Other aspects of this botanical knowledge ‘factory’ could be seen, for example, in the rapid rise of seed companies during the late 18th and on into the 19th century. Originally a highly localised practice, seed collection and distribution took on a national and then international scope, with seed distribution going in both directions – from imperial centres to colonial peripheries and back again. Seed companies added to the experimental nature of botanical knowledge as well as its commercialisation. And the format of the seed company became transferable across the [2]British Empire. We can perhaps see the garden and its practices as a particular form of techne is which varieties of practical knowledge inform and generate meta-knowledge, such as theories of classification, evolution and genetics (see below).
I have mentioned Linnaeus in previous work because of his profound influence on the ways in which knowledge began to be accumulated, ordered and analysed in the European tradition. More particularly, the rise and rise of taxonomic practices and the conceptualisation of information as both sortable and splittable/branchable, have influenced various forms of knowledge production down to the present day. This was different from the long-established 'great chain of being' which had been the established norm for centuries.

Linnaeus got his first academic position as a lecturer in Botany at Uppsala University, later becoming a professor of medicine and, for our purposes, affirming the deep historical link between medicine and the botanical garden. In this position he went on field trips to Lapland to collect botanical samples. From there he went on to establish networks of colleagues and collectors who would send samples to him. From these processes he developed the concept of nested hierarchies or groups within groups. This proved profoundly useful in building a structure of knowledge about known plants, and other living things, as well as creating a broader conceptual framework (kingdom, phylum, class, order, family, genus, and species) within which to place and order new plants as they emerged.

The man whose work came to epitomise this great transformation in our understanding of the natural world was Charles Darwin and his development of a coherent, encompassing evolutionary theory. While his journeys on HMS Beagle are now famous and we know that he was deeply committed to fieldwork, he also utilised gardens in his research and intellectual work. His garden at Down House was known for being a laboratory for work on both plants and animals. However, it seems even this research was long preceded by work at the gardens of Woburn Abbey in the early part of the 19th century, long before the publication of the Origin of Species. What this suggests is that the garden acted as a locus for both practical and intellectual experimentation over the longer term, permitting scientists to test, modify and re-test their ideas and to then develop overarching theories about the natural world.

Mendel and his pea experiments produced another pivotal form of knowledge generation in and through the garden by proving the concept of genetic inheritance. Mendel selected pea plants for his experiments because they had high variability and could be reproduced quickly meaning that both his experiments and also data collection and analysis were accelerated compared to experiments in many other plants or animals. Although Mendel published his work in 1866, it received limited attention and only gained wider notice at the turn of the century as the search for explanations for hereditary became increasingly important. Here too the locus of the garden acting as laboratory and plants as research subjects provided a means of rapid, quantifiable and highly documentable experimentation.

The logic of knowledge production in relation to the garden can be seen as including a well-established tradition of cultivation and land management that episodically encountered new plants, techniques, tools and ideas. By the early 19th century, this flow of new plants, methods of cultivation and experimentation, as well as applied scientific knowledge was becoming a continuous flood of data, information and knowledge - rather than a transitional or episodic process.
The convergence of the known and the new took some resolving and required ongoing processes of not only accommodation but formalisation – in effect, the science concept began to be applied in earnest in this domain.

Conclusion

What I have described here is an example of how deep cultural forms of knowledge (and knowledge practices) have progressed and changed over time emerging as the modern knowledge systems we take for granted today. Gardens and gardening have lost none of their popularity in contemporary culture but they have also led to industrial and scientific specialisms in their own right. The early information age of the 19th century saw a formalisation and differentiation of this broadly shared cultural knowledge into a variety of scientific undertakings. The expert knowledge of the botanist became more overtly separated from the ‘amateur’ or applied knowledge of gardener or botanical enthusiast. Expertise and specialist knowledge gained cultural capital in this period and formalised structures emerged to conduct directed research and produce academic and applied scientific knowledge on botanical matters.

With the high degree of generalist expertise still common in the Victorian period, this knowledge production and its associated processes was also readily dispersed within and between countries. Even today the majority of non-European botanic gardens are in India, the same gardens which were used to produce part of the British imperial knowledge base. This also hopefully illustrates how knowledge production and innovation can originate as readily in what we might call the applied sciences as in the more formalised research and academic models with which we are now familiar. Expertise was readily generated through forms of practice and then theorised outwards from this specific experimental environment. Finally, the garden in its various developmental forms provided a coherent locus for knowledge production that crossed conventional disciplinary boundaries and produced new information, concepts and theories. The garden is in a sense the archetypal knowledge engine, one we still maintain and develop.

Dysology (2016-09-09 12:04:28)
This is interesting. I enjoyed reading it. But: I'm afraid you missed out the most important gardener in the history of scientific discovery. Patrick Matthew - a fruit grower from Scotland - is universally acknowledged by the world's leading evolutionary biologists to have been first into published print 27 years before Darwin's and Wallace's (1858) Linnean Society papers replications and Darwin's (1859) "Origin of Species" without citation of the originator. The latest sociological research (see Sutton's 2014 book "Nullius in verba: Darwin's greatest secret" now newly reveals that the old paradigm of the tri-independent discovery of Matthew's prior published full conception of macro evolution by natural selection is built on the now punctured premise that no one known to Darwin or Wallace read the original ideas in Matthew's (1831) book. However, in fact, they did. Seven naturalists are newly discovered to have cited Matthew's 1831 book pre-1858 - four played major roles at the

4572
pre-1858 epicentre of influence on Darwin and Wallace and on their acknowledged influencers. Interestingly, Wallace made the astonishing claim to have independently conceived Matthew’s prior-published conception whilst suffering from malarial delirium in the jungles of Malaysia. If true that is the only known example of cognitively enhancing fever in the history of the world. In realist, Wallace’s (1855) Sarawak paper editor (selby) had read and cited Matthew’s (1831) book in 1842. And selby was a friend of Charles Darwin’s father and his Charles’s great friend Jenyns. Hence - if you Google “on knowledge contamination” (be sure to use the speech marks and all three words) you will find out why the sociological concept of knowledge contamination is ore rational than the long- wild imaginations of the scientific establishment, Dr Mike Sutton

Hamish Robertson (2016-09-24 13:26:48)
Thanks for your response, I’ll follow up on your references.

Social Media and Academic Labour (2016-08-27 08:00)

It is increasingly hard to move without encountering the idea that social media is something of value for academics. The reasons offered are probably quite familiar by now. It helps ensure your research is visible, both inside and outside the academy. Many of us might be sceptical of the dominant discourse of impact within which such a concern for visibility tends to be expressed. I certainly am in many ways, worrying that this is irrevocably tied up in the instrumentalisation of research, the declining autonomy of researchers and the marketisation of the Academy within which research takes place. Nonetheless the imperative to make and demonstrate impact is already an entrenched characteristic of the research economy and looks likely to stay that way.

In this short talk, I will make the case that social media in general and blogging in particular represent a way to expand academic autonomy, improve the quality of our scholarship and nonetheless meet the demands of what I have elsewhere called the Accelerated Academy, all at the same time. This might seem implausible, so please bear with me. If it seems overly optimistic, let’s talk about this at the end because my actual view of the research economy is pretty grim and depressing. My enthusiasm for social media comes in large part because I see it as something that can, at least potentially work to ameliorate a whole series of problems that afflict those within the contemporary research economy.

A good way into this is to consider some of the other benefits increasingly held to obtain through academics using social media. I already mentioned visibility, internal to the academy and outside of it. Related to this, is the chance to practice communication with nonspecialist audiences. It’s a faster way to get your research findings out. It allows you to build an audience for future publications, in advance of their actual release. In doing so, it allows you to find people who share your research interests, as connections more or less inevitably form on the basis of what you publish and what you read online.

But the advantage that I’m most interested in and the one that will be key to the argument I’m making here, is that the more you write, the easier writing gets. The more you think, the easier thinking gets. My enthusiasm for social media in general, as well as blogging in particular, stems from the endless occasions they offer for thinking and writing.

But isn’t thinking and writing what we do anyway? Well yes, on one level, it is. Though I think there are important questions to be asked about how the accelerating pace of working life in contemporary universities impacts on the time and energy available for thinking and writing. But talk today is not about that.

It’s this presumably everyday quality to academic thinking and writing which has increasingly left me confused about one of the most common concerns, even objections, to academic social media: isn’t it just one more thing for already busy people to do? On the surface, this makes complete sense. This is certainly true for some people.
It’s almost certainly true for everyone at least some of the time. But much of what academics do on social media should not be something extrinsic to their scholarship but instead should be constitutive of it. As the sci-fi author, digital rights activist and blogger Cory Doctorow puts it: blogging is “my major way of thinking through the stuff that matters to me”. This is true of myself as well. I think it’s true of many academics using social media, even if they don’t recognise it. Furthermore, I think much of the value that social media has for academics within the contemporary research economy won’t be actualised until this has become a ubiquitous feature of how we talk about the way we can use social media as researchers.

There’s a lovely extract of [1]the Academic Diary in which Les Back reflects on the life and work of the social theorist Vic Seidler. Remarking on the vast range of topics on which Seidler has written, Les suggests that this deeply committed man “writes not because his academic position expects it but because he has something to say and communicate”. For someone like Seidler, writing is something a person does because they are “trying to work something out”.

This captures what I see as the promise of academic social media. It’s a platform for trying to work things out. More so, doing it in the open grants each of these attempts a social existence, one that comes with undoubted risks but also enormous rewards. Little bits of thought shrapnel, brief attempts to make some sense of the ‘feel of an idea’, come to enjoy their own existence within the world. They’re mostly forgotten or even ignored from the outset. But there’s something quite remarkable about occasions when these fragments resurface as someone sees something of value in them, perhaps when you saw no value in them yourself.

In this way, it attunes you to the impulse to write because you have “something to say and communicate”. This isn’t always the case and I worry that the metricisation of scholarly blogging will prove immensely destructive of it. But there is at least for now something deeply rewarding about seizing on an inchoate idea, developing it and throwing it off into the world to see what others make of it. For no other reason than the pleasure inherent to it. Whether this non-instrumental exploration of ideas remains the norm or could be sustained in the long term is a different question – as I’ll come on to, I think there are reasons to worry that the research economy is inimical to this.

What does this all mean practice? I’m talking about quite straightforward practices which all of those conducting research engage in to differing degrees. I’ve often used the term ‘public notebook’ and the existence of non-public notebooks is the most obvious point of comparison here. Prior to starting a research blog early in my PhD, I used to scribble notes in a succession of moleskin notebooks – ones I would later struggle to decipher due to my scrawled handwriting. The radical sociologist C Wright Mills wrote a wonderful appendix to his famous The Sociological Imagination about scholarly craft: he argued for the necessity of keeping a ‘file’ in order to ‘keep one’s inner world awake’. These are activities we all engage in but which, rather interestingly, tend not to feature in public discourse: the daily minutiae of scholarship. Notebooks, filing cabinets, file cards, newspaper clippings, print outs, drawings, marginalia in books, annotated papers, reading lists etc. Modern digital equivalents involve tools like Evernote or OneNote. These have many of the advantages of using social media – they can also of course be integrated with them, for instance by quickly sharing notes from Evernote or automatically clipping content you discover on social media into the appropriate Evernote folder. But as with social media use, they have the advantage of mobility, in so far as that one can use them across devices and across contexts – rather than the careful work of keeping physical files or the necessity of ensuring one always has one’s physical journal and never, under any circumstances, lose it.

The features I discussed earlier might all sound individualistic. But it’s in considering how the use of social media differs from contemporary alternatives like Evernote that it becomes apparent how the benefits of social media are intrinsically social. Later in the book I mentioned earlier, Les Back suggests that Twitter sometimes facilitates our “inhabiting the attentiveness of another writer” by providing “signposts pointing to things going on in the world: a great article, an important book, a breaking story”. Through the things that others share, we sometimes enter into their world and participate in an economy of “hunches and tips” which is the “lifeblood of scholarship”.

4574
These provide pathways through the literature, allowing others to use them as guides into and through often difficult bodies of work.

It's in this sense that I'm arguing social media increases the autonomy of researchers, both individually and collectively. If we accept the argument that metrics necessarily entail the evisceration of self-governance, with hierarchical regulation replacing horizontal norms, then this new horizontal space of collaboration and cooperation begins to looks exceedingly valuable. It's a new kind of space and one which could be easily destroyed if we too easily accept that what we do within it should be measured and incorporated into the logic of career advancement.

The kinds of scholarly communities of practice we can see perpetually coming to life online are obviously not confined to the digital sphere. But academic social media is at present profoundly generative of them, whereas the broader research economy is increasingly characterised by a competitive individualism which works to preclude them. However, I think this not just important within the academy but also in the relationships between academia and other institutional spheres. For instance, academic social media is changing how journalists and academics interact: it's easier to identify academics, but it's also easier to make demands upon them which might be unreasonable or unwelcome, often with only a cursory understanding of what they hope to achieve through such a potential collaboration. It's also changing the relationships between social scientists and the communities they research, as organised groups increasingly monitor and engage with academic research, in ways that can throw up all such of problems. This is why the nature of the 'third space' of academic social media is so important.

There are all sorts of instrumental gains to be had through engaging with social media: increasing your visibility, expanding your network, ensuring your work is widely read, engaging with non-academics publics and making an impact outside of the academy. But there are gains to scholarship which are more important and perhaps more diffuse than this. What increasingly interests me is the tension between them the two tendencies: how the instrumental use of social media, encouraged within the contemporary research economy, might imperil the gains which I've suggested can be made on the level of craft and collaboration.

I've suggested that the value of social media for academics can be seen in terms of craft and careers. These two dimensions often overlap but I think it's useful to separate them analytically: contributions to individual and collaborative scholarship on the one hand, contributions to the development of careers on the other. Obviously the former usually takes place in the context of the latter – though the rise of the 'alt-academic', pursuing scholarship without pursuing a traditional academic career, can be seen to break this link. But the relationship between them isn't always clear. For instance, in recent work, myself and Filip Vostal have been exploring the manner in which the accelerative pressures found in the contemporary academy militate against good scholarship. If people are asked to do more with the same or less, then what effect does this have? If we construe it in traditional terms, particularly as something conversant with and contributing to 'the literature', then good scholarship becomes structurally difficult. 28,100 journals publishing 2.5 million articles a year. Under such circumstances we come to encounter surface writing rather than depth writing, rearranging ideas rather than developing new ones: scholasticism on the one hand, empiricism on the other. My point is not to explore the accelerated academy here but simply to flag up how institutional changes complicate the link between craft and careers. This is the environment within which the latent value of social media for academics comes to be actualised along either dimension.

As I mentioned earlier, I'm particularly interested in how time pressure figures into the developing discourse about social media for academics. On the one hand, I think the idea of social media being 'just one more thing to do' is straightforwardly a mistaken way of understanding what academics do on social media. On the other hand, I think the temporal pressures to which academics are subject in their institutional lives will inevitably shape the character of their social media use:
1. Time-pressure can be a symbol of status and flaunting it can represent one of the few socially acceptable forms of conspicuous self-aggrandizement available (Ian Price)

2. Time-pressure can reduce the time available for reflexivity, 'blotting out' difficult questions in a way analogous to drink and drugs

3. Time-pressure can facilitate a unique kind of focus in the face of a multiplicity of distractions: past commitments 'choose' for us

4. The accelerative pleasures and creative inducements of 'binge writing' and working to a deadline (Maggie O'Neill)

5. Time-pressure can leave us feeling that we are living life most fully. If the good life is now seen as the full life then living fast feels like living fully (Harmut Rosa)

These all contribute to a broader context in which speed becomes problematic within the academy. It comes to enjoy an immense psychic charge as something which feels like, to paraphrase Homer Simpson, the cause of and solution to all life's problems:

Coupled with intense competition within the academic career structure, as well the broader spectre of redundancy which Bauman argues characterises academic life as a whole in late modernity, it's inevitable that what Ruth Müller theorises as anticipatory acceleration arises as a situationally logical strategy: going faster without specific goal in mind, seeking to outpace competitors given limited positions available for a cohort. As I understand her argument, which I really recommend reading directly, this gives rise to a subjugation of present pleasures to anticipated future rewards, with a contraction of alternative futures envisaged by the subject. The more hyper kinetically you commit yourself to career advancement, pursued through anticipatory acceleration, the more difficult it becomes to climb off the treadmill because your horizons narrow to the next goal. Though her empirical work has focused on post-docs in
the life sciences, the scope of her concepts seem broader than this, both in terms of discipline and career stages. The conditions she describes in the condition from post-doc to faculty surely also obtain in the transition from lecturer to senior lecturer, from senior lecturer to reader and from reader to professor.

The ensuing dynamic of competitive escalation is crucial to understanding labour in the contemporary academy. It is a social mechanism driving the intensification of labour and destroying solidarity, tied up in a life-destroying feedback loop with the systems of audit which work to replace the horizontal regulation of professional standards with the vertical regulation of metrics. The value of social media for academic craft can mitigate these effects by grounding individuals in non-instrumental motivations for their work (curiosity, playfulness, exploration) and facilitating collaboration between such individuals outside the rubric of competitive individualism. But how likely is this to continue? I’m interested in how what Jose Van Dijck calls the popularity principle intersects with the competitive individualism of the accelerated academy: will the metrics of social media become just one more way in which academics can evaluate themselves in relation to others and be evaluated as they proceed through an increasingly rigidly defined career structure? If the logic of careers comes to dominate academic social media, can the logic of craft survive? If not then what does this mean for the broader conditions of academic labour? The institutionalisation of alt-metrics seems likely to be the most important vector through which the answer to these questions will begin to unfold. How will social media activity be measured and how will this new process of measurement intersect with existing processes of measurement? Will alt-metrics unsettle existing hierarchies or simply lead to dual hierarchies that might converge upon the same academic celebrities who dominate the intellectual attention space?

However there are other substantive areas in which these issues are currently being played out: online harassment of academics, social media policies within universities, institutional reaction to online academic speech, regulation of the corporate brand, social media training and support offered by staff. I think the way in which the benefits of social media are coming to be framed is particularly interesting and we’re likely to see this come to be dominated by the language of ‘impact’ and ‘engagement’ on the one hand, ‘academic citizenship’ and ‘academic civility’ on the other. There’s nothing intrinsically wrong with these things but what gets squeezed out in the middle is scholarship. I’ve not really talked about substantive cases in these areas today. There’s a few reasons for this: some of them are very contentious and I’m more comfortable writing about them then speaking about them, doing them justice requires a lot of empirical detail and would take a long time, it’s easy for this reason to get lost in detail and miss the broader picture. After all, it’s this broader picture which interests me. Social media is tied up in all manner of ways with the transformation of the university, as well as the transformation of the universities place within wider social life. There are many other factors, but the institutionalization of social media is a key vector in these unfolding changes. One which, I’ve tried to argue and hope we can discuss further, has important ramifications for academic labour.

Call for blog posts: the lived experience of interdisciplinarity in social research (2016-08-30 08:00)

Following on from our successful workshop at Social Media & Society 2016, the [1]Digital Social Science Forum is seeking blog posts describing and reflecting on the lived experience of interdisciplinarity in social research. The workshop itself sought to explore conceptual challenges in interdisciplinary social media research, encountered at the level of substantive theoretical commitments but also in terms of taken-for-granted assumptions that inform everyday practice. But our intention for this project is broader, seeking reflections on any aspect of the lived experience of conducting research across and through disciplinary boundaries.

Our primary focus is on digitally orientated research, e.g. social scientists and computer scientists working together, but we warmly welcome contributions from other areas. These might reflect upon things like:

- The role of ‘boundary objects’ in facilitating work across disciplinary boundaries.
- How a lack of clarity about mutual definitions can both support and hinder interdisciplinary collaboration.
- The importance of reclaiming ‘the human’ as a shared focus in interdisciplinary research.
- Coping with the challenge of an imperialistic naturalism i.e. forceful assertions of the failure of the social sciences and the necessity of remaking them along the lines of the natural sciences.
- The messy reality of working in interdisciplinary teams.
- What does conceptual development mean in collaborative work across disciplinary boundaries?
- The role of personal relationships in facilitating successful interdisciplinary work.
- Failures and frustrations of interdisciplinarity.
- Getting beyond the motif of the ‘attic scholar’ and socialising the research process.
- The role of doctoral pedagogy in hindering successful interdisciplinary collaboration.
- Organisational helps and hindrances to working across disciplinary boundaries.
These are just suggestions. Our interest is in how these sometimes obtuse issues are worked out at the level of everyday co-operation: how is the messy reality of interdisciplinarity lived and how should this shape our approach to it? These blog posts will be compiled at the Digital Social Science forum, organised thematically and circulated on social media channels as a public resource.

Contributions should be short (500-1500 words) and will be accepted on a rolling basis. Please send as a word document to mark@markcarrigan.net. Feel free to get in touch to discuss a potential contribution.

________________________

DEADLINE TODAY: The Accelerated Academy (2016-08-31 08:00)

30th November to 2nd December 2016, Leiden, the Netherlands

From the 1980s onward, there has been an unprecedented growth of institutions and procedures for auditing and evaluating university research. Quantitative indicators are now widely used from the level of individual researchers to that of entire universities, serving to make academic activities more visible, accountable and amenable to university management and marketing. Further demands for accountability in academia can be related to general societal trends described under the heading of the audit society (Power 1997), and the evaluation society (Dahler-Larsen 2011). As part of broader transformations in research governance, indicators on publications and citations are now permeating academia: from global university rankings to journal-level bibliometrics such as the journal impact factor and individual measures like the h-index. Yet, it is only recently that considerable interest has been directed towards the effects that these measures might have on work practices and knowledge production (c.f. de Rijcke et al. 2015), and the role they might be playing in accelerating academic life more generally (c.f. Vostal 2016).

