details

Time: 10.30am – 3.30pm

Admission: Free but delegates are asked to register before hand

Registration and Further Information:

Siôn Jobbins: [1]s.jobbins@colegcymraeg.ac.uk | 01970 622893

Conference Hashtag: #CredydCynhwysol

Social media and ambient intimacy (2015-01-14 08:00)

http://gty.im/135199854

There’s a pervasive tendency to see social media as something detrimental to the quality of human relationships. The precise formulation tends to vary but in practice it amounts to a claim that ‘real’ and ‘meaningful’ (i.e. relationships sustained through face-to-face communication) are being replaced with ‘virtual’ and ‘superficial’ ones (i.e. relationships sustained through digitally mediated communication). It doesn’t take much thought to recognize [1]this is simplistic but I think something important is changing here.

One important aspect of this is how intimacy emerges within geographically dispersed but highly networked social orders. Intimacy is an important part of human relationships and for much of human history it was grounded in (to some extent) shared experiences within a (to some extent) common context – what Margaret Archer calls contextual continuity. The continuity that such circumstances made possible provided a reliable stock of common reference points, taken for granted understandings and modes of self-expression: a shared mental furniture. This facilitates forms of self-disclosure that are otherwise unreliable. When we share this common mental furniture, it becomes easier to externally communicate our internal conversations: the other is much more likely to understand what we mean when we disclose our inner life to them. They understand where we’re coming from.

This general experience finds it apotheosis in the development of intimacy: a general understanding of where we’re coming from develops into a refined sense of who we are. With such people, we don’t need to explain why we experienced something as a slight or a joy. They get us. In romantic relationships and close friendships this is something elective: we work at sustaining continuities because we value the relationship. My suggestion is that the degree to which this intimacy is elective goes hand-in-hand with a decline in our ability to take for granted a general continuity with the other people in our lives. We value intimacy more because a commonality rooted in a converging context can no longer be taken for granted. It still exists but it’s becoming the exception rather than the rule for most and it’s a contingent accomplishment rather than an ongoing feature that fades into the background. However new
forms of intimacy are facilitated by digital communications. I like the idea of ambient intimacy suggested by Leisa Reichelt,

> Ambient intimacy is about being able to keep in touch with people with a level of regularity and intimacy that you wouldn’t usually have access to, because time and space conspire to make it impossible. Flickr lets me see what friends are eating for lunch, how they’ve redecorated their bedroom, their latest haircut. Twitter tells me when they’re hungry, what technology is currently frustrating them, who they’re having drinks with tonight.

Who cares? Who wants this level of detail? Isn’t this all just annoying noise? There are certainly many people who think this, but they tend to be not so noisy themselves. It seems to me that there are lots of people for who being social is very much a ‘real life’ activity and technology is about getting stuff done.

There are a lot of us, though, who find great value in this ongoing noise. It helps us get to know people who would otherwise be just acquaintances. It makes us feel closer to people we care for but in whose lives we’re not able to participate as closely as we’d like.

Knowing these details creates intimacy. (It also saves a lot of time when you finally do get to catchup with these people in real life!) It’s not so much about meaning, it’s just about being in touch.

This isn’t intimacy in the sense in which we usually use the term. I’d prefer to think of it as a form of mediated continuity to be compared to contextual continuity. Could we say that continuity itself – either mediated or contextual – stands as a necessary but insufficient condition for intimacy? It does not in itself lead inexorably to intimacy, to the discovery of commonality in spite of difference and the emergence of relationships, but without this continuity the possibility of intimacy doesn’t arise.

---

**Subtraction stories and social change (2015-01-15 08:00)**

The closest thing I have to an historiographical principle is to always be suspicious of what Charles Taylor calls ‘subtraction stories’. While he uses the concept to refer to congratulatory stories of rational emancipation in which human beings have gradually dispensed with myths and illusions that served to limit them, it can equally be applied to refer to narratives of gradual decline in which we have progressively lost touch with the authentically human. To
call something a subtraction story does not entail that we think the story is false so much as that it is simplistic. In the more sophisticated forms of subtraction stories, elements that are empirically accurate serve to reinforce the plausibility of an account that is appealing on a narrative level but analytically deficient.

The temptation here is to flip to the opposite extreme, responding to the obvious simplicity of a subtraction story by denying its claims in their entirety. For instance, to respond to those who say we have lost everything by claiming that we have lost nothing. While the inverse position might be more sensible than that which it is a response to, it’s no less questionable to me because it reproduces the narrative structure which is the underlying problem. There’s a certain temptation to these positions, with the bold pronouncements of epochal change (or lack thereof) which they license. I think sociologists are far too prone to them. In practice, I lean much more towards the proclamation of change rather than its denial because I think things are changing in a significant way. But I think this narrative temptation inheres in any attempt to offer accounts of social change that go beyond the merely descriptive.

Demographics of social networks in the US (2015-01-16 08:00)

These findings from the [1]Pew Internet Project are interesting. I had no idea how widely used Pinterest and Instagram were:

- **Facebook**: 23% of adult internet users/19% of entire adult population
- **Twitter**: 71% of adult internet users/58% of entire adult population
- **Instagram**: 26% of adult internet users/21% of entire adult population
- **Pinterest**: 28% of adult internet users/22% of entire adult population
- **LinkedIn**: 28% of adult internet users/23% of entire adult population

LinkedIn has the lowest daily use (13%) and the highest percentage of users (61%) who use it less than once a week. It would be interesting to know how many of these 61% use the service at least monthly. My hunch is that LinkedIn has spread because of an effective automatic invitation system and a widespread sense that opportunities are available through the system (without anyone being particularly clear about what those opportunities actually are) - it’s technically very easy to get drawn into it and there’s a diffuse sense that allowing oneself to do so might be valuable at some unspecified point in the future. In essence, I’m suggesting that LinkedIn is a triumph of marketing over functionality.

Another interesting finding is that Instagram has the highest portion of daily users (49%) after Facebook and roughly half of internet using 18-29 year olds use the service. The recent $35 billion valuation it received seems (slightly) less absurd when you take these demographic factors into account and assume social media as a whole will grow in a sustained way over coming years.

Colin Mills from [1]Oxford Sociology has posted an interesting response to [2]Steve Fuller’s piece here last week about the fortunes of Sociology in the UK’s research assessment exercise. Many of the complaints that have followed the REF concern the peer review process itself and the nature of the standards applied in enacting it. Mills offers a very plausible case that the intellectual promiscuity of sociology (my phrase) leaves assessments of quality as little more than contingent expressions of personal preference because there aren’t generally agreed upon standards of what constitutes ‘good’ and ‘bad’ sociology:

"Successful" disciplines - in the social sciences the paradigm case is probably economics - define relatively tightly what kind of thing is inside and outside of the tent. Standards about what is and is not an acceptable question or solution to a question are shared and there is a consensus about the suite of acceptable research strategies - though not necessarily agreement about the applicability of a particular tool in each case. All this is not to say that people agree all the time about all the questions and the ways to answer them, but people do agree about the sort of thing they are doing to the extent that they can meaningfully talk to each other. The Economic Journal does not publish [3]poems.

Paradoxically a "discipline" in which "anything goes", is, of course, not literally a discipline in which everything goes. It is simply a discipline in which quite arbitrary decisions about academic value get made that depend on whoever has grabbed or promoted themselves to positions of power and influence. Sometimes these decisions coincide with what is reasonable, sometimes they are absurd. How they look will very much depend on what flavour of "sociology" the observer happens to prefer.

When I’ve read about graduate education in the US and compared it to my own experience in the UK, I’ve been struck by the disparity. I feel like I’ve thrived intellectually in the conceptually anomic environment of British Sociology but this is a statement about personal experience rather than anything else. I find it hard to see how anyone could contend that more professionalisation in graduate education wouldn’t contribute to raising intellectual standards - unless one perhaps were to argue that any attempt to this end would inevitably be done rather badly under current conditions.

Mills goes on to argue that personal interests have led many to acquiesce to a fragmentation of the discipline that they privately bemoan:

The real criminals, in my view, are the people that have led and been influential in running the major British sociological institutions. The BSA Presidents, the editors of the journals, the Professors in the major departments, in short the people who could have led but instead sat back and let a hundred flowers bloom while saying things in private like: "I know that what x says is correct but I can’t be seen to endorse that because it will upset y and lead to z and then w won’t like me and therefore I won’t be invited to v."

I have no idea if this is an accurate picture. Though I’m again struck by the disjuncture between my subjective
satisfaction (I quite like an environment in which a “thousand flowers bloom”) and my reflective agreement with the spirit of what he’s saying, even if I dislike the way he says it. I enjoy this slightly anarchic atmosphere but if we think the discipline of Sociology is an intellectual project with value then it seems obvious to me that the former is in tension with the latter. I find invocations of ’hobbyist sociology’ obnoxious and yet I do see what they’re getting at: perhaps my discomfort with reaching these conclusions goes some way to explaining why I find the terminology so irritating.

I’m reminded of what Christian Smith says in the Sacred Project of American Sociology about the ’peace treaty’ within the discipline: “everyone should mostly think and do whatever he or she wishes in terms of methods, theory, and intent and not suggest that what anyone else is doing might be a problem” (pg. 142). The result isn’t really pluralism in any meaningful sense, in so far as that people aren’t within the same argumentative space (as Doug Porpora would put it) but are rather simply doing their own thing within more or less shared institutions. Though I’ve been told that what I do isn’t sociology enough times at this nascent stage of my career that perhaps a revocation of the ’peace treaty’ would mean I get kicked out and I’d have to go a philosophy department and perhaps change the name of this blog. Hmm.

Tony Lawson: 90%+ of economics taught in Western world is based on mathematical modelling that is useless (2015-01-18 08:00)

IFRAME: [1]//www.youtube.com/embed/b_vMLHis5cE

rennie warburton (2015-01-19 03:48:18)

Lawson’s presentation is understandable, clear and well-supported by the examples he provides. Are there economists who have taken up Lawson’s ontology and demonstrated its relevance to their discipline?

What will post-democracy look like? (2015-01-19 08:00)

As anyone who reads my blog regularly might have noticed, I’m a fan of Colin Crouch’s notion of post-democracy. I’ve interviewed him about it a couple of times: once in [1]2010 and again in [2]2013. Whereas he’d initially offered the notion to illuminate a potential trajectory, in the sense that we risk becoming post-democratic, we more latterly see a social order that might be said to have become post-democratic. He intends the term to function analogously to post-industrial: it is not that democracy is gone but that it has been hollowed out:

The term was indeed a direct analogy with ‘post-industrial’. A post-industrial society is not a non-industrial one. It continues to make and to use the products of industry, but the energy and innovative
drive of the system have gone elsewhere. The same applies in a more complex way to post-modern, which is not the same as anti-modern or of course pre-modern. It implies a culture that uses the achievements of modernism but departs from them in its search for new possibilities. A post-democratic society therefore is one that continues to have and to use all the institutions of democracy, but in which they increasingly become a formal shell. The energy and innovative drive pass away from the democratic arena and into small circles of a politico-economic elite. I did not say that we were now living in a post-democratic society, but that we were moving towards such a condition.

Crouch is far from the only theorist to have made such a claim. But I think there’s a precision to his argument which distinguishes it from the manner in which someone like, say, Bauman talks about *depoliticisation*. My current, slightly morbid, interest in representations of [4]civilisational collapse has left me wondering what *entrenched post-democracy* would look like. Asking this question does not refer to an absence of democracy, for which endless examples are possible, but rather for a more detailed sketch of what a social order which was once democratic but is now post-democratic would look like. While everyday life might look something like that which can be seen in Singapore, ‘the city of rules’ as [5]this Guardian article puts it, I think there’s more to be said than this. However we can see in Singapore a vivid account of how micro-regulation can be deployed to facilitate a city in which ‘nothing goes wrong, but nothing really happens’ as one ex-pat memorably phrases it in that article. Is it so hard to imagine *efficiency* and *orderliness* being used to secure consent, at least amongst some, for a similar level of social control in western Europe or America?

Perhaps we’d also see the *exceptional justice* that intruded into UK life after the 2011 riots, with courts being kept open 24/7 in order to better facilitate the restoration of social order. There’s something akin to this in [6]mega sporting events: opaque centralised planning overwhelms democratic consultation, ‘world cup courts’ dish out ad hoc justice, the social structure contorts itself for the pleasure of an international oligopoly upon whom proceedings depend, specialised security arrangements are intensively deployed in the interests of the event’s success and we often see a form of social cleansing (destruction of whole neighbourhoods) presented as a technocratic exercise in event management. We also see pre-arrests and predictive policing deployed to these ends and only a fool would not expect to see more of this as the technological apparatus and the political pressures encouraging them grow over time.

These security arrangements point to another aspect of a post-democratic social order: the economic vibrancy of the security sector. There is a technological dimension to this, with a long term growth fuelled by the ‘war on terror’ coupled with an increasing move towards ’disruptive policing’ that offers technical solutions at a time of fiscal retrenchment, but we shouldn’t forget the more mundane side of the security industry and its interests in privatisation of policing. This is how Securitas, one of the world’s largest security companies, describe the prospects of the security industry. Note the title of the page: *taking advantage of changes*.

The global security services market employs several million people and is projected to reach USD 110 billion by 2016. Security services are in demand all over the world, in all industries and in both the public and private sectors. Demand for our services is closely linked to global economic development and social and demographic trends. As the global economy grows and develops, so do we.

Historically, the security market has grown 1–2 percent faster than GDP in mature markets. In recent years, due to current market dynamics and the gradual incorporation of technology into security solutions, security markets in Europe and North America have grown at the same pace as GDP. This trend is likely to continue over the next three to five years.
Market growth is crucial to Securitas’ future profitability and growth, but capitalizing on trends and changes in demand is also important. Developing new security solutions with a higher technology content and improved cost efficiency will allow the private security industry to expand the market by assuming responsibility for work presently performed by the police or other authorities. This development will also be a challenge for operations with insourced security services and increase interest in better outsourced solutions.

Consider this against a background of terrorism, as the spectacular narrative of the ‘war on terror’ comes to be replaced by a prospect of state of alert without end. We've not seen the end of the ‘war on terror’, we've seen a spectacular narrative become a taken for granted part of everyday life. It doesn't need to be narratived any more because it's here to stay. Against this backdrop, we're likely see an authoritarian slide in political culture, supplementing the institutional arrangements already in place, in which 'responsibility' becomes the key virtue in the exercise of freedoms – as I heard someone say on the radio yesterday, "it's irresponsible to say democracy is the only thing that matters when we face a threat like this" (or words to that effect).

Crucially, I don't think this process is inexorable and it's certainly not the unfolding of an historical logic. It’s enacted by people at every level – including those who reinforce the slide at the micro level of everyday social interaction. The intractability of the problem comes because the process itself involves a hollowing out of processes of contestation at the highest level, such that the corporate agents pursuing this changing social order are also benefiting from it by potential sources of resistance being increasingly absent or at least passive on the macro level. This is how Wolfgang Streeck describes this institutional project, as inflected through management of the financial crisis:

The utopian ideal of present day crisis management is to complete, with political means, the already far-advanced depoliticization of the economy; anchored in recognised nation-stated under the control of internal governmental and financial diplomacy insulated from democratic participation, with a population that would have learned, over years of hegemonic re-education, to regard the distributional outcomes of free markets as fair, or at least as without alternative.

Syndicalist Sociology: The Forgotten Work of Guillaume De Greef (2015-01-20 08:00)

by Jeff Shantz, Kwantlen Polytechnic University, Vancouver

Radical perspectives, particularly those that have connections with or roots in actual movements for social change and resistance, often find their contributions unacknowledged or marginalized within formal academic disciplines such as the social sciences. Even where such radical perspectives make useful, insightful contributions to the development of, and developmental debates and arguments within an academic discipline, they are often written out of the history of those disciplines after the fact. Such has been the case especially for those theories that challenge instituted structures of authority, such as anarchism or syndicalism.

Despite the fact that anarchism has always informed sociological thought and debates (from the inception of sociology as a formal discipline up through the present) anarchism has largely been excluded from discussions of sociological thought. This is true in the case of both texts on the history of sociology as well as in works focused on traditions of sociological theory (see Shantz and Williams 2014). Recently, though, some work is being done to re-evaluate the contributions of anarchism to the social sciences more broadly (See Howell 2014; Shantz 2014; Shantz and Williams 2014; Williams 2014).

If anarchism has been marginalized within disciplines like sociology, the situation is even more dire for treatments of syndicalist theory within sociological history (and thought). With a few exceptions syndicalism has been rendered, unjustifiably, invisible. Syndicalism emerges as part of the radical working class movements in the nineteenth century, not only in Europe but on virtually every continent (see van der Walt 2010). It presents searching perspectives on exploitation, labor, and workplace relations that eschew hierarchy, including labor hierarchies, and emphasizes informal work networks, rank-and-file self-determination, and working class solidarity and autonomy from capital. At the same time syndicalism highlights social developments that hint at alternative social relations in formation, suggestive of “a new world within the shell of the old.” This is an anti-authoritarian vision of labor that focuses on working class self-organization and decision-making. It views such organizing as incubators for new, innovative, non-exploitative, forms of human social arrangement.

Syndicalism has made important contributions to thinking about work, production, divisions of labor, hierarchy, authority, class relations, democracy, etc. Yet an examination of sociological history or theory texts shows that syndicalism is almost entirely absent from the literature. The few exceptions include brief discussions of Georges Sorel, theorist of revolutionary syndicalism, the general strike, and social myth, who wrote numerous notable texts such as The Decomposition of Marxism (1908), The Illusions of Progress (1908), Material for a Theory of the Proletariat (1919) and most famously Reflection on Violence (1908).

Yet there are other, intriguing yet hidden, syndicalist contributions to sociology, from practicing sociologists, from within formal sociology. Among the most interesting and insightful if unjustly long forgotten syndicalist contributions to sociology is the work of Belgian sociologist, and contemporary of Sorel, Guillaume De Greef (1842–1924). Indeed, De Greef has been recognized as Belgium's most prominent and noteworthy sociologist (of any tendency or tradition). The radical character of De Greef’s work perhaps contributed to the limitation on its broader influence on
De Greef was born in Brussels in 1842 and was raised in a family of free thinkers and artists. In his youth he read progressive philosophers, like Voltaire, who influenced the thought of Revolutionary France and the generations following the Revolution (Douglas 1948, 539). As a university student he gravitated toward the works of utopian socialists, including Saint-Simon and the proto-anarchist Charles Fourier, before coming to his greatest influence Pierre-Joseph Proudhon, the first to explicitly identify his philosophy as anarchist. De Greef adopted Proudhon’s theory of mutualism that emphasizes social order and interchange on the basis of mutually beneficial, equal, exchange or interaction. De Greef would go on to edit the Proudhonian journal La Liberté along with his colleague and classmate Hector Denis.

From his days as a university student onward the petit bourgeois De Greef would dedicate himself to the cause of the working class and social reform (Douglas 1948, 539). It is believed that De Greef prepared the program if the Belgian delegates to the International Workingmen’s Association (IWMA, or First International) in the 1860s. A clearly Proudhonian program, emphasizing free credit and opposing any state, this perspective was defeated at the International by the approach promoted by Karl Marx, which asserted the necessary role of a proletarian state in the transition to communism. The growing dominance of Marxism in international socialist movements contributed to the marginalization of De Greef’s syndicalist perspective, as indeed it did for other libertarian and anti-statist versions of socialism and communism.

With his influence within the labor and socialist movements waning, De Greef devoted his efforts increasingly to his academic research and writing. De Greef’s first published monograph in theoretical sociology appeared circa 1886 with his relatively influential Introduction à la sociologie. The critical response to De Greef’s initial work was so positive that he was appointed the first Chair in Sociology at the University of Brussels. While in this position De Greef became embroiled in some controversy related to the university’s decision to dismiss respected geographer, but active anarchist, Élisée Reclus, due to that eminent scholar’s political agitational work. In response De Greef mobilized an exodus of numerous other professors and students from the school (Douglas 1948, 540). The departed scholars soon founded a new progressive institution, L’Université Nouvelle, which was committed to work in the social sciences while also asserting freedom of thought and cooperation with the educational movement of workers (Douglas 1948, 540). This project, and the earlier support of Reclus and academic freedom, shows De Greef as a committed public intellectual and principled scholar. The project also represents a much earlier model of institutions such as the New School for Social Research set up as centers of critical research, scholarship, and pedagogy in the face of politically motivated attacks on critical and progressive scholarship and faculty.

De Greef’s sociological work builds upon Proudhon’s conception of free credit associations and proposes the notion of occupational representation through trade associations. In this perspective free credit associations would be organized on a trade by trade basis in each locale. In this they would carry out their more traditional economic activities but also, at the same time, assume the functions currently carried out by the political state. In this the trade associations provide the basis for a syndicalist form of social order. Notably this vision of social order is developed by De Greef more than a generation before the ideas presented in the works of better known syndicalists such as James Guillaume and Emile Pouget or in the guild socialism of G.D.H. Cole (which is perhaps closest to De Greef’s perspective).

Among De Greef’s major theoretical works are Structure général des sociétés and Lois sociologiques. His applied works, which stand as some of his most engaging, include Ouvrière dentellière (The Women Lace-Makers), Rachat des charbonnages (The Repurchase of the Coal Mines), and Régime représentatif (How Government May Be Made Representative). These give a robust presentation of the Proudhonian syndicalist social order in the actual contemporary conditions of life which they discuss (rather than in a future utopian scheme). In his social researches De Greef finds evidence for such directions among social conditions and practices. His is not some speculative or utopian approach.
De Greef’s analysis centers on the role of workers’ associations, something similar to but more than trade unions as typically understood. Collective bargaining in industry provides the model for an occupational parliament on a national scale for De Greef. This occupational parliament is accompanied by transformation in systems in credit (in a manner inspired by Proudhon’s discussions). In terms of political transformations, De Greef suggests that formal democratic practice may be reformed immediately by having all people register at polls by trade instead of by simple geographic divisions or ridings. In these trade polls, workers and management are represented separately and equally (Douglas 1948, 541). While his will initially result in an inequality of representation, as fewer owners will have the same representation as far more workers, De Greef is not overly concerned by this. From his perspective this approach makes its contradiction open for all to see unlike current representative democracy which masks this fundamental reality of social structure and inequality. In his view:

Equality is not personal, but functional....Suppose there were formed a nationwide trust of all coal mines....in the hands of a dozen....large capitalists. These twelve....could have a representation equal to that of the 144,000 workmen!....well, I do not recoil before this abominable situation. Why? Because....I prefer a truthful representation to one which is fictitiously and deceptively democratic. What matters it if the mirror that reflects our social system gives back an ugly image? Is it the fault of the mirror that society is not beautiful, and should we in anger throw down and break the mirror. (quoted in Douglas 1948, 542)

As labor comes to play a more predominant economic role (in cooperative ownership, for example) its representation will grow accordingly. As capital becomes usurped or expropriated its representation will diminish such that workers solely will be represented.

At the same time governance can occur on a day to day basis in local joint industrial councils. These industrial councils, including employers and workers, will oversee grievances, working conditions, and trade issues.

For De Greef, these innovations, which are possible within current conditions, would bring the social questions, and key economic functions, to the center of politics (rather than giving them the phony cover they enjoy in conventional parliamentary politics). At the same time they would shift the reconstruction of these systems in the direction of control by labor (Douglas 1948, 542). This would occur because of the day to day practical and pedagogical effects of a national system of mass, rather than trade-based or union based, collective bargaining in which all were directly and actively involved.

It was De Greef’s expectation that the syndicates would eventually take on the functions of employment, through cooperatives for example, and thus assume all political power (Douglas 1948, 542). In terms of the system of credit, De Greef suggests the issuing of what amounts to fiat currency, alongside redeemable money (Douglas 1948, 541). Fiat notes would reflect the commercial and industrial transactions underway at a given time. They would not carry any interest above a nominal charge for overhead and risk and would be apportioned to member institutions, typically workers’ associations, which would supervise applications for credit by members and apportion the notes accordingly to them. Such readily accessible credit made available to productive enterprises would allow for syndicates to quickly take over collective contracts for work (Douglas 1948, 541). In De Greef’s view, this would mean that idle capital would be absorbed by the syndicates with the capitalist employer eventually dispossessed (as a matter of economic efficiency rather than political ideology or revolution).

De Greef analyses processes that simultaneously bring social contradictions to the surface of politics and transform social relations in the present. His evolutionary approach is a break with most syndicalism which asserts revolutionary perspectives on social change. Indeed, De Greef’s work is particularly at odds with the perspective of Sorel who...
abhors notions of worker and management councils or collective bargaining which he views as buffers on class struggle. For Sorel, the emphasis is on scission or the rupture, along class lines, of workers and capital. In this, class violence famously plays a part in Sorel's view.

De Greef, perhaps ahead of much early sociology, provides an ecological analysis that recognizes and emphasizes the connectedness of humans and the natural world and centers this in his analysis. He emphasizes not only humans and their social relations, but situates these within the physical environment in connection with which he says human relations must be studied. De Greef constructed Herbert Spencer’s notion of social evolution in terms of increasing differentiation and coordination (Douglas 1948, 542). This is similar to the ecological notion of unity in diversity.

Overall, De Greef understood his sociology as a merging of Comte (classification), Spencer (social evolution), Quételet (statistics and quantitative analysis), with socialism in his view sociology is scientific socialism. Yet this is a socialism of Proudhon rather than of Marx. De Greef’s syndicalist perspective suggests that economic activities outweigh the political. In addition, organic economic divisions according to function represent the rational seats of power in the future (Douglas 1948, 551). At the center of his analysis is his conception of débat, or processes of mutual interest adjustment between groups and group pressures. In a subsequent article I examine this and other key components of De Greef’s sociology.

Prosumption, appropriation and the ontology of economic form – January 27th @SocioWarwick
(2015-01-20 08:30)

Dave Elder-Vass (Loughborough)
Tuesday, January 27, 2015
5:00 PM to 6:30 PM, R1.15
Ramphal Building, University of Warwick

Prosumption – the unpaid performance of productive work by ‘consumers’ who thus help commercial businesses to generate a profit – is perhaps the most studied of the many hybrid forms of economic practice that have proliferated in the digital economy. A number of critical accounts have analysed prosumption in terms of Marx’s labour theory of value, suggesting for example that as prosumers do useful work for free they are infinitely exploited by the firms that profit as a result. But such accounts analyse the digital economy in terms that were derived from the nineteenth century factory – and terms that were highly questionable even in that context.

The spectacular mismatch between this model of capitalism and the case of prosumption exposes the inadequacy of the standard monolithic conception of capitalism as a homogeneous and universal contemporary economic form – a conception that at a certain level is also shared by the marketised discourse of mainstream economics. We need a new ontology of economic form that goes beyond the totalising concepts of mode of production and market economy and instead provides us with tools for understanding the sheer diversity of forms of economic practice in the contemporary economy. This paper offers the concept of appropriative practices as a contribution to such an ontology and applies it to the case of prosumption.

Dave Elder-Vass is a senior lecturer in sociology at Loughborough University, where he teaches a variety of core sociology modules. He also offers an MA module on Digital Economies and an innovative undergraduate option that consists entirely of debates between students on popular recent books. He is available to supervise PhD students, particularly those with an interest in social theory, critical realism, digital social developments or economic sociology.

Previously, he spent three years as a British Academy post-doctoral fellow in the Department of Sociology at the University of Essex, after completing his PhD at Birkbeck, University of London. Before returning to the academic world he was a senior IT executive in a major UK retail business.
The Relational ‘We’ in Personal Morphogenesis – February 3rd @SocioWarwick (2015-01-20 08:31)

Beth Weaver (Strathclyde)
Tuesday, February 3rd
5:00 PM to 6:30 PM, R1.15
Ramphal Building, University of Warwick

This paper discusses my empirical application of a relational realist analytic framework to illuminate the role of social groups or collectives, as social relations, in shaping and affecting outcomes for individuals and for groups. Using the morphogenetic sequence developed by Archer, to illustrate the conceptual schema progressed by Donati (2011), this framework affords equal recognition to individual actions, social relations and social systems. To empirically capture the relational ‘we’ in social morphogenesis, however, requires taking the social relation as a central unit of analysis. This means empirically conceptualising the social relation as both context and as interaction, and it means analysing the shifting dynamics and influences on the form and shape of a given social relation. Such an analysis can reveal what triggers reflexivity, what different forms of reflexivity entail, and how social relations can shape and influence outcomes for individuals and groups as well as how such processes shape and alter the relations themselves. Using examples from my own research examining the dynamics of desistance from crime, I will show how both individual and relational contributions are interconnected, and how the manner of relating and the reciprocal orientation of individuals-in-relation towards the maintenance of a given social relation are significant in understanding the relational ‘we’ in social morphogenesis.

Beth Weaver is a Lecturer at the Glasgow School of Social Work, University of Strathclyde. Prior to entering academia, she worked in the areas of youth and criminal justice social work in Scotland and latterly as a MAPPA Coordinator.

2015 - The year of the new necropolitics? (2015-01-21 08:00)

by Emilie Whitaker

Unusually for a festive period associated with new beginnings and births, the past fortnight has been suffused with debate around death and dying. The death of [1]Debbie Purdy, long-term campaigner for assisted dying, reopened the ‘right to die’ debate in frank fashion. In obituaries, commentators called for the House of Commons to support Lord Falconer’s Assisted Dying Bill which would allow doctors to prescribe a lethal dose to terminally ill patients judged to have less than six months to live. As a barometer of the public mood, a steady 60 - 70 % are in favour assisted dying. Those of us who are fortunate enough to work with the practitioners of tomorrow are likely to report similar patterns of support amongst students in our classrooms. In my own experience many despair at the ‘warehousing’ of older people and argue for ‘self-determination in death.’

Debate over what constitutes a ‘good death’ has moved from the hands of bioethicists into mainstream and

There has been the rise of the 'death café' which seeks to engage the public at large on debates about death and dying. Indeed the mundane interaction of strangers gathering over cake to discuss death in order to [4] "increase awareness of death with a view to helping people make the most of their (finite) lives" underlines how death discussion is losing the protective clothing and going mainstream. There can be little doubt that the stories of those living with dying have through their adoption of social media, brought the debate into kitchens, chat rooms and pubs. The intently personal reflections by Gould and Dr Kate Granger and the sociability of the death cafés make it increasingly difficult, perhaps passé, to keep death sealed in the box we all hold at the back of our minds.

The shift from the social denial and medicalisation of death to the conversational and public has been placed into sharp relief by a [5] controversial blog post written by Dr Richard Smith. Smith, a former editor of the British Medical Journal wrote that cancer provided the "best way to die". His argument rested on temporality and vitality. He outlined the long decline of dementia “slowly erasing” the person, the "up and down" of organ failure as 'tempting' doctors to 'treat too long' before dismissing the widely preferred quick, sudden death as self-centred, "That may be OK for you...but it may be very tough on those around you." On his case for cancer he writes,

You can say goodbye, reflect on your life, leave last messages, perhaps visit special places for a last time, listen to favourite pieces of music, read loved poems, and prepare, according to your beliefs, to meet your maker or enjoy eternal oblivion.

Dr Smith revives in many ways, the most ancient of arguments - that only through confronting death can we truly know how to live.

From a sociological viewpoint these events mark a reorientation in the politics of death and dying, one which alerts us to the generative as well as punitive aspects of what Mbembe (2003) coined ‘necropolitics.’ In Mbembe’s Foucauldian-inspired theorising, our current geopolitical condition is indicative of unprecedented forms of biopolitical governmentality in which the technologies of control strategically subject life to the power of death. Drone strikes, ISIS orgies of violence and the geopolitics of the Ebola outbreak underline such a thesis, but perhaps there is more to necropolitics as a site of inquiry and human experience.

The current academic writing on necropolitics tends to deny the generative aspects of Foucault’s schemata – the subversions, the resistances the alternate narratives, the cultural. The work of those like Gould, Dr Granger and participants in death cafés suggest that necropolitics can be a site for cultural action and broadening public understanding. The turn outwards to debate what a ‘good death’ means is sociologically instructive of a burgeoning public reclaiming of death. Such an expansion troubles the current conceptualisation of necropolitics, challenging it to encompass the generative cultural responses and subversions of citizens to biopolitical governmentality exercised not only on the battlefield but in hospitals and residential homes across the county.

Reflecting these burgeoning cultural shifts in the practices, narratives and cultures of death and dying I, with Professor Steve Fuller, have a call for papers on "Beyond the Negativity of Death: Towards a New Necropolitics" in a special issue of the journal Social Sciences. Open until 30 June 2015. [6] http://www.mdpi.com/journal/socsci/special_issues/beyond_the_negativity_of_death

How to be an academic and deal with stupid & hostile interviewers (2015-01-22 08:00)

IFRAME: [1]//www.youtube.com/embed/Jt1cOnNrY5s
What is Digital Sociology? (2015-01-23 08:00)

What is Digital Sociology? I really like that Deborah Lupton suggested this title for her recent lecture at Warwick because it’s a question which fascinates me. Obviously this is in part a matter of terminological novelty, with ‘digital sociology’ obviously supplementing parallel projects of ‘digital humanities’, ‘digital geography’ and ‘digital anthropology’ in ways that are nonetheless difficult to pin down. However I think there’s more to it than this and that asking the question ‘what is Digital Sociology?’ helps keep our focus on digital sociology as a project that is open-ended and integrative, aiming to combine the various disparate strands of sociological engagement with digital matters into a more or less unified field of inquiry. One of the many things I like about Deborah Lupton’s work on Digital Sociology is the way it attempts to answer this question in a way that is intellectually diverse but nonetheless remains coherent. I’m increasingly drawn to the idea that Digital Sociology could be conceived of as:

1. an intellectual and institutional project which aims to build spaces within which these strands of activity can be brought into productive dialogue with one another

2. the totality of work which emerges from within such spaces having been shaped by them
It sounds absurdly abstract when I phrase it like this. In practice I’m talking about quite mundane things like expanding study group activity, organising conferences, developing websites, establishing journals. I’m also speculating about what will emerge out of such spaces because I don’t know but I’m convinced it would be valuable. I’m also convinced it’s going to prove crucial to the future of the discipline in an increasingly inhospitable climate, though whether I’m able to justify that intuition evidentially is another question. I think there’s something very exciting beginning to happen though and it feels like Digital Sociology is beginning to take some kind of concrete shape rather than simply being something which is invoked in a quasi-speculative manner.

One of the things that appeals to me most about digital sociology is the possible transformation in sociological practice which it both reflects and reinforces. If digital communications increasingly become part of the research process itself then there’s a tendency towards a form of continuous micro-publication, almost constituting a kind of open-source sociology, which could contribute in an important way to the profile of the discipline. I’m cautiously optimistic that the tendency within sociology to see the communication of sociological knowledge as something of secondary importance could become a thing of the past & sociologists could become somewhat more sociable than they have tended to be. I’m also excited by the feral forms of public engagement which are proliferating on social media and hope they resist assimilation into the assessment structures of the academy. I’m deeply opposed to social media metrics being incorporated into academic assessment precisely because I think it’s likely they’ll squeeze the life out of the nascent sphere of activity. In this sense I think the potential implications of digital sociology extend far beyond new research topics, new methods and new methodologies – underlying questions of what constitutes sociological craft and how, if at all, it should be revised to take account of new circumstances have heretofore entered rather naturally into digital sociology. I hope these won’t be sidelined as it continues to develop.

CFP for the Asexuality Studies Interest Group at the NWSA Annual Meeting 2015 (2015-01-24 08:00)

2015 Call for Papers about Asexuality

Asexuality Studies Interest Group

National Women’s Studies Association (NWSA)

November 12-15, 2015, Milwaukee, Wisconsin

The NWSA Asexuality Studies Interest Group welcomes papers for the 2015 NWSA annual conference. These asexuality-related themes are orientated towards the full NWSA 2015 CFP which can be found here: http://www.nwsa.org/Files/2015/NWSA %202015 %20CFP_Final.pdf

If you are interested in being a part of the 2015 Asexuality Studies Interest Group panels at NWSA, please send the following information to the designated panel organizer (listed under each theme) by Friday, February 6, 2015:

Name, Institutional Affiliation, Mailing Address, Email, Phone
We will try to accommodate as many qualified papers as possible, but panels are limited to 3-4 presenters. NWSA will make the final decision about which panels are accepted. Presenters accepted into the conference program must become members of NWSA in addition to registering for the conference.

1) Sponsored Session: Disciplining Bodies, Regulating Identities: Affect/Eros and the Intersection of Asexual and Fat Identities

This is a sponsored session of the Asexuality Studies Interest Group in collaboration with the Fat Studies Interest Group.

The fields of Asexuality Studies and Fat Studies are two exciting areas of inquiry in the contemporary academy. Rigorous scholarly analyses and theoretical production combine with cutting-edge social activism to create new epistemologies, creative political strategies and visionary, new social paradigms. Understandings of affect and eros have informed these two academic fields and social movements by fostering knowledge about the role of affective and erotic economies, intensities and potentialities. As the NWSA CFP states: “There is ample evidence of communal and collective practices that invoke alternative imaginaries, worlds, memories, mythologies, desires, cosmologies, embodiments, and yearnings and that disrupt the disciplining of non-normative emotions, desires, bodies, peoples, practices, histories, spaces, and ideas. Affect and eros can thus be considered pivotal both to understanding how precarity is structured and also contested.” This session will utilize perspectives gleaned from asexuality studies and fat studies to explore the fields’ relationship to affect/eros and the productive potential of these intersectional analyses to interrogate, deconstruct and reimagine oppressive corporeal regimes based on compulsory sexuality and the tyranny of slenderness. Topics for this session could include, but are not limited to:

- the experiences of individuals who identify simultaneously as fat and as asexual and the vulnerability engendered by converging ideological systems based in acephobia and fatphobia; affective knowledge of uniquely fat and asexual grammars of the body

- the ways in which affective and/or erotic work is deployed in service of fat and asexual acceptance, rights, visibility, community-building and education; the fostering of fat and asexual affective solidarity

- the corporeal disciplining of fat and asexual bodies and the regulatory control of these identities through affective and erotic inducements in a culture of precarity

- The construction of fat bodies as inherently asexual and the theoretical, discursive and political implications of this conflation

- The stereotyping, bias and discrimination faced by fat and asexual communities; affective and erotic policing and regulatory surveillance of fat and asexual bodies and identities within a neoliberal cultural economy

- The ways in which asexual and fat eros/affect intersect with multiple categories of difference including race, ethnicity, class, age, immigrant status, dis/ability and religion

Please submit materials for the sponsored session to organizer, Joelle Ruby Ryan (Joelle.Ryan@unh.edu).
2) Co-Sponsored Session with Trans/Gender-Variant Caucus:

Institutions, Containments and the Intersection between Asexuality & Trans/Gender-Variance

This is a co-sponsored Round Table Discussion* with the Trans/Gender-Variant Caucus and the Asexuality Studies Interest Group.

Institutions, even with the best of intentions, can create containments or confinements for those they work to serve, and exclude those outside predetermined groups. Asexuality and trans/gender-variance often fit outside institutional categories, which can cause uncertainty, insecurity, or precarity for one’s well being. This discussion will focus on the intersection of trans/gender-variance and asexuality, how their resistance to control, repression, and confinement overlap, and power imbalances between them.

Proposals for this theme may include, but are not limited to, the following topics:

●How can the intersections of trans/gender-variant and asexuality studies serve as a way to critique institutional control and containment, through disability, debility, race, citizenship, sexuality, class, and gender?

●How are asexual and trans/gender-variant bodies positioned within hierarchies of power and what (different) avenues are available for contestation and resistance to those hierarchies?

●Collaborations and intersections between trans/gender-variant and asexual studies can be key to contesting the violence of institutions/containments and to addressing pervasive injustice, but how are power asymmetries addressed within such work?

●How do institutions promote and help asexual, trans/gender-variant, and queer communities and how do they induce precarity, marginalization, and containment?

●Where do trans/gender-variance and asexuality intersect and how can they work against precarity?

●How can asexuality and trans/gender-variant identity be a form of empowerment and not stigma?

As a round table discussion there may be 4-6 presenters. In addition, paper titles are not required for individuals and 50-100 words introducing your contribution to the discussion will suffice as an abstract.

Please submit materials for the co-sponsored session to organizer Bauer McClave (Caroline) at bauer1331@gmail.com

3) Theme 1: Debility/Vulnerability:

The Relevance of Asexualities, Debility and Vulnerability

This panel examines the adaptability of asexualities, debility and vulnerability, as related to both current and past issues of precarity and paradox: indifferent and varying working contexts and creative agency and voice; uncertain futures and possibilities of the present; established hierarchies and open, horizontal structures - largely organized online; old nationalism and new cosmopolitanism; individual inadequacy regarding climate change and project based alliances.

Questions to consider for applicants:
- In what ways are asexualities connected to, and different from, debility and vulnerability?

- How do asexualities, debility and vulnerability represent a radical challenge to power structures rooted in heteronormativity?

- What are working lives of lived asexualities, vulnerability and debility like, within framework of heteronormative dominant culture?

- What are the risks, possibilities and ensuing tension implied within asexualties, debility and vulnerability?

Please submit materials for this session to organizer Anna Lise Jensen, aaaonyc@gmail.com

4) Theme 2: Affect/Eros

Between Affect and Eros: Precarity and the Asexual Community

Following the NWSA theme of Precarity and Affect/Eros this panel will explore the "embodied, political, affective, economic, ideological, temporal, and structural conditions" which construct and regulate asexuality. Precarity "draws attention to the lived conditions, structures nature, and relational aspect of systemic inequality" as an emerging and often contested sexual orientation asexuality is a precarious identity, and asexual individuals often find themselves in precarious positions. As an emerging political identity and orientation asexuality challenges established understandings of both eros and affect. What role can eros play in the politics of asexuality? How do eros and affect emerge in the daily lived experiences of asexual individuals? What expectations around affective labor does asexuality reinforce or challenge? Can eros and affect be deployed to challenge the precarious and marginalized position of asexuality? Or do eros and affect contribute to the precarious position of asexual identities?

Proposals for this theme may include--but are not limited to--the following topics:

● What can be gained by attending to eros and affect together, as sites where Asexual Identity is both precarious and resisted?

● How have affect and eros served as sites of social control? How does Asexuality challenge these conceptions across context and over time?

● How has the surveillance and regulation eros and affect been differently marked in the asexual identity and across intersecting identities such as race, class, disability, citizenship status, gender, ethnicity, religion and/or spirituality and body size?

● How does asexuality eros and affect transform inequality and challenge hegemonic values and practices?

● What productive investigations can be produced by placing asexuality into conversation with affect theory?

● How can feminist theoretical understanding of asexuality produce challenges and knowledge about the norms of romantic love?

● How can asexual identities and experiences challenge, reinforce or dismantle expectations of eros and affective labor sexual relationships of all kinds

3236
5) Theme 3: Institutions/Containments

This theme will seek to explore how various institutions and regimes of social control have sought to contain or regulate asexual identity, as well as how asexuals might form coalitions to resist oppression and precarity. Papers might address any of the following questions, or other relevant questions:

- What is the state of asexual institution building? Do these institutions help asexuals resist precarity or do they further reproduce it?

- How have various institutions and regimes of social control (medical, legal, educational, cultural, carceral, etc.) sought to contain, regulate, or define asexuality across different historical and geopolitical contexts?

- How might asexuals’ coalition building with other gender and sexual minorities contest the violence of institutions/containments and combat pervasive injustice? How are power asymmetries addressed within such work?

- What are the possibilities and potential problems inherent in institutionalizing asexuality under the umbrella of queer identity? Is such an alliance a site of resistance or containment?

- How does asexuality intersect with other institutionalized forms of oppression, including racism, sexism, heterosexism, ableism, colonization, and poverty, to produce precarity?

Please submit materials for this session to organizer Kara French at kmfrench@salisbury.edu

6) Theme 4: Distortion/Dispossession

This year’s conference theme of precarity is particularly relevant to Asexuality studies and to work which intersects many fields of study including health sciences, sociology, anthropology, geography, and others. Precarity, as the NWSA 2015 CFP indicates, is intended to "draw attention to the lived conditions, structured nature, and relational aspects of systemic inequality. Focusing on diverse forms of violence, inequality, and harm pervading contemporary life, precarity names a 'politically induced condition in which certain populations suffer from failing social and economic networks of support and become deferentially exposed to injury, violence, and death.'"

To address precarity and differential suffering, distortion (via representational economies and controlling images) and dispossession (structural dispersal and material deprivation) are key areas of interest. This panel will look specifically at social and material realities of Asexuality, including the effects of distortion and dispossession at both individual and collective levels and possibilities for resistance. From relationships with Queer/LGBT communities, to media representations of Asexuals using only White representatives, to the lack of legal protection for Asexual/LGBTQ people in many states, this panel is intended to build from lived experiences of Asexuality in relation to the systemic and structured nature of inequality and violence.

Proposals for this theme may include–but are not limited to–the following topics:

- Asexual activism as resistance to dispossession/distortion

- Intersections of distortion and dispossession in Asexual experience/Asexual community

- Differential suffering of/for/by Asexual people
-Ways that structures, institutions, and systems perpetuate dispossession/distortion around Asexuality and Asexual people and the associated effects

-How do Asexual people deferentially “experience the material, representational, environmental, political, and discursive effects of dispossession, distortion, and degradation?”

-Solidarity with Asexual people/communities and confronting dispossession/distortion/degradation

Please submit materials for this session to organizer Sarah Jasmine Stork, stork.sarahj@gmail.com

The Sociologist in the Strip Club (2015-01-26 08:00)

There’s a wonderful essay in the New Yorker reflecting on Howard Becker’s life and work. Among many other features, it contains a trenchant critique of Bourdieu:

“Bourdieu’s big idea was the champs, field, and mine was monde, world—what’s the difference?” Becker asks rhetorically. “Bourdieu's idea of field is kind of mystical. It's a metaphor from physics. I always imagined it as a zero-sum game being played in a box. The box is full of little things that zing around. And he doesn't speak about people. He just speaks about forces. There aren't any people doing anything.” People in Bourdieu's field are merely atom-like entities. (It was Bourdieu's vision that helped inspire Michel Houellebecq's nihilistic novel of the meaningless collisions of modern life, "The Elementary Particles.")

Call for papers: Beyond the Negativity of Death: Towards a New Necropolitics (2015-01-27 08:00)

Dear Colleagues, At least since Ernest Becker’s 1970s anthropological classic, The Denial of Death, but with precedents from Epicurus to Freud, death has been presented as the ultimate fact about the human condition, which while certainly not positive in its own right, only becomes more negative through its denial. This Special Issue is dedicated to denying the two assumptions in this line of thought: (1) that death is the negation of life; (2) that the terms of death are non-negotiable. In this respect, the Special Issue will develop positive, empowering attitudes toward death, perhaps even an 'economy of death', removing the sense of absoluteness that still surrounds the topic.

- Death as the ultimate challenge for science to overcome to prove humanity's supremacy: longevity medicine, cryonics.
• Death as a moment in a process of rejuvenation or resurrection—a re-booting of life.
• Benefits to reputation from either dying early or long ago: i.e., how absence makes the heart grow fonder.
• Death as an opportunity for a new life, say, in a ‘digital afterlife’.
• Death as a hypothetical perspective for regarding the world: i.e., the standpoint of quasi-human spiritual entities who no longer have a material investment in what they observe.
• Death as an incentive for productivity in life: i.e., optimizing personal resources in a finite space and time to leave the greatest legacy.
• Death as an occasion for the individual to validate the collective, say, through self-sacrifice.
• Death as a normal and arguably even progressive feature of experimentation and innovation: e.g., the role of mutation and selection in evolution, the use of extreme experience to define the limits of life.
• Models from the non-human world for adopting a positive attitude toward death: e.g., planned obsolescence, recycling.

Theoretical, empirical, and practice-based studies are welcomed, from any disciplinary or methodological perspective. Prof. Steve Fuller Dr. Emilie WhitakerGuest Editor Submission Manuscripts should be submitted online at [1]www.mdpi.com by [2]registering and [3]logging in to this website. Once you are registered, [4]click here to go to the submission form. Manuscripts can be submitted until the deadline. Papers will be published continuously (as soon as accepted) and will be listed together on the special issue website. Research articles, review articles as well as communications are invited. For planned papers, a title and short abstract (about 100 words) can be sent to the Editorial Office for announcement on this website. Submitted manuscripts should not have been published previously, nor be under consideration for publication elsewhere (except conference proceedings papers). All manuscripts are refereed through a peer-review process. A guide for authors and other relevant information for submission of manuscripts is available on the [5]Instructions for Authors page. [6]Social Sciences is an international peer-reviewed Open Access quarterly journal published by [7]MDPI. Please visit the [8]Instructions for Authors page before submitting a manuscript. For the first couple of issues the [9]Article Processing Charge (APC) will be waived for well-prepared manuscripts. English correction and/or formatting fees of 250 CHF (Swiss Francs) will be charged in certain cases for those articles accepted for publication that require extensive additional formatting and/or English corrections.

Disposed to Learn: Schooling, Ethnicity and the Scholarly Habitus by Megan Watkins and Greg Noble is a thought-provoking, cohesive, and deeply engrossing monograph of research which will be of interest to scholars studying ethnicity and education using a Bourdieusian lens. Throughout their scholarship, Watkins and Noble have challenged the tendency toward the essentializing of ethnicity within multiculturalism, while presenting a more sensitive analysis of the relationship between ‘culture’ and academic outcomes. Keeping relations between ethnicity and dispositions towards learning as a central focus, this book examines the dynamics of learner differences. The work is designed to both enable the reader to gain an overview of the key debates regarding the role ethnicity plays in education before focusing on a specific research project with families of Chinese, Pasifika and Anglo backgrounds in Australia. The research presented draws from work across ten schools using survey and observational methodology. This review intends to provide an overview of Watkins and Noble’s contribution with a focus on the way their epistemological underpinnings and theoretical framework inform their analysis and discuss some of their main findings before concluding with some thoughts on the significance of the text from the perspective of an educational researcher who is interested in Bourdieusian ‘tools’ in practice.

One of the most striking things, when one first begins reading Disposed to Learn, is how assiduous Watkins and Noble are as they navigate the tricky terrain of ethnicity and learner identities. The ethnicization of educational achievement is widely discussed in popular and educational discourse, but it is a difficult area to theorize. As scholars, Watkins and Noble caution against the reductive use of ethnicity in explaining educational performance and argue that broad correlations can only be a starting point for analysis. Cultures and ethnic groups are no longer totalities and, arguably, never were. Watkins and Noble contend:

“‘Ethnicity’, ‘culture’ and ‘race’ are all complex and problematic terms evoked in discussions about educational (and economic and social) disadvantage.” (4)

Of credit to the quality of analysis to come, the authors spend a considerable amount of time (Chapters 1 and 2) putting forth the complex nature of these terms while defining key debates. These early chapters are very accessible and the analysis presented will be of substantive interest to social theorists. Critiquing the various pathologies surrounding ethnicity, Watkins and Noble discuss how ethnic-centered notions of academic attainment are taken up in the media, specifically the controversy over Amy Chau’s ‘Tiger Mother’ and the significance of privately operated academic coaching/tutoring colleges. As this book is intended to be an account of how students are ‘disposed’ to learn, Watkins and Noble continue with a key focus on how dispositions come into being and the various factors which work in practice to form these dispositions. The authors write that rather than view dispositions as innate qualities of one’s ethnic background, dispositions must be studied as specific capacities and forms of educational capital that emerge from specific practices.

As the work seeks to unearth a more nuanced understanding of tropes commonly associated with ‘ethnicity’ and ‘culture,’ Watkins and Noble’s argument concerning scholarly habitus becomes an essential theoretical lens. Scholarly habitus – or what Bourdieu called the competence of ‘educational capital’ – covers the wide array of skills and knowledges that serve these functions within the schooling system. Conceptualizing within a Bourdieusian framework of practice allows Watkins and Noble to synthesize what they consider to be the factors which influence academic engagement and capacity for scholarly labor, mainly: parental engagement, aspirations, stereotypes, homework habits, spatial and corporeal congruence, schemas of perception, and student attitudes to teaching and learning. Watkins and Noble do some excellent theoretical work on capturing how the scholarly habitus forms. They write:

“The concept of a scholarly habitus is useful then in exploring the links between home and school practices,
embodied dispositions and sociocultural background because it allows us to address issues of self-regulation and the possession of educational capital without falling into simplistic arguments about ‘ethnic drive.’” (8)

Through this attention to practice in the construction of a scholarly habitus, they also extend Lareau’s work on ‘accomplishment of natural growth’/’concerted cultivation.’ This becomes a particularly excellent part of the book where Watkins and Noble are able to build upon existing social theory, while continuously drawing back to their concept of scholarly habitus, as they interrogate commonly held assumptions regarding ethnicity and academic attainment. To explore how these factors manifest, Watkins and Noble present small illustrative case studies. The case studies in Chapter 5, concerning teacher perceptions of normative behavior concerning ethicized learning styles and how school cultures influence the ongoing formation of dispositions toward academic success, remain particularly striking. In Chapter 6, the authors extend this knowledge to show how pedagogy and school cultures of discipline and control contribute to the formation of academic engagement.

What will be of significant interest to scholars in the social sciences is how staunchly Watkins and Noble argue that scholarly activities are “dependent upon bodily control” where “a certain kind of stillness affords a readiness to engage in higher order activities” (53) or what they also referred to as “productive stillness” (83). These dispositions, the authors contend, are embodied through specific practices, specifically the cultural background and resources available; Watkins and Noble argue that bodily control has tremendous productive capacities. Furthermore, they contend that to fully understand the bodily control/embodied capacities argument, bodies must be thought about in specific fields and not in terms of “abstracted notions of class or ethnicities inscribed in the habitus” (54), which may raise eyebrows for strict Bourdieusian scholars who will read this as a misinterpretation of how habitus can be utilized in educational research.

As fruitful as Bourdieu’s tools are, especially in considering the linking of home and school, Watkins and Noble explore – through a more cautious approach – how educational knowledge and skills becomes “a social mechanism of distinction and legitimation and reproduction of social power” (37). After all, they point out that not all “educational knowledge is the class-based knowledge of the powerful,” and analysis must open the door for “the socially useful skills that are largely monopolized by the powerful” (37). This point reminded me of how class is not necessarily about resources but the strategies employed around resources.

Before concluding this review, I want to critique Disposed to Learn from the perspective of a Bourdieusian scholar. While fastidious Bourdieusian scholars may expect to a larger attention paid to social class/social mobility/cultural capital, what I found particularly interesting about the work was how Watkins and Noble account for the influence of the school on the habitus. While there has been some work done in this area (cf. Atkinson 2011), it is certainly an unexplored area in Bourdieusian scholarship. Of course, it is interesting that Watkins and Noble have chosen to use Bourdieu as a theoretical lens, given his gaping silences concerning gender and race/ethnicity. Given their area of expertise and knowledge of Bourdieusian theory, I wanted to know more about how Watkins and Noble conceive of race/ethnicity working (with)in the habitus.

In order to capture the formation of educational capital, Watkins and Noble’s work is required to be expansive, in depth, and consistently theoretically robust. While it obviously is an important book for those interested in educational social theory and ethnicity, it must be noted how Watkins and Noble construct the work so it is accessible to those who do not necessarily have knowledge of these areas. The active engagement with this contentious area (which runs through the introduction, discussion, and conclusion of each chapter) enhances the scholarship. In their exploration of the formation of a scholarly habitus, Watkins and Noble meticulously balance the theory and the empirical creating a compelling narrative. In conclusion, Watkins and Noble’s investigation of the complex relationship between ethnicity, habitus and dispositions to learn shows an exciting capacity to build on existing socio-cultural work.
Ignorance in the ‘Golden Age of Television’ (2015-01-28 08:00)

by Tracy Jensen

Last month the House of Commons hosted an evening debate “Manufacturing Stereotypes of Benefit Claimants: the role of the media and political leaders”. It was remarkable for all the wrong reasons and I’ve been getting stuck trying to write this post about it ever since. Finally this week I realized that I was trying to say about that evening – and as is usually the case, that realization came in an unexpected moment, during a meeting with a student who made a wise comment about how politicians, knowing nothing about poverty, carelessly reducing incomes by a few pounds here, a few pounds here, have no idea of the devastation they create. So this post is about ignorance and its production across politics and media.

The House of Commons debate itself took place at the end of the corridor of Committee Rooms, the high-ceilinged, wood-paneled debating chambers, access to which takes you on a humbling tour of the upper echelons of political power. In Westminster Hall, a parade of stalls sold a range of tastefully-branded festive gifts (House of Lords champagnes truffles, anyone?) and the Committee corridor took me past many portraits and marble statues of dead white men who peered down at me with the same expression of disapproval. What chance do ordinary people have of being represented in this setting? The evening was a stark reminder of our current crisis of representation, which both media and political agents contribute to, sometimes greasing the wheels and sometimes driving the machine of welfare commonsense. This machine insists that unemployment, poverty and precarity are the result of individual poor decisions, lack of willpower or motivation. The commonsense narrative of the welfare state is that welfare itself has created something called ‘welfare dependency’; a state of infantilised reliance, indulgence, entitlement, the ‘[1]something for nothing’ culture [2]so often spoke of by [3]political elites. Accompanying such ‘welfare dependency’ talk is the fantasy solution of ‘getting tough’, hardening our ‘soft touch’ welfare, making assessment more rigorous, reducing eligibility criteria, increasing conditions and so ensuring that people become more ‘responsible’, ‘reliant’, that they make better ‘lifestyle choices’.

The debate panel, while set out as an opportunity for the speakers to think reflexively about the role they play, intentionally or otherwise, in benefit stigma, was largely, disappointingly, unreflexive. The most interesting and useful comments of the night came from Professor Ruth Lister, who highlighted the “insidiously corrosive” effect of the concept of ‘welfare dependency’, and particularly of the conventional wisdom that there are families where...
‘several generations have never worked’. Such myths have been consistently exposed by decades of sociological re-
search (most recently [4]here) and yet they keep returning in the rhetoric of political elites, whose poverty-producing
policies rely on such bogeymen.

The two politicians in attendance on the panel, John Redwood MP and Steven Baker MP, repeated echoes of
these myths in their debate comments. Discussing the workfare programme, Redwood suggested that it “helps
people gain the habit of work” which they have lost; reproducing the myth that unemployment is caused by
an individual lack of willpower. It is frustrating to see such myths circulate endlessly, particularly in light of the
consent they generate for increasingly punitive and conditional welfare reforms. See for yourself how [5]Redwood
and [6]Baker have voted in recent welfare reform motions. The stubbornness of this mythology in the House of
Commons also – perhaps – reflects the narrowing of avenues that can lead there: last year the Social Mobility
and Child Poverty Commission published [7]a report which powerfully documented the dominance of a tiny elite
in the political chambers who should represent (‘reflect’) us all. What can we expect from a House of Commons
increasingly filled by this ‘[8]class apart’, cushioned from poverty and precarity, for whom working class people
are some ‘quaint ethnicity’. We should not be surprised that in this crisis of representation, these representatives
increasingly rely on a commonsense shorthand, obligingly circulated by [9] neoliberal thinktanks and special advisors.

The crisis of representation extends too to media; and at this debate we heard from several figures in the
television industry. Richard McKerrow, founder of Love Productions, must win a prize for most regrettable comment
of the evening when he stated that we are in a “golden age of television”, including presumably his own Benefits
Street. When Channel 4 broadcast Benefits Street at the beginning of 2014, the eruption of disgust and hate that it
seemed to authorize was alarming. During broadcast there were threats across social media sites to firebomb James
Turner Street, and in the days and weeks after a shocking and sustained campaign of media intrusion into the lives
of the programme’s participants. (The sociological response to the programme, and to the genre of ‘poverty porn’
can be accessed [10]here.) I started thinking seriously about this genre in September 2013 and since that time I have
struggled to keep up with the great swathes of symbolically violent television that (re)presents poverty in voyeuristic
and damaging ways. The latest example of this ‘golden age’ genre forensically charted the welfare ‘burden’ of several
trails for Love Production’s second season of Benefits Street and the producers must be eagerly anticipating the
guaranteed attention currency that will be generated by its broadcast. The directors proudly describe the second
season as if it will be a public service, telling the [12] local Teesside newspaper that “we’re looking to give a voice to
a community that don’t really have a voice […] we think it’s incredibly important to represent those people”; yet to
me the real, invisible story is one of cold, hard economics. The value of Love Productions [13] increased by twenty
five per cent in 2014. Not one penny went to any of the people living on James Turner Street, whose unpaid labour
provided the thirty pieces of silver swiftly pocketed by Love Productions once they were done ‘representing’.

What struck me most about McKerrow’s comments at the House of Commons – and the comments of other
speakers – was how media and political elites strategically profess ignorance. In the audience discussion, I asked
why social scientists – experts on poverty, inequality and precarity – are not routinely invited to the table of political
and media debate about welfare reform. It was a genuine question aimed at both McKerrow (Love Productions,
as far as I know, did not take any advice from social scientists or sociologists while producing Benefits Street) and
at Baker (a member of think-tank Centre for Social Justice, who have managed to produce not one but [14] two
reports on poverty without consulting a single social scientist, see Slater, 2012). The response to this question was
disappointing; the chair asked how anyone is to keep up with the great volume of social research produced every
year? (to which I would answer: keeping up with any of it would be a start).

Of course, the conditions under which we come to know – and to not know – are deeply political, and the
study of knowledge (as well as a counterstudy of ignorance) reveals the multiple dimensions of power. When McK-
errow (and other poverty pornographers) state that programming “[15]shines a light on poverty” he is participating
in a re-invention of ignorance that both serves him with a rationale to make his programme, and also denies that
anything useful is already known. “We must shine a light on poverty because we know so little about it!” Poverty pornographers have shown that they are not interested in exploring the hundreds of detailed, thoughtful, sociological books about poverty and inequality. They have not attempted to enlist the advice or counsel of researchers who have spent years researching communities on the breadline: communities they may live in, often the very same communities that directors wish to ‘represent’ (this award-winning sociological study was based in Teesside, where Benefits Street 2 is set, yet its authors have not been consulted nor are they serving as advisors to the production). The study of ignorance, mapped out by Proctor and Scheibinger in their 2008 edited collection Agnotology: The Making and Unmaking of Ignorance, can point us to how and why certain knowledge and forms of knowing become ‘disappeared’, delayed or neglected.

Image: Local knowledge: Benefits Street camera crew had ‘local connections’ which (eventually) granted access. Photograph: Gazette Live, 2014

(Of course, even this liberal use of ignorance requires the occasional strategic flash of knowledge. When location scouting in Teesside for Benefits Street 2, producers were initially chased out by residents who did not want to be insects under their microscope. They were given a clear message by Middlesborough football fans who unfurled a banner reading “Being Poor Is Not Entertainment: Fuck Benefits Street!” The eventual selection of Stockton as a location came about partly as a result of the ‘local knowledge’ of some of the film crew who hailed from the area, which eventually granted access and ‘consent’. This flags up a useful site for starting to unpick the interweaving of knowledge and ignorance; the shaky politics of ‘representation’ in contemporary reality television; the hierarchies of ‘technician’ and ‘creative’ in the cultural work of media production. Most importantly it reminds us that welfare commonsense machinery is staffed by a whole range of exploited workers – some paid behind the camera, some completely unpaid in front of it – whose compliance is essential but precarious).

My question then is not “how can documentary television shine a light on the unknown world of poverty”, since that world is far from ‘unknown’. My question is equally not “how can we stop such television being made”. Television is an incredibly powerful medium, which can drive and shape social debate and change political consensus. Rather, my questions are; is our representation ‘machinery’ broken? Has television craft become television franchise? What are the conditions that enable ignorance about poverty to be claimed, constantly; by television producers who claim to bravely explore it while reproducing the same tired visual scripts; by politicians who cling
to myths about the feckless welfare-dependent poor? What would television look like if production companies consulted advisors with actual, sociological expertise about the very processes they wish to ‘represent’? What would welfare policy look like if politicians read sociological research about poverty rather than a narrow range of think-tank publications? How bold would it be if, rather than inviting them to appear as ‘reality stars’ in their vision, directors gave cameras to people marginalised by poverty, showed them how to use them, and asked them to represent themselves and their lives in self-authored programming? Then we would truly be in a golden age of television.

Notes

Thanks to Tom Slater who introduced me to the term ‘agnotology’ which in turn led me to Proctor and Scheibinger’s bracing [19]collection. You can read Tom’s blistering article on agnotology and welfare reform [20]here

[nbox type='notice']Tracy Jensen’s research explores the classed and gendered intersections of contemporary parenting culture, and how these are reproduced across social, cultural, media and policy sites. Tracy tweets at @Drtraceyjensen[/nbox]

Steve Fuller (@ProfSteveFuller) (2015-01-28 08:15:32)
While I appreciate your outrage and I certainly endorse the study of agnotology, your piece reads more like an advertisement for the need for more research into the public misrepresentation of poverty than a strategy for addressing the response of the committee chair who professed not knowing where to begin sifting through the relevant social research literature. This suggests to me that sociologists should try to work as researchers for MPs and their committees to bring the relevant literature to their attention. Otherwise, you may just end up unwittingly reproducing the problem that you’re trying to solve – i.e. by expanding the literature base and pushing it in a more inward-looking (i.e. academically oriented) direction.
I take the point Steve, and thank you for it. At the same time, I don’t agree that ‘academically oriented‘ necessarily means ‘inward-looking‘ - I know so many public-facing sociologists who are trying to bring their research, and the research of others, onto the tables where it can influence and shape policy (we all want our research to have ‘impact’, right?) - too often they are blocked, silenced and ignored. If anyone is inward-looking it is think-tanks (and the politicians who set them up) who fail/refuse to consult these experts and instead conduct their own rigged research (what Tom Slater memorably calls ‘policy-based evidence-making’), rely on ‘research by dipstick’ and ‘anecdote’ to drown out the literature base that already exists.

Class, integrity and carpetbagging: Labour’s MP selection in York (2015-02-06 14:50:48)

[...] So when we consider who is the ‘best’ candidate, we must think who can ‘best’ connect, understand and appreciate the challenges of York’s residents. Class in politics does matter, and Tracy Jensen explains why far better than I ever could here. [...]
‘For sociology to be to be effective, especially beyond the academy, it must have literary ambitions. Mills’ assessment of the quality of the sociological writings of his time is damning. He argues that there is a “serious crisis in literacy” in which sociologists are “very much involved” (1959:239). Mills’ position here is an extension of his earlier attack on Parsons and Lazarsfeld, and is just as fierce in tone. He observes that “a turgid and polysyllabic prose does seem to prevail in the social sciences” (Mills, 1959:239), and adds that this style of writing has nothing to do with the complexity of the subject matter. Mills explains the prevalence of this style, instead, in terms of a quest for status. He declares: “Desire for status is one reason why academic men slip so readily into unintelligibility. And that, in turn, is one reason why they do not have the status they desire” (Mills, 1959:240). This thirst for status is said to be driven by an underlying desire for the sociologist to achieve recognition as a “scientist”; something, he argues, that led to sociology written in clear and accessible prose (including, presumably, his own work) to be dismissed by many as mere journalism.’

Mills saw the promise of sociology as being undermined by this quest for status and the sclerotic forms of expression he saw associated with it, with sociologists prone to ‘stereotyped ways of writing which do away with the full experience by keeping them detached throughout their operations’ almost as if ‘they are deadly afraid to take chance of modifying themselves in the process of their work’ (Mills, 2001: 111). He saw this failure of vision and expression in what could almost be construed as epochal terms, representing a failure of sociological imagination at precisely the moment when this distinctive sensibility was most needed. Mills was, in many ways, estranged from the academic establishment and this was, in part, both cause and a consequence of his critique. This estrangement gave him a degree of intellectual freedom from the cultural norms prevalent within the professional sociology of his day and this was in turn entrenched by the manner in which he employed that freedom to pull apart many of the orthodoxies which he saw as so inimical to his understanding of sociology’s promise. This post by Mark Carrigan and Milena Kremakova is an extract from a [1]longer co-authored essay.

An eclectic account of lay morality and charitable giving in the UK - Feb 17th @SocioWarwick (2015-01-29 20:00)

Balihar Sanghera (Kent)
Tuesday, February 17th
5:00 PM to 6:30 PM, R1.04
Ramphal Building, University of Warwick

This paper examines how charitable giving is an outcome of different interacting elements of lay morality. Charitable giving reflects people’s capacity for fellow-feeling (or sympathy), moral sentiments, personal reflexivity, ethical dispositions, moral norms and moral discourses. An eclectic account of lay morality and charitable giving is warranted because of the complex nature of the object. Though ordinary people engage in ethical reasoning, they often think and act in piecemeal fashion, so that confusion and inconsistencies can occur. This is particularly evident when gender, class and ‘race’ shape people’s feelings and evaluations of others, their attention and care for others, and their understanding of responsibility and blame for social issues. Morality is further complicated because it takes place in the mundane world of everyday life that can result in inconsistent and confusing judgements and actions on giving.

What is Philosophical Sociology? (2015-01-31 08:00)

In this podcast recorded at a [1]Centre for Social Ontology seminar, Daniel Chernilo (Reader in Social and Political Thought at [2]Loughborough University) discusses his work on philosophical sociology. This was the basis for a [3]recent paper in the British Journal of Sociology.

2. [http://www.lboro.ac.uk/departments/socialsciences/staff/academicandresearch/chernilo-daniel.html](http://www.lboro.ac.uk/departments/socialsciences/staff/academicandresearch/chernilo-daniel.html)

[... a recent example in touch with the meta-debate of method and philosophy, Daniel Chernilo (2014), in a recent paper (also presented at the Centre for Social Ontology), introduces what he calls philosophical sociology, described in the abstract as “an

When considering the future of the research seminar, it’s best to begin by recalling that ‘seminar’ relates to words like ‘seminal’ and ‘seminary’. No, I don’t mean the politically correct point that it is focussed on the male semen. Rather, I mean that it is focussed on the early stages of research, where one is sharing initial findings with others who might or would like to offer input into its further development. It follows that a research seminar should be exploratory and relatively non-threatening in character. Invitees should be discouraged from reading already published works in this context, and no one should be required to attend if they do not feel they have anything useful to say. Both of these conditions add up to a relatively open intellectual environment. It is also in the spirit of teaching seminars, where students are normally expected to set the terms of the discussion in light of a lecture. The difference here boils down to voluntary attendance in research seminars and compulsory attendance in teaching seminars. At least that’s the theory...

However, the research seminar is too often turned into a church service where a department’s identity is reinforced in the presence of an outside speaker, who may or may not be a willing celebrant. This is the source of stories about certain departments being supportive, hostile or indifferent to outside speakers. If research seminars did what they should be doing, these stories would not be in circulation. Those who share the speaker’s concerns would not be reduced to ‘witnessing’ in the face of half-informed sceptics in the audience: A more productive exchange would result. To be sure, attendance might be lower. But outsiders would not be invited to where they are not wanted, and locals would be able to decide whether to attend an advertised event without fear of violating some imagined sense of collective identity.

The last point raises the crux of the matter: namely, that as long as departments are seen as units of research assessment, there will be a tendency to ‘churchify’ its activities into opportunities for collective expressions of a common faith, albeit often expressed in a more pedagogical way: ‘You should learn what your colleagues are doing’. This is a big mistake, albeit one that the current UK assessment regime encourages. In contrast, I believe that a sharp line should be drawn between a research seminar and a public lecture – basically the private/public split, but inscribed within academia itself. Public lectures, the stuff of academic conferences, should operate on the principle of widest participation, encouraging no holds barred performances from both lecturer and audience. This is where people should see a field at the top of its game. However, research seminars should be much more like incubation spaces. At the moment, academics blur the two contexts to the disadvantage of both sides – and to the misery to all who get caught in the mixed messages.

Are disciplines too big to grasp? (2015-02-01 08:00)

I saw an interesting talk recently given by W.G. Runciman on Evolutionary Sociology. The whole notion was very thought provoking but there was one particular aspect that was curious. He described the central conflict facing the discipline being one of Evolutionary Sociology in confrontation with Rational Choice Theory. But I’d never heard of
Evolutionary Sociology prior to this talk and I rarely encounter Rational Choice Theorists. If you'd asked me what about the central conflict that would define the future of the discipline I'd have told you it was one of how we interpret and use transactional data. This left me wondering how perspectival our accounts of these issues will inevitably be. Are disciplines as a whole too big to grasp?

jimsresearchnotes (2015-02-01 09:20:53)
I can relate to that because I spent much of my working life trying to incorporate my interest in symbolic interactionism into my housing and urban sociology, and largely failing because housing and urban studies were incorrigibly positivistic. It is somewhat better now but the bias is still there.

SheriO (2015-02-01 15:31:37)
Disciplines feel arbitrary. Sociology so often verges with psychology. Why is there a distinction between mathematics and statistics? From the perspective of doctoral education, the doctoral researcher most often develops niche knowledge that may be applicable to one scholarly journal in the world. To describe this person as a steward of a vast and ever-expanding discipline hardly fits. Without disciplinary silos, how would universities ever teach undergrads?

An eclectic account of lay morality and charitable giving in the UK – Feb 17th @SocioWarwic (2015-02-01 15:58)

Productivity culture, cognitive triage and the pseudo-commensurability of the to-do list (2015-02-04 08:00)

For a couple of years I’ve been striving to empty my e-mail inbox on a daily basis. It doesn’t particularly bother me if I don’t succeed and I often don’t. I go through phases of doing this daily and then, for whatever reason, fall out of the routine. I’ve rarely had to spend more than a hour a day on e-mail this way because there’s only so much that accumulates in the space of twenty-four hours. It’s left me with a firm conviction that e-mail is only really a problem if the quantity exceed a certain point (e.g. if dealing with a day’s e-mail always took a few hours or more) or if you don’t attend to it regularly. Obviously, it can be difficult to attend to it regularly for all sorts of reasons. That in fact is why I write this as someone who does ‘inbox zero’ for a couple of weeks at a time rather than as a continuous feature of my life. But from my point of view what I formerly experienced as a real problem now just seem as if I was doing it wrong. It used to stress me out a lot and, at least when I’m in a phase of emptying my inbox daily, it just doesn’t stress me out at all. I drink coffee, listen to Today on Radio 4 and have cleared my inbox by the time I start my day.

What struck me this morning however is that this process can have unforeseen consequences. It’s not a case of ‘stress’ caused by e-mail giving way to an absence of stress but something more subtle than that. I tweeted earlier today:

Spend day crossing items off to do list.
Spend next morning adding ‘to do’ items from new e-mails
Spend day crossing items off to do list.

I was suddenly struck by the horrible repetitiveness of this process. Had the character limit not precluded it, I would have likely added a fourth line: “continue daily until death”. Well actually I probably wouldn’t because of how unspeakably depressing a sentiment that would be in the absence of the navel-gazing contextualisation a blog post like this would provide. Nonetheless I’ve been thinking about that feeling all morning. It quickly passed but it was an arresting sense of the intrinsic pointlessness of practices conducted in this mode.
I say intrinsic because it has all sorts of extrinsic benefits: by dealing with e-mail in this way I neutralise it as a source of stress, I ignore my inbox for the rest of the day*, I have more time and energy for the things I care about etc. But in and of itself, the practice of ‘inbox zero’ is devoid of value: it’s a kind of cognitive triage, systematically attending to what is urgent in order to free up resources for what is important. That at least is what it’s supposed to do. But I think the instrumentalism of triage practices, desiring to do something as quickly as possible because you’re fundamentally irritated by the fact it’s necessary and want to get it out of the way, risks seeping into how other activities are engaged with.

What provoked that slightly despairing feeling in me this morning was the exercise of going from e-mail to omnifocus: clearing my inbox, clarifying the necessary actions ensuing from those e-mails and filing them in my organiser. Suddenly the various lists contained within that organiser grew dramatically – in one case going from 10 items to 20 items. My problem is that while some of those tasks were incredibly dull, others were not and yet the way I framed them led me to see them all as problems to be solved. They were irritants, barriers to a conceptually incoherent state I was implicitly seeking to attain in which everything I’d ever have to do was now done.

This is the mentality that cognitive triage generates: things are conceived as obstacles to be eliminated rather than activities to be enjoyed. As the list gets bigger, it becomes harder to see the individual ‘to do’ items as activities in their own right. They are reduced to uniform list items and nothing more. Things you enjoy and things you despise are given equal weight. The logic of the to-do list is one of commensurability and this is the problem with it. The process of triaging combined with the logic of the to-do list can lead to an evisceration of value: the potential goods internal to activities, those experiences of value that can only be found through doing, get obliterated by the need to cross items off a list. There’s a relational richness to practical activity which can easily be obliterated at the level of phenomenology by the tendency of ‘productivity’ to give rise to ‘mindless busyness’. This is how Heidegger describes it in *What Is Called Thinking?*

A cabinetmaker’s apprentice, someone who is learning to build cabinets and the like, will serve as an example. His learning is not merely practice, to gain facility in the use of tools. Nor does he merely gather information about the customary forms of the things he is to build. If he is to become a true cabinetmaker, he makes himself answer and respond above all to the different kinds of wood and to the shapes slumbering within wood – to wood as it enters into man’s dwelling with all the hidden riches of its nature. In fact, this relatedness to wood is what maintain the whole craft. Without that relatedness, the craft will never be anything but empty busywork, any occupation with it will be determined exclusively by business concerns. Every handicraft, all human dealings are constantly in that danger. The writing of poetry is no more exempt from it than is thinking. (pg 14-15)

In other words: your desire to ‘get things done’ obscures the fact that you actually like many of the things you’re doing and, as a statement about moral psychology, if you forget this fact then you’re much less likely to enjoy doing them. Being in a rush to get something done runs contrary to attending to the task itself. Unfortunately, it is only through attentiveness that we derive value from practical activity. Focusing on the next thing you have to do squeezes out awareness of what you are presently doing. Wondering how quickly you can get something done makes it hard to focus on the logic of the task itself. Seeing something as an obstacle to be overcome precludes experiencing it as a source of fulfilment. Productivity culture or rather the various forms of triaging it encourages can easily undercut many of the things which motivate it in the first place e.g. seeking to perform mundane tasks more efficiently in order to have more time to write.

Well actually I don’t but at least I recognise that it’s blind compulsivity that undermines this rather than any practical necessity.
What is social ontology? An introduction in 13 minutes by Margaret Archer (2015-02-05 08:00)

This podcast is an introduction to social ontology given by Margaret Archer at a Centre for Social Ontology event in June 2014.

This podcast is an introduction to social ontology given by Margaret Archer at a Centre for Social Ontology event in June 2014.

psdmccartney (2015-12-15 03:12:41)
this is great but the volume is lousy...can you normalise it or boost the dB level? even with headphones on I could barely hear it

Mark Carrigan (2015-12-15 13:38:03)
volume is fine on my computer - don’t get the problem so unsure how to solve it...

How to use @Artefact_Cards for academic writing (2015-02-05 08:00)

I finally received my Artefact Cards last week and I love them. They were a pain to get hold of due to a spectacularly inept delivery company but Artefact soon rectified this when I e-mailed them to complain. They’re probably only likely to appeal to those with a real stationary problem but if you too find yourself fixated on Moleskine notebooks and their ilk then I suspect you will like them every bit as much as I do.

The idea behind the cards is to materialise ideas. This is a concept that appeals to me immensely. One of the weirdest experiences of my life was the first time I printed out my PhD thesis. Suddenly the ethereality which had recurrently seeped into every part of my life over the past six years was transmuted into a thing... it was just some stuff that I had written. This was a more intense form of a feeling that I often get when writing. Getting the words out into the world, giving them a form, somehow makes my mind feel lighter, even if that form is digital. The idea becomes something 'out there' rather than 'in here', with a definite form rather than a potential range.

The card themselves are designed to “help you craft better ideas, create new idea combinations by moving, shuffling, stacking, dealing and matching them”. In essence they’re just blank playing cards, with a look and feel which has obviously been the subject of much thought, which can be filled using the supplied Sharpie. They’re perhaps slightly overpriced but it’s hard to begrudge an individual creator this for a product that so much love has clearly gone into.
I’m already finding them immensely useful. In the cards below are the talk I’m giving at the Digital Sociology conference in New York in a couple of weeks. I recorded everything I wanted to say on its own individual card. I’m now going to arrange them in order to draw out clusters, perhaps discard a few and then write the talk using these cards as prompts. In this sense, it allows me to organise my ideas in a more systematic way without sacrificing the writing-to-see-what-happens approach which I prefer. I’m sure some of the prompts will be discarded, others will be rethought and all of them will exceed the limits of what I placed on the card itself.

In the past I’ve blogged about this in terms of non-linear creativity. I’ve always struggled to write and think in a linear way. I find it difficult to develop ideas sequentially and planning pieces of writing just doesn’t work for me. I often don’t completely know what it is I’m trying to write when I start the process. Assuming I’ve previously [3]baked ideas in the unconscious mind the kind of writing I enjoy most is quasi-automatic. I prefer to write in fragments and piece them together, with the overall structure being something that emerges through this process:

Another example in a very specific area is given by a client in a follow-up interview as he explains the different quality that has come about in his creative work. It used to be that he tried to be orderly. “You begin at the beginning and you progress regularly through to the end.” Now he is aware that the process in himself is different. “When I’m working on an idea, the whole idea develops like the latent image coming out when you develop a photograph. It doesn’t start at one edge and fill in over to the other. It comes in all over. At first all you see is the hazy outline, and you wonder what it’s going to be; and then
gradually something fits here and something fits there, and pretty soon it all becomes clear – all at once.”

*Carl Rogers – On Becoming a Person Pg 152*

I find this immensely enjoyable and blogging is the apotheosis of it for me. However in the last couple of years, I’ve taken this too far and I’m trying to reintroduce structure into the process. Overly-enthused by the discovery that I can write pretty endlessly about subjects that I’ve thought a lot about, I submitted a series of journal articles that were basically 7000 word blog posts. The responses weren’t actually that bad but they were uniformly requests for major revisions and the experience made me realise that I need to introduce much more discipline into my academic writing and this is what the Artefact Cards seem to be helping with already. I need to develop ideas in a more sustained way, producing more tightly argued and well integrated scholarship, without sacrificing the creative side of the process that I enjoy so much. In other words, I have lots of ideas but I need to learn to develop them much more systematically in order to produce journal articles of the standard which I’d like to.

I’m convinced that the Artefact Cards will prove very helpful in this respect. They introduce another step in the planning process before any kind of writing has taken place: rather than having the ideas churning in the back of my mind, it’s possible to get them out into a physical form where they can be sifted, shuffled and sorted. Here are some other ways I’m using them:

1. I’m setting myself 500 word writing assignments for *Social Media for Academics*. I’m going through the book as it currently stands and recording every idea I have about something that should be added in. I’m going to take some of the ensuing cards in my wallet whenever I travel so that I can do brief bits of focused writing on my iPad on the train.

2. I have close to 100 cards now which record every idea I have about the *acceleration of higher education* for the project I’m doing with Filip Vostal. I did hit exhaustion point with the cards and that was interesting. I had a very definite sense that “this is everything I think about this subject” and I’ve had no further ideas since (whereas with others, ideas keep occurring to me). It’s presented me with the limitations of what I have to say about the subject but also left me with a more clearer sense of what I do want to say, even if it’s not quite as expansive as I thought it was. I’m going to use these cards to do some prompted blogging on [accelerated.academy](http://accelerated.academy/), consult them when planning the conference and use them as a source of ideas in the writing we’re doing.

3. I have a stack of cards for the large post-doc project that is starting to take shape in my mind. This is much more provisional and I only have 20 or so cards thus far. This has left me aware of how much more work I need to do because the ideas on the cards are very general. I’m going to try and develop these in clusters: going from an idea like ‘cognitive triage’ to develop many other related notions. I plan to add to these over time and hopefully by the time I start putting together a grant application at the end of the year, I’ll have a much more concrete sense of the planned project than I do at present.

These are just a few ideas I’ve had in less than a week of owning the cards. I’m sure I’ll have many more. Though I’ve almost finished a £36 box of cards since then, it’s been a really useful experience and left me with a much greater degree of purchase upon the projects I’m in the process of developing. I doubt this intensity of usage will be the norm but I’m certain that Artefact Cards will be a regular part of my working life from this point onwards.

An important event for anyone interested in self-tracking:

CALL FOR SUBMISSION

The Society for Social Studies of Science (4S) invites submissions for its 2015 conference in Denver, Colorado, November 11-14.

There are numerous open panels to which submissions are invited, but I wanted to notify you about the panel on self-tracking and quantified self:

Exploring self-tracking: between submission and resistance

Ever-increasing number of apps and sophisticated technologies allow us on a minute-basis to know our bodies in unusually detailed ways: the number of calories consumed, the steps taken, our average heart-beat, hours of REM sleep etc. The use of these new technologies are often referred to as ‘self-tracking’.

Technologies of self-tracking can be perceived as a way of governing that greatly highlights the individual responsibility for personal well-being and can be seen as encouraging ‘the entrepreneurial, self-regulating subject that is represented as the ideal responsible citizen in neoliberal societies’ (Lupton 2012:235). Seen from this point of view self-tracking implies submitting oneself under the neoliberal self-governance to maintain the health and wellbeing as they are defined by the discourses of biomedicine.

However, alternative takes on self-tracking exist. The Quantified Self community offers a platform for people involved in self-tracking to share their ideas and experiences. Very often people in this community build new technologies or tinker and individualise the old ones to gather the self-knowledge they want. This emphasises the n=1 approach to self-tracking, where the most important data is individual, rather than statistically defined. Based on this Nafus and Sherman (2014) argue that Quantified Self can be seen as ‘soft resistance’ to the authoritative meanings of wellbeing.

This panel aims to develop a better understanding of self-tracking as both technologies closely related to and diverging from biomedicine and biopolitics. It invites participants to explore, for example, what kinds of knowledge self-tracking technologies employ and what kinds of subjectivities they shape. Can its users be classified as simply controlled or resisting? Is self-tracking a product of ever-increasing medicalisation or new ways of exploring your body outside the realm of clinic and biomedical knowledge? What needs and ideas shape self-tracking technologies and what kind of users they are tailored to?

You are kindly invited to submit your papers here (includes more info about submission requirements): [1]https://convention2.allacademic.com/one/ssss/4s15/

IMPORTANT DATES
Wednesday, Feb. 4, 2015: Submission opens
Sunday, March 29, 2015: Deadline for submissions of individual papers, session proposals and movies/videos.
May 25 – August 9, 2015: Early registration.
September 1, 2015: All presenters must register to be included in the program. For papers with more than one author, one presenter must register to be included in the final program.
September 13: Program posted

A Proposal for a Public Understanding of Sociology Chair (2015-02-06 12:01)

This morning Mark Carrigan opined on twitter that it would be great to have at least one chair in Public Understanding of Sociology, given how such chairs have benefited not only the natural sciences, where they began around 1990, but also philosophy, where it is now used to great effect by its first holder, Angie Hobbs.

In case it’s not obvious to the reader why there might be a need for such a chair, Mark outlines the reasons [1]here. In addition, one might add a particular 'crisis' of sociology that is exhibited in the last quarter-century of research assessment in the UK – namely, that ever fewer 'units of assessment' self-identify as 'sociology'. While research assessment is obviously a game of strategy, it’s striking just how easily the baggage of 'sociology' is dropped to gain strategic advantage. So if there’s something at stake in having a distinctively 'sociological' perspective, then this is the time to make it publicly visible.
So here is my proposal for how the Chair in Public Understanding of Sociology should be selected and financed.

1. You have an open competition in which universities wishing to house the chair would bid with a candidate in mind, for whom they would be already committed to providing the basic salary.

2. However, this person may be either someone already hired or someone the university would be willing to hire, were that person to get the chair – but perhaps not otherwise. This condition is important to incentivize departments to think in terms of the value they might provide to the discipline as a whole rather than simply their own place in a league table.

3. This candidate would be worthy of a chair in Public Understanding of Sociology but not necessarily worthy of a chair simply based on research achievements. This means that in principle someone who is young but is very knowledgeable and articulate in public settings in sociology could get the chair. There might even be a preference for appointing such a person.

4. The application process would be initially about certifying a sufficiently high level of sociological competence by more conventional means (e.g. degrees, publications, letters). But at the shortlist stage, it boils down to who can write and speak in many media. Once candidates are shortlisted, they may be required in advance of the interview to send e.g a 750-word newspaper column on one of four possible assigned topics that represent the broad remit of the discipline. The 'interview' phase may require speaking to camera for 2-3 minutes on, again, one of four topics, from which they are allowed a free choice.

5. Those involved in vetting and deciding who gets the chair would provide a top-up to the successful candidate's salary that would relieve them of most if not all of their teaching and administrative burdens. Since the British Sociological Association and the Academy of Social Sciences claim to speak on behalf of sociology, I would prima facie expect them to be strongly involved in both the vetting of candidates and financing the top-up. Yes, as far as the professional societies are concerned, there is a 'put your money where your mouth is' aspect to this proposal.

6. But the chair in public understanding of sociology would be a fixed-term deal (say, three years), at the end of which all parties concerned may refuse to renew the association. In the meanwhile the BSA and the Academy of Social Sciences would endeavour to raise capital to keep the chair alive as an ongoing concern.

7. However, the first chosen chair will not be required to be involved in this fund-raising process – other than by setting an example in their practice as a public intellectual who inspires others to think that such a chair might be worth funding indefinitely. (Of course, in the meanwhile, if some university or even private donor, wishes to provide an indefinite endowment, then that would be need to be taken seriously.)

Now if it turns out that a chair cannot be appointed under something like the above conditions, then it speaks against sociology's long-term prognosis as a discipline.

Postscript (8 February 2015): A couple of days later, in response to e-mail traffic, I posted my response here to most frequently asked questions about this proposal.

1. http://t.co/dXe1Q8Hoys
2. http://www.britsoc.co.uk/
I understand the need to generate 'public understanding' in the context of perhaps, enhancing the standing of the discipline amongst a range of audiences including the 'public'. Is that what your are aiming to achieve here? The title, however, has connotations of the old deficit model of public engagement, aimed at securing a license to practise, and little else. Perhaps this is what you want but is that not rather limiting? The term, 'public understanding', also implies a one-way communication with our audiences including the public, ignoring a need to genuinely understand, on our part, what the role of the discipline is in society today. It would be better if the role of this chair, and the title, clearly demonstrated that we, as a discipline, are seeking to build a constructive, two-way relationship with our audiences. That we are willing and able to listen to our audiences, to consider other perspectives and to have a dialogue about any aspect of the discipline.

Steve Fuller (2015-02-06 19:41:13)
You're just describing what many sociologists already do. But the idea here is that there really needs one or more people dedicated to putting across a distinctly 'sociological' perspective on matters in public forums. At the moment, the discipline's identity is rather invisible, either because sociologists are removed from the public altogether or they just dissolve into it, which your comment comes close to endorsing.

JEBounford (2015-02-06 20:35:04)
I understand what you are saying about the need for visibility but would argue that there is a distinction between dissolution and dialogue.

Why is social science communication so underdeveloped compared to natural science communication? | The Sociological Imagination (2015-06-01 15:03:13)
[...] months ago about the need for a public understanding of sociology chair and how this might work: here, here and here. More self-interestedly, it also relates to my awareness that despite effectively [...]
As the alarming consequences of the dominance of anthropocentric forms of thinking and politics on environmental, social and mental ecologies (Guattari, 1986) become ever more apparent, there has been a surge of interest in inventing new ways of collaborating with, listening to, and granting authority to new kinds of voices, including more-than-human life and forms of material agency. In this symposium, we invite participants to explore practices, politics, histories and futures of attunements to voices, temporalities, and material processes that exceed the human subject. In doing so, we ask participants to consider the ways in which matter and more-than-human life can make demands for human ethical and political response (Jackson, 2012).

Practices of attunement are associated with various traditions of thought including: phenomenological ideas of dwelling and worlding (Heidegger, 1923); post-phenomenological and neo-vitalist theories of encounters, affect, and hybridity (Bennett, 2009; Haraway, 2008; Anderson, 2014; Ash & Simpson, 2014); sensory methodologies (Evans & Miele, 2012; Spinney, 2015); spiritual practices (Oosterbaan, 2008); feminist materialisms (Braidotti, 2002); speculative modes of theory and politics (Whitehead, 1967; Stengers, 2011); and indigenous traditions of responsibility to the natural world, which have arguably been marginalized in recent debates (Tallbear, 2015).

Attunements strive to attain greater familiarity or intimacy with more-than-human worlds. In doing so, they experiment with creating more sustainable and egalitarian social forms. However, when attunement starts to invoke normative ideals of being 'in harmony', those who appear 'out of tune' (strangers, outsiders) can be registered as dangerous and threatening (Ahmed, 2013). Nevertheless, attunements can also affirm difference and be receptive to non-human 'qualities, rhythms, forces, relations and movements' (Stewart, 2011). Post-human attunements generate monstrous aesthetic forms (Dixon, Hawkins & Straughan, 2012) and require inventive practices of listening (Hetherington, 2013). When objects, forces and spirits that exceed the spaces and times of human experience press themselves upon us with increasing force, attunements can be strange, uncanny and uncertain. They bring us into contact with lost futures and haunted presents (Fisher, 2014). In fact, attuning to non-human or post-human worlds may require actively distancing our enquiries from the intimacy of the organic body and its lived experiences and affects (Colebrook, 2014).

This symposium invites participants to explore ‘attunement to the world in all its particularity, strangeness, enchantment and horror’ (Anderson et al., 2012). In doing so, we aim to contribute to recent efforts to recalibrate notions of authority, voice, and objectivity in ways that work towards more egalitarian, sustainable worlds.

Topics that will animate the discussion may include:

- Practices of attunement that aim to facilitate deeper collaborations between humans, more-than-human life, and material agency;
- Materialisms (old and new);
- Intersections or tensions between new materialisms and indigenous standpoints;
- Attunements, spirituality and ritual.
- The role of attunements in (re)distributing power and authority;
- Attunements and aesthetics;
- How attunements affect the quality of experience and encounters;
- Narrative and non-narrative forms for expressing experiences and practices of attunement;
- Material/semiotic figures of attunement (stranger, diplomat, monster, guide, alchemist...);
• Biopolitics, the anthropocene, and the inorganic.

Apply to attend / present a paper.
Researchers from across the arts, humanities and social sciences are warmly welcome. If you wish to attend, or to give a 20-minute paper, please complete the form at: [2]http://www.authorityresearch.net/spaces-of-attunement-abstract-submission.html before 1800, February 10th, 2015. We will respond to all applicants by the end of that week.

Proposals for alternative presentation formats, artworks, performances, films, sound art etc. are encouraged. We will do everything we can to help with this in terms of technology, time, and potentially some extra financial resources. Please get in touch.

Making Sense of the Crisis: Is the financial crisis cascading into a democratic crisis in Europe? (2015-02-08 08:00)

The lecture will take place in the Sir Charles Wilson lecture theatre, from 17.00 to 18:30 on Tuesday March 24th.

The lectures are free to attend and open to all so please feel free to forward word of this to anyone who might be interested. Details of how to reach the campus are here: [1]http://www.gla.ac.uk/about/maps/howtogethere/ Lecture Title: 'Making Sense of the Crisis: Is the financial crisis cascading into a democratic crisis in Europe?' Abstract: The European nightmare is that economic crisis leads to the re-emergence of ethno-nationalism and fascism, with violence engulfing democratic institutions. Potentially, the crisis, starting in finance in the US and UK in 2007, cascading into the real economy of output and employment, cascading into fiscal crisis and 'austerity', and cascading into political crisis, will become a crisis of democracy in the European Union. Sociology did not see the crisis coming and has struggled to produce adequate analyses of its various phases and of its political dynamics. What are its gender dynamics and why do these appear invisible to Sociology? The developments challenge traditional systems theory as well as the recent 'cultural turn'. Using the insights of complexity theory, I re-work core Sociological concepts and theories: re-thinking rather than rejecting the concept of system; re-thinking the concept of society in a globalizing world; developing the concepts of 'tipping point' and path dependency; rethinking the intersection of gender, class and ethnic inequalities and of political projects. These enable a more adequate account not only of the changes in capital, but also of the gendered nature of the neoliberal project that is challenging social democracy.

1. http://www.gla.ac.uk/about/maps/howtogethere/
In the last couple of days, I have received many queries about the public understanding of sociology chair that I proposed [1]here. What follows is a set of answers to those questions.

1. Why even have such a thing?
   a. There have been chairs in the public understanding of science, sponsored in various ways, for the last quarter-century. The occupants of these chairs have been generally very media-friendly but differ quite substantially in the interpretation of their remit. Yet, the overall effect has been to raise the profile of the natural scientist in the general public and perhaps even to provide nuance to the perception of scientists. An important feature of this development is that professional scientific bodies have never attempted to 'recall' such a chair-holder, even when, say, Richard Dawkins overstepped what many saw as appropriate for a scientist to say.

2. But isn’t this even more reason NOT to have such a chair in sociology?
   a. On the contrary, if sociologists cannot find people to trust as competent spokespersons, even when they say things that many practising sociologists would disagree with, then the point of having such a chair would be defeated. The strength of having such a chair comes at least as much from an ability to display publicly what it means to think 'sociologically' as from an ability to represent 'what most sociologists think' about various topics.

3. But doesn’t the very idea of this chair go against the spirit of most sociological research, which is about revealing the complexities of social life that emerge from engaging empirically with real people?
   a. Most sociological research does indeed do this, but the need for the chair arises from a general unclarity – both inside and outside the discipline – about what is especially 'sociological' about this research. Thus the ideal chair-holder would be someone who is familiar with the diversity of the field yet able to present any bit of it as distinctly 'sociological'. This means that any prospective chair-holder would have to want to see the field better integrated than it currently is.

4. But your conception of the chair seems to presuppose a univocal conception of 'sociology' that really doesn’t exist – if it ever has...
   a. You may be right. However, turning this point into the last word on the matter runs the risk of calling into question the viability of 'sociology' as the name of a discipline – as opposed to a market signal for a variable range of courses that students might find attractive in different universities.

5. But what could possibly be such a univocal conception of 'sociology'?
   a. Well, it’s back to Durkheim, really: Society is sui generis. To think sociologically is to think in terms of how what people think and do contribute to some collective fate shared by all of them, regardless of their individual differences. The nation-state has been historically in the business of promoting this idea as the default mind-set of citizenship. But with the rise of globalization and neo-liberalism, the public availability of this idea is much less secure – and hence there is a greater need for a 'public understanding of sociology' that reinvents Durkheim’s original concerns in a new key for a new time.

6. But isn’t this what Michael Burawoy’s call for a ‘public sociology’ is all about?
   a. No. On the contrary, I see ‘public sociology’ as a policy that would let the discipline's research priorities be driven mainly by the agendas of those in society whose voices have not been traditionally given their due. Of course, there is nothing wrong with redressing long-standing social injustices. However, the task of sociology as a discipline is to conceptualize – and promote – an idea of 'society' in terms of which it makes sense to say that certain groups have been systematically disadvantaged by virtue of the activities of others. Ideas of justice and (dis)advantage only make sense in relation to some normatively bounded sense of 'society'. And it is at this second-order level that sociologists need to be publicly understood.
7. So how should someone think about whether this chair is something worth pursuing – since you say it could go to people at virtually any stage in their career?
a. Here’s a litmus test. If you think that Margaret Thatcher has turned out to be way too effective when she declared in 1987 that ‘there is no such thing as society’, then you appreciate the job ahead of you. Demonstrating that ‘society’ exists above and beyond the voluntary associations and familial ties of individuals is not an easy sell in 2015 Britain. But that’s what the chair would need to do.

Prosumption, appropriation and the ontology of economic form (2015-02-09 08:00)

This podcast by [1]Dave Elder-Vass (Loughborough University) is from a Centre for Social Ontology event in January 2015. Unfortunately it cuts off a few minutes from the end - sorry!

[ soundcloud url="https://api.soundcloud.com/tracks/188485232" params="auto _play=false &hide _related=false &show _comments=true &show _user=true &show _reposts=false &visual=true" width="100 %" height="450" iframe="true" />

Prosumption – the unpaid performance of productive work by ‘consumers’ who thus help commercial businesses to generate a profit – is perhaps the most studied of the many hybrid forms of economic practice that have proliferated in the digital economy. A number of critical accounts have analysed prosumption in terms of Marx’s labour theory of value, suggesting for example that as prosumers do useful work for free they are infinitely exploited by the firms that profit as a result. But such accounts analyse the digital economy in terms that were derived from the nineteenth century factory – and terms that were highly questionable even in that context.

The spectacular mismatch between this model of capitalism and the case of prosumption exposes the inadequacy of the standard monolithic conception of capitalism as a homogeneous and universal contemporary economic form – a conception that at a certain level is also shared by the marketised discourse of mainstream economics. We need a new ontology of economic form that goes beyond the totalising concepts of mode of production and market economy and instead provides us with tools for understanding the sheer diversity of forms of economic practice in the contemporary economy. This paper offers the concept of appropriative practices as a contribution to such an ontology and applies it to the case of prosumption.
The Alaskan town straight out of a Ballard novel (2015-02-10 08:00)

This video shows Whittier, Alaska, a town where most people live and work in one building, and is only accessible by a miles-long tunnel with limited hours:

An eclectic account of lay morality and charitable giving in the UK – Feb 17th @SocioWarwick (2015-02-10 15:57)

Balihar Sanghera (Kent)
Tuesday, February 17th
5:00 PM to 6:30 PM, R1.04
Ramphal Building, University of Warwick

This paper examines how charitable giving is an outcome of different interacting elements of lay morality. Charitable giving reflects people’s capacity for fellow-feeling (or sympathy), moral sentiments, personal reflexivity, ethical dispositions, moral norms and moral discourses. An eclectic account of lay morality and charitable giving is warranted because of the complex nature of the object. Though ordinary people engage in ethical reasoning, they often think and act in piecemeal fashion, so that confusion and inconsistencies can occur. This is particularly evident when gender, class and ‘race’ shape people’s feelings and evaluations of others, their attention and care for others, and their understanding of responsibility and blame for social issues. Morality is further complicated because it takes place in the mundane world of everyday life that can result in inconsistent and confusing judgements and actions on giving.

All welcome! E-mail socialontology@warwick.ac.uk with any questions
“All this happened a long time ago—so many years ago that if you counted them on your fingers among all the old men in the village you would have to borrow some from the children. But the children are running around. So try and find out when this was!” (Nagishkin 1980).
I will filch a trick from Gottschall’s book, when I ask did you imagine the village? Did you imagine the people?
The short quote above is to illustrate that a story can be irresistible to our brains. Before introducing Johnathan
Gottschall’s book, The Storytelling Animal, I want to ask why should sociology as a field care about storytelling?

To answer this question requires a redefinition of storytelling from its oral, and perhaps overly nostalgic, tradi-
tions. For the purposes of this article storytelling could be redefined as narratives in different forms: literature, TV,
films, video-games, music, media, education, the internet and interaction with other people, like friends and family,
all contain stories. This is not an extensive list, yet illustrates how commonplace stories are in our everyday lives.
Story needs to be researched because we do not yet understand story’s relevance to society.

I am currently writing a research paper which questions the use of storytelling as a catchall term. A general
search on storytelling on Web of Science resulted in 404 papers. Of these papers 20 were tagged with oral story-
telling. When studies involving digital storytelling, oral history and reading, studies were removed this left two papers
on oral storytelling (none of which involved folk or fairy tales). Where is the storytelling in ‘storytelling’ research? A
redefinition of terms would enable researchers to share relevant research.

The Sociology of Story

According to Ken Plummer:

...a sociology of stories would be concerned not with analysing the formal structures of stories/narratives,
but with studying the social roles stories play: the ways they are produced, read, change, and so on. This means trying to answer the following research question: What social role does a particular instance
of story-telling play in society? What political process does a particular instance of story-telling play in

Plummer explored, through accounts of sexual identity and ‘narratives of the intimate’, the place for narratives in
sociological research (1995a: 6). He proposed that there should be a sociology of story. But that this sociology of
story need not be limited to personal narratives. Sociology already uses story: it ‘is bound up with gathering other
people’s stories (via interviews and so on) and telling stories (about modernity, class, the degradation of work, and
so on)’ (Plummer 1995a: 18).

The literary-evolutionary perspective: people as storytelling animals

I enjoyed reading Gottschall’s The Storytelling Animal: How Stories Make us Human for the simple way it tack-
led a difficult subject. Gottschall addresses the relevance of story to society through a literary and evolutionary
perspective. His book bridges biology, literature, psychology and neuroscience to ask ‘How did we become the
storytelling animal?’ Gottschall uses the metaphor of a fish out of water to illustrate that we cannot function
without story because make-believe has played a major role in the evolution of human society (2013: xiv). His argument echoes that of literary critic Jack Zipes, who believes that fairy tales have had an historical influence on the behaviour of young people, an influence which continues today through different forms of narrative such as Disney films (2006: 20). Therefore story might play a role as a stabilising, or possibly as a subversive, influence in society.

What is the role of story in society that Gottschall proposes? Gottschall's focus is on the evolution of story. He asks, ‘How did we become the storytelling animal?’ Each chapter lays out why as humans we cannot function without story: why it is irresistible to our brains, the nature of dreams, and how we can learn morals from stories. Gottschall concludes that we are storytelling animals, and that make-believe has played a major role in the evolution of human society. He illustrates through psychology, neuroscience and evolutionary thought how characters and situations ‘shape our behaviours and our customs, and in so doing, they transform societies and histories’ (2013: 145).

My main criticism is that Gottschall talks about storytelling when he really means narratives. If this were an academic book, Gottschall would have chosen a different title, because he is talking about storytelling when referring to the different narrative forms of story, and these two things are different. However The Narrative Animal, as a title, doesn’t have quite the same ring to it. Using ‘storytelling’ reinforces his point that the brain finds a good story pattern hard to resist. And as the main audience for this book is the general public the title works well in that context. I liked the way each chapter began with a story which relates to Gottschall’s argument. I think that anyone who has an interest in story would benefit from reading the book.

mashup32 (2015-02-16 16:56:31)
Thanks for your review, Emma! I also think important and interesting can be found in Gottschall’s book to understand the social role of storytelling. However, as sociologists, shouldn’t we be more skeptical about his evolutionary approach? For instance, a risk is to assume that the social functions of stories are a-historical...

Jaames Waddington (2017-08-21 11:37:44)
Interesting review. I haven’t read the book, but I’m certainly interested in the evolution of the story as a major part of the evolution of the human extended phenotype, or culture as it is more popularly known. So I’m puzzled by the specific use of the term evolution by mashup32 above. The Darwinian hypothesis is profoundly historical - that was one of the main elements of the Enlightenment, that e.g. the bible was not an a-historical given but a super-narrative that changed over time, and also
‘Questioning Technology’: The Importance of Empirical Work and Ontological Philosophy (2015-02-10 18:26)

by Declan Mcdowell-Naylor

There’s little question that, for at least two decades, technology has been a centre piece of enquiries across the humanities and social sciences. Nearly every field has made valuable empirical contributions, addressing plenty of normative questions ‘about technology’. Yet, there’s lacking a question ‘of technology’, though in many areas this is changing. Nonetheless, I feel it persists enough to make a point on it and to advocate the continued use of philosophy alongside empirical studies.

It is often the case that the initial assumptions, or analytic consensuses, about technology go unquestioned. This can be damaging to otherwise useful empirical investigations of normative concerns. Because they are, typically, reductive or undetermined in some way, they severely limit the horizons of their argument and findings. Additionally, they risk creating false scenarios based on a limited set of circumstances, usually in the form of a dichotomy. Lastly, they sometimes make statements that are entirely incorrect.

There are few common examples of these initial assumptions, or analytic consensus. The first, and perhaps most common, is the idea that technology, and usually that just means social media, is a just a tool (and that data is just data). There are examples of technology, being referred to as a political tool for use in elections, or as a means to achieve political goals in movements. This is openly contestable, yet I’ve frequently seen it explicitly referred to as ‘merely a tool’. This is certainly accurate intuitively, but that’s a very limited basis.

Another assumption is that questions about technology must take place within the two sided-political debate based on competing political factions, typically institutions or movements. It leans on the notion of technology as tool, arguing its use as such should be for democratic and emancipatory ends, as opposed to totalitarian ends. So the argument usually ends with the dictum that we should strive for genuine democracy or some hopeful conclusion that we find ourselves on the cusp of a better society. Good ideas, sure, but are they enough?

I’m not saying they’re necessarily incorrect assumptions, or the only ones. This is the point. Technologies are tools in a sense, and we do encounter situations where technology plays a role in what is generally a struggle between two forces. But these statements in no way exhaust what technology is or does, and to frame it that way not the best foundation for empirical work, as I’ve stated above. They are at least useful contributions. There are situations where there are basic errors and bad uses of data, usually in journalistic discourse adapting academic discourse, used to inflame technophobia.

So, why endorse a philosophical approach to empirical studies about technology? For me, when it comes to writing ‘about’ technology, retaining the popular and normative concepts attached to the issue can only take an empirical study so far. Not only this, we also have to be aware of how our research feeds into public discourse. Encouragingly, the advocates of philosophy come from many different areas.

For example, a few days ago I found [1] a blog post which argued why the concept of ‘cyberspace’ must die. Cyberspace, with all its historical connotations and metaphorical guise, is totally unsuited to a world in which we have the Internet of Things. And it was right. Likewise, a few years ago now, the philosopher of technology, Andrew Feenberg wrote Ten Paradoxes of Technology, in which he argued, quite bluntly, that most of what we know about technology’s ontology is false. Accordingly, he argues these common sense conceptions have- far from abstract
worrying political consequences in the real (that is, empirical) world. Likewise, ANT theorists have for years now being advocating a mixture of philosophy and sociological empirical work, from their early work in science labs, to my favourite study: Annmarie Mol’s The Body Multiple (2002). Recently, from the PIR department which I work in, Andrew Chadwick’s The Hybrid Media System (2013) adopts an ontological approach to the concept of ‘hybridity’ to inform an empirical analysis of political communication and the attendant technologies. From sociology, Judy Wajcman (2008), in establishing her sociology of technology and time, carefully considers the “need for increased dialogue to connect social theory with detailed empirical studies”. There’s more examples, of course, these are simply indicative.

What is clear is that the philosophical approach has gained particular traction around the question of humanity, a question with perhaps the closest tie to the questions about technology. We see this in work of the ‘post-humanists’. As a recent example in touch with the meta-debate of method and philosophy, Daniel Chernilo (2014), in a recent paper (also presented at the Centre for Social Ontology), introduces what he calls philosophical sociology, described in the abstract as “an enquiry into the relationships between implicit notions of human nature and explicit conceptualizations of social life within sociology”.

So we are certainly seeing a constellation of advocates from many disciplines. Venn and Blackman put forward that ‘common ontologies’ are emerging across the humanities, social sciences of natural and physical science. Unifying them in this sense, the basic argumentative premise is actually nothing unusual, but it is important. It basically says that if we apply different initial assumptions derived philosophically, this will lead to a different range of enquiry, and thus the approach to a normative issue under consideration. Still, we have to appreciate the perspectives of different disciplines without blithely assuming there is an automatic ease transitioning concepts. Writing about human nature is comparative to writing about technology’s nature, and we already know about the philosophical and political debate on the former. But, equally, this doesn’t mean we should just stick to what we (think) we know every time.

To conclude, it is particularly important to broaden our assumptions about and of technology, since technology is already broadening and challenging our assumptions in the way in which it newly enables certain new forms of sociality and practice. We need to keep up with it, empirically and philosophically. How this reaches out into the methodologies of natural and physical science is significant for the future of technology design and implementation, as Feenberg suggests. I’ve seen a recent theoretical computer science paper which was attuned to the need for formal philosophical enquiry. In this regard, we need to continue to pay attention to the ontological arguments which relate to ethical issues and the normative moralities across society- for that challenge, empirical observations will certainly not alone suffice.

Reflexivity and an interdisciplinary approach to the ‘structuring of agency’ (2015-02-11 08:00)

This podcast by [1]Graham Scambler was recorded at a Centre for Social Ontology event in November 2014.

[soundcloud url="https://api.soundcloud.com/tracks/188525951" params="auto _play=false &hide _related=false &show _comments=true &show _user=true &show _reposts=false &visual=true" width="100 %" height="450" iframe="true" /]

Margaret Archer’s recent contributions to our understanding of reflexivity in late capitalist society provide useful resources for theorizing across the substantive domains of sociology. Using illustrations from my own work on the sociology health inequalities in general, and my ideal type of the ‘vulnerable fractured reflexive’ in particular, I examine some of the pros and cons of adopting an interdisciplinary approach to the structuring of agency. I conclude with a skeletal research programme involving interdisciplinary collaboration.

The Philosophy of Data Science (2015-02-12 08:00)

• [2]Rob Kitchin: “Big data should complement small data, not replace them.”

Sociological Perspectives on Digital Health (2015-02-13 08:00)

This seminar organised by the Quantified Self Research Network brought together a range of thinkers to discuss sociological perspectives on digital health.

Dr. Conor Farrington (Cambridge) - The Sensemaking Spectrum: Understanding User Interactions with the Artificial Pancreas

The artificial pancreas (AP) is a system for the treatment of diabetes, incorporating a body-mounted glucose sensor and body-mounted insulin pump in conjunction with an algorithm controlling insulin dosage. In common with many new medical technologies, the AP presents users with both opportunities and challenges – opportunities in terms of improved outcomes, and challenges in terms of incorporating new artefacts, systems, and treatments into everyday life. Research on ‘sensemaking’ in the information technology and organisational fields shows that different users, and groups of users, ‘frame’ and ‘make sense’ of (i.e. interpret) technology in different ways, with significant impacts on patterns of use and eventual outcomes. While technology is often assumed to be ‘univocal’ (i.e. meaning the same to all users), sensemaking research reveals the ‘equivocality’ of technology, and the ways in which technology can be interpreted and used in different ways by different users. Likewise, different patients (and groups of patients) often experience the opportunities and challenges presented by new medical technologies in different ways, owing in part to varied understandings of technology, illness, and healthcare, and (more widely) distinctive identities, formed against varied socio-economic, ethnic, educational, and geographical backdrops. These varied sense-making experiences have the potential to generate differences in the way that patients interpret the AP technology and incorporate it into their self-management routines, and thus potential variations in the effectiveness.
and acceptability of the technology in everyday settings and long-term use and adherence. Likewise, the use of AP technology, in common with the use of new technology in general, may in turn influence and potentially transform users’ wider perceptions of technology, illness, and healthcare, with potential implications for future attitudes towards, and usage of, new medical technologies.

Prof. Deborah Lupton (Canberra) - Critical Digital Health Studies: A Research Agenda

In this presentation I discuss the various elements that comprise the digital health phenomenon and consider the implications for social and cultural analyses of medicine and public health. Most popular and professional representations portray digital health technologies in utopian terms, focusing on the benefits they may offer to healthcare delivery and public health surveillance and illness prevention. Yet, as I have argued in recent work, a critical approach to digital health technologies is important to go beyond instrumental concerns and identify their social, cultural, ethical and political dimensions. I will identify some important questions for a sociological critique of digital health technologies and talk about some of my current research, including analyses of self-tracking technologies, apps as sociocultural artefacts and 3D printing in medicine and health.

Sam Martin (Warwick) - Twitter: Re-Writing The City Landscape With Health Knowledge

There is a huge body of research relating to e-health and the interaction between people’s online engagement and their health practices. Main approaches look at how e-health can be used for medical intervention to promote healthy behaviour and self-management of chronic conditions, and the quality of e-health information on websites and smartphone apps.

However, there is little on how patients self-managing chronic conditions use real-time social media, such as Twitter, as decision-making and risk-aversion tools to navigate the physical environment of the city. In this presentation I discuss how individuals’ online interactions on Twitter inform their health navigation of the city, and how this process performs a re-writing of the city landscape with health knowledge. With the case study of Coeliac Disease, my research explores different ways of analysing and visualising the ways that patients share information about the diagnosis, symptoms and daily self management of chronic illness. I will also discuss how this interaction informs Coeliacs’ evolving identity with food, and different ways that data mining, social network analysis and data visualization techniques can be used to map both textual and visual interaction across cities in a comparative study of activity in London and New York.

International Association for Critical Realism (IACR) 2015 Annual Meeting (2015-02-14 08:00)

"Critical Realism: Reimagining Social Science"

July 28-30, 2015
Notre Dame, IN (USA)

“What difference does critical realism make for how we do our empirical work?” That is the question that
many social scientists who hear about critical realism initially ask, especially in the United States. This is an honest question that needs good answers.

How does the alternative meta-theory of critical realism change the kinds of scholarly research we conduct and the ways we conduct it? What real differences does critical realism make analytically and methodologically? How would social science that was primarily informed by critical realism, instead of some other background philosophy, look and act differently?

Critical realism makes a big difference, in fact. Some of these differences are subtle, others more profound. Yet more work must be done to think through and spell out specifics on how critical realism already does and might continue to re-orient scholarly research in practical ways.

“Critical Realism: Reimagining Social Science” is the theme of the 2015 Annual Meeting of the International Association of Critical Realists (IACR), to be held at the University of Notre Dame, July 28-30, 2015. Papers on all topics relevant for critical realism are invited for submission for presentation in a session at IACR 2015, but papers that focus on the practical analytical and methodological implications of critical realism are especially welcome.

To submit a paper for consideration, please prepare an abstract of no more than 500 words and send it by email along with your paper title, name, contact info, and organizational affiliation to Nicolette Manglos-Weber at [nmanglos@nd.edu]. Submissions must be received by April 1 for full consideration for inclusion on the program.

Registration costs are only $400 USD, which includes full room and board from the evening of July 27 to the evening of July 30. All participants must register for the conference by May 30. After that date, an additional fee of $40 USD will be applied.

Conference costs are supported with generous grants from the Institute for Scholarship in the Liberal Arts at Notre Dame University and the Templeton Religion Trust.

An eclectic account of lay morality and charitable giving in the UK – TOMORROW @SocioWarwick
(2015-02-16 08:00)

Balihar Sanghera (Kent)
Tuesday, February 17th
5:00 PM to 6:30 PM, R1.04
Ramphal Building, University of Warwick

This paper examines how charitable giving is an outcome of different interacting elements of lay morality. Charitable giving reflects people's capacity for fellow-feeling (or sympathy), moral sentiments, personal reflexivity, ethical dispositions, moral norms and moral discourses. An eclectic account of lay morality and charitable giving is warranted because of the complex nature of the object. Though ordinary people engage in ethical reasoning, they often think and act in piecemeal fashion, so that confusion and inconsistencies can occur. This is particularly evident when gender, class and 'race' shape people's feelings and evaluations of others, their attention and care for others, and their understanding of responsibility and blame for social issues. Morality is further complicated because it takes place in the mundane world of everyday life that can result in inconsistent and confusing judgements and actions on giving.

The Fetishisation of Intelligence Under Neoliberalism (2015-02-17 08:00)

An interesting exchange on Twitter last year about how intelligence is represented in film and TV has stayed with me since it occurred. Watching Hannibal with a friend who was a big fan of it, I found myself obsessed by the quasi-supernatural form which Will Graham's intelligence takes in the show, allowing him to see through the superficial veneer of a crime scene and reconstruct the truth of what occurred. Though Hannibal's talent is slightly different to Will's, relying on personal observation rather than contextual reconstruction, it's also nonetheless akin to a superpower. Will has "pure empathy" and can entirely assume another's point of view, whereas Hannibal can anatomise the psyche of an individual, pulling it apart as reliably as if he were taking a scalpel to their brain:

[youtube https://www.youtube.com/watch?v=fgy4vQfVYhc]

Much to my friend's irritation, I found myself embroiled in a fascinating conversation on Twitter about the cultural politics of how intelligence is represented. One of the people I was talking to, whose name I have forgotten and would love to know if they happen to read this so that I can attribute the thought to them, pointed out that this is a broader tendency in contemporary television: intelligence is fetishised because 'merit' is such an ambivalent topic within our 'meritocracy'. Once you start looking for it, there are examples everywhere. One of the most prominent is the "Sherlock Scan" portrayed so characteristically by Benedict Cumberbach:
A few years ago I found myself strangely obsessed with a pretty awful show called Suits. It’s a weird throwback to the 1980s, with obnoxious corporate lawyers being presented as noble warriors in suits. Utterly devoid of irony, it rests upon the exploits of Harvey Spectre, the supernaturally self-possessed attorney, mentoring his young protégé Mike Ross. What got me hooked on the show is how it presents the latter’s talent. He wanders into a recruitment event for the high powered law firm, which only hires from Harvard Law School, in order to escape a drug deal gone wrong. With his photographic memory, he proves sufficiently impressive that they hire him, before increasing numbers of staff at the firm come to look the other way in virtue of his sheer talent.

Talent trumps prestige. If someone sufficiently talented takes their chance, no matter how bizarre the circumstances are that lead to it, their advancement is justified. But what is this talent? In effect, he’s an informational sponge. His talent is not only akin to a superpower, it’s one emptied of positive content. It’s not an ability to do things in the world as such but rather that Mike lacks the tendency of others to lose information. Yet the show frames attempts to expose him by enemies at the firm as irrational projects motivated by petty loathings and personal jealousies, rather than their seeking to hold to account a drug dealer who wandered into a law firm and now regularly goes up in front of judges pretending to be a lawyer.

Another example is The West Wing’s Jed Bartlett, though in a slightly different way. He’s a liberal fantasy figure, allowing mainstream Democrats in the US to imagine a world in which Bill Clinton was also a morally flawless figure with a nobel prize in Economics. The most obvious example of this is the debate in an early season between Bartlett (Al Gore) and Richie (Bush) but this stuff pervades the whole show:

I particularly love the "oh my god" from CJ Craig at the end of this clip: "he’s so smart, so witty, so articulate! how lucky we are to have such an intelligent president". However what interests me about this is how Bartlett’s intelligence is represented. He’s obsessed with trivia and constantly quizzing his staff on obscure topics. We see intelligence reduced to an ability to recall ephemera and to litter utterances with it at a rate which is at best unlikely and at worst utterly ridiculous. This is reflected more broadly in Aaron Sorkin’s characteristic fast talking dialogue, representing intelligent people being intelligent as little more than talking very fast and very articulately, usually while walking.

These representations interest me because ‘talent’ has become so integral to the defence of social inequality. We can see this when Boris Johnson [1]mocks the 16 % of our species’ with an IQ below 85 and praises the 2 % with an IQ over 130. It’s why the popularisation of developmental neuroscience is so sinister: it heralds a social imaginary in which ‘talent’ can be understood as hardwired, while still acknowledging that circumstances plays a role in how these characteristics are inscribed in the human i.e. it justifies present arrangements while licensing punitive interventions against parents who fail to raise their children in a way conducive to the genesis of talent. Looking to the more ridiculous forms this fetishisation of talent takes can help us critique the more insidious and sophisticated variants that are increasingly dominant. This case can be made in particular about the most popular forms of self-help in recent years:

And this is the most remarkable feat of The Secret: its ability to defend inequality. While the 99 per cent has become a worldwide slogan questioning the concentration of wealth, the author of The Secret offers...
an alternative view of the situation. 'Why do you think that 1 percent of the population earns around 97 percent of all the money that’s being earned?', Bob Proctors is asked rhetorically in the book, answering, 'People who have drawn wealth into their lived used The Secret, whether consciously or unconsciously. They think thoughts of abundance and wealth, and they do not allow any contradictory thoughts to take root in their mind.

*The Wellness Syndrome, Carl Cederstrom & Andre Spicer, pg 80*

What makes The Secret so interesting is how nakedly metaphysical it is. The affluent do it 'unconsciously' and that is why they are affluent. Those who are not nonetheless have the choice to do it. If they do it correctly then they too will become affluent. If they do not then they deserve their fate. This bizarre concept of "The Secret" fascinates me because it’s easy to see how it holds the whole picture together: this latent faculty, to which we all have access, allows us to succeed. Some people are disposed to access it already (inherited privilege) but this places no restriction on others. We can all access this latent ability to be a success if only we choose to do so and then use it in the proper way. Replace "The Secret" with "Intelligence" or "Talent" and you have the governing ideology of neoliberalism.

Weirdly, it seems to me that The Secret is actually more coherent. Its metaphysical character reconciles the tension within neoliberalism, much as the eidetic memory of Mike Ross obscures the fact that lawyers probably do need some specialised training. As soon we start specifying what ‘intelligence’ or ‘talent’ is in a positive way, we find ourselves embroiled in complex questions of social causation which undercut the simplistic moral logic in which each gets what they deserve. Representing talent as magical or metaphysical escapes this problem and, through continuous repetition in popular culture, reinforces the intuitive plausibility of successful people being so in virtue of their innate talent.

1. [http://www.theguardian.com/politics/2013/nov/28/is-boris-johnson-right-about-iqs](http://www.theguardian.com/politics/2013/nov/28/is-boris-johnson-right-about-iqs)

kerrysmallman (2015-02-27 09:01:11)
Thanks for drawing my attention to this! In a paper I’m half working on, I came to a very similar conclusion. While capitalism is quite comfortable with worker/owner inequality, it seems to feel the need to defend inequality within the bourgeoisie. The protestant work ethic, eugenics and IQ were all invented as ways to explain inequality of outcome in capitalism.

Good post. In his book "Twilight of the Elites", Christopher Hayes wrestles with a similar topic; worth a read.

Deborah (2016-09-19 07:09:01)
I don’t think an interest in intelligence can be so neatly layered to that pop term neoliberalism. People really hate sharp auto-didacts from working-class backgrounds, for example, and there’s a secret envy directed against them. Look at how they often fare in higher education. Or highly intelligent women, or super clever foreigners. Class, gender and race trumps everything in the UK (impoverished people that we are), though it’s true the US is more ideologically meritocratic (and always has been, predating 'neoliberalism'). Incidentally, the point about Jed Bartlett was his grasp of detail, something often lacking in US politics. The show was about the triumph of rationality and intelligence over ideology. Guess that would piss some people off....
I'm currently reading [1]Ghosts of My Life: Writings on Depression, Hauntology and Lost Futures by Mark Fisher. It's an interesting book which explores a condition in which "life continues, but time has somehow stopped". His claim is that this "stasis has been buried, interred behind a superficial frenzy of 'newness', of perpetual movement" and he explores it in terms of popular musical culture:

Nowhere is this clearer than in popular music culture. It was through the mutations of popular music that many of those of us who grew up in the 1960s, 70s and 80s learned to measure the passage of cultural time. But faced with 21st-century music, it is the very sense of future shock which has disappeared. This is quickly established by performing a simple thought experiment. Imagine any record released in the past couple of years being beamed back in time to, say, 1995 and played on the radio. It's hard to think that it will produce any jolt in the listeners. On the contrary, what would be likely to shock our 1995 audience would be the very recognisability of the sounds: would music really have changed so little in the next 17 years? Contrast this with the rapid turnover of styles between the 1960s and the 90s: play a jungle record from 1993 to someone in 1989 and it would have sounded like something so new that it would have challenged them to rethink what music was, or could be. While 20th-century experimental culture was seized by a recombinatorial delirium, which made it feel as if newness was infinitely available, the 21st century is oppressed by a crushing sense of finitude and exhaustion. It doesn’t feel like the future. (loc 183)

Can we see a similar process in higher education? The way Fisher describe the hyperactively inert quality of contemporary music immediately resonated with me: “the rates of innovation in both these areas had enormously slackened”. This is precisely the terminology Filip Vostal and I have been using to discuss the acceleration of higher education: we’re interested in how the rate of innovation relates to the rate of publication. Our hunch is that the former declines as the latter increases. We’d like to substantiate this. But perhaps more importantly, we’d like to explain it.

What would this hyperactive inertia look like in higher education? We’d see the same underlying ideas being expressed in new ways. We’d see the same underlying debates – conflicts between ideas – being pursued in new forms with no reference to previous skirmishes which largely or entirely addressed the same issue. We’d see reiteration that understood itself as novelty – making no reference to what has come before because the temporal horizons are sufficiently circumscribed that this novelty appears to unfold within a perpetual present. We’d see a perpetual forgetting coupled with perpetual innovation: nothing moves forward because the foundations upon which innovation might be built would be constantly discarded.

I’d argue we can see this. It’s a process that seems pretty obvious to anyone who’s kept up with academic literature over a sufficient number of decades (or maybe it’s just the people in this category whom I happen to talk to a lot). Part of the project we’re planning would intend to actually map this empirically. But the indicators are pretty clear: conceptual commonalities between referentially disconnected literatures, shrinking time horizons of citations, constant invocation of 'turns' in the name of innovation. Constant movement without anything ever progressing.

What makes this odd is how unnecessary it is. Since I started working at the Sociological Review, I’ve been slightly obsessed by the fact that the archive extends to 1908 and is fully digitised. It’s as easy to access a paper from 1915 as it is to access a paper from 2015. I’ve gone around telling anyone who might care about this in a way that extends far beyond any remit arising from the fact I’m employed by the journal. This fetishisation of the past is exactly what I take Mark Fisher to be concerned with – I’ve been hugely enthusiastic about these archives without ever seriously engaging with them. Crudely: I think it’s really cool that they are accessible but I’m not really...
sure why I think this. As Fisher observes, “it seemed that practically everything was available for re-watching. In conditions of digital recall, loss is itself lost” (loc 105). There’s no technical reason for this loss of the sociological past but this seems to make little practical different, suggesting that the reasons for this loss have very little to do with technological capacity. This recent post by Graham Scambler identified one of the core reasons for this forgetting:

There is now a premium on roller-coaster productivity pertinent to crass metrics like the REF. To (appear to) stand still is to attract opprobrium, too often from line-managers as crass(ly ambitious) as the metrics they bend the knee to. We are fast accelerating away from the concept of education as intrinsically worthwhile. Education in its entirely needs defending against the bureaucratic instrumentalism characteristic of this vicious neo-liberal interlude.

The broader perspective of social acceleration helps situation this institutionally specific trend in terms of broader macro-social processes. But it’s important not to lose sight of the institutional specificity of higher education. I like how Graham describes the dilemma for scholarship posed by what I’m suggesting is the acceleration of higher education:

we already possess a considerable and under-utilized body of work, both theoretical and empirical (and yes, empiricist too). While the need for innovative theorizing and for up-to-date or novel data and analyses remains, there are published warehouses of the stuff that we neglect. It would pay us to tap and reflect on these. It really is okay to relearn lessons from dead social theorists, sociologists and researchers!

Much of my own recent output – mainly publications, but a few blogs too – comes within the orbit of meta-reflection. This is especially true of my work on health inequalities, but it applies also to my discourses on stigma. I have attempted to draw on and occasionally to develop extant theory as well as quantitative, qualitative and mixed-methods investigations to explore optimal ways of determining the extent and nature of, and ultimately explanations for, enduring health inequalities and stigmatization. I have staked claims for theory that is in my view consonant with available evidence bases. I am of course deeply indebted to innumerable predecessors and contemporaries!

It’s for this reason that I think questions of scholarly communication are integral to the future of the social sciences. But my reasons for believing this to the case are somewhat idiosyncratic. This is another theme which we’re hoping to explore in our project (and at the conference we’re organising in [4]Prague in December). There’s a big picture here that is getting lost because of the very academic specialisation it has some important consequences for.

The price of modernity: Disentangling the source of modern terror (2015-02-18 16:29)

By Ralf Wetzel

The bloody advent of Al-Qaeda and, more recently, the so-called Islamic State has incited much and heated debate about the sources that evoke and feed modern terror. The main suspect so far has been religion, especially a fundamentalist interpretation of Islam. The propagation and enforcement of its tenets seem to be an obvious cause. However, this is too short-sighted an explanation. Religion is certainly involved, but neither more nor less than modern politics, law, or mass media. Modern terror tells us much more about the structure of the modern society and the side-effects of the over-simplifications we use on a daily basis than it does about any radical tendencies in religious beliefs. It is time to move beyond everyday simplifications and understand what there might be hiding behind.

The end of an ordered world

For the last fifteen years now ever more so than ever before, the West is being forced to decide about political and military interventions, while experiencing the constant risk of disaster. America is hesitant to get drawn in too close again into the quagmire of Iraq or Syria, while the actions that it does take have only limited impact. Europe is forced to decide whether to give weapons to the Kurds without knowing on which side of the front they will end up being used. The Kremlin supports local dictators, knowing full well that this might undermine its regional influence in the long run. Somehow, modern terror forces us to put aside the old distinctions that told us the lines along which the world is divided. For a long time, it was quite easy to tell Americans from Russians, democracy from stratified polities, the poor from the rich, deliberate intervention from sheer chaos, the 'here' of the West from the 'there' of the conflict zones, neo-liberals from left-wingers. All of that has collapsed to Western eyes as we witness the new battle for Iraq, the battle against the Islamic State. The classic order of this world has been broken time and again and, what is much more important, so has the moral code that attributes and distinguishes the good from the bad. It is as sub-complex as it is dangerous to still stick to the image of a liberal, enlightened West, threatened by some tribal, fundamentalist pre-nation states as well as astonishingly post-modern, agile militant networks. It does not do the problem justice. Let's take the description of the problem to another level: We need to move beyond a worldview which understands the world as a biological body, in which everything has its place, and terror is just a happenchance disturbance, a kind of 'infection' indicating sickness in the body politic that just has to (and can) be healed. This metaphor does not help much.

The 'event' of terror and the structure of modern society

Terror attacks modern society, and it attacks it as a whole, not only its specific parts. Following Peter Fuchs, one of the strongest and most innovative developers of Niklas Luhmann's systems theory, it is a kind of protest against modernity, containing not merely the rejection, but the communicated end of communication. Terror rejects communication with the societal conditions that surround it. Probably the most frightening feature is its 'blindness', its undirected, furious rage which hits usually innocent people, meaning individuals who personally do not have any links to what happens some 2000 miles away, who individually did nothing specifically 'wrong' whichever vantage point one might apply. This rupture, this communicated termination is directed at a society that, according to German sociologist Niklas Luhmann, can be characterized as a functionally differentiated society. Such a society is a network of communication, structured into heteronomous domains like economy, politics, law, science, arts, or mass media. Each of these functional domains consists of communication alone, not of people, and each provides a specific function (e.g. distributing scarce goods = economy, establishing collectively binding decisions = politics) for society. Each domain operates autonomously. By contrast to medieval or ancient times, modernity has lost its inner hierarchy, the primacy of a single observer, a role once fulfilled by religion in medieval Europe. Modernity has no centre. Triggering first the French and later the Industrial Revolution, functional domains like economy, politics, education, science, or law have replaced the hierarchy of different strata (aristocrats, guilds, slaves) that were dominant in earlier times. With this shift, another feature of the stratified order has been
lost: modern society has no single representation anymore, no unifying institution which stands for society as a whole. Unlike medieval times, there is no god (or his earthly representative in the form of the pope) to whom communication could turn as a single representation of society. Someone to get in touch with, someone one could write a letter to. In other words, modern society cannot be directly accessed, the functional systems of politics or economy have no homogenic and unifying body anymore. There is nobody to contact or to vent one's anger and frustration to. One can only reach and access organizations or individuals, who alone are still addressable. However, the organization of the European Commission, the State Department, or the headquarters of McDonalds are not fully unifying institutions of society. One could attack them, but one would only find the European Commission, the State Department or the McDonalds headquarters, not society as a whole. Terror communicates to modern society that it does not want to communicate with society. However, the communication of this rejection never reaches its intended audience. The fury of modern terror therefore rails mainly against the lacking addressability of modern society. It is built on the insight that attacking modernity directly in fact comes to nothing. Since terror does not find an addressee, it attacks substitutes found in the environment of functional systems: innocent people, respectively their bodies. The core speculation of terror is that modern society is extremely sensitive in observing individuals and their bodies, and that all functional systems can become alarmed by the experience of innocent dead people. The fact that every (sic!) body (sic!) can become a target is what alarms almost all functional systems of modernity. This alarm takes place indirectly, and it takes advantage of one specific functional system: mass media.

**The role of mass media**

That terror, although confronted with the inaccessibility of its target, can nonetheless have impact happens for a reason. Modern society is an observed society, in which functional systems observe each other. One of the core functional systems providing self-observation in society is the system of mass media. This system is constantly engaged with the production of information, especially information that is new, emotional, and able to affect people in the environment of functional systems. The result of terror, the bleeding bodies, the buildings destroyed, the general outcry, together with the fury of the attack and the observable innocence of the victims, feed mass media like no other system. Terrorist attacks and their aftermath cannot be ignored by mass media. In this respect, modern terror rides the code of mass media. Terror itself is in this respect ‘modern’. It can be sure that this system will transform its substitutive work on bodies into the social language of society: Politics cannot ignore information spilled across society by mass media. Neither can law; neither can economics. Terror, as a modern system on its own, and mass media are structurally coupled; they feed and re-enforce the demands of each other. Both enable each other. Mass media is the interface through which terror irritates modern society. Even the attempts to respond to terror are, as such, bound to the logic of mass media. In this sense, they again feed the goal of terror.

**And ... religion?**

All of this can operate without having to fall back to the one system that is regularly scapegoated as the source of terror: religion. However, religion might be as closely coupled with terror as mass media is, given its stratified internal order and the existence of formal representatives. Religion is a copy of the lost order of stratified society, the society that religiously flavoured terror in essence refers back to. The similarity of the internal structure of religion with a stratified society provides the semantics, the language that terror can start from. Clearly, this is not a feature of Islam alone. It is inscribed in nearly all religions. And in this respect, almost no religion is safe from becoming a resource or semantic for modern terror, however it eventually occurs.

**So what?**

All of this gives not much reason to hope for a quick solution. It seems as though terror has become a genuine feature of modern society. It might only become subject to change, once the structure, the differentiation of modern society changes. However, there are not many indications that this will happen any time soon. We might have to live with terror, whatever intervention strategy we can dream up. However, two things are needed to be set
clear: The first is that the modern appearance of terror is not about religion in the first place. Terror is a reaction to a core feature of modern society, and religion is just one functional milieu giving source to its appearance. The second is that terror might become one functional milieu of its own to modernity. In this respect, it is a side effect of modern differentiation and it fuels it by its own means.

Ralf Wetzel began his career as an electrician. He joined Vlerick Business School as a Professor of Organization and Management after extensive work experience in management and organization research and after being a head of a joint research and consulting group. His career path led him from Germany to the UK, via Switzerland to Belgium. He applies art-based research like improvisation principles and theatre play in his work, especially for inquiring into topics like organization theory & behaviour, change management, consulting, leadership, organization & society. Lean in and die trying. A lesson in how to obscure instead of solve a problem (2015-02-18 21:17)

By Ralf Wetzel

[1]
Today’s chauvinists live in difficult times. Waving the flag of equality, women successfully conquered most domains of modern life decades ago, with no regard for the consequences for their poor male counterparts. That’s nothing new. They found ways to adapt, in the worst case by resorting to cynicism. However, encountering an average chauvinist these days means witnessing a state of sheer devastation. Famished, pale, hopeless, almost with tears in his eyes. What happened? Women have obviously overrun one of their last strongholds, one of their last resorts. So far, they always could retreat to one safe zone in their arguments, to one last point of polemic: ‘Dear ladies, overall, you’re just not smart enough.’ Well, that’s history. Even that polemic is now found on the lips of women, they have conquered the last bastion as well. From now on, chauvinists are truly somehow, ... well: homeless.

The hypothesis of ‘Lean In’

‘Lean in’ has been one of the management bestsellers of the previous years. Sheryl Sandberg wants to offer a refreshing look into gender inequalities, especially in the world of business and management. And she aims to provide a clear and empowering guidance for women planning to step into higher management positions and crack the ‘glass ceiling’. The ambition to "help" women to liberate themselves from low self-perception and considerable self-restrictions is more than laudable, and she herself seems to give the proof that it works. As COO of Facebook, she has climbed to the top of the greasy pole with mind-blowing speed and success. She seems to be the role model for the quickest way to the top, given that no one else will fight for women’s rights and equality than themselves. Cut to the bones, the core message of the book claims: ‘It’s you, stupid!’ If women only were more active and went bravely against stereotypes, if only they started investing more in knowledge-building and networking, if only they adapted to assertive decision-making and generally had more presence to fight their claims, they would be more successful. It’s the women’s own problem is the message, heralded by one of their own. But how much substance is there to this argument?

The hidden role of cultural capital

However, steeped in American individualism and pragmatism, the arguments of Sandberg miss some important side conditions of modern gender inequality which we need to understand as its very core. It was Pierre Bourdieu, the French philosopher and sociologist, who made it clear that there is a structural societal background that gender inequalities especially stem from. Bourdieu introduced aside the notion of economic capital the idea of non-monetary, non-financial capital that individuals have access to, can acquire, barter and store, even build a living upon. Economic capital becomes relevant, since it can be exchanged and transformed into other, none-economic capital, when university degrees become subject of admission fees for example. For the non-economic sorts of capital he distinguishes between social, cultural, and symbolic capital, of which social capital stands for access to and relevance in networks, cultural capital for the acquired knowledge and behavioural richness, and symbolic capital for the value of all capital, for the prestige of a person. The more a person can acquire these different sorts of capital, the more vertically and horizontally mobile he or she becomes between the different layers of society. For example, a university degree implies a proficiency in a language that someone without a degree hardly can keep up with. A childhood in a family of academics implies a versatile and eloquent turn in the given tongue that someone being raised in a blue-collar family can almost never reach. The societal ‘pedigree’ and the amount of formal education are important pre-conditions for the eventual societal position of any person. If you have been socialized in the English upper class, this upper class will much more easily welcome and embrace you than if you haven’t. Clearly, the ways in which these capitals can be accumulated reinforce the given distribution. Societal inequality supports societal inequality. Women face the problem of graduating less and, when they do so, preferring degrees in sectors and industries which tend to have a lower societal rank and remuneration than their male counterparts. Strikingly, professions which become feminized experience a reduction of status over time. It is the non-financial capital that women lack and that substantially impedes their societal mobility, on a structural basis, based on a lack of economic capital that furthermore would allow to better acquire non-economic capital. The vast majority of women who Sandberg reaches out to lack symbolic and economic capital compared to their male peers. Sandberg
obscures the fact that the accumulation of non-financial capital is mainly a long process of socialization, only partly influenced by individual action. To change this inequality, a toolbox of intervention with a quite different armour is needed, since it is about changing complex, and mainly sublimely operating discriminating gender regimes, and less about individualistic action. And whether this part of modern feminisms, which fancies work as a mere means to emancipation, is better than other predecessors, which aimed to distribute work and non-work-loads differently, is at least worth a second look.

**The obscuring impact of modern organizations**

Since Sandberg is most concerned with the problem of the glass ceiling, one of the core domains where inequality persists, as is visible in the enduring underrepresentation of women in the management boards of companies, another blind spot needs to be spotted here. The organization, that is, the social order that companies incorporate, is by definition, by its sheer constitution – unequal, asymmetric, in short: hierarchical. More problematically, it represents the core mechanism of modern society for solving one of its core paradoxes. Modern society claims to be an equality-based society, where everybody should have access to all societal sectors and services like the economy, law, politics, or education. Factually, however, this equality is not given. It seems as if the more equality is in demand, the more inequality is the result. According to Niklas Luhmann, a German sociologist, organizations ‘help’ solve this problem. Organizations include only a very limited number of people as members, though the sheer number of organizations enables society to include almost everybody in one or more of them. Which role and position the included members acquire is then again open to acquired individual symbolic capital, but this is almost invisible to the outside society. All members of society are included, albeit not equally so. Furthermore, organizations act as a collective person; they establish an address by which they can be reached. Around this address, a fully fleshed-out ‘front’, a façade is established which is shown to the outside world to cover and shelter all the micropolitics, inefficiencies, and all premature innovation from external observation. These facades help to make organizations acceptable on the outside. To establish legitimacy, organizations react to external expectations (such as equality) while disconnecting these from internal realities (such as unbending hierarchy). It took a while for feminist activists and even gender theorists to realize that organizations play a core role in maintaining gender inequality as well. When organizations establish gender mainstreaming programs and announce gender or diversity positions, then this should not be misunderstood as a contribution to societal equality. It is an attempt to meet external societal and moral needs instead, presenting formal and objective measures which, once installed, are driven by internal political games and informality like everything which happens in the sub-cosmos of organisations. Organizations serve their own operational interests and are clever enough to transform external moral demands into internal means, feeding the on-going informal and formal battles.

**Another type of organizations?**

‘Lean In’ is, in this respect, certainly a necessary and important hygienic factor to keep the movement going. However, given the absence of context sensitivity, it creates a strong risk for women to fail and fall prey to frustration of the second order. Obviously structural shifts of society are required to fundamentally change the equality conditions which let individual action somewhat restricted. Two things might help nonetheless. The first is simple patience, since women have indeed been shown to accumulate symbolic capital over longer periods of time. The rising number of women attending first-tier business schools is a sign of this, although the prospects of female alumni are far from unrestricted. A second glimmer of hope might rest in the advent of new organizational forms, avoiding or minimizing (formal) hierarchy, incorporating equality standards in their core values that conflict with the appearance and constitution of their traditional predecessors. Whether these new forms can escape their paradox-solving role for contemporary society is currently being researched intensively and must remain open here. At least the principle of hope - again - will remain. That the old-schooled business masculinity will get back in its office remains improbable in any case. However, with new organizational and societal forms of order, there might emerge a new form of testeronized daily practises too. To announce and celebrate its societal death would certainly be somewhat premature, to which the currently rising claim for ‘mainstreaming men’ might be only one indicator.

Applying for postdocs - what are your tips? (2015-02-19 08:00)

This Guardian Higher Education articles offers 18 tips for applying for postdoc jobs. There's some really useful advice supplied for each one, which you can read in full [1]here:

- Get advice from your PhD supervisor
- Start building your networks early
- Finding funding
- Be cautious about firing off out-of-the-blue emails
- Look for opportunities outside your specialism
- Look worldwide
- Consider opportunities for a portfolio career
- Try working as a researcher for a company
- If you don’t meet the essential requirements, don’t apply
- If there is a formal application process, read the guidance
- Avoid excessive jargon
- The cover letter should entice the recruiter to the CV
• Always tailor your application
• Put yourself in the principal investigator’s shoes
• Show that you’re a team player
• First impressions count
• Talk about something other than your PhD
• Make sure you are able to work well with your prospective boss
• Think carefully about whether you want to stay in academia

What would you add? Are there any you disagree with? Are there some disciplinary specific aspects to this question which a general article overlooks? How do these issues differ internationally?