The Accelerated Academy draws together a number of cross-disciplinary conversations about the effects that acceleration towards metric forms of evaluation is having upon research, and the implications this holds for living and working in contemporary academia (Felt et al. 2009). Building on the successful maiden edition of the Accelerated Academy series in Prague in 2015, this year’s Leiden conference will be especially focussed towards the following questions:

• What does acceleration mean in different research contexts?
• What are the implications of digitally mediated measurement and tools for quantifying scholarly performance?
• What are the knowledge gaps regarding the effects of metrics on scientific quality and societal relevance of research?
• How can we harness the positive and minimize the adverse effects of performance measurement in universities?

Confirmed keynote speakers include Peter Dahler-Larsen (University of Copenhagen), Ulrike Felt (University of Vienna) and Michael Power (LSE).
We invite submissions for presentations of around 20 minutes. The deadline for submitting abstracts will be August 31st 2016. Please send two pages or 800 words describing your contribution including a short biographical note to: [1]a.e.reyes.elizondo@cwts.leidenuniv.nl.

Conference organisers

[2]Sarah de Rijcke, Centre for Science and Technology Studies, Leiden University
[3]Björn Hammarfelt, University of Borås, Sweden | Leiden University
[4]Alex Rushforth, Centre for Science and Technology Studies, Leiden University

Scientific committee

[5]Mark Carrigan, University of Warwick
[6]Tereza Stöckelová, Czech Academy of Sciences
[7]Filip Vostal, Czech Academy of Sciences
[8]Paul Wouters, Leiden University
[9]Milena Kremakova, University of Warwick

Event registration will be free of charge. In addition, a limited number of travel and accommodation support bursaries will be made available for researchers especially inhibited by the costs of travel. Please contact the conference manager [10]Andrea Reyes Elizondo for more information.

7.9 September

Cyborgology is looking for new regular contributors! (2016-09-02 08:24)

The excellent blog Cyborgology is looking for new contributors:

For nearly six years Cyborgology has been dedicated to producing thoughtful essays and commentary about society’s relationship to technology. Writers enjoy significant freedom to write essays and stories of varying length, style, and topic. We are now looking for several new contributors to join Cyborgology.
What we are looking for: People willing to write about society, culture, and technology in an accessible but smart way. Contributions can take many forms and we are flexible about writing frequency. Scrolling through the last few months of Cyborgology is the best way to get an idea of the style and frequency of pieces we want to see. We are especially interested in writers from under-represented or marginalized subject positions. You do not need to be affiliated with any institution of higher learning but you do have to be comfortable writing about and through theoretical concepts. Of course writing schedules are very flexible and we are open to whatever work arrangement you can put together. The best way to know what kind of work we want is to read the site and check out our submission guidelines for guest posts.

The benefits of writing for Cyborgology: For better or worse, Cyborgology is a volunteer effort. None of us get paid and we do not anticipate that changing anytime soon. Writing for Cyborgology has, however, been known to open up new opportunities of a monetary nature. We are also proud to have a dedicated, smart audience that likes to share and discuss our ideas. Work on Cyborgology has also been linked to and shared by large media organizations including The New York Times, The Washington Post, Buzzfeed, Huffington Post, Pacific Standard, and many more. All writing on Cyborgology is covered under a Creative Commons attribution license and authors retain full control over their work. We are also a member of an awesome community of blogs and publications under The Society Pages umbrella.

How to apply: As our past and present contributors can attest– writing for Cyborgology is a strange animal. Therefore, we’ve done our best to simulate writing for Cyborgology in the application process. We want three polished writing samples between 500-1000 words, at least two of which need to grapple with a current event between now (July 18, 2016) and the due date which is September 1, 2016. It is totally fine to send us something you’ve published elsewhere or turned in for an assignment. We may also ask if we can run some of your submissions as guest posts before we make any final decisions. Writing samples should be saved as either .doc or .docx and sent as an attachment to david.adam.banks [at] [1]gmail.com. In the email please indicate the best email address to reach you, a short three sentence bio, and any other accomplishments you think we should know about. A full cover letter is not necessary.

1. http://gmail.com/
retrenchment and deepening inequalities, the call focuses on this crisis in terms of precarity experienced by people both in and out of work. Contributions are invited to think critically not only about ‘precarity’, but also about the agency of those within precarious conditions and about how to move beyond them. This Special Issue would therefore welcome papers that investigate or explore:

1. **Theoretical contributions around the concept of precarity and its relation to class**
2. **Patterns of precarisation, and alternative ways of understanding questions of insecurity at work**
3. **The role of the state and other institutions (including unions and employers) in shaping (in)security for workers**
4. **Conflicts over precarious work, including new forms of labour organising**
5. **A future beyond precarity: beyond exploitation, alternative forms of production and circulation beyond the capitalist wage relation**

**Deadline for submissions (full papers): 01 March 2017**

To read the full call for papers and for instructions on how to submit, [1]please visit the BSA website.

The guest editors welcome informal conversations about potential submissions. For further information please contact Gabriella Alberti ([2]g.alberti@leeds.ac.uk) or Charles Umney ([3]C.R.Umney@leeds.ac.uk)

---

**We should be very careful about how we construct ‘the public’ in discourses of public engagement**

(2016-09-04 08:00)

I just came across this description of Robert Moses, by the American Sociologist and former Secretary of Labour Frances Perkins, concerning his attitude towards the public. It was quoted in an essay by Jackson Lears in vol 38 number 6 of the London Review of Books:

He loves the public, but not as people. The public is just the public. It's a great amorphous mass to him; it needs to be bathed, it needs to be aired, it needs recreation, but not for personal reasons – just to make it a better public.

And some would say it needs to be *engaged*. We should be very careful about how we construct ‘the public’ in discourses of public engagement. Treating it as axiomatic that public engagement is a good thing can sometimes hide some rather problematic attitudes about who this ‘public’ is.
For those unfamiliar with her, it’s worth finding out more about Frances Perkins. She’s a hugely impressive and important figure. This Democracy Now interview covers a lot of ground:

[2]https://www.youtube.com/embed/x0jVwmQ2y0w
This new six-week course is designed to help post-docs improve their writing and maximise their chances of publication. The course is run by [1] Dr Helen Kara (UK) and [2] Dr Janet Salmons (US) who, between them, have extensive publication experience and knowledge. The course includes webinars, weekly lessons and exercises, feedback and discussion, and an online peer support group which will continue after the course is finished. By the end of the course each student will have an individually tailored publication strategy covering the next 1-5 years, and will have a plan for implementing their strategy.
Create Your Publication Strategy will enable you to:

- **Assess** the publication potential of your thesis: know which parts to publish and how to develop them for publication
- **Reflect** on scholarly or professional choices in light of your career goals, and know how to use publication to help you move closer to those goals
- **Evaluate** steps to pursue traditional, online, or self-publishing: understand the pros and cons of writing for blogs, academic journals, books and other formats
- **Develop** a clearly defined 1 to 2-year publication strategy that aligns with your career goals
- **Connect** with a writing community in the form of an ongoing online support group for course students and alumni

The course is appropriate for anyone who has completed their thesis within the last five years. All you need is a good standard of written English and the ability to commit to a six-week course.

The initial course runs from 10 October to 18 November 2016, and the registration fee for this first course carries a 20% discount. The course will be run again in February-March 2017 at the full fee. Contact us with any questions or book here.

3 dystopian visions of the future of gaming (and capitalism) (2016-09-05 08:00)
In a near future America, the world is locked into an inglorious decline while the majority of its population is locked into an intoxicatingly expansive virtual world. Ecological crisis and economic ruin operate hand-in-hand to leave the 99% living in sprawling slums, consisting of endless stacks of trailer parks, around the periphery of the surviving cities within which some economic activity takes place. The game provides an escape from this, offering an endless array of worlds full of wonders in contrast to the grim reality of the singular world the players inhabit in the rest of their lives.

On the surface, Ready Player One might seem to be an inditement of gaming, framing it as the source of widespread acquiescence to social collapse. But it has a much more nuanced approach than this. Firstly, there's a profound nostalgia which suffuses the book, suggesting that what’s of most value in the cutting edge of gaming in this dystopian world inevitably borrows from and looks back to an older age of gaming from the 70s, 80s and 90s. Secondly, the narrative of the book hinges upon the possibility for re-enchantment that gaming offers. The global game into which the world's population has immersed itself might be implicated in this widespread withdrawal from social concern, but it also offers a solution. The game itself opens up the possibility for heroism, for mass collective struggle to change the world, which ultimately makes itself felt back in the ‘real’ world.

In this sense, the book offers a pessimistic vision of the future of capitalism but a qualified optimism about the future of gaming. It’s nonetheless realistic about the relationship between the two, with capitalism having facilitated the worst of what is latent with gaming but also being susceptible to being changed by the best that can be found within the craft of gamers.
The recent film Nerve offers a more straightforwardly moralistic vision. It tells the story of an underground viral game called 'Nerve', which allows participants to be either 'players' or 'watchers'. The former earn rewards for acting on dares offered by the latter, who are encouraged to follow the players around and live stream their daring actions. The first moral of the story rests upon the dangers of celebrity, suggesting that the combination of teenage social pressures and an anonymous crowd can create immense pressure, potentially leading anyone to do things they'll later have reasons to regret. The second moral of the story is more interesting, with a slightly contrived plot being used to explain how some players get locked into a game which, because it relies on the block chain, cannot simply be shut down. This expresses an interesting fear we're perhaps likely to see ever more explorations of: socio-technical novelties that cannot be suppressed or switched off. The moralistic streak in the film undermined the potential power of its story telling here because the valiant and sneaky actions of the protagonists lead them to escape the game and destroy it. I can easily imagine a much bleaker and more interesting film which took the fear it raised seriously.
Traders is a gloriously dark film set in post-crash Dublin, exploring the changing fortunes of young financiers who briefly had everything and now must come to terms with having lost it. Much like Nerve, Traders revolves around a viral game, trading, in which desperate bankers who’ve lost everything can agree to fight to the death for the remaining assets of their opponent. Successful traders soon build up an impressive prize fund, incentivising others to match them and the ‘dark web’ game takes on a life and energy of its own. The logic of the game escapes its creator, whose desperate attempts to regain his hold on it leads to his own downfall, introducing elements into the game which accentuate the worst aspects of its own internal rationality.

Ready Player One, Nerve and Traders are very different works. But what they have in common is a confrontation with the social reality of gaming. Rather than seeing gaming as an individual pursuit, involving a retreat from the social, all these works recognise the intrinsically social nature of contemporary gaming. Gaming is in the world, of the world and acts on the world. But it’s more than this: the liberation of gaming from relatively static hardware which encouraged, though by no means determined, fixture within the home has opened up an entirely new arena of socio-technical novelty.

What Nerve, Traders and Ready Player One explore is gaming-as-social-structure. The most engaging scenes in Nerve are when the logic of the game override normative expectations in social situations: in this sense a game acts as social structure, in a way disruptive of existing social order but also leading to the generation of new forms of order. The prospect of mobile augmented gaming, particularly if it has the massively distributed game dynamics of something like Nerve, heralds a profoundly morphogenetic form of social structure i.e. its operation encourages change in everything it encounters, in unpredictable and often dangerous ways. If we see the massive growth of games like Pokemon Go, as well as their further development, I think this characteristic of games will be an ever more potent object of cultural expectation.
WHAT IS A ZINE?

"Zine" is short for fanzine.

"For all intensive purposes, a zine is a cheaply-made, cheaply-priced publication, often in black and white, which is mass-produced via photocopier and bound with staples.

Most zines revolve around a music scene of some sort, but others are dedicated to artwork, poetry, cartoons, editorials and short stories. Because zines do not have any sort of corporate backing, they are very rugged, individualized, and much more charismatic than larger, more popular magazines whose content is often dictated by their advertisers" - [1]definition taken from Urban Dictionary.

MANCHESTER METROPOLITAN UNI REQUEST FOR ZINES.

"At MMU Special Collections, we already have a small selection of zines that sit alongside our other collections. The DIY methods of production and design of the zine are an often overlooked aspect of the history of printing and represent a legitimate addition to our established collections. Due to their ephemeral nature they can be hard to source, so we are asking for help with finding zines that we might acquire".

For more details:
https://mmuspecialcollections.wordpress.com/2016/08/31/we-need-your-zines/

Practical Sociology: Agenda for Action (2016-09-05 21:15)

BSA Sociologists outside Academia, in collaboration with Sage Publishing Ltd and the Sociological Imagination

Practical Sociology: Agenda for Action

A half-day workshop

British Psychological Society meeting rooms, Tabernacle St
London EC2A 4UE
Monday 17 October 2016, 12.30 – 4.30pm

How come – at least in the UK – you don’t come across people with ‘sociologist’ in their job title working in industry, business, the civil service, or pretty much anywhere outside academia or independent research organisations?

Sociologists seem to all reside in universities, unlike psychologists and economists, who have colonised many kinds of workplaces.

Most sociologists believe our subject is essential for understanding the world around us, or to resolve contemporary problems, from gender violence to climate change. We have the concepts (like ‘cultural capital’, ‘intersectionality) and the theories (social mobility, moral panic). But where are the practical sociologists?

So what would it take to establish a ‘practical sociology’ in the UK and elsewhere, with sociologists employed to use sociology concepts and models to address problems in industry, business, government, education or health? This half-day workshop aims to establish an agenda for practical sociology.

The workshop will explore pressing questions about how a practical sociology may apply its expertise, skills and knowledge to problems at work or in the community.

- What has prevented the emergence of practical sociology in the UK?
- What are the core knowledge and models that are needed to solve the problems that organisations, businesses and the public sector face?
- What kinds of skills would be needed to work as a practical sociologist?
- How would a practical sociology career pan out?

This workshop will be of interest to sociologists and others who are keen to see the application of sociological concepts, models and theories in practical settings in the public, private and third sectors. Please come along and help us set an agenda for developing practical sociology.

Registration

**BSA Members £5; Non-members £8; BSA Concessionary members and full-time students £3.**

Tea and coffee will be provided: please bring your lunch.

__________________________

**CFP: Hackademia! Activism, Scholarship & the Internet (AoIR satellite event) (2016-09-06 08:00)**

*Call for participants: Hackademia! Activism, Scholarship & the Internet*

Tuesday, October 4, 2016, 2-6pm
Berlin, Germany (location TBA)

**Workshop organizers:**
Nathalie Maréchal, University of Southern California/Ranking Digital Rights
Jillian York, Centre for Internet and Human Rights/Onlinecensorship.org

Many Internet researchers straddle the line between academic Internet research and digital rights advocacy, including hacker communities. This workshop aims to strengthen the ties between these two modes of inquiry, leveraging AoIR 2016’s location in Berlin to invite digital rights activists from outside the academy to engage with the scholarly conversation. While many scholars and activists express interest in cross-sector collaboration, there are a number of barriers to such efforts, including mismatches between the career incentives, funding mechanisms, and timelines prevalent in the academic and NGO worlds. Nevertheless, the organizers of this half-day workshop have found that collaboration between civil society and academia are crucial to both research and to change.

The first portion of the workshop (two hours) aims to:

- Explore what “research” means to scholars and to activists
- Surface the barriers to cross-sector collaboration
- Brainstorm strategies for transcending such barriers
- Provide a networking forum for scholars and activists working on similar or complementary projects

The second portion of the workshop (two hours) will include a dive into the world of commercial content moderation. Using a fishbowl format, we will hear from experts looking at the topic from a variety of angles: as an issue of labor, of free expression, and of information hegemony. Participants will be encouraged to take part in the discussion and share new ideas for research and advocacy.
Interested participants should complete the registration form at [1]https://goo.gl/forms/9isVlduYmkeqMeG43 by Sept 1, 2016. The organizers hope to have roughly equal participation from academia and from civil society, and will use the requested information to plan the details of the workshop. Questions can be addressed to Nathalie Maréchal, [3]marechal@usc.edu, at any time.

CfP: Social Media and Social Futures – a special issue of @DiscoverSoc (2016-09-06 15:08)

Co-edited by Mark Carrigan and William Housley

Social media is conventionally located within a commercial narrative that theorises an array of emerging ‘disruptive technologies’ that includes big data, additive manufacture and robotics. These and related technologies are underpinned by computational developments that are networked, distributed, digital and data driven. It has been argued that these technologies not only disrupt markets; but also wider social and economic relations and organization. These include social institutions such as the family, work, health care delivery, education, relationships and the ‘self’. But how do we separate the hype from the reality while nonetheless recognising how powerful this rhetoric is on a purely discursive level? What social futures are potentially shaped by social media and how can we talk about them in a way that emphasises our capacity to shape them collectively?

Social media is one of the first waves of digital disruptive technologies whose mass global take-up via multiple platforms is still being assessed and understood, as a social force in it’s own right. Standardly, ‘social media as data’ has provided a plethora of studies and projects that have examined the big and broad social data opportunities provided by the social media for understanding populations on the move ‘in real time’. In some cases this has led certain commentators to enthusiastically claim that the analysis of social media as data offers opportunities for prediction and the forecasting of behavior at the population level although this rhetoric is not without it’s skeptics and critics. Is this a plausible vision of the future? Is it a desirable one? Can we see a longstanding impulse towards addressing social problems finally having the necessary techniques and capacities to achieve its potential? Or are we witnessing a potentially authoritarian turn in which social engineering can operate with an unprecedented degree of granularity?

Furthermore, these methodological opportunities and oracular imaginaries are being accompanied by an ‘ontological velocity’ generated by the social and economic implications of social media as data, practice and a globalizing networked communicative force that is shaping being and becoming in the digital age. A key issue here is the relationship between social media, society, time and the ‘future making’ capacities and affordances of these and allied technologies. Yet little work has been carried out on the temporal ramifications of social media (and other
disruptive technologies) in relation to emerging digital ‘timescapes’. To this extent the study of the relationship between social media and society remains under-conceptualized especially in relation to our understanding of late modernity at the beginning of the 21st century. The relationship between social media and the social generation of risk, it’s contributions to new digital timescapes and the trajectory of the self and identity alongside empirical concerns is sociological work in waiting. How does social media complicate or perhaps confirm existing theories of social change? Or is such epochal thinking itself a problem, ripe to be deployed by social media corporations apt at marketing their own ‘disruptive’ capacity?

For this special issue of Discover Society we welcome short articles (1500 words) that relate to the above and the following topics:

- Social Media, Timescapes and Futures
- Social Media, Prediction and Critical Data Imaginaries
- Visioneering, ‘Futures’ and Social Media
- Tracing Emerging Technologies in the Digital Agora
- The Future of Social Networks: Social Organization, Data and Engineering
- Computational Politics and the challenges facing Democracy
- Social Media and the Transformation of Everyday Life
- Digital Afterlives? Social Media, Time, Traces and Accountability
- Digital Social Science and Social Futures

Please see the Discover Society website for more details about [1]formatting requirements. Articles should be accessible for a general audience, as well as accompanied by a suitable royalty-free image for publication and suggested tweets for @DiscoverSoc.

Timeline for contributions:

**September 30th:** Confirmed intention to submit with title & brief description

**November 20th:** Delivery of final article, with image and tweets

**December 20th:** Return of any requested edits and revisions

**January 4th:** Publication of the special issue

Contact details: Mark Carrigan (mark@markcarrigan.net) and William Housley (housleyw@cardiff.ac.uk)

Symposium: Anxiety and Work in the Accelerated Academy (2016-09-06 15:32)

Friday September 23rd at the University of Warwick, 9:30am to 6:00pm

The culture and organisation of knowledge production are undergoing dramatic transformations.

Neo-managerialist models for the management of research and teaching, the expansion of audit and academic
rankings, and the recasting of universities as service providers and students as consumers are just several of the main features of the ongoing marketisation of science, higher education and academia. Further important structural changes include the casualisation of academic labour and the “acceleration” of academic life.

These transformations concern the mathematical, natural and social sciences and humanities in equal measure, if perhaps in different ways. The careers, working lives and identities of scholars, researchers and higher education teachers are all affected.

In this symposium, we bring together international and UK-based scholars who study science, higher education and academia. We focus on a particular aspect of neoliberal academia, namely its anxiety-inducing environment - not as an object in itself, but as a symptom of what Ros Gill called “the hidden injuries of neoliberal academia” and of the need for meaningful change. We will discuss what is happening to the work, careers, lives, identities and epistemic communities of scientists, while the scientific institutions are changing.

We invite everyone interested in issues of work, labour and employment in the sciences and academia - scholars, students, practitioners, administrators - to join the symposium and take part in the discussions.

Speakers:

Liz Morrish - Metrics, Performance Management and the Anxious University
With responses by Gurinder K. Bhambra & Maria Ivancheva

Maggie O’Neill - Pace, Space and Well-Being: Containing Anxiety in the University
With responses by Vik Loveday & TBC

Filip Vostal - Beyond the dichotomy of slow and fast academia: On temporal multidimensionality of science
With responses by Mark Carrigan & Milena Kremakova

Each speaker will talk for thirty minutes, with responses of fifteen minutes each, before an hour’s open discussion.

The Dispositions of the Metricised (2016-09-07 08:00)

In our discussion of metrics systems, it’s easy to treat subjectivity as a cipher, regarding people as passively moulded by algorithms or blindly governed by the incentives that operate through the institutionalisation of the metrics. My objection to the former is not the claim that people are shaped by metrics, but rather the assumption that this process is basically passive. My interest is in how metrics come to matter to us. How are people shaped over time? How do their biographically accumulating dispositions and concerns influence the actions they take over time? How
do these feed back into the metrics system and the organisations within which they are institutionalised?

The fictional portrayals that are starting to emerge of this – novels like *Super Sad True Love Story*, the *Circle* and *Whiskey Tango Foxtrot*, films like *Nerve* – often struggle to represent this engaged subjectivity because the imperatives of effective story telling militate against it. What we really need is a novel or film that explores metricisation through the internal monologue of what I imagine would turn out to be an unreliable narrator.

**An Open Access Series of Books on Why We Post (2016-09-08 08:00)**

I’ve just started working my way through this series of books produced by [1]UCL's massive Why We Post project. The past work of the project team is fantastic and I'm hopeful this will prove to be an important series of books, breaking new anthropological ground in our understanding of how and why people use social media. Not all of the books are released yet but these are the ones currently available:

- [2]How the World Changed Social Media
• [3] Social Media in an English Village
• [4] Social Media in Southeast Turkey
• [5] Social Media in Northern Chile
• [6] Social Media in Industrial China
• [7] Social Media in Rural China
• [8] Social Media in Southeast Italy

They’re also freely available in PDF! This is a wonderful innovation from UCL’s Press and one we’ll hopefully see more of in the future.

Call for Papers: Philosophy and Technology special issue on The Governance of Algorithms (2016-09-09 08:00)

Call for Papers for Philosophy and Technology’s special issue on The Governance of Algorithms
GUEST EDITORS
Marcello D’Agostino (University of Milan, Italy) and Massimo Durante (University of Turin, Italy)

INTRODUCTION
In our information societies, we increasingly delegate tasks to automated systems, devices and agents that mediate human relationships by making decisions and acting on the basis of algorithms. Their increased intelligence, autonomous behavior and connectivity are changing crucially the life conditions of human beings as well as altering traditional concepts and ways of understanding reality. Algorithms are directed to solve problems that are not always detectable in their own relevance and timeliness. They are also meant to solve
those problems through procedures that are not always visible and assessable in their own. In addition, technologies based on algorithmic procedures more and more infer personal information from aggregated data, thus profiling human beings and anticipating their expectations, views and behaviors. This may have normative, if not discriminatory, consequences. While algorithmic procedures and applications are meant to serve human needs, they risk to create an environment in which human beings tend to develop adaptive strategies by conforming their behaviour to the expected output of the procedures, with serious distortive effects. Against this backdrop, little room is often left for a process of rational argumentation able to challenge the results of algorithmic procedures by putting into question some of their hidden assumptions or by taking into account some neglected aspects of the problems under consideration. At the same time, it is widely recognized that scientific and social advances crucially depend on such an open and free critical discussion.

TOPICS
The aim of this special issue of Philosophy & Technology is to explore questions about the governance of algorithms in light of the technological dependence of our information societies. We ask how to face theoretical and practical challenges in order to assure that technological innovations go hand in hand with human needs, beliefs and expectations. We solicit the submission of papers from different disciplines (law, ethics, economics, computer science, social studies, epistemology and philosophy of science) to address questions such as:

C2B7 How to deal with the "knowledge problem" (as Franck Pasquale put it), i.e., with the openness, transparency and fairness of algorithmic procedures and applications?
C2B7 How to govern those algorithmic procedures and applications once we delegate them the accomplishment of tasks or the solution of problems?
C2B7 By which standards the relevance and the timeliness of problems as well as the efficiency and the legitimacy of solutions are measured?
C2B7 Is the extensive functioning of automated systems, devices and agents based on algorithms able to impair human freedom and autonomy, free critical discussion and reflexivity?

TIMETABLE
December 19, 16: Deadline for paper submissions
February 13, 17: Deadline reviews papers
March 13, 17: Deadline revised papers
April, 17: Publication of accepted papers

SUBMISSION DETAILS
To submit a paper for this special issue, authors should go to the journal’s Editorial Manager
responding author for each submission in case of co-authored papers) must register into EM. The author must then select the special article type: "The Governance of Algorithms" from the selection provided in the submission process. This is needed in order to assign the submissions to the Guest Editors. Submissions will then be assessed according to the following procedure: New Submission > Journal Editorial Office > Guest Editor(s) > Reviewers > Reviewers' Recommendations > Guest Editor(s) > Editor-in-Chief's Final Decision > Author Notification of the Decision. The process will be reiterated in case of requests for revisions. For any further information please contact: GUEST EDITORS' CONTACT DETAILS Marcello D'Agostino: marcello.dagostino@unimi.it Massimo Durante: massimo.durante@unito.it

3. mailto:marcello.dagostino@unimi.it
4. mailto:marcello.dagostino@unimi.it

The #Brexit Fortune Teller (2016-09-10 08:00)
A fantastic invention by Bob Dickinson! Here’s how to make one:

HOW TO MAKE THE BREXIT FORTUNE TELLER

1 trim the paper to a square, flush with the edges of the artwork

2 artwork face up, fold diagonally, corner to corner

3 unfold. Then fold along the other diagonal, corner to corner.

4 unfold. You should have a square of paper with a cross-shaped diagonal fold.

5 turn over, so artwork is face down. Fold each corner back, from half way along each edge, so all four corners meet in the middle. You should now have a small square shape with the heads of the four
politicians literally at each others’ throats.

6 turn the small square over. Fold each corner back, from half way along each edge, so all four corners meet in the middle, on which you should be seeing triangles with two sets of numbers.

7 turn over. Stick fingers under each politician’s head so that it peaks up into a pyramid shape. You can now start using the fortune teller.

HOW TO USE

1 ask someone to pick a politician.

2 spell out the politician’s name out loud opening the fortune teller one or other direction for every letter.

3 ask your victim to pick a number at the point you finished spelling the politician’s name. Read out the number and the information alongside it.

4 unfold the triangle to read the prediction underneath.

The Familiarity of the Future: A Look Back from 1999 (2016-09-10 17:56)

In preparation for writing a review of the Unabomber’s new book, I have gone through my files to find all the things I and others had said about this iconic figure when he struck terror in the hearts of technophiles in the 1990s. Along the way, I found this letter written to a UK Channel 4 producer on 26 November 1999 by way of providing material for a television show in which I participated called ‘The Trial of the 21st Century’, which aired on 2 January 2000. I was part of the team which said things were going to get worse in the 21st century. What is interesting about this letter is just how similar ‘The Future’ still looks, even though the examples and perhaps some of the wording are now dated. It suggests that there is a way of living in the present that is indeed ‘future-forward’ in the sense of amplifying certain aspects of today’s world beyond the significance normally given to them. In this respect, the science fiction writer William Gibson quipped that the future is already here, only unevenly distributed. Indeed, it seems to have been here for quite
a while. Dear Matt, Here are the sum of my ideas for the Trial of the 21st Century programme, stressing the downbeat: Although the use of the internet is rapidly spreading throughout the world, it is also spreading at an alarmingly uneven rate, creating class divisions within nations much sharper than before. (Instead of access to the means of production, it is now access to the means of communication that is the cause of these divisions.) A good example is India, where most of the population continues to live in abject poverty (actually getting poorer relative to the rest of the world), while a Silicon Valley style community thrives in Bangalore with close ties to the West and a growing scepticism toward India's survival as a democracy that pretends to incorporate the interests of the entire country. (The BBC world service did a story a couple of years ago after one of the elections, arguing that this emerging techno-middle-class is, despite its Western ties, are amongst those most likely to accept the rule of a dictator who could do a 'Mussolini' and make the trains run on time, and otherwise protect the interests of these nouveaux riches, etc.) In this respect, the spread of the internet to the Third World is actually a politically destabilizing force, creating the possibility of a new round of authoritarian regimes. This tendency is compounded by a general decline of the welfare state mentality, so that these new dictators wouldn't even need to pay lip service to taking care of the masses, as long as the middle classes are given preferential tax rates, etc. But even in the West, the easy access to the internet has political unsavoury consequences. As more people depend on the internet as a provider of goods, information, entertainment, etc., and regulation of the net is devolved into many commercial hands, it will be increasingly tempting for techno-terrorists to strike by: corrupting, stealing and recoding materials stored therein. In other words, we should see a new generation of people who are the spiritual offspring of the Unabomber and average mischievous hacker. Indeed, many of these people may be motivated by a populist, democratic sentiment associated with a particular ethnic or cultural group that otherwise 'info-poor'. Such techno-terrorism is likely to be effective when the offending Western parties are far from those of the offended peoples – one wouldn't need to smuggle people and arms into Heathrow; one could just push the delete button 5000 miles away... I am frankly surprised that the major stock exchanges and the air traffic control system haven't yet been sabotaged, considering how easy it is for major disruptions to occur even without people trying very hard. These two computerized systems are prime candidates because the people most directly affected are likely to be relatively well-heeled. In contrast, sabotaging various military defence systems could lead to the death of millions of already disadvantaged people, so I doubt that they would be the target of techno-terrorists (though they may be the target of a sociopathic hacker...) One seemingly good feature of our emerging networked world is that we can customize our consumption better than ever. However, this customization means that we are providing more of our details to sources capable of exploiting them – not only through marketing, but also through surveillance. In this respect, remarks about the 'interactivity' of the internet should be seen as implying that others may be able to 'see through' you while you are merely 'looking at' them. While this opens up the possibility of government censorship, a bigger threat may be the way in which access to certain materials may be 'implicitly regulated' by the 'invisible hand' of website hits. Thus, if a site gets a consistently large number of hits, it may suddenly start charging a pay-per-view fee, whereas those getting few hits may simply be taken off cyberspace by commercial servers. This could have especially pernicious consequences for the amount and type of news available (think about what sorts of stories would be expensive to access if news coverage were entirely consumer-driven), as well as on-line distance learning courses. Here we see the dark side of the 'user friendliness' of the net: it basically mimics and reinforces what we already do until we get locked in. (In other words: spontaneous preferences are turned into prejudices and perhaps even addictions.) In the past, government and even businesses saw themselves in the role of educating or, in some other way, challenging people to change their habits. But this is no longer necessary, and may be even inconvenient as a means to a docile citizenry. (Aldous Huxley's Brave New World was ahead of the curve here.) There are also some problems arising from advances in biotechnology:

1. As we learn more about people's genetic makeup, that information will become part of the normal ways we account for ourselves – especially in legal settings. For example, you may be guilty of alcohol-related offences even if you are below the 'legal limit', if it's shown that you're genetically predisposed to get drunk easily. (Judges have already made such rulings in the US.) Ironically, then, although we have no say in our genetic makeup, we will be expected not only to know it, but also to take responsibility for it.

2. In addition, while our personal genetic information will be generally available (e.g. used by insurance companies to set premiums), it may also be patented as intellectual property legislation seems to be allowing the patenting
of substances that already exist in nature as long as the means is artificial (e.g. biochemical synthesis of genetic material for medical treatments).

3. This fine-grained genetic information will refuel the fires of the politics of discrimination, both in its negative and positive extremes: i.e. those who want to take a distinctive genetic pattern as the basis of extermination or valorization. (A good case in point is the drive to recognize homosexuality as genetically based: both pro- and anti-gay groups seem to embrace this line, even though it could mean either preventing the birth of gay children or accepting gayness as a normal tendency in humanity)

Finally, there are some general problems with the future of knowledge production:

1. It will become increasingly difficult to find support – both intellectual and financial – for critical work that aims to overturn existing assumptions and open up new lines of inquiry. This is because current lines of research – especially in the experimentally driven side of the natural sciences – have already invested so much money, people and other resources that to suggest that, say, high-energy physics is intellectually bankrupt or that the human genome project isn’t telling us much more than we already know would amount to throwing lots of people out of work, ruining reputations and perhaps even causing a general backlash against science in society at large (since public conceptions of science are so closely tied to these high-profile projects).

2. Traditionally radical ideas have been promoted in science – at least in part — because the research behind the ideas did not cost much to do, and not much was riding on who was ultimately correct. However, this idyllic state of affairs ended with World War II. Indeed, it has gotten so bad – and will get worse in the future – that one can speak of a kind of ‘financial censorship’ in science. For example, Peter Duesberg, who discovered the ‘retrovirus’, lost his grants from the US National Institute of Health because he publicly denied the HIV-AIDS link. One result of this financial censorship is that radical researchers will migrate to private funders who are willing to take some risks: e.g. cold fusion research continues today in this fashion. The big downside of this possibility, though, is that if this radical research does bear fruit, it’s likely to become the intellectual property of the private funder and not necessarily used for the public good.

I hope you find these remarks helpful. Leave a message at ... when you’re able to talk. Yours, Steve

Call for Applications: Work, Employment and Society Editorial Board (2016-09-11 08:00)

Work, employment and society Editorial Board

Call for Applications

Deadline: Wednesday 21 September 2016, 17:00 (GMT)

Work, employment and society is seeking 10 new members to join its Editorial Board and serve for three years from January 2017 to end of December 2019.

The Board welcomes applications involving any areas of methodological, theoretical and empirical expertise, 4604
though all applicants should be able to demonstrate an interest in and understanding of sociology. Candidates with expertise in the following areas are particularly needed:

- Quantitative methods
- Gender, work and employment
- Labour markets
- Knowledge work/the professions
- International and comparative sociology of work and employment
- Unpaid, invisible and 'non-standard' forms of work and employment
- Migration
- Intersectionality
- Creative industries
- Economic/labour geography

WES seeks academics based in the UK for the editorial board, but welcomes members from diverse backgrounds – both cultural and academic – to contribute to the diversity of research published by the journal.

The full call and online application form are available at:

If you have queries about the application process, please contact UK Engage, who are running the election process at: [2]britsoc@uk-engage.org

If you have queries about the role or about your eligibility, please contact the Chair of the Editorial Board, Professor Jackie O'Reilly ([3]J.O'Reilly@brighton.ac.uk)

1. http://www.uk-engage.org/britsocwes
2. mailto:britsoc@uk-engage.org
3. mailto:J.O%27Reilly@brighton.ac.uk

Eliminating the first person from ethnography (2016-09-12 08:00)

A powerful argument by Matthew Desmond from the conclusion of his incredible book [1]Evicted. What do you think? Far from being a prerequisite for reflexivity, can writing the "I" into ethnography inadvertently make the text about the author rather than the subject matter?
But first-person narration is not the only technique available to us. In fact, it may be the least well-suited vehicle for capturing the essence of a social world because the "I" filters all. With first-person narration, the subjects and the author are each always held in view, resulting in every observation being trailed by a reaction to the observer. No matter how much care the author takes, the first-person ethnography becomes just as much about the fieldworker as about anything she or he saw. I have sat through countless conversations about a work of ethnography or reportage that have nothing to do with the book’s subject matter and everything to do with its author’s decisions or mistakes or "ethical character." And after almost every academic talk I have given on the material in this book, I have been asked questions like: “How did you feel when you saw that?” “How did you gain this sort of access?” These are fine questions, but there is bigger game afoot.

There is an enormous amount of pain and poverty in this rich land. At a time of rampant inequality and widespread hardship, when hunger and homelessness are found throughout America, I am interested in a different, more urgent conversation. "I" don’t matter. I hope that when you talk about this book, you talk first about Sherrena and Tobin, Arleen and Jori, Lorraine and Scott and Pam, Crystal and Vanetta—and the fact that somewhere in your city, a family has just been evicted from their home, their things piled high on the sidewalk. There are costs to abandoning the first person. In the context of this study, it meant disguising when I intervened in nontrivial ways. There are two such instances in this book. When a “friend” rented Arleen a U-Haul truck to move from Thirteenth Street and when Vanetta borrowed money from a “friend” to buy a stove and refrigerator in anticipation of a visit from Child Protective Services, that was me. It is also important to recognize that none of the tenants in this book had a car. I did, and I sometimes drove people around when they were looking for housing. When I didn’t, people relied on Milwaukee’s irregular bus system or set off on foot. It would have taken families much longer to find subsequent housing if they hadn’t had access to my car (or phone).

alwayslearning7 (2016-09-14 13:04:43)
How do you eliminate the I in ethnography. I have written a case study about my lived experience in a certain environment, linking the experience to relevant theory. How can I do this without being a part of it? My study sounds like a novel rather than an academic piece of writing with myself being the main character. Thanks, I hope my question isn’t too long and makes sense.

Images of the end of capitalism (2016-09-13 08:00)

In various posts over the last few years, I’ve written about my fascination with [1] images of civilisational collapse. Reading Riots and Political Protest, by Steve Hall, Simon Winlow, Daniel Briggs and James Treadwell, I find myself wondering if this fascination is in large part because of how ‘civilisational collapse’ and the ‘end of capitalism’ tend to be conflated under our present circumstances. As they write on pg 18,

The dominant images of the end of capitalism in Western culture are those of absolute economic devastation and crushing hardship, a return to Dark Age repression and poverty. In the popular imagination, capitalism is lively and vivacious, and all alternatives to it are dull, grey and monotonous.
Images of civilisational collapse are so emotive under current conditions because of our much remarked upon inability to imagine a world beyond capitalism. For this reason I think sociological engagements with how these dystopias are represented could provide rewarding. By identifying their questionable assumptions, highlighting what is untenable in accounts of collapse and what might turn out differently in reality, could we open up the space in which to think about a *beyond* rather than merely an *end*?

---

**What do you do when people you like act offensively online?** (2016-09-14 08:00)

I’ve been planning how to address this issue much more comprehensively in a second edition of [1]Social Media for Academics. But then [2]Vox helpfully shared this flow chart and I’m not sure I have anything further to add:
Are we dominated by our smart phones and mobile games? (2016-09-15 08:00)

https://twitter.com/_sakanoue/status/759615450497978368
CfP: Social Media and Social Futures – a special issue of @DiscoverSoc (2016-09-15 15:28)

Co-edited by Mark Carrigan and William Housley

Social media is conventionally located within a commercial narrative that theorises an array of emerging ‘disruptive technologies’ that includes big data, additive manufacture and robotics. These and related technologies are underpinned by computational developments that are networked, distributed, digital and data driven. It has been argued that these technologies not only disrupt markets; but also wider social and economic relations and organization. These include social institutions such as the family, work, health care delivery, education, relationships and the ‘self’. But how do we separate the hype from the reality while nonetheless recognising how powerful this rhetoric is on a purely discursive level? What social futures are potentially shaped by social media and how can we talk about them in a way that emphasises our capacity to shape them collectively?

Social media is one of the first waves of digital disruptive technologies whose mass global take-up via multiple platforms is still being assessed and understood, as a social force in it’s own right. Standardly, ‘social media as data’ has provided a plethora of studies and projects that have examined the big and broad social data opportunities provided by the social media for understanding populations on the move ‘in real time’. In some cases this has led certain commentators to enthusiastically claim that the analysis of social media as data offers opportunities for prediction and the forecasting of behavior at the population level although this rhetoric is not without it’s skeptics and critics. Is this a plausible vision of the future? Is it a desirable one? Can we see a longstanding impulse towards addressing social problems finally having the necessary techniques and capacities to achieve its potential? Or are we witnessing a potentially authoritarian turn in which social engineering can operate with an unprecedented degree of granularity?

Furthermore, these methodological opportunities and oracular imaginaries are being accompanied by an ‘ontological velocity’ generated by the social and economic implications of social media as data, practice and a globalizing networked communicative force that is shaping being and becoming in the digital age. A key issue here is the relationship between social media, society, time and the ‘future making’ capacities and affordances of these and allied technologies. Yet little work has been carried out on the temporal ramifications of social media (and other disruptive technologies) in relation to emerging digital ‘timescapes’. To this extent the study of the relationship between social media and society remains under-conceptualized especially in relation to our understanding of late modernity at the beginning of the 21st century. The relationship between social media and the social generation of risk, it’s contributions to new digital timescapes and the trajectory of the self and identity alongside empirical concerns is sociological work in waiting. How does social media complicate or perhaps confirm existing theories of social change? Or is such epochal thinking itself a problem, ripe to be deployed by social media corporations apt at marketing their own ‘disruptive’ capacity? For this special issue of Discover Society we welcome short articles (1500 words) that relate to the above and the following topics:

• Social Media, Timescapes and Futures
• Social Media, Prediction and Critical Data Imaginaries
• Visioneering, ‘Futures’ and Social Media
• Tracing Emerging Technologies in the Digital Agora
• The Future of Social Networks: Social Organization, Data and Engineering
• Computational Politics and the challenges facing Democracy
• Social Media and the Transformation of Everyday Life
• Digital Afterlives? Social Media, Time, Traces and Accountability
• Digital Social Science and Social Futures

Please see the Discover Society website for more details about [1]formatting requirements. Articles should be accessible for a general audience, as well as accompanied by a suitable royalty-free image for publication and suggested tweets for @DiscoverSoc. Timeline for contributions: September 30th: Confirmed intention to submit with title & brief description November 20th: Delivery of final article, with image and tweets December 20th: Return of any requested edits and revisions January 4th: Publication of the special issue Contact details: Mark Carrigan (mark@markcarrigan.net) and William Housley (housleyw@cardiff.ac.uk)

Brassed Off (Oldham Coliseum until 1 October) (2016-09-15 20:24)

BRASSED OFF

7 SEP – 1 OCT 2016

“I don’t know anyone who admits to voting Tory but t’buggers keep getting in”.