The Promise of Sociology in 2015 (2015-02-20 08:00)

Earlier this month, I spoke to Nicholas Gane (Warwick) and Les Back (Goldsmiths) about an article they published in Theory, Culture & Society. It was called [1]C. Wright Mills 50 Years On: The Promise and Craft of Sociology Revisited and, as you can see from the title, it was concerned both with C Wright Mills himself and the way of doing sociology he has come to personify. It’s the relationship between the two that has always fascinated me and it became something of an obsession after I read his [2]letters and autobiographical writings. But what’s more important here is how his life and his work can illuminate present dilemmas facing the discipline. This is what I spoke to Nick and Les about and the conversation soon extended beyond C. Wright Mills and turned to the many continuities between his circumstances and our own, as well as how his responses to them might guide ours

1. http://tcs.sagepub.com/content/29/7-8/399.abstract%20C.%20Wright%20Mills%2050%20Years%20On%3A%20The%20Promise%20and%20Craft%20of%20Sociology%20Revisited

Tom (2015-02-20 10:24:25)
Really enjoyed that, thanks. Haven’t seen Nick since York years ago.
Coping with Acceleration (2015-02-21 08:00)

I wrote recently about [1]cognitive triage in higher education and its ramifications for personal reflexivity. My claim is that an inflation of situational demands leads subjects to prioritise the urgent, moving immediately from one necessity to another, in a way which crowds out the important. While the urgent/important dichotomy is a feature of the ‘productivity culture’ I’m trying to analyse, I nonetheless think it’s actually a useful contrast. It loosely reflects the distinction between first-order desires and second-order desires offered by Charles Taylor and Harry Frankfurt: between our immediate desires and our desires about our desires e.g. I don’t want to go outside into the snow to walk to work but I want to want to do this and will if my second-order desire wins out over my first-order desire.

I’d like to develop the urgent/important contrast as a way of conceptually unpacking how reflexivity operates in working life. Dealing with both entails reflexivity but of very different sorts. The reflexivity of urgency is much more limited in its scope, often instrumental and usually restricted to situational considerations. The reflexivity of importance is much more expansive, often value-rational and tends to transcend situational limitations. It’s the latter that is the foundation of agency, as what is important leads to action orientated towards changing our circumstances or exiting them ([2]another aspect of what I’d like to do with this project). This is an overview of what I’m trying to argue:

1. Social acceleration leads what is urgent to crowd out what is important via an escalation of situational demands
2. In doing so, personal reflexivity tends towards the urgent rather than the important
3. This has important ramifications for how subjects behave within the workplace
4. Coping strategies by subjects reinforce this tendency towards urgent reflexivity
5. These coping strategies also tend to reinforce acceleration within the workplace, as they facilitate the continual escalation of situational demands

Along with Filip Vostal, I want to develop this argument using higher education as a case study but I believe the process is far from restricted to the academy. In short, we’re trying to explore how a ‘circle of acceleration’ is intensified by personal coping strategies. These questions seem politically pressing to me because social acceleration is not an inexorable phenomenon. While some important aspects of it are technological, there’s nonetheless a large element which emerges from new technologies of control within the workplace (and is in turn being entrenched through an expansion of the technological facilities for audit & intervention). This amounts to, as Will Davies put it, “[3]heating up the floor to see who can keep hopping the longest” (I’ve had this line stuck in my head since I encountered it) – what we’re interested in is how people seek to get better at hopping and how this reinforces the overall trend.

1. http://markcarrigan.net/2015/02/02/higher-education-and-the-temporal-conditions-for-critique/

Steve Fuller (2015-02-21 08:26:44)
I find this a rather topsy-turvy way, though perhaps interesting, way of talking about the problem of ‘discounting’ in what is known as ‘picoeconomics’ (i.e. the economics of allocating psychic resources). People generally discount the future too
heavily when deciding what to do. Thus, short-term desires swamp long-term desires, even when people know that long-term desires are more important. This is how addiction is explained by people (e.g. George Ainslie) who apply rational choice theory to psychiatry, namely, as people lurching from satisfying one short-term desire to the next, fully realizing that their long-term desires are less likely to be satisfied in the process. However, your example about not wanting to go to work in the snow is unclear. Is your lack of desire to go out to be read as a sign of discounting or not? Because you want to give this a social acceleration spin, one might interpret you to mean that actually the first-order lack of desire is the right one, since the second-order desire is simply imposed by our urgency culture. However, in the normal picoeconomic rendering of the example, that second-order desire would be seen as the one to follow because it has your long-term interest in view.

Sociological Imagination (2015-02-21 18:08:10)
Thanks Steve, I'd never heard of 'picoeconomics' and it's fascinating - this seems to be the thread that unites all the things I'm trying to do at the moment. A kind of sociological picoeconomics I guess. But I'm not sure I accept the framing of 'discounting': it seems to imply a cognitive bias in an otherwise uniform faculty of cognition, whereas I'm trying to suggest that cognition is *not* uniform in the first place. Social conditions engender different temporal horizons and these in turn tendentially lead to outcomes. It's a minor distinction between this and what you mean by 'discounting', assuming I've understood you correctly, but I think it's an important one in terms of the methodological consequences that follow from it.

Sociological Imagination (2015-02-21 18:21:26)
In other words, I think 'discounting' suggests the variation in cognition is entirely individual in its origins, whereas I'm suggesting it's mostly social.

rbotoole (2015-04-29 09:46:12)
There's also a more extreme kind of behaviour sometimes called "hurdling" - where the hurdler actively seeks out a constant stream of small but challenging problems to "hurdle" at just the right speed. They get really good at managing the stream of incoming problems so as to get the pace and intensity right. There's a psychological dynamic, a focus and adrenalin curve, involved in it. I'm a computer programmer, so I know what it is like - and I know programming teams who work in this way (Jira is their favoured platform). My theory is that such people are in increasingly powerful positions in the technocratic world. So they actively construct a reality adapted to their hurdling-addiction. They might have, for example, propagated the myth that "change only happens when there is a burning platform". Thus adding to the sense of acceleration.

I really like the idea! I also immediately started wondering about whether I've been implicitly striving towards hurdling...

CfP: Thinking Beyond Capitalism, Belgrade, June 24-26, 2015 (2015-02-22 08:00)

International Conference

Thinking Beyond Capitalism, Belgrade, June 24-26, 2015
Institute for Philosophy and Social Theory

How is it at all possible to make sound statements about contemporary capitalism? How does one adequately diagnose the current state of the economy? Clearly there is no consensus whether the financial crisis which culminated in 2007-2008 should be seen as a symptom of the structural crisis of neoliberal capitalism only, or of capitalism in general. Moreover, one should keep in mind that the term 'crisis' is itself laden with different ideologems. The talk of 'crisis' implies the existence of a superior prior state of capitalism, free of any crisis, and that we are now witnessing an extraordinary phase which is alien to the 'normal functioning' of the system. Should we understand the crisis merely as the means for restructuring the existing system, or as the beginning of an irreversible demise of the current mode of production? Is it possible that the crisis has actually enabled the exacom preservation of the status quo, and has prevented any change? Or was the crisis, on the contrary, the crucial catalyst for the politicization of the otherwise depoliticized actors within late capitalism? We are thus simultaneously exposed to various institutional-reformist suggestions, more or less grounded apologias, and identifications of fundamental contradictions within the capitalist reproduction process.

In The Communist Manifesto Marx argues that capitalism is a social order which arises and subsists in the form of a critique of all alternative orders and subjective dispositions. Capitalism has proven more radical than its competitors: it has destroyed the ancien régime, has rendered all societal bonds flexible and has constantly revolutionized the means of production. It is a system in which 'all that is solid melts into air, all that is holy is profaned'. To what extent, then, is it even possible to formulate a critique of such societal system, a system that has managed to incorporate critique itself? Can one stage a revolution against the 'revolution' itself? If capitalism thus emerges as the actual constitutive framework of our thought, how do we begin to think beyond capitalism?

Starting from the assumption that crises are in fact situations which open up space for thought rather than obstruct it, we intend to thematize the following spectrum of problems:

- Difficulties regarding the self-valorization of capital
- Inequalities within the global division of labour and the challenges of (re)distribution
- Reproduction of social classes and forms of domination
- Structural unemployment and the growth of the precariat
- Tensions between market imperatives
- Ideologems of management, esprit d’entreprise...
- The transformed property relations characterizing 'non-material goods'
- Geographical aspects of capitalism (territories, borders, etc.)
- Tensions between the centres, semiperipheries and peripheries of capitalism
- Dangers of climate change
- Competing dimensions of normativity (universal, global, particular, local, singular...)
- Democracies versus authoritarian social orders
- The cultural dimensions of neoliberalism
- Critique of ideology, critical discourse analysis of neoliberalism
- Neoliberal patriarchy and the new feminisms
- The rise and evolution of anti-neoliberal / anti-capitalist movements
- Left, right, and Romanticist anti-capitalism

Organization of the conference

The conference is organized by the Group for the Study of Social Engagement, part of the Institute for Philosophy and Social Theory in Belgrade, with the support of the Serbian Ministry of Education, Science and Technological Development, Centre for Advanced Studies in Rijeka, Croatia, the Centre for Ethics, Law and Applied Philosophy in
Belgrade, and the French Institute in Serbia. The official language of the conference is English. Presentations should not exceed 20 minutes. The Program Committee of the conference will select the presenters based on the submitted abstracts. The book of abstracts will be published by the time of the conference. Conference applications should be sent only via e-mail to the following address: [1]ifdt.capitalism@gmail.com We kindly ask you to put in your email subject the following title: 'Application: title of the paper'. The complete application in the .doc, .docx or .pdf format must contain: the title of the presentation, an abstract of up to 200 words and a short biography, in English. There will be no registration fees. Conference organisers will provide lunch and light refreshments during the conference program. Participants are kindly requested to make their own accommodation and travel arrangements.

Important dates

Application deadline: 10 April 2015

Notification of acceptance: 25 April 2015

Conference dates: 24–26 June 2015

Program Committee

Petar Bojanić, Institute for Philosophy and Social Theory, University of Belgrade
Laurence Fontaine, CNRS, Centre Maurice Halbwachs/ENS, Paris
Mladen Lazić, Faculty of Philosophy, University of Belgrade
Toni Prug, Queen Mary University of London
Catherine Samary, Université Dauphine, Paris
G. M. Tamás, Visiting Professor, CEU, Budapest
Mislav Žitko, Faculty of Humanities and Social Sciences, University of Zagreb

Much of the debate occasioned by the development of ideas about reflexivity and morphogenesis has turned on the status of habit. Whilst recognising the importance of this debate, this seminar takes an alternative tack. Returning to Bhaskar’s formulation of ‘position-practices’, it reviews recent work on organizational routines. Developing a position which sees routines as a key emergent property of organizations, recent developments in information technology are seen to cement autonomous reflexivity. Accompanied by an increasing discourse of ‘strategizing’, this might limit the development of meta reflexivity.

All welcome! E-mail socialontology@warwick.ac.uk with any questions
David Cameron as neoliberal prophet (2015-02-23 08:00)

I recently heard these prophetic words from UK Prime Minister David Cameron on the radio:

"if you're not good or outstanding, you have to change. If you can't do it yourself, you have to let experts come in and help you"

He was talking about [1]schools. But have you ever encountered a purer statement of neoliberal ideology? In practice this demand for excellence amounts to, as Will Davies puts it, “[2]heating up the floor to see who can keep hopping the longest”.

The dogs of the Moscow metro (2015-02-24 08:00)

Can you think of a space more emblematic of urbanism than a metro? I can’t and perhaps that’s why I’m so preoccupied by [1]Moscow’s metro dogs: it’s a reminder that cities are sites of ecological novelty, rather than human constructions that have constituted nature as ‘outside’. I love reading about the distinctive behaviours that have emerged amongst Moscow’s metro dogs:

Rather than chasing the dogs away, metro workers fed them. Riders, too, were kind: if a tired dog fell asleep in the middle of a marble station, people walked around the animal to avoid waking him. The dogs have learned to recognize stations from the announcers’ voices—though Neuronov added that he doubts the oft-repeated assertion that, like humans, the commuting dogs occasionally fall asleep and miss their stops. “There are three models of metro dogs,” he explained: dogs who live in the subway but do not travel, dogs who use the subway to travel short distances instead of walking, and entrepreneurial dogs who spend the day riding back and forth, busking. This last type of dog takes long trips, working the crowd for treats and emotional contact. (On trains, dogs “seeking tenderness” are particularly inclined to approach women over forty who are carrying large shopping bags.) And, according to the results of a study Neuronov conducted of the Red Line, some dogs hop on the train for purely recreational reasons. “Like in human society,” he said, “there are dogs who are inclined to see new places.”

I'm aware that I probably come across like I hate Slavoj Zizek but there are many aspects of his work which I really like. My favourite is his account of neoliberal ideology which I understand to be an argument about how subjective disavowal goes hand-in-hand with objective complicity: we maintain a critical distance from a system while nonetheless behaving in a way conducive to its reproduction. Rather than labouring under illusions which, if absented, would lead to action, we see things as they are but in a way that engenders passivity. We expressively repudiate our conditions while nonetheless continuing to acquiesce to them. In fact the former reinforces the latter. We invest ourselves in having seen through the mystification of the system but the pleasure we take in this cynical distance leaves us able to pragmatically continue as if the mystification was still operative.

It seems obvious to me that this cynicism is rife within higher education. Consider the REF: widely scorned yet near universally acquiesced to. My point is not to minimise the practical obstacles to resisting it but simply to suggest that the contrast between the vehemence with which it is discussed and the pragmatism with which it is adapted to is, to put it mildly, rather curious. However I think Zizek’s account helps illuminate the tension here but doesn’t entirely explain it. I’m curious about whether there’s a temporal dimension to critique that needs to be invoked in order to explain this tendency. For a while now, I’ve been trying to develop the notion of cognitive triage: coping strategies on the part of overburdened subjects in which they prioritise the most immediate and urgent demands upon them.

The urgent things which we must attend to tend to be situational. The more time we spend triaging, the more situational factors occupy our decision making. Given our finite attentional resources, we can therefore talk about situational factors crowding out trans-situational considerations. Our decision making doesn’t cease but its temporal scope diminishes. Urgent requirements for next week, tomorrow or later today crowd out considerations of next month, next year or next decade. People adapt to this in all sorts of ways and I would argue that things like digital detoxes can be understood as a coping strategy under conditions where triaging is proving frequently necessary. These coping strategies in turn act back upon the subject when they are pursued habitually. If we are what we habitually do then when, say, one draws on life hacking techniques to cope with their burdens one eventually becomes a life hacker. I’m not sure this is a good thing but reasons I’ll do my best to explain.

My suggestion is that many second-order coping strategies actually intensify the tendency towards triaging. One finds oneself in this state of cognitive triage (first-order) and begins to consult resources to develop techniques to avoid this overburdened fire fighting (second-order). But these techniques will usually involve cultivating a more refined process of self-management: deliberate triaging rather than desperate coping. These techniques involve greater scrutiny of first-order responses in order to better facilitate policing of reactions e.g. measuring and controlling a proclivity towards distraction. In doing so, the slide into situationalism is actually reinforced. The strategies we draw upon to help us cope with the intensity of situational demands leave us more embroiled in situationalism. We do it more gracefully and more efficiently but the tendency towards a narrowing of our temporal horizons is entrenched.

The problem is that critique is necessarily trans-situational. Lay normativity rests on personal concerns which
by their nature transcend particular situations. If we’re embroiled in coping with day-to-day demands then it’s very difficult to step back and reflect critically upon the conditions within which those demands occur. It’s more difficult still to consider potential courses of action through which we could individually, let alone collectively, work to change conditions that generate these ceaseless demands that leave us pushed and pulled by forces beyond our immediate control. Under such circumstances, it seems to me that expressive disavowal occupies an important psychological role as a safety valve. It lets us vent and moan. It lets us experience an ephemeral feeling of moral agency over circumstances that frustrate and impede our sense of what a good life could and should be. When we do it collectively, it has the feel of collective repudiation of that which we reject in common. But unfortunately it rarely, if ever, will lead to action. There’s a character in the John Lanchester novel Capital who continually fantasises about leaving his job:

That didn’t mean he didn’t think about giving it up and doing something else. He did, almost every day. The thought was a safety valve; the idea that he could quit whenever he liked was one of the things which kept him in the job. The exit was always in his line of sight. The idea of it helped him to stay put and to cope with the rough parts of his job and his day.

I’m suggesting inertia of this sort is a common phenomenon under conditions of social acceleration. As things get faster, as the demands upon us increase, we are left scrabbling to cope with immediate demands. We don’t lose the capacity to think about the longer term but we do it less and it becomes harder to sustain. The better we become at coping with these situational demands, the more we become locked in the immediate and urgent. The longer this continues, the more we recognise these conditions as ‘life’ and fail to imagine anything else. We don’t cease to be agents but the scope of that agency begins to change in a radical way. Critique and the action to which it leads increasingly gives way to cynicism and inertia. The fact this is occurring in institutional environments where those in charge are “[1]heating up the floor to see who can keep hopping the longest” only makes it worse.

Name-Dropping vs Name-Checking as Academic Vices (2015-02-25 08:58)

When I was a student, teachers used to warn against ‘name-dropping’ as a scholarly faux pas. This is when you suddenly provide a string of names in place of a substantive argument. The implication is that if you read the guys behind the names, you would understand what the author is trying to say. However, this was seen as an unfair imposition on the reader, who should be able to judge an argument through direct presentation. In fact, name-dropping would be cited as a paradigm case of ‘argument from authority’, a fallacy of informal logic. It was seen as a very elitist – if not outright bullying – tactic. But I now believe that this attitude is an artefact of the context in which scholarly communication was conducted in the 20th century, an exponential growth in publications while ordinary human cognitive capacities remained largely the same – i.e. technologically unenhanced.

I seem to see fewer complaints about name-dropping these days. A big reason no doubt is the widespread adoption of the so-called Harvard style of scholarly reference (i.e. author/date format embedded in the text), which basically allows you to drop names with impunity but in a superficially accountable way. Another reason, of course, is that search engines allow the reader easy access the identities behind the names, so that one can quickly discern the
pattern of thought that the names trace. In fact, the burden of proof is beginning to shift, so that if someone complains that they didn’t know half the names mentioned in an article, they’re told, ‘Why didn’t you Google the names?’

However, name-dropping is not the same as name-checking. Name-checking is when you do more than simply say you’re relying on the authority of someone else’s work. Rather, a stronger bond is suggested, namely, that you’re somehow part of the same team, party or movement as the other person. Thus, a much stronger sense of identification is being asserted – in fact, so strong that the name-checking serves to pre-empt any criticism that the name-checked party might have of you. This is recognizable as part of the Mafia’s gift-giving modus operandi: I go out of my way to do something nice for you in order to put you in my debt, which you may repay simply by keeping quiet if I do something (to someone else) that you don’t happen to like.

(I must confess that this influences my view of gift-giving more generally: in other words, I tend to regard it as a mildly aggressive act unless the gift-giver is clearly exposing themselves to risk.)

I first associated name-checking and the Mafia mentality when I heard a distinguished feminist theorist periodically name-check people in the audience by referring to them as ‘my dear friend’, which I found (and still do) vaguely annoying. She spoke in the sort of raspy voice that I associated with[1] Borscht Belt comedians, who also use the same mode of address. The Borscht Belt bred America’s edgiest comedy talent, but the resort hotels in which they operated were under the protective gaze of the Mafia. My view is that these comedians incorporated Mafia discourse protocols into their acts, so as to co-opt the audience into accepting things that they might not otherwise, were the audience not overtly made complicit in them by the comedian.

The interesting thing, of course, is that comedians often refer to literal strangers in the audience as ‘my dear friend’, which is much braver than academics who cite as ‘friends’ people they already know – and perhaps whose behaviour they can then more easily control.

------------

davemack (2015-02-25 13:09:33)

’on being accused of name-dropping, [Norman] St John-Stevas is said to have sighed: “The queen said the exactly same to me yesterday”’ (http://www.economist.com/node/21549927)

**Understanding academia through food (2015-02-26 08:00)**

Is it a meme? Is it a research project? Does it matter?

We aim to understand academia through food. Do you have a picture of an academic event or function where food is provided? Who was there and what was happening?

(HT [2]Kirsty Liddiard)
We have for some time been looking into the effects of neoliberalism on culture, identity, and institutions - effects that have included 'audit culture' (Marilyn Strathern), self-branding, and the subsuming of any collective 'voice' into individualistic 'consumer power' (Nick Couldry). At the same time, we have struggled with the fading importance of structural inequalities in the minds of policymakers.

There are developing answers, though, in many theoretical idioms. Stephen Ball has commented that "both structural and poststructural theories and analyses are necessary for 'bearing witness' and for an adequate critical understanding of educational realities". We could add to this that other kinds of practice, developed in fields like art or drama, also contribute to the working out of critique and the embodying of alternatives.

At DPR, these varied perspectives all find a home. Over the years, the conference has asked, how can we develop such creative theoretical approaches? And how would they look in practice? DPR 15 continues this line of work. Beyond critique, it asks how we can resist, subvert, and create spaces for multiple and collective voices, for change, and for social justice.

The conference brings together a range of practitioners, researchers, policy-makers, learners and teachers, who are actively engaged in these kinds of challenge. Presentations at the conference will take the form of papers, workshops, performances, exhibitions, and posters. We hope that presenters will come with ideas to share about research and practice, through single or joint presentations or as a contribution to any of the symposia that will be taking shape. [2]Please keep an eye on the DPR15 web page for further details.

If you have suggestions, or ideas for a contribution you would like to discuss, please contact the conference organizer:

Anna Carlile

CfP: Web Science 2015 (2015-02-27 08:00)

Call for Papers & Posters ([1]text version)
The Web Science conference welcomes participation from all disciplines including, but not limited to, art, computer and information sciences, communication, economics, humanities, informatics, law, linguistics, philosophy, political science, psychology, and sociology, in pursuit of an understanding of the Web. This conference is unique in bringing these disciplines together in creative and critical dialogue. We particularly welcome contributions that seek to cross traditional disciplinary boundaries.

Following the success of WebSci’09 in Athens, WebSci’10 in Raleigh, WebSci’11 in Koblenz, WebSci’12 in Evanston, WebSci’13 in Paris, and WebSci’14 in Bloomington, for the 2015 conference we are seeking papers and posters that describe original research, analysis, and practice in the field of Web Science, as well as work that discusses novel and thought-provoking ideas and works-in-progress. There is a [2]separate call for colocated workshops.

Possible topics for submissions include, but are not limited to, the following:

- Theoretical, methodological and ethical approaches for Web Science
- Web practices – individual and/or collective and/or institutional
- Humanities on the Web
- The architecture and philosophy of the Web
- Web Science approaches to Data Science and the Web of Data
- Web Science and the Internet of Things
- Social machines, collective intelligence and collaborative production
- Social Media analytics for Web Science
- Web economics, social entrepreneurship and innovation
- Web Science and Cybersecurity
- Governance, democracy, intellectual property, and the commons
- Personal data, trust, and privacy
- Web access, literacy, and development
- Knowledge, education, and scholarship on and through the Web
- Health and well-being online
- Arts and culture on the Web
- Data curation and stewardship in Web Science
- Web archiving techniques and scholarly uses of Web archives
Submission
Web Science 2015 is a very selective single track conference with a rigorous review process. To accommodate the distinct traditions of its many disciplines, we provide three different paper submission formats: full papers, short papers, and posters. For all types of submissions, inclusion in the Association for Computing Machinery Digital Library proceedings will be by default, but not mandatory. All accepted research papers (full and short papers) will be presented during the single track conference. There will be a reception for all accepted posters, which will all be displayed in a dedicated space during the conference.

Full research papers (8-10 pages, ACM double column) Full research papers should present substantial theoretical, empirical, methodological, or policy-oriented contributions to research and/or practice. This should be original work that has not been previously published.

Short research papers (up to 5 pages, ACM double column) Short research papers may present preliminary theoretical, empirical, methodological, or policy-oriented contributions to research and/or practice. This should be original work that has not been previously published.

Posters (up to 2 pages, ACM double column, poster reception and presentation) Extended abstracts for posters may be up to 2 pages.

Other types of creative submissions (flexible format) are also encouraged, and the exact format and style of presentation are open. Examples might include artistic performances or installations, interactive exhibits, demonstrations, or other creative formats. For these submissions, the proposers should make clear the format and content and any special requirements they would need to successfully deliver this work (in terms of space, time, technology, etc.)

Submission instructions

Review Process
The Web Science Programme Committee covers all areas of Web Science. Each submission will be refereed by three Programme Committee members and one short meta review written by a Co-Programme Committee chair, to cover both the research background of each submission as well as the necessary interdisciplinary aspects.

Digital Library
All accepted papers and posters will by default appear in the Web Science 2015 Conference Proceedings and can also be made available through the ACM Digital Library, in the same length and format of the submission unless indicated otherwise (those wishing not to be indexed and archived can "opt out" of the proceedings).

Important Dates
20 Mar 2015
Deadline for paper and poster submissions

30 Apr 2015
Paper/poster notification

15 May 2015
Paper/poster camera-ready

Programme Chairs

- Christine L. Borgman, Professor and Presidential Chair in Information Studies, UCLA
- Pete Burnap, School of Computer Science & Informatics, Cardiff University, UK
- Susan Halford, Professor of Sociology, Web Science Institute, University of Southampton, UK

Call for Workshops
For WebSci15 the workshops will be integrated into the main conference programme, running in the afternoons of June 30 and July 1. The workshops offer organisers the opportunity to curate panels, or collaborative research and scholarship activities around a key Web Science theme and to explore this in depth. Workshops may be proposed on any theme that facilitates interdisciplinary discussion of the Web and approaches to Web Science research. We particularly welcome applications that are ambitious in scope and aim to address the pressing challenges of Web Science. This might include, but is not restricted to:

- Theorising the Web
- Data ownership, access and ethics
- Digital cultures
- Digital inequality, citizenship and governance
Workshops can have a mixture of panel presentations and invited speakers, but presentations should reflect the diversity of approaches that characterise the multidisciplinary nature of Web Science.

**Workshop submission**

Workshop proposals should contain the following information:

1. Title summarising the tutorial goals or workshop theme.
2. Details of the organising committee, including names and institutional affiliations.
3. Max two-page description about the relevance, motivation and goals of the tutorial or workshop.
4. Schedule of sessions, panels, and talks (half day 14:00-17:00).
5. Names of instructors and potential invited speakers.
6. For workshops, selection criteria for papers to be presented.
7. Workshop website URL (desirable).

It is the prerogative of organisers to decide whether to have an open call for participants and papers, or arrange panels by invitation only. Proposals should include as many details as possible about sessions, speakers, and talks: they will be evaluated by their coherence and ability to address the stated goals.

It is the responsibility of organisers to advertise their event, and constitute a program committee to review and select papers, manage the review process, and possibly arrange for selected papers to be published in a special issue of a to-be-identified journal.

If successful, we advise proposals to have a website describing the event (within two weeks of acceptance) and, if applicable, information about similar events held in the past. Workshops will be linked from the main conference site. Proposals should be submitted in pdf format through EasyChair to: [easychair.org](https://www.easychair.org/conferences/?conf=websci2015ws).

**Workshop proposal review**

The Web Science programme chairs will review each submission and select those with the higher scores on originality, timeliness and relevance of the proposed topic, its interdisciplinarity, rigour of the review process, coherence with the conference aims, and potential to attract a large audience.

**Workshop proposal deadlines**

February 27, 2015

Workshop proposal submissions
March 6, 2015
Notification of workshop acceptance

March 13, 2015
Workshop website due

5. https://easychair.org/conferences/?conf=websci2015
6. https://www.easychair.org/conferences/?conf=websci2015ws

JG Ballard’s High-Rise recreated in lego (2015-02-28 08:00)

JG Ballard’s High-Rise is one of my favourite novels. It’s easy to see why sociologists would like it and it seems I’m [1]not the only one this is true of. So I’m not sure what to make of High-Rise recreated in lego... it’s a homage but it feels like it also trivialises it somewhat. These haunting scenes that have stayed with me long after I read the book actually look twee when materialised in lego. This is how the author describes the project:

I was in Covent Garden at the time, on one of my many trips to pillage London, and as I had been to the tavern the night before and imbibed enough alcohol to bring down a small Bilgesnipe, it is entirely possible that I only accepted the challenge because I was still slightly tipsy. I still believe it was an excellent choice, nevertheless.

To adequately tell the story of High-Rise I decided to do one image per page of the book, which would be 166 photos according to my battered paperback copy of the novel.

Due to budget constraints I could only afford to buy enough LEGO bricks to build one set at a time, so to save time and avoid having to rebuild the same set multiple times I began work on a shooting script.

3304
Unless you’ve read the novel this must all be pretty meaningless (and you probably skimmed the first few sentences at most). But for those who did, [7]see what you think:

Later, as he sat on his balcony eating the dog, Dr Robert Laing reflected on the unusual events that had taken place within this huge apartment building in the previous three months.
You can read the lego story in full here. But if you haven't already, please read the book. It's fabulous.

6.3 March

Vocabularies of Active Female Desire: A FemGenSex Symposium 30 March at Middlesex University
(2015-03-01 08:00)

Vocabularies of Active Female Desire: A FemGenSex Symposium
Monday, 30 March 2015 from 13:00 to 17:30
To book a free ticket please register on Eventbrite: [1]https://www.eventbrite.co.uk/e/vocabularies-of-active-female-desire-a-femgensex-symposium-tickets-15356200810

Despite years of heated debate, reaching back at least as far as the feminist sex wars of the 1970s and 1980s, issues surrounding the depiction of active female desire remain high on the cultural agenda. Whether it be new UK regulations taking aim at the depiction of certain kinds of female sexual enjoyment in video-on-demand pornography, or the upcoming release of the film adaptation of Fifty Shades of Grey, it is clear that desire, sexual difference, and representation continue to form a complex and provocative conceptual nexus. Such a nexus demands careful consideration from a variety of perspectives if we wish to cultivate a more nuanced and holistic understanding of a topic too often generative of uncritical kneejerk reactions or rehearsed moral panics. This one day symposium, to be held at Middlesex University in London, invites theorists and practitioners from a range of disciplinary backgrounds to discuss the challenges posed by attempts to represent active female desires (inclusively defined), as well as to explore some of the innovative contemporary strategies for addressing these challenges within various media and discursive traditions. In what ways is female desire active, and what activates it? What might such a desire look like? How does it sound, and what language does it use? Where can we detect the presence of active female desire in contemporary legal, medical, and other discourses, and how have artists, writers, and filmmakers sought to represent it? These are some of the topics that 'Contemporary Vocabularies of Active Female Desire' will seek to address. Confirmed speakers: Katherine Angel [2]http://katherineangel.com/, Dr. Alison J Carr [3]http://alisonjcarr.net, Alex Dymock, Royal Holloway[4]http://royalholloway.academia.edu/AlexDymock, Professor Feona Attwood [5]http://www.feonaattwood.com, Dr Helen Hester, Lecturer in 3306
Routines and Reflexivity – March 10th @SocioWarwick (2015-03-01 12:17)

[1]
Much of the debate occasioned by the development of ideas about reflexivity and morphogenesis has turned on the status of habit. Whilst recognising the importance of this debate, this seminar takes an alternative tack. Returning to Bhaskar’s formulation of ‘position-practices’, it reviews recent work on organizational routines. Developing a position which sees routines as a key emergent property of organizations, recent developments in information technology are seen to cement autonomous reflexivity. Accompanied by an increasing discourse of ‘strategizing’, this might limit the development of meta reflexivity.

11 reasons why we need a Chair for the Public Understanding of Sociology (2015-03-02 08:00)

- It would provide a default point of contact for the media when looking for a sociological perspective.
- It would allow someone the time & support necessary to build up working relationships with a wide range of figures in the media.
- These relationships would be of use to the discipline more broadly by allowing the chair to refer journalists and broadcasters to specialists in particular areas
- It would increase sociology’s media profile through the prominence of a particular figure who intervened across a range of areas
- It would demonstrate that communicating sociological knowledge is valued by the discipline
- The chair would be able to provide informal support and mentoring to other younger sociologists who try to be media active
- The chair could help establish a body of know how which could help other sociologists when engaging with the media
- I can think of a range of sociology professors in the UK who would be good at this. The specialised chair would free them up from teaching and administration in order to allow them to concentrate full time on public engagement.
- The philosophers have one
- So do pretty much all the natural sciences
- We can’t leave it all to Owen Jones (as Lisa Mckenzie wisely observed in a talk last year)
agree— the universities do have their own protocols for referring media inquiries on specific topics, but a figurehead like this could do a lot towards increasing awareness (and dispelling doubts) of the field as a whole.

These are very good and indeed convincing observations, Mark. I’m fully behind the proposal for a public chair in sociology. I just wonder though about the VERY different views that sociologist have about….well pretty much everything that takes place in society and how the holder of this chair may end up promoting a particular understanding of sociology and its role in society - one that other sociologists may want to distance themselves from...! I'd think that for natural scientist this isn’t a major problem but maybe philosophers have found a way of dealing this problem?! All best Daniel

Marilyn Sanders (2015-03-30 15:28:05)
This role should be central to the purpose of the discipline to help increase the knowledge & understanding of the population beyond that of mere ‘common sense', our views tend to be drawn from narrow personal experience married together with the equally prejudiced views of journalists in the media, a much less sound source of critical thought than a discipline whose main function is to question assumptions and to knit together knowledge of interconnected fields e.g psychology, human geography, history, genetics. For a sound democracy we need an informed society but at present this information often remains lodged in the silos of educational establishments. Such a waste.

What constitutes a civilisational collapse? (2015-03-03 08:00)

What constitutes collapse? This is the important question which Phil BC asks in response to my post on the sociology of civilisational collapse. If I mean the notion as anything other than a fleeting speculative thought* then conceptual clarification is essential. I said in the original post that I understand collapse to be the loss of an ability to change state, as opposed to any particular catastrophic change in the social order. By this I mean that the social order, as an emergent totality, ceases to possess the capacity to change its state. It’s these objective possibilities for change, known fallibly by situated actors through all manner of cultural constructions, through which collective agents seek social transformation. It’s the activation of these latent capacities for change which is what people are fighting over.

But what change ensues comes about through the unintended consequences arising from their conflictual plans rather than as the result of any grand design. But latent in any project of social transformation is a set of claims, implicit or explicit, concerning the capacity of the social order to change state. These claims may be idiotic, deluded or incoherent but they nonetheless have an objective referent. Accepting the objective capacities for change within any social order (though not necessarily our ability to know them with any reliability) allow us think about collapse in a sociological way. All manner of epistemological obstacles impede our knowledge of collapse but I don’t see this as creating any difficulties for attempting to posit it as a possibility.

If the social order is an emergent totality, collapse can be best understood as its de-emergence (if anyone could suggest a less clumsy antonym than this, I’ll be forever in your debt). The social order loses its malleability as a totality. This doesn’t mean it dissolves but it does mean it begins to crumble. It loses its susceptibility to steering. Things fall apart; the centre cannot hold (etc). Most of the examples Phil cites are about dramatic social
transformations and in this sense they’re not instances of collapse: it’s this very susceptibility to transformation, even if the actual changes elude the intentions of those groups fighting over them, which I’m suggesting is lost under conditions of civilisational collapse. This is not a matter of the ‘parts’ of the society (people, social relations, organisations, institutions) but rather a feature of the ‘whole’: an emergentist ontology lends itself to quite a specific understanding of civilisational collapse but this is obviously neither an argument for that ontology nor the notion of collapse itself.

The de-emergence of the social order in this sense does not mean that we see the collapse of social order as such. As Phil points out, the durability of social relations mitigates against this:

Therefore theorising about collapse has to take into consideration is the durability of social relations. At certain levels of abstraction, sociology assumes the durability of social relationships because they have proven to be just that. There is social change, but the – on paper – precariously balanced division of labour with its innumerable interdependencies has not just survived, but has thrived economic shocks and world wars, and has spread itself across the globe. The social substance is elastic and tough, I’d wager, because on the one hand capitalist societies are constituted in their production and reproduction by irreducibly antagonistic relationships, and on the other human beings cannot be anything but social, meaning-making beings in the Goffman mode who, in turn, constitute/reproduce social structures as per Giddens and Bourdieu. It’s also worth noting that crisis tendencies are organic to capitalism, that each of its myriad points of tension are pregnant with destruction and creation, of enculturation and barbarism. In other words, while there are precedents from history of civilisations coming and going, none have attained the level of social complexity and productive prowess as our own. Fundamentally speaking, the Romans, the Mayans, the Hittites, and the Babylonians were static societies. The advanced capitalist, industrial societies of today are dynamic and fluidic. They have momentum that might carry them through a huge disaster, or allow them to adapt to real and imagined threats posed by climate change, pandemics, artificial intelligence, and so on.

While I’m far from clear in my own mind about these questions, it’s the characteristics of social orders as emergent totalities (for which I’m using ‘civilisation’ as a lazy shorthand) which interests me. I’m undecided whether I’m serious about the notion of the collapse or if I just see it as a thought experiment with which to consider the characteristics of social totalities with the widest possible lens. It offers an interesting way to consider what it means to talk of a social totality as ‘having momentum’ or attaining a certain level of ‘social complexity’ and ‘productive prowess’.

I’m still far from certain that I do.

3. http://markcarrigan.net/2014/03/20/the-epistemology-of-civilizational-collapse/
Hi Mark, per your description of "de-emergence" I'd usually say "loss of adaptive capacity" or "rigidity trap": http://www.ecologyandsociety.org/vol13/iss2/art40/ Something like what you have in mind?

Sociological Imagination (2015-03-05 08:14:01)
I like it!

The sociological imagination of Ava DuVernay (2015-03-04 08:00)

The latest issue of the BFI’s Sight & Sound has an illuminating interview with Ava DuVernay, director of Selma, in which she describes her sensibility and approach to directing. The film itself resists a tendency towards hagiography, instead focusing upon Martin Luther King as a ‘leader of leaders’, continually seeking to explore the social and cultural context within which these networks worked together as part of a movement. When asked about a focus upon bureaucracy in the film, DuVernay replies:

I don’t see it as bureaucracy, I see it as my interest in process ... the process by which minds are changed and hearts are changed. And part of that is bureaucracy and heavy lifting, and passion. That’s where my interests lie as a filmmaker. "How does this work?" is usually what I’m asking for

While sociology cannot be reduced to this, it nonetheless captures much of interest. When presented with social change, asking “How does this work?” and looking to the processes through which people and circumstances are transformed surely represents the sociological imagination in action: connecting biography and history in a way that helps us better understand both. Selma offers a wonderful example of what this looks in practice and it’s something that would be worth engaging with in the way David Beer describes in Punk Sociology:

Using cultural resources to think through problems, issues, and questions is not uncommon in academic work. It is far from a mainstream approach, but there is a growing body of work that attempts to use literature (Lewis et al., 2008; Carlin, 2010; Taylor, 2008, Daniels et al., 2011), poetry (Abbott, 2007; Brown, 1977; Martin, 2010), film (Diken, 2005; Alsayyad, 2006), TV (Gregg & Wilson, 2010; Penfold-Mounce et al., 2011), music (Beer, 2014), social media (Crampton, 2009), and other types of cultural resources to explore social and cultural phenomena. These works often use such resources to engage the sociological imagination and to think through the analytical issues that are being considered. In these instances fictional and other cultural resources are used to explore actual social and cultural phenomena. This type of work can be seen to be controversial in some respects, but it appears to be the way that cultural forms enable the illumination and reappraisal of established research topics that generates a good deal of enthusiasm amongst researchers.
Maggie Feeley’s book *Learning care lessons - Literacy, love, care and solidarity* is the result of a period of longitudinal ethnographic research with survivors of the industrial school system in Ireland. Feeley spent some years as a voluntary literacy tutor at an education centre for ex-residents of Irish industrial schools. Over the years she gained the trust of those attending and, in her capacity as a researcher, some agreed to share their stories. What results is a book about her methodology, her understanding of the changing nature of literacy education under neo-liberal policy making and, the imperative to validate ‘care’ in the learning process. The book examines, what can only be described as, the inhumane treatment of children under the supposed care of the state. Feeley posits, through the voices of her participants, that state neglect, but also the lack of care on the part of individuals involved in the running of the homes as well as a care-less complicit society, need to be challenged to ensure affective inequalities are recognised in future policy making in education.

Using New Literacy Studies (NLS) as her theoretical framework, alongside radical, liberatory theories of literacy education such as Freire’s, Feeley initially travels back through the past landscape of literacy and observes the power always enmeshed within it. Those who have literacy and the ‘authority of the written word’ have always had more power, not only within educational frameworks but socially and economically also. Feeley is particularly interested in equality and structures of power. Neo-liberal policy-making links adult literacy learning with social inclusion and economic improvement, however it places the responsibility to learn on the shoulders of the individual. Feeley drives home the importance of the affective domain for learning and how structural variances lead to putting some sections of society at a disadvantage from birth. Literacy is not just a set of reading and writing skills, it is an interpersonal event, a communicative event. In reducing it to a set of measurable skills, to be acquired by the adult learner, nothing is done to reveal the reasons why those skills were not gained as a child. Naming the many learning care domains in which a child needs to feel safe in order to learn, the home, school and community, Feeley argues the existing structural inequalities means that some children will always be at a disadvantage and that interventions such as family literacy programs can only go some way to addressing the problem. Furthermore, that learning care, especially in the case of adults with unmet literacy needs, needs to be part of the lifelong learning process.
Through the generosity of the adult learners revealing their childhood stories, the reader gains an understanding of the compacting inequalities which led to their not only missing out on literacy learning but the injustices of a society which saw some individuals as worth less and so powerless, and the state took advantage of this power inequity. Their stories make for heart-breaking reading. These are extreme cases of abuse, and it is easy to see that learning under such conditions was next to impossible. Those who did manage to learn stated that either they may have had some skills prior to entering the homes or learned as a means to escape the horrors around them. The lack of care was astounding, but it is the intentional institutionalised abuse of these children, already at a disadvantage in their primary care homes, which makes for much soul searching when reading the book. Who has responsibility to fight for those more disadvantaged? One of the participants put so eloquently when she said "It might sound simplistic but it is every adult’s responsibility to ensure every child is educated", the truth is often that simplistic.

This book will be of interest to anyone in the field of literacy, social work, sociology and psychology. With Ireland’s past history of abuse of its most vulnerable, and current UK revelations of abuse of those in care homes and hospitals, by not only the carers but celebrities in positions of power, Feeley's book will demonstrate the lifelong effects of those who most are vulnerable to structural inequalities and powerlessness. Her plea for the state to recognise its neglect in not recognising the value of 'care' to mitigate inequalities is a powerful one.

Gwen Redmond is studying for a Master of Education degree in The Department of Adult and Community Education at Maynooth University, Kildare, Ireland. Working in the field of Adult Literacy education for ten years, her studies and practice are informed by Critical Theorists.

“Apparently, he comes with a rider these days" (2015-03-04 12:33)

By Kip Jones
Narrative Practitioner Conference, Keele University, 2009. I asked audience members to bring objects with them. In the photo, they are exchanging them with someone they do not know.

I remember quite well a major national disciplinary group's annual conference in Birmingham that I attended some time ago now. We were kind of 'outsiders' at the time, but excited to present our government-funded project to this particular interest group. We thought that they might, indeed, be 'interested' in our project.

The presentation went well, but we were attending only for the first day, mostly because of the expense of the conference. At the day's end I was waiting for my colleague in a seating area of the hotel's lobby. I noticed a table with materials on it set up nearby and decided to investigate. As soon as I approached the area, a bloke came up to me and said, 'You can’t be here. It’s for members only'. He pointed to a line on the carpet as some sort of barrier. The space was about to be turned into a cocktail do for the great and the good. I was astounded quite frankly. What a stupid, little club.

Years later, even after having accomplished a major project in their subject area, I still choose not to attend their annual conferences because of that experience.

I also remember early days as a PhD student and wanting to attend conferences to hear from and (hopefully) engage with as many of the big guns at the theoretical end of my field as possible. I had a modest amount of ESRC money annually for such activity, which meant budgeting and planning travel and accommodation carefully.

On one occasion, I took a ferry to Amsterdam, and then caught two trains packed mostly with local commuters, changing trains and platforms twice, to eventually arrive at the conference in Nijmegen. The opening night of the conference was astounding. They had a drinks and nosh welcome party with a Mariachi band. Now first, who came up with the idea of a Mariachi band (brilliant) and secondly, how did they ever find one in Holland? Two key players in my PhD’s method were presenting at the conference—one is a personal hero of mine. I got to hear and meet both of them. On this occasion as well, I had to leave a day early because I couldn’t afford accommodation for the full conference.

I took a ferry another time, first to Hamburg, then caught the train to Berlin in order to present at a conference where my hero was again keynoting. He mentioned my presentation in his keynote. To me, it was like receiving an Academy Award as well as great encouragement to forge my own path and, at times, go it alone.

As my career progressed after completing my PhD, I found myself involved in planning and organising annual conferences myself. One of the first things I noticed was that most of the income from conference attendees’ fees went towards flying in heavy hitters as keynotes and put them up in the style to which they had become accustomed. Although I realised the importance of these ‘stars’ of the field in attracting attendees, I also felt that more attention (and budget) might be paid to the conference ‘experience’ itself and what participants were getting for their money. (A Mariachi band?) For instance, were paying delegates given opportunities to interact with these academic heavy-hitters? Could we provide even more organised opportunities for conference participants to engage with each other? Audience involvement and ways to develop its potential became part of my theoretical development of a Performative Social Science from that point forward.

Lately, I mostly attend conferences as a keynote myself. I have become quite fussy about travel and accommodation arrangements and even joke that I come with a ‘rider’. I fondly recall presenting at LSE recently. When asked why I liked that particular experience so much, I replied, ‘Well, the marble floors and the handsome young men who offered me lunch, direct me to the hall and handled my technical needs’.

What is (still) most important to me even now, however, is how my presentations contribute to the conference experience for delegates. I try not to be a ‘parachute’ keynote, i.e., one that shows up, talks (usually reading
from a PowerPoint) and leaves immediately following the presentation. (And how many Deans, VCs, etc. show up to open a conference in this way, then never bother to stick around to find out what the conference is really about?)

My favourite part of presenting is the Q & A that more often than not follows my contribution; I try to allow at least half of the allotted time for this. Nonetheless, a chance for a conversation over lunch or even a coffee is still the best bet. This is where communication really takes place, and what conferences should be all about, serendipitous encounters.

Dear Colleagues

Discourse, Power, Resistance 15 - Creative Spaces for Collective Voices
Come to a conference at Goldsmiths on 15th-17th April 2015. Abstracts have been submitted from all over the world including:

- Reigniting the Flame of Activism: Challenging Homophobia as the final socially-acceptable form of discrimination in Australian schools
- The End of Democracy and the Modes of Resistance
- Presentation & workshop: Clowns, buffoons and the power of the killing laugh: an investigation of CIRCA (The Clandestine Insurgent Rebel Clown Army) and its unique approach to the subversion of power and place through non-violent direct action
- Thinking past the Black/White binary: mixed heritage children in London schools
- The rock or the hard place: Discursive invisibility and misrecognized visibility of school-going Muslim girls across the policy-practice continuum
- Exploring Britishness in a GCSE Art class: Emancipatory pedagogy in creative space
- Living politics and the City: Youth protests, art and the view from elsewhere

There is still time to contribute a paper or a poster, or to take part in a symposium, or simply to come and join in. But time is passing so I’d strongly recommend you to act without delay if you want to take part. See https://dprconf.wordpress.com/ for more details.

---

**How to use @Artefact_Cards for academic writing (2015-03-05 08:00)**

I finally received my @Artefact Cards last week and I love them. They were a pain to get hold of due to a spectacularly inept delivery company but Artefact soon rectified this when I e-mailed them to complain. They’re probably only likely to appeal to those with a real stationary problem but if you too find yourself fixated on Moleskine notebooks and their ilk then I suspect you will like them every bit as much as I do.

The idea behind the cards is to *materialise ideas*. This is a concept that appeals to me immensely. One of the weirdest experiences of my life was the first time I printed out my PhD thesis. Suddenly the ethereality which had recurrently seeped into every part of my life over the past six years was transmuted into a *thing*... it was just some stuff that I had written. This was a more intense form of a feeling that I often get when writing. Getting the words out into the world, giving them a form, somehow makes my mind feel *lighter*, even if that form is digital. The idea becomes something 'out there' rather than 'in here', with a definite form rather than a potential range.

The card themselves are designed to "help you craft better ideas, create new idea combinations by moving, shuffling, stacking, dealing and matching them". In essence they’re just blank playing cards, with a look and feel which has obviously been the subject of much thought, which can be filled using the supplied Sharpie. They’re perhaps slightly overpriced but it’s hard to begrudge an individual creator this for a product that so much love has clearly gone into.

I’m already finding them immensely useful. In the cards below are the talk I’m giving at the Digital Sociology conference in New York in a couple of weeks. I recorded everything I wanted to say on its own individual card. I’m
now going to arrange them in order to draw out clusters, perhaps discard a few and then write the talk using these cards as prompts. In this sense, it allows me to organise my ideas in a more systematic way without sacrificing the writing-to-see-what-happens approach which I prefer. I’m sure some of the prompts will be discarded, others will be rethought and all of them will exceed the limits of what I placed on the card itself.

[2]

In the past I’ve blogged about this in terms of non-linear creativity. I’ve always struggled to write and think in a linear way. I find it difficult to develop ideas sequentially and planning pieces of writing just doesn’t work for me. I often don’t completely know what it is I’m trying to write when I start the process. Assuming I’ve previously [3]baked ideas in the unconscious mind the kind of writing I enjoy most is quasi-automatic. I prefer to write in fragments and piece them together, with the overall structure being something that emerges through this process:

Another example in a very specific area is given by a client in a follow-up interview as he explains the different quality that has come about in his creative work. It used to be that he tried to be orderly. “You begin at the beginning and you progress regularly through to the end.” Now he is aware that the process in himself is different. “When I’m working on an idea, the whole idea develops like the latent image coming out when you develop a photograph. It doesn’t start at one edge and fill in over to the other. It comes in all over. At first all you see is the hazy outline, and you wonder what it’s going to be; and then gradually something fits here and something fits there, and pretty soon it all becomes clear – all at once.”

_Carl Rogers – On Becoming a Person Pg 152_
I find this immensely enjoyable and blogging is the apotheosis of it for me. However in the last couple of years, I've taken this too far and I'm trying to reintroduce structure into the process. Overly-enthused by the discovery that I can write pretty endlessly about subjects that I've thought a lot about, I submitted a series of journal articles that were basically 7000 word blog posts. The responses weren't actually that bad but they were uniformly requests for major revisions and the experience made me realize that I need to introduce much more discipline into my academic writing and this is what the Artefact Cards seem to be helping with already. I need to develop ideas in a more sustained way, producing more tightly argued and well integrated scholarship, without sacrificing the creative side of the process that I enjoy so much. In other words, I have lots of ideas but I need to learn to develop them much more systematically in order to produce journal articles of the standard which I'd like to.

I'm convinced that the Artefact Cards will prove very helpful in this respect. They introduce another step in the planning process before any kind of writing has taken place: rather than having the ideas churning in the back of my mind, it's possible to get them out into a physical form where they can be sifted, shuffled and sorted. Here are some other ways I'm using them:

1. I'm setting myself 500 word writing assignments for Social Media for Academics. I'm going through the book as it currently stands and recording every idea I have about something that should be added in. I'm going to take some of the ensuing cards in my wallet whenever I travel so that I can do brief bits of focused writing on my iPad on the train.

2. I have close to 100 cards now which record every idea I have about the acceleration of higher education for the project I'm doing with Filip Vostal. I did hit exhaustion point with the cards and that was interesting. I had a very definite sense that "this is everything I think about this subject" and I've had no further ideas since (whereas with others, ideas keep occurring to me). It's presented me with the limitations of what I have to say about the subject but also left me with a more clearer sense of what I do want to say, even if it's not quite as expansive as I thought it was. I'm going to use these cards to do some prompted blogging on [4]accelerated.academy, consult them when planning the conference and use them as a source of ideas in the writing we're doing.

3. I have a stack of cards for the large post-doc project that is starting to take shape in my mind. This is much more provisional and I only have 20 or so cards thus far. This has left me aware of how much more work I need to do because the ideas on the cards are very general. I'm going to try and develop these in clusters: going from an idea like 'cognitive triage' to develop many other related notions. I plan to add to these over time and hopefully by the time I start putting together a grant application at the end of the year, I'll have a much more concrete sense of the planned project than I do at present.

These are just a few ideas I've had in less than a week of owning the cards. I'm sure I'll have many more. Though I've almost finished a £36 box of cards since then, it's been a really useful experience and left me with a much greater degree of purchase upon the projects I'm in the process of developing. I doubt this intensity of usage will be the norm but I'm certain that Artefact Cards will be a regular part of my working life from this point onwards.

In light of today’s Google doodle in honour of Geradus Mercator, it’d be worth drawing your attention to the 11th century, in which four centuries prior to Gerardus Mercator allegedly “created a flat map”, [2]scientist Al-Idrisi from modern day Morocco is said to have “used in a creative way the system of cylindrical projection of the Earth’s surface, which was to be claimed some centuries later, in 1569, by the Flemish Gerard Mercator.

[3]Mahmud of Kashgar, also from the 11th century, Xianjiang, modern day China drew maps which pertained to the world being round.

Not to mention, [4]Piri Reis from the Ottoman Empire who in the 16th century is said to have drawn maps highlighting projection centres.

There are other cartographers such as Al-Muqaddasi from Jerusalem, Palestine and the author behind the “Book of Curiosities” in the 11th Century.

For more information, see the [5]Muslim Heritage website.
Sairah Yassir works for The Foundation for Science, Technology and Civilisation (FSTC) is a British not-for-profit, non-political, and non-religious organisation founded in 1999 by a group of philanthropic historians, scientists, engineers and social scientists.

by Hafsah Aneela Bashir
"So I watched the film Kingsman - The Secret Service, based on the acclaimed comic book, directed by Matthew Vaughn (Kick Ass, X-Men First Class) which tells the story of a super-secret spy organisation in London. Described by one review as 'perhaps the riskiest mainstream movie in years, Vaughn's love letter to spy movies may be uneven in places, but it's ultra-violent, envelope-pushing, and fun enough to overcome the flaws. Bond with the stabilisers taken off'.

I don’t know if I was the only one to see beyond the fun but I found it to be an accumulation of disturbing stereotypes coupled with the stuff of nightmares depicting a not so distant future.

The trailers promoting the young to join up as cannon fodder for the army were bad enough but the film itself glorified the sacrificing of new generations for the state as an honour - at least for those who can truly become a ‘gentleman’ which by my understanding meant, shedding your underbelly/working class identity, and joining the secret service where, donned in pinstripes and posh English accents, one can save the world. As long as your white that is which smacks of the white saviour complex that we all too often see in movies.

Spoof of previous spy movies or no spoof, comedy or satire, what was noticeable was that all the people in positions of power were white males, the black man was the criminal super mind, the Arabs were the enemy and women the sexualised prop at the sides of men- if not helping save or destroy the world with their male counterparts then certainly offering their ass to men for gratification. Maybe this is explained away by the reviewer who said 'the core story unfolds predictably, but, like the Kingsmen themselves, with style. Vaughn keeps his tongue firmly in cheek as his ever-dynamic camera conveys the action. Yet, admirably impudent and slyly funny as the film can be, it’s mostly just an exploration of typical comic-book tropes.'
I don't think so. How far from the film's reality are we really (is what I found myself asking during the super slick CGI far fetched illusory of the film)?

It glorifies warfare, killing, gun culture, deception, sacrificing the young for state and country in a world where nothings is as it seems. The young must become killing machines and demonstrate endurance. Placed among some humorous shots, the most disturbing scene of the film I found was the mass killing of racist bigots in an American church, where the congregation turn on each other like animals and kill in brutal sick fashion. Apparently shown to be done by triggering neurological waves via phone sims rendering all human inhibitors to switch off thus causing brutal aggression, it made me think of MK Ultra and mind control conspiracies that we are so quick to shoot down. But then the film also plays on other concepts that have been relegated as conspiracy theories such as New World Order, the mass culling of humans, saving a chosen elite, security chips to control human activity, global warming among other things! How much of this is truth hidden in plain sight?

The film also reminds us that not only does murder become devoid of guilt when one is not pulling the trigger themselves, but also how people's ignorance and inability to challenge or question what is going on around them makes them easy targets for manipulation.

Corruption and greed festers at the top of society's triangle while mass waste features at the bottom with 'sheeple' only interested in consumerism and themselves. It's dog eat dog world at its worst. I don't have to look far to see what power structure that's based on!

It left me feeling alarmed at what messages our kids are being subjected to when watching morally ambiguous films, even if they are peddled as comedy. That they still promote negative stereotypes and dominating ideologies is problematic to me. You only need to look at highly sexualised music videos that are nothing short of soft porn to realise how influential these messages can be. Call me a prude if you want to. I call it a concerned conscious!

Hafsah Aneela Bashir is currently studying for an MA in Postcolonial Literature and Culture at the University of Leeds. She writes and performs poetry and is part of a Humanitarian organization delivering medical aid and emergency supplies to conflict zones as well as working with projects within her community. These interests infuse social and political experiences with creativity to provide commentaries on ethnicity, religion, identity, racism and resistance.

Fuller’s Law of Intellectual Influence (2015-03-05 16:02)

The law is simply stated: If you exert intellectual influence, it is not for the distinctive thing you say but for the conceptual framework that you had to assume in order to say it.
What this means is that you end up receiving credit for both more and less than your actual contribution. The current scientific citation culture – represented by the so-called Harvard style of referencing – outright encourages this behaviour, but of course did not originate it. In any case, whenever a work is cited without page or chapter, it probably says more about how the citer came to acquire the framework assumed by the cited party than the cited party’s own distinctive position in that framework.

In historical terms, the paradigm case of Fuller’s Law is Darwin, who is popularly credited with the theory of evolution, full stop. Of course, he did not invent evolution. Lamarck probably did. Moreover, Darwin’s particular version of evolution – based on natural selection – was for many decades the most controversial, on both empirical and more metaphysical grounds. However, there is no doubt that Darwin’s *Origin of Species* was understood to be a game-changing book shortly after publication. Why? Because in order to put forward his particular theory of evolution, Darwin had to assume that evolution was broadly speaking true, which meant that certain non-evolutionary theories (e.g. special creationism) just become irrelevant to a discussion that involves much fine-grained natural history. Darwin never polemicizes against creationism: He simply ignores it.

Here it is worth recalling that before Darwin, there was no generally recognized categorical difference between evolutionary and creationist accounts of natural history. Many, if not most, commentators occupied what we would now regard as hybrid positions. However, after Darwin the distinction in accounts becomes clearly marked, which is then backdated to some allegedly perennial ‘war’ between science and religion, usually starting with the trial of Giordano Bruno or Galileo, 300 years before Darwin. And so it continues to this day. To be sure, this manufacturing of the science-religion controversy did not necessarily make it easier for people to accept Darwin’s own theory of natural selection. On the contrary, it has arguably delayed acceptance. Nevertheless, wherever you stood on this manufactured controversy, Darwin was framing the key issues, which in the long term served to make his name synonymous with ‘evolution’ itself, even after the details of evolutionary theory had strayed far beyond what Darwin could have imagined.

People familiar with media theory will recognize what I’m talking about as [1] ‘agenda setting’. Darwin is modern biology’s agenda setter. More generally, intellectual influence is more about agenda setting than about getting people to take a particular side in the agenda, though that may well be a long-term effect of adopting the agenda. Kuhn got close to this point with his idea of paradigm, the scientific theory that exerts a hegemonic control over the research agendas of scientists in a particular field. However, Kuhn presumed that you first had to buy the theory before you can buy the world-view that makes the theory possible. Thus, you had to accept Newton’s account of planetary and projectile motion before accepting the idea that reality is one big machine. Indeed, this is the sense in which ‘scientific revolutions’ are science-driven for Kuhn.

I am proposing something rather different in spirit. Newton’s empirically grounded theories constituted an elaborate marketing device – perhaps even baiting – to get you to buy into the Newtonian world-view. The theories didn’t need to be true in the sense of being the foundation stones on which an epistemic edifice is built. Rather, they just needed to be true enough for you to think that any problems that are later thrown up will be solved by more of the same. Apple’s radical consumer incorporation strategy extends this model into everyday life. Thus, one becomes a member of a ‘community’ through a ‘gateway product’, such a particular make of iPhone. This locks you into a certain way of thinking about how your needs are to be serviced. To be sure, some other company may come along to service those needs better, but they too would be part of the same framework. The difference between science and Apple, of course, is the former’s frameworks are collective and the latter’s corporate, which boils down to a difference in the concentration of social power.

Tomorrow is going to be the 350th anniversary of the scholarly journal on March 6, 1665. The publication permitted easier exchanges between members of the Royal Society of London, and is still in print. The royal society adopted a motto of 'nullius in verba' meaning don’t trust claims, but check them out. Scholarship hovers around this motto. To what degree is the influence of a scholarly mind frame, 'nullius in verba,' the warrant that allows for intellectual upheaval and influence?

'We believe' - but who are we? Margaret Archer on the Relational Subject (2015-03-06 08:00)

The Lure of Minimalism (2015-03-07 08:00)

What is ‘lifestyle minimalism’? To a certain extent it depends upon whom you ask. It’s often talked about as a ‘tool’ to live a simpler and more meaningful life. It’s often framed in terms of reducing ‘stuff’ through sometimes extremely rigid regimes of limiting ownership to a certain number of objects. It’s correspondingly hostile to ‘clutter’ and imbues it with almost magical capacities to shape one’s psychic life. It sometimes celebrates nomadism – of a very privileged sort – including a permanent home within the category of ‘stuff’ that constrains our lives. It’s most influentially
propounded by people who are making a career out of propounding it.

I see it as one strategy amongst others that is emerging to cope with acceleration. Lifestyle Minimalism is a response to a particular sort of consumerist ennui, responding to a failure of possessions to bring happiness through a corresponding declaration of possessions as being the enemies of happiness. It’s hard not to see a neurotic element in the recurrent counting of possessions: it’s like an ascetic bodily regime but enacted at the level of the lifestyle, purging one’s life of ‘stuff’ in order to[1]apophatically enact purpose. While I find Lifestyle Minimalism immensely off-putting, I nonetheless find minimalism itself appealing. It becomes so in relation to what Harmut Rosa describes as the growing sense of the good life as the full life:

the idea that an accelerated enjoyment of worldly options, a “faster life,” will once again allow the chasm between the time of life and the time of the world to be reduced. In order to understand this thought one has to keep in mind that the question concerning the meaning of death is indissolubly tied to the question of the right or “good life.” Thus the idea of the good life corresponding to this answer, which historically became the culturally dominant idea, is to conceive of life as the last opportunity, i.e., to use the earthy time span allotted to humans as intensively and comprehensively as possible before death puts a definitive end to it. Pg 181, Social Acceleration.

Left unchecked this inclines one towards doing everything all at once. There’s a latent agony in every moment of choice because of the possibilities it forecloses. Given that our knowledge of possibilities expand faster than our capacities to act on them (there’s always more books to read, more people to meet, more places to go, more things to do – with each one we do, we learn of many more) there’s a performative contradiction loaded into this existential ethic. The desire to live most fully, with a maximum intensity, continually thwarts itself through a perpetual expansion of horizons that inevitably elude us. We’re always looking beyond what we are now doing.

Lifestyle Minimalism is a particular regime (or cluster thereof) which aims to regulate this tendency through behavioural prescriptions of various sorts. Minimalism as an ethos distinguishable from this reflects a concern for the quality rather than the quantity of experience. The frantic movement of a full life in which no experience is ever really attended to can only be considered ‘full’ in a very truncated sense. It opens up the possibility that we might live maximally but in a self-consistent way, following the paths outwards from our present possibilities but doing so at our own speed in a way that enables us to attend to the reality of our present activity.

Cherie Knighton (2018-10-22 09:41:00)
I enjoyed reading this a few times. Do you write any scholarly acedmic articles? Would love to find out soon as I’m doing my research on this same topic. ☺ On another note, I see both points of views when it come to minimalist behavior. I didn’t agree with a few things, of how you viewed minimalist lifestyle, but some of it is true.

'Are we going to be allowed to stay here?': Migration, Discrimination and Resistance (2015-03-07 17:26)

'Are we going to be allowed to stay here?': Migration, Discrimination and Resistance
19th March 2015

The Drum, 144 Potters Road, Aston, Birmingham B6 4UU

7-9PM

(Free entry and no need to prebook)

Immigrants are being blamed for pressures on housing, jobs and infrastructure, in a context of austerity which is hitting the poorest hardest. Vulnerable people are being encouraged to blame their problems on other vulnerable people, while the government introduces ever harsher measures that directly discriminate against immigrants and people from immigrant backgrounds. Politicians state that ‘it’s not racist to talk about immigration’ at the same time as using the language of Enoch Powell and telling people to ‘Go Home’, while ordinary people such as landlords, teachers and doctors are being required to ask people they suspect may be migrants to prove their right to housing, education and health. All the main political parties are promising harsher treatment of immigrants in their election manifestos.

This meeting will address the questions:

What are the consequences of this for immigrants themselves and for British citizens?

Are new forms of racism, xenophobia and discrimination emerging?

How can we resist this?

A panel of invited speakers will address the questions above with reference to their own experience and expertise, and invite lively debate and contributions from the meeting.

Panel:

Kirsten Forkert, BCU on findings from the Mapping Immigration Controversy research project which examines the effects of government anti-immigration campaigns on migrants and non-migrants, including activist resistance, in Birmingham and nationally.

Saqlain Shah and Boniface Mambwe from Birmingham Asylum and Refugee Action on their project to expose the housing conditions faced by asylum seekers in housing managed by G4S in Birmingham, and on particular self-organising and campaigning by migrants themselves.
Speaker from Movement Against Xenophobia on their organisation and campaigns, in particular the 'right to rent' pilot requiring landlords to check the immigration status of tenants being piloted in the West Midlands and their survey about its effects

Shreya Paudel, National Union of Students, on how immigration policy changes are affecting international students in Birmingham, and how students, migrants and others can work together

Speaker from UCU (University and College Union) on trade union organising and equalities, and in particular attendance monitoring of international students and how it can be resisted

Chair: Hannah Jones, University of Warwick

The evening is designed to bring together community activists, trade unionists and those with an interest in social justice. If you just want to find out more and/or share your views on these burning issues please join us.

The Pleasures of Acceleration (2015-03-08 08:00)

Acceleration is often framed as a problem. Things are speeding up. We never have enough time. We’re always falling behind. These will be familiar experiences to most. While the problem is more complex than may initially appear to be the case, with little quantitative time squeeze actually registering, it nonetheless leaves us with a sense of late modernity as a ‘runaway world’ in which things are accelerating beyond our capacity to cope with them. This diagnosis tends to identify the causality at the systemic level and occludes the role of agency: it’s ‘modern life’ which is running away from us while we’re left merely struggling to catch up.

The difficulty here is that the role of agency is crucial if we are to understand the time-pressure paradox. If we have roughly the same amount of time, what is it about how we orientate ourselves towards temporality that accounts for the pervasive sense that we are perpetually running out of time? It’s important that we resist the urge to do what Andrew Sayer calls a ‘pomo flip’ and respond to the systemic bias of the acceleration thesis with a corresponding bias towards agency. The motor of acceleration cannot be seen as straightforwardly arising from the social system, in the sense that it produces changing circumstances to which agents can do nothing but adapt or fail. But nor should it be seen as something that arises from people ‘using time badly’ (whatever that would mean) or any other account of (implicitly pathological) responses by agents leaving them feeling more harried while the objective availability of time remains constant.

Instead we need to understand acceleration in terms of the interface between the social system & agency. Crucially, this doesn't mean 'agency' in a schematic sense: we need to understand how embodied people, with capacities & liabilities, live through the temporal horizons obtaining within the system and, through doing so, contribute to the transformation or reproduction of those (temporal) structures. One useful concept I’m thinking
about at the moment which helps in this respect is that of the pleasures of acceleration. For all that people complain about time pressure – particularly, it should be noted, when responding to researchers studying the time-pressure paradox – there are also pleasures to be found within it:

1. Time-pressure can be a symbol of status and flaunting it can represent one of the few socially acceptable forms of conspicuous self-aggrandisement available.

2. Time-pressure can reduce the time available for reflexivity, ‘blotting out’ difficult questions in a way analogous to drink and drugs.

3. Time-pressure can facilitate a unique kind of focus in the face of a multiplicity of distractions. If we accept that priorities are invested with normative significance (i.e. they matter to us in direct and indirect ways) then prioritisation can be pleasurable. This can take the form of people who rely on deadlines to ensure things get done. More prosaically, it can undercut procrastination by leaving one with finite temporal resources to utilise for non-negotiable obligations.

4. Time-pressure can leave us feeling that we are living life most fully. If the good life is now seen as the full life then living fast feels like living fully.

We need to understand the pleasures as well as the pains of acceleration. Through doing so, it becomes possible to flesh out the rather anaemic conception of agency usually found within the acceleration literature and instead look at speed as something which matters to people, in ways that are complex and often contradictory. We don’t just have first-order responses to our circumstances (whims and desires) but also second-order responses (concerns and commitments) which are themselves shaped by our cumulative experience of circumstances past. Understanding how people cope with acceleration requires that we attend to the former and the latter. We can’t treat agency as a cypher in the analysis of acceleration.

Nonetheless my point isn’t that people are embracing acceleration because they (secretly) like it. I’m only suggesting that there are pleasures to be found in it, alongside the many pains, which need to be recognised before we can even begin to grasp the agential dimension of social acceleration.

1. [http://markcarrigan.net/2014/10/21/the-existential-analytics-of-speed/](http://markcarrigan.net/2014/10/21/the-existential-analytics-of-speed/)
Much of the debate occasioned by the development of ideas about reflexivity and morphogenesis has turned on the status of habit. Whilst recognising the importance of this debate, this seminar takes an alternative tack. Returning to Bhaskar’s formulation of ‘position-practices’, it reviews recent work on organizational routines. Developing a position which sees routines as a key emergent property of organizations, recent developments in information technology are seen to cement autonomous reflexivity. Accompanied by an increasing discourse of ‘strategizing’, this might limit the development of meta reflexivity.

All welcome! E-mail socialontology@warwick.ac.uk with any questions

A viral video was released depicting NFL player Raymell M. Rice dragging his then fiancée Janay Palmer out of a Revel Casino elevator on February 15th, 2014. He was then charged with aggravated assault by the police in March of 2014, which is also the same month that Rice and Palmer married. The outcome of the incident initially sparked a two game suspension for the 2014 NFL season. Upon a second video release depicting Rice actually striking Palmer in the elevator, Rice was suspended indefinitely and subsequently released by the Baltimore Ravens. Legally, Rice was granted a twelve month pretrial intervention as part of a deal with Atlantic County, New Jersey prosecutors. This would allow Rice, a first time offender, to have his record cleared if he follows protocol. The NFL’s policy on domestic violence has been subject to strict scrutiny and criticism in lieu of the Ray Rice incident. Many organizations, such as the National Organization for Women, have called for NFL Commissioner Roger Goodell to step down following the labeled “debacle.” As a response the NFL has revised its domestic violence policy stating that first time offenders will receive a six game ban without pay, and second time offenders will receive a lifetime ban from the NFL. Concordantly, Goodell sent a letter to each NFL owner notifying them of six actions to reinforce and enhance their new policies. The NFL also implemented a “NO MORE” Public Service Announcement aimed at bringing attention to domestic violence and sexual assault. The salience of domestic violence in the NFL was highlighted by a New York Times article depicting the types of crimes reported by the news media from 2000 to 2014. Using a record maintained by USA Today, the NY Times finds that there were 713 arrests of NFL players over the 14 year period, of which 85 were domestic violence related. Based on their report, they find that on average 1 in 40 NFL players will be arrested in a given year, with about 12 % of them being domestic violence violations. The take home message for readers of this article is that domestic violence has been a recurrent problem long before the Ray Rice incident. Following the aftermath of Rice’s incident, the NFL had numerous questions to answer regarding current NFL players. For example, Carolina Panther Defensive End Greg Hardy was accused of domestic violence on May 13, 2014 after reports that he beat and verbally assaulted his then girlfriend Nicole Holder. After being convicted he was deactivated for week 2 but still was paid a full salary for the rest of the season before the case was eventually dismissed. San Francisco 49er Defensive Tackle Ray McDonald was arrested on August 31, 2014 and was accused of domestic violence charges although no formal charges were filed. He was subsequently released from the 49ers after another being suspected of another incident of domestic violence. Moreover, news outlets have shown that this is not an isolated incident but rather a recurring theme amongst professional male athletes. In the MLB, former Minnesota Twin, New York Yankee, and Kansas City Royal Chuck Knoblauch was arrested the same month (July 2014) that evidence was released concerning Ray Rice’s case; despite garnering little to no mainstream media attention. Additionally, UFC star War Machine (real name Jonathan Koppenhaver) was arrested following an August 8, 2014 attack on adult film actress Christy Mack. He was formally charged with felony battery, assault and coercion charges and is currently serving time in prison. The NFL’s NO MORE campaign and major media outlets address important issues such as domestic violence, institutional rule changes, and women’s rights. However, the NFL is still a for-profit corporation with billions of dollars on the line concerned by stakeholders, investors, and its employees—which are male-dominated. All institutional policies are thus garnered with a male-perspective in mind, and are enforced by males themselves. For example, a four game suspension was given to Seattle Seahawks cornerback AJ Jefferson for domestic violence. This suspension went relatively unnoticed by mass media and the public, and was not highly scrutinized like the Rice case. It was only when a superstar, Rice, was convicted with video evidence that there was public outcry for the lack of action against domestic violence perpetrators. Here, it becomes obvious that only until the problem reaches a precipice wherein the NFL is facing heightened scrutiny will it take action to appease the public. Otherwise, it is business as usual—making money and maintaining a profitable name brand—that are important to those in power. Now that some time has passed and free agency is set to begin, we wonder if players such as Ray Rice will get a second opportunity in the NFL despite their troubles with domestic violence. We suspect that the NFL will continue to act in concordance with the norms of mainstream society in its reaction to domestic violence—specifically by ignoring it. Notes

Amanda Admire and Christopher Vito are PhD candidates at the University of California, Riverside. Amanda’s research interests include gender studies, criminology and socio-legal studies, intimate partner violence, and immigration. Chris’ research interests include hip-hop culture, political economy and global social change, and gender studies.