![Brassed Off Image](image)
Brassed Off film fans will very much enjoy the Oldham Coliseum Theatre production of the hugely successful screenplay by Mark Herman. Local prize-winning brass bands from Saddleworth feature on stage stealing the show with their numbers. Paul Allen’s adaptation transports you to the Yorkshire landscape of 1994 where 10 year old narrator Shane (Thomas Weir) – who dreams of being a world champion at The Crucible - introduces the significant others in his world. These are the days when everyone was either your aunty or uncle. Shane tells us his mum is “mental”: “it’s because we’ve got no money I think”. His mum, Sandra (Natalie Grady) yearns for the merriment and mirth of a carefree night out, to escape her son asking: “Why are we so poor?”

Shane’s parents (Natalie Grady and Paul Barnhill)

“Even the men don’t wear suits around here”. An outsider arrives in Grimley with her flugel horn in tow, hoping to be welcomed and permitted to join the band? Delph and Dobcross and other Saddleworth villages await the marching band. Danny has big dreams beyond marching bands, to play at the Albert Hall but Shane’s dad – Danny’s son – cannot afford food for the family table and the threat of the bailiffs and loan sharks is looming. Will Danny’s dream come true?
The locker room 'Yorkshire man' banter between the miners amuses and saddens the audience. Their wives are dedicated to providing moral support chanting 'coal not dole' and 'say yes to miner's jobs' at the picket line. The women campaign to keep the pits open even though they hate the dangers of the pit. The closure of the pit looms. Anxieties increase as 1200 jobs are to go. Communities, homes and lives will be destroyed. As well as humour and drama, the play offers deep sociological insight about growing up in a close-knit mining community, social class divisions, generational changes, the threat of pit closures and unemployment and gender roles.

The Delph Band

The men worry about idle prospects of watching Richard and Judy with their wives made to seek jobs to feed
the family. Hope prevails for the wives: “the pit ain’t gonna close it is?” The tough men though can barely afford to contribute to the colliery band kitty, but are “shitting bricks” to tell Shane’s grandad Danny (Ged McKenna). The jubilance and joy brought by band practice gives the locals a much needed camaraderie. The band brings the townsfolk together: "The band symbolises pride". And Danny knows ‘music never lets you down’ even if there is frustration, bitterness and resentment brewing because of socio-political changes tearing friends and families apart.

Registration Open: Bourdieu, Aesthetics and the Body (2016-09-16 08:00)

Registration is now open for the forthcoming BSA Bourdieu Study Group Event: Bourdieu, Aesthetics and the Body. You can register here: [1]http://portal.britsoc.co.uk/public/event/eventBooking.aspx?id=EVT10592 Bourdieu, Aesthetics and the Body. London Monday 28th November, 2016 10.00-18.00 What can Bourdieusian theory add to exploration of the body and its aesthetic and performative capacities? Bourdieu (1984) argued that the body is a socially shaped generator of divisions. The body bears the imprint of divisions as a result of a person’s social location, habitus and taste. The body has long been a bearer of symbolic value and this symbolic value is bestowed to particular bodily forms. With the legitimisation of certain bodily types over others, and unequal opportunities for people to produce symbolically valued bodily forms, the internalisation of images that others form of oneself – even when these are stereotypes – raises questions of self-identity. Bourdieu (1990, p.69) also argued that: ‘Symbolic power works partly through the control of other people’s bodies’. The ‘normalising’ of bodily practices and its cultivating capacities, as well as the commodification of the body in modern society, increases the body’s attachment to pre-existing social inequalities. This event will bring together a range of sociologists who will open up discussions of the relevance of Pierre Bourdieu’s conceptions of the body to: identity work and performances of self along social lines and gender, the management and appearance of bodies within sport and the health/’beauty’ industry, and the applicability of Bourdieusian theory to the development of disability theory. Timetable 10.00-10.30 Registration and Refreshments 10.30-10.45 Introduction 10.45-12.00 Opening Keynote: Dr Stephanie Lawler (University of York) Disgusted subjects: the making of middle-class identities 12.00-12.20 Refreshments 12.20-13.00 Carl Mallett (University of Warwick) Martial Arts and ‘Habitus’ 13.00-13.40 Dr Nicola Ingram (Lancaster University) Working and middle class undergraduate students’ constructions of masculine identities 13.40-14.40 Lunch 14.40-15.20 Dr Jenny Thatcher Symbolic Violence and the ‘Beauty’ Industry 15.20-16.00 Dr Natalia Slutskaya (University of Sussex) The Body Dances: Carnival Dance and Organization 16.00-16.20 Refreshments 16.20-17.30 Closing Keynote: Professor Rob Imrie (Goldsmiths, University of London) The relevance of Pierre Bourdieu’s conceptions of the body to the development of disability theory 17.30-17.45 Closing Remarks and Goodbye This event costs £25 for BSA student members, £35 for BSA-members and £45 for non BSA members. Refreshments and lunch are included. Early booking is recommended as we anticipate this to be a popular event. There will be 35 places available. To Register please go to the BSA Event’s Page: [2]http://portal.britsoc.co.uk/public/event/eventBooking.aspx?id=EVT10592

How is that for a Hollywood movie scenario: a young woman starts dating a poor student, but then dumps him for a rich old man, whom she tries to relieve of his treasures before getting arrested. Not too feminist, eh? And yet, it’s a rough sketch of the Manon Lescaut opera that was successfully performed at [2]Salzburg Festival in a breathtaking interpretation of Anna Netrebko. When people listen to classical opera, they don’t necessarily bother deciphering the lyrics. Even if you have subtitles your gaze will be torn between the action on stage and the screen above it. It might be worth while taking a closer look.

Most operas will probably fail the famous [3]Bechdel test: you can hardly find 2 female characters who would talk - correction, sing - about something else other than men or their feelings for the men. In Madama Butterfly there is almost a Bechdel moment when [4]Chio-Chio-San asks Suzuki to decorate the room... to prepare for her husband’s arrival. Il Trovatore’s Leonora and Ines [5]discuss Manrico, Aida’s Amneris and Aida [6]talk about Radames, Turandot’s Liu only tells the princess how [7]love to Calaf will transform her. Even in Evgeny Onegin the famous duet/quartet at the beginning hardly lasts 2 minutes before [8]Tatyana’s mother and nanny reminisce about the former one’s love interests and how the habit of being with someone replaces love. A strong female character, a chief priestess no less, Norma, who encourages druids to take revenge on the conquerors from Rome, only discusses [9]her unfaithful lover with a female co-worker (i.e., a fellow druid priestess, job options for women were rather limited back in the day).
In many European operas a woman's value seems to be only in her (virgin) body and even the agency of often titled female characters is questionable. The above mentioned Norma has to immolate herself because she broke her vow of chastity. Il Barbiere di Sivilla Rosina [10]literally waits for Count Almaviva to rescue her from her uncle not doing anything by herself. It’s the clever barber who shows signs of mental activity. I won’t even mention some of Wagner’s operas, where women [11]sleep and wait to be awoken by “true heroes”. Manon Lescaut, the only female role in Puccini’s beautiful opera shows that women have no self-sufficiency at all. She is first accompanied by her brother who is supposed to put her in a monastery, then taken by Des Grieux (albeit voluntarily), then she becomes a mistress of an old man and revels in the jewels and gifts showered by her benefactor. Afterwards she is arrested and can only be rescued by her lover. Most of them time if women can actually accomplish something, they either kill or offer their body. Tosca, a brave singer who tries to save her lover Cavaradossi [12]kills Scarpia (but only after he sings a stunning aria professing [13]his passion to her). Leonora in Trovatore offers her body to the villain and is [14]instantly rebuked by the man she sacrificed herself for, as though it’s fun for women to be molested by a man they don’t love.

Moreover, women are usually linked with the male protagonists' tribulations. It’s [15]Rigoletto’s anguish at the death of his daughter Gilda that takes center stage and not Gilda's sacrifice or her despair after the Duke leaves her for another woman. Orpheus is [16]miserable when Eurydice dies and has to battle his way to the underworld, where Eurydice ruins his attempt to rescue her. [17]Jealous Marfa (who is also a witch) persuades Prince Andrey to burn on a pyre in Khovanschina, although his misfortunes were caused by the political turmoil in 17th century Russia. Manrico has to save Leonora from a man she doesn’t love; in Arena di Verona version [18]Manrico literally rides in on a white horse. He then is captured and beheaded because his mother was clumsy enough to get caught by Manrico’s nemesis. Onegin is depressed because Tatyana (spoiler alert) refused to be unfaithful to her husband, an act that is a subject of [19]an opera in itself that portrays female treachery. Admittedly, I cherry-picked several popular operas and used them to illustrate my point about representation of female characters in popular culture. [20]Feminist frequency blog takes the issue of female representation seriously and makes a compelling case for combatting misogyny in video games, where women are portrayed by means of distinctive tropes such as ‘damsel in distress’ or ‘women as reward’. In the meantime, however, Kobbe’s Opera Book could really use some disclaimers.

Elizaveta Gaufman received her PhD in Political Science from the University of Tübingen. Her research focuses on the exploration of verbal and visual enemy images through big data analysis, combining international relations theory with media and cultural studies. Twitter: @lisas_research

Semantic satiation refers to the making strange of words by continual repetition until they become meaningless. Within the discourse surrounding the Fundamental British Values (FBV) since their introduction into schools in 2014 words such as extremism and radicalism recur so frequently they begin to float free from signification. Rather than scouring dictionaries for definitions, an alternative approach is to consider how, using an arts methodology, the words might be enacted through drawing, dancing, or miming. Extreme suggests stretching out, and reaching, poses that extend and expand from the norm. A radical posture would be wide and connected strongly to the ground. Such movements necessitate breathing deeply and are energising. Conversely, the antonyms of extreme and radical suggest the body curling inwards, shrinking and pulling away from the furthest reaches and rootedness to the earth, leading to feeling constrained, small, and defensive.

These contrasts of the expansive against the diminished provide a useful visualization of the problem of FBV in relation to art education in schools. Davies[1] argues that the anti-extremism agenda is reductive and superficial. She uses Sen's term miniaturisation[2] to describe how speaking of ‘groups’ and ‘communities’ minimises individuals making it easier to generalise, stereotype, and assign labels. FBV are not the only reductive policy at play in education and seeing anti-extremist initiatives as separate from the wider situation can mask important criticisms. Sukarieh and Tannock (2015) contest that anti-radicalisation should be seen as part of a wider shift in schools and society ‘leading to the abandonment and undermining of the radical tradition in education at precisely the time it is needed most’[3].

When reading the (highly problematic[4]) [1]signs of ‘radicalisation’ parents and teachers are to look out for, I was struck by the how similar the list was to those found on websites devoted to other [2]teenage hazards (such as eating disorders or addictions). These include the tell-tail signs of becoming withdrawn, changing friends or style of dress, behaving secretly, becoming obsessive, isolation at school, trauma, experience of bullying or discrimination, being a perfectionist. As a parent of teenagers one cannot help but be moved by families broken by the defection of their children to join terrorist groups. These are families as ordinary as those torn apart by a child’s self-harming, anorexia or addiction. All can arrive in a family’s life unannounced and are indicative of the challenges of contemporary teenage experience - growing up in an incredibly complex and alienating world and working out how on earth I’m going to find a feasible life for myself.

The notion of a ‘feasible world’ comes from Martin Buber who produced his life’s work through two world wars and conflict in the Middle East, providing first hand experience of violent extremism and constant threat. For Buber, the discovering of a feasible world was the purpose of education. His understanding of the nature of being was relational taking the form of either the I-Thou or the I-It[5]. If students (or teachers) became ‘Its’ to be made useful, rather than ‘thous’ to be nourished the world created would be less expansive and life-affirming than it might potentially be. His philosophy is pertinent to the problem of ‘radicalisation’ today; individuals resort to unhealthy extremes when the world they inhabit feels unfeasible and they have no creative means to make it so.

Davies suggests the ‘current obsession with excellence and standards may actually be conducive to extremism. This does not teach people to be at comfort with ambiguity or with the notion of a school or pupil being ‘good enough’[6]. School-based initiatives that seek to [3]foster resilience in young people abound. Coppock and
McGovern suggest that linking notions of ‘prevention’ to the well-being, beliefs and behaviour of individuals fails to address cause at a societal level.[7] Davies argues we are not radical enough, the current approach does not go to the root of the problem and the miniaturising language of de-radicalisation increasing the stereotyping and alienation that is known to make young people vulnerable. An alternative is to:

... enhance the resistance to such simple labels and categories, and give children status by showing how original and special each of us is... to celebrate not a bland diversity, but a resistant hybridity and originality in each child...[8]

Yet education policy currently mitigates against the celebration of hybridity and the uniqueness of every child. The shrinking and narrowing and constraining of schools is felt most acutely in those subjects that equip us as human beings to invent and imagine and hope for a feasible world that is uniquely ours. Adams describes how rather than exploring the ways arts practice can assist young people in creatively responding to the challenges they face,

‘... creativity is suppressed by performativity in the form of high-stakes testing and league tables, which makes it far too risky for school managers to contemplate, especially when more compliant and easily assessed activities can readily replace creative ones. This does not necessarily require the removal of arts or creative-designated subjects from the curriculum, rather it entails the extraction of their critical, relational and subjective features, so that what remains is a husk largely devoid of actual creativity. ... Such reductive practices, which may nonetheless be attractive or sumptuously decorative, effectively exclude the learners’ voices, or learners as directors of their own learning’.

In relation to British values this is seen most crudely in the prevalence of paintings of union jacks, portraits of the Queen, and other visual caricatures devoid of creativity and criticality.

The FBV agenda is an opportunity for art educators but it’s a problematic one because it goes against a core belief that teachers should maintain political neutrality. This perhaps leads to the selection of apparently benign imagery rather than a critical engagement with notions of democracy, free speech or tolerance. Buber suggested that teachers can influence the lives of students in two ways, through propaganda (coercion) or education (communion). As .... stated,

"the real choice, does not lie between a teacher's having values and not having them, but between his imposing those values on the student and his allowing them to come to flower in the student in a way which is appropriate to the students personality...'

The Fundamental British Values of democracy, the rule of law, individual liberty, and mutual respect and tolerance of those with different faiths and beliefs and non, are arguably connected with a neoliberal agenda that sees the preservation of the status quo as necessary for the smooth exchange of global capital. Karaba argues that neoliberal education policies are eroding, democratic, progressive education[9]. He emphasises that Hayek’s definition of freedom ‘the state in which a man is not subject to coercion by the arbitrary will of another or others’[10] is both defined negatively (the absence of something) and conceived of individually. This is a notion of freedom defined by ‘tolerance’, where individuals (or groups) exist side by side but do not relate, or change, or grow. Buber suggests the opposite of compulsion or coercion is not freedom but communion[11]. He uses the word Zwischenmenschliche, meaning the space between people, to refer to this in-between place of communion and sharing[12]. Art is crucial
to peaceful and meaningful existence in creating zwischenmenschliche and enabling communion.

Herbert Read, took up Buber’s ideas when, against the backdrop of World War 2 he wrote, ‘Education through Art’ - his manifesto for an education for peace. Read saw the creation of the right environment as essential for learning; one characterized by trust and the absence of fear[13]. It is fear that causes us to retreat into ourselves, to put up defenses, to protect ourselves, to worry we will be misunderstood, to stay silent, to choose not to share who we are or want to be. As the Sufi poet Hafiz wrote,

How
Did the rose
Ever open its heart

And give to this world
All its
Beauty?

It felt the encouragement of light
Against its
Being,

Otherwise,
We all remain

Too

Frightened[14].

Of course, the aim of teachers everywhere is not to miniaturise, or diminish, or cause students to close up but to see students blossoming, expanding and growing. For that they need not to be afraid. This is where art pedagogy has much to offer the anti-extremism agenda. Every day through relation and dialogue, art educators sit, for example, alongside students as they draw and sculpt and create and talk to students about their lives. The process of making together creates the Zwischenmenschliche in ways that other subjects do not. Art teachers choose imagery to share with students that ‘makes the familiar strange’ and encourages them to expand their horizons,
they teach skills that equip students with a language through which to be expressive and communicate their unique perspective to others, they select starting points for projects that enable them to explore their own sense of who they are and what their ‘feasible world’ might be, they communicate one to one and understand the vulnerability of students when they share their ideas with others, and they engage in group crits where the establishing of trust is essential and respectful listening and challenge opens up a space for transformation. Effective art pedagogy is fundamentally about relationships – it opens up the in-between space where communion, or to use another German word, *gemeinschaft* is able to happen.

How does art education respond to the Fundamental British values agenda? – not through reductive displays of the Queen, union jacks, cup cakes and cups of tea but through doing what we do really well – valuing the uniqueness of each individual and encouraging them to imagine a feasible world for themselves. This is not the time to take on reductive pedagogies that miniaturise and stereotype – we need more radicalism, not less in schools. Sukarieh and Tannock point to Freire’s definition of ‘Radicalization’, as a ‘process of liberation’ that is ‘nourished by a critical spirit’ and ‘involves increased commitment to the position one has chosen, and thus ever greater engagement in the effort to transform concrete, objective reality’[15]. We need young people who are brave enough and extreme enough to dream of a better and more equal world – to find feasible solutions to the challenges of today. We need them to be deeply and radically rooted, not swayed by popular opinion or propaganda. We need them to reach out beyond divisions and stereotypes. As educators we need to be the light so that they will not be afraid.

A wonderful example of how universities can use YouTube (2016-09-17 08:00)

There’s a background to this hugely successful engagement project [1] here:

Mike Featherstone’s unpublished MA thesis on Ecology and the Chicago School (2016-09-18 08:00)

Roger Burrows shared this link to Mike Featherstone’s unpublished MA thesis a few weeks ago. It really is an [1] incredible piece of work:

The development of human ecology is closely associated with the rise of empirical sociological research in the United States. Human ecology played an important part in the programme of research into the city of Chicago which was formulated by Robert Park and carried out by his associates and graduate students in the Sociology Department of the University of Chicago in the inter-war years. As the name of the
sub-discipline suggests, human ecology derived a series of theoretical principles about the sustenance and spatial relations of population aggregates from plant and animal ecology, and applied them to the study of human society. An understanding of the central theoretical assumptions of Chicago human ecology can be gained by an exploration of human ecology's relationship to sociology and general ecology, as well as by examining the sub-discipline's contribution to the Chicago Sociologists' theory of the city. Human ecology's development can also be understood as having been influenced by the empirical studies of the city of Chicago which were carried out by Park's students in the 1920s and early 1930s. These studies, which used human ecology as a frame of reference played a very important part in establishing a tradition of empirical sociological research in the United States.

As Roger explained, this piece of work reflected a very different structure of MA teaching to that found in the UK today:

The Pseudo-Catharsis of Social Media (2016-09-19 08:00)

From Rethinking Social Exclusion, by Simon Winlow and Steve Hall, pg 73:

Political protests these days are taken not as an indication that something is going wrong and that a significant number of the population are dissatisfied with the nation's political leadership. Rather, they seem to indicate that a healthy and vibrant democracy is in place, one that welcomes political contestation and vigorous public debate about government policy. 'Look at the wonderful world liberalism has created!', our politicians proclaim. 'Political protests like this would never be tolerated in a non-democratic totalitarian regime!' Of course, when the demonstration is complete, nothing has changed. The political protest ends up continuing only for a short time as an online blog or a Twitter post, offering nothing more than a cathartic opportunity to vent one's spleen accompanied by the sad recognition that in all likelihood no one is listening, and no one really cares. It is also worth considering whether the peaceful protest now offers nothing more than an opportunity for the protestor to relinquish their subjective sense of duty to battle injustice. Once the protest is complete, and the world continues unchanged, the subject is allowed the comfort of having registered her dissatisfaction; whatever happens, it does so 'not in my name'.

It's this line I've put in bold which I've been thinking about a lot recently. How much of what is seen to be 'trolling' online represents a frustrated, even mutolated, impulse towards collective action?
In a way Winlow and Hall are too rosey in their framing here, positioning the pseudo-catharsis of social media as something that follows from the frustrations of contemporary public protest. What about when there is no prior collectivity, however frustrating and frustrated? What does the individualised rage we see seeking satisfaction through social media mean for the possibility of collectivity in the future?

What about the experience of mediated collectivity: how does a symbolic sense of ‘us’, others like oneself seeking outlets for ‘our’ rage, leave what might otherwise possibly become a solidaristic impulse locked into this destructive register?

Virtuous, vulnerable and burdened: how feminism is undermined by making everything ‘a feminist issue’

(2016-09-20 08:00)

By Tina Sikka

Language, discourse, and other symbolic forms have real, tangible, material consequences. This is something I tell my students over and over and over (and over) again. It is also something I hope readers keep in mind while reading through this piece. The oft-stated argument that ‘it’s just semantics – why quibble over words?’ just does not hold water. In addition to being empirically false, it also undermines the seriousness with which journalists, novelists, columnists, critics and others go about trying to facilitate social change through their words.

So, to the issue at hand: over the last year or so a flurry of op-eds, columns, academic papers, books, courses and conferences have been organized around the central theme of x, y or z being a ‘feminist issue.’ In the past few weeks even the Brexit vote, fracking, the Panama Papers and high heels have been described by such outlets as.opendemocracy.net, The Guardian, The New York Times, and Salon as ‘feminist issues.’ My argument, in this piece, is that the assumptions and expectations contained in this kind of discourse risks placing even more responsibility, labor, and general onus on women to drive social change, oftentimes as individual actors, in language that is laudatory and venerating.

The most basic definition of something being a ‘feminist issue,’ is that it is of significant cultural, social, political and/or economic concern to women and their interests. More often than not, the subject(s) at hand are also broadly in line with the pursuit of intersectional gender equity, social justice, empowerment, fairness, and recognition. Oftentimes this language of oppression and disproportionality is interlaced with a recognizable liberal feminist rhetoric of personal empowerment and freedom.

What is most significant about this discourse is its foundational logic. For something to be a ‘feminist issue’ it must be grounded in what development and feminist academic Seema Arora-Jonsson has termed the virtue/victimization binary. This is the key characteristic of the ‘feminist issue’ discourse that I find to be most problematic and the characteristic on which I focus. As well, a final characteristic of most of the pieces that deploy this rhetoric is to
include a generalized call for society, but particularly women, to cognitively acknowledge the inequity, condemn it as discriminatory and unjust, and to take action to combat the situation (e.g. to work for tax reform, take off those high heels, demand environmental justice and gun control, refuse the normative policing of our bodies etc.).

The most obvious problem with this discourse, and the kind of objection one might hear in an introductory gender studies course, is that it tends to essentialize women and treat them as a monolithic category where, as in the past, women in positions of power and their interests (often upper middle class, white women and from Western countries) come to represent the interests of all women. Yet, on the other hand (I add this in pursuit of symmetry), proponents of perspectives that embrace treating women as a distinct social group point out that calls for feminist action have the capacity to propel a sense of solidarity amongst diverse groups of women and can stimulate both agential and group activism. I am going to put this particular debate to one side and simply point out that, in this context, if something is a ‘feminist issue’ it is usually something that all women who subscribe to the label feminist, of which I include myself, should pay attention to and, most importantly, act on. Note that this is qualitatively different in tone and effect from calling something gendered or in need of a gendered analysis. More on this later.

As stated, my biggest problem with the ‘feminist issue-ization’ of so many socio-political and economic problems is that it risks diluting the culpability of entrenched structural problems and overloads women by suggesting that the way to for them to overcome vulnerability and/or victimization is through a narrow form of self-empowered and self-propelled political engagement. Ironically, this ‘lean-in’ form of participation, while appearing to valorize and recognize women’s unique contributions, really just puts more responsibility on women as a social group to push for socio-political change and structural reform on their own. By repeating this discourse in a variety of spheres, i.e. in academia, policy, the media, it causes the virtue/victim binary to appear as intuitive normative truth.

Arora Jonsson spells out how precisely this binary works her article “Virtue and vulnerability: Discourses on women, gender and climate change.” Her basic argument, which I have adapted for this piece, focuses on how this gendered binary works to discursively frame women as either virtuous, and worthy of praise, veneration and increased responsibility, or vulnerable and in need of protection. While Jonsson’s focus is on the environment and climate change, what I want to demonstrate is how this binary has made its way into a whole host of social and political spheres. Think of it as the ‘feminization of activism’ – that is, the multiplication of women’s responsibilities from a place of reverence which simply adds even more ‘shifts’ to women’s already demanding lives.

My variation of Johnson’s thesis, taking climate change as an example, goes like this: Women of the global South constitute an especially vulnerable social group. As such, they more likely to suffer the worst consequences of, for example, climate change. Some of the reasons in support for what has become somewhat of a truism can be found in the reports of organizations like the UN and a plethora of NGOs, as well as the pages (web and paper) of such varied news outlets as Vice News, The Guardian and The New York Times. They consist of what are often empirically dubious (see Johnsson on this) and generalizing assertions like: women are more likely to suffer from food insecurity and access to land (which is exacerbated during climate crises); resources like water, most often collected by women, becomes more difficult to procure; women are less likely to survive natural disasters since women tend to put the safety of others before themselves and often cannot swim; they are more susceptible to violence and abuse during periods of forced dislocated; and, finally, women are likely to face more physical challenges when trying to secure shelter for their families.
Johnsson critiques some of the shakiest assumption associated with these assertions including the lack of rigorous statistics, the lack of context, and basic oversimplification and overgeneralizations. She points out that in some cases of natural disasters that involve significant rates of flooding the mortality rates for men outnumber that of women since, as a group, they are more likely to take risks.

Now here is the kicker: at the same time that women are seen as at risk, Johnsson demonstrates how they are also framed as virtuous, as a direct result of their perceived vulnerability, and are fated, or anointed, to be the source of social change. It is at this point that women in the West are incorporated in the debate. Women as a group, it is argued, tend to be more responsive to perceived risk and thus more amenable to adopting behavioral change on a whole host of issues. For instance, they are oftentimes considered to be more environmentally conscious than men (some empirical evidence does bear this out). It is this specific generalization that I think gives epistemological heft to the ‘feminist issue’ phraseology. The logic goes like this: women, as an assemblage are vulnerable and hold less power. Ergo, they are also, as a group but more often as individuals, more likely to push for social justice and political transformation on the ground. Thus we, as a society, should turn to them to take this on.

To be clear, this is distinct, from calling something a gendered issue or ‘gender mainstreaming’ a subject. Analyzing something through a ‘gendered lens,’ as per the academic lingo – which refers to basically the same thing, implies, first, that the subject, structure, policy and/or institution at hand has effects on women that tend to be underrepresented, underreported, or entirely ignored. Second, it also maintains that the way to address what are often violently felt omissions is through structural socio-political, economic and cultural change instigated not just by women but through a kind of coalition politics that is inclusive and burden-sharing.

There is a much less burdening effect from this rhetorical frame – which is to say it calls for concerted action rather than placing the need for mobilization squarely on the shoulder’s of women. A great example of this from can be found in a piece for CityMetric in which Caroline Criado-Perez draws attention to [2] how city-planning decisions can be gendered. She shows how the lack of efficient snow clearing in Sweden, for example, tends to impact women differently since women are more likely to use non-vehicular modes of transportation (e.g. public transit, walking, biking) than men. Another example appears in Quartz’s coverage of the Zika virus in which it criticizes international (WHO) and governmental calls for women to avoid pregnancy and practice safe sex while ignoring both sexual power dynamics and lack of access to contraception – particularly among poor and racialized women.

This is in direct contrast to media examples that draw on the victim/virtue binary. The first, which I feel I have to start with, is on the subject of age and gender wage gap. A recent article in Bustle (“[3]The Gender Wage Gap Gets Worse At Age 32 For Most Women, Proving Once Again That Ageism Is A Feminist Issue”) ties the widely acknowledged phenomenon of entrenched wage discrimination to ageism noting that as women get older, due to systemic sexism, they are less likely to get promotions, thereby exacerbating wage disparities. After fulfilling the victimization portion of the victim/virtue binary (and yes, these are empirical facts), the piece closes with the following statement: “while we’re waiting for things to catch up, we still can — and should — advocate for ourselves. So basically, don’t stop asking for a promotion. You probably deserve one.” Here, women are seen as virtuous instigators of change on an individual level – just lean in!

Another case, from the UK’s arm of The Huffingtonpost (“[4]The Arm’s Trade is a Feminist Issue”), has to do with how to deal with the complicated nexus of arms, war, and women’s rights. In the piece, feminists are encouraged
to reclaim the discourse of women’s rights from governments who have used it to justify liberal interventionism in wars against Afghanistan and Iraq. They are also urged to mobilize against the export of arms by states, and the UK government in particular, to authoritarian regimes – particularly those whose commitment to women’s rights are lacking. To be clear, yes to all of this – yes to the critique of war in the name of women who do suffer irreparably in a myriad of ways, yes to the need to confront the legacy of irresponsible arms deals, and the yes to the requisite need to challenge war in all its forms. But to put this responsibility on women, as I have argued, perpetuates a wider tendency to use the language of empowerment to place the responsibility on women to rectify a state of affairs not of their doing.

The feminist call to arms against high heels in Salon’s post, “[5]High Heel’s are a Feminist Issue,” is a cheeky appeal to heel burning, an homage to bra burning, in response to a celebrity instigated social media backlash against the footwear. While the article is somewhat tongue and cheek, it also raises salient points – yet in a manner that is not always helpful. Specifically, women are constructed simultaneously as the victims of workplace policies that mandate ridiculous criteria around ‘appropriate’ heel size (2-4 inches), while also being the sole source of change (via stories about successful online petitions, court cases – filed individually) in abolishing these rules. While it is laudable that individual women have taken it upon themselves to organize petitions and engage in litigation, it must be said that more onus needs to be placed on a society wide engagement in eradicating the legal sexualization of women in the workplace and the attendant serious questioning of a culture that has taken this long to see it as a problem.

A final international example which does not draw on the ‘feminist issue’ phraseology directly but which I feel I had to include because of its textbook use of the virtue/vulnerability binary, can be seen in the way international conflict and negotiation is framed. In a recent piece for the Council on Foreign Relations titled “[6]Women Around the World,” a case is made that including women in conflict prevention and peace building initiatives are substantially more likely to succeed over a timeframe of at least 15 years. The most notable example given is with respect to violent extremism. It is argued, in a manner completely consistent virtue/vulnerable binary, that women can play a significant role in countering terrorism and terrorist action: “[7]Research finds that women frequently the first targets of fundamentalism, are often the first to stand up against it” by de-escalating tensions, reporting violence, and working to foster socio-political stability. It is also notable that the article states that this would go a long way towards “reducing overall U.S. spending abroad.” Interests indeed. A similar argument was made a few years back in a Huffingtonpost article whose title; “[8]Can Mother’s Stop Terrorism?” says it all. Spoiler, yes they can.

Let me be SUPER clear, my problem with this framing is not that it is inaccurate; women have the capacity to be active agents in all of these areas – particularly in circumstances where they are marginalized and systemically discriminated against. Nor is it a call for women to remain passive in the face of such discrimination. My issue is with a discourse that builds on a foundational construct of women as either (or both) victim and virtuous agents in manner that adds even more responsibility on individual women to change the very prejudiced practices, laws, behaviors and social norms that gave rise to such unfair conditions in the first place. Reframing the discourse as CityMetric and Quartz have done, is one way this can be challenged, while another, of which I am a fan, is by intentionally redistributing responsibility for social change to agents involved in these structures as a generalized social practice. A weighty burden to be carried by all...since these are much more than just ‘feminist issues.’

Academics as bullshit detectors (2016-09-21 08:00)

I love this idea from the introduction to Mark Blyth’s book [1]Austerity: The History of a Dangerous Idea:

Part of what academics do is generate ideas and teach. The other, perhaps more important part, is to play the role of “the Bullshit Police.” Our job is to look at the ideas and plans interested parties put forward to solve our collective problems and see whether or not they pass the sniff test. Austerity as a route to growth and as the correct response to the aftermath of a financial crisis does not pass the sniff test. The arguments given for why we all must be austere do not pass the sniff test.

If you’re unfamiliar with his work, check out this YouTube video on austerity and consider buying his superb book:

https://www.youtube.com/watch?v=go2bVGi0ReE

Doug Hartmann (2016-09-21 18:59:09)

While it is far from the only role we fulfill, that line and characterization of academics is a fun and fairly accurate one. I did a post on The Society Pages a while back that seems related, calling sociologists the “super egos of society:"

https://thesocietypages.org/editors/2013/10/24/sketch-6-societys-super-egos/
A distinction I find rather tenuous, invoked by Ray Brassier in [1]his attack on the self-importance of the speculative realist blogging community:

What is peculiar to them is the claim that this is the first philosophy movement to have been generated and facilitated by the internet: a presumption rooted in the inability to distinguish philosophy from talk about philosophy. The vices so characteristic of their discourse can be traced back directly to the debilities of the medium. Blogging is essentially a journalistic medium, but philosophy is not journalism. Exchanging opinions about philosophy, or even exchanging philosophical opinions, ought not to be equated with philosophical debate. This is not to say that one cannot produce and disseminate valuable philosophical research online. But the most pernicious aspect of this SR/OOO syndrome is its attempt to pass off opining as argument and to substitute self-aggrandizement for actual philosophical achievement.

Given he accepts one can “produce and disseminate valuable philosophical research online”, it’s hard not to wonder about the criteria for distinguishing between philosophy and talk about philosophy. This seemingly narrow debate is one we can expect to see much more of, in other disciplines and in relation to other topics, as social media becomes increasingly mainstream within academic life.

Steve Fuller (2016-09-22 08:16:09)
You’re right about this. In fact, Brassier seems to have a rather inflated conception of philosophical argumentation – and how and where it occurs. The book which first got Ernest Gellner public notoriety – Words and Things – was an expose on how much of analytic philosophy was simply trumped up transcripts of Oxbridge common room chatter. Yet often this ‘chatter’ is taken to be the gold standard of philosophical argument. To be sure, there is interesting work to be done looking at the media environment in which philosophical arguments are made and developed. And here one would include not only the internet and the common room, but also the pub, the coffeehouse, the bistro, etc.
A wonderful archives of videos produced by the American Sociological Association (2016-09-23 08:00)

The Individualisation of Utopia (2016-09-24 08:00)

From Riots and Political Protest, by Simon Winlow, Steve Hall, Daniel Briggs and James Treadwell, pg 42:

Utopianism did not disappear, but it came to address the libidinal dreams of the individual rather than the political dreams of the collective. Utopia was an individual space in which we were free from the encroachments of authority, free to enjoy as much as possible the short time each individual has on Earth. Life ain’t a rehearsal. It’s a short burst of total self-determination in which we can indulge in pleasurable pursuits and choose only those social obligations that suit us. And the beauty of all this was that one didn’t need to overcome capitalism to get there.

I like this idea a lot, ever since I first encountered it in a fascinating ethnography of weight-lifting which talks about ‘utopic body projects’.

What interests me at the moment is how this utopic horizon can recede without vanishing. Subjects can overload themselves with demands, orientated towards a utopic horizon, but doing so in a way which leaves them
spending large tracts of their lived life triaging, attending to immediate demands as temporal horizons contract. What happens to utopia under these circumstances?

‘Conference Business’ as Usual? Open Letter to European Sociological Association (2016-09-25 08:00)

We’re a bit late posting this, but those concerned with the future of the European Sociological Association should definitely [1]read this open letter and engage with the accompanying website:

As participants of the 12th Conference of the European Sociological Association (ESA), we were disappointed by the discrepancy between the main topic and the actual event. The ESA conference is an important academic meeting that influences European sociology and consequently we feel that it is important to open discussion about its purpose, format, and desirable impacts, issues that seem to have not been questioned in recent debate.

We are well aware that the ESA conference is embedded in the much larger structures of the academic world of which it represents just one small part. Despite this, we believe it is important not to be cynical and accept the view that when things are done in a certain way they cannot be changed. Some scholars are uncomfortable with mass events like the ESA conference, for reasons that we shall outline below. They react by avoiding them, but that will only serve to deepen cleavages within European sociology. We have therefore decided not to remain silent. We hope that the comments and proposals we present in this letter can help make the ESA conferences better and more consistent with the issues they address.

CfP: Social Media and Social Futures – a special issue of @DiscoverSoc (2016-09-25 15:28)

Co-edited by Mark Carrigan and William Housley

Social media is conventionally located within a commercial narrative that theorises an array of emerging ‘disruptive technologies’ that includes big data, additive manufacture and robotics. These and related technologies are underpinned by computational developments that are networked, distributed, digital and data driven. It has been argued that these technologies not only disrupt markets; but also wider social and economic relations and organization. These include social institutions such as the family, work, health care delivery, education, relationships
and the ‘self’. But how do we separate the hype from the reality while nonetheless recognising how powerful this rhetoric is on a purely discursive level? What social futures are potentially shaped by social media and how can we talk about them in a way that emphasises our capacity to shape them collectively?

Social media is one of the first waves of digital disruptive technologies whose mass global take-up via multiple platforms is still being assessed and understood, as a social force in its own right. Standardly, ‘social media as data’ has provided a plethora of studies and projects that have examined the big and broad social data opportunities provided by the social media for understanding populations on the move ‘in real time’. In some cases this has led certain commentators to enthusiastically claim that the analysis of social media as data offers opportunities for prediction and the forecasting of behavior at the population level although this rhetoric is not without it’s skeptics and critics. Is this a plausible vision of the future? Is it a desirable one? Can we see a longstanding impulse towards addressing social problems finally having the necessary techniques and capacities to achieve its potential? Or are we witnessing a potentially authoritarian turn in which social engineering can operate with an unprecedented degree of granularity?

Furthermore, these methodological opportunities and oracular imaginaries are being accompanied by an ‘ontological velocity’ generated by the social and economic implications of social media as data, practice and a globalizing networked communicative force that is shaping being and becoming in the digital age. A key issue here is the relationship between social media, society, time and the ‘future making’ capacities and affordances of these and allied technologies. Yet little work has been carried out on the temporal ramifications of social media (and other disruptive technologies) in relation to emerging digital ‘timescapes’. To this extent the study of the relationship between social media and society remains under-conceptualized especially in relation to our understanding of late modernity at the beginning of the 21st century. The relationship between social media and the social generation of risk, it’s contributions to new digital timescapes and the trajectory of the self and identity alongside empirical concerns is sociological work in waiting. How does social media complicate or perhaps confirm existing theories of social change? Or is such epochal thinking itself a problem, ripe to be deployed by social media corporations apt at marketing their own ‘disruptive’ capacity? For this special issue of Discover Society we welcome short articles (1500 words) that relate to the above and the following topics:

- Social Media, Timescapes and Futures
- Social Media, Prediction and Critical Data Imaginaries
- Visioneering, 'Futures' and Social Media
- Tracing Emerging Technologies in the Digital Agora
- The Future of Social Networks: Social Organization, Data and Engineering
- Computational Politics and the challenges facing Democracy
- Social Media and the Transformation of Everyday Life
- Digital Afterlives? Social Media, Time, Traces and Accountability
- Digital Social Science and Social Futures

Please see the Discover Society website for more details about [1]formatting requirements. Articles should be accessible for a general audience, as well as accompanied by a suitable royalty-free image for publication and suggested tweets for @DiscoverSoc. Timeline for contributions: September 30th: Confirmed intention to submit with title & brief description November 20th: Delivery of final article, with image and tweets December 20th: Return of any requested edits and revisions January 4th: Publication of the special issue Contact details: Mark Carrigan (mark@markcarrigan.net) and William Housley (housleyw@cardiff.ac.uk)
On a recent [1]Any Answers, there was a call so fascinatingly stupid that I’ve been intermittently thinking back to it for the last few days. In a discussion about the possible reintroduction of grammar schools, a couple who had been to grammar schools but were ‘forced’ to send their children to a comprehensive, explained how there was "no comparison" because the grammar school will be filled with pupils who are “bright and motivated” and come from “homes with very supportive parents who want them to be there”. In comprehensives there are “far more disruptions” and the “very brightest pupils have to lower their standards”. She went on to explain that her daughters both succeeded immensely at A Levels and university “simply because we could afford to give them private tuition” which wouldn’t have happened if they’d been sent to a grammar school. This understanding of the trajectory of her daughters reflected a broader social outlook:

I truly believe that we will never all be equal. Some of us are born beautiful, some of us intelligent, some us not quite as wealthy as others and some from supportive homes. We’re all genetically geared to have different hopes and aspirations. Not everyone wants to go to university. I really think that if a child wants to go and work in a shop, or wants to do marketing, we should teach them a decent work ethic and not tell that they’re second class because they didn’t get into a grammar school.

The presenter raises the possibility that grammar schools intensify inequality because it’s the already privileged who are most likely to gain access to them. But the caller says that the solution is to build more grammar schools so that “the children who are not quite at the top of the tree” get an opportunity.

A later caller offers a spirited defence of grammar schools, explaining how her own experience of grammar schools improved her life: she was able to get any job at work she wanted with just an interview because they could tell she was able & when her husband died, she was able to cope with everything she faced when taking over his business. She then explains how “the legacy went on to my children”, “one went to university and the other could do anything he wanted if he set his mind to it”, and her grandchildren are now “well placed to take advantage of this legacy”. Her experience sounds like an interesting example of Margaret Archer’s (contentious) point that social structures don’t constrain until you formulate a project that runs up against them. There are presumably many jobs this caller wouldn’t have got without an interview, or even with one, but these constraints aren’t experienced and they fade from view for her.

What fascinates me about this is how ‘intelligence’ serves as an umbrella under which a vast array of social, cultural and personal factors are subsumed: aptitude for academic work, supportive parents, stable homes, engagement with institutions, good behaviour at school. The complexity of the social world gets built into the designator ‘intelligent’ in a way that renders it opaque: the concept of ‘intelligence’ stitches together an otherwise untenable individualism. Yet both callers recognise the possibility of inherited privilege and yet this doesn’t undermine their determinedly reductive view of intelligence.

Interestingly, I have come across the same sort of conversations in a few recent Radio 4 discussions of grammar schools in which I noticed a focus on the concept of intelligence in a similarly reductive and woolly manner. Also interestingly, these discussions tacitly linked “intelligence” with “progress”. I think that Radio 4 should take to task these assumptions. Furthermore, when people discuss education and they start talking about vocational pathways and academic routes, despite their best intentions, they end up reinforcing prevalent, reductive ideas about education. Such conversations end up framing education as something that equips people with the bare minimum of knowledge with which to get employed, whether as a “professional” (aren’t we all professionals?) or otherwise. It’s quite depressing.

**Ethnography as being-in-the-world rather than method (2016-09-27 08:00)**

A fascinating discussion by Matthew Desmond in the conclusion of his wonderful book [1]Evicted:

There’s this idea that ethnography is a “method.” When we see it this way, we tend to ask methodological questions about it. How do I get my project approved by the IRB? When should I write field notes? I tend to think of ethnography as a sensibility, a “way of seeing” as the anthropologist Harry Wolcott once put it. This means that ethnography isn’t something we go and do. It’s a fundamental way of being in the world. If we think of ethnography this way, then we begin to ask different questions. How can I get strangers to talk with me? How can I become more observant? If we approach ethnography as a sensibility, then we can begin cultivating a set of skills or disciplines long before we actually enter the field. It is possible to transform yourself into an ethnographer—day in, day out—so that when the time comes for you to set foot in the field, you already are one. (It also helps to get rid of your smartphone.)