1. http://www.tmz.com/videos/0_c5nk3w3n/
I am a feminist sociologist turned novelist. My primary interests are in gender and methodology. For me, methodological issues are about how we can best build and share knowledge. The desire to make social research engaging, provocative, impactful, and accessible, brought me to arts-based research.

Arts-based research practices (ABR) are methodological tools that adapt the tenets of the creative arts in order to address social research questions in engaged ways. They can be used for data collection or data generation, analysis and/or representation (Leavy, 2015). ABR requires researchers to think conceptually, symbolically, metaphorically (Saldaña, 2011) and thematically and requires us to use intuition, creativity and flexibility. ABR also pushes us to think seriously about the audiences for social research as well as the craft of writing. Genres of
ABR include any art form or combination of art forms, but for this piece I am focusing on fictional formats which might include novels, novellas, short stories, experimental writing, graphic novels, and so on. I turned to fiction as a research practice as a way of sharing cumulative insights from my research, teaching and personal experiences, engaging readers on deeper levels with the hopes of causing self and social reflection, and to contribute to public sociology. There is also reason to believe that readers can learn more, and more deeply, from fiction than from other forms of writing. There’s a field called “literary neuroscience” that examines how literature impacts our brains. There have been several recent studies that show reading fiction can impact us deeply, engage more parts of our brains, and leave more lasting impressions as compared to nonfiction. This research accounts for experiences such as getting so immersed in a novel you lose track of time, or not being able to get a story you are reading out of your mind.

I have written two novels based on my research (and recently released an expanded anniversary edition of my debut novel). Over the course of a decade, I conducted hundreds of interviews with women, as well as some men, about their relationships, body image, sexual and gender identities and related topics. I learned about women’s struggles for self-esteem, the impact of toxic media on body image and sexual identity, and the challenges young women face in their romantic and other relationships. During the same time period I was a professor teaching sociology courses about gender, popular culture and intimate relationships. Both inside and outside of my classes students often shared their personal experiences and stories about their peers and peer culture. I learned endlessly about their experiences, including their struggles with self-worth and identity. For instance, many young women had experienced dysfunctional or confusing relationships, abusive relationships or sexually dissatisfying relationships. Some women recounted roller coaster romances where they never quite knew where they stood; others described "game playing" and other power issues that I interpreted as disempowering, and many others simply resigned that they were “unlucky” in the romance department. Beyond this, most of the women I interviewed over the years struggled to build an identity for themselves that was not dependent on their relationship status. I also heard story after story of poor body image and even body hatred, low self-esteem, unhealthy eating habits, extreme exercising, and so on. What was frustrating in all of these situations was that as an interviewer/professor I was limited in my ability to respond freely. Interviewers are not therapists and they are not there to judge or deliver advice about how one should live her life. Professors are discouraged from getting overly involved with their students personally.

Although I did publish some of my research as journal articles and deliver conference papers, those formats are very constrained and I was not able to properly share the stories I’d heard or express all of my interpretations. Moreover, scholarly journals are not keen on publishing "cumulative knowledge" but rather focus on specific studies. Many of my insights were cumulative and based not only on my research but also my encounters in and outside of class with students, as well as my own experiences and those of my friends. In short, I felt like I had learned a lot that I wanted to share in the hopes of helping others. I also owed a debt to the women who gave me their time and trust, whose stories hadn’t been properly told. And let’s face it, academic journal articles are inaccessible in every sense of the word. They are jargon-laden, dry, and circulate in hard-to-get journals. They simply don’t reach the public. So I decided to write a novel titled [2]Low-Fat Love.

Thematically, Low-Fat Love explores the psychology of dissatisfying relationships, identity-building, the social construction of femininity within popular culture and the importance of self-acceptance. The novel is underscored with a critical commentary about how, too often, women become trapped in limited visions of themselves. Women’s media is used as a signpost throughout the book in order to make visible the context in which women come to think of themselves as well as the men and women in their lives. In this respect Low-Fat Love offers a commentary about popular culture and the social construction of femininity. Ultimately, the book explores women's identity struggles in relation to the men in their lives in light of their attraction to men who withhold their support. Women often develop myopic images of themselves as a part of "face-saving" strategies employed to cover up shame and a learned devaluation of self. Low-Fat Love suggests women seek new ways to see that are not dependent on male approval so that they will value themselves and reject degrading relationships. Moreover, as the main characters in the book learn, the most toxic relationship a woman may participate in is often with herself. So, too, the male characters learn that one must find one’s voice or suffer the consequences. I hope an empowering message emerges
through the characters’ struggles.

The novel format invites readers into the characters’ stories with the hope of achieving resonance, disrupting the familiar and prompting them to engage in self-reflection. If readers get immersed in a novel they may engage in self-reflection and in essence, connect the dots for themselves and in a way that works for them, individually. Based on the incredible response to the novel which is widely used in both college courses across the disciplines and has a popular audience, I wrote my second arts-based novel, *American Circumstance*, which explores appearance versus reality in people’s lives; how our lives and relationships look versus how they feel. For me, the turn to fiction as a part of my sociological practice has been enormously rewarding. I have been able to share my insights freely, reach public audiences, and connect with readers who have sought me out to tell me how their lives relate to the novels.

Writing sociology as fiction isn’t for everyone or for every project, but if you’re interested in exploring this approach, here is my list of top 10 tips for turning research into fiction (which originally appeared in *The Huffington Post* on July 2, 2013):

1. **Goals**: it’s important to start by clarifying your goals. While you always want to write a great story, what is the topical or thematic content you want to explore? What do you want readers to learn or reflect on?

1. **Target Audience**: determining your target audience(s) will help you select an appropriate genre, style and tone.

1. **Meticulous Research**: once you’ve selected your topic it’s important to do your homework and seek multiple perspectives on the subject. Your research may consist of a literature review to see what experts have written about your topic and/or first-hand data through interviews and the like.

1. **Distill Themes**: after you compiled your research you need to sort through it and reduce it to key themes.

1. **Let Go**: despite all of the work you’ve done conducting extensive research, you need to let it go so it doesn’t bog you down and detract from writing a great story. While you’ll never be able to fit all, or even most, of your research directly into the fictional rendering, the more you have learned about your topic the stronger the result will be.

1. **Good Story**: don’t lose sight of writing a good story. At the end of the day if your work isn’t engaging, authentic and resonant, readers are unlikely to take anything away from it. So pay attention to aesthetics, literary craft and the construction of narrative.
1. Literary Tools: use the power of literary writing, such as the ability to represent interiority (the inner life of characters) through interior dialogue. Fiction is uniquely able to engage, transport and build connections with readers.

1. Specificity: incorporate specific details from your research into your fictional work in order to build authenticity, believability and trustworthiness. The fictional world should ring true.

1. Foreword/Preface/Afterword: consider including a brief foreword, preface or afterword in which you note the research you conducted.

1. See It Through: all writing takes guts. When we’re blurring genres and innovating we open ourselves up to even more potential critique. See your vision through by believing in your goals and staying true to your vision.

I have long thought that what we study in sociology should be expressed in narrative form and appreciate your post for its honesty and advice. Looking forward to reading your novels for inspiration!

Patricia Leavy (2015-03-11 14:45:39)
Thank you so much! I hope you enjoy them. There are loads of other examples out there, by other authors, so you could be reading for a while if you so choose. :)

Janice Wilson Stridick (2015-03-12 13:30:18)
Fascinating approach, thanks for laying it out so clearly. I’ve struggled with the boundaries between fiction and non-fiction or years. In fact, I turned to poetry as a result. Research pulls me in so deep I have a hard time staying true to task. I think the last tip is the most difficult.

Patricia Leavy (2015-03-16 14:22:28)
Thanks so much for your comments. I think so many struggle with those boundaries. I have several colleagues who write poetry as a part of their research (there’s a terrific book by Sandra Faulkner with Left Coast Press if you’re interested in that topic). So true, seeing it through is always the hardest (I think for many reasons). Good luck in your work!

Book Review: The Nature of Intractable Conflict by Christopher Mitchell (2015-03-10 12:08)

by Bradley W Williams
In the third edition of *Contemporary Conflict Resolution*, Oliver Ramsbotham, Tom Woodhouse, and Hugh Mi-
all (2011) note that the "new field of conflict resolution in the 1950s defined itself in relation to the challenge of
understanding and transforming destructive human conflicts". The literature on conflict resolution has grown consid-
erably in the past several decades and a review of that dense literature will always be welcome in the sub-field. *The
Nature of Intractable Conflict* by Christopher Mitchell not only provides a comprehensive review of the literature, but
as the title of the book suggests, he also frames his arguments around the problem of seemingly intractable conflicts.

In 1981, Mitchell released his influential text *The Structure of International Conflict*. Mitchell explains that he
was first approached by Macmillan to create an updated version of this text. Instead he offers something far more
substantial, a text that takes the whole of conflict resolution literature into account while changing the direction of
the conversation to a focus on intractability. A theme running throughout the book is that many conflicts that seem
intractable can in fact be reconciled through innovation and a focus on the causes of intractability. As he states in
the book's Afterword, "I began with the argument that to end a conflict 'for good and all' it was necessary to find
a solution to the goal incompatibility that was the genesis, the starting point, for difficult, protracted, deep-rooted,
intractable conflicts"(292).

The book is divided into chapters that each act as a step in the linear process from the formation of interests
around seemingly intractable conflicts and their perpetuation, through processes of prevention and mitigation, to
processes of innovation, termination, and reconciliation. The linear process structure makes this book an accessible
research tool, while covering a daunting amount of information. Regardless of the overall structure, students and
researchers will make good use of the index, as researchers will approach questions of intractability from distinct
disciplines, particular levels of analysis, and centered on cases that are at unique points within the processes of
formation, perpetuation, and reconciliation.

Chapters 5, 6, and 7 survey research concerning the prevention, mitigation, and regulation of intractable, or
protracted conflicts that may be familiar to many. These sections break down key environmental, social-relational,
and political factors that affectively stifle conflicts at the level of goal incompatibility. The chapters on mitigation
and regulation are particularly useful for cultural theorists in the sub-field. I found myself gladly rereading sections
concerning sacred, or defended, spaces and persons, and particularly the author's analysis of rituals as symbolic
referents for peace processes. Mitchell surveys the breadth of information in a accessible way, producing a book that
at once provides a definitive and unique view of conflict analysis and resolution without overly daunting the reader.
The last three chapters particularly deal with ending protracted conflicts through innovative approaches to addressing goal incompatibility. As Mitchell explains, sources of conflict tend to go understudied, while theorists overwhelmingly concern themselves with analyzing factors that either perpetuate already existent conflict or provide classifications for specific types of conflicts. Mitchell shows that it may be possible to mitigate or end seemingly intractable conflicts where the adversaries’ behaviors and attitudinal changes are key drivers of contention. Besides a focus on behaviors and attitudes, the book closes by showing how “a search for solutions in conflicts over scarcities, ostensibly indivisible goods, incommensurable, belief systems and even ‘existences’ were not quite as hopeless, at least in theory, as they might often appear” (292).

This book is an indispensable resource for research ideas or solutions to problems. The number of sources and case studies presented in the text is immense. Due to the dearth of information, readers will make a lot of use of the index. For example, researchers interested in information about the Palestinian-Israeli conflict will find specific aspects of the analysis in various parts of the book, though this should be expected from a text with as much on offer as this. Researchers looking for particular cases may find themselves somewhat more reliant on the well-crafted index than those that are interested in specific processes and situational dynamics, but either way navigating this book is easy. The book will be valuable to researchers studying conflicts and peace processes at all levels of intensity and complexity, applicable to any discipline within the social sciences. Far from being exhausted, Mitchell provides a considerable amount of evidence to suggest that research in conflict resolution is only gaining momentum.

Bradley W Williams is a doctoral researcher at George Mason University. His research is located within the intersection of sociology, anthropology, and international relations. He studies transnational governance, religion, social movements, and peace processes.

Considering becoming an indy scholar? 5 tips to get you started... (2015-03-10 12:30)

By Floor Basten

You’re approaching the end of your PhD. While considering your alternatives for work, why not flirt with entrepreneurship? In 2003, almost a year after I left the university, as a postdoc, I decided to start my own business. Twelve years since, I have learned some things I’ll share here with you, so that entrepreneurship can enter your window of opportunities.
First and foremost, tell everyone you know you’re thinking about starting your own business. As long as people think you’re employed by a university, they assume you’re taken care of, at least financially. The minute you start talking about setting up your own business, they’ll think along with you and come up with ideas and potential clients. Don’t seclude yourself in the attic writing a Five-Year Plan (Soviet Union style!) by way of business plan. Include your personal network and have them introduce you to their networks, and from thereof you can start growing a professional network. Use LinkedIn to showcase your work.

Secondly, build a portfolio that illustrates how you helped what kind of clients. This is different from your academic resume. For most non-academics, your specific expertise/PhD project is abracadabra. Furthermore, academic origins suggest to them a lofty inclination to theory and a clumsiness with practice. Yet, most clients don’t struggle with theoretical issues. Their challenges are in practice. Research can be one of the solutions so your expertise can help them out. Your particular research experience can be in completely different fields, but you know your methods, so be creative. If your PhD thesis is about Papua New Guinea, remember that organizations, urban areas and all other sorts of communities can be analyzed as societies. Think about how to translate your expertise into a potential offer for a client.

Thirdly, don’t give away your expertise like candy on Halloween! You’ve worked hard and invested a lot to become the expert you are now. Temper your desire to build an impressive portfolio asap and resist the temptation to work for free. Here are some pitfalls to avoid:

- Clients will attempt to seduce you to work in exchange for ‘network’ and ‘name’. In some cases this works out well, but in others you end up being the only unpaid individual in the room as the others cash their salaries at the end of the month. Inexperience in entrepreneurship is no reason to lower your price. Prospective clients will thank you for the work you put into designing research which they can now do themselves. No need to see all prospectives as potential profiteers, but some vigilance is necessary.

- You can be asked to be on board a project that never starts. The hours spent aren’t necessarily wasted as you can benefit from contacts and ideas in future projects, but be careful not to invest weeks into nothing—and you might want to reconsider future invitations by people who turned out unable to successfully land a project. Having said this, you can never invoice every minute of work, so don’t be too stiff with the quid pro quo.

Fourthly, entrepreneurship calls for investment, for instance in your own research program. This helps you bring coherence into your projects and it increases visibility, expert status and credibility. Use social media. Blog about your observations, participate in discussions on your subject via Twitter. When I started, I focused on the narrative method I developed for my PhD. This wasn’t an easy route, as ‘narrative’ wasn’t very en vogue then. Although it can be applied to any subject—and in fact I did, from educational innovation to soil sanitation—the breadth of subjects was confusing for clients. I decided to make a clear choice and given some recent large-scale projects, I now present myself as an expert in urban development based on the initiatives of residents and local entrepreneurs (not that I decline research on other subjects). Make sure to clearly profile your qualities too. If you’re a researcher with little experience in advice, don’t call yourself a consultant, even if this resonates more with clients. I introduce myself as a researcher and once I teamed up with experienced consultants, we can offer the full package—and it’s nice to work with others.

Last but not least, help your client.[3] Elsewhere I explained the difference between how academics help each other and how clients want to be helped. In a nutshell, where academics use criticism in a peer-review setting, clients consider this to be yelling. They look for solutions that don’t hurt them. That doesn’t preclude criticism, but means that criticism isn’t the primary focus of your research. While you may have learnt to speak truth to power, remember two things. One, your clients aren’t stupid. Often they understand the truth perfectly but work within the
constraints of power balances that are carefully and subtly negotiated. The outcome may not be ideal, but it may be the worst except for all others. You calling out the elephant in the room can be insulting and destructive—you wouldn’t consider that a perfect strategy in a university context either. Two, again, your clients aren’t stupid. Their truth matters as much as yours. Don’t ignore, or worse, deny their perspective on the matter. They’ve probably been thinking about their problems long before they asked you to help them. Use their experiences and insights, acknowledge their expertise.

So there you have 'em, five pointers that should set you right on your way to becoming an indy scholar. There’s more to say about this, so [4]I started a weekly blog. Follow me via @BlanchefleurX for weekly updates.

Suzanne (2015-05-08 18:28:50)
thank you for sharing your insights, very helpful in the start of my journey. It is a bit intimidating, so helpful to know it can be done ;)

The Tyranny of the Forced Smile (2015-03-11 08:00)

An [1]interesting article in the New York Times discusses the mandated enthusiasm which increasingly characterises labour. This can be seen most emphatically in service jobs (e.g. the training required by [2]Pret A Manger and its subsequent monitoring) but it’s also a feature of higher education:

A decade ago I was interviewed by three academics for a teaching job at a university. The final question went something like this: Would you describe yourself as a passionate teacher? A silence fell over the room; it lasted much too long. I’d surely lost the job by the time I cleared my throat and began to qualify an answer I’d yet to give. The truth was I didn’t consider myself a teacher at all — I hadn’t been in a classroom in years. I stumbled my way through a circuitous reply and concluded by saying that, yes, actually, I suppose I could describe myself as passionate, in a sense.

In a sense. I couldn’t resist the qualification. It was like a nervous tic. Moments later, the interview was over and I was leaving the room. As I shut the door behind me, the committee erupted into laughter.

Thankfully, I did manage to land a job, one I greatly enjoy, and now find myself on the other side of the hiring process. This winter I am serving on a committee charged with interviewing applicants for a new professorship here at the Maryland Institute College of Art. Wary of lawsuits, the school has seen fit to train me and my colleagues on what the law permits us to ask applicants. All questions, H.R. has advised,
should relate to three core concerns: Can the applicant do the work? Will the applicant fit in? Will the applicant love the job?

I was surprised to learn that love is now considered essential to the employment relationship. Some of us are lucky enough to have lovable jobs, but this strikes me as an extreme standard to apply with respect to most positions.

This mutation of capitalism has left us with a situation where, as the author puts it, "we are all expected to whistle like Disney dwarfs". Is this trend one of emotional labour becoming a general feature of employment? At least in the abstract, I quite like the idea of a vocation - see for instance this [4]micro-podcast by Les Back on Sociology as a Vocation. But is this lending intellectual weight to a deeply corrosive trend in which there's no such things as a 'just a job': increasingly it seems to be expected that every job should be treated as a vocation and that there's something disreputable about those who fail to do this.

--

Power, Acceleration and Metrics in Academic Life, 2nd-4th December 2015, Prague (2015-03-12 08:00)

Power, Acceleration and Metrics in Academic Life, 2nd-4th December 2015, Prague

Call for papers: Power, Acceleration and Metrics in Academic Life

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological
developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim 'patent and prosper' (Schachman) supplements the traditional 'publish or perish'). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This conference will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars' complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis

The workshop will take place from **December 2nd to 4th 2015 in Prague**.

Deadline for abstracts will be May 1st 2015. Please send 250 words and short biographical note to Mark Carrigan (mark@markcarrigan.net) and Filip Vostal (filip.vostal@gmail.com) by the deadline.

**Keynote Speakers:**

Roger Burrows – Ancient Cultures of Conceit Reloaded

Philip Moriarty – The Perils, Pitfalls, and Power of Peer Review in Public

Susan Robertson – Vertigo: Time and Space in the Contemporary University

James Wilsdon – In numbers we trust? Reflections on the UK’s independent review of the role of metrics in research assessment

**Fee**

50 Euros (standard) / 25 Euros (PhD/ECR)

Registration to open in summer 2015

**Venue**

3342
Hosted by Institute of Philosophy of the Czech Academy of Sciences the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic ([1]http://www.vila-lanna.cz/index.html)

**Travel**

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.

Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n.), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.

**An invitation to Digital Public Sociology (2015-03-14 08:00)**

This is a slightly abridged version of the talk I gave at the Digital Sociology mini-conference at the Eastern Sociological Society conference in February 2015. At some point this will be the basis for a paper:

[1]Listen to ‘What is digital public sociology?’ on audioBoom

---

[...] Not necessarily so. [http://burawoy.berkeley.edu/PS/Open %20Letter %20to %20Mills.pdf](http://burawoy.berkeley.edu/PS/Open%20Letter%20to%Mills.pdf) I’ve written about this as the ‘fallacy of amelioration’: the notion that all it takes to solve social problems is [...] 

---

**Call for Papers: Journal of Intercultural Studies Inaugural Conference 2015 (2015-03-15 08:00)**

**Call for Papers: Journal of Intercultural Studies Inaugural Conference 2015**

CUNY Graduate Center, New York November 19-20, 2015

*Submission Deadline: 1 June*
The Journal of Intercultural Studies is pleased to announce a call for papers to be presented at its Inaugural Conference at the CUNY Graduate Center in New York City, NY on November 19-20, 2015.

Confirmed Keynote Speakers

Professor Eduardo Bonilla Silva, Duke University, USA

Professor Gurminder K Bhambra, University of Warwick, UK

We hope to bring together research on a number of themes that together represent the breadth of journal’s aims and scope, as well as its interdisciplinary and global content. The event encourages the participation of emerging and established scholars from a variety of disciplines and locations with an interest in critical scholarship on the challenges and potentialities of contemporary cultural formations and transformations.

We welcome theoretically-informed abstracts on these themes but not limited to

Citizenship, Nationhood and Racialisation

Transnationalism and Diaspora

Hybridity and Border-Crossing

Mixed-Race Postcolonialism and Indigeneity

Multicultural Alternatives

Everyday Multiculturalism

Performing Culture Migration Theory

Please submit your abstracts to [1]unesco.cdsj@deakin.edu.au

Hosted by the Journal of Intercultural Studies, supported by CUNY Graduate Center, the UNESCO Chair in Comparative Research on Cultural Diversity and Social Justice, and Taylor and Francis

Regulating Intimacy: A Research Symposium (2015-03-16 08:00)

Regulating Intimacy: A Research Symposium

"Intimate Labors and the Labors of Intimacy"

Indiana University, Bloomington
Regulating Intimacy is an interdisciplinary research symposium held annually at Indiana University. We seek to bring together scholars and professionals at all levels from a wide variety of (inter)disciplines, including women's and gender studies, law, education, public health and biology, to discuss the institutional forces—legislation, policy, religion, and scientific authority, and many more—and the gendered, raced, classed, and dis/abled sociocultural norms that define and regulate human relationships.

The theme of the 2015 Regulating Intimacy Research Symposium is "Intimate Labors and the Labors of Intimacy." Both labor and intimacy are broadly understood to include traditional notions of workplace, markets, and the labor force as well as emotional labor, caregiving, relationship building, and networks. How is work intimate? Which jobs/occupation/labors are or can be considered "intimate"? Should intimacy and labor be intertwined? What labor goes into creating and sustaining intimacy? How do work spaces generate or inhibit intimacy? Regulating Intimacy will explore the cultural, technological, and historical legacies, significances, and implications of laboring alone or together, on small and grand scales, and across time and space.

We are accepting proposals for both full panels and individual papers. Full panel proposals should include panel rationales of 300 words, and up to four paper abstracts of 250 words each. Individual proposal should include abstracts of 250 words.

Submissions may include, but are not limited to, the following:

- Sex Work (prostitution, stripping, sexual surrogates)
- Pregnancy & Surrogacy
- Caregiving (nursing, child care, elder care, companions, care for disability)
- Professional Relationships (doctor-patient, attorney-client, co-workers, bosses)
- Workplace Intimacy (dating, harassment, power dynamics)
- Parenting, Homemaking, & Intergenerational Care
- Intimate Spaces (physical, virtual, transient)
- Networks of Intimacy (markets, community, government, production)
- Spheres of Intimacy (work/play, public/private)
- Building and Maintaining Relationships (courtship, friendship, networking, marriage)
- Laboring Bodies (committees, councils, body politics; vulnerable bodies, physical labor)

Individual and panel submissions are due on Friday, May 8, 2015. For more information and answers to frequently asked questions, please see the Regulating Intimacy website at [2]regulatingintimacy.wordpress.com.
Selling psychopathy in late modernity (2015-03-17 08:00)

A few weeks ago, I was browsing the bookshop in Kings Cross while waiting for the Eurostar and came across this disturbing book:

![Book Image](image1)

Given I was on my way to a much needed holiday, I didn’t buy the book at the time, intrigued though I was by it. I just went on Amazon to finally purchase it and was genuinely surprised to discover that this isn’t the only one:

![Book Images](image2) [image3]
The author is a psychologist at Oxford who seems to be carving out a media career as Dr. Psychopath. However there are also many other texts with ‘psychopath’ in the title which intrigue me. Many seem to be self-published texts offering advice on avoiding manipulation by ‘psychopaths’. Others are confessional texts of various sorts. Whereas others seem to be popular science books which, I imagine, likely come close to the territory of Kevin Dutton’s books at points.

2. http://www.amazon.co.uk/Wisdom-Psychopaths-Kevin-Dutton/dp/0099551063/ref=sr_1_6?ie=UTF8&qid=1424767790&sr=8-6&keywords=psychopath

samanthawhyte (2015-03-17 09:10:35)
There’s also a trend for "listicles" citing highly ambiguous alleged "red flags" for psychopathy (usually the kind of traits one might attribute to a former parter following an acrimonious split). I blame Jon bloody Ronson.

Sociological Imagination (2015-03-17 12:35:49)
Lots of people seem to be self-publishing books on a similar basis!

Dr Max Tookey (2016-01-10 21:30:10)
I read this post and thought it was very interesting. For the last few years psychopathy has been a key part of a course I currently teach at the University of Greenwich in Organisational Behaviour - which has proved to be very popular with my students. My own interest in this topic came about when I was the victim of a psychopath in 2003/4 and again in 2011, and I can honestly say that it was one of the most genuinely upsetting and terrifying experiences of my life. If I knew then, what I know about psychopathy now, I would have avoided this terrible experience. But I have since read a range of excellent material about what psychopathy represents, how to avoid it, and what to do when we encounter a psychopath. And this has effectively informed the material I currently teach on this topic. I don’t agree what was mentioned in one of the comments to this post, and I think that Jon Ronson’s excellent book in this area (The Psychopath Test) is one of the most accessible and engaging commentaries on how psychopathy manifests itself in contemporary society. I also don’t agree with the perspective of psychopathy offered by Kevin Dutton and Andy McNab in their book on this topic. I feel that this represents a disturbing precedent in how this truly

3347
abhorrent human condition is becoming conceptualised, and I don’t think that there is anything "good" about psychopathic behaviour. While I wouldn’t argue that many "successful" individuals would indeed score high on Hare’s Psychopathic Checklist (PCL), I would also suggest that the damage incurred by psychopathic behaviour should be given a lot more attention. I believe that the study of psychopathy has now "hit the zeitgeist" in terms of what is fashionable in the sociological and human sciences, and I would suggest that the author of this post avoids Dutton/McNab’s work, as above all, it "sensationalises" this condition, without looking enough at its real impact. I have personally learnt a lot about this pathological aspect of the human condition since I first seriously studied it five years ago - including the many forms it takes, the effects it has, and the strategies I will adopt to ensure that the psychopath I encountered will be accountable for their behaviour. As a postscript to this reply, I would welcome a debate on the "sociological role of psychopathy" for this blog, and be willing to make further contributions towards this. From Dr Max Tookey - Senior Lecturer in Organisational Behaviour (University of Greenwich)

@GeneticPsycho (Tina) (2016-09-29 12:30:04)
Dear Dr. Tookey, You are right on point. Kevin Dutton is a quack. I slowly came to understand that the dysfunctional behaviors in my family, and my resulting episodes of major depression, were due to my family being mostly psychopaths. The gene runs strong in my family, and there are equal numbers of female-to-male psychopaths in my family. Why is it nobody teaches children about personality disorders and protecting yourself from con artists? There seems to be some conspiracy among psychopaths in power (they are definitely in the Psychiatric Associations) to keep the disorder hidden from society. Psychopathic politicians make policies that keep people ignorant. I happen to think that if someone had told me at the age of twelve that my father had a brain disorder, I would have adjusted much better in life. By studying my family, and other psychopaths along my life path, and I was able to create a list of their pervasive habits so that anyone can spot a psychopath, even when they are well behaved: https://www.facebook.com/notes/psychopathy-genetics/how-to-spot-a-pro-social-psychopath/781795738538803 I also have campaigns ongoing to raise psychopathy awareness: http://NoPsycho.org and http://nopsychos.wordpress.com I am so glad that you are in a great position to use your experience with psychopaths to educate others "officially" in a university setting. The best of luck to you!

John bird (2016-07-09 18:49:10)
Maybe we need a distinction between psychopath and sociopath. Does the lack of empathy that many sociopaths exhibit have an affinity with a post-modern, narcissistic and celebrity-obsessed society?

Three Modes of Academic Success, none of them quite autonomous (2015-03-17 11:07)

Early career academics periodically ask me what it takes to be successful – as if I would know! Nevertheless, I do have some general observations on the topic based on what seems to work. Unfortunately, the three strategies listed below have nothing to do with the individual autonomy of academic inquirer as popularized by Max Weber in his advice to graduate students, ‘Science as a Vocation’. But in the end, I’ll return to Weber.

Discipline-based success: You become someone who is seen to have made a distinctive contribution to the collective knowledge process of a discipline. It is what Kuhn called ‘normal science’. However, because your contribution is exhaustively explained in terms of the larger disciplinary narrative, you end up being no more than a vehicle to move the plot along and so your name is forgotten shortly after your work has been superseded. Weber believed that this was the fate of most academics, regardless of the formal autonomy of their work conditions.

Constituency-based success: You become the academic voice of a recognizable sector in society. Michael Burawoy's idea of 'public sociology' seems to aspire to this status, especially for sectors of society that might not otherwise be given effective voice. This sense of success is likely to be held hostage – or at least accountable – to the changing fortunes and dispositions of the constituency in question. So, if your own thinking does not move in the same direction as that of your constituency, you may find yourself out of a job, just like an MP!
**Funding-based success:** You become a ‘rain-maker’ who can parlay the same toolkit of concepts and methods in many different funding environments to success. (Science & Technology Studies comes to mind here.) Indeed, your flexibility might be easily mistaken for autonomy, especially if you normally get the money that you apply for. However, such a person’s curriculum vitae tells otherwise, since there is no clear narrative thread running through the series of successful funding bids (other than perhaps size of bid) that might amount to ‘intellectual progress’.

To be sure, these are ideal types that may be mixed in practice. I’m particularly struck by the hybridisation of the first two types – namely, the elective affinity between an established body of academic knowledge and an established extra-academic constituency. These are the sorts of figures who had they not already existed could be easily invented. Slavoj Zizek and Judith Butler come to mind as people who have leveraged into public discourse a certain set of texts that humanistic academics had already been reading in consort for around a generation. (Roughly speaking, for Zizek it’s the French Marx-Freud complex, for Butler the French post-structuralist complex.) This helps to explain the rather polarized attitude – ‘you either get it or you don’t’ – that has surrounded their public reception. The people who think such people are geniuses are basking in the reflected glow of their own college days, whereas those who don’t see the genius in Zizek and Butler didn’t go to the same colleges.

But finally let’s go back to Weber. What makes him appear so ‘autonomous’ to us is something that would not have been so obvious to his contemporaries. After all, this was a guy trained in law and political economy who found himself somewhat awkwardly placed in those disciplines because of the nature of his interests and his approach to them. However, once ‘sociology’ came to be recognized as a separate academic subject (which was shortly before Weber died), he was seen as a ‘founding father’, a godlike figure who set the terms that others then developed. In short, he was deemed ‘autonomous’.

Autonomy requires a collective Gestalt switch on the part of the academic community to turn someone’s awkwardness into originality. Weber may have reflexively understood this process, which is simply a secular way of talking about the complementarity of what he had identified in the great world-religions as ‘charisma’ and ‘routine’. Thus, Jesus remains an awkward Jew in the history of Judaism but the founder of a new faith in Christianity.

---

Thomas Basbøll (@ThomasBasboell) (2015-03-17 11:25:33)
Or the way Socrates was a somewhat awkward sophist, and yet a (the?) founder of philosophy.

**Lately everybody seems to be talking about Digital Sociology (2015-03-18 08:00)**

Or at least it’s easy to get that impression if you spend your time talking to digital sociologists. Last month saw the world’s first digital sociology (mini) conference, part of the Eastern Sociological Society’s event in New York. It was an exciting event with a range of international speakers over an intensive two days. If you’d like to find out more, here’s a Storify of the conference:
Here are some post conference notes by myself and Jessie Daniels on what we felt was expressed at the event:
The return of serious research into psychedelic drugs (2015-03-19 08:00)

While psychedelic drugs are now seen as illicit and criminalised around the world, with even those few remaining substances not criminalised occasionally cropping up as a potential bête noire for politicians, they were once at the forefront of psychiatric research. Here's an astonishing video which gives a sense of this long suppressed research activity:
This fabulous New Yorker article introduces the background to this research and details its contemporary resurgence, as well as the many challenges it faces before any hoped for normalisation could come to pass:

Between 1953 and 1973, the federal government spent four million dollars to fund a hundred and sixteen studies of LSD, involving more than seventeen hundred subjects. (These figures don’t include classified research.) Through the mid-nineteen-sixties, psilocybin and LSD were legal and remarkably easy to obtain. Sandoz, the Swiss chemical company where, in 1938, Albert Hofmann first synthesized LSD, gave away large quantities of Delysid—LSD—to any researcher who requested it, in the hope that someone would discover a marketable application. Psychedelics were tested on alcoholics, people struggling with obsessive-compulsive disorder, depressives, autistic children, schizophrenics, terminal cancer patients, and convicts, as well as on perfectly healthy artists and scientists (to study creativity) and divinity students (to study spirituality). The results reported were frequently positive. But many of the studies were, by modern standards, poorly designed and seldom well controlled, if at all. When there were controls, it was difficult to blind the researchers—that is, hide from them which volunteers had taken the actual drug. (This remains a problem.)

By the mid-nineteen-sixties, LSD had escaped from the laboratory and swept through the counterculture. In 1970, Richard Nixon signed the Controlled Substances Act and put most psychedelics on Schedule 1, prohibiting their use for any purpose. Research soon came to a halt, and what had been learned was all but erased from the field of psychiatry. “By the time I got to medical school, no one even talked about it,” Ross said.

Two points stand out: (1) we have vast evidence of experiences induced by psychedelic drugs which cohere with 3352
religious experiences recorded in the scholarly literature concerned with them (2) we have strong evidence of the therapeutic potential of psychedelic drugs and the biggest obstacle to overcoming the risks concerning them (the most sensible objection to this research) are constraints on serious clinical research itself.

Big data philanthropy (2015-03-20 08:00)

This recent article in the New Yorker introduces a new counselling service, based in New York, which uses text messages a point of contact for young people experiencing crisis. It's an intriguing discussion of changing generational norms regarding communication, offering a rich account of why SMS is so amenable a channel for young people seeking help:

A person can contact Crisis Text Line without even looking at her phone. The number—741741—traces a simple, muscle-memory-friendly path down the left column of the keypad. Anyone who texts in receives an automatic response welcoming her to the service. Another provides a link to the organization's privacy policy and explains that she can text "STOP" to end a conversation at any time. Meanwhile, the incoming message appears on the screen of Crisis Text Line's proprietary computer system. The interface looks remarkably like a Facebook feed—pale background, blue banner at the top, pop-up messages in the lower right corner—a design that is intended to feel familiar and frictionless. The system, which receives an average of fifteen thousand texts a day, highlights messages containing words that might indicate imminent danger, such as "suicide," "kill," and "hopeless."

However what really stood out to me was the role of data science in this charity’s activities. The CEO of the charity describes how "We think of ourselves a lot more like Airbnb or Uber or Lyft" and this is reflected in the centrality accorded to the analysis of digital data across all their activities:

Like a tech company, C.T.L. analyzes feedback from users, performs A/B testing, and is quick to make changes on the basis of what it finds. Although other data-driven philanthropic missions exist—Kiva, the microfinance site, and the public-school donation service Donors Choose are among the more well known—nonprofits have generally been reluctant to embrace methods of quantification that big corporations increasingly take for granted. But at C.T.L. the chief data scientist, Bob Filbin, was Lublin's second hire. He co-wrote the data algorithms for C.T.L.'s system after travelling to crisis centers across the country and interviewing hundreds of volunteers about how their work could be made more effective. The communication techniques employed by C.T.L. counsellors are largely modelled on standard crisis-counselling practices, but C.T.L. has made modifications based on its data. It turns out that, for instance, statements couched in the first person ("I'm worried about how upset you seem") are associated with positive responses.
The organization’s quantified approach, based on five million texts, has already produced a unique collection of mental-health data. C.T.L. has found that depression peaks at 8 P.M., anxiety at 11 P.M., self-harm at 4 A.M., and substance abuse at 5 A.M. The organization is working on predictive analysis, which would allow counsellors to determine with a high degree of accuracy whether a texter from a particular area, writing in at a particular time, using particular words, was, say, high on methamphetamine or the victim of sex trafficking. A texter who uses the word “Mormon” tends to be reaching out about L.G.B.T.Q. issues.

Out of consideration for texters’ anonymity, Crisis Text Line displays its findings only by state. (Arkansas ranks highest for eating disorders, Vermont for depression; suicidal thoughts are most common in Montana and least common in New Hampshire.) But eventually there will be enough data to allow the organization to confidently reveal Zip codes and area codes without the risk of making any single texter identifiable. Such a wealth of data is new in the field of mental health. Isaac Kohane, a pediatrician who also has a Ph.D. in computer science and is the co-director of the Center for Biomedical Informatics at Harvard Medical School, told me, “You cannot have accountable care—financially or morally accountable care—if you cannot count, and until recently we literally could not count with any degree of acceptable accuracy.” He added, “It’s been mind-boggling, to those of us who knew what was available, that Amazon and Netflix were creating a far more customized, data-driven, evidence-based experience for their consumers than medicine has.”

While they have thus far resisted pressure to monetise the data by selling access to it, it’s hard not to wonder if this is a stance likely to persist in the event of a shortfall in funding. My point is not to criticise a charitable initiative that is doing important work in an innovative way but only to point out potential longer-term ramifications of this model. It surely represents a seismic shift in philanthropy which needs to be better understood.

by Tom Brock
Social Morphogenesis is the first volume in a series of books, edited by Margaret Archer, that seeks to develop an explanatory framework that can account for how the rate of social change has ‘speeded up’ in the last three decades. The first volume is dedicated to an analysis of what the ‘generative mechanism’ is that produces such rapid change and discusses how this differs from Late Modernity. The first volume can be seen as an elaboration of Archer’s Morphogenetic Project, which over the last thirty years has focused on theorising social stability and change in a way that is applicable to three levels of social analysis - micro, meso and macro– and across all three elements of social transformation – structure, culture and agency. The challenge of the Morphogenetic Project has been to specify their interplay with Archer’s offering a sociological interpretation of Morphostasis and Morphogenesis to help make sense of the processes that tend to either preserve or change a social system’s given form or structure. The term ‘social morphogenesis’, then, elaborates on these previous developments and refers to the generative mechanism that Archer and 10 other contributors are interested in holding to account for the increasing rapidity of social change.

Each chapter engages with the question of social change and reproduction within social systems and each chapter talks broadly and critically to the idea of a Morphogenetic Society. The breadth and depth of the philosophical discussion that takes place in each chapter makes the volume a difficult but valuable read. It also makes it difficult to review in as far as each chapter speaks to issues that range from broad theoretical questions (see Popora, p.25) to more specific areas of inquiry (see Wight, p.85 or Lazega, p.167). Thus, I’ll only speak to the broad themes of the book here.

The volume is held together by a clear sense of direction towards one important question, which Archer summarises in the opening passage,

This book is about theorising a possible transition from the social order of late modernity... In itself, rapid social change does not necessarily signal, much less constitute, a new type of social formation. What intrigues us is whether or not this increasingly important process could be responsible for generating a different kind of social formation - Morphogenetic Society (p.1)

Archer adds, 'All of us are vary about the array of social forms that have hastily been advanced as superseding modernity. Thus, we do not precipitously announce a new “Beyond”’. The modesty is reassuring, particularly at
a time when it feels as if the search for answers to big questions, like 'what direction is society going in' or 'how can people effect social change' can be achieved through appeals to big data analytics and empiricism. Indeed, as Archer assures us, 'the books deals with "social morphogenesis" as a process rather than an end product' (p. 1; my emphasis), and this means that 'speculations' must be 'vented' (p.2) towards if one is to theorise social change or, more specifically, possible changes in the 'balance' between morphostatic and morphogenetic sequences. Indeed, a proportion of Archer's introductory chapter is dedicated to demarcating one of the important principles of realist social theory – ontological realism – and whilst Archer suggests that not all of the contributors are critical realists, it appears that all agree on the shortcomings of empiricism and, in particular, how it has been used to announce various new societies.

One way in which such empiricism announces itself in the literature on 'globalization' is in the over-hasty proclamation of new 'Ages': the Global Age itself (Albrow 1997), the Information, Knowledge, Network, Risk, Liquid, etc., societies. Significantly, each of these adjectives highlights a characteristic that is held to be distinctive of a 'new' social ordering and justifies differentiating it from the preceding social formation. But what is the nature of these characteristics singled out? Are they descriptive or explanatory? Mostly, these seem to begin as the former but then pretend to be the latter, as is generically the case with empiricism (p.5-6)

Archer's introductory chapter, then, sets the beginnings for a project that sees a number of contributors engage critically with the idea that society has 'speeded up' but all whom seek to provide an explanatory account of why this has happened, rather than a descriptive account of the changes that have occurred. For those unfamiliar with Archer's work, this focus comes from a long-standing interest that she has had in providing causal explanations of social change, particularly with reference to the interaction between structure and agency over time. This position, which is fully elucidated in her work Realist Social Theory: The Morphogenetic Approach but, in short, is an explanatory framework that draws out a sense of how Morphogenesis and Morphostasis operate at different 'levels' of reality with, potentially, transformative effects.

The basic shortcoming of empiricist and actualist accounts is that observable transitional features are simply extrapolated and presumed to constitute transformation. Instead, and at most, social morphogenesis has been discussed as a process that could prove transformational. Contributors are in agreement about the meta-theoretical need to adduce a generative mechanism accounting for the possible transition towards transformation, but not yet clear – and therefore cannot be consensual – about either its definition or operation (p.19)

It is through a discussion of three different 'levels' of reality that we get a clearer sense of what this generative mechanism might constitute:

At the macroscopic level (third-order), the generative mechanism is held to derive from 'Contingent Compatibilities' coming to predominate for the first time... At the institutional (second-order) level, however, we confront the paradox of various institutions seeking to take advantage of such synergy whilst also retaining the situational logic of competition... At the (first-order) level, agents (individual or collective) and actors confront rapidly changing structural and cultural contexts in daily life and across generations (p.20)

Throughout the volume a number of contributors begin to adduce what this mechanism might look at these various

3356
levels. Archer talks of ‘reflexivity’ (p.9) and the ‘conflicting pressures of primary and corporate agency’ particularly as these relate to the situational logics of ‘opportunity’ and ‘competition’ in a Morphogenetic Society (p.14). In other words, one might begin to account for the mechanism of social morphogenesis (‘variety producing more variety’) through a look at how people respond to the expansion of choice in their lives. Thus, Archer’s account of modes of reflexivity (see The Reflexive Imperative, 2012) seems integral to her account of social morphogenesis.

Similarly, Pierpaolo Donati’s discussion of relational sociology talks to this search for a generative mechanism, which he sees in terms of ‘relational feedback’ (p.219). Donati opens his chapter by providing an overview of what he views relational sociology to be and he demarcates it from the work of other sociologists, such as Nick Crossley through a discussion of Archer’s morphogenetic approach. In doing so, Donati distances himself from an understanding of social relations as ‘dyadic’ and looks to ‘the triadic nature of social relations’ (p.215) to make sense of the emergent effects of reciprocal action between social subjects. One such effect is what he calls ‘relational feedback’, which is defined as:

...those feedbacks which: (i) are non-automatic; (ii) are generative in the sense of giving birth to a new, relatively stable, relational configuration; (iii) they are special positive feedbacks, which operate according to a many-valued and transjunctive logic, not according to a mechanical binary (positive/negative) logic; (iv) imply a social networks of agents (partners); (v) so that the feedback loop is regulated mainly by redefining the goals and/or rules of the network step-by-step (p.219)

In terms of social morphogenesis, then, how variety is produced, how the selection of variety is accepted and rejected and how the stabilisation of these emergent forms arises, is regulated through feedback. As Donati suggests, ‘The direction of MG [morphogenesis] depends of the type of feedback that prevails’ and, thus, it is to the relational character of feedback that one can begin to consider the path that social change will make. In Donati’s own words,

In many respects, the emerging society has to look for remedies to the negative outcomes of modernity, to the extent that the latter has been governed by the principle of ‘institutionalized individualism’, by reversing this principles into a principle of relationality. The incoming morphogenetic society is society that has a ‘relational matrix’ run by a many-valued and transjunctive logic (p.206)

It appears, then, that generative mechanisms, like the ones offered above can lead to social outcomes that are often unpredictable and rarely patternable but nevertheless work, increasingly, to create conditions whereby ‘variety produces more variety’. This is certainly a thought-provoking idea and one that appears to be based upon the suggestion that one should engage, critically, with discussions about social ontology, and how it is to be operationalized to inform better empirical research. There is little sense of wanting to foreclose on the possibility of undertaking social research (see Donati, p.225) but, rather, to better equip sociologists with a practical social theory that “tallies” with a realist social ontology and an interest in causal explanation. To achieve this, the volume challenges its readers to think through the consequences of asking big questions and, in the process, provides them with the outline of a theory that might one day yield answers.

I found the philosophical theorising and language to be abstract and, at times, I found myself often re-reading sections to help clarify my understanding of certain topics. Nevertheless, I found each discussion incredibly valuable. The contributions made here have sharpened my understanding of morphogenesis as a meta-theory, which is providing the grounds for a sensible discussion on the future direction of society. That the beginnings of such an ambitious project would need to flesh out the theoretical terrain, particularly given the number of collaborators involved, should not be surprising. However, I would expect that future volumes begin to engage more readily with

3357
practical issues of social research, not least because it will help present the case of why this modelling is so important.

Tom Brock is a Lecturer in Sociology at Manchester Metropolitan University. He has research and teaching interests in the areas of digital sociology, politics and social theory. Tom is currently writing a paper that re-conceptualises video game consumer culture through a discussion of habitus and reflexivity.

Weber/ Simmel antagonisms: Staged dialogues (2015-03-21 08:00)

Weber/ Simmel antagonisms

Staged dialogues

University of Edinburgh

10/11 December 2015

A conference organized by the Max Weber Group of the British Sociological Association & Sociology Edinburgh

Call for outlines

Much has been said about the strong oppositions between Simmel and Weber as founding fathers of sociology – as well as about their shared concerns. Capitalism and culture, ‘worlds’ and their tensions, rationalization and objectivation, the city, music, the methodology of the social sciences and ideal types, equally exercised their thought and yielded very different creatures.

But rather than merely intellectual or methodological quarrels, the antagonisms between Simmel and Weber engaged their whole way of being and acting in the world – the constantly renewed aspiration yet impossibility of
reconciliation with oneself and the world, for Simmel; agonic tension, struggle with oneself and the world, for Weber. This is perhaps the reason why Weber/Simmel antagonisms have had continuity in social theory and shaped some of its major currents of thought. More importantly perhaps they spur us to be and act in the world in very different ways: hence this conference, which does not only explore these differences, but stages them.

The **format** of the conference is inspired after the staging of the Tarde/Durkheim debate by Latour/Karsenti, but rather than recreating a real debate with prominent actors, we invite outlines for short ‘imagined dialogues’ between Weber and Simmel on topics which were addressed by both. The topics chosen should not be of merely scholarly interest but rather capture problematics mattering today.

**Keynote dialogues**

Money Nigel Dodd (LSE).................................................. ‘Simmel’

Geoff Ingham (Cambridge)......................... ‘Weber’

Capitalism (TBC)

Scott Lash (Goldsmiths)...............................‘Simmel’

Uta Gerhardt (Heidelberg)............................‘Weber’

Verstehen and writing

Rosalie Dion (Montréal).........................‘Simmel’

Barbara Theriault (Montréal)...................‘Weber’

Conflict

Thomas Kemple (UBC)..........................‘Simmel’

Austin Harrington (Leeds)......................‘Weber’

Philosophical & political stance Olli Pyyhtinen (Tampere)..............................‘Simmel’

Carlos Frade (Salford)..............................‘Weber’
Outlines can be submitted by pairs or by individual academics and students. PhD students are particularly encouraged to take part. Selected pairs will be asked to play their dialogues at the conference. If you are an individual with a dialogue but without a partner, we can supply one from our Edinburgh team!

Outlines should include:
- the theme chosen for their dialogue
- the key texts serving as a basis for the dialogue;
- a starting imagined dialogue between Weber and Simmel, of about 500 words.

**Deadline for submission: 29 May 2015**

**Send to:** [1]webersimmel@ed.ac.uk

The selected applicants will then be invited to submit their fully written dialogues in advance of the conference. This will allow the Conference committee to make suggestions and above all to plan the staging of the dialogues. The dialogues will be read/acted at the Conference, and will be recorded and put on line.

We are aiming to put together a special issue of *Classical Sociology* featuring some of the best dialogues.

**Fee:**
Academics £75
Students £50

We are currently seeking to arrange travel/accommodation grants for about 10 participants from the UK and Europe (or a contribution towards costs for travel from further afield). These are meant to encourage participation from students and early careers researchers without a permanent University contract. If you are in such case and would like to be considered for a grant please let us know when you submit your outline.

---

**Power, Acceleration and Metrics in Academic Life, 2nd-4th December 2015, Prague (2015-03-22 08:00)**

**Power, Acceleration and Metrics in Academic Life, 2nd-4th December 2015, Prague**

**Call for papers: Power, Acceleration and Metrics in Academic Life**

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological...
developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim ‘patent and prosper’ (Schachman) supplements the traditional ‘publish or perish’). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This conference will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis

The workshop will take place from December 2nd to 4th 2015 in Prague.

Deadline for abstracts will be May 1st 2015. Please send 250 words and short biographical note to Mark Carrigan (mark@markcarrigan.net) and Filip Vostal (filip.vostal@gmail.com) by the deadline.

Keynote Speakers:

Roger Burrows – Ancient Cultures of Conceit Reloaded

Philip Moriarty – The Perils, Pitfalls, and Power of Peer Review in Public

Susan Robertson – Vertigo: Time and Space in the Contemporary University

James Wilsdon – In numbers we trust? Reflections on the UK’s independent review of the role of metrics in research assessment

Fee

50 Euros (standard) / 25 Euros (PhD/ECR)

Registration to open in summer 2015

Venue
Using fiction to write about your research (2015-03-22 16:40)

I was fortunate to meet Tim Maughan at the Digital Sociology conference in New York last month. Along with Sava Saheli Singh, he's been exploring how design fiction can be used to communicate sociological ideas. This is how Sava and Tim describe design fiction:

Design fiction is a term first coined by Julian Bleecker and popularized by SF author Bruce Sterling, who describes it as “the deliberate use of diegetic prototypes to suspend disbelief about change.” and that it "attacks the status quo and suggests clear ways in which life might become different."

Design fiction isn't science fiction, it's not just a telling of stories in the future or trying to make predictions of the future, instead it is a way of trying to envision and interrogate possible futures based on research data, current trends, and/or technologies. Originally, primarily used by product designers as a cheap alternative to prototyping new products, it has found traction as a critical tool allowing us to see through the fog of hype and digital evangelism.

I find this idea really exciting and I invited Tim to give a talk when he visits London. If you’d like to come then you can register here. It’s a free event that will take place at Goldsmiths on the afternoon of May 13th. I’ll be talking, as will Les Back, Keith Kahn-Harris and Sarah Burton.
In the meantime, here’s a great example of the work produced by Tim:

For a workshop on future London, five individuals—Arup, Social Life, Re.Work, Commonplace, Tim Maughan and Nesta—created 10 Future Londoners for the year 2023. This is a short fictional piece describing the working day of 19 year old Nicki, a zero hours retail contractor.

[9]https://medium.com/@timmaughan/zero-hours-f68f17e8c12a

Here’s an example of what Sava and Tim have worked on together:

People talk about the future of technology in education as though it’s right around the corner, but most of us get to that corner and see it disappearing around the next. This innovation-obsessed cycle continues as we are endlessly dissatisfied with how little difference these promises make to the people implicated in these futures. These products and practices, cloaked in the latest buzzwords and jargon, often trickle down to non-western geographic regions after they’ve been tried and rejected, yet still adopted as the new and advanced “western” methodology that will solve the “problem” of education.

In an attempt to cut through the relentless TED Talk-like optimism of ed tech marketing, this year at the HASTAC conference in Peru we presented a series of fictional case studies. These four design fiction based personas aimed to illustrate the possible impact on society and education, in both positive and negative ways, of not just emerging technologies but also global social and economic trends. They give brief snapshots of the lives of individuals in imagined futures from different geographic, ethnic, economic, and cultural backgrounds, illustrating how each of them might interface and interact with the different technologies.

Social ontology is integral to the study of society. It is impossible to inquire into the social world without some understanding, at least tacitly, concerning the entities which make up that world and their properties and powers. However social ontology remains an often confused and contentious matter within the social sciences.

The first Centre for Social Ontology PhD and ECR conference seeks to address this matter through papers exploring the role of social ontology within sociology. This could include but is by no means limited to:

- The relationship between tacit assumptions concerning social ontology and reflective theoretical positions
- Social ontology and the formulation of research questions
- Social ontology as a topic standing at the interface between the social sciences and philosophy
- The methodological implications of social ontology
- The ontological assumptions implied by research methods
- The social ontology of particular areas of inquiry e.g. social movements or digital technology
- Disciplinary differences in approaches to social ontology
- Social ontology and philosophical under-labouring
- The limits of social ontology and where under-labouring has to stop
- New directions in sociological research through questions of social ontology
The conference is open to all PhD students and Early Career Researchers with an interest in social ontology.

Please send abstracts of 200 words or less and a short biographical note to [1]socialontology@warwick.ac.uk by May 1st

Registration will be free and a limited number of small travel bursaries will be available to support attendance at the conference.

Collective Cleanliness: A Meta-Discursive Study of Academic Tearoom Culture

Lotha Wadhwa and Duya Dishoe.*

* Associate Professor, School of Social Harmony and Sociology, National Capital University, Canberra, 2000 Australia

Journal of Applied Elbow Grease

ARTICLE INFO

This paper presents a meta-analysis of literature contributing to academic tearoom culture. We present a renewed argument for a grass-roots approach to the mechanics of tearoom cleanliness, specifically in the microclimate of academic tearoom contexts where time is of the essence in an increasingly deregulated and over-scheduled higher-education system. We re-contextualize the concept of early studies to evacuate the focus away from washing up mechanics toward the concern with the maintenance and encouragement of positive social bonds in tears. In surveying recent experimental studies, this paper presents an optimistic view of the capacity for long-lasting cultural change in academic tearoom environments.

ABSTRACT

Keywords:

Cleanliness, Byssenthal Effect, Workplace harmony, Tangential disbelief, Passive-Aggressive non

1. Introduction

In this study, we follow Tallies (2011) who has called for a renewed investigation into the cultural mechanics of tearoom culture. She questions the apparent paradigm of social researchers’ awareness of the importance of cleanliness to social cohesion, but our inability or perhaps reluctance to apply these in regards to the dishes at hand.

Early functionalist accounts of tearoom culture focused on the breakdown in the processes associated with keeping dishes clean (Elabor & Scott, 1954; Cisneros & Bock, 1960) and removing tlc from tearoom fudge in a timely manner (Finke & Bouch-Durnault, 1990). Traditional methods (Sudd & Bubba, 1834; Scrub & Tense, 1930) have all proven to be more effective at the physical work of cleanliness than those proposed by other studies (Stocket & Romaney, 2014; Leavitt-Dury, 2015).

Later studies focused on the gendered dimensions of the work of maintaining cleanliness in the tearoom environment (Steph & Impress, 1979) which ordinary, everyday昀analytic questioned whether poicy or paid faculty were more likely to make messes (Workez-UNisy 1978).

1. Experimental Participatory Action Research in Etcology

In our previous work on passive-aggressive note (Dishoe & Brou, 2010), one notable exception of this cycle in various forms of group gatherings which tend to produce an excess of consumables which are then placed under refrigeration (Cooling, 1993). These well intentioned actions result in the creation of communal consumables (Sharlot, 2002) which rather than being consumed, leaving many tearoom refrigerators resembling something that belongs to a chemistry lab (Molody-Geize, 1988).

What is theory? (2015-03-24 08:00)

Another interesting video from [1]iai.tv:

Theories, Mysteries and Mistakes

We assume our theories about the world are gradually uncovering the way it really is. Yet from quantum mechanics to post-structuralism, the reality the theories describe is contradictory. Should we conclude that the world is essentially unintelligible? Or is it simply the theories that are mistaken?

The Panel

Founder of Loop Quantum Gravity Carlo Rovelli, post-postmodernist Hilary Lawson, and philosopher of mind Jennifer Hornsby confront the limits of our understanding.

Call for an Internet Social Forum (2015-03-25 08:00)

The Internet belongs to all people – Let’s occupy it

More and more, the Internet is the place where we meet up with our friends, get information, organise work, store our pictures and texts, do our banking, see videos, buy tickets and get public services. As we use the Internet extensively, we begin to be “known” through the Internet equally intimately. Soon, it will also hold extensive transactional information from the many “things” in our daily lives—the entire range of domestic devices as well as public and private infrastructure and services. All this knowledge is power, which can be put to good use or bad. Not only does the Internet increasingly hold too much information about us, with the advancing networked automation and remote access, it provides the power to reach anywhere to control physical spaces and activities.

It being so central to our daily lives and social systems, what do we want the Internet to look like in the future? Should it be a decentralised network for unmediated social connections, and for creating, exchanging and sharing information, publicly or privately as we choose? Will we have applications oriented to better living conditions, education and cultural development for all; services that guarantee the privacy of our data; technology our communities can trust, collectively own and control? Or will it be a surveillance-centric network controlled by a handful of governments and corporate monopolies that have a continuous micro-view of our interaction spaces; commoditise our information; extract exorbitant revenue by selling our private data; and police all of our online (and increasingly offline) activities? What Internet do we want?

As in the beginnings of the Internet, both trends are present; but the Internet is fast evolving towards the second scenario, as major transnational corporations concentrate their control over the net and security services such as the US National Security Agency and its close allies engage in pervasive monitoring. Such centralised control of international communications and data, alongside a vacuum of legal checks and balances with global application, are leading to an accumulation of global power in a few hands. This, in turn, not only threatens to further exacerbate imbalances of wealth and power, but could undermine the very bases of democratic society.

So then, what can be done to reverse this trend, before it becomes irrevocably ingrained in the Internet’s DNA, and ‘normalised’? In particular, how can organisations working for social justice, democracy, communication rights, free/libre and open-source software, net neutrality, or the broad range of human rights, as well as for citizen empowerment above that of governments or corporations, contribute to building a People’s Internet?

This call for an Internet Social Forum aims to create a global space precisely to take up these issues, where we will discuss the Internet we want, share information on our endeavours and struggles for democracy, human rights and social justice in relation to the Internet, and develop collective action agendas.

Why a Social Forum? The Internet Social Forum (ISF) takes its inspiration from the World Social Forum (WSF) process and its visionary call that “Another world is possible”—we are suggesting that “Another (People’s) Internet is possible”. Recalling the WSF Charter, which calls for a different kind of globalisation than that “commanded by the large multinational corporations and by the governments and international institutions at the service of those corporations’ interests”, we are calling for an Internet from below which is controlled by the people— including those not yet connected.

The WSF Charter presents the vision that “globalisation in solidarity will prevail as a new stage in history”, 3368
marked by respect for universal human rights and the environment, and resting on democratic international systems
and institutions at the service of social justice, equality and the sovereignty of peoples. We see the ISF as a direct
parallel to these efforts but within the sphere of the Internet and its governance.

From its first edition in Porto Alegre, in 2001, the WSF has been conceived as a people's opposition to the
elites of the Davos World Economic Forum (WEF) which we have now come to call the “1 %”–those who represent
and benefit from banker imposed austerity measures, from the globalisation of capital, and the ideological and
institutional dominance of neo-liberalism; and also now in its Internet embodiment– the "Net Mundial Initiative"
(NMI), recently launched by the World Economic Forum. The WEF’s NMI is directed as the elite’s attempt to provide
self-serving ‘solutions’ with regard to global Internet-related public policy issues, and it simply takes one significant
step forward in the WEF’s continuing efforts to enable an economic and political hegemony by global corporations
and the global 1 %. The WSF process appears as the obvious and appropriate space to launch a movement for a
People’s Internet rather than an Internet in the interests of global economic and political elites.

Beyond the technical issues of standards and management of domain names, Internet governance is increas-
ingly about finding appropriate ways to respond to the larger framework of social and economic justice and human
rights issues that are emerging as the Internet impacts society at large. The governance of the Internet should be
undertaken based on the same democratic principles and mechanisms as we expect in other aspects of our lives.

The Internet Social Forum will be open to participation by all those who believe in the philosophy and values
of the WSF, and that the global Internet must evolve in the public interest. It will be underpinned by values of
democracy, human rights and social justice. It will stand for participatory policy-making and promote people’s control
of social technologies, as for instance is represented in the community media movement. It will seek an Internet
that is truly decentralised in its architecture and based on people’s full rights to and control over data, information,
knowledge and other ‘commons’ that the Internet has enabled the world community to generate and share.

The Forum also proposes to launch a bottom-up process for developing a People’s Internet Manifesto, involving all
concerned social groups, communities and movements, in different regions; from techies and ICT-for-development
actors to media reform groups, democracy movements, women’s rights organisations and social justice activists.

Next steps: A preliminary planning workshop will be held at the 2015 WSF, in Tunis, in March, titled 'Organis-
ing an Internet Social Forum – A call to occupy the Internet’. The Internet Social Forum is being planned for late 2015,
or early 2016. Provision will be made for remote participation.

How to participate in the ISF initiative: As a people's initiative, anyone motivated to support the public inter-
est is welcome to join. However, as a matter of maintaining a congruence of some basic values, we follow the
criteria of participation followed by the World Social Forum which can be found at [1]https://fsm2015.org/en/criteria-
participation. Anyone self-declaring as fulfilling these criteria may join by sending an email to the following addresses.

This innovative conference brings together leading figures from a variety of fields which address issues of digital technology and digital data. We’ve invited speakers with a range of intellectual perspectives and disciplinary backgrounds who engage with questions relating to digital data and digital technology in their work. Our suggestion is that social ontology, however this might be construed, represents a potential common ground that could cut across this still rather siloed domain of inquiry into the social dimensions of digital technology.

The conference aims to explore this possibility by assembling a diverse range of perspectives and drawing them into a dialogue about a common question, without assuming a shared understanding of the topic at hand. Our aim is to extend this digitally via twitter, podcast and blog beyond the event itself, in order to facilitate an extended conversation that will draw more people into its remit as it circulates after the conference itself.

To this end, we invite each speaker to address this theme (the social ontology of digital data & digital technology) in whatever way they choose. Each speaker will have 30 mins to talk and 15 mins for questions. We’ll have an accomplished audio editor on hand to record each talk as a podcast. These will be released on [1]www.socialontology.org and will be circulated on social media in order to try and stimulate a continuing debate around the issues raised at
the conference. The hashtag for the day will be #socialontology.

Confirmed Speakers:

- Noortje Marres (Goldsmiths) - Does Digital Sociology have a Problem?
- Jochen Runde (Cambridge) - Non-materiality and the Ontology of Digital Objects
- Alistair Mutch (NTU) - title TBC
- Susan Halford (Southampton) - title TBC
- Nick Couldry (LSE) - title TBC
- Another speaker TBC

**Power, Acceleration and Metrics in Academic Life, 2nd-4th December 2015, Prague (2015-03-26 08:00)**

**Call for papers: Power, Acceleration and Metrics in Academic Life**

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim ‘patent and prosper’ (Schachman) supplements the traditional ‘publish or perish’). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.
This conference will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis

The workshop will take place from **December 2nd to 4th 2015 in Prague.**

Deadline for abstracts will be May 1st 2015. Please send 250 words and short biographical note to Mark Carrigan (mark@markcarrigan.net) and Filip Vostal (filip.vostal@gmail.com) by the deadline.

**Keynote Speakers:**

Roger Burrows – Ancient cultures of conceit reloaded

Philip Moriarty – The perils, pitfalls, and power of peer review in public

Susan Robertson – Vertigo: Time and space in the contemporary university

James Wilsdon – In numbers we trust? Reflections on the UK’s independent review of the role of metrics in research assessment

Oili-Helena Ylijoki – ‘Projectification’ and conflicting time orders in academic knowledge production

**Fee**

50 Euros (standard) / 25 Euros (PhD/ECR)

Registration to open in summer 2015

**Venue**

Hosted by Institute of Philosophy of the Czech Academy of Sciences the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic ([1]http://www.vila-lanna.cz/index.html)

**Travel**

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.
Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n.), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.

---

**Saying goodbye to Apple, Microsoft and Google** (2015-03-27 08:00)

[1] Provocative reading for those, such as myself, who have become utterly reliant upon the products produced by these corporations:

I’ve moved to these alternative platforms because I’ve changed my mind about the politics of technology. I now believe it’s essential to embed my instincts and values, to a greater and greater extent, in the technology I use. Those values start with a basic notion: We are losing control over the tools that once promised equal opportunity in speech and innovation—and this has to stop.

Control is moving back to the center, where powerful companies and governments are creating choke points. They are using those choke points to destroy our privacy, limit our freedom of expression, and lock down culture and commerce. Too often, we give them our permission—trading liberty for convenience—but a lot of this is being done without our knowledge, much less permission.

This review was originally posted on the LSE Review of Books

Media Technologies: Essays on Communication, Materiality, and Society is an impressively cohesive collection that seeks to map the intersections between Science and Technology Studies (STS) and Communication and Media Studies (CMS). The quality of the project has its origins in the approach the authors took to producing it: each essay went through many iterations, including a face-to-face meeting at a special workshop, with the demonstrable result of a diverse mix of contributions which nonetheless fit together into an overarching project. This endeavour was animated by a sense that both fields have come to share a concern with theorising media technologies but have in recent years been constrained by intellectual legacies that close down more than they open up in relation to this area of research (particularly the polarisation between technological determinism and social constructionism). In this sense, the project of the volume is a positive one, seeking to deploy the intellectual resources of both traditions in a way that better facilitates the investigation of these convergent objects of inquiry. However, what this means in practice varies greatly across an engagingly eclectic range of contributions made by scholars from both STS and CMS.

The third essay in the collection, written by Pablo J. Boczkowski and Ignacio Siles, draws on the notion of cosmopolitanism to outline an intellectual agenda for transcending the disciplinary boundaries which they, as with so many other contributors, see as constraining our understanding of media and communications. The division of labour encoded in the disciplinary silos which characterise the contemporary field have profound analytical implications for their objects of study e.g. scholars studying production rarely consider reception (and vice versa), while those studying the materiality of technology rarely consider their associated content dynamics (and vice versa). They make a plausible case that this structuring of social scientific knowledge has the effect of artificially prising apart shared objects in which these various aspects exhibit a deep interrelationship. In their view, the contemporary field of inquiry into media and technology encompasses four distinct spaces of scholarship: production/content, consumption/content, production/materiality and consumption/materiality. The relatively discrete form taken by these areas of inquiry has the effect of imposing a strong separation between elements of the technologies which commonly intermingle along their life cycle. The authors advocate a cosmopolitan sensibility as the solution to this problem, arguing that by seeking to overcome ‘provincial’ intellectual tendencies, we help make a more holistic approach to media technologies possible.

There are two important ways in which their argument is more sophisticated than a simple call to transgress artificial boundaries. Firstly, they recognise that these silos have their origins in the development of both STS and communications studies. Both fields originated in a project that cut across existing disciplinary boundaries in exciting and productive ways, however in recent years they have turned inwards as a product of institutionalisation, with deleterious consequences for their intellectual vibrancy. They suggest that the cosmopolitan sensibility which is the focus of their chapter did once animate both fields and that it can be recovered by stepping backwards in order to move forwards. Secondly, their claim about the interpenetration of different aspects of media technologies is not simply a theoretical one: even if we affirm the artificiality of these analytical boundaries on a theoretical level, we’re still faced with the methodological challenge of overcoming the limitations they impose when conducting empirical research. The cosmopolitanism they propose would work towards the reintegration of these ‘spaces of inquiry’ across the full range of practices we tend to subsume under the label of ‘scholarship’. Through doing so, they make a convincing case that STS and CMS can recapture the outwards facing orientation which animated their initial projects. Doing so can provide the foundation for a broader engagement with the social sciences that takes on a newfound importance at a time when media technologies are ever more closely woven into the fabric of social life.

The tenth essay in the collection, written by Christopher M. Kelty, addresses a very different concern but one no less radical in its inclination to traverse disciplinary boundaries. Observing the close relationship between the language of technology and the language of freedom, Kelty’s contribution begins with the obvious question of precisely what this connection should be understood to be. Is it rhetorical or is it something more than this? The
author leans towards the latter view, drawing on a curious mix of the social history of technology and political philosophy in order to make his case. He suggests that the treatment of the political in STS and CMS tends to be circumscribed, restricted to the affirmation of the existence of a political dimension of technology rather than any attempt to unpack its political origins and consequences. He traces the emergence of the personal computer, arguing that it has long been framed in terms of a specific concept of freedom because of the circumstances under which it was developed and the genuine liberation of sorts it entailed for those who had formerly worked with mainframes. A brief overview cannot do justice to the subtlety of an argument that weaves such distinct strands of inquiry together into a compelling whole. In this sense, the essay resembles the book as a whole: an impressive achievement, creatively traversing disciplinary boundaries in a manner valuable both in itself and for the further inquiry its diverse contents will no doubt provoke.

*Media Technologies: Essays on Communication, Materiality, and Society* is a fascinating volume, likely to be of interest to anyone working within STS and CMS or for those, such as myself, with an interest in issues pertaining to media and materiality emerging from other disciplinary modes of inquiry.

Making Sociology Public (2015-03-29 08:00)

This was originally published on [1]Making Science Public

Ever since I began to study Sociology, I’ve been fascinated by the question of how the discipline orientates itself towards public life. When I first encountered Sociology I was an intellectually frustrated philosophy student with a desire to study something that informed my activism. The political philosophy which had been the main object of my interest was clearly related to my activism but it was only when auditing a module on sociology that this weird tension in my experience, in which I tried to bridge a gap between activism and theory, began to dissipate in the face of a discipline that in an important way refused this separation. Like many other activists entering Sociology, I gravitated towards Public Sociology and the work of C. Wright Mills, soon coming to a deep conviction that the discipline should be engaged in and with public life, even if I wasn’t entirely clear what form this should take. It was through my fumbling engagements with this question that I began to see that my longstanding hobby of blogging was hugely relevant to my academic goals. This was a pretty organic process: as I began to study sociology, my predominately political blog posts began to take on a distinctly sociological tenor, with my activist blogging ultimately giving way to a much broader sociological identity.