As he goes on to write later in the conclusion:

To me, ethnography is what you do when you try to understand people by allowing their lives to mold your own as fully and genuinely as possible. You do this by building rapport with the people you want to know better and following them over a long stretch of time, observing and experiencing what they do, working and playing alongside them, and recording as much action and interaction as you can until you begin to move like they move, talk like they talk, think like they think, and feel something like they feel. In this line of work, living “in the field” helps quite a lot. It’s the only way to have an immersive experience; and practically speaking, you never know when important things are going to happen. Renting a trailer allowed me to meet dozens of people, pick up on rumors, absorb tenants’ concerns and perspectives, and observe everyday life all hours of the day.

Ethnography and science fiction I – notes (2016-10-02 16:11:11)

[...] Desmond, the author of Evicted, talks in his conclusion about ethnography as 'a sensibility, a “way of seeing” ... a fundamental way of [...]

Engines of Knowledge in the First Information Age: Geography and the Map (2016-09-28 08:00)

by Hamish Robertson

Introduction

The map and hence geographic thinking and cartographic skill are as old as human civilisation. It has been suggested that [1] spatial cognition may even preceed the emergence of both numeracy and literacy. Navigating the world in which we live has been underway at least since humans began their journeys out of Africa. The earliest known maps range from those produced in Babylon to those of China's Qin Dynasty, in a conceptual, artistic and practical device that is almost universal. Map making and navigational skills took the ancient [2] Polynesians from the coasts of what is now Taiwan southwards and eastwards to the eastern edges of the Pacific Ocean and as far [3] south as anyone had been until European explorers arrived. We can even understand spatial thinking (including cartography and astronomy) as a human evolutionary advantage, suggested by Keith Clarke, foundational to our current place in the world.

Geographic perception, theorising, information accumulation and practical application have clearly developed over the millennia, with a primary instrument of such understanding being the map. Maps have their own history, a huge topic, which I will only briefly mention here but for which a variety of detailed [4] free resources exist. The focus here is on the centrality of geographic knowledge to our understanding and interpretation of the world, and the influence our spatial epistemologies, ontologies, methods and instruments have on that understanding. Maps and mapping imply not only an abstract conceptualisation of the 'world' which we cannot understand by other means but also a basis for the measurement and quantification of that world.

Latitude, Longitude and Projections

To know where we are on the planet requires a level of abstraction supported by mathematics and geometry in particular. While we have known for centuries that the world is not flat, it is also not entirely round either being a [5] lumpy mass with water filling in the remaining space (to put it very briefly). Crossing its seas and oceans has always been highly risky so much so that forms of maritime insurance were developed as early as the classical Greek and Roman periods, with fully developed schemes developed in the Renaissance Italian sea-faring states of Genoa and Venice. Travel, transport and the concept of risk have probably been linked since the very earliest times.

Latitude and longitude were theorised long before they could be accurately measured but this also indicates that the idea of a spatial logic emerged very early too. The conceptual and representational limitations of the two-dimensional map become especially apparent in the issue of projection. The earth is 3-dimensional in reality and flattening this onto a piece of paper distorts that shape and its proportions enormously. Historically the Mercator projection has dominated mapping while the more recent Peters projection is technically more accurate if far less familiar. There is
a now famous segment on the television series [6]West Wing that connects these issues of physical representation to our politics and cultural assumptions in a very concise manner. Consequently, we can the map and geographic understanding as possessing both scientific, as we now understand it, and profoundly cultural underpinnings. To know space is to possess a certain kind of power than can be converted in political and social authority.

Cartography and Modernity

If the imperial state dominated the 18th century, the 19th century was characterised by the emergence of nation states in a variety of forms and through a variety of means. More particularly, the demand for, and suppression of, cultural and linguistic self-determination became a refrain across the whole of that century and on into the next. One of the ways of understanding the scope of the nation state was to map it, a process that had emerged from the earlier sovereign's desire to know the extent of their dominion and the people or people's contained within. The discipline of geography developed rapidly in response to this demand for knowledge of the nation, the land and its peoples. Cartography became the applied science that supported both imperial imaginings and nationalist fantasies alike. To draw the map was, at least in miniature, to be able to conceptualise and contain the nation.

The European nation, it has been argued, was often engineered into existence, a process that we see repeated down to the present day. Large scale engineering projects, especially roads and canals, not only connected the centre to the periphery but gradually acted to formalise and aggregate older, looser systems of identification, containment, administration and governance. [7]Mukerji has described how the emergent French state was shaped by early canal-building efforts including the Canal du Midi, while [8]Alder showed how the French Revolution saw a huge effort at standardisation and uniformity in manufacturing, administration, measurement systems and elsewhere. Carroll's work on the [9]colonisation of Ireland has shown a variety of discourses emerged in these environments which proved both highly flexible, and portable, under both nationalistic and imperial frameworks.

In the United Kingdom roads were driven into the previously rebellious Highlands and the growing discourse of [10]improvements justified not only colonial Ireland but much of the British Empire. Mythologies of progress rapidly took shape which persist down to the present day in justifying almost anything that suits dominant interests - with ethnic [11]primitives set against rational modernists. The architecture of the modern state increasingly relied on knowing about the extent of its territories, its physical characteristics and its inhabitants. No surprise then that the first comprehensive statistical survey in the United Kingdom were Sinclair's Statistical Accounts of Scotland first published in the 1790's and modelled on the German concept of statistics as state-istics, that is the counting and calculation of the population as the foundational basis of the modern state.

Quantifying the Physical World

The Victorian era saw a huge expansion in the type and quantity of geographical knowledge being produced. Navigation was increasingly accurate but travel itself was still highly risky and mapping systems emerged to capture and measure data about navigational processes, tides and weather patterns (rainfall, air pressure etc.) in support of
safer maritime navigation. A result of this was a growing quantification of the physical world including not only the production of thousands of maps and the measurements it took to produce them, but also maps at different orders of magnitude or scale.

The use of latitude and longitude coordinates are themselves navigational devices using quantification – the traditional degrees, minutes and seconds approach. Also the accumulation of log books by navigators for military and civilian purposes meant that processes of data accumulation were engaged in with naval log books usually submitted to authorities on a ship's return. Much of this was secret information in the early days of European exploration and colonisation because good data was so scarce but gradually it became part of an increasingly shared knowledge system. Filling in the remaining gaps became, for the most part, more important than holding on to strategic data when such information had been incredibly limited in supply.

In India the British began the Great Trigonometric Survey in 1802, finally completing it in 1871. Exceptions to this growing openness remained including during the Great Game of the 19th century during which British agents, the pundits, secretly helped map Tibet which was largely closed to outsiders. The most famous of these was Nain Singh Rawat who not only learned the Tibetan language and customs to facilitate his mission but was eventually honoured by the Royal Geographical Society. The Society, founded in 1830, was not simply a gathering of armchair geographers but an active promotor of (1) specific expeditions to new locations about which little was known and (2) technical developments that supported the production of improved geographic knowledge. In effect, geography was a discipline heavily engaged in what we know consider geopolitics. Even today the politics and mapping of borders and boundaries are alive and well, and deeply integral to many of the major conflicts of our time.

**Geographical Knowledge and Modernity**

In both empires and emerging nation states, concerns with travel and infrastructural development also meant that transport systems started to develop rapidly for civil and military purposes, often serving both purposes in periods of insurrection. Knowing how far away one town (and also what defined a village, town, city etc.) was located from another grew more important as clock time became the norm and economic systems expanded internally and externally. We can see how speed became both a necessary concept and a driving factor in the 'conquest' of distance which persists even today when we hear business pundits talk about the 'elimination' of distance by technology. From roads to canals and on to steam ships, railways, bicycles, motorcycles, cars and so on – the search for and measurement of accuracy and exactitude became integral in the development of Victorian and now modern logistics and infrastructure. There were supported by additional technologies such as telegraph, facsimile and telephone – all emerging information technologies designed to speed up communication processes. All of these technologies involved a rising tide of calculation and quantification.

Postal systems, for example, relied on the safe, consistent and confidential delivery of the mail and on locational accuracy for its delivery. Mapping towns and cities with the location of public and private buildings became even more important. From traditional medieval towns and cities we see a logic of urbanism emerging in the 19th century with planned cities and suburbs in association with theories of health, safety and a rational basis for modernity. Form became closely wedded to function and knowing where buildings, sewers, roads, footpaths and
public spaces became important mappable information. This conception of the city as space can still be seen to conflict with more social, organic conceptions of the city as place in yet another geographical discourse.

Where and when became intimately connected and this was achieved through measurement and quantification. As quantification fed this emerging knowledge system new variables could be added by definitional agreements and then processes of data collection. Agreement amongst parties could support such processes and did, eventually, in cases such as the Greenwich meridian mentioned above. But other systems such as tidal or weather data became increasingly useful in expanding the ‘systemic’ knowledge base as geographic and related information sciences developed.

**From Analogue to Digital**

The struggle to translate growing volumes of analogue data to a digital format began quite early in the piece including the Jacquard loom, the Babbage machine and a variety of pioneering and precursor efforts in what we now call information science. The logic was clear in that growing data types, data measures and data quantities required new methods for their collection, management, analysis and storage. The earliest computers were individuals trained to calculate and tabulate census results and similar large-system data. As this system expanded with typewriters and calculating machines, that labour process was gradually deskilled and [feminised](http://www.npr.org/2014/01/09/260918293/there-she-blew-volcanic-evidence-of-the-worlds-first-map) in a pattern familiar for decades to come (the male secretary became a female one, the person was replaced by a machine and so on). Despite the recognition of the scope of the problem, its full resolution proved difficult and took a long developmental curve through the likes of mechanical calculators, tide-measuring machines and IBM’s tabulation technology. Electrification and World War Two finally connected the previous steps towards what we understand today as the fully digital data environment. Today the map is increasingly digital, including geographic information systems, and the concept of ‘data visualisation’ more generally is spatial in nature.

**Conclusion**

Spatial conceptualisations are central to the human experience. They are so deeply internalised that we frequently take space and our relations with it completely for granted. We can see this in the way that spatial technologies become incorporated into everyday life without many people even considering how these technologies emerged or their complex and contested histories. Where we now have digital maps integrated into an expanding range of technologies, the possibility of these features of modernity emerged in a previous period, one in which the paper map reigned. The map was not only an epistemic device for reducing and understanding the complexity of the world but produced its own distinct ontologies. The political and modernist ideologies that maps increasingly served relied on data production, collection, analysis and storage. Knowing the world gradually segued from an experiential phenomenon to an abstract, quantified and scientific one (map scales for example). Not only the map itself but the geographic knowledge production processes it supported emerged as an engine of knowledge in their own right.

[13]Hamish Robertson is a geographer at the University of New South Wales with experience in healthcare including a decade in ageing research. He has worked in the private, public and not-for-profit sectors and he has presented and published on a variety of topics ranging from ageing, diversity, health informatics, Aboriginal health, patient safety and spatial science to cultural heritage research. Hamish is currently completing his PhD on the geography of Alzheimer’s disease and recently finished editing a book on museums and older people.

Sufis, Salafis and Islamists: The Contested Ground of British Islamic Activism by Sadek Hamid (2016)

reviewed by Tamim Sadikali
What attracts young Muslims to this type of ephemeral but ferocious activism? One does not have to subscribe to determinist social theories to realise the importance of the almost universal condition of insecurity, which Muslim societies are now experiencing. The Islamic world is passing through a most devastating period of transition. A history of economic and scientific change, which in Europe took five hundred years, is, in the Muslim world, being squeezed into a couple of generations [. . .] Such a transition period, with its centrifugal forces, which allow nothing to remain constant, makes human beings very insecure. They look around for something to hold onto, that will give them an identity. In our case, that something is usually Islam. And because they are being propelled into it with this psychic sense of insecurity, rather than by more normal processes of conversion and faith, they lack some of the natural religious virtues, which are acquired by contact with continuous tradition, and can never be learnt from a book.

Question to the floor – what is a Wahabi? What’s a Salafi? Can an Islamic activist ever be in sync with ‘British values’, or is the idea mere sophistry - camouflage for a wannabe Jihadi? For many, there is no need to unpick warp and weft of the Muslamic landscape – it’s a uniform and featureless desert. And therein lies the rub, because as Sadek Hamid shows us in Sufis, Salafis and Islamists, the major trends in British Islam since the 1990s have all been reactions to the inclement environ in which Muslim youth have found themselves. Alienated from their parents’ culture and unable to find sure footing within a secular milieu, a cornucopia of organic, grassroots movements took form, all self-styled
with cultivating a counter-culture for British Muslim youth. And the body of Hamid’s work is given to analysing four such Islamic trends in Britain: The Young Muslims UK, Hizb ut-Tahrir, Salafism and neo-Sufiism.

Despite personal history as an ex-activist, Hamid’s scholarly approach holds a close but dispassionate lens up to each movement’s trajectory: from their inception and sources of inspiration, drivers, growth, internal and external conflicts, and ultimate transition or demise. For anyone genuinely interested in this field, the insider view which Hamid offers – a result of personal knowledge, painstaking research and scores of interviews with key past and present players - is without doubt a fascinating and robust account. But crucially, the cool, almost detached nature of Hamid’s analysis draws the heat out of the subject matter, allowing the reader to engage with greater objectively. And this last aspect carries a surprising payload – for the detachment afforded via Hamid's academic lens makes these contestations between Islamic trends seem less other-worldly and more mundane; indeed, remarkably similar to the familiar battleground of secular, democratic politics. It strips the esoteric of its mystery, making it seem rather everyday – wherein what are essentially different parties refer to common political totems, and vie for the attention of an increasingly whimsical constituency.

When it comes to British Islamic politics, like in British politics more generally, the tail is most definitely wagging the dog, as Hamid shows us via the changing mission statements of the Young Muslims UK from 1993 to the present day:

The Young Muslims UK, (like its parent movement, The Islamic Society of Britain) is a limb of the global Islamic Movement, sharing its understanding with all the major world-wide movements. Our situation here in Britain reflects the domination of ignorance and the absence of Islam [. . .] Unfortunately for the people of this country, batil (falsehood) reigns. And one of its manifestations is the prevalence of shirk (associating partners with Allah) – the greatest injustice of all. It is our responsibility that Islam should be introduced to the people of this country not as ‘the religion of the Saracens’ nor as ‘the next threat to the West’ but rather as the cure to its many diseases.

YM UK was set up in 1984 to provide a vehicle for committed young British Muslims to combine their knowledge, skills and efforts for the benefit of one another and British society as a whole. We bring together the youth, men and women from all social and ethnic backgrounds, and different schools of thought, for the benefit of all. As such, our membership largely reflects the diversity of the British Muslim landscape. We welcome all Muslims and non-Muslims, helping them understand Islam and live by its teachings and principles. We strongly believe that working for Islam is not just about campaigning for Muslim rights, but also about sharing Islam’s view on God, life and society. We do so as an organised and dedicated group, engaging in sincere and constructive dialogue.

As Hamid correctly explains, understanding the history of British Muslim activism is a vital precursor to engaging with their present and future. And in Sufis, Salafis and Islamists, that recent past is succinctly unpacked, before projections into possible futures are considered. And for such highly-charged subject matter, it’s the perfect sober,
Against the notion of ‘craft’: thoughts on the cultural politics of romanticising exploitation (2016-09-30 08:00)

On pg 106 of their *Rethinking Social Exclusion: The End of the Social?* Simon Winlow and Steve Hall describe the changing realities of work, as more and more jobs become "non-unionised, low paid, short-term, insecure and part time":

> We should also note that few of these jobs enable workers to construct and maintain an image of themselves as socially valuable (Winlow and Hall, 2006, 2009a; Southwood, 2011; Lloyd, 2012); in fact, many of these McJobs (Ritzer, 1997) communicate the exact opposite: the low-level, low-paid service worker is seen as disreputable, exploitable and untrustworthy, the homo sacer of the post-political order, waiting tables, flipping burgers and sweeping rubbish. These are fundamentally insecure and alienating jobs. The people who have these jobs do not want to retain them beyond the obvious and pressing need to earn enough money to pay for their immediate living expenses (Winlow and Hall, 2009a). Most of the positive symbolism associated with traditional work has already been stripped away. They do not cling to and seek to defend an image of themselves as fast food workers, call centre operatives, cleaners, supermarket shelf stackers or factory box-packers.

This is the context in which I’m interested in contemporary discourses of ‘craft’. As anyone who’s followed my work will probably have noticed, I’m drawn to these ideas because they seem to promise a bulwark against alienation. For instance in higher education, I’ve long seen the idea of ‘craft’ as a way of experientially reclaiming the pleasures of scholarship in an institutional context which increasingly hinders, if not outright obliterates, such internal goods.

But are these residual pleasures mere consolation prizes against a background of exploitative precarity and communal diminishment? Increasingly, I wonder if they are but the theoretical challenge as I see it lies in recognising the reality of these internal goods while nonetheless being critical of their cultural deployment in the creation of a new ethos of work.

Can we see the notion of ‘craft’ as something that is developing alongside, indeed implicated in, the stripping away of traditional bases of working identity? On the one hand, for example the elaboration of the role of barista into that of cultural producer able to meaningfully express oneself through latte art (etc), goes hand-in-hand with the normalisation of part-time labour and zero hours contracts in the hospitality sector. On the other hand, craft micro-production and the opportunities for micro-enterprise are being embraced alongside the decline of secure employment, the growth of underemployment and the still expanding phenomenon of forced freelancing.
To explain away the real pleasures people take in these ‘crafts’ is problematic. But we need to avoid a dichotomy in which we take their accounts of craft pleasure at face value or we reject them in the name of being ‘critical’. What interests me is how the discourse of ‘craft’ increasingly organises the pleasures and dissatisfactions of contemporary labour, giving cultural form to “I am” statements about one’s working life in a context where structural trends had made such statements less tenable in precisely the way Winlow and Hall suggest.

The notion of ‘craft’ also finds itself employed as part of a macro-economic narrative in which the harms of structural unemployment, particularly that led by technology into the previously secure professions which are themselves subject to longer-term trends toward depersonalisation, can be offset by the imperative towards craft production. There’s a kernel of truth here but only a kernel. The idea that mass unemployment can be offset by the expanding ranks of Etsy craft sellers is obviously absurd. But it’s another vector through which ‘craft’ can be used to effectively romanticise exploitation and abjection.

So on level, I increasingly find myself opposed to the notion of ‘craft’, despite this being an idea which I’ve gone on about for years to anyone who’ll listen to me. On another level, I’m still drawn to it as a way to organise my own experience, something which I think is ripe for informal autoethnography. There’s also a critical potential in the notion of ‘craft’ which I think shouldn’t be lost and that’s why we need to avoid dispensing with it entirely. What I mean here is captured incredibly forcefully by Akala after his freestyle in this video: ‘the craft’ is something which transcends marketing and commerce, something basically irreducible in any arena of human activity and a site upon which excellence can be achieved:

IFRAME: [1]https://www.youtube.com/embed/J8umCijRdnQ?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&start=642&wmode=transparent

This is an expression I heard on a radio call in show i.e. “I am an X”. I wish I could remember which one because I’d love to cite this properly.

1. https://www.youtube.com/embed/J8umCijRdnQ?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&start=642&wmode=transparent
To me, craft means having an intuitive sense, developed through experience, of how to do something well, and taking pride in it. I think that’s entirely compatible with engaging in struggles for job security, good wages, professsionalisation, and control of the means of production. Indeed it could help motivate such engagement, because it offers a conception of work that’s intrinsically worth doing and therefore worth fighting for, work that’s satisfying partly because it involves a degree of autonomy, and therefore requires control over the means of production.

A Mini-conference on Elites

Studying Up in the 21st Century: Issues & Methods

2017 ESS Annual Meeting, Philadelphia, PA, February 23-26

We live in a world of increasing inequality, in which political, economic, and social elites in the richer parts of the world command more wealth and power that at any other time in the post-World War II era. As elites come to dominate society in new ways, with new means of control, it is imperative that social scientists reconsider old methodologies and categories of distinction. In this mini-conference, we seek a variety of papers that challenge us to rethink how we study elites. The mini-conference will feature three panels (12 papers total), including, but not limited to, the following sets of questions and themes:

Class:

· How do classes reproduce themselves in an age of rapid technological transformation?

· Have recent changes at the global level improved the well-being of those in poorer countries?

· Who are the elites outside the rich world?

· What role do education and notions of meritocracy play in the making of new elites?

· What causes inequality today and how can it be addressed?

· What are the political orientations of new elites?

Race:

· How are racial differences conceptualized, in light of the disparity between white and non-white or light-skinned and dark-skinned individuals among political, economic, and social elites?

· How do elites mobilize racial categories, as a way to sustain existing boundaries?

· Does race carry different relevance or meaning for elites in developing and developed worlds?

· How do legacies of colonialism inform an understanding of race in affected countries or regions?

Gender:
· How do elites "do" gender, as compared to others in working or middle class milieus?

· What are the many layers of gender privilege that appear among elites?

· How is gender mobilized to secure resources and minimize competition?

· What are the different and competing feminisms on display among elites?

· How do women acquire and use power to distinguish themselves?

· What solidarity do elites perceive between themselves and others of shared genders of non-elites?

Research methods:

· How do researchers overcome challenges of access, and what challenges remain if they gain it?

· How do researchers navigate the material and cultural differences between them and informants?

· How do researchers work within competing social networks that invariably form among elites?

· How does proficiency in different languages impede understanding, and even access?

· How do researchers overcome challenges like insider tales and jokes?

We welcome papers that address these themes, specifically, in addition to papers that take up other important topics that challenge us to think deeply about elites in the modern era. Please direct all inquiries to either Hugo Ceron Anaya (hrc209@lehigh.edu) or Patrick Inglis (inglispa@grinnell.edu). Authors must submit their proposals through the ESS online abstract submission system. The deadline is October 15, 2016. In the "Submission Details" window, select “Paper” for “Type of Submission,” and select "miniconference: elites" for "Select the topic area that best describes your submission." Be sure to include a paper title along with your abstract of 250 words or less, your name as it should appear in the ESS program, institutional affiliation, and contact information.

The strange new death of neoliberalism? (2016-10-04 10:00)

Is neoliberalism dying?

Neoliberalism has been a much debated topic in sociology and other disciplines in recent years. It has been applied to a wide array of topics with claims of neo-liberalisation of [1]education, [2]healthcare and [3]young academics.

There is a growing sense, however, that neo-liberalism may be coming to an end. If not yet in practice then at least perhaps in its forebear, political rhetoric. Both of the UK’s major political parties seem to advocating a stronger state. [4]Theresa May presenting a vision of stronger state security and investment and [5]Labour’s shadow
chancellor John McDonnell offering a new "entrepreneurial state" built on intervention and investment with an end to that footsoldier of neo-liberalism, austerity.

The vote to leave the European Union and (at least the perception of) a desire by some sectors of the British public for stronger border controls, less market integration and greater isolation seems to legitimize this new stronger state.

Of course we should be cautious of any grand claims to the death of an economic philosophy which has [6]proved highly resilient in the past.

[7]Jason Cowley writing in the *New Statesman*, in conversation with Martin Jacques, suggests this return of the state is due to the inequalities wrought by globalisation. Donald Trump and Nigel Farage have both played on the insecurity and sense of being "left behind" felt by many people in areas of USA and UK which have seen declines in living standards since their industrial heydays.

Increased fear of terrorist activity in the last two decades has also contributed to an increased appetite for, or acceptance of, stronger state security (or state surveillance and repression).

Neoliberalism was never simply an economic project but was (at least for a time) [8]associated with a more general liberal freedom. However, outside of western Europe, USA, Australia and a few other places this failed pretty quickly. [9]Russia returned to autocratic style leaders, repression of marginalised groups, propaganda and warmongering. Although China embraced a marketisation of some kind it has always been a sort of [10]state capitalism with the retention of strong state controls over economic planning, media, etc.

I wonder how sociologists will react to this. Neoliberalism has become one of the "go to" concepts which sociologists pull out of their bag of tricks to explain all kinds of "bad stuff" in society. [11]Some scholars have dismissed neoliberalism as a useful category partly because it has been applied to so many things that it starts to become meaningless. I do think it retains some analytical power when used in certain ways, at least.

The way I understand neoliberalism is strongly influenced by Michel Foucault and is, I think, fairly straightforward with two main aspects:

- The spread of market principles to previously non-marketised areas - what Foucault referred to as "the application of the economic grid to a field [...] defined in opposition to the economy, or at any rate, as complementary to the economy" (Foucault, 2008: 240)

- Government which is always cautious of governing too much - or what Foucault referred to as "state phobia"(Foucault, 2008: 75-6).

For me these two aspects are intertwined and of equal significance. Neoliberalism is not simply the reduction of state activity and the privatisation of everything. As Foucault made clear, neo-liberalism requires the state in order to enable the spread of market principles and to define the rules of the game.

For instance, it is accurate to discuss a neoliberalisation of UK universities even if most of them are non-profit making charities. They can be considered as becoming more neo-liberal because they are increasingly managed according to market principles.

Within universities the departments are often run as individual services who act as "service users" or "service providers" for one another. Academics are under pressure to compete against one another for research funding and
have the importance of self-promotion thrust upon them. Teaching staff are subject to student feedback which most resembles customer satisfaction surveys rather than meaningful academic engagement with their work.

Universities also compete with one another for higher places in league tables which has become even more important since the government lifted the cap on the amount of students each course could take (when the burden of fees shifted entirely from the state onto the individual). Soon this competition will be intensified when the new Teaching Excellence Framework (TEF) is introduced with a state sanctioned system of measurement and the awarding of Bronze, Silver and Gold medals to universities to indicate their "quality". A similar system of research assessment, the REF, is well-established with departments being required to demonstrate the quantity and quality of their "research outputs" in order to compete for a central pot of money provided by Higher Education Funding Council for England (HEFCE).

Much of the money sloshing around the university system is public, either direct funding from central government (HEFCE), via government funded research bodies (eg. ESRC, AHRC), or indirectly through student fees (which are mostly paid for through government loans), so it would be wholly inaccurate to describe this as a privatised system, however, it has been substantially marketised. But this market system has been imposed by government "reform" and is managed and administered by state bodies. Markets are considered, by the government, to be ideologically preferable but they are aware that markets will not develop spontaneously; they must be created.

What some people take issue with, I think, is the use of neoliberal to refer to individual and identity-level phenomena. For instance, some people might consider the kind of self-promotion common to social media to be a kind of neoliberal identity. Perhaps the notion of the 'entrepreneurial self', as extensively outlined and analysed by Ulrich Bröckling, is more useful in this context.

So does this seeming resurgence of the state signal a decline for neoliberalism? I don't think market principles will be disappearing from universities, criminal justice or healthcare and many other areas of public life any time soon. Marketisation is too much of an effective disciplinary tool for it to be given up easily. Nor can I imagine a conservative government (or centre-right Labour government should one re-emerge) giving up its cosy relationship with big business, especially with the notorious "revolving door" between Westminster and the boardroom.

However, it is possible that governments might abandon their hand wringing over "governing too much". They might be less coy about imposing markets, especially given there seems to be a new desire for strong, authoritarian leaders and states. If this is how things spin then would that mean an end to neoliberalism? Perhaps this would be something more along the lines of a "state marketisation"?

How will sociologists respond to this?

COLIN GORDON (2016-10-13 09:49:56)
I think people are rediscovering the wheel - neoliberalism involves a strong state, that is not news. As for Theresa May's Milibandian speeches, I would not get excited just yet. She is the strong state, for sure, but Home Office and hedge funds, not Mazzucato.

J. Britt Holbrook (2017-05-18 15:17:44)
Good stuff. I agree with Cowley (or at least your gloss of Cowley). The one place I do think neoliberalism is still going strong is the EU. In some sense, the EU just IS neoliberalism. With the recent election in France, that's still the case. However, unless Macron is successful, I think France will turn away from the EU, effectively bringing it to an end.

A Trump Presidency and the Militarisation of America (2016-10-05 08:00)

There are many reasons not to take Trump seriously. But given the real possibility he might win the election, we need to think through the stated consequence of his policies, particularly given the evident inability of the Republican establishment to restrain him before he holds political office, let alone when he has it.

To take one example: a former head of Immigration and Customs Enforcement cautions that Trump's stated plan to deport all illegal immigrants is foolish but not impossible. What would it look like in practice?

Julie Myers Wood, who headed Immigration and Customs Enforcement during the Bush Administration, told me that she is appalled by parts of Trump's immigration plan and cautioned critics not to assume that it is impossible. "It's not as binary as some people suggest," she said. "You could think of some very outside-the-box options." A President Trump could permit ICE officers to get access to I.R.S. files that contain home addresses. (Undocumented immigrants who pay taxes often list real addresses, in order to receive tax-refund checks.) He could invoke provision 287(g) of the Immigration and Nationality Act, in order to detail thousands of local and state agents and police officers to the deportation effort. "You'd put people on a train," she said. "Again, I'm not recommending this. You could have a cruise ship."
The American Action Forum, a conservative Washington think tank, ran budget projections of Trump’s plan: raids on farms, restaurants, factories, and construction sites would require more than ninety thousand “apprehension personnel”—six times the number of special agents in the F.B.I. Beds for captured men, women, and children would reach 348,831, nearly triple the detention space required for the internment of Japanese-Americans during the Second World War. Thousands of chartered buses (fifty-four seats on average) and planes (which can accommodate a hundred and thirty-five) would carry deportees to the border or to their home countries. The report estimated the total cost at six hundred billion dollars, which it judged financially imprudent.

What would this do to America? A logistical exercise of this scale and cost could perhaps be seen as a dark and fascistic stimulus plan, bringing together vast numbers of Americans into an (evil though nonetheless) collective project. The discord this would sow at all levels of American society would lead to further polarisation, inviting ‘tough measures’ to crack down on opposition to this ‘necessary policy’ of the Trump administration and ‘protect our brave law enforcement’ officers.

Even if Trump’s alleged fascism is opportunistic rather than ideological, I find it very easy to see how this policy alone – let alone the other stuff – could lead to an unprecedented militarisation of America and a very rapid descent into actually existing fascism.

If we consider the second-order and third-order effects, high profile injustices and protests against them and reactions to those protests, it’s worth asking how the structures of repression (digital or otherwise) built up in America over recent years might be leveraged against those seen as hostile to the executive? Furthermore, if American troops and law enforcement are widely perceived by the right to be under threat, could this unite currently anti-Trump figures in the security establishment against him?

Some thoughts on fast and slow science in the accelerated academy (2016-10-06 08:00)

I’ve been thinking a lot recently about how the social sciences are proving too slow in catching up to developments in digital technology. This means that engagements with new possibilities are often piecemeal and ad hoc, pushing the threshold of innovation in methods while methodological and theoretical discussion lags further behind. We see changes at the level of platforms, infrastructures, devices and practices which allow new techniques to be developed but discussion of the implications of these techniques, how we should understand what they’re doing and how they fit with older and more established techniques struggles to catch up.

I’ve argued that the reasons for this are largely to do with the structure of scholarly communication. The proliferation of publications, with an [1]estimated 28,100 journals publishing 2.5 million articles a year, encourages
specialisation in both writing and reading. I’ve watched this happen first hand with the asexuality literature, something which has grown from literally a handful of articles seven or eight years ago to a topic which would have to now be my primary focus to ‘keep up with the literature’. This is a microcosm of a much broader trend which I think it’s important for us to understand.

This is compounded by a norm for much longer articles in many social science disciplines vis-a-vis scientific reports. The imperative to ‘keep up with the literature’ militates against exploration and experimentation, while established forms of social scientific writing make it difficult to get important technical details included in substantive articles in mainstream disciplinary journals. Furthermore, publication is slow and this compounds the inter-journal competition which inculcates intellectual conservatism all around by discouraging epistemic risk taking on behalf of those seeking to be published in the highest status journals and instrumental strategies from lower status journals seeking to raise their impact factors. The more that’s published, the more markers of prestige get fought over in order to ensure that one’s intellectual wares stand out in a crowded market place.

Established structures of scholarly communication engender slowness in catching up with technical developments. Is the solution therefore to find structures which facilitate faster communication? Two obvious examples stand out here: open science practices and social media. It’s surely a positive thing that open science is becoming better established within the social sciences, such as a journal like Big Data & Society requiring authors to publish datasets and self-archiving of pre-prints becoming an established practice now mandated in the UK in the case of papers. Likewise I think it’s a good thing that social media has been taken up by so many social scientists. It reduces the opportunity costs of exploring outside one’s own area e.g. it’s much less onerous to follow a data science blog then it is to keep up with the latest data science papers. As a corollary, it also makes it easier to form connections outside one’s own circles, both by making it easier to have things in common to talk about and also simply making contact with these people in the first place.

But the idea these practices would fix the problems of scholarly communication appears to me to rest on a fallacy: ‘slow’ communication is problematic because it entails friction and lag in what would otherwise be ‘fast’ communication. If we break down the barriers, will everything flow more freely and these seemingly intractable problems might be solved? There’s a rich imagery of ‘fast’ & ‘slow’, ‘open’ and ‘closed’, lurking in the background here which we need to be critical of on a political level. But in a more prosaic sense, I think it straight forwardly distracts from the fact that the problem with slow scholarship isn’t simply a structural matter, such that the established system of scholarly communication (aided and abetted by the incentive structures of the contemporary academy) moulds academics to be ‘slow’ and that if we ‘hack the system’ then it might then mould academics to be ‘fast’.

Under present conditions, I can see how ‘open science’ might lead to all sorts of new pathologies, particularly if the transition from ‘filter then publish’ to ‘publish then filter’ is tied up with the commercial logic of platforms like Academia.Edu, Mendeley and now SSRN. If monetisation of these platforms is dependent on user attention and user data, it stands to reason that engineering strategies serving to maximise both will become a commercial imperative, if they’re not already (and we shouldn’t underestimate how long tech companies can be propped up with capital while making zero profit). The in itself entirely reasonable proposition that non-traditional forms of influence should be incorporated into scholarly metrics is likely to compound such a move, naturalising the algorithmic black boxes of social media and open science platforms and creating new forms of prestige available for fast scholars.

These mechanisms might not dominate the platform, but the idea of fast, free, openscholarly communication allowing a million flowers to bloom away from the disciplinary structures of the contemporary academy is a dangerous illusion. It represents the common sense of the ‘market’, the epistemic superiority of the crowd, creeping into how we view scholarship. We can need to be profoundly critical about how attention, reward and hierarchy work on these new platforms without jettisoning their affordances entirely in our rush to critique. I’m not saying we shouldn’t use social media, only that we shouldn’t culturally embrace it as the superior ‘new’ in relation to the inferior ‘old’. It should be both/and rather than either/or. This is something which I think will be much harder if we
continue to think in terms of ‘fast’ and ‘slow’, at least as an abstract dichotomy we apply to complex systems.

Nonetheless, I do think we need to in some way hack the structures of scholarly communication if the social sciences are going to reliably keep up in anything more than a narrowly technique-driven way to emerging technologies. But rather than ‘fast’ and ‘slow’, we should perhaps see this in terms of ‘collaborative’ and ‘atomised’: resisting the algorithmic incentives of platforms while embracing the affordances they offer for new forms of working together, even within the constraining structures of the accelerated academy.

CFP - special issue of Qualitative Inquiry on methods/newmedia/intimacies (2016-10-07 08:00)

We hereby invite contributions to a special issue of Qualitative Inquiry to be published 2018, provisionally titled:

RESEARCHING INTIMACIES AND NEW MEDIA: METHODOLOGICAL OPPORTUNITIES AND CHALLENGES

Guest Editors: Katherine Harrison (University of Copenhagen, Denmark & Lund University, Sweden) & Maria Bee Christensen-Strynø (Roskilde University, Denmark)

Deadline for submission: 1 December 2016

New media are increasingly intersecting and intertwined with our daily lives, bodily and intimate practices, and relationships. This special issue will present contributions from researchers who are investigating practices of intimacy mediated either wholly or in part through new media. In particular, it will focus on the methodological issues involved in conducting qualitative research in this flourishing field.

A number of volumes published in the last decade have variously covered affect and methodology (e.g. Fraser and Puwar 2008; Pink 2009; Richardson 2005; Stage and Timm 2015), affect and new media (e.g. Chambers 2013; Garde-Hansen and Gorton 2013; Hillis at al 2015; Karatzogianni and Kuntsman 2012; McGlotten 2013; Paasonen 2011; Payne 2014; van Dijck 2013), or online methodologies (e.g. Hine 2000; Kozinets 2012; Markham and Baym 2009). This special issue builds on this existing body of scholarship and develops it further by narrowing the focus to methodological issues of research conducted on/with/through new media and specifically concerned with practices of intimacy. This special issue will zoom in on questions of method and methodology as they are experienced by researchers working at the cutting-edge of scholarship on intimacies and new media. It will share knowledge and experiences from the field, as well as proposing innovative methodological solutions and ideas on how to enter, survive and exit these highly charged fieldsites. Both personal experiences and reflections on current policies, procedures and paradigms will be welcomed.

Researching intimacies encompasses a wide variety of practices and relationships, including but not limited to kinship, sexual encounters, body and gender, dis/abilities, migration, friendship, birth and death, romantic relationships, non-monogamies, dating or community formation. Each of these finds different forms in its mediatization. Simultaneously “new media” comprises a variety of digital platforms that offer distinctive ways to share, connect and
communicate; differences in hardware and software intersect with situated sociocultural norms about technology use. The combination of intimate practices and new media thus poses challenges to existing methodological paradigms due to the limitations/affordances of the medium intersecting with continuously shifting practices of intimacy. This special issue will present a range of intimate practices as well as a selection of digital sites and apps. In so doing, a variety of different methodological issues will be highlighted and discussed.

Suggestions for topics that contributors may wish to engage with include, but are not limited to:

- Logistical and technical difficulties in collecting ephemeral or unstable personal data
- Intimacy and loneliness of the researcher
- Commercialization of online intimacies
- The blurring of personal/professional lines of conduct as a researcher
- The borderline between “lurking”, voyeurism and participation
- Public intimacies in private spaces – accessing and exiting personal spaces as fieldsites
- Technical glitches in online intimacies
- The illusion of online anonymity or distance
- Negotiating national differences in ethical guidelines for online collection of "intimate" data
- Tracking intimacies over time, space and media
- Capturing and processing vast amounts of intimate data
- Finding participants when the topic provokes shame, anger, or embarrassment
- How multiple understandings of “intimacy” affect methodology
- Sudden changes to fieldsites in response to public outcry/moral outrage
- Adapting old methods to new and slippery fieldsites
- Legal frameworks as intimate practices move between screen and materiality
- Inclusion/exclusion mechanisms and accessibility

We welcome papers from a wide range of disciplines. The editors welcome expressions of interest and are happy to discuss proposals for contributions.

Please send your abstract to: [1]tjx856@hum.ku.dk AND [2]mariabee@ruc.dk. Abstracts should be maximum 500 words long and written in English. Please include your name, title, and affiliation. Deadline for submission of abstracts: 1 December 2016.

If accepted, final versions of papers should follow the Qualitative Inquiry submission guidelines which can be
Out of Data: Launch Event (2016-10-08 08:00)

The Centre for Interdisciplinary Methodologies is happy to invite you to the launch event of its new annual theme, Out of Data, on October 4th, at The University of Warwick.

4-6 pm, followed by drinks 6-7pm – room MS.03

In a dynamic format of short presentations, each member of staff will respond to these issues through their own work, raising questions, challenges and opportunities. An open discussion will follow, and we will close with drinks.

We hope to see you there, and please stay tuned to our next Out of Data activities ...

The modern world is into data, but what is out and what is coming out of data? Facts and figures, to be sure, but what else? New methods for seeing, acting and shaping our world? New cultural forms, experiences and artefacts?

Some say data is the new oil, so what can we distil out of data? What classifications of people, objects and spaces are produced out of data? What do different analytical methods reveal and leave out of data? Who is overlooked and what remains hidden?

Despite data's new abundance, we can find ourselves out of data. Is being out of data when data are missing, forgotten, or yet to be collected? When signal becomes noise? Or noise is mistaken for signal? When access is denied, not wanted, or the correct technical configuration is lacking? How to respond to being out of data? What if we are out of data and unaware?

Over the next 12 months CIM is getting into out of data at [1]http://blogs.cim.warwick.ac.uk/outofdata/

Ambient intimacy and cultures of overwork (2016-10-09 08:00)

In a recent book about the neoliberal superstar turned aspiring world saviour Jeffrey Sachs, a quote from his wife caught my attention. On loc 2909, she describes how Sachs only sleeps for four hours a night and works constantly throughout his waking hours. Even on a family holiday, he often gave two or three speeches a day in addition to meetings starting anytime from 7 a.m. till late at night. He then spent most nights writing technical papers, articles, memos and proposals, while keeping in daily contact with his colleagues, working with them via phone, fax and email. All this, while consuming about a book a day on topics ranging from ecology through tropical diseases.

How do you feel when you read this? Sachs is obviously an extreme case but the uptake of social media in academia makes it much more likely we’ll be exposed to information about the working routines of people outside our immediate circles.

In some cases, this can be a good thing and such ambient intimacy can be a foundation for solidarity, as people see the possibility of working collectively to ameliorate shared conditions. But it can often be decidedly negative, creating unrealistic perceptions of how much others are working and helping contribute to cultures of overwork.

We need to be careful about how we present our own working habits through social media, as well as how we interpret the self-presentation of others.

Melanie Rimmer (2017-05-03 15:20:02)
My father often told a story about when my grandmother was dying: the doctor made a house call (which dates the story right away) and was shocked to find her scrubbing the kitchen floor. He said to my grandfather "Can’t you make her stop?" to which my grandfather replied "Can you?". I always hated this story, and when I started to study sociology I found a vocabulary to articulate why.

Mark Carrigan (2017-05-06 18:25:15)
That’s a depressing but arresting story.

Searching for Asylum: a film by Jan Haaken and Maggie O’Neill (2016-10-10 08:00)

De/Humanisation and Organization at EGOS (2016-10-11 08:00)

Please consider submitting a short paper to the EGOS2017 sub-theme on 'De/humanisation and Organisation'. The purpose of this sub-theme is to explore the dehumanising effects of contemporary organisations but also the potential of organisations to rehumanise social relations. Deadline: 9 Jan 2017, length: 3,000 words.

In many ways, our current epoch witnesses dehumanized social relations. While alienation (Marx), disenchantment (Weber) and the deficit in social solidarity (Durkheim) are by no means recent phenomena, processes of dehumanization continue to prevail in most spheres of society. In the public sphere, discussions privilege compliance with bureaucratic regulations and quantifiable indicators (such as GDP and its growth) over human needs and flourishing, have the effect of excluding large portions of the electorate from public debate while accelerating the demise of the Welfare State. More recently, Western countries’ securitarian and paranoid responses to terrorist attacks have reinforced a climate of generalized suspicion in which the neighbour is deemed to be a potential enemy (Zizek, 2009).