However while it’s obviously the case that social media is relevant for public sociology, I’ve found it harder to be clear about precisely what this relationship entails. The communicative affordances of social media obviously play an important part in this: these tools are ‘fast, cheap and out of control’ as the educational technologist[2] Martin Weller has put it. But there are good sociological reasons to reject a view of the communication of sociological knowledge as intrinsically valuable, as well as important conceptual questions about what exactly we mean by ‘sociological knowledge’. The discipline’s identity is far from secure and ritualistic invocations of the sociological imagination (etc) need to be treated with caution at a time of institutional instability. That said, I’m still convinced that Sociology has an important role to play in public life and I’m much more interested in [3]getting good at public sociology than I am in adding to an already voluminous [4]literature.
To a certain extent this ambition fits with the theme of 'making science public'. I'm interested in how we can use these new tools to help make sociology public. What are we doing? What could we be doing? What should we be doing? There's a theoretical dimension to such questions but it's one with a fundamentally practical orientation.

To my slight surprise, I've recently been finding the later work of [5]Pierre Bourdieu immensely useful towards this end. One aspect of this that has particularly influenced me is Bourdieu's suggestion that collaborations with artists allow us to give symbolic force to social scientific ideas. This was the understanding that motivated a project I undertook with my friend Holly Falconer, a photographer, which was recently published by Vice. This project was an attempt to convey photographically something which I'd struggled somewhat to articulate in the context of journal articles. Having undertaken research on asexuality, I'd reached the conclusion that much of what makes asexuality problematic is the widespread assumption that it must be problematic. Many of the problems encountered by asexual people have their origins in a widely shared assumption about sexual attraction (specifically: it's universal and it's uniform) that lead people who aren't asexual to act in inadvertently pathologizing ways towards those who are. On an academic level, I was reasonably pleased with how I'd developed this notion of 'the sexual assumption' but there was something dissatisfying about the way in which it was necessary to publish what was an abstract critique of an (often) unacknowledged assumption. The appeal of the project with Holly was the immediacy with which we could convey this notion through photography, communicating that asexual people live just fine, without falling back into the obtuse formulations that are so hard to avoid with academic writing.

Photography is only one example here, albeit one with which Bourdieu was intensely engaged as both theorist and practitioner. Another which I've been preoccupied by recently is Social Fiction or Design Fiction, which using fiction to explore social scientific ideas in the mode of 'showing' rather than 'telling'. To get a sense of what this might look like, it's worth reading [7]Zero Hours by Tim Maughan which was written as part of a NESTA project on [8]Future Londoners. Tim explores the near future implications of gamification, zero hour contracts and micro-tasking to convey the texture of daily life for a young Londoner caught in an exhausting cycle of 'digitally enhanced' precarious labour only eight years from now. The capacity of such fiction to bridge description and explanation, illuminating social forces by describing their imagined ramifications, represents something I think many critical social scientists could find hugely promising. We can see similar ideas at work in the [9]Social Fictions series edited by Patricia Leavy or the [10]Performative Social Science enacted by people like Kip Jones.

While I don’t think these can be reduced to the category of public scholarship of the form I’m advocating, in fact it would be unfair on those in question to do this, it nonetheless shows us that there are a range of possible forms through which we can seek to communicate critical ideas in more immediate ways. This notion of 'giving symbolic force, by way of artistic form, to critical ideas and analyses' was offered by Bourdieu before social media. But the only thing which has been changed by the emergence of these services is the ease with which we can pursue such activity, not least of all in seeking collaborators and circulating what has been made collectively. The opportunities for an artistically orientated Public Sociology are more pronounced than ever and Bourdieu's account allows us to see this activity as intrinsically political, seeking as it does to communicate critical abstractions with an immediacy and power that academic writing inevitably lacks.

1st Non-Monogamies and Contemporary Intimacies Conference (2015-03-30 08:00)

1st Non-Monogamies and Contemporary Intimacies Conference (Sept. 25th–27th, '15) Call for Contributions – Deadline 18th May 2015 (To see a longer version of this Call for Contributions, please go [1]here) || PLEASE SHARE Research in sociology, psychology, anthropology and contemporary history has shown that traditional concepts and practices regarding marriage, family, sexuality, and intimacy have been changing rapidly in recent decades. There have been radical revisions of thinking and practice not only related to sexuality but also involving gender roles, single-parenthood, family structures, contraception, abortion, and divorce. Many of these areas have been linked to transformations in broader social, economic and political constructs, such as same-sex marriage. These changes are faced with mainstream negative representations of non-monogamy which describe it as “infidelity”, “serial monogamy”, or “failures” of the “normal” pattern of intimacy. Such perspectives assign a privileged role to the idealized couple, portrayed as intrinsically better. The dominant academic paradigm legitimates and strengthens monogamy’s normativity. At the same time, academia frequently fails to acknowledge the existence of open, consensual non-couple-based forms of relationships, and of a-romantic and/or asexual intimacies. Moreover, even the limited existing research on consensual non-monogamies focuses mostly on English-speaking and socio-economically privileged white groups and communities. The rise in critical discourses regarding normative sexualities and intimacies (and the ways in which these two elements interact) calls into question the traditional paradigm of lifestyles that have been at the core of the sex-gender system, as well as hetero-mono-normative institutions and practices in general. Topics: With this conference, we intend to bring together research, activism and other forms of social expression, focusing on, but not limited to, the following topics:

- Research around the lived experiences of non-monogamies, especially those considered consensual;
- Ideological and representational changes in how intimacies are thought of;
- Intersections with race, sex-gender, sexual orientation, kinship, kink, sex work, class, culture, religion, dis/ability, asexuality, a-romanticism;
- Activism and community-building around non-monogamies;
- Reproduction of normativities and resistances: polynormativity and relationship anarchy, neo-liberalism and political contestation;
- Evolution of scientific discourses on non-monogamies;
- Challenges to counseling, psychotherapy, (public) health and legal frameworks around non-monogamies;
- The roles of mass media and new technologies around transformations of intimacy.

Our goal is community-building within and beyond academia in all its fields and disciplines, challenging traditional models of the hegemonic Global North system of knowledge production. Therefore, we encourage the submission not only of academic papers and thematic panels, but also round-table discussions, film screenings and debates,
installations, activist-driven reflections and other modalities. **Language & accessibility:** For logistic reasons, the conference’s common language will be English, and abstracts must be submitted in English. If you wish so, you can also send us your abstract in another language, provided that you also submit it in English. It is highly recommended (but not mandatory) that presentations during the conference are in English. The venue is wheelchair-accessible. If you require a Sign Language interpreter, please contact us via email; unfortunately we cannot guarantee that this will be provided. **To submit:** Abstracts of up to 250 words for individual submissions and up to 500 words for panel submissions, by May 18th, using [this platform](https://nmciconference.wordpress.com/submissions/submit/). **Before submitting, please read the instructions** [HERE](https://nmciconference.wordpress.com/submissions/presenterinfo/). Any doubts or technical difficulties should be addressed to the following email: nmciconference@gmail.com **Venue:** Faculty of Social and Human Sciences (UNL) in Lisbon, Portugal **Read the Call for Contributions in other languages**

**Preview of Book: Muslims, Schooling and the Question of Self-Segregation (2015-03-30 20:06)**

![Preview of Book](https://nmciconference.wordpress.com/category/call-for-contributions/2015-lisbon-pt/)

Muslims, Schooling and the Question of Self-Segregation by Shamim Miah
'Integration' or the supposed lack of it by British Muslims has been a ubiquitous feature in political, media and policy discourses over the past decades, often with little or no evidence base. This book is particularly timely as it draws on empirical research amongst both Muslim school students and parents to examine the question of 'self-segregation' in the light of key policy developments around 'race', faith and citizenship. It aims to contribute towards a national debate on segregation, schooling and Muslims in Britain through deconstructing the received wisdom of 'Muslim separateness'.

Reviews:

"This book makes an incisive intellectual contribution to understanding contemporary educational politics, policy and practice, with a specific focus on the schooling of Muslim students. It brilliantly investigates several highly contested concepts – segregation, integration, radicalisation, Britishness – offering innovative insights into how we re-imagine educational equality and justice." - Mairtin Mac an Ghail, Professor of Education at Newman University, Birmingham

"Theoretically informed and empirically substantiated, Shamim Miah has produced a vitally important intervention on the 'integration' debates. Originally formulated and clearly presented throughout, Muslims, Schooling and the Question of Self-Segregation is a must read for both researchers and policy makers alike." - Dr Nasar Meer, Reader in Comparative Social Policy and Citizenship, Strathclyde University.

"Muslims, Schooling and the Question of Self-Segregation is a compelling and penetrating analysis of civic integration and community cohesion in Britain. Demonstrating how complex choices surrounding housing and schooling have been misconstrued as 'self-segregation', Shamim Miah clearly indicates that British Muslims consistently strive to contribute, to engage and to integrate." - Paul Nesbitt-Larking, Professor of Political Science and Visiting Professor, Department of Political Science, Huron University College, Canada and School of Health and Human Sciences, University of Huddersfield, UK

Dr Shamim Miah is a Senior Lecturer at the University of Huddersfield, UK.
The End of Theorists?  (2015-03-31 08:00)

We’ve indirectly linked to this before but stumbling across it momentarily reminded me of how good it is:

6.4 April

Power, Acceleration and Metrics in Academic Life, 2nd-4th December 2015, Prague  (2015-04-01 08:00)

Call for papers: Power, Acceleration and Metrics in Academic Life

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim ‘patent and prosper’ (Schachman) supplements the traditional ‘publish or perish’). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This conference will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:
• empirical and theoretical engagements with the acceleration of higher education
• the origins of metrification of higher education
• metrification as a form of social control
• the challenges of self-management posed by metrification and/or acceleration
• common strategic responses to these challenges
• the relationship between metrification and acceleration
• how metrification and acceleration relate to a broader social crisis

The workshop will take place from **December 2nd to 4th 2015 in Prague**.

Deadline for abstracts will be **May 1st 2015**. Please send 250 words and short biographical note to Mark Carrigan (mark@markcarrigan.net) and Filip Vostal (filip.vostal@gmail.com) by the deadline.

**Keynote Speakers:**

Roger Burrows – Ancient cultures of conceit reloaded

Philip Moriarty – The perils, pitfalls, and power of peer review in public

Susan Robertson – Vertigo: Time and space in the contemporary university

James Wilsdon – In numbers we trust? Reflections on the UK’s independent review of the role of metrics in research assessment

Oili-Helena Ylijoki – ‘Projectification’ and conflicting time orders in academic knowledge production

**Fee**

50 Euros (standard) / 25 Euros (PhD/ECR)

Registration to open in summer 2015

**Venue**

Hosted by Institute of Philosophy of the Czech Academy of Sciences the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic ([1]http://www.vila-lanna.cz/index.html)

**Travel**

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.

Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n.), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.
CfP: The Politics of Data (Science) (2015-04-02 06:42)

The Politics of Data (Science)

This special issue of Discover Society will explore the political implications of ‘big data’ and the systems of expertise emerging around it, including though not limited to Data Science. In doing so it will aim to bridge the gap between the methodological discourse surrounding data science and the political discourse beginning to emerge around ‘big data’. Here are some of the questions the issue will address:

- How is ‘big data’ understood and acted upon? How should we understand its cultural power?
- How is ‘big data’ reconfiguring the social sciences? Do we risk all science becoming data science?
- How and why has the ‘data scientist’ come to be seen as the ‘sexiest job of the 21st century’?
- Is the ‘data scientist’ just a ‘Statistician who lives in Shoreditch?’ Or is this a genuinely new intellectual role?
- Can ‘big data’ address ‘big questions’? If not, is this a problem?
- What are the precursors of ‘data science’ within the academy and/or within corporations?
- What implications does corporate data science have for the relationship between corporations & consumers?
- What implications does national security data science have for the relationship between the state & citizens?
- Can the use of digital data lead to efficiency savings in public services? How does this relate to the politics of austerity?
- How could predictive privacy harms emerging from data analytics be addressed politically?
- Can the opacity of algorithmic processes be challenged? Or are we heading inexorably for a ‘black-box society’?
- How are new forms of digital data reconfiguring activity in particular social environments?

However these are just suggestions and ideas beyond the scope of this list are very welcome.

The deadline for contributions is June 15th. Contact mark@markcarrigan.net to discuss a potential contribution.

The article will constitute the July issue of Discover Society. Most articles will be **1500 words** however there are a number of special sections in the online magazine.

Front line – 1500 words  
View point – 1500 words  
Policy briefing – 1500-2000 words

If you would be interested in writing one of these thematic sections, please get in touch asap.

The issue will follow the usual formatting guidelines of Discover Society. Please consult the [1]notes for contributors.
The difficulty of organising events in a digital age, or, 'y u register but no turn up?' (2015-04-02 08:00)

I’ve often seen events advertised, thought ‘that looks interesting’ and booked a place, giving little thought to how I’ll actually get there on a specific day. It’s an expressive action, with booking a place being more a matter of wanting to attend the event than it is of actually deciding to attend it. It’s the kind of action which is more likely in a state of perpetual distraction.

Post. Post. Post. Click. Click. Click (as Jodi Dean conveys it)

I try my best to ensure I tell the organizers when/if I realise I won’t actually attend. I sometimes fail to do this. More often I do it too late for it to be of any use in terms of reallocating tickets. I try to remind myself of this when I’m the organiser. It’s started to really irritate me when people do this at events I’ve organised. At a recent event three people, who didn’t show up despite three requests that anyone not willing to attend let me know, denied a potential place to three of the people on the waiting list. It wasted money but the fact other people might have turned up was what bothered me.

However I recognise that this is easy to do. Quite obviously because I do it myself. When there are so many opportunities, so much of interest that we confront when we browse social media, it’s easy to be overly enthusiastic when it comes to registering for events. Particularly given the mentality which emerges with such reliability when we’re immersed in social media.

Post. Post. Post. Click. Click. Click
Identity, Neoliberalism and Aspiration - Educating white working-class boys

by Garth Stahl

Adopting a culturalist approach and a Bourdieusian lens, the book focuses on research conducted in London to learn about white working-class students’ experiences, identities and aspirations in the multiple sites of school, home and community, with the underlying theoretical approach that “identity is always residual, refracted, emergent and contested” (p1). Identity is constructed and contested in spaces such as schools and communities, and thus the
book successfully explores the nuances involved in white working-class boys' social and learner identities as they strike a balance between sometimes fluid and sometimes fixed identities. Neoliberalism encourages "competitive, economic and status-based" aspirations and subjectivities (p2), and these boys' lives are inevitably shaped by neoliberal systems of schooling, where the boys want to do well, but not too well. In the contemporary globalised world, where identities are fluid, flexible and hybrid, Stahl also points towards how some white working-class youth experience identities and subjectivities that are "fixed in place by both circumstances – material, economic, familial, cultural" and by "neoliberal discourses" (p159). The boys become neoliberal subjects "enmeshed in processes of individualisation and individualised failure", yet they work towards presenting themselves as "valuable individuals where egalitarianism becomes a process of amelioration, contestation or resistance" (p133).

Following contemporary theories and empirical studies on classificatory struggles, Stahl too discusses social class as cultural and ideological, rather than solely concerned with wealth and occupations, thus the research highlights in great detail how white working-class boys are socially positioned in schools. Aspiration and subjectivities are thoroughly explored in order for us to gain a deeper insight into the shaping and re-shaping of learner and social identities. Stahl shows how white working-class boys' subjectivities and aspirations are intricately meshed with social, structural and economic factors, and he problematizes what he refers to as common and crude conceptions of white working-class culture – for example, poor aspirations, poor parental attitudes, poor work ethic and poor attendance. The boys' aspirations are shown to be deeply intertwined with neoliberal educational practices, all the while schools' policies and practices regarding ability and achievement, through certain fixed assumptions, can result in racist and classist ideological structures. The research explores the contradictions and ambivalences in identity issues as the boys fear academic failure but simultaneously they fear academic success. Stahl offers recommendations of ways in which schools and teachers could better engage white working-class boys in order for them to enjoy and benefit from the curriculum and general schooling in order for them to enhance their learner and social identities. Having taught for in white working-class communities for many years

Part One of the book reviews contemporary education debates and literature on the educational policies which impact upon white working-class communities, in particular, drawing upon Bourdieu, Stahl raises key concerns about aspirations and identities of white-working class boys. In keeping with contemporary revival of Bourdieu's theoretical frameworks, Stahl advocates multiple and nuanced readings of gendered/classed identities and aspirations through a detailed examination of interrelated and interdependent capitals, habitus, field and associated disjunctures. Part Two of the book then goes onto examining the site of the school and the identity work therein – how identity construction and contestation impacts upon the boys' definitions and discourses of everyday experience of social class, and as a result the consequences for their learning and aspirations. We learn about how these boys have become adept in evading "labels, judgements and distinctions" (p7), and how they adopt strategies to reaffirm their own respectability through a process of ‘othering’ boys they deem different.

The book is timely, accessible, engaging and thoroughly grounded in extensive empirical work conducted in contemporary south London sites of schooling with boys whose voices come alive as we learn about their conflicting experiences, aspirations and identities, and their everyday experiences of the negative discourses imposed upon them. The boys know shame, self-doubt and poverty, as they reveal their ambivalent relationship with their locality, and make meaning through identifying boundaries. Thus Stahl's ethnographic study is an urgent and necessary read for teachers, educationalists, researchers, policy makers and sociologists interested in the interplay between intersections of whiteness, social class, gender and identity issues in the lives of young boys.

Garth Stahl completed his PhD at Cambridge in July 2013 while working as a teacher in a traditionally white working-class section of South London. He currently works as a Lecturer at University of South Australia.

Cruel optimism in #highered (2015-04-03 08:00)

This powerful essay by Maria Warner in the LRB echoes what I was trying to say recently about the perils of passion:

A university is a place where ideas are meant to be freely explored, where independence of thought and the Western ideals of democratic liberty are enshrined. Yet at the same time as we congratulate ourselves on our freedom of expression, we have a situation in which a lecturer cannot speak her mind, universities bring in the police to deal with campus protests, and graduate students cannot write publicly about what is happening (one of my students was told by management to take down the questions she raised on Facebook). Gagging orders may not even be necessary. Silence issues from different causes: from fear, insecurity, precarious social conditions and shame. It is the shame of the battered wife that allows her husband to count on her silence. I recognise, for example, the compunction in the words of Rosalind Gill in her fine article 'Breaking the Silence: The Hidden Injuries of the Neo-Liberal University'. She nearly didn’t write the piece, she says, because she felt that ‘pointing to some of the “injuries” of British academic life had a somewhat obscene quality to it given our enormous privileges relative to most people in most of the world’. She felt ashamed to be complaining about conditions at work because she was in it ‘for the satisfaction, not the money’. The managers count on that feeling – in others, not themselves. Gill recognises that the very sense of specialness that still attaches to the idea of being a teacher or a professor – especially for women, after our late acceptance into the profession and our erratic and precarious progress within it – has stood in our way; or rather, it predisposes us to be agreeable. ‘We therefore need,’ she writes, ‘urgently to think about how some of the pleasures of academic work (or at least a deep love for the “myth” of what we thought being an intellectual would be like ...) bind us more tightly into a neoliberal regime.’

Gill is describing an instance of what the American scholar Lauren Berlant calls ‘cruel optimism’. People open themselves to exploitation when the sense of self-worth that derives from doing something they believe in comes up against a hierarchical authority that is secretive, arbitrary and ruthless. Cruel optimism afflicts the colleague who agrees to yet another change of policy in the hope that it will be the last one. The cruel optimism that motivates the colleagues who undertake examining for the REF has grown out of a long, deeply held belief in the value of knowledge and the wish to pass it on – from one person to another, from one generation to the next. Yet university life has depended on this willingness of colleagues to undertake all manner of tasks above and beyond the ordinary job, reading one another’s work, writing recommendations, making nominations, translating, assessing and examining and sitting on councils and external bodies, developing analyses and plans, arranging for this and that conference or lecture or seminar series, without every moment and every act being quantified and calculated. Not everything that is valuable can be measured. But I am talking as if the chief sufferers from cruel optimism are teachers. This is of course not the case; students are above all the victims. The new managers want to pack ‘em in and pile ‘em high – and then neglect their interests by maltreating their teachers.

CfP: The Politics of Data (Science) (2015-04-03 11:45)

The Politics of Data (Science)

This special issue of Discover Society will explore the political implications of 'big data' and the systems of expertise emerging around it, including though not limited to Data Science. In doing so it will aim to bridge the gap between the methodological discourse surrounding data science and the political discourse beginning to emerge around 'big data'. Here are some of the questions the issue will address:

- How is 'big data' understood and acted upon? How should we understand its cultural power?
- How is 'big data' reconfiguring the social sciences? Do we risk all science becoming data science?
- How and why has the 'data scientist' come to be seen as the 'sexiest job of the 21st century'?
- Is the 'data scientist' just a 'Statistician who lives in Shoreditch'? Or is this a genuinely new intellectual role?
- Can 'big data' address 'big questions'? If not, is this a problem?
- What are the precursors of 'data science' within the academy and/or within corporations?
- What implications does corporate data science have for the relationship between corporations & consumers?
- What implications does national security data science have for the relationship between the state & citizens?
- Can the use of digital data lead to efficiency savings in public services? How does this relate to the politics of austerity?
- How could predictive privacy harms emerging from data analytics be addressed politically?
- Can the opacity of algorithmic processes be challenged? Or are we heading inexorably for a 'black-box society'?
- How are new forms of digital data reconfiguring activity in particular social environments?

However these are just suggestions and ideas beyond the scope of this list are very welcome.

The deadline for contributions is June 15th. Contact mark@markcarrigan.net to discuss a potential contribution.

The article will constitute the July issue of Discover Society. Most articles will be 1500 words however there are a number of special sections in the online magazine.

Front line – 1500 words
View point – 1500 words
Policy briefing – 1500-2000 words

If you would be interested in writing one of these thematic sections, please get in touch asap.

The issue will follow the usual formatting guidelines of Discover Society. Please consult the [1]notes for contributors.

Are academics very well-educated journalists who write badly but will work for free? (2015-04-04 08:00)

A few years ago I wrote a short article about the relationship between academic blogging and journalism which received a pretty positive reaction online. My suggestion was that academic blogging increasingly constitutes a ‘third space’ between the academy and journalism which facilitates translation between the two institutional spheres. It becomes easier for journalists to find relevant academics when their research is expressed in a few blog posts as well as articles in scholarly journals. However might we increasingly see academics become journalists? Not necessarily in the sense of individual career transitions (though this does happen) but rather in a blurring of the two activities that has important consequences for those working at the intersection.

Part of me likes this: I want critical social scientists* to ‘occupy debate’ in a way that gets social scientific ideas out of the academy. However in a way it’s also rather sinister if we look at the broader transformations underway within both spheres. Is there a risk that junior academics, keen to differentiate themselves and demonstrate a capacity for impact as they strive to move beyond precarious contracts, come to be seen as a reserve army of well-educated quasi-journalists who may write badly but will work for free? Maybe even ones who aren’t critical, at least if they write reasonably well.

1. http://markcarrigan.net/2013/01/10/academic-blogging-both-and-rather-than-either-or/

Definitely a concern. I wonder how much young academics are aware of places that pay for their words, esp. as many of the CFPs that circulate are for unpaid labor. Are there places on the web where we can encourage each other to write for appropriate compensation? I’m definitely up for joining / supporting a community like that!

From passion to profit: exploitation under neoliberalism, or, how seriously should we take latte art? (2015-04-05 08:00)

Since I first encountered the notion of a calling, I’ve found it a difficult category to expunge from my thought. It appeals to me greatly on a personal level: it points to the higher dimension to human experience which I believe tends to be ‘flattened out’ in the culture of liberal democracies. It helps us attend to the possibility of work that is meaningful and non-alienated so as to give shape to a life and provide the qualitative distinctions of worth in relation to which we can orientate ourselves existentially.

However I find myself increasingly troubled by the appeal this has held for me, as well as how notions of this sort might buttress exploitation under contemporary conditions. For instance consider the ‘perils of passion’ in the video game industry, as detailed in this excellent Jacobin article:
Again and again, when you read interviews or watch industry trade shows like E3, "passion" is used as a word to describe the ideal employee. Translated, "passion" means someone willing to buy into the dream of becoming a video game developer so much that sane hours and adequate compensation are willingly turned away. Constant harping on video game workers' passion becomes the means by which management implicitly justifies extreme worker abuse.

And it works because that sense of passion is very real. The first time that you walk through the door at an industry job, you're taken with it. You enter knowing that every single person in the building shares a common interest with you and an appreciation for the art of crafting a game. Friendships can be built immediately – to this day, many of my best friends arose from that immediate commonality we all had on the job.

This is an incredibly enticing proposition; no one who goes in is completely immune to it, no matter how far down the totem pole of life's interests gaming is. And there are few other jobs quite like it. Geek culture takes such strongly held commonalities of interest and consumption far more seriously than most other subcultures. I recently wrote a [1]piece for this publication which was, in part, about the replacement of traditional class, gender, and racial solidarity with a culture of consumption. Here, in the video game creation business, is the way capital harnesses geek culture to actively harm workers. The exchange is simple: you will work 60-hour weeks for a quarter less than other software fields; in exchange, you have a seat at the table of your primary identifying culture's ruling class.

This isn't a new phenomenon. Another example can be found in the comics industry, as far back as the early days of the contemporary corporations. With the original creators leaving, having scarcely been rewarded for much of the creative labour underlying the emergence of Marvel Comics, [3]the corporation turned to “a new generation of creators, wide-eyed twenty-somethings who flashed their old Merry Marvel Marching Society badges as though they were licenses for breaking rules”. The grievances of those original creators faded from view as their creations inspired a new generation willing to work under precisely the conditions which had forced their predecessors to leave.

What about higher education? Does a sense of social science as a calling leave people continuing to chase a career which is in reality only available to a fraction of those pursuing it? Does it lead to an acceptance of precarity as a way of life, with the harsh realities of labour relations within the academy being softened by the rewarding ideal of a calling? Part of my political and theoretical problem here is that I don't want to fall into the trap of denying the reality of passion by reducing it to an instrument of exploitation. Doing so makes it difficult to explain precisely why people persist in these fields in the way that they do. But we must conversely refuse a naive reading of 'calling', which I see in terms of a cluster of concepts of which 'passion' is just one, in moral terms so as to neglect this pernicious systemic trend.

Another way to frame this question: how seriously should we take latte art? I've more than once had a conversation with a barista about this practice who clearly takes great satisfaction from it. However it's hard not to wonder if this is a cynical attempt to introduce craft and creativity into a job which some would consider the archetype of zero hours employment. I'd love to visit latte art competitions in an ethnographic capacity to explore how seriously the participants take these endeavours and how pervasively such events are permeated by corporate imperatives. Till that day, I'm left to speculate that this is a case of craft being encouraged by owners for reasons that are largely self-serving, even if they understand their motivations in terms of a benign concern for the well-being of their employees.

19 interesting ways to communicate knowledge (2015-04-06 08:00)

- Through Design Fiction (e.g. [1]Zero Hours)
- Through Social Fiction (e.g. [2]Low Fat Love)
- Through Visual Journalism (e.g. [3]Days of Destruction, Days of Revolt)
- Through Visual Biography (e.g. [4]Robert Moses: The Master Builder of New York City)
- Through Graphic Novels (I lack examples of this – I'm also aware the distinction between 'graphic novels' and 'visual biography' and 'visual journalism' may be so fine grained as to be pretty meaningless)
- Through Photography (e.g. [5]Art Sexual)
- Through Creative Non-Fiction (e.g. [8]Zeitoun, [9]Venkatesh's work)
- Through Film or Animation (e.g. [10]Rufus Stone, [11]Waking Life)
- Through Theater (e.g. [12]the Fabulous Ruins of Detroit)
- Through Video Games (e.g. [13]Celiac Sam)
- Through Buzzfeed Style Lists (e.g. [14]this)
- Through Walking Tours (e.g. the superb tour of Manhattan given by an urban sociologist at the 2015 Eastern Sociological Society conference)
- Through Podcasted Dialogues (e.g. [15]the Promise of Sociology in 2015)
- Through Filmed Dialogues (e.g. [16]British Sociology since 1945 or this dialogue between [17]Carol Smart and Jeffrey Weeks)
- Through Stand Alone Prezis & Slideshare (e.g. I've never given [18]this as a talk in person or intended to)
- Through Short Story (e.g. [19]The Last Seminar)
- Through Musical Theater (e.g. [20]The Theory of Justice Musical)
- Through Cut & Paste Assembly (e.g. [21]Kant in Hand!)

Sociological Imagination (2015-04-07 14:36:51)
thanks! I'll order it now

An introduction to Design Fiction for Sociologists, May 13th at Goldsmiths (2015-04-07 08:00)

Design fiction is a term [1]first coined by Julian Bleecker and [2]popularized by SF author Bruce Sterling, who describes it as "the deliberate use of diegetic prototypes to suspend disbelief about change." and that it "attacks the status quo and suggests clear ways in which life might become different."

Design fiction isn’t science fiction, it’s not just a telling of stories in the future or trying to make predictions of the future, instead it is a way of trying to envision and interrogate possible futures based on research data, current trends, and/or technologies. Originally, primarily used by product designers as a cheap alternative to prototyping new products, it has found traction as a critical tool allowing us to see through the fog of hype and digital evangelism.

In this event Tim Maughan introduces design fiction for sociologists. He discusses the work he is undertaking with Sava Saheli Singh (New York University) and its possible implications for how we write about research.

Keith Kahn-Harris will discuss his new project which looks at how kinds of mainstream texts other than science fiction also generate ‘social science fictions’, often ‘accidentally’ as a result of the pragmatic requirements of generating workable plots and scenarios. Such texts can help force attention to a neglected sociological question: what are the limits of possibility in human society?
Sarah Burton will also speak on a topic to be finalised.

Les Back and Mark Carrigan will each offer a short response before the event is opened up for a general discussion.

Call for papers: Centre for Social Ontology PhD/ECR Conference (2015-04-08 08:00)

Centre for Social Ontology PhD/ECR Conference
June 23rd, University of Warwick, 10am – 4pm

Social ontology is integral to the study of society. It is impossible to inquire into the social world without some understanding, at least tacitly, concerning the entities which make up that world and their properties and powers. However social ontology remains an often confused and contentious matter within the social sciences.

The first Centre for Social Ontology PhD and ECR conference seeks to address this matter through papers exploring the role of social ontology within sociology. This could include but is by no means limited to:

- The relationship between tacit assumptions concerning social ontology and reflective theoretical positions
- Social ontology and the formulation of research questions
- Social ontology as a topic standing at the interface between the social sciences and philosophy
- The methodological implications of social ontology
- The ontological assumptions implied by research methods
- The social ontology of particular areas of inquiry e.g. social movements or digital technology
- Disciplinary differences in approaches to social ontology
- Social ontology and philosophical under-labouring
The limits of social ontology and where under-labouring has to stop

New directions in sociological research through questions of social ontology

The conference is open to all PhD students and Early Career Researchers with an interest in social ontology.

Please send abstracts of 200 words or less and a short biographical note to socialontology@warwick.ac.uk by May 1st

Registration will be free and a limited number of small travel bursaries will be available to support attendance at the conference.

1. socialontology@warwick.ac.uk

You must change your life! (2015-04-09 08:00)

I was introduced to this Rilke poem via a book by Peter Sloterdijk:
We cannot know his legendary head
with eyes like ripening fruit. And yet his torso
is still suffused with brilliance from inside,
like a lamp, in which his gaze, now turned to low,
gleams in all its power. Otherwise
the curved breast could not dazzle you so, nor could
a smile run through the placid hips and thighs
to that dark center where procreation flared.

Otherwise this stone would seem defaced
beneath the translucent cascade of the shoulders
and would not glisten like a wild beast’s fur:

would not, from all the borders of itself,
burst like a star: for here there is no place
that does not see you. You must change your life

He takes the closing line as the title for his book. I’ve struggled somewhat with it. I don’t find Sloterdijk to be a clear or careful writer. It’s also a translated work which I’ve been reading in fragments. But his interpretation of Rilke’s words has stuck with me:

‘You must change your life!’ – this is the imperative that exceeds the options of hypothetical and categorical. It is the absolute imperative – the quintessential metanoetic command. It provides the keyword for revolution in the second person singular. It defines life as a slope from its higher to its lower forms. I am already living, but something is telling me with unchallengeable authority: you are not living properly.

This authority touches on a subtle insufficiency within me that is older and freer than sin; it is my innermost not-yet. In my most conscious moment, I am affected by the absolute objection to my status quo: my change is the one thing that is necessary. If you do indeed subsequently change your life, what you are doing is no different from what you desire with your whole will as soon as you feel how a vertical tension that is valid for you unhinges your life.

I think this is another example of what Ian Craib describes as the [2]importance of disappointment: “what happens, what we feel, when something we expect, intend, or hope for or desire does not materialise”. If Craib is right that we often retreat from disappointment in the late modern world, reflecting “a desire to get out of the mess of life”, we also miss out on these moments in which we confront ‘vertical tensions’. The discomfort generated by a vertical tension, in which we recognize a gnawing sense of ‘subtle insufficiency’, might come to
be seen as pathological: what should be a spur to self-transcendence instead becomes seen as a threat to self-esteem.

Call for papers: Power, Acceleration and Metrics in Academic Life (2015-04-10 08:00)

Call for papers: Power, Acceleration and Metrics in Academic Life

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim ‘patent and prosper’ (Schachman) supplements the traditional ‘publish or perish’). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This conference will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars' complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis

The workshop will take place from December 2nd to 4th 2015 in Prague.

Deadline for abstracts will be May 1st 2015. Please send 250 words and short biographical note to Mark Carrigan (mark@markcarrigan.net) and Filip Vostal (filip.vostal@gmail.com) by the deadline.
Keynote Speakers:

Roger Burrows – Ancient cultures of conceit reloaded

Philip Moriarty – The perils, pitfalls, and power of peer review in public

Susan Robertson – Vertigo: Time and space in the contemporary university

James Wilsdon – In numbers we trust? Reflections on the UK’s independent review of the role of metrics in research assessment

Oili-Helena Ylijoki – ‘Projectification’ and conflicting time orders in academic knowledge production

Fee

50 Euros (standard) / 25 Euros (PhD/ECR)

Registration to open in summer 2015

Venue

Hosted by Institute of Philosophy of the Czech Academy of Sciences the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic ([1]http://www.vila-lanna.cz/index.html)

Travel

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.

Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n.), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.

Towards a Sociology of the Good Life (2015-04-11 08:00)

What is the good life? It's a question which preoccupied me in my past life as a trainee political philosopher and it's one which still concerns me as a sociologist. It's rarely addressed within the discipline for reasons that cut through a number of trends within the field: a hostility towards normativity, an admission of normative question in a restrictively critical mode and a scepticism concerns questions pertaining to the particular character of individual lives. This is a shame because I believe sociology has a lot to contribute towards questions of the good life, not least of all because it can ensure otherwise abstract ruminations are grounded in an appreciation of the variable circumstances within which actual lives are lived. It can also help link these philosophical questions to empirical ones concerning dominant trends in how 'the good life' is conceived within a particular social order.

In this sense we could see existential questions as close to invariant but the dominant cultural answers as being immensely variable through history and across the planet. This is not a matter of individual variation, such that each person individually confronts universal existential dilemmas and through their responses contributes towards patterns that register aggregatively at the macro level as empirical patterns in understandings of 'the good life'. It's also necessary to distinguish between discursive formulations and actual practice without prioritising one over the other. Cultural formulations of 'the good life' are intimately connected to lived practices in a way that necessitates we appreciate their entanglement if we are to properly understand either culture or life. Only through doing so does it become possible to understand how change occurs at either level, as people individually or collectively advocate for heterodox understanding of the good life or elaborate upon prevailing ideas through their personal or shared practice which may come to be formulated at a discursive level and so escape their original context and begin to potentially exert an influence in others.

The work of Harmut Rosa offers clues about what a sociology of the good life might look like, though his suggestions are only a peripheral part of a much larger and very different project. In his Social Acceleration, he writes about the notions of a good life that emerge under conditions of acceleration and describes how these have been shaped by older conceptions of the life well lived:

> the idea that an *accelerated enjoyment of worldly options*, a “faster life,” will once again allow the chasm between the time of life and the time of the world to be reduced. In order to understand this thought one has to keep in mind that the question concerning the meaning of death is indissolubly tied to the question of the right or “good life.” Thus the idea of the good life corresponding to this answer, which historically became the culturally dominant idea, is to conceive of life as the *last opportunity*, i.e., to use the earthy time span allotted to humans as intensively and comprehensively as possible before death puts a definitive end to it (pg. 181)

These are theoretical observations that are informed, albeit unsystematically, by historical sociology. I think they could also be informed by cultural sociology and cultural studies, drawing upon popular texts which deal with these themes. For instance I've been reading [1]Late Fragments by Kate Gross, a former high flying civil servant, who died of colon cancer at the age of 34 and left a moving collection of ruminations on life catalyzed by its early end and the pain of leaving behind two young sons and a much loved husband.

Acceleration is a theme that runs through the book, albeit without using that term, for instance in her description of friendships that "survive on scraps of time and emails, squeezed between the rest of life, and very often conducted thousands of miles apart" (pg 51) and her wonderment at the life she has lived (analysis of her privilege would be an important part of a Sociology of the Good Life, though in Kate's case, it's hard to think this through without feeling immensely uncharitable):
There is wonder in my past, and in my present. As I write this book, I lay out my memory quilt to see all the dancing I have done: places I have been, people I have met. I have fitted so much colour into my short life that I wonder if I lived on hyper-speed, as if, somehow, I knew my time was limited. (pg 30-31)

My suggestion is that Kate Gross embodied Rosa’s accelerationist ethic, feeling compelled at she did to fit so much into her life and confrontation with an early death leads her to reflect on the virtues and limitations of it. Her account of the cancer in part frames it in terms of *deceleration*, in which “time was carved out for friendship again” (pg 52) and she was led, by existential need rather than reflective inclination, to cultivate those aspects of herself which had been lost in the rush:

> It is too easy, as an adult, to let life rush past with its business of succeeding, working, consuming, rearing. All of that can be joyful and fulfilling, I grant you. But it is so, so easy in the rush of life to neglect your inner world. I know mine was dead for many years, squeezed between work and achieving *stuff* and my darling little ones – it’s a choice I made, and gladly. But one of the unexpected blessings of illness is that it has given me time to tend my mind again. (pg 75).

I found the phrase ‘achieving *stuff*’ immensely powerful. It conveys her continued investment in what she has accomplished while expressing how the details (what? when? why? with whom?) have begun to fade away in the face of finality. Perhaps this suggests it was the *achievement* rather than the particular achievements which were deemed worthwhile: securing the worth of life through what is achieved in its short span. This points us towards questions of qualitative worth: what distinguishes an ‘achievement’ from the simple fact of something we have done? Does it entail leaving a lasting mark? Once we start to ask these questions, we’re already way outside the realms of the hedonistic calculus currently being reinvented by behavioral scientists like Paul Dolan. The graphic artist Jim Steranko conveys this vividly in his account of the meaning he derives from his work:

> I believe that happiness is nothing ... I don't think people were put here to be happy. I think if you decide to be an artist or a writer, you automatically accept the responsibility of being alone. However, after your 50 or 60 years are up you'll be able to look back and see this output that you've done that will endure long after you're gone, and will continue to fill the minds of millions of people.

*Marvel: The Untold Story, Pg. 83*

Would this still provide meaning for him if his work endured but it was largely forgotten? There are lots of different levels on which statements *of* purpose and statements *about* purpose (with the latter probably more interesting) can be analyzed. I think a Sociology of the Good Life would be well equipped to do just this. The study of texts could supplement the theoretical work undertaken by someone like Rosa in a way that enhances both. However I think there would be much more to it than this, for instance looking at the material constraints upon the good life and how these ideas help reproduce existing inequalities, not least of all by binding people in to life strategies that perpetuate structural injustice.

1. [https://kateelizabethgross.wordpress.com/late-fragments/](https://kateelizabethgross.wordpress.com/late-fragments/)
Over the past few weeks I have been having a series of interesting exchanges with a young Canadian philosopher (who works outside of academia), Adam Riggio, who has been responding chapter-by-chapter to my latest book, *Knowledge: The Philosophical Quest in History*. [1]In the most recent exchange, Riggio brought up the state of the university, which figures in the book – and my writings more generally. He is understandably concerned about the role of neo-liberalism in the transformation of the university. You can judge for yourself what to make of the exchange.

The general point I wish to make here is that no type of political regime holds a monopoly on the capacity for justice. An autocrat can do justice just as well as a democratically elected assembly. But clearly they meet the demands of justice differently – and should be judged accordingly. Thus, we can have just and unjust neo-liberal regimes, in the same sense that we can have just and unjust socialist regimes. Here ‘justice’ depends on the consistency with which a politically inspired standard is applied. Of course, one may not like the outcomes, and this would be grounds for changing the regime.

In theology, the field of ‘theodicy’ was canonized by Leibniz in the early 18th century to capture arguments about God’s sense of justice. In today’s terms, we might see this as the algorithm that God uses to redistribute costs and benefits to get the results he wants. Given that we typically don’t know what God is on about until after the fact, it follows that the significance of things is not quite as they seem, and one needs to watch history play out longer to get a clearer sense. (Hegel name-checks Leibniz early in his lectures on the philosophy of history.)

Now we can imagine a human-sized deity who doles out justice in a neo-liberal academic regime. What would that look like? At the very least it would mean subjecting everyone to the same performance review standards – including the most senior professors. It would also involve being on the lookout for market bottlenecks that end up concentrating resources inefficiently – understood from the standpoint of spawning innovation and wealth creation, however broadly ‘innovation’ and ‘wealth’ are understood (i.e. not necessarily commercial). This too is likely to put professors under more severe scrutiny by preventing them from simply drawing on the reputation of their previous work to extend their current value indefinitely. At the same, investment might be shifted to junior people simply based on a compelling forward-looking proposal, regardless of prior track record – but requiring delivery by a fixed date.

In this respect, the UK Research Excellence Framework institutes a brutal version of the neo-liberal ideal, since both junior and senior academics are in principle placed on a level playing field, having to justify themselves in terms of work actually produced over a fixed period in the immediate past. To be sure, the system is far from perfect. But the imperfections are to do more with a refusal on the part of academics to fully implement it, resulting in an unsatisfactory hybrid system that often ends up doing the worst thing that a market-based regime of justice can do: namely, obscure the signals generated by the market, such that those in it aren’t quite sure how to turn them to their advantage.

The take-home point here is that justice and neo-liberalism are not mutually exclusive categories. To think otherwise is to engage in a category mistake. However, neo-liberalism (like any other political regime) may be implemented unjustly, which is to say, by compromising its own principles.

The Ashgate Research Companion to Multiculturalism provides a thoroughly detailed and very contemporary analysis of the problematic and nuanced nature of the important concept and public practice of multiculturalism. It is an accessible edited collection of modern takes on multiculturalism for those new to the great variety of arguments regarding multiculturalism who are keen to gain an understanding of the meaning of modern multiculturalism, yet at the same time it is in-depth and appealing to those who are already familiar with the ambiguities of thought on multiculturalism who are consolidating their knowledge of this "awkward term" (p1) and this "demanding and risky ideal" in practice (p11), and learning about the different types of multiculturalism in a range of contexts. The book raises key questions about "what or who is the proper subject of multiculturalism – individuals, groups, peoples, cultures?" (p5), as well as exploring different forms of multicultural belonging.

Some chapters closely examine multicultural society in light of indigenous people belonging to that place, whilst other chapters focus on newcomers, new migrants and refugees. A concurrent theme running through the edited collection is the need to remind ourselves that context matters and impacts upon how multiculturalism is practised. We gain insight into how multiculturalism has impacted upon and transformed how people “think about the world, but also how they interact with others, and especially the shape and look of their public institutions” but equally importantly it affects nation, national identity and “economic and political power” (p11). We learn about how political theory – and in particular, multicultural thinking – is sometimes neglectful of gender issues, despite being concerned with the promotion of “human freedom and equality” (p138). Thus, from a feminist perspective, women struggle when there is a backlash against multicultural policies and practices: for instance by becoming even more restricted to the private sphere, and pushed out of the public sphere due to attitudes towards the hijab or niqab. Eisenberg’s Chapter problematizes feminist responses towards Multiculturalism, Gender and Justice: referring to France she discusses how “many people involved in this debate seem to been blind to the irony of the state forcing girls not to wear headscarves in order to protect them from being forced by their communities to wear them” (p123).

Multiculturalism is defined as referring to “theories, attitudes, beliefs, norms, practices and policies that seek to provide public recognition of and support for accommodation of non-dominant ethnocultural groups” (p2).
Any writing on multiculturalism will inevitably engage with ideas of culture, as well as “freedom, equality, democracy and justice” (p2). Ivison, the editor, in his introduction, emphasises three ways of understanding multiculturalism: protective/communitarian multiculturalism, liberal multiculturalism and imperial multiculturalism. Protective/communitarian multiculturalism is concerned with preservation/protection of the culture of the minority group. Liberal multiculturalism, which is universalist and the most popular multiculturalism in contemporary political thinking, refers to promoting liberal values like “equality, autonomy, toleration, or equal respect” (p3). Thus we can ask questions like “are we seeking to promote a greater diversity of cultures, languages, and ethnic groups in order to provide a richer set of choices and experiences for individuals?” (p5). Finally, there is imperial multiculturalism which is “a new version of the hierarchical and/or racialized modes of political order that it was supposed to have displaced” (p4). Thus this approach to multiculturalism interrogates how minority and majority communities are defined in public discourses.

The book is beneficial to scholars from diverse backgrounds as a multidisciplinary approach to analysing multiculturalism is presented through the inclusion of distinctive perspectives from fields such as philosophy, political science, sociology and anthropology. The book brings forth an important discussion about how multiculturalism is increasingly becoming a steady feature in global discourses. The structure of the book neatly yields significant ideas on multiculturalism through three sections: Foundations, Challenges and Alternatives. The first part – Foundations – contains detailed definitions, advantages, limits and critiques of liberal multiculturalism, as well as socio-political developments that have impacted particularly on perceptions of Muslims and belonging; there is discussion on how some argue that multiculturalism is dead, whilst others believe it is alive and ever relevant and needed; the nature of culture, identity and power in modern multicultural society is also examined.

Part Two of the book brings to light key Challenges involved in referring to associated concepts of multiculturalism. For example, toleration – “what toleration is, why we ought to tolerate, and what we ought to tolerate” (p75). Part Three offers Alternative Perspectives: Ghassan Hage considers the limits of “multicultural governmentality” in the Australian context with its heavy reliance on colonial politics and its difficulties in dealing with the “ungovernable”. Thus, Hage recommends “intercultural relations” that move beyond the stale polarity of multiculturalism-assimilation (p253). Rita Khaur Dhamoon discusses how multicultural discourses of securitization are concerned with powerful meaning-making about nation and belonging: the focus is “territory, identity, whiteness and economic development” in Canada’s hegemonic nation-building endeavours (p257). She recommends that “alternative counterpractices and discourses are necessary” (p274), as are disruptions and deconstructions of power relations. Jeffrey Riegel’s fascinating chapter entitled Master Kong versus Master Mo: Two Views of Cosmopolitanism and Multiculturalism in the Early Chinese Philosophical Tradition most definitely provides us with alternatives in explaining ways in which we can understand cultural difference through a reading of early Chinese philosophies, particularly the teachings of Confucius.

Who is this describing? (2015-04-12 08:00)

From this [1]article (don't read it yet though!):

1. "barely capable of distinguishing themselves from the consuming desire to work at all times"
2. "neurotic people who deploy a series of practices that coincide quite neatly with the requirements of the neoliberal, predatory, continually mutating capitalism of the every moment"
3. "people who behave, communicate, and innovate in the same manner as those who spend their days trying to capitalize every moment and exchange of daily life"
4. "they offer no alternative to this"

Workshop: Investigating the Internal Conversation (2015-04-13 11:26)

I’m organising this workshop at Warwick in June for anyone using Margaret Archer’s work on reflexivity in empirical research. She’ll be there all day & will discuss the development of this work as well as answering questions about it. There will also be a few speakers (including myself, talking about my PhD, which I so rarely do) who have used these ideas in empirical studies. If you know anyone studying reflexivity in this way then please do let them know about the workshop:

Investigating the Internal Conversation
June 2nd at the University of Warwick

The Centre for Social Ontology invites applications for this practical workshop aimed at those investigating human reflexivity through empirical research. The ‘internal conversation’ was developed by Margaret Archer as a solution to the problem of structure and agency: a mediatory mechanism that accounts for how society’s objective features influence its members to reproduce or transform society through their actions. Since initially discussed in Being Human, this account of human reflexivity has been developed through a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

This workshop intends to support those who are currently undertaking or in the process of planning empirical research investigating the internal conversation. The day will begin with an introductory lecture by Margaret Archer in which she will discuss the development of her work on reflexivity, ranging from the initial formulation in Being Human through to her recent work with Pierpaolo Donati on relational reflexivity. Then [1]Mark Carrigan (Warwick), [2]Monder Ram (Birmingham) and [3]Balihar Sanghera (Kent) will each give a shorter talk about their experience of investigating reflexivity through empirical research. The rest of the day will address the methodological and theoretical questions often encountered when studying reflexivity e.g. how to identify the modes of reflexivity of research subjects.
The workshop is free but registration is essential. If you would like to participate then please e-mail socialontology@warwick.ac.uk with a brief description of your project. We’re keen to adapt the content as much as possible to meet the needs of participants. If there are particular issues you would like us to address then please suggest these in your initial e-mail.

1. http://markcarrigan.net/

As part of its effort to expand beyond traditional types of academic publication, Big Data & Society has introduced an Early Career Researcher Forum targeted to scholars finishing or having recently completed advanced graduate degrees. More specifically the ECR forum seeks work by researchers reflecting about some of the challenges of their work (related to Big Data topics) in about 1000 to 2000 words with a range of illustrations, figures, etc. as well as a brief bio (100 words). The goal is to encourage reflexive submissions that explore what it means to be a researcher studying issues concerning big data and society. As guidance we ask authors to consider a series of questions (addressing any or all of these):

- What kinds of challenges empirically and/or methodologically have you encountered in your work?
- Do you have an example of these challenges, particularly one that can be shared in an online forum such as the journal offers, i.e., with visualizations, graphs, etc.?
- Does Big Data allow you to ask new questions or explore old issues?
- Are there questions that your data can not answer? Why? What else is necessary?
- Why is your research important and interesting?
- How do you relate back to your home discipline, and do your colleagues understand you?

In addition to targeted submissions, the Early Career Researcher forum accepts unsolicited contributions and encourages those who are interested to correspond with the co-editors (Irina Shklovski and Matthew Zook) for guidance.
In my talk at the Digital Sociology conference in New York in February 2015 (available online [1]here) I explained my enthusiasm for the new possibilities afforded by social media for doing research in real time with communities. These are the two examples I’m familiar with but I’d like to know about any others that exist.

1. Every minute of every day was an experiment in 'real time ethnography' undertaken by Les Back and others at Goldsmiths. You can read about it [2]here. Unfortunately the project’s website is no longer online because it was hosted on Posterous website. This is sad and highlights some of the risks involved in relying upon commercial problems.

2. The Barrio Ed Project is a "digital, participatory research project on Comunidades Latinos & EdReform". You can read more about it [3]here.

One potential constraint upon these projects is the absence of a pre-existing audience. In some cases this won’t be a problem but in others I expect it will be and interesting work will be done that would benefit from a much wider audience. The life cycle of any project makes it difficult to gather an audience purely for that project. Obviously an audience doesn’t constitute a public but in many cases the project might benefit from a public and an audience.

Given that the original idea for SociologicalImagination.org was a platform for public sociology, I’d love to open it up for use by research projects if it would be helpful. The twitter feed has almost 17,400 followers and the blog gets 1000-3000 page views per day so there’s a significant audience already in place. I’m not sure exactly how this would work in practice but if you’d like to discuss it further then please do get in touch. My e-mail address is mark AT markcarrigan.net.

Using social media to improve the student experience: creating a departmental back channel for undergraduates (2015-04-15 08:00)

A few years ago when I was running the Twitter feed for the Sociology department at Warwick, I noticed how readily first year undergraduates tweeted practical questions to the account during their first few weeks of the first term. Students tweeted questions intermittently throughout the year but it was particularly marked at the start of their time within the department. As someone who spent 6 years studying the undergraduate experience, it’s not hard for me to understand why this would be so: the organisation the student has joined tends to seem rather large and they often feel they have only a superficial grasp on how it works.

What I find harder to answer is why universities haven't seized upon social media as tool for improving the...
‘student experience’. As well as the aforementioned questions, I noticed a few instances of forthcoming students tagging the department on Twitter prior to starting their degree. As a part-time PhD student with little practical involvement in the department beyond my role maintaining the twitter feed, I often found myself unable to answer the questions undergraduates had and struggling to welcome forthcoming students to the department in any meaningful way.

I find it easy to imagine how this could be done with social media in an effective way: inviting forthcoming students to engage with the department prior to joining it, encouraging them to address any questions they have to the twitter feed and checking in with the students on a semi-regular basis throughout their first year. It would require an investment though not a particular significant one – perhaps it could be factored into the workload allocation of an existing administrator? The work involved would be regular but fairly unsubstantial, necessitating that someone knowledgeable about the day-to-day life of the department were to prioritize twitter as a communications channel alongside e-mail.

My experience of the 'back channel' that Twitter provides at conferences is that it makes large and impersonal events feel friendly and accessible. Could the same effect be achieved with the student engagement project I’m outlining?

CfP: The Politics of Data (Science) (2015-04-15 11:45)

The Politics of Data (Science)

This special issue of Discover Society will explore the political implications of 'big data' and the systems of expertise emerging around it, including though not limited to Data Science. In doing so it will aim to bridge the gap between the methodological discourse surrounding data science and the political discourse beginning to emerge around 'big data'. Here are some of the questions the issue will address:

- How is ‘big data’ understood and acted upon? How should we understand its cultural power?
- How is 'big data' reconfiguring the social sciences? Do we risk all science becoming data science?
- How and why has the ‘data scientist’ come to be seen as the ‘sexiest job of the 21st century’?
- Is the ‘data scientist’ just a 'Statistician who lives in Shoreditch?’ Or is this a genuinely new intellectual role?
- Can ‘big data’ address ‘big questions’? If not, is this a problem?
- What are the precursors of ‘data science’ within the academy and/or within corporations?
- What implications does corporate data science have for the relationship between corporations & consumers?
- What implications does national security data science have for the relationship between the state & citizens?
- Can the use of digital data lead to efficiency savings in public services? How does this relate to the politics of austerity?
- How could predictive privacy harms emerging from data analytics be addressed politically?
- Can the opacity of algorithmic processes be challenged? Or are we heading inexorably for a ‘black-box society’?
- How are new forms of digital data reconfiguring activity in particular social environments?

However these are just suggestions and ideas beyond the scope of this list are very welcome.

The deadline for contributions is June 15th. Contact mark@markcarrigan.net to discuss a potential contribution.
The article will constitute the July issue of Discover Society. Most articles will be **1500 words** however there are a number of special sections in the online magazine.

Front line – 1500 words  
View point – 1500 words  
Policy briefing – 1500-2000 words

If you would be interested in writing one of these thematic sections, please get in touch asap.

The issue will follow the usual formatting guidelines of Discover Society. Please consult the [1]notes for contributors.

---

**Call for papers: Centre for Social Ontology PhD/ECR Conference (2015-04-16 08:00)**

**Centre for Social Ontology PhD/ECR Conference**  
**June 23rd, University of Warwick, 10am – 4pm**

Social ontology is integral to the study of society. It is impossible to inquire into the social world without some understanding, at least tacitly, concerning the entities which make up that world and their properties and powers. However social ontology remains an often confused and contentious matter within the social sciences.

The first Centre for Social Ontology PhD and ECR conference seeks to address this matter through papers exploring the role of social ontology within sociology. This could include but is by no means limited to:

- The relationship between tacit assumptions concerning social ontology and reflective theoretical positions  
- Social ontology and the formulation of research questions  
- Social ontology as a topic standing at the interface between the social sciences and philosophy  
- The methodological implications of social ontology  
- The ontological assumptions implied by research methods  
- The social ontology of particular areas of inquiry e.g. social movements or digital technology  
- Disciplinary differences in approaches to social ontology  
- Social ontology and philosophical under-labouring  
- The limits of social ontology and where under-labouring has to stop
The conference is open to all PhD students and Early Career Researchers with an interest in social ontology.

Please send abstracts of 200 words or less and a short biographical note to [1]socialontology@warwick.ac.uk by May 1st

Registration will be free and a limited number of small travel bursaries will be available to support attendance at the conference.

That time we went on a pub crawl with Karl Marx (2015-04-16 12:00)

I can't recall encountering any other fragment of writing which brings a historical figure to life for me as vividly as [1]this does:

One evening, Edgar Bauer, acquainted with Marx from their Berlin time and then not yet his personal enemy […], had come to town from his hermitage in Highgate for the purpose of “making a beer trip.” The problem was to “take something” in every saloon between Oxford Street and Hampstead Road – making the something a very difficult task, even by confining yourself to a minimum, considering the enormous number of saloons in that part of the city. But we went to work undaunted and managed to reach the end of Tottenham Court Road without accident.

There loud singing issued from a public house; we entered and learned that a club of Odd Fellows were celebrating a festival. We met some of the men belonging to the “party,” and they at once invited us “foreigners” with truly English hospitality to go with them into one of the rooms. We followed them in the best of spirits, and the conversation naturally turned to politics – we had been easily recognised as Germany fugitives; and the Englishmen, good old-fashioned people, who wanted to amuse us a little, considered it their duty to revile thoroughly the German princes and the Russian nobles. By “Russian” they meant Prussian nobles. Russia and Prussia are frequently confounded in England, and not alone of account of their similarity of name. For a while, everything went smoothly. We had to drink many healths and to bring out and listen to many a toast.

Then the unexpected suddenly happened...

Edgar Bauer, hurt by some chance remark, turned the tables and ridiculed the English snobs. Marx launched an enthusiastic eulogy on German science and music – no other country, he said, would have been capable of producing such masters of music as Beethoven, Mozart, Haendel and Haydn, and the Englishmen who had no music were in reality far below the Germans who had been prevented...
hitherto only by the miserable political and economic conditions from accomplishing any great prac-
tical work, but who would yet outclass all other nations. So fluently I have never heard him speak English.

For my part, I demonstrated in drastic words that the political conditions in England were not a bit better than in Germany [... ] the only difference being that we Germans knew our public affairs were miserable, while the Englishmen did not know it, whence it were apparent that we surpassed the Englishmen in political intelligence.

The brows of our hosts began to cloud [...]; and when Edgar Bauer brought up still heavier guns and began to allude to the English cant, then a low "damned foreigners!" issued from the company, soon followed by louder repetitions. Threatening words were spoken, the brains began to be heated, fists were brandished in the air and – we were sensible enough to choose the better part of valor and managed to effect, not wholly without difficulty, a passably dignified retreat.

An introduction to Design Fiction for Sociologists, May 13th at Goldsmiths (2015-04-17 08:00)

Design fiction is a term [1]first coined by Julian Bleecker and [2]popularized by SF author Bruce Sterling, who describes it as "the deliberate use of diegetic prototypes to suspend disbelief about change." and that it "attacks the status quo and suggests clear ways in which life might become different."

Design fiction isn’t science fiction, it’s not just a telling of stories in the future or trying to make predictions of the future, instead it is a way of trying to envision and interrogate possible futures based on research data, current trends, and/or technologies. Originally, primarily used by product designers as a cheap alternative to prototyping new products, it has found traction as a critical tool allowing us to see through the fog of hype and digital evangelism.

In this event Tim Maughan introduces design fiction for sociologists. He discusses the work he is undertaking with Sava Saheli Singh (New York University) and its possible implications for how we write about research.

Keith Kahn-Harris will discuss his new project which looks at how kinds of mainstream texts other than science fiction also generate ‘social science fictions’, often ‘accidentally’ as a result of the pragmatic requirements of generating workable plots and scenarios. Such texts can help force attention to a neglected sociological question: what are the limits of possibility in human society?

Sarah Burton will also speak on a topic to be finalised.
Les Back and Mark Carrigan will each offer a short response before the event is opened up for a general discussion.

Call for papers: Power, Acceleration and Metrics in Academic Life (deadline May 1st! All 5 keynotes now confirmed) (2015-04-18 08:00)

Call for papers: Power, Acceleration and Metrics in Academic Life

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim 'patent and prosper' (Schachman) supplements the traditional 'publish or perish'). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This conference will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars' complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis
The workshop will take place from **December 2nd to 4th 2015 in Prague**.

Deadline for abstracts will be May 1st 2015. Please send 250 words and short biographical note to Mark Carrigan (mark@markcarrigan.net) and Filip Vostal (filip.vostal@gmail.com) by the deadline.

**Keynote Speakers:**

Roger Burrows – Ancient cultures of conceit reloaded

Philip Moriarty – The perils, pitfalls, and power of peer review in public

Susan Robertson – Vertigo: Time and space in the contemporary university

James Wilsdon – In numbers we trust? Reflections on the UK’s independent review of the role of metrics in research assessment

Oili-Helena Ylijoki – ‘Projectification’ and conflicting time orders in academic knowledge production

**Fee**

50 Euros (standard) / 25 Euros (PhD/ECR)

Registration to open in summer 2015

**Venue**

Hosted by Institute of Philosophy of the Czech Academy of Sciences the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic ([1]http://www.vila-lanna.cz/index.html)

**Travel**

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.

Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n.), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.

What would British fascism look like? (2015-04-18 14:22)

I recently stumbled across [1]this old* Huffington Post article by James Bloodworth, editor of Left Foot Forward, speculating about what a British fascism would look like. I don’t think it’s actually very good but it’s a fascinating question to ponder.

And yet, were a far-Right government ever to win power in Britain – and never get too complacent, for a [2]Searchlight poll last February found a staggeringly high number of voters who said they would be prepared to vote for party of the far-Right if it renounced violence – what might it do in its first year of power?

This is pure speculation of course, but interesting all the same, I think.

One of my favourite works of fiction in recent years was [4]Dominion by C.J. Sansom which depicts a Britain that surrendered in World War 2 and has become a satellite state of Nazi Germany. I found it much more plausible than Bloodworth’s speculations but perhaps that’s in part due to gradually showing this world over 500 pages rather than boldly stating it in a 1500 word blog post.

Thanks to Danny Birchall for sharing this film – "It Happened Here":

IFRAME: [5]http://www.youtube.com/embed/HhGxM4hXBjk?version=3 &rel=1 &fs=1 &showsearch=0 &showinfo=1 &iv_load_policy=1 &wmode=transparent
There’s also a 2004 documentary drama which addressed this question: [6]https://www.youtube.com/watch?v=7NnsRCt8-TGM (embedding disabled)

I wonder if counter-factual drama of this sort can be included within the remit of design fiction for digital public sociology?

Well 2012. I’m not sure when that became ‘old’.

Heating up the floor to see who can keep hopping the longest (2015-04-19 08:00)

This expression by Will Davies has stuck with me since I read it a [1]few months ago. Teaching is a disturbing example of the process Will is alluding to: ratcheting up demands on staff to the point where many are unwilling to continue. In fact increasing numbers seem unable to continue:

The BBC has also seen a survey of 3,500 members of the Nasuwt teaching union which shows more than two-thirds of respondents considered quitting the profession in the past year.

Workload was the top concern, with 89 % citing this as a problem, followed by pay (45 %), inspection (44 %), curriculum reform (42 %) and pupil behaviour (40 %). In addition:

- 83 % had reported workplace stress
- 67 % said their job has adversely impacted their mental or physical health
- Almost half of the three thousand respondents reported they had seen a doctor because of work-related mental or physical health problems
- 5 % had been hospitalised, and
- 2 % said they had self-harmed.

Much of the issue here stems from the demand for ‘excellence’: as David Cameron recently put it, “if you’re not good or outstanding, you have to change. If you can’t do it yourself, you have to let experts come in and help you”. For head teachers a bad Ofsted report can mean the end of their career and this tyranny of excellence mutates into
something ever more brutal as it works its way down the hierarchy.

Replace ‘heads’ with ‘HoDs’ and ‘Ofsted’ with ‘REF’ and we can see the same trend at work in higher education. Meanwhile the VCs fly around the world, creating strategic partnerships to actualise latent synergies. Here on the ground, [3] one in six universities refuse to answer freedom of information requests about their expenses.

Across both spheres, we can see people breaking the professions, one personal tragedy at a time, while rewarding themselves extravagantly for doing so.

Workshop: Investigating the Internal Conversation (2015-04-20 14:33)

I’m organising this workshop at Warwick in June for anyone using Margaret Archer’s work on reflexivity in empirical research. She’ll be there all day & will discuss the development of this work as well as answering questions about it. There will also be a few speakers (including myself, talking about my PhD, which I so rarely do) who have used these ideas in empirical studies. If you know anyone studying reflexivity in this way then please do let them know about the workshop:

Investigating the Internal Conversation
June 2nd at the University of Warwick

The Centre for Social Ontology invites applications for this practical workshop aimed at those investigating human reflexivity through empirical research. The ‘internal conversation’ was developed by Margaret Archer as a solution to the problem of structure and agency: a mediatory mechanism that accounts for how society’s objective features influence its members to reproduce or transform society
through their actions. Since initially discussed in *Being Human*, this account of human reflexivity has been developed through a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

This workshop intends to support those who are currently undertaking or in the process of planning empirical research investigating the internal conversation. The day will begin with an introductory lecture by Margaret Archer in which she will discuss the development of her work on reflexivity, ranging from the initial formulation in *Being Human* through to her recent work with Pierpaolo Donati on relational reflexivity. Then [1]Mark Carrigan (Warwick), [2]Monder Ram (Birmingham) and [3]Balihar Sanghera (Kent) will each give a shorter talk about their experience of investigating reflexivity through empirical research. The rest of the day will address the methodological and theoretical questions often encountered when studying reflexivity e.g. how to identify the modes of reflexivity of research subjects.

The workshop is free but registration is essential. If you would like to participate then please e-mail socialontology@warwick.ac.uk with a brief description of your project. We’re keen to adapt the content as much as possible to meet the needs of participants. If there are particular issues you would like us to address then please suggest these in your initial e-mail.

Bruno Latour: The Whole is Always Smaller than the Parts (2015-04-21 08:00)

The digital availability of profiles deeply modifies the definition of what it an individual agent and, reciprocally, what is a structure because of the new ways in which researchers navigate database. This is true not only for human actors but for any agent on which individualizing items are accessible (ants, baboons, as well as bacteria or scientific papers). Building on actor-network theory, physics of complex systems and the visualizing work of Sciences Po médialab, the paper resuscitates the notion of monads that Gabriel Tarde had brought forward and that had disappeared through lack of efficient data tracing tools.

The fact that you have a Ph.D. – let alone that you teach at a good university – doesn’t make you an intellectual. Being an intellectual means, at the very least, that you can convey ideas in multiple media, thereby testifying to the very existence of ‘ideas’ as entities that transcend a particular medium of expression. In its backhanded way, the phrase
‘public intellectual’ concedes the point, as it desperately tries to reserve the term ‘intellectual’ for well-credentialed academics who talk about big issues but to audiences no larger than their classrooms.

Nevertheless, academics, as their degrees signal, are in the first instance experts in particular fields of knowledge, which means that they can say things that other like-credentialed people find sound and interesting, even when they don’t agree. This matters to the larger society only because the particular field of knowledge matters to the larger society. The media – which is the natural home for intellectual life – grasps this point perfectly. This is why when they’re putting together a story of any depth, they’ll ask, say, ‘Where can we find a sociologist?’ It doesn’t matter who the sociologist is, as long as they are reputable in the field. This is just the right way to think about the default position of academics vis-à-vis intellectual life.

Now, of course, some academics function in a more expansive and personal capacity in intellectual life. But can you name one who has not been censured for having done so, especially when their academic expertise gets dragged into public debates? An Einstein or Chomsky figure is quite rare, namely, someone whose prominence in their own fields is such that they are allowed to talk about things quite unrelated to their expertise. Usually academics who become intellectuals are, in some sense, leveraging their expertise without having received collegial approval. Richard Dawkins is an obvious case in point. What this shows is that academic disciplines are mainly in the business preserving the integrity of their knowledge base, and public enlightenment is something to be tried only in a low risk environment. Thus, the day that ‘peer review’ becomes totally demystified – be it by metrics-based replacement or some larger democratization process – the value of holding a degree in a particular academic field will disappear altogether. However, the value of holding an academic degree as such – say, in something quite generic like ‘liberal arts’ – will not disappear.

In light of the above, academics who are reluctant to become ‘public intellectuals’ (to use their preferred phrase) are prone to two complementary modes of fallacious reasoning, which together constitute misplaced modesty:

- I’m afraid of the impact that my words, even if correctly understood, might have on policy: Despite its surface modesty, this concern presupposes, rather arrogantly, that academic experts are given so much credit in a democratic society that the lives of millions hang on their every word. Of course, their words will be taken seriously, but only alongside other words uttered by experts and non-experts. So no excuse not to argue your case, given the opportunity!

- I’m afraid that my words will be misunderstood and spun in the wrong way: This is the flipside of the first fear. But really, if you want to exert such proprietary control over how your words are used, then you need to see your intervention as an opening move in a public conversation, in which you continue to participate by clarifying your position. Otherwise, you should be psychologically prepared to let others do what they will with what you say – in the spirit of a vendor who doesn’t fret over how the client uses his wares.

If I were a psychoanalyst, I would say that the fallacy of misplaced modesty reflects the passive-aggressive attitude that contemporary academics have towards democracy: They claim to love it but they are repulsed by the prospect of entering into it. Moreover, I think this neurosis is endemic to the postmodern condition, since as Allan Bloom notoriously alleged in The Closing of the American Mind, academics from the 1960s to his own day (the mid-1980s) were more than happy to promote quite specific anti-establishment agendas both inside and outside the classroom. Ah, the good old days!
I see the situation differently. As you quite rightly point out, academics are "in the first instance, experts in particular fields of knowledge". But by the same token they are generally no wiser than others on issues outside their particular area of expertise. And because life is complicated, the narrow prisms of academia are by definition inadequate as a basis for opinions on wider matters. This is not misplaced modesty but commonsense. This is nothing new. See Hazlitt’s 1822 essay "On the Ignorance of the Learned".

perfect answer...

Jason (2015-04-22 06:11:29)
>the day that 'peer review' becomes totally demystified – be it by metrics-based replacement or some larger democratization process – the value of holding a degree in a particular academic field will disappear altogether. The merit of peer-reviewed work is not determined by the author's degree. An excellent paper or insight can come from anywhere; but, most scientific fields require significant background in math, physics, chemistry, biology, and/or the subject matter at hand. A degree is simply a reflection of a student’s mastery of these subjects. Few, if any, PhD students are in it “for the degree." I can’t imagine what you would hope to accomplish by opening up the peer review process to the public. It’s safe to assume that the average person is not well versed in any particular academic subject. What is the merit of allowing such people to determine the merit of a scientific paper? I can’t speak for the "metrics" system you vaguely mention, but can only point out that such a system would have to be designed by someone – presumably an expert. You would be trading a dynamic peer-review system for an arbitrary set of someone's biases. There's no way out. Someone has to decide the merit of these things, and if you don't think a panel of experts are the right people to do it...are you really of the opinion that you know better? Because your suggested alternatives suggest that you don’t value scientific rigor in the least.

Chris (2016-01-16 19:57:00)
Two thoughts - one in response to the original post, and one in response to Jason, above. 1. I agree with the overall depiction of "misplaced modesty," and the two sides of that coin. However, PARTICULARLY in the case of the latter ("I'm afraid that my words will be misunderstood and spun in the wrong way"), but true for both sides - when considering our post-modern condition, we must consider how complex ideas end up circulating as memes, 140-character tweets, and other bytes of compressed information. It is all too easy for either the correct interpretation of a hastily-conceived idea...or the incorrect interpretation of any idea or sound byte - to take on a life of its own. While misplaced modesty is a problem, we can’t fail to be cognizant of this aspect of the post modern condition, whether the academic pursues and alter ego as an intellectual or otherwise. Even leaving it in the classroom, conference presentation, abstract, or paper, our words, thoughts, slides, deeds etc. can be shared instantly, whether we want them to be or not. 2. Regarding Jason's concern about peer-review and its potential democratization - perhaps the original post meant exactly what Jason appears to be concerned about, i.e. that people without any relevant expertise might be reviewing technical or specialized manuscripts (if I have understood Jason correctly). However, "democratization" of peer review might not be so extreme. I think moving the peer review system beyond the opinion of a single editor and 2-4 anonymous reviewers that she or he selected could happen lots of ways. Unblinded review, post-publication review, or "open comment" periods extended to members of the profession or those with relevant knowledge, etc. may all be more democratic, without going all the way to what I believe causes Jason concern. Indeed, the traditional peer review system has, at best, been tried-and-often-true, but also error prone and subjective; at its worst, it allows predatory journals to hide behind the traditional anonymity to implement (and I use that term loosely) non-expert or completely falsified review processes. The fact that a predatory journal can use a facsimile of the traditional peer review system to produce exactly the opposite effect of that traditional system, is also a product of the post modern condition that we must acknowledge. My two cents...

John Harris (2016-01-16 23:13:56)
According to the dictionary the term intellectual means someone with a highly developed intellect. There’s no reference in that definition to the requirement or demand to share the fruits of that development abroad, especially amongst the flashing
lights and blaring noise of today’s ‘news as entertainment’ marketplace. Besides, what exactly is an ‘intellectual’ in today’s argot? If I talk on NPR, do I become one? What if I tweet, or maintain a blog? And what am I called if I speak at a rally? Maybe a ‘public intellectual’ is just an ‘independent scholar’ with tenure? Just as a PhD does not mean one is automatically a competent teacher, neither does it denote one as readily publicly vociferous in advancing a theory or view. Perhaps the fault lies then with our own expectation - that the one be the other, or both.

**Geek Revenue: The Cultural Industries in the Age of Digital Piracy (2015-04-22 08:00)**

This video essay uses classical cultural theory as well as current internet research to address the relationship between the cultural industries and the increasingly active and tech savvy audiences of the 21st century. Is there always a clear-cut division between capitalist media institutions on the one side, and a pirating audience on the other? What space is there for remix culture and other potentially copyright infringing activities in the discourse of digital content monetization?

The Journal of Academic Videos (2015-04-23 08:00)

What a brilliant idea! See more [1]here:

Audiovisual Thinking is a leading journal of academic videos about audiovisuality, communication and media. The journal is a pioneering forum where academics and educators can articulate, conceptualize and disseminate their research about audiovisuality and audiovisual culture through the medium of video.

International in scope and multidisciplinary in approach, the purpose of Audiovisual Thinking is to develop and promote academic thinking in and about all aspects of audiovisuality and audiovisual culture.

Advised by a board of leading academics and thinkers in the fields of audiovisuality, communication and the media, the journal seeks to set the standard for academic audiovisual essays now and in the future.

Video submissions are welcome from all fields of study and, as one would expect, the main criteria for submissions are that the discussion and thinking are conveyed through audiovisual means. [2]Submit your video here.

Call for papers: Queer Methods (2015-04-23 08:00)

WSQ, Call for Papers: Special Issue

QUEER METHODS

Guest Editors:

Amin Ghaziani, Associate Professor of Sociology, University of British Columbia
Queer Studies is experiencing a methodological renaissance. In both the humanities and the social sciences, scholars have begun to identify research protocols and practices that have been largely overshadowed by advances in queer theory. The fall 2013 "Queer Method" conference organized by Heather Love at the University of Pennsylvania indexed this shift toward methods by reframing the question "what is queer theory?" to "how is the work of queer theory done?"

Evocative in this regard are David Halperin's works How to Do the History of Homosexuality and How to Be Gay, along with the 2010 collection Queer Methods and Methodologies: Intersecting Queer Theories and Social Science Research, edited by Kath Browne and Catherine Nash. These efforts have pioneered a new conversation, one that links an account of a situation (or "theory") with a set of guidelines about how to gather evidence to explore or test those particular propositions (or "methods"). Genny Beemyn and Susan Rankin's large-scale empirical study, The Lives of Transgender People, exemplifies how queer methodologies can allow scholars to envision a world that is otherwise obscured by traditional approaches. Despite these early advances, however, vast opportunities for exploiting the innovations of queer methods remain. This issue of WSQ will take up some of the most pressing of those yet-unaddressed queries as it explores the queer take on research methods in the humanities and social sciences.

The question of method inevitably incites a discussion of disciplinarity, since theories generally precede and largely determine particular research strategies. Yet queer studies, much like women's and gender studies, stakes its claims by working at once within, against, across, and beyond disciplinary boundaries, which provocatively blurs distinctions between "the field" and "its methods." If inter-disciplinarity, multi-disciplinarity, and even anti-disciplinarity are all hallmarks of queer and feminist theories, then what promises and pitfalls inhere in the development of queer methods? What inferential and interpretive possibilities are afforded to scholars when we think about queer methods as a distinct analytical approach? How can we queer established protocols while generating new queer methodological possibilities? Finally, borrowing from Valerie Traub, how might traditional disciplinary-specific approaches to methodological scrupulousness and exactitude allow us to be precise about the imprecisions of queer?

While this special issue understands theory and method to be in close conversation, it focuses on the methodological parallels to queer theory. To do this, it will create a forum among qualitative and quantitative scholars from the humanities and the social sciences to discuss either methodological challenges that arise when applying traditional methods to LGBTQ populations or innovations in methodology that can inform further theorizing on the epistemological distinctiveness of gender and sexuality. Conducting research with sexual and gender minorities raises a host of issues pertaining to recruitment (how can we reach hidden populations?), ethics (what are the potential negative impacts of unpopular findings on the communities of study?), measurement (how can scholars operationalize the many modes through which people think about the origins, mutability, and stability of sexual orientation categories?), and meanings (what is the significance of engaging in particular sexual practices?), along with implications for challenging normative conceptions of what constitutes positivist, post-positivist, essentialist, constructionist, interpretivist, and queer social research.

We solicit paper proposals that are theoretical, conceptual and/or empirical on a wide range of topics relating to queer methods, including but not limited to the following:

What are similarities and differences between queer and feminist methodologies?

How can queer methods, like feminist methods, overcome biases that inhere in traditional social scientific and humanist approaches? How can they bring about social change?

When is a queer method/intervention called for?
What interdisciplinary methodologies are employed by queer studies? In what ways is this methodological whole greater than the sum of its disciplinary parts?

How can humanities and social science scholars use scientific studies in their work?

How can humanities and social science scholars use humanist approaches in their work?

What do we gain and lose by queering established protocols versus generating new queer methods?

Is queer theory itself a method of inquiry, and if so, what kind?

How can we count the non-heterosexual and non-cisgender population? And are there ways to approximate random sampling?

What practices and protocols can we establish for constructing queer archives? And how can we index or historicize the ways queer methods change over time and across locations?

What methods and techniques can advance queer library sciences? Performance studies? Dis/ability studies? Trans* studies?

How can "big data" produce queer subjectivities, bodies, and populations?

What procedures should we employ for queer oral histories? Queer reading strategies?

How can we queer the case study approach?

What are the links between queer research methods and critical pedagogies?

How might the institutionalization of queer studies affect how we conduct queer inquiry?

How might we queer "best practices" for research?

How can we assess queer pedagogies?

What methodologies can we devise for conducting LGBTQ campus climate surveys?

Scholarly articles and inquiries should be sent to guest issue editors Amin Ghaziani and Matt Brim at WSQqueermethodsissue [at] gmail.com. We will give priority consideration to submissions received by September 15, 2015. Please send complete articles, not abstracts. Submissions should not exceed 6,360 words (including un-embedded notes and works cited) and should comply with the formatting guidelines at http://www.feministpress.org/wsq/submission-guidelines.

Poetry submissions should be sent to WSQ's poetry editor at WSQpoetry [at] gmail.com by September 15, 2015. Please review previous issues of WSQ to see what type of submissions we prefer before submitting poems. Please note that poetry submissions may be held for six months or longer. Simultaneous submissions are acceptable if the poetry editor is notified immediately of acceptance elsewhere. We do not accept work that has been previously published. Please paste poetry submissions into the body of the e-mail along with all contact information.

Fiction, essay, and memoir submissions should be sent to WSQ's fiction/nonfiction editor, Asali Solomon, at WSQCreativeProse [at] gmail.com by September 15, 2015. Please review previous issues of WSQ to see what type of submissions we prefer before submitting prose. Please note that prose submissions may be held for six months or longer. Simultaneous submissions are acceptable if the prose editor is notified immediately of acceptance elsewhere. We do not accept work that has been previously published. Please provide all contact information in the body of the e-mail.
A scientist discovers ethnography (2015-04-23 09:53)

This is a [1]fascinatingly open reflection upon discovering ethnography for the first time and how it challenges one's training in the 'scientific method':

In summary, this experience has been a fascinating one – a new world for me. I have been trained as a scientist. As a scientist, I have ideas about what scientific method is, and what evidence is. I now understand the value of the qualitative approach – hard for a scientist to say. Qualitative research opens a window to descriptive data and analysis. As our markets change, understanding who constitutes our market, and how users behave is more important than ever.

The Long Game of Creativity (2015-04-23 09:59)

A world without foundations: Politics, society and history in post-foundationalist thought (2015-04-23 19:06)

International Conference

A world without foundations:

Politics, society and history
in post-foundationalist thought

September 23 & 24, 2015

Universidad Diego Portales, Santiago de Chile

Keynote speakers:

Oliver Marchart (Academy of Arts Düsseldorf, Germany)

Martín Plot (CalArts, EE.UU.)

In political as well as scientific debate, not having “foundations” for the things one says or does is often considered as indicating a failure to comply with certain moral or epistemic standards, as it suggests the absence of grounds upon which one’s words and actions may be interpreted, evaluated and justified. In view of this fact, it may seem surprising that “post-” or “antifoundationalism” has become established as a label and general description for a particular strand of contemporary philosophical, political and social thought. The term designates a kind of thinking that conceives the human being, society, history, or the cosmos at large as lacking any fixed ground or telos (revealed divine precepts, universal moral and political principles dictated by reason, immutable laws of nature, etc.), a thinking that insists on the contingency, fragility, and plurality of our modes of living. Thinkers as diverse as Arendt and Foucault, Laclau and Deleuze, Agamben and Badiou—to name but a few of the most prominent—have been associated with this description.

This conference is intended to explore the very idea of anti- or post-foundational thought from an interdisciplinary perspective (including philosophy, sociology, politics, history, among others). More specifically, it seeks to discuss the various challenges that this way of thinking confronts. How can one think without solid foundations? Can such an approach be consistently carried out, i.e., can it avoid the risk of self-contradiction? Does it lead to the sterile conclusion that “anything is possible” or “anything goes”? Are the thinkers who commonly receive the label adequately understood in this way?

The conference invites proposals for presentations in English or Spanish. We welcome submissions of extended abstracts of around 500 words, or else of complete papers. They should be prepared for blind review and sent to [1]coloquio_sin_fundamentos@mail.udp.cl. The **deadline** for submissions is **June 14**. Notices of acceptance will be sent by July 6.
The conference is hosted by the Instituto de Humanidades and the Facultad de Ciencias Sociales e Historia of the Universidad Diego Portales. For additional information, please contact the organizers, Rodrigo Cordero and Wolfhart Totschnig, at the email address above.

1. mailto:coloquio_sin_fundamentos@mail.udp.cl

CfP: The Politics of Data (Science) (2015-04-24 08:00)

The Politics of Data (Science)

This special issue of Discover Society will explore the political implications of 'big data' and the systems of expertise emerging around it, including though not limited to Data Science. In doing so it will aim to bridge the gap between the methodological discourse surrounding data science and the political discourse beginning to emerge around 'big data'. Here are some of the questions the issue will address:

- How is 'big data' understood and acted upon? How should we understand its cultural power?
- How is 'big data' reconfiguring the social sciences? Do we risk all science becoming data science?
- How and why has the 'data scientist' come to be seen as the 'sexiest job of the 21st century'?
- Is the 'data scientist' just a 'Statistician who lives in Shoreditch'? Or is this a genuinely new intellectual role?
- Can 'big data' address 'big questions'? If not, is this a problem?
- What are the precursors of 'data science' within the academy and/or within corporations?
- What implications does corporate data science have for the relationship between corporations & consumers?
- What implications does national security data science have for the relationship between the state & citizens?
- Can the use of digital data lead to efficiency savings in public services? How does this relate to the politics of austerity?
- How could predictive privacy harms emerging from data analytics be addressed politically?
- Can the opacity of algorithmic processes be challenged? Or are we heading inexorably for a 'black-box society'?
- How are new forms of digital data reconfiguring activity in particular social environments?

However these are just suggestions and ideas beyond the scope of this list are very welcome.

The deadline for contributions is June 15th. Contact mark@markcarrigan.net to discuss a potential contribution.

The article will constitute the July issue of Discover Society. Most articles will be 1500 words however there are a number of special sections in the online magazine.

Front line – 1500 words
View point – 1500 words
Policy briefing – 1500-2000 words

If you would be interested in writing one of these thematic sections, please get in touch asap.
Overcoming your modernist training for constant improvement, advancement, development and accumulation (2015-04-25 08:00)

Overcoming your modernist training for constant improvement, advancement, development and accumulation. That’s what the social psychologist Kenneth Gergen advocates in the new introduction to his famous work The Saturated Self, as quoted by Harmut Rosa in Social Acceleration:

I am also struggling against my modernist training for constant improvement, development, and accumulation. Slowly I am learning the pleasures of relinquishing the desire to gain control of all that surrounds me. It is the difference between swimming with deliberation to a point in the ocean – mastering the waves to reach a goal – and floating harmoniously with the unpredictable movements of the waves.

This rather Taoist sentiment does not necessarily entail passivity, as much as an embrace of situational constraint. It’s probably easier to embrace as a life philosophy when you’re an internationally renowned tenured professor at a private liberal arts college. I think we need to recognise this privilege but it would be a mistake to dismiss what he is saying on this basis. We should take his life philosophy seriously, as well as the goods that it can lead us to:

The rewards can be substantial – the devotion of one’s intimates, happy children, professional success, the achievement of community goals, personal popularity, and so on. All are possible if one avoids looking back to locate a true and enduring self, and simply acts to fulfil potential in the moment at hand.

What Gergen articulates is one particular solution to a problem we all face: how to give shape to our lives? This has a practical dimension to it. Any plan for the future provides a framework within which present choices can be understood as moving us further towards or farther away from where we hope to get to. I think there’s a more affective dimension to this as well, albeit one which varies a lot between people for reasons that likely incorporate the social, cultural, psychological and neurophysiological. Our future plans create a structure for our present experience by constituting a sense of how the present connects to the future. It is in virtue of this that we feel our lives are ‘going somewhere’ or that we are ‘drifting’.

What Gergen’s responding to is the stress produced by the drive towards “constant improvement, development, and accumulation” when it operates under uncertain conditions. With the acceleration of social change, our experience comes to be characterised by instability, both ontologically (circumstances are unlikely to last) and epistemically (circumstances cannot be assumed to last). My plan to ‘play the game’ and climb to the top of my profession begins to seem implausible if the ‘game’ itself is seen as being in a state of flux. My plan to ‘lay down roots’ in a particular geographical area comes to seem implausible if the characteristics of that area are changing rapidly (or my ability to preserve these roots is likely to be interrupted by the demands of my a changing professional ‘game’).
He’s suggesting that it is our “modernist training for constant improvement, advancement, development and accumulation” which is the problem here. As Bauman puts it, “the site on which we build is always cluttered: the past lingers in the same ‘present’ in which the future tries to take root”. Extending the metaphor, I take Gergen to be saying that our ‘modernist training’ leads us to grasp hastily at potential futures taking root in the present, trying to steer the unfolding of events but killing these roots in the process: an activity that fails to work and makes us miserable in the process.

Either we kill potential futures by grasping too hastily or we ignore potential futures because of our fixation on our prior blueprint. Trying to control the direction of our future leaves us failing to attend to our present. Instead, Gergen advocates we should embrace the reality of our present situation, act in ways that are valuable within it and cultivate an equanimity towards the future unfolding of events.

However the social world is not so ‘liquid’ as thinkers like Bauman are prone to suggest. While radical changes does occur, it is far from the norm: our circumstances are not transformed in each successive moment. Margaret Archer suggests that instrumental rationality becomes increasingly untenable with the intensification of social change. This doesn’t mean that people abandon it, only that strategic planning in terms of means and ends becomes error-prone to the degree that each is prone to change. The point can sound trivial in the abstract but when you consider the number of contingencies built into any ‘life plan’ that has been elaborated with any degree of detail, it starts to seem much more significant. The point is not that planning is becoming impossible but rather that it is becoming unreliable.

We might respond to this by building contingencies into our life plans and returning to them with much greater frequency. These changing circumstances therefore encourage an intensification of reflexivity, an expansion of life tactics to ensure the endurance of our life strategy. This will work most effectively when our ends remain stable (e.g. becoming established & recognised within a given profession that remains securely existent) and only the means are

IFRAME: [1]http://www.youtube.com/embed/b54EEpdv9q8?version=3 &rel=1 &fs=1 &showsearch=0 &showinfo=1 &iv_load_policy=1 &wmode=transparent
subject to change (e.g. changing expectations attached to this professional role, changing practical activity necessary to establish oneself within the field).

An alternative strategy is to temporise, reducing the window of time within which we seek to enact a plan in order to preserve the efficacy of our planning, as can be seen in the example of Spotify's 31 year old CEO:

Ek describes himself as “missionary,” by which he means he likes to formulate five-year missions for himself. “That’s how I think about life,” he said. “Five years is long enough for me to achieve something meaningful but short enough so I can change my mind every few years. I’m on my second five-year commitment on Spotify. In two years, I will have to make my next one. I will need to ask myself if I still enjoy what I’m doing. I’m kind of unusual that way, but it gives me clarity and purpose.”

Without a window of five years, it becomes possible to "achieve something meaningful". Ek might well have accomplished something similar if muddling through situationally in the way advocated by Gergen. But this would be a collection of actions rather than a project: it would be something we look back and realise we've done rather than a growing awareness of succeeding in something we'd sought to accomplish. However if advocates of the acceleration thesis are to be believed, it is likely the window within which instrumental rationality could be operative in a subjectively satisfying way will continue to decrease: the practicality of ‘five years’ as a unit of time for Ek cannot be assumed to be sustainable.

It's against this background that we can see how planning can come to take on a fetishistic character. We look to our plans to secure us against contingency, providing us with a sense of security and direction in a world that makes the achievement of either into a precarious accomplishment. We look to 'escape the mess of life', as Ian Craib puts it, fantasising about a life in which plans unfold smoothly and taking the inevitable failures we experience in reality as invitations to plan further and plan better. It's in view of this that Gergen's suggestion comes to seem distinctly therapeutic, representing a regime of equanimity through which we seek to stop worrying about the future and start living in the present.

However when does equanimity become drift? When does acceptance become passivity? The instrumentally rational life plan operates at the level of biography as a whole and increasingly fails for this reason. The 'five-years missions' of Ek enact this strategy over a shorter span of time, ensuring the same motivational pay-off while building in uncertainty in a way that makes the missions into plausible undertakings. Gergen's presentism embraces living well under current circumstances and accepting our inability to dictate the direction of their change. The problem with this is that much of what matters to us extends beyond our present situation. There's a dimension to human experience, in which we recognise ourselves as having become the person we are now at this moment through a process that goes back far into the past and extends forward through the entirety of our life. Gergen's account confuses the capacity to control our biography with the reality of that biography itself. His person risks idling away their life in a diverting and enjoyable way only to wonder in old age about all the things they could have done with their life if only they had looked beyond the confines of their circumstances.

So how can we shape our lives while avoiding the sisyphean business of life plans? By finding meaningful projects and cultivating the mindfulness necessary to attend to them maximally. Any project pursued in such a way is liable to change because neither self and circumstances are static. But our projects and the concerns in virtue of which they are meaningful to us constitute a thread through which purpose is enacted at the biographical level, linking the many situations within which we find ourselves over time through our projects and the meaning they hold for us.
The drip-by-drip erosion of our liberties in an age of austerity (2015-04-26 08:00)

Towards the end of her memoir/manifesto, the Green Party MP Caroline Lucas offers an articulate warning about the "drip-by-drip erosion of our liberties":

There is little risk of anyone seizing power, declaring martial law or suspending the constitution in Britain; instead through a hundred lesser acts, the state takes more and more power to itself, and our protections becomes steadily weakened. We are comforted by being told that these are a response to an extraordinary situation; but we have seen time and time again that powers given supposedly to fight terrorism are used by the police for far less significant threats, such as checking up on whether people have claimed the right benefits or tax rebates, or even spying on protesters or campaigners.

I've always found the tendency of some on the left to invoke the spectre of a 'police state' to be worrying and irritating in equal measure. Even in its most sober versions, it tends towards a ridiculous degree of overstatement that is offensive to those who have actually lived under such conditions. It also contributes to an atmosphere within which conspiracy theories can thrive on the left, not least of all the appearance of 9/11 trutherism in the UK.

However the risk is that this position can too easily give rise to the dismissal of the underlying concerns. The reality is much more mundane. In a [1]New Statesman essay last year, David Runciman made a convincing case that we are witnessing a trajectory towards long-term decline in British politics of the sort in which "nothing gets sufficiently broken for anything to get finally fixed". He compares our present circumstances to the intensity of the political crisis in the 1970s:

The first is that there existed a surprisingly widespread belief during the mid-1970s that, were the muddle to continue, it might need to be ended by force, with a military takeover. A coup was not outside the realms of political possibility (and we now know that rogue forces within the secret services made cack-handed attempts to organise one, with either the Duke of Edinburgh or Lord Mountbatten as the preferred strongman to replace Wilson).

The particular focus of these fears was rising inflation. It was a common assumption at the time that no democracy could survive a sustained bout of inflation above 30 per cent - and in Britain the rate hit 25 per cent in 1975. It was commonplace to invoke the baleful example of Latin America, where the global economic crisis of the mid-1970s led to the collapse of a number of democratic regimes. The economist Milton Friedman suggested in 1974 that the failure to control inflation had been responsible both for Heath’s replacement by Wilson in Britain and for Allende's replacement by Pinochet in Chile. It
cost one man his job; the other his life. The barely veiled sense of threat was apparent.

Today the talk of democracy-destroying inflation has more or less disappeared. Yes, we face a mix of rising prices and stagnant or falling wages – the “cost-of-living crisis”, as the Labour Party likes to call it – that has some echoes of 1970s stagflation. But the scale is very different. Ours is a slow-burning, incremental squeeze on living standards, not the threat of an inflationary rip tide sweeping away savings and security. In large part because of the fears generated in the 1970s, we now have economic technicians in charge of an independent central bank whose job is to ensure that inflation remains more or less under control. Likewise, the idea that the current crisis might result in a military coup seems laughably remote. We worry – or at least some of us do – that the military-security complex is squeezing what is left of our privacy by spying on our communications. We don’t, however, worry that the security services are secretly plotting to install a member of the royal family as an unelected head of the government.

What we’re seeing is not the emergence of a ‘police state’ but rather the drip-by-drip erosion of liberties in conjunction with a growing inability of any political agency to reverse the trend. The issue doesn’t capture the attention of a distracted public, the political socialisation of MPs mitigates against concerning themselves with such matters and the time horizons of party-politics incentivise headline grabbing announcements concerned with the performance of virtue rather than the practicality of policy.

Such a gradual trend that results from so many disparate causes resists easy theorisation. But if the politics of austerity are here to stay, we should all be concerned by the shrinking sphere of civil liberties. The notion of ‘extremist’, one who has been subject to ‘radicalisation’ and now promulgates ‘extremism’, increasingly dominates government rhetoric and it’s a terrifyingly elastic notion. These are two aspects of the recent bill which particularly concern me:

- Creating an obligation to monitor and report extremism – Colleges, schools, prisons, GPs and councils will now have a legal duty to prevent people being drawn into terrorism. Schools, nurseries even GPs will be required to monitor those they provide services to and report anyone they believe is at risk of, or has in fact been drawn in to terrorism. Universities will have to draw up policies on extremist campus speakers, and prisons will be required to have policies for dealing with radicals. The Home Office will be able to get court orders obliging bodies to comply with their obligations.
- ”De-Radicalisation” Panels – The Bill creates a legal duty that will require local authorities to establish a panel to refer people identified as being at risk of ‘being drawn into terrorism’. The composition of that panel is set out in the Bill, and its purpose is to draw up a “de-radicalisation” plan for the person identified as being at risk. The Bill makes no provision for the person identified to have legal or other representation, or in the case of a child, to have a parent present.

But what I find so disturbing is that this legislation seems as much to do with Theresa May positioning herself as Iron Lady 2.0 in order to compete for the leadership of the Conservative Party as it does with any reflective desire to solve a social problem, as much as I might disagree with either the interpretation of the problem or the proposed solutions.

If ‘extremism’ entails ‘opposition to British values’ and those values include ‘free markets’, it’s not unlikely we’ll see some of these new powers brought to bear upon anti-cuts protesters. These will be situational application of new powers rather than a considered attempt to suppress dissent. But the effect will be that possible agencies of change outside parliament will come to be muted in much the same way as those within it. Thus reinforcing our long post-democratic drift into a state of perpetual crisis in which “nothing gets sufficiently broken for anything to get finally fixed”.

The Social Ontology of Digital Data & Digital Technology, July 8th in London (2015-04-27 08:00)

This innovative conference brings together leading figures from a variety of fields which address issues of digital technology and digital data. We’ve invited speakers with a range of intellectual perspectives and disciplinary backgrounds who engage with questions relating to digital data and digital technology in their work. Our suggestion is that social ontology, however this might be construed, represents a potential common ground that could cut across this still rather siloed domain of inquiry into the social dimensions of digital technology.

The conference aims to explore this possibility by assembling a diverse range of perspectives and drawing them into a dialogue about a common question, without assuming a shared understanding of the topic at hand. Our aim is to extend this digitally via twitter, podcast and blog beyond the event itself, in order to facilitate an extended conversation that will draw more people into its remit as it circulates after the conference itself.

To this end, we invite each speaker to address this theme (the social ontology of digital data & digital technology) in whatever way they choose. Each speaker will have 30 mins to talk and 15 mins for questions. We’ll have an accomplished audio editor on hand to record each talk as a podcast. These will be released on [1]www.socialontology.org and will be circulated on social media in order to try and stimulate a continuing debate around the issues raised at the conference. The hashtag for the day will be #socialontology.

Confirmed Speakers:

- Noortje Marres (Goldsmiths) – Does Digital Sociology have a Problem?
- Jochen Runde (Cambridge) – Non-materiality and the Ontology of Digital Objects
- Alistair Mutch (NTU) – title TBC
- Susan Halford (Southampton) – title TBC
- Nick Couldry (LSE) – title TBC
- Another speaker TBC
Workshop: Investigating the Internal Conversation (2015-04-27 14:37)

I'm organising this workshop at Warwick in June for anyone using Margaret Archer's work on reflexivity in empirical research. She'll be there all day & will discuss the development of this work as well as answering questions about it. There will also be a few speakers (including myself, talking about my PhD, which I so rarely do) who have used these ideas in empirical studies. If you know anyone studying reflexivity in this way then please do let them know about the workshop:

Investigating the Internal Conversation
June 2nd at the University of Warwick

The Centre for Social Ontology invites applications for this practical workshop aimed at those investigating human reflexivity through empirical research. The 'internal conversation' was developed by Margaret Archer as a solution to the problem of structure and agency: a mediatory mechanism that accounts for how society's objective features influence its members to reproduce or transform society through their actions. Since initially discussed in Being Human, this account of human reflexivity has been developed through a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

This workshop intends to support those who are currently undertaking or in the process of planning empirical research investigating the internal conversation. The day will begin with an introductory lecture by Margaret Archer in which she will discuss the development of her work on reflexivity, ranging from the initial formulation in Being Human through to her recent work with Pierpaolo Donati on relational reflexivity. Then [1]Mark Carrigan (Warwick), [2]Monder Ram (Birmingham) and [3]Balihar Sanghera (Kent) will each give a shorter talk about their experience of investigating reflexivity through empirical research. The rest of the day will address the methodological and theoretical questions often encountered when studying reflexivity e.g. how to identify the modes of reflexivity of research subjects.

The workshop is free but registration is essential. If you would like to participate then please e-mail socialontology@warwick.ac.uk with a brief description of your project. We're keen to adapt the content as much as possible to meet the needs of participants. If there are particular issues you would like us to address then please suggest these in your initial e-mail.
Call for papers: Centre for Social Ontology PhD/ECR Conference (2015-04-28 08:00)

Centre for Social Ontology PhD/ECR Conference
June 23rd, University of Warwick, 10am – 4pm

Social ontology is integral to the study of society. It is impossible to inquire into the social world without some understanding, at least tacitly, concerning the entities which make up that world and their properties and powers. However social ontology remains an often confused and contentious matter within the social sciences.

The first Centre for Social Ontology PhD and ECR conference seeks to address this matter through papers exploring the role of social ontology within sociology. This could include but is by no means limited to:

- The relationship between tacit assumptions concerning social ontology and reflective theoretical positions
- Social ontology and the formulation of research questions
- Social ontology as a topic standing at the interface between the social sciences and philosophy
- The methodological implications of social ontology
- The ontological assumptions implied by research methods
- The social ontology of particular areas of inquiry e.g. social movements or digital technology
- Disciplinary differences in approaches to social ontology
- Social ontology and philosophical under-labouring
- The limits of social ontology and where under-labouring has to stop
- New directions in sociological research through questions of social ontology

The conference is open to all PhD students and Early Career Researchers with an interest in social ontology.

Please send abstracts of 200 words or less and a short biographical note to [1]socialontology@warwick.ac.uk by May 1st

Registration will be free and a limited number of small travel bursaries will be available to support attendance at the conference.
(Re)situating Queer Theory on the Critical Left (2015-04-28 14:30)

(Re)situating Queer Theory on the Critical Left
A Morning Seminar at Warwick University, 10.30am – 1pm, Friday 22 May 2015
Ramphal Building, Room R0.3-4

This seminar aims to explore and debate two influential recent attempts to (re)situate queer theory within the broader field of critical social and cultural theory on the Left, with a particular but not exclusive focus on the relevance of this discussion within French Studies:

This exploratory seminar is intended principally for early-career academics and post-graduate researchers in French Studies, Sociology, Gender Studies, Queer Studies, Women’s Studies and related areas but all are welcome. Participants are invited to offer a 5-10 minute paper, which could explore an aspect of either or both texts, in isolation or in relation to the speaker’s own work.

Participants are asked to signal their desire to take part to Oliver Davis (O.Davis@warwick.ac.uk) by 1 May 2015 and also to indicate whether or not they would like to deliver a short paper. Selected participants will be invited to develop their paper into a submission for the edited volume arising out of the AHRC-funded research project to which this workshop is attached, Queer Theory in France. Participants who have already confirmed their attendance at this seminar include Oliver Davis (French Studies, Warwick), Alex Dymock (Law, Criminology and Sociology, Royal Holloway), Elliot Evans (French, KCL), Hector Kollias (French, KCL), Kayte Stokoe (French Studies, Warwick), Matthew Waites (Sociology, Glasgow) and Emma Campbell (French Studies, Warwick).

The seminar will take place in Room R0.3-4, Ramphal Building (Main Campus). Room R0.03-4 is an accessible room on the Ground Floor of the Ramphal Building on the main campus of Warwick University. Travel directions to the campus may be found here: [1] http://www2.warwick.ac.uk/about/visiting For a map of the campus (the Ramphal Building is number 53, square D4) please see here: [2] http://www2.warwick.ac.uk/about/visiting/maps/campusmap/

Please contact Oliver Davis with any questions (O.Davis@warwick.ac.uk)

Queer/Coercion
An Afternoon Critical Sexology in the Midlands Public Research Seminar, 2 – 5pm, Friday 22 May 2015
Warwick University, Ramphal Building, Room R0.03-4

Queer thought and activism may be defined by their vigilance to the varieties of violence with which norms coercively constitute gendered sexual subjects. At a moment when, in numerous national contexts, the work of sexual and gender policing is increasingly abetted by manifestations of organized state violence against dissidents – so extreme in some cases, as in Uganda, as to suggest the idea of genocide – this afternoon seminar will explore the topic of coercion in a global perspective and across the related fields of queer, feminist, and masculinity.
studies. Concretely, the event will focus on legal responses to the phenomenon of 'revenge pornography', on the representation in pop music videos of violence against men and on the scope and value of the concept of genocide for global queer politics resisting coercion in the particular context of Uganda. Questions to be explored include the following:

How does contemporary queer thought envisage and resist coercion?
How can we conceptualise feminist responses to 'revenge pornography'?
How to account for the remobilisation of recognisably queer representational codes and strategies (e.g. camp) in mainstream music videos depicting violence against men?
To what extent is genocide a useful concept for global queer politics today?
How and why do queer, feminist, and masculinity studies differ in their apprehension of the coercive force of the law?

Speakers and paper titles:
Alex Dymock (Law, Criminology and Sociology, Royal Holloway), ‘Eroticising retribution?: criminalising “revenge pornography”
Marc Lafrance (Sociology, Concordia), ‘The Dark Side of Camp: Violence Against Men in Popular Music Videos Made by Women’
Matthew Waites (Sociology, Glasgow), ‘Queering Genocide'

Respondents: Oliver Davis (French Studies, Warwick) and Kayte Stokoe (French Studies, Warwick).

For further information about Queer/Coercion, including full paper abstracts and speaker biographies, please visit:

An introduction to Design Fiction for Sociologists, May 13th at Goldsmiths (2015-04-29 08:00)

Design fiction is a term [1]first coined by Julian Bleecker and [2]popularized by SF author Bruce Sterling, who describes it as "the deliberate use of diegetic prototypes to suspend disbelief about change." and that it "attacks the status quo and suggests clear ways in which life might become different."

Design fiction isn’t science fiction, it’s not just a telling of stories in the future or trying to make predictions of the future, instead it is a way of trying to envision and interrogate possible futures based on research data, current trends, and/or technologies. Originally, primarily used by product designers as a cheap alternative to prototyping new products, it has found traction as a critical tool allowing us to see through the fog of hype and digital evangelism.

In this event Tim Maughan introduces design fiction for sociologists. He discusses the work he is undertaking with Sava Saheli Singh (New York University) and its possible implications for how we write about research.
Keith Kahn-Harris will discuss his new project which looks at how kinds of mainstream texts other than science fiction also generate ‘social science fictions’, often ‘accidently’ as a result of the pragmatic requirements of generating workable plots and scenarios. Such texts can help force attention to a neglected sociological question: what are the limits of possibility in human society?

Sarah Burton will also speak on a topic to be finalised.

Les Back and Mark Carrigan will each offer a short response before the event is opened up for a general discussion.

The dead zones of the imagination in higher education (2015-04-29 10:00)

In his recent book on bureaucracy, David Graeber often turns to higher education to furnish examples of the broader tendency he describes. I thought this was a particularly vivid passage worth reproducing:

The explosion of paperwork, in turn, is a direct result of the introduction of corporate management techniques, which are always justified as ways of increasing efficiency, by introducing competition at every level. What these management techniques invariably end up meaning in practice is that everyone winds up spending most of their time trying to sell each other things: grant proposals; book proposals; assessments of our students’ job and grant applications; assessments of our colleagues; prospectuses for new interdisciplinary majors, institutes, conference workshops, and universities themselves, which have now become brands to be marketed to prospective students or contributors. Marketing and PR thus come to engulf every aspect of university life.

The result is a sea of documents about the fostering of “imagination” and “creativity,” set in an environment that might as well have been designed to strangle any actual manifestations of imagination and creativity in the cradle. I am not a scientist. I work in social theory. But I have seen the results in my own field of endeavour. No major new works of social theory have emerged in the United States in the last thirty years. We have, instead, been largely reduced to the equivalent of Medieval scholastics, scribbling endless annotations on French theory from the 1970s, despite the guilty awareness that if contemporary incarnations of Gilles Deleuze, Michel Foucault, or even Pierre Bourdieu were to appear in the U.S. academy, they would be unlikely to even make it through grad school, and if they somehow did make it, they would almost certainly be denied tenure.

The Utopia of Rules: On Technology, Stupidity, and the Secret Joys of Bureaucracy pg 134
His claim is an empirical one: ever greater tracts of time are consumed by activities other than scholarship. This in turn has obvious implications for scholarship. Dead zones of the imagination can increasingly be found in our universities.

kerrysmallman (2015-04-30 14:06:32)

My husband resigned from a readership at Edinburgh university in the year 2000, when the paperwork became so immense that teaching and research became impossible. I can’t help but think that this is a key factor in the lack of imagination in new research. The REF or RAE is probably the single biggest cause of the decline in originality, however. The big name journals simply do not allow for research which is truly paradigm-breaking. The constant need for funding also means that the research which gets done is the type which serves a purpose for corporations or governments. Research into esoteric or controversial subjects get sidelined in favour of working within the capitalist/bureaucratic orthodoxy.

Call for papers: Power, Acceleration and Metrics in Academic Life (deadline May 1st! All 5 keynotes now confirmed) (2015-04-30 08:00)

Call for papers: Power, Acceleration and Metrics in Academic Life

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement and quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life (i.e., in many disciplines the new maxim ‘patent and prosper’ (Schachman) supplements the traditional ‘publish or perish’). Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays (i.e., the shifting parameters and patterns of academic subjectivity). Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This conference will inquire into the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
• the relationship between metrification and acceleration
• how metrification and acceleration relate to a broader social crisis

The workshop will take place from December 2nd to 4th 2015 in Prague.

Deadline for abstracts will be May 1st 2015. Please send 250 words and short biographical note to Mark Carrigan (mark@markcarrigan.net) and Filip Vostal (filip.vostal@gmail.com) by the deadline.

**Keynote Speakers:**

Roger Burrows – Ancient cultures of conceit reloaded

Philip Moriarty – The perils, pitfalls, and power of peer review in public

Susan Robertson – Vertigo: Time and space in the contemporary university

James Wilsdon – In numbers we trust? Reflections on the UK’s independent review of the role of metrics in research assessment

Oili-Helena Ylijoki – ‘Projectification’ and conflicting time orders in academic knowledge production

**Fee**

50 Euros (standard) / 25 Euros (PhD/ECR)

Registration to open in summer 2015

**Venue**

Hosted by Institute of Philosophy of the Czech Academy of Sciences the event will take place in Vila Lanna, V Sadech 1, 160 00, Prague 6, Czech Republic ([1]http://www.vila-lanna.cz/index.html)

**Travel**

Air: From Vaclav Havel Airport Prague take the bus no 119 to Dejvicka (which is the terminal stop). Vila Lanna is 5-6min walk from there.

Train: From Main Railway Station (Praha hlavni nadrazi, often abbreviated Praha hl. n.), take metro line C (red), change at Muzeum for line A (green) and get off at the terminal stop Dejvicka. Vila Lanna is 5-6min walk from there.

The Politics of Data (Science)

This special issue of Discover Society will explore the political implications of 'big data' and the systems of expertise emerging around it, including though not limited to Data Science. In doing so it will aim to bridge the gap between the methodological discourse surrounding data science and the political discourse beginning to emerge around 'big data'. Here are some of the questions the issue will address:

- How is 'big data' understood and acted upon? How should we understand its cultural power?
- How is 'big data' reconfiguring the social sciences? Do we risk all science becoming data science?
- How and why has the 'data scientist' come to be seen as the 'sexiest job of the 21st century'?
- Is the 'data scientist' just a 'Statistician who lives in Shoreditch'? Or is this a genuinely new intellectual role?
- Can 'big data' address 'big questions'? If not, is this a problem?
- What are the precursors of 'data science' within the academy and/or within corporations?
- What implications does corporate data science have for the relationship between corporations & consumers?
- What implications does national security data science have for the relationship between the state & citizens?
- Can the use of digital data lead to efficiency savings in public services? How does this relate to the politics of austerity?
- How could predictive privacy harms emerging from data analytics be addressed politically?
- Can the opacity of algorithmic processes be challenged? Or are we heading inexorably for a 'black-box society'?
- How are new forms of digital data reconfiguring activity in particular social environments?

However these are just suggestions and ideas beyond the scope of this list are very welcome.

The deadline for contributions is June 15th. Contact mark@markcarrigan.net to discuss a potential contribution.

The article will constitute the July issue of Discover Society. Most articles will be 1500 words however there are a number of special sections in the online magazine.

Front line – 1500 words
View point – 1500 words
Policy briefing – 1500-2000 words

If you would be interested in writing one of these thematic sections, please get in touch asap.

The issue will follow the usual formatting guidelines of Discover Society. Please consult the [1]notes for contributors.

3rd British Sociological Association Early Career Theorists Symposium
Friday May 292015
3446
Professor Stuart Hall Building room 326, Goldsmiths College

Organised by Francisco Calafate-Fario (Goldsmiths) and Silvia Pasquetti (Cambridge)
Supported by Goldsmiths’ Department of Sociology

Attendance is free but places are limited. Please email Francisco: f.calafate@gold.ac.uk or Silvia sp638@cam.ac.uk to book a place

12.00 Arrival and registration (coffee and light snacks provided)

12.30 Differences and Indifferences: Emergent Conceptualisations of Inequality. Discussant: Steph Lawler (York)
12.40 – 12.50 Jon Dean (Sheffield Hallam): The Illegitimacy of Informal Volunteering
12.50 – 13.00 Barbara Neukirchinger (Bangor) Critical Theory: Poststructuralism and the Intersection of Gender and Disability
13.00 – 13.20 Steph Lawler’s response
13.20 – 13.45 Discussion

13.45-14.00 coffee break

14.00 Spatio-temporalities of Political Subjectivity and Belonging. Discussant: Manali Desai (Cambridge)
14.00 – 14.10 Miranda Iossifidis (Goldsmiths): The Spatio-temporality of Polytechnico Remembrance: Indirect Embodied Resistance, Storytelling, and Tradition
14.10 – 14.20 Sam Burgum (Warwick): Occupying London: Post-Politics or Politics Proper?
14.30 – 14.50 Manali Desai’s response
14.50 – 15.15 Discussion

15.15 – 15.45 coffee break

15.45 Senses and Affect in Public Encounters. Discussant: Les Back (Goldsmiths)
15.55 – 16.05 Lambros Fatsis (Sussex): Becoming Public Characters, not Public Intellectuals: Notes Towards an Alternative Model for a Sociology of Intellectuals
16.05 – 16.15 Simone Varriale (Warwick): Beyond Distinction: Theorising Cultural Evaluation as a Social Encounter
16.15 – 16.35 Les Back’s response
16.35 – 17.00 Discussion

17.00 - 18.00 After panel with Hannah Jones (Warwick), Dariusz Gafijczuk (Newcastle), and Raphael Schlembach (Sussex)

18.15 Drinks and dinner at Natura Café, Goldsmiths
#FreshersToFinals: Understanding LGBT people's perspectives on higher education (2015-04-30 14:41)

Lesbian, gay, bisexual and trans* (LGBT) young people are increasingly visible in policy and practice, often in relation to homophobic, biphobic and transphobic bullying. However, this can result in misunderstandings and/or over-simplification about all LGBT students' needs and experiences. The #FreshersToFinals project is being undertaken by Sheffield Hallam University and seeks to develop a fuller understanding of LGBT experiences of higher education.

The project will culminate in two free events - booking is now open! Further details at the links below:

Manchester July 17th http://lgbtqatuniversity.eventbrite.com
Sheffield July 24th http://lgbtq-universities.eventbrite.com

The events are designed to feedback on the #FreshersToFinals project, and explore the implications for practice.

For more details about the project see http://research.shu.ac.uk/ceir/fresherstofinals.html

The next five years of sociologicalimagination.org? (2015-04-30 14:55)

The fact we've just moved to a new server, it's almost five years since we started the site and an impending deadline have left me contemplating future plans for SI. I recently closed my personal blog in order to focus on SI and I'd like to expand what we're doing over the coming years. Here are some ideas:

- [1]Opening up @soc_`imagination as a platform for public engagement
- Incorporating the [2]Alternative History of Sociology into SI
- Finding a new theme for the site & generally improving how it looks
- Experimenting with eBook publishing, particularly tied to interesting events
- More generally hosting interesting examples of sociological communication.
- Finding some additional regular bloggers whose interests match those of the site.
- Launching more calls for guest posts focused on our core themes.
• Possibly a shop... I've had a couple of ideas for SI themed t-shirts which I think are quite good. Less certain about this than the other suggestions though.

• Finding another editor to join myself, Milena and Sadia.

Any other ideas are very welcome! Now I've got that down on paper, I should return to the chapter that has to be submitted in 9 hours.

6.5 May

What will micro-publishing look like in higher education? (2015-05-01 08:00)

A few weeks ago I was browsing a photography bookshop in London and came across the term ‘micro-publisher’ for the first time. The friend I was with seemed slightly bemused that I hadn’t encountered the term and explained that it just meant small publishers with tiny print runs. Here's how Wikipedia defines micro-publishing:

• The book publishing industry sometimes uses this term in discussing publishing companies below a certain revenue level.

• It is also used to describe the use of efficient [1]publishing and [2]distribution techniques to publish a work intended for a specific [3]micromarket. Typically, these works are not considered by larger publishers because of their low [4]economy of scale and [5]mass appeal and the difficulties that would arise in their [6]marketing.

The two meanings seem obviously connected to me, in so far as that the former will be the likely state of companies who only engage in the latter. In fact, as the Wikipedia articles goes on to make clear, it's only with the growth of Print on Demand that the niche markets to which micro-publishers cater became financially feasible because of a radical reduction in the upfront investment that was necessary. This trend intensified with the emergence of online publishing in general and eReaders in particular. As the Wikipedia articles continues:
Before the emergence of the internet, micropublishing was considered a "microtrend" that would not play much of a role in the publishing world, because costs per copy were too high. The internet has changed this by providing authors and micropublishers with an affordable medium through which to publish and distribute their works.\footnote{citation needed}

The Internet is also evolving how the works from traditional publishing, self-publishing and micro-publishing are distributed. The long imagined dream of digital distribution for published works is quickly becoming a reality. For micro-publications, digital distribution may enable greater numbers of authors and potential authors to enter the publishing industry to access readers who prefer to receive and/or consume content in digital form.

Digital micropublishing sites like Scribd and Docstoc enable micro-publishers to easily distribute their digital works using intellectual property licenses. Licensing micro-publications simplifies protecting and tracking those works which are distributed digitally, an approached used for many years by software producers, and in the last decade by MP3 music distributors.

Micro-publishers and authors who use intellectual property licensing sites are not limited to a specific medium (like eReaders) to distribute their works. This flexibility may allow micropublishing to significantly expand readership while protecting copyrights.

\footnote{http://en.wikipedia.org/wiki/Micropublishing}

The Subcompact Publishing manifesto thinks through the potential implications of this for the nature of the magazine. To produce a digital edition of a print publication leaves a publisher under a very particular set of constraints:

A generalized print magazine may be composed of the following qualities:

- Each issue contains a dozen or more articles.
- Issues operate on a monthly cycle.
- All articles are bundled and shipped at the same time.

Almost all of these qualities are the result of responses to distribution and production constraints. Printing and binding takes a certain amount of time. Shipping the issues takes another chunk of time. In order to find a balance between timeliness of content and shelf-life, a month makes a pretty sensible — if brisk — publishing schedule.

Old into new

So why do so many of our digital magazines publish on the same schedule, with the same number of articles as their print counterparts? Using the same covers? Of course, they do because it’s easier to
maintain identical schedules across mediums. To not design twice. To not test twice (or, at all).

Unfortunately — from a medium-specific user experience point of view — it’s almost impossible to produce a digitally indigenous magazine beholden to those legacy constraints. Why? Not least because we use tablets and smartphones very differently than we use printed publications.

One of the great benefits of being part of the emergent publishing world is that you don’t have multiple mediums to publish across. You can and probably should focus squarely on digital. Perhaps later — contingent on market demand and content quality — you can consider publishing a print anthology to give your publication a stronger literal edge.

The author then outlines how ‘Subcompact Publishing’ can take advantage of freedom from these legacy constraints:

Subcompact Publishing tools are first and foremost straightforward.

They require few to no instructions.

They are easily understood on first blush.

The editorial and design decisions around them react to digital as a distribution and consumption space.

They are the result of dumping our publishing related technology on a table and asking ourselves — what are the core tools we can build with all this stuff?

They are, as it were, little N360 s.

I propose Subcompact Publishing tools and editorial ethos begin (but not end) with the following qualities:

• Small issue sizes (3-7 articles / issue)
• Small file sizes
• Digital-aware subscription prices
• Fluid publishing schedule
• Scroll (don’t paginate)
• Clear navigation

To my surprise, the author suggests that Apple’s Newstand is actually a grossly under-appreciated tool to this end.
The argument seems convincing:

Newsstand is perhaps the most underutilized, under-imagined distribution tool in the short history of tablet publishing. If you squint your eyes and tilt your head at just the right angle, you’ll notice something magical about Newsstand: given the proper container, it’s a background downloading, offline-friendly, cached RSS machine people can subscribe to. For money.

What I find interesting is how much of the innovation in this field has been driven by the facilitation of micro-publishing by others:

The Magazine is no longer alone as an enterprising app-magazine. It has been joined on the Newsstand by a host of publications put out by [24]29th Street Publishing, which acts as a publisher and marketer for indie editors and writers, and now a clutch of other startups have entered the fray, each toting cheap or free tools that help regular schmoes produce and sell beautiful cross-platform publications. The options available to independent publishers have never been better, but it’s also likely that this space is going to get saturated quickly. Below is a rundown of the new companies that offer digital publishing products.

Here are some of the tools listed in this article:

1. [26]Readymag
2. [27]Periodical
3. [28]Blookist
4. [29]Glossi
5. [30]TypeEngine
6. [31]Packagr

What does all this mean for scholarly publishing? Three initial thoughts occur to me. Firstly, it’s clearer to me than ever why I’m ambivalent about the growth of new journals facilitated by [32]Open Journal Systems. If the journal is freed from the complexity of sales & licensing then why so enthusiastically reproduce the form of long established non-OA journals? Secondly, these tools could offer new opportunities for dissemination by large research projects, publishing accessible material on an ongoing basis rather than restricting dissemination to the end of the project. Thirdly, it potentially becomes feasible to run public engagement projects on an ongoing basis without being completely reliant on grant funding and/or endless unpaid labour.
The surprisingly vitriolic misogyny of James Bond (2015-05-02 08:00)

I recently started reading the Ian Fleming novels for the first time. While I expected some unpleasant sentiments in them, I've been surprised by quite how vitriolic Bond’s misogyny is:

And then there was this pest of a girl. He sighed. Women were for recreation. On a job, they got in the way and fogged things up with sex and hurt feelings and all the emotional baggage they carried around. One had to look out for them and take care of them.
'Bitch,' said Bond, and then remembering the Muntes, he said 'bitch' again more loudly and walked out of the room.

Casino Royale, Pg 32

This was just what he had been afraid of. These blithering women who thought they could do a man's work. Why the hell couldn't they stay at home and mind their pots and pans and stick to their frocks and gossip and leave men's work to the men. And now for this to happen to him, just when the job had come off so beautifully. For vesper to fall for an old trick like that and get herself snatched and probably held to ranson like some bloody heroine in a strip cartoon. The silly bitch. [...] 

The idea was a straight swap. The girl against his cheque for forty million. Well, he wouldn't play; wouldn't think of playing. She was in the Service and knew what she was up against. He wouldn't even ask M. This job was more important than her. It was just too bad. She was a fine girl, but he wasn't going to fall for this childish trick. No dice. He would try and catch the Citroen and shoot it out with them and if she got shot in the process, that was too bad. He would have done his stuff - tried to rescue her before they got her off to some hideout – but if he didn't catch up with them he would get back to his hotel and go to sleep and say no more about it. The next morning he would ask Mathis what had happened to her and show him the note. If Le Chiffre put the touch on Bond for the money in exchange for the girl, Bond would do nothing and tell no one. The girl would just have to take it. If the commissionaire came along with the story of what he had seen, Bond would bluff it out by saying he had had a drunken row with the girl.

Casino Royale Pg. 116-117

Through the red mist of pain, Bond thought of Vesper. He could imagine how she was being used by the two gunmen. They would be making the most of her before she was sent for by Le Chiffre. He thought of the fat wet lips of the Corsican and the slow cruelty of the thin man. Poor wretch to have been dragged into this. Poor little beast.

Casino Royale, Pg 137

laimgr (2016-01-19 12:34:53)

It’s interesting - I always thought the films put a gloss on the novels in this respect. they were sexist but not anywhere near as misogynistic as the books. However, the misogyny has definitely surfaced in the Daniel Craig films. Skyfall was appalling in this respect.

Call for papers: The Great Outdoors? (2015-05-02 08:32)

Call for Papers
THE GREAT OUTDOORS? CHILDREN, YOUNG PEOPLE AND FAMILIES IN NATURAL AND RURAL SPACES

9th and 10th September 2015
Centre for Children & Youth, and Institute of Health & Wellbeing
University of Northampton

Organising committee:

John Horton, Faith Tucker, Michelle Pyer

Keynote speaker:

Professor Owain Jones (Bath Spa University)

Themes:

This conference marks 15 years since the publication of Matthews et al.'s (2000) 'Growing up in the countryside: children and the rural idyll'. This anniversary represents a timely moment for reflection on the state of research into children, young people and families in, and in relation to, 'rural' and 'natural' spaces. We suggest that this anniversary should prompt consideration of the complex ways in which rural and natural spaces have changed over last two decades, recognising the multiple, shifting ruralities and natures which constitute the everyday lives of children, young people and families in diverse international contexts. We also call for continued critical reflection upon the categories of 'natural' and 'rural' which are perhaps too-often conflated, sentimentalised and idealised in relation to childhood, youth and families.

In a context of growing policy/practitioner concern about the value of outdoor, natural and rural spaces (e.g. for education, play, health and well-being) and on-going conceptual/critical reflections upon ideas/norms about nature and countryside (e.g. via wonderfully rich theorisations of landscape, materiality, vitalities, human-nonhuman interactions, emotions/affects), we invite papers which focus on children, young people and families in relation to the following topics:

Managing natural and/or rural environments for children, young people and families;
Play and learning in natural and/or outdoor spaces;
Rural change and livelihoods in the Global South;
Health and wellbeing in natural and/or outdoor spaces;
Friendships, relationships and belonging in rural and/or natural environments;
Innovative concepts and research methods for exploring rural and/or natural spaces;
Community social norms and surveillance in rural and/or natural areas;
Participation, activism and citizenship in natural and/or outdoor spaces;
Concepts of rural idyll, nature deficit disorder and the great outdoors;
Changing contexts of policy and service provision for rural spaces;
Rural mobilities, economies and housing

Abstracts (c.200 words) should be emailed to: faith.tucker@northampton.ac.uk by 15th June 2015.

Further information:

Location: The conference will be held at Sunley Conference Centre, University of Northampton.
Conference registration: standard fee £160, postgraduate students £90. Fee includes lunch on both days and conference dinner on 9th September. Accommodation can be booked at Sunley Conference Centre (http://www.sunley-northampton.co.uk/index.php). Please note that there is an additional charge for accommodation.

Email: faith.tucker@northampton.ac.uk

For those unfamiliar with it, Microtasking could be the future of work. As well as digitised tasks that can literally be minutes long (see [1]Amazon Mechanical Turk) companies like [2]TaskRabbit unbundle what might have previously been temporary jobs and allow those who would not or could not hire a full time assistant to occasionally hire people to perform assistant like tasks. This is how TaskRabbit works:

Doesn’t it look nice? Well, no, not really. The chronopolitics of it are extremely interesting (i.e. using wealth to free up your time by hiring those who need to sell theirs) and the potential long term trajectory is extremely worrying: see [4]Zero Hours for an example of where this might lead. If you’re interested in finding out more, the Matter online magazine are running a series of reflections called the on-demand diaries. Here are links to the first two and there are apparently more to come:

A new campaign for accessible conferences fees (2015-05-03 07:51)

Do you think conference fees are too high? Lots of people do (including the [1]editor of this site). Sign a [2]petition here to show your support. You can find out more about the campaign and the issues it’s addressing [3]here:

And yet, our universities and our academic events (including conferences) keep ignoring this reality. It’s time for conference organizers and, more generally, our departments and universities to acknowledge the existing variability in job conditions, and stop ignoring it. Adjuncts and lecturers, and (perhaps to a lesser extend) also postdocs, are generally outside the domain of most, if not all funding opportunities, in spite of constituting an important part of our universities and carrying an important burden of each department’s teaching load. They are neither students, nor real faculty members. They are at the margins. Creating a third category for conference registration is just one step, but an important one, towards recognizing the conditions of scholars who are struggling to be part of the research community, in spite of their uncool job titles and their job instability.

This is an important attempt to create the expectation that the pricing of events be done in a way that makes them accessible. Obviously it’s difficult to organise events but, if it’s really not possible to organise a conference in a way that fundamentally excludes a large (and growing) section of the academic workforce then we need to [5]rethink what exactly we mean by a ‘conference’ and the purposes that it serves.

3. https://academiserias.wordpress.com/

Benjamin Geer (2015-05-03 08:31:50)

Have any anthropologists figured out the purpose of conferences? I’ve been to quite a few, because everyone said it was the thing to do, and I’m still puzzled. Why spend all that money on planes and hotels just to listen to people read papers out loud, as if we were all children who need to have our bedtime stories read to us because we can’t read them ourselves? Sure, it’s nice to catch up with friends, but couldn’t we just skip the conference and go on holiday together, probably to someplace much nicer?

Sociological Imagination (2015-05-03 08:52:11)

Well said

This Day event will take place in the James France Building, room CC021, from 10.30-4.30pm - 2 June 2015, and
will focus on the Future of Social Critique.

The event was organised to celebrate the careers of two renowned colleagues in our department, Prof Michael Pickering and Prof. Graham Murdock, but also as an opportunity to broaden the discussion on the subject.

Synopsis
The continuing financial crisis of capitalism in Europe has been accompanied by a right-wing response that has sought to reduce the size of the state and the power of labour, changes that will inevitably increase income inequality and consequently other inequalities in the future placing the burden of the crisis on the shoulders of those least able to bear it. This neo-liberal response has not gone unchallenged at least in some European countries. We have witnessed the growth of extra-parliamentary and more recently parliamentary opposition on both the right and the left. In the UK, however, whilst we have experienced a ‘revolt from the right’ with the growth of UKIP, the response from the left has been more muted. While there has been some left opposition to austerity, it has remained largely on the margins. In contrast, the early years of the Thatcherite project in the UK saw a flowering of radical opposition that crossed over from politics to culture to the academy. The questions animating this seminar are: if then, then why not now? What has changed both inside and outside universities? How do we assess questions of value and make this a key aspect of critique? What resources are generally available for the renewal of critique? Whatever happened to the 'public intellectual'?

Some brief thoughts about digital social ontology (2015-05-03 08:00)

A few years ago I sat in a publishing workshop in London listening to a presentation about ontology. My confusion grew as the presenter continued to make all manner of claims about ontology that I didn’t understand. As someone who had two degrees in philosophy before turning into a theoretically inclined sociologist, I thought I had a pretty confident grasp of what ontology was and how it was discussed. Yet I had no idea what on earth she was talking about. It eventually clicked that ontology meant something very different to publishing & information science people. I’ve been thinking about that experience recently, as I’ve been making plans for the [1]digital ontology symposium that the Centre for Social Ontology is holding in London this July.

The idea for the event is to bring together people from web science, media sociology, science & technology studies, social informatics and complexity with a shared focus on digital data and digital technology. My hope is that digital social ontology might bridge the gap between these different forms of ontology: understanding taxonomies as (re)produced and transformed, mediated by the material constraints & enablements of technological artefacts, through human activity within a social context and in turn exercising causal power in relation to happenings within
that context, as mediated through digital artefacts & infrastructure.

This would be a crude overview of a realist approach to digital social ontology but my broader point is about the need to incorporate these three areas of ontological discourse (social context & activity, technical artefacts & infrastructure, relational & conceptual taxonomies) into one overarching frame of reference. This isn’t new: I’m aware that software studies & STS have, in different ways, done this already. Plus I’d appreciate anyone pointing out other instances I might not have encountered! But I’m suggesting that a meta-theoretical conversation across disciplinary and paradigmatic boundaries could help structure a broader domain of ‘digital social ontology’ with practical transdisciplinary relevance.

The burden of continual assessment in a digital age (2015-05-03 11:58)

Due to my current reliance upon a laptop that’s unsuitable for my work, I presently find myself running a disk cleaning utility on a near daily basis. It’s a very useful bit of software that very quickly wipes caches and clears unneeded files. I like it a lot and it was pretty cheap to purchase. But every time I use it, I’m presented with the following request:

Selecting the happy face produces a request for a ‘review or rating’. Selecting the neutral or sad faces leads to an invitation to get in touch to raise concerns or address technical problems. The software casts the user in a role of perpetual evaluation from which it’s relatively easy to escape (with one or two clicks) but impossible to reject all together. This strikes me as an interesting metaphor for operation of digital systems which aim to produce ‘excellence’ through real-time user feedback - in this sense, I see this as big data even if the data in question are not very, well, big - as well as a taste of what seems likely to become a potentially overwhelming routine feature of daily life in the near future. Each individual act of evaluation is trivial but the aggregate cognitive burden likely isn’t.

The Social Ontology of Digital Data & Digital Technology, July 8th in London (2015-05-04 08:00)

This innovative conference brings together leading figures from a variety of fields which address issues of digital technology and digital data. We’ve invited speakers with a range of intellectual perspectives and disciplinary backgrounds who engage with questions relating to digital data and digital technology in their work. Our suggestion is that social ontology, however this might be construed, represents a potential common ground that could cut across this still rather siloed domain of inquiry into the social dimensions of digital technology.

The conference aims to explore this possibility by assembling a diverse range of perspectives and drawing them into a dialogue about a common question, without assuming a shared understanding of the topic at hand. Our aim is to extend this digitally via twitter, podcast and blog beyond the event itself, in order to facilitate an extended conversation that will draw more people into its remit as it circulates after the conference itself.

To this end, we invite each speaker to address this theme (the social ontology of digital data & digital technology) in whatever way they choose. Each speaker will have 30 mins to talk and 15 mins for questions. We’ll have an accomplished audio editor on hand to record each talk as a podcast. These will be released on [1]www.socialontology.org and will be circulated on social media in order to try and stimulate a continuing debate around the issues raised at the conference. The hashtag for the day will be #socialontology.

Confirmed Speakers:

- Noortje Marres (Goldsmiths) – Does Digital Sociology have a Problem?
- Jochen Runde (Cambridge) – Non-materiality and the Ontology of Digital Objects
- Alistair Mutch (NTU) – title TBC
- Susan Halford (Southampton) – title TBC
- Nick Couldry (LSE) – title TBC
- Emma Uprichard (Warwick) - title TBC
The ten habits of failed grant proposal writers (2015-05-04 08:06)

An incredibly useful post by Pat Thomson, particularly for those early career researchers (such as myself) beginning to cautiously dip their toes into the water of applying for grants:

[1]the ten habits of highly unsuccessful research bid writers

Early retirement blogging (2015-05-04 08:22)

Would you like to retire? While many might have this thought as a fleeting whim on a bad day at work, the internet is giving rise to a subculture in which strategies to achieve retirement earlier are shared and refined. Here's [1]an example:

Unlike many other ERE (early retirement extreme) blogs I've included some fairly specific details about my income below. Having read quite a few of these blogs it really isn’t helpful that most of them don’t talk about their incomes because this makes it very difficult to assess how likely it would be for someone else to pursue a similar financial plan. I've decided to include my own actual income in order to make it very clear that my early retirement strategy excludes at least the bottom 80 % of income earners. So in short, unless you’re a high income earner in the UK already, or are on the path to becoming one, there is no point you reading this! This is what all ERE blogs should say, but don’t.

My grand plan pads out into three stages – 40-48/ 48-60/ 60+. The boundaries are flexible. NB I only stumbled upon and committed to the idea of early-retirement when I was 41 this August 2014 (so slightly oddly I've backdated this plan!)

The author in question explicitly links their ambition to [3]the transformation of teaching and their lack of satisfaction under new conditions. In this sense, it’s an obvious question to ask whether the rise of early retirement strategizing
has its roots in an occupational crisis within the professions. But there’s clearly a crucial role being played by social media, facilitating the elaboration of a discourse that allows what might otherwise have been vague aims to become precisely formulated plans articulated in a shared vocabulary.

Sometimes it takes a more extreme form than this. Early-retirement extreme can be seen as akin to lifestyle minimalism, an ascetic practice of renouncing consumption motivated by the desire for clarity and focus, except for the sake of retirement at the end of it rather than being an end in itself. It also seems to be a field in which, like lifestyle minimalism, people stake out a claim as gurus and make the secondary income stream (which these blogs say is necessary for early-retirement) by preaching the virtues of early-retirement itself. Presumably though, as in any other field like this, there will be many making no money from such cultural entrepreneurialism for every person who is doing so successfully.

'Media, Gender & Culture' Summer School, King’s College London (2015-05-05 07:14)

King's College London Summer School 2014

'Media, Gender & Culture'

How does gender organize contemporary life? What role does media play in shaping individual identities, cultural attitudes and social practices? How can we understand gender inequality on a global scale? What is the relation between media and capitalism? Can media be used as a resource for cultural politics and activism? By who, and in what ways?

3476
Exploring these and other questions, this course offers students the opportunity to study media, gender and culture in transnational perspective. Students on the course will gain a critical foundation in gender and cultural theory, examining issues such as the representation of women in news media, constructions of gender and sexuality in advertising, as well as the role of gender in shaping media production practices. Examining current trends in popular film and television, we will consider debates over 'postfeminism' and the 'sexualisation of culture'; through discussion of both transnational protest movements and local activist campaigns, we will think through some of the ways social media might be used as a tool of social change. In dedicated workshops students will learn how to critically analyse a range of media forms, including print, screen and digital media. Taking advantage of our central London location, the class will visit a number of the capital’s foremost cultural institutes – including BBC Broadcasting House and the Victoria and Albert Museum – where students will have the opportunity to meet with practitioners from the media and cultural industries. At all points the course will promote intersectional thinking, as we consider how gender interacts with other axes of power such as sexuality, race, and class. Engaging research and theory from a diverse range of social and cultural contexts, students will develop the knowledge and critical skills necessary to analyse gender, media and culture in a global arena.

Registration for the 'Media, Gender & Culture' Summer School course is now open.

Academic entrepreneurship and white privilege (2015-05-06 08:00)

An interesting story circulated recently which was widely seen as a particularly egregious instance of white privilege within the academy:

On the evening of March 25, the hashtag #CadaanStudies ("cadaan" meaning "white" in Somali) emerged amongst Twitter timelines as a small collective of Somali academics and writers spoke out, 140 characters (or less) at a time. Initiated by Safia Aidid, a Canadian Harvard PhD candidate, the hashtag gradually became a commentary on the whiteness and privileges prominent within academia. More specifically, the online conversation served as a direct response to the launch of the Somaliland Journal of African Studies (SJAS), a peer-reviewed scholarly journal that claims a particular focus on East Africa—the absence of a single Somali editor, advisory board member, or contributor left many pointing out that the only thing Somali about this journal is its title.

Founded by Rodrigo Vaz, a white male MSc candidate for The School of Oriental and African Studies at University of London, the journal was made in collaboration with University of Hargeysa's Institute for Peace and Conflict Studies. Yet somehow, it lacks any Somali involvement. This fundamental error is one often repeated in academia or any platforms that narrate the black or African experience.

While agreeing with how this case has been framed, as well as the condemnation it has been subject to, it strikes me that there's another aspect of the story which has been less widely remarked upon:

But its description stating that SJAS is dedicated to "covering an academic research area in clear expansion" led many to wonder if this journal was simply created by an aspiring young, white academic hoping to attain credit in an area with growing scholarship that's still garnering little attention.

Consider what has happened here: a masters student founds a journal and appoints himself Editor-in-Chief. How long has this been something that masters students do? It's a broader instance of something that fascinates me. We can see it in the endless ‘turns’ in which someone seeks to capture the intellectual attention space in a way that ensures their own prominence within it. We can see it in the endless proliferation of X Studies in which the intellectual attention space fragments into discrete areas of inquiry with their own conferences, journals and networks within which early entrants automatically find themselves placed in a position of prominence.
There’s much more to academic entrepreneurship than this (as can be seen in the academic-as-fundraiser model we’re sliding towards) but these intellectual strategies can usefully be seen in these terms. The impulse to pro-actively shape a field in this way is a situationally rational response to an accelerated academy in which secure jobs are scarce and attention spans are short. My point is not that privilege is incidental to the case but rather that what makes this story so off putting is the way in which academic entrepreneurship intersects with white privilege.

[...] Girlhood in Post-Socialist Times [...] 

The Sussex Humanities Lab at the University of Sussex is pleased to invite applications to study for a PhD. We are offering 4 Home/EU fully funded scholarships and 1 International fully funded scholarship OR 5 Home/EU fully funded scholarships depending on the applicants.

The Humanities demand re-invention. Digital transformation means the objects of humanist study have changed. This project and programme of activities is designed to develop critiques, methodologies, and tools ensuring this field is fit for the future. As our culture is re-born digital, old divisions that marked out image from text, music from paint and object from performance, have become increasingly archaic - legacies of the technologies of print and the medieval university. When all the forms of cultural production flow through the digital, the boundaries between them are reconfigured. This reality calls for us to build fields of study informed by new digital objects of study, rather than by inherited disciplinary silos.
We welcome applicants with humanities, social science and computational specialisms and anticipate cross-school supervision teams.

Successful international applicants to either School of Media, Film and Music, the School of History, Art History and Philosophy or the School of Education and Social Work will be eligible to compete for a Sussex Humanities Lab scholarship.

**Timetable**

[1] 27th May 2015 - Deadline for completed applications

[2] 3rd June 2015 - List of applicants holding offers to be sent to Panel for consideration

[3] 15th June 2015 - Deadline for applicants to be informed of the outcome

[4] [http://www.sussex.ac.uk/study/money/scholarships/pgr2015/view/504](http://www.sussex.ac.uk/study/money/scholarships/pgr2015/view/504)

**The omnipresent threat of violence under neoliberalism (2015-05-07 08:00)**

An important argument by David Graeber in his new book. I've been thinking about this (particularly on university campuses) since [1] events at Warwick last term and I find his analysis deeply persuasive:

And indeed, in this most recent phase of total bureaucratization, we've seen security cameras, police scooters, issuers of temporary ID cards, and men and women in a variety of uniforms acting in either public or private capacities, trained in tactics of menacing, intimidating and ultimately deploying physical violence, just about everywhere – even in places such as playgrounds, primary schools, college campuses, hospitals, libraries, parks, or beach resorts, where fifty years ago their presence would have been considered scandalous, or simply weird.

All this takes place as social theorists continue to insist that the direct appeal to force plays less and less of a factor in maintaining structures of social control. The more reports one reads, in fact, of university students being tasered for unauthorised library use, or English professors being jailed and charged with felonies after being caught jaywalking on campus, the louder the defiant insistent that the kinds of subtle symbolic power analysed by English professor are what's really important. It begins to sound more and more like a desperate refusal to accept that the workings of power could really be so crude and simplistic as what daily evidence proves them to be.

It is curious how rarely citizens in industrial democracies actually think about this fact, or how instinctively we try to discount its importance. This is what makes it possible, for example, for graduate students to be able to spend days in the stacks of university libraries poring over Foucault-inspired theoretical tracts and the declining importance of coercion as a factor in modern life without ever reflecting on that fact that, had they insisted on their right to enter the stacks without showing a properly stamped and validating ID, armed men would have been summoned to physically remove them, using whatever force might be required. It’s almost as if the more we allow aspects of our everyday existence to fall under the purview of bureaucratic regulations, the more everyone concerned colludes to downplay the fact (perfectly obvious to those actually running the system) that all of it ultimately depends on the threat of physical force.

**Straight with a twist*: reflections on heterosexuality beyond the heteronormal (2015-05-08 08:00)**

heterosexuality beyond the heteronormal

Call for Papers on the 3rd European Geographies of Sexualities Conference, Rome, 16-18 September 2015

Session organizers:
Valerie De Craene and Maarten Loopmans, University of Leuven, Belgium

In recent years, geographers have paid increasing attention to heterosexuality, underlining the multiplicity of heterosexual identities and performances. Normative heterosexuality has been described as "a highly unstable, default characterization for people who have not marked themselves or been marked by others as homosexual. (...) The resulting class of heterosexuals is a default class, home to those who have not fallen out of it" (Halley, 1993, p 83, 85).

This session aims to critically reflect on and explore possibilities for a queer analysis of heterosexuality. We follow the line of argument that queer should not be reduced to sexual preference (cfr. "Queer is more than short hand for LGBT" (Browne, 2006, p. 886); Thomas, 2000), nor should it (only) imply an expression of "an affiliation with antihomophobic politics" (Butler, 1993, p. 230). If we understand queer as resistance to regimes of the normal (Warner, 1993), we can critically engage with heterosexuality within and beyond the heteronormal through a queer lens. It offers possibilities for a queer analysis of processes of inclusion and exclusion, of deconstruction and (re)production of heterosexual desire, behavior, identities, practices.

Such straight queer aspiration has a clear political ambition. As Thomas (2000) puts it, straight disloyalty to straight identity is "to assist in working the weaknesses in the heterosexual norm, to inhibit the practice of heterosexuality’s rearticulation and inhibit its hegemonic dominance" (p. 31). Indeed, the repeated subverting, parodying and challenging of heteronormativities, might actually help to change dominant 'scripts' (Butler, 2000). Taking a position of a queer aspiring straight should always be handled with care, bearing in mind the privileged position one speaks from, and therefore always requires a complicated negotiation of a straight critic’s subject position (Schlichter, 2004).
As such, recent geographic research on non-heteronormative heterosexualities has emphasized the biopolitical regulatory urge which has set aside non-heteronormative heterosexualities as a discursive and spatial antipode for the construction of heteronormality. In such discourse, a moral geography is constructed segregating certain performances of heterosexuality as "incompatible with family occupation" (Hubbard and Prior 2013, p. 145). The policing and control of heterosexualities outside the norm, such as adult entertainment, is exposed as functional to the biopolitical regulation of the wider population (Howell, 2004; Brown & Knopp, 2010; Evered & Evered, 2013).

Simultaneously, micro-spatial studies have emphasized everyday spatial performativities (Gregson and Rose, 2000) to demonstrate how heteronormativity is at the same time challenged and reproduced through the repeated construction and performance of also straight queer subjectivities (Faier, 2014; Silvey, 2010). Moreover, geographers have emphasized how performances and places are mutually constitutive and intrinsically related; performances take and make place simultaneously and both are constitutive to sexual identities. Performances in one place and time cannot be understood in isolation from experiences and performances in other places and times.

The overall aim of this session is to develop a better theoretical understanding of heterosexuality beyond the heteronormal and to explore its various guises empirically and theoretically. We encourage a wide variety of contributions, on topics such as (but not limited to):
- How do new media and digital social networks favour the expression of different forms of heterosexuality?
- Queer spatial performances of heterosexualities
- Exploring heterotopia from where to challenge heteronormativities
- Queering heterosexuality from the rural to the urban
- Spaces of queer heterosexualities from transactional sex to Durex Play

Proposals (max. 250 words) can be submitted by email until April 28, 2015 to: Valerie.Decraene@ees.kuleuven.be and Maarten.Loopmans@ees.kuleuven.be.

Outline of a relational realist theory of anarchism (2015-05-09 08:00)

In the last few days I read David Graeber’s new book which begins to develop a novel left-wing critique of bureaucracy. I’d seen Graeber lecture but hadn’t read anything by him previously. His anarchism comes through much more clearly in his book than it did in the lecture I saw him give on the the history of debt at the International Association for Critical Realism conference last year.

It’s left me thinking about my own anarchism: something which was central to my outlook on the world and my activism for a long time but which I gradually drifted away from in the process of my transition into a sociology department. In part this was because I began to realise that my anarchism had been sociologically naive (something I realise now was a statement about my anarchism rather than anything intrinsic to it as a political outlook) and I was troubled by the individualism I increasingly saw as latent in it in spite of my frequent invocations of the nebulous concept of ‘community’. I also had an increasing awareness of the usefulness of bureaucratic organisations that sat uneasily with my professed anarchism. I’ve always endorsed what Noam Chomsky sees anarchism to be but I’ve never been convinced he’s describing anything more than anti-authoritarianism when he makes statements like [1]this:
Well, anarchism is, in my view, basically a kind of tendency in human thought which shows up in different forms in different circumstances, and has some leading characteristics. Primarily it is a tendency that is suspicious and skeptical of domination, authority, and hierarchy. It seeks structures of hierarchy and domination in human life over the whole range, extending from, say, patriarchal families to, say, imperial systems, and it asks whether those systems are justified. It assumes that the burden of proof for anyone in a position of power and authority lies on them. Their authority is not self-justifying. They have to give a reason for it, a justification. And if they can't justify that authority and power and control, which is the usual case, then the authority ought to be dismantled and replaced by something more free and just. And, as I understand it, anarchy is just that tendency. It takes different forms at different times.

I’m increasingly wondering if relational realism provides a useful starting point for conceptualising the theory and practice of anarchism. From this perspective, much of sociological thought has either assumed relations and treated them as epiphenomenal or dealt with them in a basically minimalistic way: as internal relations between social roles (e.g. landlord/tenant, teacher/student), the occupancy of social position within distributional structures or as trajectories of iterated interaction. The former view treats role incumbents as basically interchangeable while the latter view presents social life as ceaseless transactions. What all miss is the quality of the social relationship which has crucial causal implications for how the parties so related act in relation to each other.

These qualities exist for those related in virtue of the relationship. For instance, you can’t point to the ‘trust’ in a trusting relationship but this quality is integral to those who are related in such a way. It’s something produced through interaction but irreducible to that interaction: it can be lost even if both parties value that trust. This is the foundation of collective concern because the character of our relations matters to us. This is what Archer and Donati talk about as collective reflexivity: ‘collective orientation to our collective outputs’. The notion of a safe space is an interesting example of this: one in which a group is concerned to develop social relations in which all members feel able to voice their concerns without censure. But collective reflexivity can be found wherever there are social relations.

This offers us a way of theorising collectivity between people that has no need to impute identical beliefs, identities or commitments to members of the collective. It’s a theory of shared commitment and I think it has important implications for political theory which I’m in the process of trying to elucidate. One of these is for anarchism itself: it seems to me that it offers a way of thinking about communality that fiercely critiques bureaucracy without lapsing into individualism. I’m playing with the idea that hierarchies in themselves tend to be corrosive towards relational goods and that there are other features of bureaucratic modes of organisation which contribute to this corrosiveness in different ways e.g. impersonality. We could see bureaucracy as a social technology which seeks to turn thick relationality (of the kind that generates relational goods) into thin relationality (links between roles within an organisation) and in doing so has an inherent tendency towards the impoverishment of human life. I think relational realism has a lot to offer Graeber’s project of trying to develop a language in which we can be much more precise about what it is we object to in bureaucracy.

kerrysmallman (2015-05-09 14:50:47)
Thanks for this thought-provoking article which has given me a great deal to add to my reading list! I find myself increasingly moving towards an anarchistic political outlook. The anti-austerity, pro-Government, pro-employment, pro-Bureaucracy
narrative which the left seems to be unable to see past is a hiding to nothing, in my opinion.

Sociological Imagination (2015-05-09 18:48:01)
David Graeber’s book is totally worth reading then :-)

The Problem of the Opaque Subject (2015-05-09 11:50)

In his recent book [1]The Happiness Industry, Will Davies offers an interesting analysis of [2]whiplash and its uneven growth across the world in recent years even as car safety standards have increased. He observes that the "bizarre philosophical status of whiplash as a form of entirely invisible pain makes it unusually amenable to fraudulent insurance claims" but that for the same reason "it is impossible to ever know how much fraud is really going on".

In this sense I think whiplash is emblematic of a more primitive philosophical problem of the opaque subject. Across the full range of human activity, we find that first-person experience takes on an enduring significance. In many cases, this significance is ignored or denied, but we can’t ever quite get away from it. Even when we look for proxies, objective features of a person to measure which stand in for subjective characteristics, we affirm the importance of first-person experience even as we try and reduce it to the measurable.

This epistemological challenge can be seen as integral to human agency: we’re disposed to be concerned about a subjective reality which forever eludes our capacity to gain what is seen as reliable knowledge about it. The intellectually history of this problem is obviously extremely complex at the level of theory, methods and methodology. But I’ve been thinking recently about how the problem of the opaque subject is engaged with culturally. Consider the lie detector:

![IFRAME: [3]https://www.youtube.com/embed/tHCDnKhppw8](https://www.youtube.com/embed/tHCDnKhppw8)

This technology is seen to help us overcome the problem of the opaque subject. It cuts through the ambivalence and uncertainty of interaction between subjects who are reciprocally opaque and helps us find the hidden truths behind the masks we wear. In reality it does little more than measure the relation between physiological arousal (blood pressure, pulse rate, breathing etc) and the questions being asked under bizarre and artificial circumstances. But we could see the 'lie detector', such a familiar trope of TV and film, as a fetish object which helps maintain an illusory belief in a world in which other people can in principle be rendered transparent. It props up a certain utopian sense of technological capacity and helps us avoid confrontation with the existential and ethical dilemmas which the problem of the opaque subject unavoidably poses for us.

Five ways to deal with 5 years of a Conservative government (2015-05-09 11:56)

An excellent post by [1]Rebecca Winson on the CLASS blog. Important advice for left-wing sociologists in the UK who are currently in a state of mild despair:

1. If you're in work - or maybe even if you're not - join a trade union.

2. Get involved in community activism too. Housing groups, food banks, local strikes, local progressive parties. Work for the vulnerable.

3. Soz, but we're going to have to be tireless.

4. Don't be tied by party lines.

5. Find a way to preach to the unconverted. We need them on our side.

These are just a summary. Read the full post [2]here.

The Dilemmas of the Consumer (2015-05-09 12:07)

It’s hard being a consumer these days. Do I buy it? Do I not buy it? How many minutes will I have left by the time I’ve blogged about it?
The gloomy digital sociology of Zygmunt Bauman (2015-05-09 13:45)

From Bauman's talk at re:publica a couple of days ago. They've released these videos with remarkable speed:

[IFRAMEx 1]https://www.youtube.com/embed/860aspvsS1E

Working in the on-demand economy (2015-05-09 13:49)

An interesting though remarkably uncritical discussion of working in the on-demand economy:
The place of sociology in the Second Machine Age (2015-05-10 08:00)

We've recently seen an emerging discourse of the 'second machine age' considering the potential implications of advances in robots and computational technologies for employment. In a recent [1]London Review of Books essay, John Lanchester offers an insightful overview of this issue:

What if that’s where we are, and – to use the shorthand phrase relished by economists and futurists – 'robots are going to eat all the jobs'? A thorough, considered and disconcerting study of that possibility was undertaken by two Oxford economists, Carl Benedikt Frey and Michael Osborne, in a paper from 2013 called 'The Future of Employment: How Susceptible Are Jobs to Computerisation?'[2] They came up with some new mathematical and statistical techniques to calculate the likely impact of technological change on a sweeping range of 702 occupations, from podiatrists to tour guides, animal trainers to personal finance advisers and floor sanders. It ranks them, from 1 (you’ll be fine) to 702 (best start shining up the CV). In case you’re wondering, here are the top five occupations:

1. Recreational Therapists
2. First-Line Supervisors of Mechanics, Installers and Repairers
3. Emergency Management Directors
4. Mental Health and Substance Abuse Social Workers
5. Audiologists

And here are the bottom five:

- 698. Insurance Underwriters
- 699. Mathematical Technicians
- 700. Sewers, Hand
- 701. Title Examiners, Abstractors and Searchers
- 702. Telemarketers

The theme is clear: human-to-human interaction and judgment is in demand, routine tasks are not. Some of the judgments seem odd: is it really the case that choreographers come in at 13, ahead of physicians and surgeons at 15, and a long way ahead of, say, anthropologists and archaeologists at 39, not to mention writers at 123 and editors at 140? Nonetheless, the paper’s methodology is sober and it makes clear just how far-ranging the impact of technological change is in white as well as blue-collar work.

Leaving aside any specific problems we can identify with the methodology here, it nonetheless raises important questions about the future of capitalism. What makes Lanchester’s article so commendable is his insistence that this tendency is not inexorable and he calls for what might be described as a repoliticisation of an issue that has been (self-interestedly?) rendered as narrowly technical. The hyper-capitalist dystopia of vast unemployment predicated upon robotics is something which has haunted popular culture, coming to be represented in everything from 2000AD to the more recent films of Neill Blomkamp:
What Lanchester suggests is that we need to move beyond dystopian imagery in order to flesh out our heretofore entirely speculative understanding of what might happen if 47% of jobs are lost in two decades. We also need to recover the latent promise that robotics and computation might prove emancipatory, creating new possibilities for human flourishing in a world liberated from mental and physical drudgery:

A great deal of modern economic discourse takes it as axiomatic that economic forces are the only ones that matter. This idea has bled into politics too, at least in the Western world: economic forces have been awarded the status of inexorable truths. The idea that a wave of economic change is so disruptive to the social order that a society might rebel against it – that has, it seems, disappeared from the realms of the possible. But the disappearance of 47% of jobs in two decades (as per Frey and Osborne) must be right on the edge of what a society can bear, not so much because of that 47% per cent, as because of the timeframe. Jobs do go away; it’s happened many times. For jobs to go away with that speed, however, is a new thing, and the search for historical precedents, for examples from which we can learn, won’t take us far. How would this speed of job disappearance, combined with extensive deflation, play out? The truth is nobody knows. In the absence of any template or precedent, the idea that the economic process will just roll ahead like a juggernaut, unopposed by any social or political counter-forces, is a stretch. The robots will only eat all the jobs if we decide to let them.

It’s also worth noting what isn’t being said about this robotified future. The scenario we’re given – the one being made to feel inevitable – is of a hyper-capitalist dystopia. There’s capital, doing better than ever; the robots, doing all the work; and the great mass of humanity, doing not much, but having fun playing with its gadgets. (Though if there’s no work, there are going to be questions about who can afford to buy the gadgets.) There is a possible alternative, however, in which ownership and control of robots is disconnected from capital in its current form. The robots liberate most of humanity from work, and everybody benefits from the proceeds: we don’t have to work in factories or go down mines.
or clean toilets or drive long-distance lorries, but we can choreograph and weave and garden and tell stories and invent things and set about creating a new universe of wants. This would be the world of unlimited wants described by economics, but with a distinction between the wants satisfied by humans and the work done by our machines. It seems to me that the only way that world would work is with alternative forms of ownership. The reason, the only reason, for thinking this better world is possible is that the dystopian future of capitalism-plus-robots may prove just too grim to be politically viable. This alternative future would be the kind of world dreamed of by William Morris, full of humans engaged in meaningful and sanely remunerated labour. Except with added robots. It says a lot about the current moment that as we stand facing a future which might resemble either a hyper-capitalist dystopia or a socialist paradise, the second option doesn’t get a mention.

This all raises the question of the place of sociology in a second machine age. It seems to me that we are strongly positioned to make a unique contribution to our understanding of possible futures (e.g. what might happen if 47% of jobs are lost in two decades) as well as, alongside other social sciences, fleshing out our knowledge about the conjunction of factors which might lead to each such possible future. This will involve going beyond the traditional repertories of scholarship and communication. It might benefit from the embrace of design fiction:

Design fiction is a term [6]first coined by Julian Bleecker and [7]popularized by SF author Bruce Sterling, who describes it as “the deliberate use of diegetic prototypes to suspend disbelief about change.” and that it “attacks the status quo and suggests clear ways in which life might become different.”

Design fiction isn't science fiction, it's not just a telling of stories in the future or trying to make predictions of the future, instead it is a way of trying to envision and interrogate possible futures based on research data, current trends, and/or technologies. Originally, primarily used by product designers as a cheap alternative to prototyping new products, it has found traction as a critical tool allowing us to see through the fog of hype and digital evangelism.

[8]https://www.eventbrite.com/e/design-fiction-for-sociologists-tickets-16160973908

There’s an example of the form such a future-orientated sociology might take in a recent event with Deborah Lupton and John Urry at the Hawke Research Institute in Australia. In Catastrophic Futures they addressed the question of what kind of future we can expect by 2050, as well as some of the methodological and political questions posed for sociology by such an investigation. There’s a podcast available [9]here and it’s really worth a listen. It also suggests a need for sociological thinkers to help ‘join the dots’: linking together what we know across a range of fields into broader synthetic accounts that accurately convey conceptually opaque aspects of our present situation and highlight potential trajectories. John Urry’s recent book Offshoring is a good example of what this might look like:
It seems obvious to me that sociology could make an important contribution to the repoliticisation that John Lanchester calls for but it’s not obvious to me that it will. Not least of all because the audit driven logic of the university mitigates against forms of sociological inquiry which by their nature would both transcend specialisation and include a speculative component that resists codification in ‘internationally excellent’ journal articles.

But if the worst does happen, if we see a catastrophic slide into hyper-capitalist dystopia driven by these technological advances, what place would there be for sociology then? It occurs to me that much of sociology could probably thrive quite well in a world where, as Lanchester puts it, "human-to-human interaction and judgment is in demand": the obvious risk is that it would be an instrumentalised sociology, robbed of any critical impulse, with sociologists reduced to technicians of human capital attendant upon the social relation of those still in employment and directed towards the problems caused by those condemned to perpetual unemployment. There might be a place for corporate ethnography but not for critique, for bounded theorising but not for expansive theory. Contrary to John Urry and Deborah Lupton in the aforementioned podcast, I think we should begin to talk about dystopias while we still can.
The Promise of Sociological Fiction (2015-05-10 11:52)

It’s been far from obvious to me what I should say for my talk at the [1]Design Fiction event at Goldsmiths on Wednesday. The motivation behind this event has been little more than "isn’t this interesting? let’s talk about it" but I realise that I’ve become *slightly* clearer through the process of organising the event about why I find it so interesting. I’ll leave it to [2]Tim to introduce design fiction. It’s a concept which is still relatively new to me but it’s one that I immediately found exciting. But it isn’t the only kind of sociological fiction.

I first encountered the *social fiction* of Patricia Leavy a few years ago. She found an outlet in fiction for expression of the cumulative knowledge which journals are ill suited for, as well as an opportunity to reach a much wider public. She edits a Social Fiction series which now has 16 titles. Fiction can, as she puts it, "enable us to crystallize micro-macro links through showing instead of telling": it can allow the sociological imagination to be exercised in a way which is vivid and direct but nonetheless grounded in research.

There are also surprising numbers of distinguished academics who have written novels without, as far as I’m aware, seeing these as social scientific projects per se. For instance Ann Oakley has written 7 novels and Richard Sennett has written 3. Rob Kitchin, who’s a leading figure in digital geography has written 4 novels and 2 collections of short-stories. It would be fascinating to know more about how such thinkers see their fiction and its relationship to their research. Then there’s someone like Sudhir Venkatesh whose work sits uneasily between fiction and non-fiction, in a way open to legitimate criticism, but who shows how sociological writing can exceed conventional categories in a way which engages a mass audience.

I’m interested in how sociological fiction can, as Bourdieu put it, give "symbolic force, by way of artistic form, to critical ideas and analyses". There’s a potentially powerful political function here: both in communicating ideas in an engaging way but also by unsettling that which is taken for granted by vividly representing futures that are either likely or which are being suppressed.

There’s another lovely phrase Bourdieu uses, he talks about the need to "throw their grain of sand into the well-oiled machinery of resigned complicities". I think sociological fiction can help do this by helping illustrate that there are *alternatives* and by exploring their character in a systematic but engaging way. I’m not for a second suggesting this is something *only* sociologists can do, such a claim would be absurd, but rather hoping that sociologists begin to experiment with fiction more widely in order to bring our particular insights and skills to an endeavour in which non-sociologists have long excelled: showing the interplay between biography and history.

[I’d love it if Sociological Imagination could become a platform for sociological fiction: if you’ve written anything that you’d like to see published then please do send it to me (mark AT markcarrigan.net). I’d love to read it.]

The history of Netflix (2015-05-10 12:19)

This talk by the CEO of Netflix is interesting for many reasons. But one more oblique one which struck me was how he describes his career in gladiatorial terms. His initial pronouncement that luck is the main part of commercial success is belied by his subsequent stories of the courageous battles he fought in which he destroyed his more powerful foes, a victory made possible through his courage and perseverance. Do corporate warriors see themselves in these terms? Or is it just something they put on when giving public talks in front of overly-eager audiences?
Who came second in the UK election? (2015-05-10 17:23)

Two very interesting maps by [1]Kieran Healy showing the disjunct between first and second place candidates in each constituency in the UK under our absurd voting system. It’s an important analysis [2]worth reading in full.
Queer Kinship & Relationship Conference 2015 - Registration till 17th of May (only few places left) (2015-05-11 07:11)

We are pleased to announce the registration for non-presenting participants for the Queer Kinship And Relationship Conference (8-11 June 2015, Zalesie, Poland). During the conference we will concentrate on different understandings of queer kinships/relationships, and present more insights into the dynamics of non-normative kinship configurations in various geo-temporal contexts.

The following speakers have accepted our invitation to participate in the conference:

Prof. Judith Butler (University of California, USA),
Dr Ulrika Dahl (Södertörn University, Sweden),
Dr Jacqui Gabb (Open University, United Kingdom),
Dr Ruth Preser (ICI-Berlin Institute for Cultural Inquiry, Germany),
Dr Ana Cristina Santos (Universidade de Coimbra, Portugal).
If you wish to know more about the conference theme and the PRELIMINARY PROGRAM of the conference please visit our website: [1]http://queerkinship.systemcoffee.pl/.

Registration fee for non-presenting participants is 240 EURO (which covers accommodation, meals for the whole conference as well as conference materials). We organize transportation (by coach, optional) from Warsaw to Zalesie and back, transportation fee is additional 25 EURO. Please note, that you can register with an accompanying person (so if you are coming with a friend and you will share a room only one of you needs to proceed with the registration process - fees for accompanying person will be added automatically by the system).

THE ONLINE REGISTRATION FOR THE CONFERENCE IS OPEN FROM 1ST OF MAY, AND WILL BE UNTIL 17TH OF MAY. In order to participate in the conference please make sure, that you register and pay your registration fees which we MUST receive no later than until 17th of May. THE ONLY WAY OF PAYING YOUR REGISTRATION FEES IS BY THE BANK TRANSFER. YOU WILL FIND BANK DETAILS IN THE SYSTEM AFTER YOUR REGISTRATION IS FINISHED. THE NUMBER OF PLACES AVAILABLE FOR THE CONFERENCE IS VERY LIMITED, so in order to participate in the conference please register as soon as possible. After filling in all the available places the registration will be closed. The conference is organized by the research team of the project 'Families of Choice in Poland' (2013-2015), Institute of Psychology, Polish Academy of Sciences. Please do not hesitate to contact us if you have any further enquiries or problems at: [2]familiesofchoice@psych.pan.pl

4th Annual Conference of the
International Social Theory Consortium
Cambridge, UK, June 17-19, 2015

RECONSTRUCTING SOCIAL THEORY, HISTORY AND PRACTICE

We are pleased to announce the 2015 meeting of the International Social Theory Consortium to be held at the Arts School Building, University of Cambridge, June 17-19, 2015.

The central theme of this year’s meeting is 'Reconstruction', dedicated to interrogating the contributions and limits of 'deconstruction' and the possibilities of a return of history.

Are there limits to the deconstruction project, and have these limits been reached? What are the possibilities for the 'reconstruction' of narratives of long-term historical change? Is it possible to include and integrate the insights and contributions of critiques of knowledge, while at the same time developing new forms of knowledge? Can we submit the project of deconstruction itself to deconstruction?

3500
In addition, we continue the ISTC’s tradition of encouraging discussion across the entire range of topics under the general heading of social theory across disciplines in the humanities and social sciences.

Confirmed Speakers include:

Peter Baehr, Lingnan University  
Gurminder Bhambra, University of Warwick  
Harry F. Dahms, University of Tennessee-Knoxville  
Sarah Franklin, University of Cambridge  
Tim Luke, Virginia Tech  
Lois McNay, Oxford University  
Stephen Turner, University of South Florida

Free Registration required through Eventbrite before end of May. Register at: [2]bit.ly/1I4Nw0g

Conference hosts:

International Social Theory Consortium and  
University of Cambridge, Faculty of Human, Social and Political Science

An important contribution to Qualitative Longitudinal Research (2015-05-11 08:00)

Qualitative Longitudinal Research has often been overlooked in the past but it’s been undergoing something of a resurgence in recent years in the UK. There’s an important special issue of the International Journal of Social Research Methodology which collects a number of papers from those at the forefront of these developments. The editorial is free to access at the time of writing:

[2]New frontiers in qualitative longitudinal research: an agenda for research

This paper outlines the state of the art in qualitative longitudinal methodology, reflecting on more than 10 years of development since a previous special issue on qualitative longitudinal research was published by the International Journal of Social Research Methodology in 2003. The papers presented in this special issue emerge from a methodological innovation network that brought together an international community of researchers in order to map new frontiers for the method. This paper summarises the development of the method from a design to a sensibility, identifying three new frontiers as part of a future research agenda including: the need for a processual imaginary; experimentation with temporal perspectives and orientations and explicating the temporal affordances of our methods.

The post-holder will contribute to the continuing success of the MA Digital Culture and Society, and will join the team teaching on and further developing the BA Digital Cultures.

They will be an internationally excellent academic in the area of digital cultures and will have strong record of publications with the potential for impact and research income generation.

They will have a clear plan for building research in digital cultures for the future and the next REF. They will be expected to foster existing and develop new connections with practitioners in the digital industries (in the UK and ideally overseas) and will be open to developing links with colleagues in other departments, and at other universities internationally.

They will be expected to enhance the capacity of the Department to develop successful bids for research grant applications, and obtain funding from third sector source.

**Critical Realism: Reimagining Social Science (2015-05-11 14:15)**

"Critical Realism: Reimagining Social Science"

at the University of Notre Dame, Notre Dame/South Bend, Indiana, USA

27-30 July 2015

"What difference does critical realism make for how we do our empirical work?" More work must be done on how Critical realism may re-orient practical Research. Papers applying a critical realist approach are invited on all topics, but in particular papers that focus on the practical, analytical and methodological implications of critical realism.

The Conference program will include a memorial for Roy Bhaskar (1944-2014)

Details about conference registration, paper submissions, housing and more: [http://csrs.nd.edu/events/iacr2015/](http://csrs.nd.edu/events/iacr2015/)
Submission of papers: send abstract of no more than 500 words to Nicolette Manglos-Weber \textsuperscript{[2]}\texttt{nmanglos@nd.edu} by April 15th 2015

Conference registration deadline: May 30 2015

Registration costs: $400 USD

Conference organiser is professor Christian Smith, Department of Sociology, University of Notre Dame.

After the Conference a one-day interdisciplinary workshop will be held on \textit{What Conversations about Science, Religion and Theology does Critical Realism make Possible (that other Philosophies of Science Do Not)?}

The annual Meeting of the American Sociological Association (ASA) will be held August 22-25 in Chicago. Notre Dame is two hours away from Chicago, and IACR participants may want to prolong their stay to attend the ASA Conference.

Podcasts from the UK Household Longitudinal Study (2015-05-12 08:00)

Understanding Society is the world’s largest household survey, jointly funded by the ESRC and government departments. Here’s how the project describes itself:
Largest household study of its kind

We interview the same people in the same households each year to build a longitudinal picture of how their lives are changing over time.

Represents the diversity of the UK

Our participants live in Scotland, Wales, Northern Ireland and England and all of Britain's ethnic groups are represented in our Ethnicity Sample.

Issues that affect all our lives

Our questionnaires cover a wide variety of themes such as family, education, finance, employment, health and wellbeing. Read about the carefully-chosen questions we ask.

[4]https://www.understandingsociety.ac.uk/about

They've also produced a vast selection of podcasts with the project team and those using the survey data. There's a full list here but we've linked below to some of the ones we thought looked particularly interesting:

- [6] Biomarkers and genetic data podcast
- [7] White flight and the rise of UKIP
- [8] Can video gaming be good for young people?
- [9] Getting online - are older people included?
• Does how we live influence how we sleep?
• Sexual orientation and poverty
• Why sample size matters
• Getting a good night’s sleep
• How British is the UK?

Doing Justice to Figures and Figuration (2015-05-12 11:21)

Registration is now open for Doing Justice to Figures and Figuration, an ESRC and Gender Institute supported one-day graduate symposium at LSE on 19 June. Please [1]visit our registration page to sign up.

Doing Justice to Figures and Figuration seeks to bring together interdisciplinary scholars in the social sciences working on figuration and/or with figures. Figuration – the process of consolidating understandings of individuals and populations into a particular form or idea – is increasingly understood as significant to mobilizing and understanding social and political life. In the stigmatization or celebration of figures, affective and historical discourses of gender, ability, race, religion, sexuality, age, class, and nation are called upon to structure social and political life. Thinking across political and academic uses of figuration, Doing Justice to Figures and Figuration seeks to create a space in which to discuss the potentials and risks of using and interrogating figures within academic research.

The symposium includes a vegetarian and vegan catered lunch, and the following papers:
A public keynote lecture:

Dr. Imogen Tyler (Co-Director, Centre for Gender & Women's Studies: Lancaster)
"Figurative Methods: Craftivist Theory"

Maria Alexopoulos (Humboldt)
"The burden of lesbian existence: Reification and refusal in feminist literature"

Elaine Forde (Goldsmiths)
"Figuring and reconfiguring: The eco-warrior as trickster"

Aura Lehtonen (LSE)
"'The Benefit Scrounger': Racialisation and Sexualisation of the Welfare Recipient in Austerity Britain"

Nicole Shephard (LSE)
"Figuring Big Data"

Lauren Tooker (Warwick)

"Not a Loan, Not Alone? Indebted figuration in the Strike Debt movement"

3508
Design fiction is a term first coined by Julian Bleecker and popularized by SF author Bruce Sterling, who describes it as "the deliberate use of diegetic prototypes to suspend disbelief about change." and that it "attacks the status quo and suggests clear ways in which life might become different."

Design fiction isn't science fiction, it's not just a telling of stories in the future or trying to make predictions of the future, instead it is a way of trying to envision and interrogate possible futures based on research data, current trends, and/or technologies. Originally, primarily used by product designers as a cheap alternative to prototyping new products, it has found traction as a critical tool allowing us to see through the fog of hype and digital evangelism.

In this event Tim Maughan introduces design fiction for sociologists. He discusses the work he is undertaking with Sava Saheli Singh (New York University) and its possible implications for how we write about research.

Keith Kahn-Harris will discuss his new project which looks at how kinds of mainstream texts other than science fiction also generate 'social science fictions', often 'accidentally' as a result of the pragmatic requirements of generating workable plots and scenarios. Such texts can help force attention to a neglected sociological question: what are the limits of possibility in human society?
Sarah Burton will discuss the use of literary techniques within critical theory, thus interrogating (apparent) disciplinary demarcations set in place. Focusing on literary techniques of the fantastic, Sarah will demonstrate how these can be usefully employed in sociology writing to question dominant ideologies and praxis.

Les Back and Mark Carrigan will each offer a short response before the event is opened up for a general discussion.

Social Theory Centre Annual Lecture @SocioWarwick: Imogen Tyler: Classificatory Struggle (2015-05-12 11:27)

Social Theory Centre Annual Lecture 2015

Classificatory Struggle: Class Culture and Inequality in Neo-liberal Times

A Public Lecture with Imogen Tyler
Warwick University, MS.02

May 13th 17.00-18.30 followed by drinks reception – this event is free to attend - all welcome!

Classificatory Struggles: Class, Culture and Inequality in Neoliberal Times

The fate of groups is bound up with the words that designate them (Bourdieu, 1984).

This paper begins by arguing that the fundamental problem that the concept of ‘class’ describes is inequality. The transition from industrial to financial capitalism (neoliberalism) in Europe has effected ‘deepening inequalities of income, health and life chances within and between countries, on a scale not seen since before the Second World War’ (Hall, et al., 2014). In this context, class is an essential point of orientation for social theory if it is to grasp the problem of inequality today. Traversing a route through Pierre Bourdieu’s relational understanding of class, Jacques Rancière’s formulation of declassificatory struggles, Beverley Skeggs’ understanding of class as struggles over value, and Wendy Brown’s argument that neoliberalism is characterised by the culturalization of political

3510
struggles, this paper develops a social theory of classification, with which we might better apprehend the escalating inequalities which characterise the societies in which we live today. The central argument is that social theories of class should be grounded not in the assumption and valorisation of class identities but in an understanding of class as struggles against classification. That is, the most effective forms of class-analysis are concerned not with undertaking classification per se, but rather with exposing and critiquing the consequences of classificatory systems and the forms of value, judgements and norms they establish in human societies. Only through a movement of declassification can social theories of class contribute to the development of alternative social and political imaginaries to the biopolitics of disposability which characterises neoliberal governmentality.

Imogen Tyler is Professor of Sociology and Co-Director of the Centre for Gender & Women’s Studies at Lancaster University. Imogen's research is concerned with social inequalities, power, injustice and resistance. It examines why inequalities exist, why inequalities are currently growing (patterns of neoliberalism, marketization, privatisation and the erosion of democracy in the transition to ‘postwelfare’ systems) and the intersections of different histories and forms of inequality. This is interdisciplinary research which employs mixed methods and draws together long-standing research interests in migration, internal and external borders, sexual politics, social class, race & ethnicity, disability and poverty, and an abiding interest in culture, processes of mediation and political aesthetics. Her book, Revolting Subjects: Social Abjection and Resistance in Neoliberal Britain (2013) developed the concept of ‘social abjection’ to examine the operations of neoliberal state-crafting and was shortlisted for the 2014 Bread & Roses prize for political writing. Imogen has also recently edited a special issue of Citizenship Studies on ‘Immigrant Protest’ (2013) and a book Immigrant Protest: Politics, Aesthetics, and Everyday Dissent (SUNY 2014). Imogen is in the early stages of a new project on the sociology of stigma in neoliberal times, 'The Stigma Doctrine'.

A rare interview in English with the enigmatic French philosopher Michel Serres (2015-05-12 12:03)

I was only introduced to Michel Serres yesterday and he [1]seems like a fascinating figure who is relatively unknown in Anglophone philosophy. Here's what seems to be a rare interview him in English:
Despite being one of our closest living relatives, bonobos are still one of the least well understood of the great apes, largely remaining in the shadow of their better known cousins, the chimpanzees. In contrast to chimpanzees, bonobo societies are characterized by strong female social relationships, female dominance and generally peaceful social interactions. Here I explore the roots of female power in bonobos, focusing on both their reproductive and feeding ecologies, patterns in their communicative behaviour, as well as the extent to which close social bonds contribute to their raised status in bonobo society.
The Shifting Sociologies of the Street (2015-05-12 15:36)

Tuesday 15 September 2015, 10.00 - 18.00, University of Kent

A symposium sponsored by The Sociological Review

The street has long been a key laboratory for studies of social life, from the roots of urban sociology in the pioneering ethnographies of the Chicago School through to the diverse studies considering the performative, affective and non-representational nature of social practice through in situ examination of street etiquette and encounter. For all this, the street remains only loosely defined, and sometimes disappears from view in studies in which social action is privileged over material context.

This symposium - and a subsequent special issue of The Sociological Review - will act as a spur to take the street more seriously in contemporary sociology, and will demonstrate the value of a more careful scrutiny of the importance of the street as a site, scale and field for sociological research.

For more information or to register, see the [1]symposium’s website at the University of Kent

Brick Walls: On Racism and Other Hard Histories - Sara Ahmed @SocioWarwick on May 20th (2015-05-12 16:48)

Warwick Borders, Race, Ethnicity and Migration Network Public Lecture 2015

Brick Walls: On Racism and Other Hard Histories

Professor Sara Ahmed, Goldsmiths, University of London

Wednesday 20th May 5pm-6.30pm
Room S0.11, Social Sciences Building, University of Warwick

In her book, On Being Included: Racism and Diversity in Institutional Life, Sara Ahmed considered how diversity work is often described as "a banging your head against a brick wall job." In this lecture, she reflects further on brick walls as the hardening of histories, or as how histories becomes concrete. But walls that are hard for some (because of who they are, or what they do) do not appear for others. This lecture will invite reflection on how some borders that are tangible and material (that can stop or block bodies from entering) can be understood and lived by others as immaterial (as phantom walls). Thinking through and with walls, the material stuff of power, allows us to explore how diversity work (both the work we do when we try to transform an institution and the work we do when
we do not quite inhabit the norms of an institution) can be an experience of shattering and of assembling worlds from being shattered.

The event will be followed by a drinks reception

This is a public lecture and all are welcome.

If you have any queries about this event please contact Dr Hannah Jones, Sociology [1]h.jones.1@warwick.ac.uk

1. [mailto:h.jones.1@warwick.ac.uk](mailto:h.jones.1@warwick.ac.uk)

The Brave New World of Work: Over 25% of Jobs on Unitemps are for Interns (2015-05-12 21:13)

Out of curiosity I just searched for 'internship' on [1]Unitemps. There are 57 results with intern in the title. There are currently 201 jobs listed on Unitemps. So over 25 % of jobs on Unitemps are currently looking for interns. Many of these have an identical description as "3 Months 'Paid' Internship". The invert commas are presumably intended to indicate a description of the status rather than to cast doubt on the meaningfulness of the pay. But the effect is jarring nonetheless.

What's even more jarring is how many of these internships are clearly just jobs. But calling it an internship is seen to justify much lower wages and/or a flat fee on the strength of a barely sustained pretence that it's a training programme rather than a strategy for recruiting staff at (and potentially below) minimum wage. Remember it's a university at the heart of this. Unitemps is "the University owned temporary staffing service providing job opportunities on campus and with local commercial businesses" for those who haven't encountered it.

The other jobs service my university runs is doing the same thing. These are the first few of the 25 results when you search for "internship" on jobs.ac.uk. Surely the first 'internship' is obviously below minimum wage?
Summary

The SSRC seeks a Program Officer/Director for its new Digital Culture program. The program engages the opportunities and challenges presented to the social sciences, and scholarship more broadly, by the digital revolution. In the program’s first phase, the Program Officer/Director will oversee the engagement of these issues through working groups, a new digital forum, the development of a research agenda, and the exploration of new techniques in digital social science.
Description

The Social Science Research Council (SSRC) is an independent, international, nonprofit organization devoted to the advancement of interdisciplinary research in the social sciences through a wide variety of workshops and conferences, fellowships and grants, summer training institutes, scholarly exchanges, research, and publications.

The SSRC invites applications for the position of Program Officer/Director for the new Digital Culture program. The program engages the opportunities and challenges presented to the social sciences, and scholarship more broadly, by the digital revolution. Opportunities for the production and dissemination of social knowledge are, in many ways, unprecedented. The digital tools and sources of information now available include digitized archives, journals and books; massive data sources of new kinds; enhanced capacity to search; the explosion of software for the organization, investigation, and display of knowledge; radically innovative techniques for data visualization; and a growing commitment by an array of scholarly institutions to extend these means to advance research, teaching, and publishing. The challenges these changes pose to the generation, quality, and availability of knowledge are equally pressing and include the hollowing out of crucial institutions, the privatization and commercialization of data, the frequent absence of gatekeeping and guardianship of standards, and stark inequalities of access.

The Digital Culture program’s first phase will engage these issues through the mobilization of working groups on the curation of scholarly knowledge, the digital social sciences (including, but not limited to, questions surrounding big data), and the reliability of social science. A new digital forum will publish ideas and generate public discussion on these and related topics. The program will also use its first phase to develop a research agenda that brings a range of social science thinking to key questions regarding digital knowledge. Lastly, it will explore and experiment with new techniques in digital social science. The Program Officer/Director will design these activities in collaboration with a program advisory committee and oversee their implementation with the support of the Digital Culture Program Assistant. This is a two-year position with the possibility of renewal.

Qualifications

The best-qualified candidates will have a PhD in one of the social sciences, the humanities, information science, or interdisciplinary fields such as communications and media studies. Strong candidates will also have demonstrated achievements as researchers, as well as experience in the design and managing of digital scholarship. Competitive
candidates should demonstrate experience in collaborative work, the organization of events, and/or connection and outreach to a range of constituencies in academia, publishing, and media. The ability to communicate effectively is crucial, and experience engaging both researchers and nonacademic constituencies, including funders and policymakers, is likewise critical. Familiarity with grants administration and budgeting is desirable. Candidates must demonstrate their ability to work collaboratively and to manage multiple priorities and projects effectively.

Responsibilities

- Manage the continued development and implementation of the Digital Culture program in collaboration with the program’s advisory committee and in consultation with the SSRC’s President and Executive Program Director. This includes the development of funding proposals to support program activities.
- Engage with key members of the program’s network, especially its advisory committee and working groups, to facilitate strategic planning and oversight of program activities.
- Oversee planning for upcoming events, including conferences, workshops, and other meetings, and manage program budgets.
- Oversee the development of the program’s digital forum, and help curate its content in consultation with an editorial board and editorial advisors.
- Oversee the process and quality of publications emerging from the program as well as its online presence.
- Facilitate connections between the program’s scholars and relevant policy and media communities.
- Develop models of “digital social science” that the SSRC could implement and/or promote.
- Liaise and coordinate with other SSRC departments and with partner organizations.
- Handle additional responsibilities and projects as directed, depending on interest and capacity.

Terms, Salary and Benefits

Annual salary will be commensurate with experience. Comprehensive benefits include health, dental, vision, disability, life, and gym reimbursement; outstanding pension plan and tax savings programs; generous vacation and sick leave; and more. Provisions are made for professional staff to continue their development as social scientists while at the Council.

Application Information
For further information or to apply, please send a cover letter that includes your thoughts on how the Digital Culture program might proceed, a curriculum vitae, one writing sample, and the names of at least three professional colleagues who can serve as references to [2]applications@ssrc.org. Please put "Digital Culture PO/PD" in the subject line. Applications will be accepted until the position has been filled but should be received by May 31, 2015, for priority consideration. Please contact Ella Wagner at [3]wagner@ssrc.org with any addition questions.

Call for Papers: Mediated Intimacies: Relationships, Bodies and Technology (2015-05-13 06:24)

Mediated Intimacies: Relationships, Bodies and Technology

Call for Papers: Special Issue of Journal of Gender Studies to be published March 2017 edited by Alison Winch, Feona Attwood, Jamie Hakim.

We are looking for 7000 word completed essays by 31st December 2015

In what ways does media convergence culture represent, intervene in, exploit and enable intimate relations? How is intimacy being reconfigured under neoliberalism?

On the one hand we are living in atomized and individualistic times where relationships are increasingly strategic and competitive. On the other the media has become, as Beverly Skeggs argues, intensely intimate. This special issue on mediated intimacies aims to explore how understandings of intimacy are (re)constructed and experienced, particularly in digital cultures. In addition, we are interested in the ways in which the apparently alienated entrepreneurial self is constructed through and by forging intimate connections and simultaneously how these networks are mined and monetized by corporate culture.

This special issue of Journal of Gender Studies is developed from a symposium held in July 2014 on Mediated Intimacies where the speakers explored, among other topics, girls’ online friendships, ‘expert’ sex advice in printed media, male seduction communities, and how pornography reconceptualises the very idea of intimacy itself.

Potential papers could explore the affective dimensions of intimate practices reflecting the pleasures and pains of life lived under neoliberalism, including how precarity and class impact on the ways in which intimacy is forged. Because digital culture is primarily corporate driven (Taylor 2014) we are interested in how user-generated media employs self-branding strategies. For example, in the refashioning of the body or gendered and sexual identities, or the ways in which intimacy can be a form of self-promotion.

Feminist and queer perspectives seek to expand the reach of what is constituted as belonging, love, connection and intimacy. Whereas recession culture has reestablished normative gender categories (Negra and Tasker 2014)
contemporary digital cultures have the potential to challenge and rework gender and sexual identities (McGlotten 2013). This issue hopes to explore these productive tensions.

Potential papers could also explore how sexuality, sex, sexual knowledges and sexual pleasure function by looking, for example, at Do-It-Yourself porn, sexual subcultures and alternative sex practices. A final consideration underpinning this issue is how different intimacies intersect along axes of class, race, disability, age and geographical location.

Possible topics could include:
● adapting and resisting gendered and sexed identities
● forging new normative gendered identities
● mediatised kinship (families, parenthood and fertility)
● geolocation technology
● dating and hook up apps, sex dating and relationship cultures
● selfies
● role of experts (e.g. sex advisors and agony aunts), including their changing meaning in peer-driven contexts
● mediated romance
● fitness apps and body culture
● use of social networking sites, including Instagram, Facebook, Twitter
● self-branding
● the mediation of friendship
● rebranding feminism
● pornography
● monetization of intimacy, including big data, content generation and PR/advertising

Please send 7000 word completed essays by 31st December 2015 through Scholar One Manuscripts: [1]http://www.tandfonline.com/toc/cjgs20/current. Call for Papers: The Futures We Want: Global Sociology and the Struggles for a Better World

Call for Papers at the ISA World Forum, Vienna, 10-14 July, 2016

Theme: The Futures We Want: Global Sociology and the Struggles for a Better World

Dear colleagues,

We would like to call your attention to the call for papers at the ISA World Forum, RC34, Sociology of Youth panel entitled ‘Understanding Youth Activism in Local, National and Transnational Contexts: Innovative Methodological Approaches’ (full description of the session can be found below).

The session will include 4 papers presented in person, with the possibility of additional papers being made available for distribution or as posters. Papers will be selected by Session Organisers from those submitted to ISA by the deadline of September 30, 2015. Abstracts should be submitted at: [1]https://isaconf.confex.com/isaconf/forum-2016/cfp.cgi

Notification of acceptance will be made by 30 November 2015.

Carles Feixa, Hilary Pilkington and Mariona Ferrer

Session title:

‘Understanding Youth Activism in Local, National and Transnational Contexts: Innovative Methodological Approaches’

Session Organisers:

Carles FEIXA, UDL, Spain
Hilary PILKINGTON, University of Manchester, United Kingdom
Mariona FERRER, Pompeu Fabra University, Spain

Session description:

Amidst the call for academics to think big and to routinely cross disciplinary and geographical boundaries, this panel invites critical discussion of what value is added to knowledge from conducting large scale, transnational research into youth activism. The session invites challenges to methodological assumptions that survey research shows the big picture but at the cost of local nuance while qualitative research cannot speak beyond the individual case. It welcomes discussion and examples of the potential for conducting context-sensitive survey research and meta-ethnographic analyses that allow interview and ethnographic data to speak across the local and national contexts in which they are embedded without making false claims to representativeness. It also welcomes contributions that demonstrate the added explanatory value that can be generated from triangulating data of qualitatively different kinds in order to understand contemporary youth experience.

“Go Home”: Mapping Immigration Controversy

End of Project Conference

[1]REGISTER HERE

June 10th, 9.30am - 6.30pm, University of Warwick, Social Sciences Building

This one day conference is aimed at academics and activists interested in discussing the findings of the Mapping Immigration Controversy project. We want to bring together learning and research within and outside universities, to discuss how government rhetoric and practice on immigration is affecting our everyday lives, and the new forms of resistance that are emerging.

Keynote speakers:

Panel discussions on:

Activist Research Methodology

State Communications on Immigration

Resistance

The conference will also include performance and interactive sessions
Free attendance, including lunch, but you need to register

The Mapping Immigration Controversy project is an 18 month research project that had been exploring the impacts on local communities and national debate of current publicity campaigns about migration by the UK Home Office. Discussions at the conference will build on our interim findings and will include other researchers and activists.

GETTING TO THE EVENT
The nearest mainline station to the University of Warwick is Coventry station. Buses and taxis to campus are available at the station. There is pay and display car parking on campus but spaces are often very limited. You can find out more about transport options here: [9] http://www2.warwick.ac.uk/about/visiting/directions/

TRAVEL BURSARIES

We have travel bursaries for travel within the UK, to enable participation from people who would not otherwise be able to come, and to encourage attendance from community organisations, activists, migrants, people directly affected by Home Office immigration campaigns, young people, students and early career researchers.

If you are applying for a travel bursary, please be prepared to write a sentence about why, and give an estimate of how much your transport costs are likely to be on the registration page. Please note that we will ordinarily expect you to pay for your travel in advance, and will reimburse you by BACS transfer to your bank account after the conference (you will need to complete a form and provide receipts). If you foresee a problem with this - for example if you are not able to pay the cost of your travel up-front, or if you do not have a UK bank account which can receive BACS transfers - please get in touch and we will try to make arrangements to book your travel for you.

Algorithms and Accountability (2015-05-13 08:00)

Algorithms and Accountability took place in the Department of Law at New York University in February. Here’s the description of the symposium:

Scholars, stakeholders, and policymakers question the adequacy of existing mechanisms governing algorithmic decision-making and grapple with new challenges presented by the rise of algorithmic power in terms of transparency, fairness, and equal treatment. Algorithms increasingly shape our news, economic options, and educational trajectories. The centrality and concerns about algorithmic decision making have only increased since we hosted the [1]Governing Algorithms conference in May 2013. This event built upon that conversation to address legal, policy and ethical challenges related to algorithmic power in three specific contexts: media production and consumption, commerce, and education.
The event was recorded in full and the videocasts are attached below:

CMRB (The Centre for Research on Migration, Refugees and Belonging) at the University of East London is pleased to announce as part of its Borders and Bordering Seminar Series:

'Sexuality, Borders, and Categorical Edges', Prof. Allaine Cerwonka (University of East London)

This seminar will take place 5-7pm, Monday 8th June 2015 in EB.G.08, Docklands Campus, University of East London, E16 2RD, nearest tube: Cyprus DLR

([1]http://www.uel.ac.uk/campuses/docklands/) The event is free but spaces are limited so please reserve a place by following this link: [2]cerwonka.eventbrite.co.uk
How obsessive auditing produces “a profession which is incompatible with a normal life” (2015-05-14 08:00)

80% of new teachers in 2005 were still teaching after their first year. In 2015 that has shrunk to just 62%, coupled with record numbers leaving mid career. In the intervening period, we’ve seen successive governments seek to transform schooling in a way that has left the [1] “profession monitored to within an inch of its life”: increasingly teaching can’t retain its new recruits and given 76% of new teachers report having considered leaving the profession, it’s possible the retention rate will continue to collapse over time.

Can you blame them? David Cameron recently pronounced that “if you’re not good or outstanding, you have to change” and that “If you can’t do it yourself, you have to let experts come in and help you” – with ‘good or outstanding’ constituted through the unreliable judgements of an audit regime utterly disconnected from the realities of teaching. The result is a ratcheting up of situational demands amidst a climate of fear, leaving teachers drowning in assessment, terrified of negative assessments and increasingly prone to illness, as a [2] recent survey found:

- 83% had reported workplace stress.
- 67% said their job has adversely impacted their mental or physical health
- Almost half of the three thousand respondents reported they had seen a doctor because of work-related mental or physical health problems
- 5% had been hospitalised, and
- 2% said they had self-harmed.

This has produced a situation which the general secretary of the ATL describes as teaching having become “incompatible with normal life”. This is what audit regimes do when they’re pursued as an instrument of workplace control. How far behind is higher education? Will the greater sunk costs of newly qualified PhDs preclude a mass exodus from the profession? The analogy is far from perfect, not least of all because of the much lower ratio of available jobs to newly qualified academics, but there seems to be a similar direction of travel in both professions.

Decolonizing Gender: Raewyn Connell at LSE (2015-05-14 08:16)

Decolonizing Gender

An LSE Gender Institute and Feminist Theory public lecture

Speaker: Professor Raewyn Connell

Date: Monday 18 May 2015
Time: 6.30-8pm
Venue: Old Theatre, Old Building
Chair: Dr Ania Plomien

Members of the public, LSE alumni, LSE students and LSE staff can request one ticket via the online ticket request form:
[1]Ticket Request - Decolonising Gender, Professor Raewyn Connell, 18 May

The creation of contemporary knowledge about gender is a revolution in thought that has been closely connected with political struggles for gender justice. In the last generation a major problem about this field of knowledge has been recognized, its constitution within a worldwide economy of knowledge shaped by the power and wealth of the global North. This lecture will explore recent attempts to overcome this problem, in feminist re-thinking of imperialism, coloniality and Southern perspectives. The lecture will consider connections of knowledge with feminist politics in the neoliberal era, when new forms of patriarchy have emerged; and will ask if we can have a fully decolonized global feminism that is both politically effective and socially radical.

____________

Campaign Against The Arms Trade: Universities Network Co-Ordinator (2015-05-14 08:18)

Universities Network Co-ordinator (internship)

This is a great opportunity for someone wanting to take their first career steps in campaigning with an award winning NGO.

The Campaign Against Arms Trade (CAAT) works to end the international arms trade and promote peace, justice and democratic values. The arms industry is a deadly, corrupt business that has a devastating impact on human rights
and security, and damages economic development.

CAAT is offering a

**9 month paid internship**

post to someone wanting to build on their campaigning and outreach skills. CAAT’s Universities Network is an informal collective of students and groups at universities across the UK who are campaigning to break ties between their institution and arms companies. We are looking for someone to

inspire

and

support

students

to

take action and

campaign

effectively.

The internship will be full-time based at our London office, although travelling to universities around the country is also a large part of the role. The intern will be offered a comprehensive training programme when they start and support from our Local Outreach Co-ordinator throughout the nine month period.

For more information on the post including how to apply please visit:

The deadline for receiving application forms is

**midday Wednesday 3rd June**

---

**Luc Boltanski at University of Westminster (2015-05-14 08:21)**

The [1]Centre for the Study of Democracy at the University of Westminster is delighted to announce that this year’s CSD Encounter will be with the internationally renowned French sociologist [2]Luc Boltanski. Convened by [3]Chantal Mouffe. Details below and attached. Additional speaker information can be found via the booking link: [4]boltanski-csd.eventbrite.co.uk. Apologies for any cross posting.

Childhood and Youth Postgraduate Summer School (2015-05-14 13:04)

5th International CSCY Summer School for Postgraduate Students
Wednesday 15 – Thursday 16 July 2015

ICOSS, 219 Portobello, Sheffield, UK

This exciting two day international summer school is for post-graduate students working in the area of childhood and youth.

The workshops and networking sessions will be of interest for students about to embark on research and for those who are preparing their dissertations.

Plenaries

Professor Allison James, Sociology: ‘Personalising children’s lives: reflections on childhood research’

Professor Kate Pahl, Education: ‘Co-production in practice: the processes and practices of research without a map’

Also featuring ....

- Practical research workshops to include visual methods, ethnography, ‘impact’ and making a difference and using social media in your research.

- Careers panel session.

- Ethical question time: submit your ethical dilemmas to a panel of experts and join in the debate!

- Students are encouraged to submit posters.

Further details, including the programme, how to book and the booking fee are available on the CSCY website: [1] http://cscy.group.shef.ac.uk/events/. If you have any queries contact Dawn Lessels, [2] d.j.lessels@sheffield.ac.uk
In January 2015, scientists recorded atmospheric levels of carbon dioxide above 400 parts per million on a regular basis – the first time such a level had been reached so early in the calendar year. It is well established that levels of CO₂ above 350 (already well above the preindustrial norm of 275 ppm) spur global warming – we are now experiencing the effects in extreme weather, droughts, rising sea levels, thawing permafrost, etc. Levels above 450 will most likely put the planet on an inescapable course toward catastrophic climate change. 400ppm is an eco-political music-video which encapsulates climate crisis and climate justice in three minutes flat. It is an intervention in popular political ecology/economy, aimed at those who are uneasy with the increasingly obvious deterioration of the living systems of which we are an inextricable part. The arc of the song begins from basic observations – symptoms of the crisis – and then shifts to the ideological problem of denial, softened in recent years by massive Corporate Social Responsibility advertising and complemented by the emergence of ‘silver-bullet’ geo-engineering schemes. At the song’s midpoint, its bridge identifies the structural drivers of the crisis: carboniferous capitalism, and the contradiction between compounding capital accumulation and the principle of homeostasis which governs the biosphere. The next verse underlines that point and invokes, with the wheel of fortune, a financialized casino-capitalism inured to its material ‘externalities’. Wes Carroll’s spirited guitar solo is accompanied by images from Canada’s notorious Tar Sands of bitumen extraction and what it leaves behind. But at this point the video begins to arc toward hope, with footage from the Tar Sands Healing Walk (featuring Cree activist and writer Clayton Thomas-Muller) – an annual event since 2010 bringing together Indigenous activists, environmentalists and others. The last verse gestures toward a just transition – a power shift – to a post-capitalist future that combines global justice and solidarity with ecological stewardship, and that abandons the consumer-capitalist logic of always having more in favour of buen vivir: ‘living well’. To get there, we had better start healing what Karl Marx called the metabolic rift between capitalist extractivism / accumulation and the conditions for a vital ecosystem. Mass popular struggle, building on but going beyond the September 2014 People’s Climate March (the final image), is a necessary condition for such a radical remaking of our world.
Bill Carroll is Professor of Sociology at the Department of Sociology, University of Victoria (Canada). We previously posted another of his sociological blues compositions, "Blind Eye Forward," and a video talk on global politics.

**Visual Matrix Workshop: Imagery, Affect and Visualisation in a Psychosocial Research Method**

(2015-05-15 08:47)

**Association for Psychosocial Studies**

in collaboration with

**Birkbeck Institute for Social Research**

[1]  [2]

[4] **Friday 5 June 2015** | 10.00am – 5.00pm | Room B03, 43 Gordon Square

*This is the first workshop in our new series, “New Developments in Psychosocial Methods”, organised by Association for Psychosocial Studies in collaboration with the BISR.*

The Visual Matrix is a new research method, led by imagery, affect and visualization, that has been developed in order to inquire into phenomena that research participants may find difficult to put into words. It works with a group, who are invited to respond associatively to a stimulus related to the research problem or question. Typically, the stimulus is presented in visual or other sensory form, and the group's associations build up over the course of an hour into a 'collage' of images, affects and ideas. This collage provides the material for a discussion that is organised through 'image mapping'. Both the matrix and the post-matrix discussion are then subjected to an interpretive process that is normally carried out by a research analytic panel.

The Visual Matrix, was developed and tested through a study (Froggett et al 2014) that aimed to understand the impact of public art on a town, through people's experience of the artworks. This included unarticulated dimensions, still in the process of emergence a year after the artworks had arrived. It has since been used in clinical environments and social interventions where people are subjected to experiences they find hard to articulate; for example the 'unspeakable' experience of breast amputation following breast cancer surgery, or in the context of an arts/health collaboration on erectile dysfunction.

The workshop will engage participants in a short 'taster' matrix and in the beginnings of the interpretive process that follows. The hybrid theoretical underpinnings of the visual matrix, will be highlighted and the further interpretative protocols, that would normally follow a matrix, explained. This will help to clarify the research outcomes that can be expected, and how they might differ from other group-based methods such as a focus group. Hence the workshop offers participation in a 'live' matrix, an understanding of how it is situated in a research process, and an opportunity to discuss its theoretical origins and research applications. A link to a short video clip of a visual matrix, recorded for demonstration purposes, can be found at [11]http://vimeo.com/97731002

Registration and payment are essential –[13]book your place here

Wednesday, May 20th, 10:30am to 3:30pm

We have launched a brand new workshop aimed at academics wanting to, or already working with community based organisations and groups. The workshop will provide you with an insight into the dynamics of Community University Partnerships (CUPS), and explore ways in which universities can work equitably with community partners.

**Objective:** To promote good practice CUPs from a community perspective

**Learning outcomes:** By the end of the workshop you will have:

- Built on your understanding of the dynamics of CUPs, paying particular attention to the role and perspective of community partners
- Identified skills and approaches that can help to create effective and mutually beneficial CUPs
- Considered ways to manage CUP working in an equitable way by drawing on messages from the UK Community Partner Network and Research for Community Heritage projects

To find out more about the workshop and how to book, visit the NCCPE website.

Last week I attended re: publica in Berlin for the first time. For those not familiar with it, it’s a vast conference about internet and society incorporating activists, journalists, hackers, academics, entrepreneurs and venture capitalists in a melange of sessions over 3 days that was at times frustrating but which I nonetheless found enormously stimulating and enjoyable. It takes place in a stunning post-industrial venue in Kreuzberg, a vast series of linked warehouses and out buildings centred around a large court yard, the scale of which can be seen in the Flickr stream for the event.

By the second day of the event, I was consumed by the thought: *what would a sociological re: publica look like?* I’ve been preoccupied by this ever since and I’m starting to plan how to make something like this happen. Obviously re: publica is a massive event that has grown over many years and I’m not planning to attempt anything on this scale. But the idea I have is for an initial 3 day event, taking place in summer 2017, taking the form of a literary festival focused around sociology, anthropology and related disciplines.

The theme of the festival would be *making the familiar strange.* This might seem too diffuse but I think it captures something crucial about the capacity of these disciplines to contradict common sense, unsettle taken for granted ways of viewing the world and to work creatively in elaborating upon dormant alternatives. In this sense all the content would be ‘critical’ but in a way that avoids obscure theoretical argument and addresses everyday life in an accessible way.

I’m obsessed with the idea that this would take place in a post-industrial venue similar, though smaller, to that of re: publica. Birmingham and Manchester immediately seem like potential locations which could facilitate this. I’m keen that the atomisation of TED talks be avoided (as well as the simplification that they sometimes fall into) so I would imagine a lot of the intellectual content of the events being centred around a key topic which speakers would explore in different ways. For instance here are some of the potential session topics that occurred to me. These only reflect my own interests and I’m hopeful that the actual range of topics would be much broader than this:
1. Life after capitalism
2. Acceleration society
3. The future of cities
4. Riots and disorder
5. Real utopias and dystopias
6. Stigma and shame
7. Robots and the end of work
8. Freedom in an age of big data

However I'd like there to be lots of stuff that isn't talks. As well as the generic category of 'workshops' (about what I'm not sure) I'd like there to be art installations scattered around the venue and the 3 days could be a host for all manner of public engagement projects that fit with the theme of the event.

This plan is far from complete but I think it's starting to take shape. I've had a first attempt at an initial financial plan and I'm cautiously optimistic that if I could raise £15k+ in funding, this could otherwise be self-financing through ticket sales at a price that wouldn't be extortionate. However this is so far beyond the scale of anything that I've ever tried to organise before that it's possible I'm being wildly unrealistic.

If this seems like something you might want to help with then please get in touch: mark@markcarrigan.net

The new Apple Watch and the problem of our creeping connectivity (2015-05-16 07:14)

by David Beer

One of the most memorable images from my childhood is a suave and leather jacketed David Haselhoff, playing the reluctant but slick hero Michael Knight in the TV show Knight Rider, speaking into his watch. He'd usually utter something like "Come and get me Kitt" or "I need you buddy". Kitt, the automaton car, would be there in seconds. The fantasy of being able to communicate through a watch was spectacular stuff for a child in the 1980s. With the launch of Apple Watch we may only be a mildly sarcastic robotic car away from that dream, but for some reason the realities of the networked watch seem a little less shiny than the fantasy version. Instead, the corporeal hyper-connectivity of this new wearable device highlights to us the strains and pressures that come with always being switched-on.

The problem is that this type of smart watch inevitably seeks to increase our already deeply connected lives. Just over a decade ago Scott Lash wrote of the lack of space for critical reflection that results from the dense information flows that have come to dominate our lives. Our constant exposure to information simply leaves us with little room to think. We live, he has suggested in a more recent book, in an 'intensive culture'. The pace and volume of these information flows are seen to be escalating and are becoming increasingly difficult to swim against.
With the arrival of smartphones in 2007 and now with the smart watch, these information flows are increasingly finding their way to the inside of our bodily routines and are embedding themselves deeply into our everyday lives. As these wearable devices connect us into our environments, it will almost certainly become harder for us to disconnect – even for fleeting moments. The Apple Watch is another step towards the networking of our bodies into the communicative networks in which we live. The consequence is that we will be opening our bodies up to the pressures of constant networking and the unstinting demands of mediated social connectivity.

Indeed, if we put this into a broader context, there has already been plenty of work to suggest that the very divide between work and leisure is breaking down. This is a result of the changing nature of work and, more specifically, the rise of mobile and home based working. It has been argued that we occupy and exist within a kind of social factory. Work and leisure blur as the time and space of labour and “free-time” dissolve into one. Our lives become spaces of production and value creation. The consequence, for writers like Ros Gill and Andy Pratt, is that work can become inescapable – as can the type of bodily and emotional sensations that it provokes within us (they report on how the precarious nature of labour and the heightened competition it fuels leads to feelings of insecurity, fatigue, anxiety and exhaustion). Alongside this, it has also been argued that the divide between production and consumption is breaking down as we engage in the significant labour required to maintain our social media profiles, feeding them with personal data for others to consume. These arguments have been unfolding for some time, but with the Apple Watch we have a device that is designed to further blur the boundaries between work and leisure and to optimize our performance as productive and active consumers. This is a device that makes clear to us the very inescapability of our role as value or content generators, and reinforces the obligation to be always switched-on.

William J. Mitchell once spoke of the way that our nervous systems are extended and augmented by mobile devices. With the Apple Watch we have the most literal and obvious embodiment of this meshing of our nervous systems with our informational environments. The biological body can now be connected ever more directly and smoothly into these information flows.

When you look at the marketing that has accompanied the launch of the Apple Watch, you actually find that this kind of bodily and nervous connectivity is a central part of how the watch is being sold. We are told that it will provide a more “haptic” experience. This is a tactile and sensory set of connections, with the watch sharing sensory information with the body. It extracts information such as heart rate, using its sensors placed on the skin, whilst buzzing with notifications and bodily interventions. For example, as the TV advert shows, the watch might buzz to tell us that we have been sitting for too long and that it is time to stand up, this is just one possible way that we can use it to enhance our lifestyles.

Reflecting on how these devices are constructed in Apple’s series of marketing videos is revealing. We find the fetishization of materials, of personalization and of capability. The “heritage” of watch making is forged in the metals and connects the past with the technological present. This is a device of precision. It is a device that heightens our sensory connections – we can now feel information as well as see and hear it. There are then various new possibilities for the body to be tracked, measured and compared. The device is presented as being part of a lifestyle in which our connectivity becomes the means of self-improvement and heightened experiences. This is a device, we are told, that helps you to be more healthy and active. As the video dedicated to health and fitness suggests, this watch “gets to know you the way a good personal trainer would”. That is to say that it takes on an active role in guiding your lifestyle, suggesting goals and activities. The promise is that you will become less sedentary and the watch’s presence on your body will stimulate and provoke action.

The launch of the Apple Watch gives us the opportunity to reflect more broadly on how connected we might want to be. Do we really want a “haptic” connection to our informational environment? Given the recent accounts of contemporary work and productive consumption, we might wonder what the consequences of not being able to step away from the intensity of contemporary culture will be. Based on the discussions of precarious forms of labour and the active role of the consumer in the production of culture, it is certainly a device that is fitting with the social
Despite their glossy appeal, I won’t be buying a smart watch. A buzzing wristwatch will only heighten my stress levels by reminding me of the work that needs doing and the things that require my attention. The type of physical feedback that these watches give, the corporeal buzz of a responsive and personalised notification, is the perfect technological embodiment of the social factory. Our bodies will get caught up in the demands of being switched-on and will become the surfaces on which the tensions between work and leisure become a reality.

So the type of connectivity that the Apple Watch offers is not so much the realization of a fantasy as the spreading of the pressures of the contemporary world. We should note William Mitchell’s observations and wonder what might be the outcomes of appending our nervous systems with such devices. Being physically connected with information and communication systems might seem like progress towards some technological dream, but it is likely to extend the reach of the demands placed upon us by the social factory. Such devices are likely to disrupt our immediate social connections and interrupt our time/space of rest, recuperation and thoughtfulness. These, via such devices, are likely to be unsettled and disturbed by the pressures of constant and inescapable connectivity. The dreams of the communicative watch that populated my childhood seem less appealing in the unforgiving and stark daylight of the present day – especially as they represent the furthering of the presence of new forms of mobile work, bio-tracking and the demands of new media-based consumption. In short, the Apple Watch is emblematic of the creeping extension of our connectivity. Its launch presents us with an opportunity to reflect on just how connected we want to be.

David Beer is Senior Lecturer in Sociology at the University of York. His publications include Punk Sociology, Popular Culture And New Media: The Politics of Circulation and New Media: The Key Concepts (with Nicholas Gane). He is currently working on a book called Metric Power and he is an editor at theoryculturesociety.org.

Dear academic hive mind, please help me identify radical education projects in the UK (2015-05-16 08:00)

A few years ago I produced a list of all the radical education projects that sprang up in the wake of the government’s agenda for higher education ‘reform’. I didn’t really have a clear definition of ‘radical education projects’ beyond
people “trying to explore different, freer and more autonomous ways of learning”. Looking back at the list now, I’m struck that I’ve forgotten what half of these projects actually were or how I came across them:

1. [1]Left Overs ([2]podcast)
2. [3]The Social Science Centre
5. [6]The University for Strategic Optimism
7. [8]The University of Utopia
10. [12]Birmingham Social Centre and Free School
12. [14]Student as producer
13. [15]The University of Incidental Knowledge
14. [16]The University Project

It seems I saw a family resemblance between a lot of different projects I encountered in a very specific period of change within higher education. However a conversation with [17]Nick Mahoney yesterday has left me wondering if my focus on responses to government policy was overly restrictive: it left me ignoring things that were more recent (the post-occupy education projects) and things that were much more long standing (the Workers Education Association). So I’d like to compile a new list of projects that represent different, freer and more autonomous ways of learning. Any suggestions? Here’s my attempt:

1. [18]The Social Science Centre
2. [19]The Ragged University
3. [20]The Workers Education Association
4. [21]WikiQuals
5. [22]New Centre for Contemporary Cultural Studies

It’s interesting to look through the previous list and see how many of the projects lapsed within a few months and how many continued for a few years. I’d love to interview people involved in both, as well as those that are still ongoing, in order to understand how these developed over time and how they changed the people involved.
Routines and Reflexivity in Organisational Life (2015-05-17 08:00)

In this podcast recorded at a Centre for Social Ontology seminar in March 2014, Alistair Mutch (Nottingham Trent University) discusses routines and reflexivity in organisations.
Much of the debate occasioned by the development of ideas about reflexivity and morphogenesis has turned on the status of habit. Whilst recognising the importance of this debate, this seminar takes an alternative tack. Returning to Bhaskar’s formulation of ‘position-practices’, it reviews recent work on organizational routines. Developing a position which sees routines as a key emergent property of organizations, recent developments in information technology are seen to cement autonomous reflexivity. Accompanied by an increasing discourse of ‘strategizing’, this might limit the development of meta reflexivity.

When Sociologists fail to talk about the future (2015-05-17 08:29)

Earlier in the week I organised a Design Fiction for Sociologists workshop at Goldsmiths with the help of Les Back. It was a really interesting event on a number of levels but the aspect of the discussion which has most preoccupied me since is the failure of sociologists to talk about the future. I learnt that projective analysis is a relatively common feature of scholarship in the material sciences and yet it is largely absent from sociology, at least as a routine and taken for granted part of research.

We need to be cautious about this. If we accept that the social world is an open system (as opposed to the closed systems produced in laboratory work) then prediction in the traditional sense would be an obviously mistaken goal. There’s simply too many contingencies, with their potential impact multiplying over time in a path-dependent way, for it to be feasible to offer definitive claims of what will happen.
But can we forecast? My hunch is that we can and that a mechanisms based sociology is actually well equipped to do this, providing it is extremely sensitive to contextual changes over time i.e. recognising how the operation of a mechanism will unfold differently across changing contexts as other, perhaps newer, mechanisms will act conjointly to amplify or impede its operation. The results are obviously fallible but so is everything else we do. I'm increasingly convinced we can sketch potential futures, as well as the conditions likely to give rise to them, in a manner that has the status of something significantly beyond speculation.

Is human culture collapsing under the weight of its own verbiage? (2015-05-17 11:33)

I just quoted [1]this article from Charlie Brooker in the section of Social Media for Academics about 'how to ensure you're not wasting your time when you should be doing real work'. I've begun to feel like this about social media sometimes (particularly Twitter) and I thought my own feelings about this could be a helpful way to structure the wider discussion in the book:

I've recently been overwhelmed by the sheer amount of jabber in the world: a vast cloud of blah I felt I was contributing to every seven days.

If a weatherman misreads the national mood and cheerfully sieg-heils on BBC Breakfast at 8.45am, there'll be 86 outraged columns, 95 despairing blogs, half a million wry tweets and a rib-tickling pass-the-parcel Photoshop meme about it circulating by lunchtime. It happens every day. Every day, a billion instantly conjured words on any contemporaneous subject you can think of. Events and noise, events and noise; everything was starting to resemble nothing but events and noise. Firing more words into the middle of all that began to strike me as futile and unnecessary. I started to view myself as yet another factory mindlessly pumping carbon dioxide into a toxic sky.

[..]

But then right now I don't "get" most forms of communication. There's just so much of it. Everybody talking at once and all over each other; everyone on the planet typing words into their computers, for ever, like I'm doing now. I fail to see the point of roughly 98 % of human communication at the moment, which indicates I need to stroll around somewhere quiet for a bit.

I'm taking a break from my own personal Twitter account for this reason. Ultimately I can't really take a break from social media (given it's my job, at least 0.6 of the time, as well as my commitment to SI and the fact I've become disturbingly dependent on blogging to develop my thoughts) but hopefully whatever step back I can take will help restore some of my currently waning enthusiasm.

You said you were disturbingly dependent on your blog to develop your thoughts. In light of your observations about the "noise" in social media, why is blogging needed for developing the thinking behind something you want to write. Granted it is very helpful for us to write down our thoughts and review them. Maybe step away and come back with fresh eyes. I may be misunderstanding. If by blogging you meant generate drafts, I totally get it. The process of writing often clarifies our thoughts. If you meant blogging as in publishing the blog, then just don’t do that step. Review it later. Or share it with a trusted colleague or friend for insight. I share this because I have started using the classic draft and develop approach to writing and just not posting until my thought processes and the end piece has gelled. Otherwise I find the responses and my subsequent reactions just take me further off target. It is the posting of the drafts "aka blogs in media-speak" that is the distraction. And it is so seductively training us to constantly respond rather than take the time to think and reason it all out. Ultimately, we all have to slow down. I appreciate your perspective and wish us both well.
The petition is online [1]here. Please forward to any Warwick staff you know who are opposed to casualisation in higher education. Events have been moving so rapidly that there’s no up to date report on events but this [2]Times Higher Education article gives useful background.

1. https://warwickstudentsolidaritywithstaff.wordpress.com/

National Demonstration Against Casualisation and TeachHigher (2015-05-17 19:03)

19th June at the University of Warwick. There’s a [1]Facebook event here. Details copied & pasted below:

“No to the ‘insourcing’ and further casualisation of academic staff!”

TeachHigher threatens job security and quality education at ALL UK universities.

Make your voice heard at Warwick University Open Day!
Warwick University staff and students call on their colleagues across UK Higher Education to support them in resisting TeachHigher. TeachHigher is a scheme whereby hourly paid academic staff will no longer be recruited and employed by academic departments but contracted via this new ‘internal academic recruitment and administration service’. TeachHigher is being piloted at Warwick but intends to franchise out at universities across the UK.

We oppose TeachHigher because it will institutionalise and entrench a two-tier system of academic staffing at Warwick – further separating off hourly-paid academics from those on more secure contracts. It will give Human Resources control over hiring and firing – not only threatening the autonomy of academic departments but also making it easier for central management to recruit ever larger numbers of hourly-paid and casualised staff while continuing to reduce the number of secure and permanent positions. TeachHigher staff will be employed on even worse terms and conditions than those currently endured by hourly paid academics at Warwick.

TeachHigher represents a threat not just at Warwick, but to anyone working and studying at a UK university. Warwick Employment Group plan to sell TeachHigher as a commercial franchise to other universities. In fact, Warwick is already complicit in promoting casualisation and precarity at numerous other UK Higher Education institutions, via Warwick-owned agency UniTemps which contracts mainly catering and cleaning staff but also some admin and academic staff. TeachHigher looks suspiciously like another version of Unitemps – a national outsourcing agency for academic staff – unless we stop it now!

Active opposition to TeachHigher among Warwick staff and students has already met with two small but significant victories – collective resistance can work! Massive public meetings, extensive press coverage and so-far three academic departments voting to boycott TeachHigher has resulted in the cancellation of the pilot scheme due to begin in April, and its postponement until October 2015. Management have also begun to backtrack on the outsourcing question – whereas the initial website for TeachHigher described it as a ‘subsidiary’ company, it is now claimed that it will be an academic services department. But there is still much to be done...

We need to act now, and act together, to put an end to TeachHigher once and for all!

This demonstration is supported by Warwick UCU.

HOW TO GET HERE:

The nearest railway stations to Warwick University campus are Coventry and Leamington Spa. Do not go to Warwick train station (it is far away, and has no public transport links.) From Coventry station catch the number 11 or 12 bus, from Leamington Spa catch the U1. 19th June is a Warwick University open day, so transport may be congested – leave lots of time to get here. There may be free shuttle buses running from Coventry railway station to campus.

An eclectic account of lay morality and charitable giving in the UK (2015-05-18 08:00)

This podcast was recorded at a [1]Centre for Social Ontology seminar in February 2015. The speaker is Balsihar Sanghera from the University of Kent.

This paper examines how charitable giving is an outcome of different interacting elements of lay morality. Charitable giving reflects people’s capacity for fellow-feeling (or sympathy), moral sentiments, personal reflexivity, ethical dispositions, moral norms and moral discourses. An eclectic account of lay morality and charitable giving is warranted because of the complex nature of the object. Though ordinary people engage in ethical reasoning, they often think and act in piecemeal fashion, so that confusion and inconsistencies can occur. This is particularly evident when gender, class and ‘race’ shape people’s feelings and evaluations of others, their attention and care for others, and their understanding of responsibility and blame for social issues. Morality is further complicated because it takes place in the mundane world of everyday life that can result in inconsistent and confusing judgements and actions on giving.

Programme:

Given that the information society and the study of information face a world of crisis today and are at a crossroads, also the future of the Internet and social media are in question. The 5th ICTs and Society Conference therefore wants to focus on the questions: What are the main challenges that the Internet and social media are facing in capitalism today? What potentials for an alternative, commonist Internet are there? What are existing hindrances for such an Internet? What is the relationship of power structures, protest movements, societal developments, struggles, radical reforms, etc. to the Internet? How can critical political economy and critical theory best study the Internet and social media today?

Collaborative Seminar, at Loughborough University on 2 June 2015

This Day event will take place in the James France Building, room CC021, from 10.30-4.30pm - 2 June 2015, and will focus on the Future of Social Critique.

The event was organised to celebrate the careers of two renowned colleagues in our department, Prof Michael Pickering and Prof. Graham Murdock, but also as an opportunity to broaden the discussion on the subject.

Synopsis

The continuing financial crisis of capitalism in Europe has been accompanied by a right-wing response that has sought to reduce the size of the state and the power of labour, changes that will inevitably increase income inequality and consequently other inequalities in the future placing the burden of the crisis on the shoulders of those least able to bear it. This neo-liberal response has not gone unchallenged at least in some European countries. We have witnessed the growth of extra-parliamentary and more recently parliamentary opposition on both the right and the left. In the UK, however, whilst we have experienced a 'revolt from the right' with the growth of UKIP, the response from the left has been more muted. While there has been some left opposition to austerity, it has remained largely
on the margins. In contrast, the early years of the Thatcherite project in the UK saw a flowering of radical opposition that crossed over from politics to culture to the academy. The questions animating this seminar are: if then, then why not now? What has changed both inside and outside universities? How do we assess questions of value and make this a key aspect of critique? What resources are generally available for the renewal of critique? Whatever happened to the ‘public intellectual’?

In this podcast I interview Andrew Sayer, Professor of Social Theory and Political Economy at the University of Lancaster, about his book Why Things Matter To People.

Here's a link to the book:

There's a review I wrote of the book here: [2]sociologicalimagination.org/archives/14330
Nothing is more distressing than a thought that escapes itself (2015-05-18 09:30)
As some people reading this might know, I’m an obsessive cultivator of habits. I’m preoccupied by them intellectually and spent 6 years writing a PhD about how who we are is shaped by the situated interplay between reflexivity and habit over time. But this is also a big part of how I orientate myself to my work: what’s the most satisfying and effective way to approach what it is I have to do? I’ve blogged in the past about [1]the apps I use for this purpose.

It’s for this reason that I’ve tried various writing routines over the last few years and I’ve recently come to the conclusion that word count goals just don’t work. In fact setting myself a goal for how many words to write a day now strikes me as representative of everything that’s wrong with the academy i.e. counting your writing rather than valuing it. Looking towards a quantity of words inevitably encourages you to see how quickly you can write them and move on to something else. If not necessarily alienating, it now strikes me as quite alienated, no matter how useful the capacity to do quasi-automatic speed writing I’ve developed over the last few years is increasingly proving to be.

Since giving up on a word count goal I’m enjoying academic writing more than I have in a long time. I’m actually finding my book interesting again, after months of seeing it as an obstacle to be negotiated through daily bouts of meeting my word target (in turn ratcheting up my stress about the book when I failed to meet them). My new resolution: to only count things if I’m certain doing so serves a useful purpose. Perhaps this is a useful starting point for thinking about how the [2]Qualified Self does inevitably sometimes interface with self-quantification.

---

As part of its effort to expand beyond traditional types of academic publication, Big Data & Society has introduced an Early Career Researcher Forum targeted to scholars finishing or having recently completed advanced graduate
degrees. More specifically the ECR forum seeks work by researchers reflecting about some of the challenges of their work (related to Big Data topics) in about 1000 to 2000 words with a range of illustrations, figures, etc. as well as a brief bio (100 words). The goal is to encourage reflexive submissions that explore what it means to be a researcher studying issues concerning big data and society. As guidance we ask authors to consider a series of questions (addressing any or all of these):

- What kinds of challenges empirically and/or methodologically have you encountered in your work?
- Do you have an example of these challenges, particularly one that can be shared in an online forum such as the journal offers, i.e., with visualizations, graphs, etc.?
- Does Big Data allow you to ask new questions or explore old issues?
- Are there questions that your data can not answer? Why? What else is necessary?
- Why is your research important and interesting?
- How do you relate back to your home discipline, and do your colleagues understand you?

In addition to targeted submissions, the Early Career Researcher forum accepts unsolicited contributions and encourages those who are interested to correspond with the co-editors (Irina Shklovski and Matthew Zook) for guidance.

CfA: Ethnographies & Health early-career workshop

LSHTM, 1st - 2nd October 2015
We are pleased to announce a call for abstracts for an exciting new workshop for early career researchers, entitled 'Ethnographies and Health', to be held at the London School of Hygiene & Tropical Medicine in London, UK, on 1st and 2nd October, 2015.

**Keynote speaker: Dr Tiago Moreira, Durham University**

We invite abstracts of up to 400 words for papers that explore topic-based, methodological and theoretical questions of using ethnographic approaches in health, and health-related research, from a variety of disciplinary perspectives. Supported by a workshop grant from the Foundation for the Sociology of Health & Illness, the workshop will be free to attend and will be structured to allow for supportive and engaged debate around each paper presented.

Please see the attached poster for more information, and please feel free to circulate this call widely.

Deadline for abstracts is 31st June, 2015. Please send abstracts (and any enquiries) to Joanna.reynolds@lshtm.ac.uk

---

**Intersections of Ageing, Gender, Sexualities (i-ages)**

**UNIVERSITY OF SURREY, GUILDFORD, UK**
6 July 2015 - 7 July 2015

This international, multidisciplinary two day conference offers a unique opportunity to explore the intersections between ageing, gender and sexualities. It explores how they work together to produce structural inequalities, privileges and disadvantages, challenges and opportunities, and diverse lived experiences. Papers will be presented by researchers from, Australia, Hong Kong, Iran, Israel, Italy, New Zealand, Spain, South Africa, Taiwan, UK and USA.

KEYNOTE SPEAKER

Professor Toni Calasanti, Virginia Tech, USA

GUEST SPEAKERS

Professor Mark Hughes, Southern Cross University, Australia

Associate Professor Travis Kong, University of Hong Kong

Professor Yvette Taylor, London Southbank University, UK

Registration for two-day event (includes lunch and refreshments both days) £80 (£40 students)

FOR MORE INFORMATION, PROVIONAL PROGRAMME & REGISTRATION GO TO [1]EVENT WEBSITE

In the late 20\textsuperscript{th}/early 21\textsuperscript{st} century, many scholars (Mac an Ghaill, 1994; Fine, Weis, Addelston, & Marusza, 1997; Weis, 2004; Nayak, 2003; 2006) have cited the massive societal shifts in economic and gender-relations which have resulted in fragmented rites of passage (employment, marriage) and which have placed the males in a position of confusion commonly called the ‘crisis of masculinity’ (Faludi, 1999). Evolving from the moral panic concerning boys‘ underachievement’ (Griffin, 2000) and, more specifically, underachieving working-class males (Epstein, 1998), debates over ‘failing boys’ has focused on the complexities associated with the so-called ‘crisis of masculinity’ (Faludi, 1999) and boys ‘underachievement’ in schooling. A highly charged context of backlash politics has shaped a particular gender agenda, and in this miscellany we see arguments concerning boys (as a homogenized group) portrayed as victims of discrimination both in schooling and in wider society (Weaver-Hightower, 2003).

As the so-called ‘crisis of masculinity’ (Faludi, 1999) occurs beyond the classroom, there has also been major pedagogic shifts inside the classroom; school processes have become increasingly neo-liberal (league tables, high stakes testing, a rise in accountability), which creates more difference and influences the how learner identities are formed (Francis, 2006; Wilkins 2011). In his analysis of the ‘boy turn’ in education, Weaver-Hightower (2003) argues that there have been four main strands to the ongoing debate on boys’ education: popular-rhetorical, theoretically oriented, practice oriented, and the feminist and pro-feminist. Weaver-Hightower contends a significant prompt for the ‘boy turn’ has been ‘increasing neoliberal education reforms and the rise of the New Right-the conservative restoration since the 1980s’ which is particularly true in England, where neoliberal reforms ‘produced an educational choice structure in which schools compete with one another for students’ (p. 476). Epstein, Elwood, Hey, and Maw, (1999) identified separate discourses used in the popular and academic press to explain boys’ educational underperformance: ‘poor boys’, ‘boys will be boys’, ‘at risk boys’, and ‘problem boys’. While these discourses have framed key debates in gender theory concerning boys, the neoliberal policy drivers ensure that working-class boys are individualised and held accountable for their failure (Francis, 2006, p. 191). Furthermore, such neo-liberal discourses, while denying the existence of any real class distinctions, limit the discursive space in which various forms of working-class masculinity are acceptable.

\textit{‘Urgency’ and ‘solutions’?}

Griffin (2000) argues that the ‘language of crisis, alarm and urgency’ (p. 170) is typically followed by a list of school-based remedies which have been posed by policy-makers to counteract male ‘underachievement’ (for critiques see Skelton, 2003; Weaver-Hightower, 2008). There have been a plethora of policy responses to this perceived ‘crisis’ but very few take into account the ‘very significant ways in which the social construction of gender impacts significantly on curriculum, pedagogical practices and relations with and between students in schools’ (Lingard, Martino, & Mills, 2009, pp. 9-10). In the policy discourses surrounding boys and schooling, there are ‘constant slippages’ that reaffirm what are ‘natural predispositions or learning behaviours and orientations for both boys and girls’ [emphasis in original] (Mills, Martino, & Lingard, 2007, p. 3561).
15). Drawing on biological essentialist notions and Gardner’s multiple intelligences, certain common tropes such as kinesthetic learning, devaluing inter/intrapersonal skills, preferring explicit/relevant teaching, and requiring male role models to learn often tend to dominate. Such strategies fail to acknowledge the culture of masculinity as well as environments and discourses from which boys draw their identity from. These initiatives risk homogenizing working-class boys into one cohesive group when we must recognize heterogeneity and their diversity in values, attitudes, and behaviour and how these are influenced heavily by their school and social contexts.

The working-class male

The ’crisis of masculinity’ is arguably felt more harshly by the working-class male. The so-called ‘macho lad’, whose ‘reproduction of working-class masculinity has been ruptured’ (Kenway & Kraack, 2004, p. 107), and who, perhaps, finds it more difficult to adapt. Today, working-class youth have to contend with a rise in credentialisation alongside a hazy economic future where stable employment is less common (Brown, 2013). As traditional social structures have disappeared, young men, particularly those from lower and working-class backgrounds, have to negotiate their identity work around rapidly changing discourses of aspiration and power. In place of traditional, respectable, working-class employment we have seen the steady rise of service-level positions which require working-class men to ‘learn to serve’ (McDowell, 2003) or ‘learn to loaf’ (Marks, 2003, p. 87). If working-class boys are drawing upon employment as part of their identity construction, they are now more likely to draw upon the ‘McJob’ (Bottero, 2009, p. 9). The impact of post-industrialism on white working-class masculine identity, specifically how masculinity is constructed in relation to education and the labour market, is framed by efforts to preserve tradition, uncertainty, survivalist mentalities, unrealistic expectations, and new searches for ‘respectability’ and ‘authenticity’ (Dolby & Dimitriadis, 2004; McDowell, 2003; Nayak, 2003).

As a result of post-industrialization, I argue working-class males draw on certain historically validated dispositions, such as social cohesion and social solidarity (through a legacy of union action and community involvement) to confirm their gendered, classed, and ethnic subjectivities inside and outside of schooling (Stenning, 2005; Mac an Ghaill, 1994: Pye, Haywood, & Mac an Ghaill, 1996). Social solidarity is often rendered through farouche ‘laddish’ or ‘loutish’ behaviours (cf. Francis, 1999) which can be socially empowering but also transgress boundaries of what is considered acceptable in a school context. Laddish behaviour is always a form of social validation and tied to self worth (Jackson, 2002; 2003).

About the author: Garth Stahl (@GarthStahl) is a Lecturer in Literacy and Sociology at University of South Australia. He is a theorist of sociology of education. His research interests lie on the nexus of neoliberalism and socio-cultural studies of education, identity, equity/inequality and social change. Currently, his research projects and publications encompass theoretical and empirical studies of learner identities, gender and youth, sociology of schooling in a neoliberal age, gendered subjectivities, equity and difference, and educational reform. Of particular interest to him is exploring counternarratives to neoliberalism around ‘value’ and ‘respectability’ for working-class youth. His book, entitled Identity, Neoliberalism and Aspiration: Educating White Working-class Boys is now available from Routledge.
This useful post on the [1]Pickle Jar blog offers some pointers about effective live tweeting. I agree it's important to remember that most (?) people reading your live tweets won't be in the room with you and thus will be confused by any features of the context you take for granted in your tweets. In that sense, I think this is excellent advice:

Context is key. If you're sending a tweet out into the world, assume your audience knows very little. If you hear something interesting, try to share it as if you're sharing words of wisdom with someone who wasn't there. Feel free to paraphrase, and take pictures of the slides if there's just too much amazing stuff on there for 140 characters. Those who aren't there will get something out of it, and those that are will have a reminder that they can re-tweet or favourite.

But surely live tweeting also serves a purpose for people within the room? The experience of live tweeting has often lived up to the rhetoric of the 'back channel': offering an outlet for both exchange with and awareness of other people at the event, many of whom I've never previously met. There are obviously risks posed by this (a topic for another post) but it's also something that can introduce a novel sociality into what might otherwise be a large and impersonal event.
This is why I think it's important to distinguish between the **official live-tweeter** (scene setter, context communicator and summariser in chief) and the voluntary live-tweeting of others at the event. Part of the role of the former is to encourage the latter through regular retweets and rapid responses to any questions. But another crucial part is to provide a sufficient sense of the context to 'outsiders' for the flurry of activity taking place amongst 'insiders' to be comprehensible and engaging. The insider activity isn't a threat to the quality of the live tweeting, it's rather what can make a hashtag fascinating to read if there is someone mediating between the two in order to ensure that 'insiders' don't exclude 'outsiders' by taking their shared context for granted.

There are numerous ways to establish context: regular reminders of what the hashtag is (e.g. “We're live tweeting from @BritSoci conference day 2, #BritSoc15”), taking pictures of the venue itself to convey a sense of place, regular statements of the schedule (e.g. “Our next speaker is @mark_carrigan from @SocioWarwick talking about social ontology of social movements”) and signalling openness to queries (e.g. “If you have any questions about #BritSoc15, whether you're here or not, please get in touch!”). This kind of activity can help if you're subsequently using the hashtag as a basis to compile a report of the event by providing way marks to make sense of what can be a vast stream of activity. But more importantly I think it also contributes to the accessibility of the event, structuring what might otherwise be an intimidating mass of communication and doing so in a way which encourages it to grow.

There's a really important suggestion later in the [3]Pickle Jar post which I've only recently started doing myself:

One way to really add some useful background is to start digging up links. Is the person on stage mentioning a project they worked on? Dig up a link to that project (or better still, a video about it), and share that on the conference hashtag. Do they have a personal site, with background detail? Go find it, and share it. It may seem like a bit of a slog, but Google is your friend here.

I prefer to live tweet on a phone but I'm planning in future to always use my laptop for this reason. If someone mentions a paper they've written, look it up and tweet the link! Tweet the institutional profile of the speaker and always ensure you link to their personal twitter feed and tag the department as well if they have a twitter presence. In this sense, the official live tweeter does a large part of the 'networking' in order that other people don't have to.

There's suggestions [5]later in the post which I've experimented with in the past but found people quite reluctant to participate in. Perhaps it's how I'm phrasing it? But the promise of Audioboom for micro-podcasts with speakers really fascinates me and I've love to find a way to suggest this possibility to speakers that doesn't immediately make them recoil in horror:

While you're there, how about tracking a few speakers down for an audio interview? [6]We've already chatted about the possibilities of platforms such as Audioboom, and you can use these with little more than a smartphone and a quiet sideroom or corridor.

If video's more your thing, why not provide some great content for curators and your followers by capturing a quick chat or a tech demo using [7]Youtube Capture, [8]Vine, or [9]Instagram Video? Or if you've got an audience that isn't in a wildly-different timezone, why not livestream an interview or a quick event summary using [10]Periscope or [11]Meerkat?
7. https://www.youtube.com/capture
8. https://vine.co/
11. http://meerkatapp.co/

Very nice, helpful. ALSO: in my experience Twitter can often be useful in those meetings where the panel or speakers share a reactionary position and the structure of the event - or lack of confidence among critics in the room - prevent a serious critical debate from taking place. Tweeting among audience can build another narrative and - who knows - embolden critics to push in to the debate.

Oh very good point - will cite in the book!

Critical Realism: Reimagining Social Science (2015-05-20 06:48)
"Critical Realism: Reimagining Social Science"

at the University of Notre Dame, Notre Dame/South Bend, Indiana, USA

27-30 July 2015

"What difference does critical realism make for how we do our empirical work?" More work must be done on how Critical realism may re-orient practical Research.
Papers applying a critical realist approach are invited on all topics, but in particular papers that focus on the practical, analytical and methodological implications of critical realism.
The Conference program will include a memorial for Roy Bhaskar (1944-2014)

Details about conference registration, paper submissions, housing and more: [1]http://csrs.nd.edu/events/iacr2015/

**Submission of papers:** send abstract of no more than 500 words to Nicolette Manglos-Weber [2]nmanglos@nd.edu by April 15th 2015

**Conference registration deadline:** May 30 2015

Registration costs: $ 400 USD

Conference organiser is professor Christian Smith, Department of Sociology, University of Notre Dame.

After the Conference a one-day interdisciplinary workshop will be held on *What Conversations about Science, Religion and Theology does Critical Realism make Possible (that other Philosophies of Science Do Not)?*

The annual Meeting of the American Sociological Association (ASA) will be held August 22-25 in Chicago. Notre Dame is two hours away from Chicago, and IACR participants may want to prolong their stay to attend the ASA Conference.

2. [mailto:nmanglos@nd.edu](mailto:nmanglos@nd.edu)
Despite years of investment into widening participation agendas, marginalised persons, whether in terms of class, gender, race, ethnicity, sexuality or disability, remain ‘devalued’ (Skeggs and Loveday 2012) owing to systems and structures of Higher Education. Reappropriating Value(s) will be a day of discussion and will bring together various academics and practitioners whose work speaks towards, or takes direct action against these practices. See here for confirmed speakers’ abstracts.

Schedule for the Day

9:30-10:15: Registration (tea/coffee)

10:15-10:30: Welcome and introduction to the day

Morning Session: Re-appropriating Values (theoretically and empirically)

10:30-11:15: Keynote 1

Dr Stephanie Lawler: ‘We’ve been framed!’ Value, social magic and symbolic power

11:15-12:15: Panel 1

Jessie Abrahams: Honourable Mobility or Shameless Entitlement? Social class and graduate employment

Rashida Bibi: "I understand how the world works much better": British South Asian Muslim women and experiences of Higher Education

Hilary Stewart: Disability, Symbolic Capitals and the Psychosocial
12:15-12:45: Discussion with keynote and panel

12:45-1:45: **Lunch** (provided)

Afternoon Session: Re-appropriating Values (politically, practically, pragmatically)

1:45-2:30: **Keynote 2**

Prof. Tracy Shildrick and Prof. Rob McDonald: 'Fat Cat Sociology' Revisited: the pressures and possibilities of 'public sociology' and 'real world' research impact

2:30-3:10 **Panel 2**

Victoria Armstrong: Introducing Mad Studies...

Dr Lisa McKenzie: 'Beyond Capital': The value of academic work

3:10-3:40 Discussion with keynote and panel

3:40-4:30 **Closing Comments & Ways Forward**

4:30-6:00 **Wine Reception and further discussion**

6:00 **Meal and more drinks for those interested**

For more info, contact [5]kirsty.morrin@manchester.ac.uk or [6]susan.oman@postgrad.manchester.ac.uk.

"The Relational Subject by Pierpaolo Donati and Margaret S. Archer

Many social theorists now call themselves ‘relational sociologists’, but mean entirely different things by it. The majority endorse a ‘flat ontology’, dealing exclusively with dyadic relations. Consequently, they cannot explain the context in which relationships occur or their consequences, except as resultants of endless ‘transactions’.

This book adopts a different approach which regards ‘the relation’ itself as an emergent property, with internal causal effects upon its participants and external ones on others. The authors argue that most ‘relationists’ seem unaware that analytical philosophers, such as Searle, Gilbert and Tuomela, have spent years trying to conceptualize the ‘We’ as dependent upon shared intentionality.

Donati and Archer change the focus away from ‘We thinking’ and argue that ‘We-ness’ derives from subjects’ reflexive orientations towards the emergent relational ‘goods’ and ‘evils’ they themselves generate. Their approach could be called ‘relational realism’, though they suggest that realists, too, have failed to explore the ‘relational subject’. 
2015 Social Media, Activism, and Organisations Symposium (#SMAO15) (2015-05-20 06:57)

2015 Social Media, Activism, and Organisations Symposium (#SMAO15)

Call for Submissions

Social media (from mainstream platforms such as Twitter to organization-specific tools) have become increasingly pervasive. This is exemplified by the diversity of uses ranging from Twitter and Facebook use during the Arab spring to the use of Snapchat by highly surveilled activist groups. Many social movements have increasingly seen social media as a means to collaboratively crowdsource, to network and communicate with diverse stakeholders. In large organizations, social media is often supported because the technology can help foster the sense of a "digital village", where individuals are able to “see” the lives of others within their organization and feel closer to them. However, the literature on social movements and social media has not fully grasped just how much social media has fundamentally changed the landscape of organizational communication, ranging from stakeholders being able to directly mobilize resources to making grassroots transnational social movements more organizationally feasible.

Social Media, Activism, and Organisations ( #SMAO15) seeks to better our understandings of how social media has shaped social movement organizations and the organization of social movements.

The Social Media, Activism, and Organisations symposium will be held in London, England on November 6, 2015 at Goldsmiths, University of London. The symposium is sponsored by The Sociological Review, The Centre for Creative & Social Technologies at Goldsmiths, and the Centre for the Study of Global Media and Democracy at Goldsmiths.

We invite you to submit short papers which explore the social media-influenced intersections of social movements and organisations. Full papers are not required for this conference, only short papers (2500 words, excluding references) related to the broad theme of “Social Media, Activism, and Organisations”.

Papers should be submitted by September 7, 2015 via Easy Chair at [1]https://easychair.org/conferences/?conf=smao15 and there is no preset template for submission. If selected, the author(s) will be invited to give a 15-minute oral presentation followed by a 5 min Q &A period at the symposium.

Author(s) of accepted paper abstracts may also be invited to submit full papers to a special issue of The Sociological Review, published by Wiley.

#SMAO15 TOPICS OF INTEREST

- Organisational communication and social media
- Democratizing organisational structures via social media
• Gender, social media, activism, and organisations
• Activist knowledge aggregation techniques
• Enterprise applications and social activism
• Collaboration, social media, and activism
• Virtual teams, social media and activism
• Activist networks and organizational communication
• Social media and organizational leadership
• Communicating organizational messages via social media
• Social media and advocacy organizations
• Inter-movement organizational communication and social media
• Visual social media and organisations
• Implications of anonymous social media

We welcome both theoretical and empirical papers and the symposium seeks to showcase a variety of case studies to advance our understandings of how social media has shaped social movement organizations and the organization of social movements.

The Study of the Learner Identity in Neoliberal Times (2015-05-20 11:24)

by Garth Stahl

Class, gender, and ethnicity, while contested areas, all play a role in the constitution of identity as the self is not fixed. Identities are not distinct from discourses but instead produced by and through them. As collections of meaning imbedded with symbolic connotations, discourses define objects set parameters on what we can think, feel, and be (MacLure 2003), where we may ‘make ourselves but not in conditions of our own choosing’ (Archer et al., 2010). Neoliberalism, as an extension of human capital theory which suggests that individuals and society derive economic benefits from investments in people (Sweetland, 1996, p. 341), was a step toward eliminating ‘class as a central economic concept’ (Bowles & Gintis, 1975, p. 74). Current iterations of neoliberalism function as a political, economic, and ideological system that gives considerable credence to the market as the best, most efficient platform for distributing public resources. This macro-level structural framework attributes greater consideration of individual duty than government responsibility (Gillborn & Youdell, 2000; Reay, David, & Ball, 2005; Zipin, Sellar, Brennan, &
Archer and Francis (2007) write that in the neoliberal reading ‘there are no foundational aspects of selfhood such as “race” or gender that preclude an individual from taking up the opportunities available to them – failure to do so simply reflects an individual lack of enterprise’ (p. 19). Within a neoliberal discourse it is argued that the self is malleable, constantly made and re-made as people must become ‘entrepreneurs of the self.’ Neoliberal ideology privileges the reflexive modernisation thesis where historic conventions of femininity and masculinity can arguably be reinscribed in new ways (cf. Adkins 2000; Kenway and Kelly, 2000) and where historic and gender-based inequalities exist simultaneously with evidence of changed expectations (Adkins, 2000). In our neoliberal times, Davies and Bansel (2007) have claim:

The so-called ‘passive’ citizen of the welfare state becomes the autonomous ‘active’ citizen with rights, duties, obligations, and expectations—the citizen as active entrepreneur of the self; the citizen as morally superior. This is not simply a reactivation of liberal values of self-reliance, autonomy and independence as the necessary conditions for self-respect, self-esteem, self-worth, and self-advancement but rather an emphasis on enterprise and the capitalization of existence itself through calculated acts and investments combined with the shrugging off of collective responsibility for the vulnerable and marginalized. (p. 252)

The neo-liberal rhetoric, where context is ignored for the sake of the entrepreneurial self, has the ability to create conditions of heightened fixity especially if one lacks certain capitals. Within neoliberalism, risk is always pervasive where today young people often seek to manage the riskiness of transitions from school to work through a range of strategies including cultivating certain identities. Saturated in labels of success/failure and active/stagnant, education today is infused with the neoliberal prerogative which increasingly fixes identities within rhetoric is risk.

The neoliberal education experience

The neoliberal policy which permeates classroom discourses becomes a powerful mediating force in the identity construction of all students (Phoenix, 2004). Neoliberalism, with its promotion of ‘efficiency’, ‘productivity’, ‘targets’, and ‘choice’, enables competition and market-driven results without strategic consideration to the gross economic inequalities it creates, particularly for marginalised communities (Ball, 2009; 2012;). Working-class students both present learner identities and have learner identities imposed upon them within a highly pressurized and stratified educational environment.

As pedagogic processes become influenced by neoliberal logic, there are overt and subtle consequences for gender identities. The presence of a competitive ‘performance-oriented culture generates anxiety, especially among boys whose gender identity needs to be based on achieving power, status, and superiority’ (Arnot, 2004, p. 35). In terms of gender, we must consider the sublimation of certain elements of the self as particularly potent for working-class boys who construct their masculinity around traditional models of ‘breadwinners’ in economies where their employment ‘choices’ are increasingly limited. In contrast, femininity seems to be less impacted by neoliberal logics as young women have been documented as ideal, flexible, neoliberal subjects (McRobbie, 2008; Walkerdine 2003).
In considering the identity work of students, the concept of ‘positioning’ raises the question of possible selves which are contradictory both to other selves and to internal selves (Davies, 1989, p. 229). The production of the self, our subjectivity, involves learning inclusive and exclusive practices and positioning oneself in relation to these practices to establish a sense of belonging (Davies & Harre, 1990). Further, it is argued that human beings ‘are characterized both by continuous personal identity and by discontinuous personal diversity’, where selfhood is the product of discursive practices and these processes lead to a multiplicity of selves (Davies & Harre, 1990, p. 46). As a result, individuals are active agents who position themselves (‘reflexive positioning’) and are positioned by others through social interaction (‘interactive positioning’) as gendered, classed, and ethnic individuals (Davies & Harre, 1990). Therefore, identity work involves grappling with both subjective constraints and the constraints of accepted discursive practices (Renold, 2004), often within powerful neoliberal discourses (Francis, 2000).

When considering an analysis of learner identities with engagement/disaffection, the emotional power of education is in the creation of the self. In schooling, the self is increasingly sublimated through neo-liberal agendas, where ‘it is the duty of the individual to be sufficiently flexible to maximize the opportunities available to her/him, and any failure resides in the individual rather than in the socio-economic structures’ (Francis, 2006, p. 191). When considering identity as negotiated through school contexts, it is essential to consider the ‘web’ of numerous and complex factors that contribute to disaffection toward school (Stevenson & Ellsworth, 1991). Therefore school failure/success is bound up with the process of students doing ‘identity work’, where young people’s engagement with schooling ‘depends in part on the sense they make of themselves, their community, and their future and in part on “the adaptive strategies” they use to accept, modify, or resist the institutional identities made available’ (Smyth, 2006, p. 290). Within or beyond the classroom, identity is positioned through conceptions of the collective and the individual and in a constant form of negotiation as it is constructively articulated, debated, and problematised.

**Works Cited:**

About the author: Garth Stahl (@GarthStahl) is a Lecturer in Literacy and Sociology at University of South Australia. He is a theorist of sociology of education. His research interests lie on the nexus of neoliberalism and socio-cultural studies of education, identity, equity/inequality and social change. Currently, his research projects and publications encompass theoretical and empirical studies of learner identities, gender and youth, sociology of schooling in a neoliberal age, gendered subjectivities, equity and difference, and educational reform. Of particular interest to him is exploring counternarratives to neoliberalism around 'value' and 'respectability' for working-class youth. His book, entitled Identity, Neoliberalism and Aspiration: Educating White Working-class Boys is now available from Routledge.

Queering ESOL: towards a cultural politics of LGBT politics in the ESOL classroom (2015-05-20 12:54)

‘Queering ESOL: towards a cultural politics of LGBT politics in the ESOL classroom’
UCL Institute of Education
19 - 20 June 2015

For info about previous seminars go to:https://queeringesol.wordpress.com/

Plenary speakers
Luiz Paulo da Moita Lopes (Federal University of Rio de Janeiro)
Queering language teaching in Brazilian schools

Holly Cashman (University of New Hampshire)
Making queer latinidad visible in the U.S. Southwest: xenophobia, identity politics, and resistance

Tommaso Milano (University of Witwatersrand)
Queer entanglements: representations, practices and the complex politics of sexuality in South Africa

Susan Stryker (University of Arizona)

3574
Crossing Genders, Crossing Borders: Transgender in Transnational Contexts

Confirmed invited speakers
Helen Saunston (York St John University)
Queering TESOL in international learning contexts

Mark McCormack (Durham University)
Moving beyond homophobic language: the intent-context-effect matrix

Nick Mai (London Metropolitan University and Aix-Marseille)
Assembling 'Samira' and 'Travel': understanding sexual humanitarianism through experimental ethnofictional filmmaking

Rusi Jaspal (De Montfort University)
ESOL An Opportunity for Challenging Homophobia

Jason Ho (City University of Hong Kong)
"Blue pill or red pill" (or both?): Critical and dramatic inquiry approaches in a CLIL curriculum on sexism, heterosexism, and transphobia

There will also be contributions from Francesca Stella (University of Glasgow), Laila El-Metoui (LGBTiq inclusion in Further Education), Joanna Pawelczyk and Łukasz Pakuła (Adam Mickiewicz University), Thorsten Merse (Westfälische Wilhelms-Universität), Mike Baynham (University of Leeds), Yiu Tung Suen (City University Hong Kong), Melanie Cook (King’s College London) and John Gray (UCL Institute of Education).

The conference will also include the screening of the film Samira, which will be introduced by the director Nick Mai.

To reserve a place contact Tracy Modha (t.modha@ioe.ac.uk).

Note that this event is free and that funding for travel of up to £75 per attendee is available for research students and ESOL practitioners.
How you can become a Twitter ninja in 7 days or less (2015-05-21 07:50)

Apologies for the title. It’s intended as an example of what this post discusses: what titles work well on Twitter? The Buffer team [1] share examples of titles that have proved particularly effective on their blog. Their average tweets receive 100-150 clicks whereas all of these reliably receive over 200:

1. Twitter Tips for Beginners: Everything I Wish I Knew When I Started
2. How I Got 4x Faster Writing Blogposts
3. The Origin of the 8-Hour Work Day and Why We Should Rethink It
4. 59 Free Twitter Tools and Apps That Do Pretty Much Everything
5. Shave 20 Hours Off Your Work Week With This Email Template
6. How to Get Your First 1,000 Followers on Twitter — A step-by-step guide!
7. 30 Little-Known Features of the #SocialMedia Sites You Use Every Day
8. How to Easily Save 60 Minutes Every Day on the Internet
9. 7 Ways I Accidentally Got More Twitter Followers (and How You Can on Purpose!)
10. 53+ Free Image Sources For Your Blog and Social Media Posts

They describe how these titles use a [2] range of reliable strategies which anyone can use when blogging:
My own experience suggests their claims are accurate. But I’m still hesitant when it comes to academic blogging. Ideally I’d like to find a middle ground between these social media friendly titles and the ‘narrative titles’ that the LSE blogs use. My fear is that following the metrics too closely inevitably leads us into [3]Upworthy territory: "You'll never believe what this start-up company is telling us about what academics have to do in order to succeed at social media". That would be bad, right?

The Journal of Applied Social Theory is an exciting new journal launched by the team behind Social Theory Applied:

The Journal of Applied Social Theory aims to provide an intellectual space where critical applications of social theory (in all its varied forms) can flourish.

The objective in setting up this new open-access journal is to fill a gap in current academic debates regarding the treatment of well-established and sometimes revered theories, theories that can all too often inhibit discussion while shying away from more applied forms of theoretical work.

By providing this platform for debate around social theory and its applications, we aim to make a strong contribution to critical understandings of how theory can be applied to various forms of practice – professional research, policy, practitioner, etc. All too often we find discussions of theory divorced from method and/or separated from practice. We hope that in the long run the Journal of Applied Social Theory can offer an online space where such troublesome boundaries and dichotomies can be traversed.

We also envisage the journal providing a space for future innovation across a range of areas, not just in contributions to intellectual knowledge, but also issues of style, delivery, engagement and impact. Combined with our sister website Social Theory Applied we see this new journal as having a role in delivering on the promise of the digital public sphere. We have a clear and unambiguous commitment to democratising knowledge while staying true to the ‘traditional’ emphasis on academic standards and peer review. In this important regard, the journal is itself a boundary spanner looking to making the best of both worlds while seeking ways via which we can shape future alternatives around questions of access, academic knowledge and impact.

Given the scope of the journal, we have a number of audiences in our sights. These include the ever growing number of academics working across a wide range of disciplines who are engaged in the application of social theory in their research. Moreover, we would like to engage with communities outside the academy. These include people working in different forms of professional practice (e.g. teachers, public administrators, health sector workers, industry, etc.), policy makers at various levels of governance (regional, national and international), non-governmental organisations (NGOs), and interested members of the wider public. Over time, what we would really like to achieve is a digital space where the interests, values, and ideas of these audiences can come together and create alternative forms of knowledge. After all, no one sector has a monopoly on useful knowledge.

To achieve this, the journal consists of two main sections:

1. Social Theory and Research
2. Social Theory and Society

These sections inevitably overlap to some extent but they have the purpose of serving different forms of practice – the first serving researchers who wish to report and discuss the challenges of combining theory and method, whilst the second section provides a home for academics and/or practitioners and/or policy makers who want to reflect more generally on social issues via a socio-theoretical lens. The second category is wider but deliberately so; we aim to be as inclusive as possible and engage with as wide a readership as we can.
Workshop on gender and climate change - 29th May (2015-05-21 07:55)

Gender and Climate Change workshop

Friday May 29th from 2.00 til 4.30

Wolfson Research Exchange at the University of Warwick

Sherilyn MacGregor (Keele)

Vulnerable victims or resilient subjects? Dismantling the gendered discursive traps of climate change politics

Abstract

Feminist activists and policy professionals have provided ample evidence that the impacts of climate change have gender dimensions, thereby putting gender on the international climate agenda. Feminist academics have been much slower to take up the issue, resulting in a shortage of theoretical scholarship on gender and climate change. What can feminist political theorizing contribute to the project of developing gender-sensitive responses to this serious global challenge? I argue that one task should be to complement field-based research on women’s experiences of climate change with feminist constructivist analyses of how discursive framings of ‘the problem’ and policy solutions often serve to reinforce neoliberal, patriarchal power relations. Understanding the complex workings of ideology, language, and power can help us to beware the discursive traps that inevitably threaten all those who work for counter-hegemonic social change. To illustrate this approach, I use feminist critical discourse analysis to interrogate the emergence of a vulnerability-resilience dualism that now dominates climate policy at all levels. I show that within the adaptation literature, the construction of the ‘resilient subject’ in opposition to the ‘vulnerable victim’ fits squarely within the dominant post-political agenda: it is founded on scientistic and masculinist values; it naturalizes neoliberal rationalities of governance; and it deflates the political capacities and identities of people as citizens. The vulnerable climate victim is weak, usually feminized, and in need of ‘knowledge transfer’ in order to become robust and self-reliant enough to survive and thrive in harsh new conditions beyond control. Not only does this simplistic binary ignore complexities on the ground, including the dubious construction of masculine resilience, but it also removes expectations of citizen resistance to the root causes of ecological crisis, thereby casting it as non-political fait accompli. I argue that feminist theoretical analyses should expose and devise strategies for avoiding this and other discursive traps that exist within the sphere of climate change politics and policy.

Biographical note

Dr Sherilyn MacGregor (PhD York University-Toronto) is senior lecturer in Environmental Politics and director of the Environmental Studies programme at Keele University in the UK. Her research expertise lies in the fields of...
gender politics and environmental politics, with a special focus on the theoretical and policy connections between sustainability, citizenship and social reproduction. She is joint editor of Environmental Politics journal and director of PublicSpace, a not-for-profit company specializing in research communication in the public interest.

Lopa Saxena (Coventry)

Gender, Climate Change and Food Sovereignty in South Asia: an exploration from a feminist political ecology perspective

Abstract

In South Asia as in many other agrarian economies in the developing South, the gendered impacts of Climate Change have led to women being disproportionately affected posing a substantial threat to food security. On the other hand, Food Sovereignty is attracting much attention as a form of resistance to dominant neo-liberal influences on food, agriculture and rural development. I am exploring the relation between the two from a Feminist Political Ecology perspective looking at some of the issues in relation to production, gender and climate change adaptation.

Biographical note

Dr Lopa Saxena has recently become a Research Associate in the Centre for Agro-ecology, Water and Resilience in Coventry University. Previously she was working as an independent researcher on consultancies and has worked on University-led team projects. Her research interests include Food Security, Climate Change and Gender, Vulnerability and Resilience, Gender and Disasters, Sustainable Land and Water use Practices, and Women Entrepreneurship. She holds a PhD in Environmental Economics and Environmental Management from the University of York (UK).

Rebekah Martin is an MA student on the Gender and International Development programme in the Department of Sociology at Warwick. She will introduce the film 'Missing: the forgotten women in India's climate plans'.
Demonstration Against Casualisation and TeachHigher

Friday 19 June, 12 noon, Library Road
“No to casualisation of academic staff!”

Make your voice heard at Warwick University Open Day!

TeachHigher threatens job security and quality education at ALL UK universities

We need to act now, and act together, to put an end to TeachHigher once and for all!

For updates keep an eye on our blog: [1]https://no2casualisationwarwick.wordpress.com/

When corporations try too hard on social media (2015-05-21 20:21)

OMG Mega Lolz, FML, I can haz KitKat? I've just been writing about this KitKat post in my social media book. It's a great example of a corporate brand trying too hard when engaging on social media. But as Kate Loose points out in this [1]wonderful New Inquiry article, it's much creepier when they get it right. The KitKat post is just slightly awkward but I find the broader trend completely unnerving:

But slowly, and by 2014, very quickly, the insouciant, lower-case voice became the mainstream, corporate voice. Now, a Denny's tweet can sound more casual and on meme than any individual's Twitter account. And it isn't just Denny's: Brands from Chipotle to Hamburger Helper have gained massive followings this way. If in the past five years we all had to grow up somewhat — Carles doesn't even tweet any more — how is it that corporations grew down, becoming the new meme-aware "teens" of social media?

It is a fact of marketing that brands can't ask for business too directly. People tend to recoil from requests that feel too direct, and this is why social-media accounts explicitly selling anything seem like spam, triggering disinterest. Brands have to make us want them by giving us something: in branding
terms, providing value. This is how humor, or the gift of laughs, becomes the universal gift that any Twitter account can provide to its followers, as #weirdtwitter proved in its universe of thousands of anonymous accounts tweeting nonsensical humor at each other.

British Sociological Association

MEDICAL SOCIOLOGY GROUP ANNUAL CONFERENCE 2015

THIRTY TWO FREE PLACES AT THE 2015 BSA MEDICAL SOCIOLOGY CONFERENCE

Thanks to successful conferences in recent years, the BSA Medical Sociology Group committee has been able to increase its support for a number of groups who may find it difficult to obtain funding for attendance at its annual conference. For the [1]2015 Annual Conference, which will take place on 9-11 September at the University of York, a number of free places will be available (including registration, meals, accommodation and conference dinner):

- 20 free places for postgraduate students
- 12 free places for individuals who are unwaged, low-waged or working outside academia (e.g. sociologists in non-academic posts, in civil society organisations or service user groups, etc.)

These places will be distributed to eligible individuals who apply to the BSA before 19 June 2015. If there are more applicants than available places, then places will be allotted to eligible applicants through a process of random allocation.

To apply for a place, please visit [2]http://www.britsoc.co.uk/events/medsoc-annual-conference/registration.aspx for detailed eligibility and to download the application form.

Please note those who have previously received a funded place will not be eligible to apply.

Completed forms should be sent to [3]events@britsoc.org.uk before the deadline above.

You will be notified regarding your application shortly after the deadline. If you are unsuccessful, you will be placed on a reserve list. If you are successful and later find that you are unable to attend the conference, please notify the BSA office as soon as possible, so that the place might be offered to someone on the reserve list.
Please note that free places cover registration, accommodation and subsistence for the conference. Unfortunately it is not possible to subsidise travel to and from the conference.

1. http://www.britsoc.co.uk/events/medsoc/
3. mailto:events@britsoc.org.uk

Social Networks and Belonging, June 10th at Keele (2015-05-22 06:14)

Social Networks and Belonging

Sociology Workshop

Wednesday, 10th June 2015

2.00pm – 5.30pm

Chancellor’s Building: CBA1.078/9

‘Refugee Week is a UK-wide programme of arts, cultural and education events and activities that celebrates the contribution of refugees to the UK and promotes better understanding of why people seek sanctuary’ (Refugee Week nd). It involves thousands of people, institutions, organizations, and individuals throughout the country. Last year Keele joined Refugee Week for the first time by [1]hosting a weeklong photographic exhibition, an opening event with a musical performance and a poetry open mic night. Placing our university on the map alongside numerous institutions and cultural hubs across the country and building on previous success, this year Keele Refugee Week will be hosting an even richer programme of events.

As part of the [2]national and [3]Keele Refugee Week celebrations, this year Sociology will be hosting a half-day workshop to highlight research on the theme of social networks and belonging among refugees and asylum seekers in the UK. Presentations will examine the politics and performances of asylum within different domestic contexts, and attempt to unpack some of the complex relationships that form between ‘host’ and ‘guest’ and within migrant networks.

This free event aims to bring together academics, students, refugees and asylum seekers and those working with refugees and asylum seekers, and to encourage lively debate about the challenges and opportunities facing refugees in the UK.

Programme

2.00: Welcome and introduction

Dr Siobhan Holohan, Keele University

2.15: Presentations
Dr Jonathan Darling, Manchester University

Dispersal and Disruption:
The Challenges of Isolation within the Asylum Accommodation Model

Natalie Soleiman, PhD Candidate, Keele University

Seeking Refuge in the UK:

An Iranian Story of Asylum and Living in the ‘In-betweens’

3.30: Break for refreshments

3.45: Presentations

Dr Simon Goodman, Coventry University

The Role of Social Networks for Asylum Seekers in the Midlands

Dr Ala Sirriyeh, Keele University

‘This is in a way my birthplace’:

Young Refugee Women, Social Relationships and Networks

5.00: Exhibition

Discussion and art exhibition by women from the ‘Women Together’ project based in Huddersfield

(Refreshments will be available)

**Admission is free:** however, please confirm your attendance with Siobhan Holohan ([mailto:s.holohan@keele.ac.uk](mailto:s.holohan@keele.ac.uk)) or Ala Sirriyeh ([mailto:a.sirriyeh@keele.ac.uk](mailto:a.sirriyeh@keele.ac.uk)) by Monday, 1st June for catering purposes. Find us on the first floor of Chancellor’s Building ‘A’ block: [download campus map](http://www.keele.ac.uk/findus/maps/Keele_campus_guide_colour.pdf). For more information about National Refugee Week go to: [http://www.refugeeweek.org.uk/](http://www.refugeeweek.org.uk/) For information about Keele Refugee Week activities go to: [http://www.keele.ac.uk/refugeeweek/](http://www.keele.ac.uk/refugeeweek/)

The latest volume in the [1]Social Morphogenesis series examines how generative mechanisms emerge in the social order and their consequences. It does so in the light of finding answers to the general question posed in this book series: Will Late Modernity be replaced by a social formation that could be called Morphogenic Society?

This volume clarifies what a 'generative mechanism' is, to achieve a better understanding of their social origins, and to delineate in what way such mechanisms exert effects within a current social formation, either stabilizing it or leading to changes potentially replacing it. The book explores questions about conjuncture, convergence and countervailing effects of morphogenetic mechanisms in order to assess their impact. Simultaneously, it looks at how products of positive feedback intertwine with the results of (morphostatic) negative feedback. This process also requires clarification, especially about the conditions under which morphostasis prevails over morphogenesis and vice versa. It raises the issue as to whether their co-existence can be other than short-lived.

The volume addresses whether or not there also is a process of ‘morpho-necrosis’, i.e. the ultimate demise of certain morphostatic mechanisms, such that they cannot ‘recover’. The book concludes that not only are generative mechanisms required to explain associations between variables involved in the replacement of Late Modernity by Morphogenic Society, but they are also robust enough to account for cases and times when such variables show no significant correlations.

Critical realism is a philosophy of science that positions itself against the major alternative philosophies underlying contemporary sociology. This book offers a general critique of sociology, particularly sociology in the United States, from a critical realist perspective. It also acts as an introduction to critical realism for students and scholars of sociology.

Written in a lively, accessible style, Douglas V. Porpora argues that sociology currently operates with deficient accounts of truth, culture, structure, agency, and causality that are all better served by a critical realist perspective. This approach argues against the alternative sociological perspectives, in particular the dominant positivism which privileges statistical techniques and experimental design over ethnographic and historical approaches.

However, the book also compares critical realism favourably with a range of other approaches, including post-structuralism, pragmatism, interpretivism, practice theory, and relational sociology. Numerous sociological examples are included, and each chapter addresses well-known and current work in sociology.

Reconstructing Sociology will be published by Cambridge University Press in September 2015. See [1] here for more details or to pre-order.

New perspectives on class, inequalities and families (2015-05-23 10:52)

BSA Teaching Group Regional Conference
New perspectives on class, inequalities and families
3588
Programme

9.30 Registration, tea & coffee

10.00 Prof Corinne Squire, UEL: Introduction and welcome

10.15 Prof Mike Savage, London School of Economics: The Great British Class Survey and new forms of class in the UK. Chair: Dr Penny Bernstock, UEL

11.00 Examination board presentation - AQA

11.30 Patrick Robinson, Cadbury Sixth Form College: Teaching the new 2015 specs: Globalisation and social networks. Chair: Prof Corinne Squire, UEL

12.15 Lunch with networking time – delegates will be invited to bring at least one resource with them which they find useful in the classroom.

13.15 Prof Gargi Bhattacharya, UEL: Living in a time of diminishing expectations: Inequality after austerity. Chair: Patrick Robinson, Cadbury Sixth Form College

14.00 Examination board presentation - OCR

14:30 Postgraduate Micro-lectures

Jenny Thatcher, UEL: ‘You got to have faith, Polish migrants in the UK and their secondary school choices

Rumana Hashem, UEL: Thinking intersectionally and taking the sociology lecture outside the classroom

Jose Ignacio Diaz-Vazquez, UEL: Becoming a woman by practising autofiction

15:15 Break, tea & coffee

15.30 Examination board presentation – WJEC Eduqas

15:45 Dr Janet Boddy, University of Sussex: Researching families across contexts.

Chair: Dr Belinda John-Baptiste, UEL

16.30 Close

Delegate rates (include lunch & refreshments):

Science, Security and the Future of Freedom

Wednesday 3rd June 2015 – All day event

Venue: MS.01. Maths Building, University of Warwick, Coventry, CV4 7AL

http://www2.warwick.ac.uk/fac/soc/pais/research/clusters/irs/wif/event/

The twenty-first century will be shaped by cyber security. In 2012, the world sent over eight trillion text messages. In five years time, everything we buy in a shop that costs more than $10 will have an IP address and will collect information on the world around it. Many farm animals now contain SIM cards that transmit their health status and in ten years time, equivalent body-monitoring for humans will be ubiquitous. In twenty years time we will think - then blink - and send an email. In cities like London, New York and Toronto the majority of human interactions will be recorded. Who will secure these digital shadows of ourselves? And will they constrain us - or make us more capable and free?

Programme

10.30 - 11.00 Registration / Coffee

11.00 - 12.30 Session 1 - Open Futures

"How I learned to Stop Worrying and enjoy Surveillance"
Richard Aldrich, (Department of Politics and International Studies, University of Warwick)

"The End of Secrecy"
Chris Moran and Melina Dobson, (Department of Politics and International Studies, University of Warwick)

"Intelligence and the Future of Accountability"
Mark Phythian, (Politics and IS, University of Leicester)
12.30 - 13.30 Lunch

13.30 – 15.00 Session 2 – Possible Futures

"The Digital Future"
Carsten Maple, (Warwick Manufacturing Group, University of Warwick)

"The Future of Technology and Privacy"
Tom Chothia, (Computer Science, University of Birmingham)

"The Future of Resilience",
Mark Freeman, (Business School, University of Loughborough)

15.00 – 15.30 Coffee break

15.30 – 17.00 Session 3 – Dangerous Ideas

"The Future of Digital Activism"
Athina Karatzogianni, (Media Studies, University of Leicester)

"Surveillance and Science Fiction"
Simon Willmetts, (American Studies, University of Hull)

"Science, Security and the Idea of Freedom"
Andrew Hammond, (Department of Politics and International Studies, University of Warwick)

17.00 Drinks

Web Science 2015: Call for Late Breaking Research (2015-05-23 10:56)
At WebSci15 we will hold an exciting and interactive session for Late Breaking Research: analysis, demos and concepts that are not yet ready for publication, but would stimulate debate and further investigation into current topics within Web Science. Abstracts are invited (approx 500 words) that propose interesting and novel research that will presented in a Pecha Kucha-style session on Sunday afternoon (28 June).

Late Breaking Research may be proposed on any theme that facilitates interdisciplinary discussion of the Web and approaches to Web Science research. We particularly welcome applications that are ambitious in scope and aim to address the pressing challenges of Web Science. This might include, but is not restricted to:

Theorising the Web
Data ownership, access and ethics
Digital cultures
Digital inequality, citizenship and governance
The future of the Web

Submissions will be reviewed by the General and Programme Chairs as they are received and will not be otherwise peer-reviewed. They should be approximately 500 words and are not required to follow ACM formatting requirements. Figures and references can be included but please respect a two page limit to facilitate review.

Submit papers using EasyChair at https://easychair.org/conferences/?conf=websci2015

Please note the interim deadline of 27 May in order to receive notification before the early bird registration deadline of 29 May. Submissions will be accepted up until 14 June.

Find out more about the conference at: http://www.websci15.org

**Brutalist urban architecture in Hong Kong (2015-05-24 08:00)**

Think a city cannot surprise you? I thought so, until I found Michael Wolf’s work. Here are some of his pretty ugly - or pretty in their ugliness, depending on your viewpoint - [1]photos of HK urban highrise blocks of flats. This is how I imagined sociology to be, when I first read my first sociology book back in 2002: Peter Berger’s "Invitation to sociology" (I found a [2]pdf of first chapter here - beware, it might hook you up on sociology). Check out more about Wolf’s photographic project on [3]life in cities.

The Independent Social Research Foundation (ISRF) provides competitive funding for independent-minded researchers. It supports original work which takes new approaches and suggests new solutions to real-world social problems, and which is unlikely to be otherwise funded.

At the ISRF Annual Workshop the ISRF’s Fellows report on their work, to each other and to a wider audience drawn here from its host, the Research Centre for Social Sciences (ReCSS) at the University of York. The Workshop focuses on the ISRF’s requirement that the research should be interdisciplinary, innovative and critical. The topic for this year’s Workshop is ‘Critique and Critiques’ and the two-day event will interrogate this theme, in a space where introductory, provocative, exploratory or research-based statements make way for audience participation and discussion by audience members.

What counts as critique varies across the disciplines; critical history, critical anthropology, critical theory and theories, critical philosophy and so on differ in theory and method. All are themselves subject to critique and, of course, the critique of the notion of critique presents a further complication. The Workshop is an opportunity to consider what the truly critical and intellectually research sought by the ISRF, and aimed at by its Fellows, might look like. On Day One there will be short presentations by the ISRF Fellows of projects from across the social sciences, and a Roundtable discussion: ‘What is critique and (how) are we doing it?’

Day Two, bringing together researchers from York and beyond, focuses on contemporary forms of critical theory and its application in empirical research. As a body of thinking, analysis and research critical theory problematizes superficial and complacent analyses of our contemporary human, social and economic condition. The day discovers the range of engagement in critical understandings of social change, progress, the impact of technology, our imbrication with economic rationalities and discourses, as well as deepening problems of ecocide, inequality and violence, in the work of the University’s social science scholars.
The ISRF funds work across and beyond the social science disciplines, to include literature, anthropology, law, history, politics, sociology, philosophy, finance, economics & psychology. This two-day event brings the ISRF and its Fellows together with York's own scholars and research establishment. ‘The politics of names and naming in India’

The Independent Social Research Foundation (ISRF) provides competitive funding for independent-minded researchers. It supports original work which takes new approaches and suggests new solutions to real-world social problems, and which is unlikely to be otherwise funded.

At the ISRF Annual Workshop the ISRF’s Fellows report on their work, to each other and to a wider audience drawn here from its host, the School of Social and Political Science at the University of Edinburgh. The Workshop focuses on the ISRF’s requirement that the research should be interdisciplinary, innovative and critical. The topic for this year’s Workshop is ‘Social Science as Communication’ and the two-day event will interrogate this theme, in a space where introductory, provocative, exploratory or research-based statements make way for audience participation and discussion by audience members.

The title ‘Social Science as Communication’ is intended to provoke uncertainty. Is one communicating when doing social science? Is one doing social science when communicating? Re-thinking social science as (being) communication? Re-thinking communication? What is being communicated? What counts as communication (anyway)? There will be a Panel of the ISRF’s Fellows to consider these and other options, and the Fellows will be asked to bear the Workshop theme in mind when presenting their own work.

On Day Two, the University of Edinburgh’s School of Social and Political Science will host panels on ‘The Media, The Academy and The Referendum’ and ‘Digital Social Science’, and will present a lunchtime communication carnival: ‘a promenade presentation of creative and committed experiments in social science communication’.

The ISRF funds work across and beyond the social science disciplines, to include literature, anthropology, law, history, politics, sociology, philosophy, finance, economics & psychology. This two-day event brings the ISRF and its Fellows together with Edinburgh’s own scholars and research establishment.

**Workshop Title:** Social Science as Communication

**Dates:** 1st & 2nd June 2015

**Location:** Summerhall, Summerhall Place, Edinburgh, EH9 1QH

The Association of (Gay) Suburban People (2015-05-24 11:17)

It’s easy to associate gay culture with urban life, as if the two are inextricably linked and always would be. But this fascinating work of social history offers an illuminating perspective on organised gay suburban life in the 1970s and 1980s:

The name was carefully chosen: it emphasized the group’s goal of challenging the sexual conformity of suburban society and also invoked the First Amendment right to peaceably assemble — yet avoided any reference to either homosexuality or Detroit. As Rogalski notes, “It was politically expedient to pick a name ... that wasn’t threatening.” Before long the group was promoting itself on the local radio show, Gayly Speaking. “Gay people in Oakland and western Wayne County no longer have to feel isolated in the desert of suburbia,” said Herbert “Bo” Taylor, the group’s first chairman, in an interview with host
David Krumroy, another ASP founder. "We saw a need to organize not only for social reasons but for political reasons, for reasons of self-protection." ASP was, he said, sparking "a new consciousness" and raising "a new awareness of the numbers of gay people in the suburbs."

Centre for Social Ontology PhD/ECR Conference

Centre for Social Ontology PhD/ECR Conference
June 23rd, University of Warwick, 10am – 4pm

Social ontology is integral to the study of society. It is impossible to inquire into the social world without some understanding, at least tacitly, concerning the entities which make up that world and their properties and powers. However social ontology remains an often confused and contentious matter within the social sciences.

The first Centre for Social Ontology PhD and ECR conference seeks to address this matter through papers exploring the role of social ontology within sociology.

The conference is open to all PhD students and Early Career Researchers with an interest in social ontology.
Schedule

9:30 to 10:00 — Welcome and coffee

10:00 to 11:30 — 3 papers

• Jonathan Beacham: Mixed Method Ontologies and Dialectical Futures
• Adam Wood: Why Architecture Needs a Social Ontology
• Giulia Lasagni: Mutual Recognition and Social Commitment

11:30 to 11:45 - Coffee

11:45 to 12:45 - 2 papers

• Janet Lord: What does it mean to be a teacher? A critical realist approach.
• Kalok Yip: IHL and IHRL – Convergence of Laws, Conflation of Ontologies

12:45 to 13:30 - LUNCH

13:30 to 15:00 — 3 papers
The multi-millionaires running higher education (2015-05-24 15:08)

To say things are "getting out of hand, especially given the tax-exempt nature of universities" shows an impressive capacity for understatement:

For E. Gordon Gee's final year as the president of Ohio State University, which he left in 2013, he got a package of more than $6 million, as was widely reported. It was a one-time bonanza, including deferred payments and severance, but he'd earned roughly $2 million annually over the previous years.

The Chronicle of Higher Education analyzed salary information for private colleges from 2012, the most recent year available, and found that Shirley Ann Jackson, the president of Rensselaer Polytechnic Institute, received a package worth over $7 million.

Fenves's salary as the president of the University of Texas puts him well behind that of his counterpart at Texas A & M University, who has an annual base of $1 million plus $400,000 in additional compensation, according to The American-Statesman.

Each profligate compensation package breeds more like it, as schools' trustees convince themselves that they must keep pace in order to recruit, retain and receive the precious fairy dust of the heaviest hitters.

They reason that "this is a winner-take-all society and that people with extremely high levels of talent are richly rewarded," said Richard Vedder, the director of the Center for College Affordability and
“But I think that things are getting out of hand, especially given the tax-exempt nature of universities,” he told me. “They’re in privileged positions, and they were given these privileged positions not to enrich themselves but to serve society. These presidents are expected to live quite nicely but not exorbitantly and not extravagantly.”

_______________

Television and feeling the passage of life (2015-05-25 08:57)
There’s an intriguing passage in Difficult Men, an account of television’s ‘third golden age’, concerning the temporality of Mad Men and how it differs from The Sopranos, which is widely acknowledged as the originator of our current glut of quality television:

And Mad Men used the ongoing, open-ended format to approach a kind of radical realism that went way beyond whether, say, the refrigerator in the Draper home was the perfect shade of 1962 olive green. The show, in a wildly un-TV-like way, insisted on portraying how the passage of life feels.

"The first season of The Sopranos, you literally felt like you were being dropped out of an air plane every episode," Weiner said. "You constantly had the sensation that you missed an episode: 'Everybody in this story seems to know that guy. Do I know that guy? Was he on last week?' No, they act like they know that guy because they have a life without you.

Brett Martin, Difficult Men, pg. 261

I take the author’s point to be that Mad Men seeks to create an experience of immersion in the passage of life within its narrative world rather than, as with say The Sopranos and The Wire, a tour of an immensely detailed social world with the route driven entirely by the exigencies of story telling. I haven’t actually watched Mad Men beyond the first series because I found it too slow. But I’ve been thinking about temporality in film and television since watching Boyhood last year, a film representing the titular boy growing up over 7 years, in the process capturing the goal of my PhD thesis (key question: what is it for a person to change?) far more perfectly than did the thesis I spent six years working on:
We’re having some problems with the new @soc_imagination site. Are any technically skilled readers able and willing to help? (2015-05-25 09:05)

As you’ve probably noticed, we redesigned the site using a new Wordpress theme which will fit the site more effectively as we become more image heavy and expand the number of our daily posts. However there’s two problems which we’re struggling to fix:

- The logo and the background on the sidebar don’t match. I’ve used an online tool to determine the precise colour of the logo. I’ve set the background to this. On my office PC, it matches. On my personal MacBook Air, it doesn’t. I’ve repeated the process the other way round, picking the colour on my laptop, only to find the mismatch now holds the other way round. What on earth is going on?

- The new theme removes Wordpress bylines and I’m trying to restore them. We’ve had lots of different people post on the site and we need to ensure that it’s clear to the reader who has written what. I’ve worked out how to reinsert author bylines with CSS by modifying single.php but my incredibly meagre CSS skills don’t stretch as far as working out how to incorporate them into the design of the theme itself. At present, I can get the byline included as a line of text at the very top of the screen but ideally I want them as ‘by [author]’ below the post title and above the main body of the post.

Any help would be much appreciated! I’ve now spent at least a day over the past week on changing the site, something which I initially thought would take a couple of hours maximum. I’m on the verge of giving up and just reverting back to the old theme.

Brilliant thanks so much Alasdair! Both things now fixed.
It was only with the success of shows like The Sopranos and The Wire that the reverence accorded directors in cinema began to be extended to creators of television. David Milch was the show runner for NYPD Blue and Deadwood. He also seems to have been a remarkably unusual creative, with the extremity of his behaviour perhaps illuminating a dimension of the creative process which too frequently passes unnoticed:

He also developed several obsessive-compulsive conditions. These included addictions to alcohol and heroin, though they were not as immediately crippling to his ambitions to become a novelist as were such habits as rewriting the same thirteen pages of prose over and over again, word for word, in longhand, for a year. Television proved a salvation [...] TV's "coercions of circumstances," as Milch called them - speed, deadlines, the constraints of genre, the necessity of collaboration - would prove to be precisely what he needed to emulate his mentor and become an author.

Brett Martin, Difficult Men: Behind the Scenes of a Creative Revolution, pg 172

For those who aren’t working with multiple addictions and suffering under the weight of debilitating obsessive compulsive symptoms, it’s easier to lose sight of the ‘coercions of circumstance’ under which we work. We could argue that these are anyway more extreme when it comes to television. But creative work always takes place within a context and I like this notion of ‘coercions of circumstances’ as a way of making sense of how these contextual factors impinge upon the rhythms and meanings of creative work. Part of the motivation for the [1]Accelerated Academy project is a desire to understand how coercions of circumstances are being transformed in the contemporary academy in a way that leaves them inimical to scholarship.

The Cheat’s Guide to Academic Success (2015-05-26 00:16)

HT [1]Petra Boynton. It’s funny but it’s fucking tragic that this is so:

The cheat’s guide to academic success.

1. Continuously check your academic evaluation grid. Select your research topics based on government policy, on your institution’s key performance indicators, or on current societal hypes. Avoid unnecessary efforts, personal passion or commitment at all cost.
2. Choose the slipstream of a colleague who is going to retire, lick his/her boots and eventually take over his/her academic chair.
3. You will never be asked to show that you are a specialist in something, but if you happen to conduct some actual research yourself: make sure to slice your work into least publishable units. Salami publications are considered to be part of the game.
4. Always add the names of four colleagues as co-authors: if they do the same, you will have four articles for the price of one.
5. Put pressure on your PhD students: it is their task to write your articles and project proposals out of sheer gratitude. Five PhD students should be sufficient to allow you to become a world expert in something.
6. Embarrass less diligent scholars with a well-placed sally from time to time, or better: ask them to add your name as seventh co-author on whatever publication. They will feel honored.
7. Avoid conference presentations at all cost. They are time-consuming and expensive, ruin your health, might shake your beliefs and do not yield any academic points. Just mention on your CV that you are a frequently invited speaker. Nobody will ever check.
8. When you really need to say something at some occasion, first spend a couple of hours finding some procedures, guidelines, rules and visitation reports to refer to. People will be impressed by your knowledge.
9. Use the real decision channels, the grapevines, not the councils, procedures and other artefacts administrators put into place to make less diligent scholars believe that they are actually involved in the decision making process.
10. Beware of the first signs of personal passion for knowledge building or commitment for societal service: these have appeared to be contagious and even fatal to more than one career. You might end up as a real scholar.

CfP: The Neoliberal University: Gender, Class, & Sexuality (2015-05-26 00:55)

This panel intends to investigate processes of bureaucratization and business-afication of the university and the role that these have in re-shaping the interrelations of class, gender, and sexuality; and the specific ways that the change from educational pedagogy to business model has impacted classed, gendered, and sexual practices and relationships.

The rise of neoliberalism coincided with the increase of enrollments in universities and this panel proposes to investigate these two in relation to each other. The scale of the university has increased in terms of rising numbers of students enrolled. Also, as university has become more accessible to larger numbers of citizens, the importance of higher education as a marker of class has become, relatively, more available.

In the light of these shifts, the question is how the (increasing) importance of the university as a site of emancipation takes on questions of gender norms and practices, as well as forms of sexuality.

On the one hand, universities can be seen as sites of normative structures regarding gender, sexuality, race / ethnicity, class, age and more, shaping normativity from aesthetics to (gendered) harassment on college campuses.

On the other hand, universities have also been the sites for social justice and emancipation, regarding gender
and sexuality, by the way of Women’s & Gender studies, LGBT studies and Queer Theory.

This panel seeks to bring together a collection of papers on the role of the neoliberal university in shaping, marking, and creating new expressions and relations of gender, class, and sexuality. In this way, it opens up the discussion to allow for the varied ways that universities implement and allow possibly opposing development of providing spaces for emancipation as well as reproducing normative spaces in terms of gendered, sexualized and classed possibilities.

Papers should seek to elaborate on both theoretical elements and empirical cases (from the Global North and South) and aspects of the role of the university in the 21st Century and its impact on gender, class, and sexuality.

The Politics of Happiness and the Purpose of the Social Sciences: an interview with @davies_will (2015-05-26 08:20)

We spend ever more hours of our day discussing, analysing and assessing what we do, and ever fewer hours actually doing it (2015-05-26 21:27)

An [1]excellent account of the stultifying experience of the [2]acceleration of higher education:

There’s a simple explanation for the drive to quantify everything: the replacement of the horizontal self-government of university departments with the vertical hierarchy of departmental heads and senior management. Academics used to document their output on their CVs; now, managers have to find ways to justify their existence. “Everyone knows the results are absurd,” Graeber tells me via email. “We all spend more and more hours of our day discussing, analysing and assessing what we do, and fewer and fewer hours actually doing it, and all of it, just to give these high-level administrators who aren’t really needed something to do for their gold-plated salaries.”

But this is more than just a power shift, Graeber notes. “It represents a transformation in our basic assumption about what a university is...Thirty years ago, if you said ‘the university’, people assumed you were referring to the faculty. Now if you say it, people assume you’re referring to the administration.” The corporate bureaucrats who now run universities are “often more interested in real estate speculation, fund-raising, sports, and ‘the student experience’ than anything that has to do with learning, teaching, or scholarship at all”.

How Much Data Is Created Every Minute? (2015-05-26 22:05)

I’m usually somewhat sceptical of content marketing infographics but I rather like this:
The naked reality of capitalism is today on display. And it’s horrible. 

PhD Studentship: Gender, Bodies and Technology, Engendered bodily practices and self-monitoring in the digital age 

There has been a significant uptake in the use of 'body tracking', m-health and e-health devices in recent years. There are many body tracking apps available on the Apple, Android and Windows app stores and many more in development. An increasing range of facets of human existence are being monitored and quantified by
devices which enable digital manipulation and analysis. Like many other forms of digital data, self-tracking data have a vitality and social life of their own, circulating across and between a multitude of sites. These devices are, however, not used by individuals in isolation, rather, they enable the online sharing and comparison of data which present new dimensions of embodied and gendered practices to examine for sociologists. Furthermore, corporations who manufacture such devices draw on aggregated, accumulated data for commercial purposes. These data, and their analysis, are reconstituting how people relate to their bodies and selves and those of others. So far these developments have not been considered in relation to how they constitute, and are constituted by, 'gendered logics'.

Thus it is timely to pursue questions of how and why people choose to engage with their health through quantification and tracking and what meanings they attach to them in relation to their gender. Body tracking' devices and their users are of increasing interest to academic and sociological researchers although so far little empirical research has been conducted. Yet the shifting forms of selfhood configured via these digital data assemblages are of huge interest to contemporary social life. The theoretical implications of the use of such methods of digital self-analysis has only just started to be explored in relation to issues of surveillance and self-surveillance (Bossewitch and Sinnreich, 2012; Lupton, 2012) and notions of ‘gamification’ (Whitson, 2013) and this scholarship provides an opportunity to contribute and work in an exciting new field.

The study will involve a mixed methods approach which will enable the researcher to generate data which give a broad but detailed picture of how data and technologies intersect with the social and embodied experience of gender through two approaches.

First, analysis of the offline aspects of this topic is to be conducted through in-depth semi-structured interviews and focus groups with users of self-monitoring techniques (both digital and analogue) and particularly those which are closest to the experience of gender and bodies (eg. exercise, fitness, menstrual cycle, food). Visual and haptic methods will be central to this aspect of the research with participants asked/encouraged to discuss their methods of monitoring, and those of others, in relation to how they look and feel. This will be achieved through direct interaction with devices and representations and some respondents creating visual and written logs of their experience.