In the economic sphere, the financialization of the economy and the spread of market ownership privilege economic profitability over human well-being. Corporate Social Responsibility is thus deployed mostly as a rhetorical device whose injunctions are followed as long as they are profitable to corporate shareholders. Yet, any contemporary observer of capitalism witnesses suffering, destitution and ethical corrosion, both in richer and in poorer countries. Equally worryingly, the private sphere also seems to have undergone dehumanization: for instance, impersonal relations are the lot of ever-growing urban centres, whilst familial duties of care are gradually replaced either by indifference or by reliance on salaried transactions with professional carers ([2]Hochschild, 2003).

The dehumanization of society is mirrored, and perhaps intensified, by the exclusion of the notion of ‘human’ and ‘humanity’ from the social sciences and humanities in the second half of the 20th Century. While philosophers such as Foucault, or more recently Butler, have warned against taken for granted conceptions of the human, their warnings seem to have produced effacement, rather than problematization, of the category of ‘human’. This is especially evident in a variety of anti- or post-humanist theorising, which either dissolves human persons into their wider material, discursive or communicative contexts, or alternatively conceptualises humanity only as an aggregate of neurological, psychological or material components.

There exist, however, significant exceptions to this trend. Neo-Aristotelian philosophers such as Sen and Nussbaum have developed political philosophies that place human capabilities at the centre of the stage. In feminist studies, Lawson (2009) advocated ‘minimal humanism’ and in sociology Archer (2000), Sayer (2011) and Smith (2010) have taken stock of the absence of human subjects from social scientific accounts and sketched the contours of a humanist social science. On the post-structuralist front, Butler’s studies of derealization and dehumanization (Butler 2004; 2009) mark a reinstatement of the category of the ‘human’ that remains conscious that norms of humanity can produce violence on those persons who do not fit them.

The major purpose of this sub-theme is to explore the dehumanizing effects of contemporary organizations but also the potential of organizations to rehumanize social relations. We welcome a range of theoretical and empirical contributions on processes of humanization/dehumanization addressing, amongst other issues, the following:

- How do contemporary modes of organizing and organization contribute to dehumanize people? For instance,
to what extent is the largely studied dark side of management amenable to dehumanization? What is gained by doing so? But, equally importantly, which aspects, if any, are not reducible to dehumanizing tendencies?

• Conversely, what contemporary movements and novel modes of organizing might contribute to enhance human flourishing and dignity? For instance, how are social movements centered on human dignity such as the Spanish Indignados readdressing the human side of social relationships? How are cooperatives and alternative organizations of work, care and political involvement developing credible instances of resistance to dehumanizing tendencies?

• Is the concept of the ‘human’ still a useful ethical category when assessing the ‘good’ organization? Does it make sense to wager, with Foucault, that ‘man would be erased, like a face drawn in sand at the edge of the sea’? Is ‘humanity’ merely an empty signifier prone to endless re-appropriation and whose value is at best tactical but never foundational for social and organizational theories and politics? Or is the notion of humanity, and associated ‘powers’, ‘rights’ and ‘flourishing’, a useful standard when assessing and criticizing organizations and societies?

• What are the new struggles arising from the attack on dignity and from the exclusion processes that are largely shaping capitalistic societies?

• Have the boundaries of what people regard as a dehumanizing treatment shifted? Have we become more willing, for instance, to disregard outrage in the name of economic and military security?

• The dehumanization of bureaucratic organizations has been extensively studied since Weber and Gouldner. But is the emergence of hybrid or post-bureaucratic organizations a safeguard against dehumanization? Or do these novel organizational forms merely shift the modalities of dehumanization?

• What is the role of information technologies in processes of dehumanization?

The history of data-as-rhetoric (2016-10-12 08:00)

From Daniel Rosenberg’s essay in Raw Data Is An Oxymoron, loc 916. What further developments are we beginning to see in the meaning of ‘data’ in a digitalised context? The author’s point is that data is not associated with veracity, such that inaccurate data is still data, but I wonder if I’ve misunderstood this because it seems so obviously misleading to me.

This observation is supported by the numbers but not generated by them: from the beginning, data was a rhetorical concept. Data means—and has meant for a very long time—that which is given prior to argument. As a consequence, the meaning of data must always shift with argumentative strategy and context—and with the history of both. The rise of modern economics and empirical natural science created new conditions of argument and new assumptions about facts and evidence. And the histories of those terms and others in the same family nicely illustrate the larger epistemological developments.

The history of data is connected to these other histories in very important ways, but in equally important ways, it remains an outlier. Curiously, the preexisting semantic structure of the term “data” made it especially flexible in these shifting epistemological and semantic contexts. Without changing meaning, during the eighteenth century data changed connotation. It went from being reflexively associated with those things that are outside of any possible process of discovery to being the very paradigm of what one seeks through experiment and observation.

I’m interested in how this supports the implicitly critical theory of data scientists: digital data reveals what people really do, rather than what they say they do. The given character of empirical data was formerly localised and now it’s seen to be generalised: given-ness suffuses the social world in a way that seemingly promises total legibility to those with sufficient literacy of the right sort.

Big data, new skills: how the accelerated academy hinders the interdisciplinary collaboration we need (2016-10-13 08:00)

Underlying many of the issues we’re discussing today is the fundamental problem of speed. We’ve seen rapid developments at the level of platforms, devices, practices and methods but this rapidity has made it difficult for
methodological and theoretical deliberation to catch up. As the Geographer Rob Kitchin puts it in his book *The Data Revolution*, such deliberation “is desperately needed in order to catch up with the pace of technical change and the roll-out of ad hoc and pragmatic approaches, and to replace proliferating forms of weak empiricism” (loc 3800-3817).

It’s this empiricism which I think is the long term worry of many, as the empirical in digital social research of this sort is too often exhausted by what registers as digital data on a given platform. If this goes unchallenged, we risk a precipitous collapse in the descriptive and explanatory horizons of the social sciences. All the more so, if it’s coupled with the untenable, yet oddly persistent, idea that big data ‘speaks for itself’ and allows us to leave theory behind.

Innovations in research methods and the new data environment will undoubtedly impact teaching and research in the social sciences. But unless we can make space for methodological and theoretical deliberation to catch up to technical developments, it’s not obvious to me that this impact will be a positive one. This catching up necessitates critical and knowledgeable engagement with technical advances, as well as forms of collaborative and exploratory interdisciplinarity which are inherently challenging.

Unfortunately, the infrastructure of scholarly communication as it presently stands works to hinder this ‘catching up’. The journal system poses a number of problems by discouraging the exploration and experimentation which we need:

- The quantitative increase in publication encourages ever-narrower specialisation, as new journals define themselves in relation to an already crowded intellectual market place.
- With an [1]estimated 28,100 journals publishing 2.5 million articles a year, 'keeping up with the literature' within one's own field becomes an ever more overloading exercise.
- This also intensifies existing access problems, particularly as newer and more specialised journals might not be widely accessible, with the political economy of journal subscriptions currently in a state of flux.
- The slow speed of publication hinders discussion and debate about new developments, albeit at a rate that varies between fields.
- The increasing importance of the established prestigious leaders within a field or discipline, something which manifests both qualitatively and quantitatively, enacts epistemic discipline as ambitious researcher compete for the limited number of slots available within that journal by adapting themselves to what they perceive as its intellectual standards.
- It also creates competition between journals, as lesser ranked journals take instrumental action with the intention of improving their impact factors (and increasingly, orientated towards improving their alt metrics scores as well).
- Existing norms of scholarship also curtail some of the discussions which the ‘catching up’ I’m talking about would necessitate. Is there space and freedom to reflect on the complex considerations involved in working with digital data? Do technical details get excluded from papers about substantive topics submitted to mainstream journals? Does the journal system impose a division of theory, method and data which obscures precisely the complexity of their entanglement in digital social research that we need to investigate?

There’s a risk of overstating the case here: there are existing innovations in journals which could mitigate these problems, such as [2]Big Data & Society’s request that authors publish primary data (or provide detailed instruction about accessing it) or Sociological Science’s [3]streamlining of the peer review process and commitment to
editorial decisions within 30 days of submission. The dynamic of specialisation I'm criticising could also work to encourage the establishment of new journals which meet precisely the needs I'm suggesting are currently unmet. There's also room to be hopeful given that some open science practices are becoming institutionalised within the social sciences, for instance the publication of pre-prints. But there are still nonetheless commercial threats to open science and some degree of conservatism built into structures of career advancement and research assessment.

These problems with the journal system are compounded by disciplinary silos. It too often shapes reading in a way which reinforces a disciplinary focus, as 'keeping up with the literature' necessitates triaging based on past experience. There's little external incentive to read widely outside one's own area, let alone the time or energy to do so when existing workload is unmanageable or unsustainable for many. These same factors militate against attending events outside one's own areas. Even when we do, the technical languages spoken and the skills presupposed by speakers make meaningful engagement inherently difficult, a matter of 'keeping up' rather than contributing.

For digital methodology and digital theory to catch up to digital methods necessitates collaboration between "computationally literate social scientists and socially literate computer scientists" but it's hard to see at present how such relations can reliably take a mutually beneficial shape, though of course this does happen in places. We don't need to be speaking the same language but we do need to be able to understand each other. Even socially literate computer scientists tend only to be socially literate in a narrow sense. More importantly from my point of view, there are still relatively few computationally literate social scientists (and I'm certainly not one of them) and it seems urgent to me that we understand why. In the absence of this reciprocal literacy, collaboration will likely be narrowly instrumental, bringing in a social scientist for their domain expertise or bringing in a data scientist for their computational skills.

However I do think there are practical steps we can take to mitigate these problems. Social media is a powerful tool for crossing disciplinary boundaries, connecting with people in other fields and keeping up to date with developments through things like blogs and twitters feeds. To give an example of how virtual spaces can be used to facilitate the methodological and theoretical 'catching up' I'm advocating: as a joint project between the Independent Social Research Foundation's Digital Social Science Forum and the International Journal of Social Research Methodology, we organised a stream at this conference on 'beyond big and small data'. The intention was to offer a conceptual and methodological framing within which all manner of related issues could be explored. What is 'big data', what is 'small data' and is this opposition a useful one?

But as well as the conference stream itself, we live tweeted the talks and recorded them as podcasts to be released on social media. The participants have been invited to write up their paper as a short article for the LSE Impact Blog, a popular website with an extremely large and diverse international audience, for a special section on Digital Methodologies. These will then be circulated, along with the podcasts from the event, as a call for more contributions to the discussion from those not at the event. Thus we intend to facilitate an ongoing conversation, building from a face-to-face meeting but using social media to extend far beyond it, one which will hopefully lead to more face-to-face meetings at future events if the discussion builds up sufficient momentum.

But even if we can explore new ways of facilitating collaboration outside the limits I've described, there's still the challenge of 'upskilling' the social sciences to expand computational literacy, while resisting the urge to simply reproduce the norms of computer science. There are free digital training tools which can be used to this end, things like Code Academy and some of the more technically orientated MOOC platforms. But the pressures of career advancement to which individuals are subject militate against this upskilling being something which can be pursued as an individual matter. It's extremely time consuming and the institutional incentives aren't there. But these digital tools could be a starting point, supplemented by peer support networks, meeting both face-to-face and digitally.

Ultimately though, we need well funded networks and institutional recognition of the importance of this en-
deavor, as well as long term changes to the structure of graduate education. Only in this way do I think it will be possible to facilitate the meaningful participation of social scientists in shaping how the new data environment impacts research and teaching, as well as the likely transformation of the social sciences themselves.

Deadline in 2 days: Consuming Gender (2016-10-14 08:00)

Call for Papers - Special Issue, 'Consuming Gender' <[1]http://www.assuminggender.com/p/call-for-papers.html> This special issue of Assuming Gender – an online, peer-reviewed academic journal from Cardiff University – seeks to explore the way gender is both presented and consumed through popular media and advertising. As Ann Herrmann points out in the article 'Shopping for Identities', commodities ‘are characterised by their dual nature: material composition and symbolic meaning’ (Herrmann 2002: 539). Consumer culture plays a significant role in constructing valid (and normative) identity categories with which consumers are encouraged to identify. Scholars as diverse as America Reed, Laura C. Nelson, and Henry Jenkins have theorised the ways in which identity and consumer culture are intertwined. Reed, for example, claims in ‘Activating the Self-Importance of Consumer Selves’ that ‘[s]ocial identities are mental representations that can become a basic part of how consumers view themselves’ (Reed 2004: 286). In a later article on ‘Identity-Based Consumer Behaviour’, Reed and others use the example of athletics to illustrate their point: ‘if consumers view themselves as “athletes”, they are likely to behave in ways that are consistent with what it means to “be” an athlete’ (Reed, Forehand, Puntoni and Warlop 2002: 310). Consumption thus becomes defined by identity, and identity becomes defined by consumption. While the construction of identities based on athleticism seems relatively benign, the case quickly becomes more complicated when consumer identities are racially, economically, or sexually coded. In addition to delineating the borders between various interest groups, consumer culture plays a significant role in establishing and maintaining binary identity distinctions (male/female, gay/straight, black/white), undermining the validity of those identifying across or in-between one or more categories, or who refuse categorisation at all. Those identities not classified as valid consumer groups are not seen as valid identities at all. For this special issue of Assuming Gender, we invite articles that focus specifically on the idea of ‘Consuming Gender’. How has consumer culture constructed (and how has it been constructed by) gender through the ages? Suggested topics include, but are not limited to: * Consuming gender/gendered consumption * Historical contexts of gendered consumption * Feminist/postfeminist approaches to consumption * Consumption and intersectionality * Queer consumption * Media constructions of (gendered) consumer identities * Post/colonialism and gendered consumption Please send a proposal of roughly 500 words to Megen de Bruin-Molé, Akira Suwa and Daný van Dam at gender@cardiff.ac.uk<mailto:gender@cardiff.ac.uk> under the subject line ‘CFP Consuming Gender’, including your name, e-mail institutional affiliation (if any), and a biographical note (100 words maximum). We welcome papers from scholars of all backgrounds, disciplines, and career stages. The deadline for proposals is 16 October, 2016, and completed papers of 5000 to 8000 words will be expected no later than 16 April, 2017. (More information available at the link: [4]http://www.assuminggender.com/p/call-for-papers.html)
Fabius’ Delight: When Everyone (If Only in the UK) Benefits by Delaying Brexit (2016-10-14 09:11)

The famed strategy of the Roman general Fabius to defeat Hannibal, the North African general trying to conquer Rome in the 3rd century BC, was simply to wait for Hannibal to get within easy range of his troops and then defeat him by continual guerrilla warfare. So even though Rome and Hannibal’s homeland Carthage (now in Tunisia) were formally at war, one side – Hannibal’s – was doing all the heavy lifting. This was also the strategy that worked during the American Revolution, which is why the commanding general George Washington was nicknamed the ‘American Fabius’. And of course, in the UK we have got the Fabian movement which helped to found the Labour Party in the early 20th century. Its strategy was about playing a long game of propaganda (they invented the ‘think tank’) and small local victories to eventually acquire power for socialist ends by peaceful means.

Now let’s look at Brexit. Suppose you don’t want Brexit to happen at all – No Brexit, even after the referendum. (I put myself in this category.) Then you want to do everything possible to obstruct it, be it through a second referendum, a requirement that the terms of Brexit be confirmed by Parliament or a high court challenge to the constitutionality of the Brexit process.

Now suppose you’re for Soft Brexit. You’ll probably be in favour of some if not all of the previous obstructionist moves. But in addition, you’ll want to let the very prospect of Brexit to unfold over several rounds of economic indicators to demonstrate the precariousness of the UK situation. The longer this delay lasts, the stronger case for the UK to remain in the single market, even if it means ditching border controls.

But now say you’re for Hard Brexit. In that case, you’d want to wait until the French and Germans have their general elections in 2017, by which time a much more Brexit-friendly regime is likely to be in place in France and whatever pressure within the German political ranks there has been to ‘punish’ the UK for leaving the EU would be mitigated by an expected rise in right-wing nationalist support there. So the longer the UK waits, the easier it might be to negotiate terms that permit free trade with the EU and allow for border controls. Of course, that scenario might also spell the beginning of the end of the European Union, as other member nations seek similar arrangements. But then, I doubt Hard Brexiteers will be losing sleep over that!

But the lesson is clear: Fabius regit!
**Historical parallels to the right-wing turn in British politics (2016-10-15 08:00)**

A brilliant rant by James O’Brien on the government’s proposal to force firms to publish lists of foreign workers:

https://www.youtube.com/watch?v=TA6XxYepCDs

---

I find Brexit an endless source of invention – perhaps that’s my unconscious reason for wanting it drag out as long as possible, what I’ve called ‘[1]Fabius' Delight’. I shall get to the phrase ‘Population Snowflake’ toward the end of this piece. But let’s work our way to it.

There are three faces of Brexit and they mirror the characterization of the early 19th century Romantic poet and Greek freedom fighter, Lord Byron, as ‘mad, bad and dangerous to know’. Together they constitute Byronic Brexit:

**Mad** = Brexit aims to do the impossible, to enable the UK engage in free trade with the world while controlling its own borders.

**Bad** = Brexit aims to run the economy into the ground in the name of border controls.

**Dangerous to know** = The terms of our Brexit negotiations with the European Union can’t be divulged, let alone approved by Parliament, because that would destroy our chances of getting a good deal. But these three faces of Brexit don’t quite capture the spirit in which the outcome of the referendum to leave the European Union has been received. The House of Commons was 4 to 1 and the House of Lords 6 to 1 against leaving the EU. Yet most parliamentarians now at least pay lip service to the claim that they need to ‘respect the will of the people’, which means implementing Brexit in some way or other. But is ‘respecting the will of the people’ anything other than treating the people as infallible when it comes to matters relating to their own interests? Certainly this was what Rousseau thought because he imagined that the ‘General Will’ inherited the prerogatives of the absolute monarch, who in turn was presumed to enjoy some divine right. An interesting feature of this sense of ‘infallibility’ is that it’s operationalized as ‘irreversibility’; hence, the taboo on calling a second referendum. Now, what if the people are just wrong and they need another chance to admit it and change their collective mind? A big problem is that this question is normally framed in terms of the people having been duped by both sides during the referendum campaign with false claims, statistics, etc. But this makes it seem as though the people were somehow deceived from believing what they should have – which in turn further assumes that the people had correct beliefs about the EU in the first place. However, this likely to be false. More likely is that the people had no clear views whatsoever about the EU – not to be confused with Europe itself – and so both sides simply supplied views that would be otherwise lacking. This would explain why whenever voters were questioned why they voted one way or the other, they always quoted campaign talking points – no independent research on the part of the voters is ever in evidence. I would say that this was mainly an oversight of the Remain campaign, which should not have taken for granted that residents of relatively impoverished regions in, say, Wales and the North of England would already know that the EU massively subsidizes various projects that keep these places afloat. When commentators speak of ‘Leave’ voters from those areas as ‘Turkeys voting for Christmas’, this is what they mean. The brute fact – which no politician dares utter – is that the people were not sufficiently informed about the European Union to vote meaningfully in the referendum. I don’t mean that the politicians did not sufficiently inform them, but rather that the people did not have enough independent views about the EU prior to the calling of...
the referendum. Thus, they had no baseline in terms of which they could evaluate the various campaign claims, true or false. (This is not to deny that there were people who voted on Brexit who were ‘informed’ in my sense – but they were only a fraction of the overall vote. At least this is what I propose as a hypothesis for further sociological research.) I happen to believe that it was a mistake to have had the referendum, partly because it was a bit like asking the public about whether to accept a proposition in cosmology. (So I was on the side of former Tory Chancellor Ken Clarke, who believed that the referendum defeated the whole purpose of having representative democracy.) No doubt, the people could be informed of various opposing views during a campaign, but they would be coming to the issue largely as blank slates without any independent views. This is not the spirit in which referenda are normally called. Referenda are supposed to be called on rather specific questions where there is good reason to believe that the voters would have first-hand knowledge lacking in politicians – e.g. on whether to raise taxes in general or hypothecate taxes in certain ways. In such cases, there are usually tricky trade-offs the outcomes of which would affect individuals differently. Those of us living in the UK know that the referendum was called largely to enable Prime Minister David Cameron to placate the significant number of Tories clamouring for a referendum to get the country out of the EU. Indeed, it seemed (both in the imagination and in votes) that the UK Independence Party (UKIP) would end up splitting the Tories if a referendum were not given. He also thought he would win the referendum, we’d stay in the EU and UKIP would be vanquished. Well, UKIP may be on its way to being vanquished but largely as a victim of its own success! The fact that no one either in or out of government had prepared a strategy for Brexit speaks to the general scepticism in the political class that a majority would vote for Brexit. Be that as it may, Brexit prevailed. Even if you agree with me that the very calling of the referendum was a mistake, we are stuck with the result as the starting point for further political debate. So what to do? I have come to believe that a second referendum may be necessary to get the people to reconsider whether they really understood what they had voted on in the first place. I don’t mean a literal re-running of the referendum, of course, but a version that puts more flesh on the bones on the proposal to connect more directly with the voters. After all, this is how referenda are supposed to be framed. That this basic point disappeared in the first place is, of course, the downside of the UK’s ‘improvised’ style of constitutionalism. So, I’m not saying anything about when the second referendum should happen – or even the exact wording of the referendum. However, I am saying something about the need for academics and politicians to be more vocal about claiming that the people did not know what they voted for when they voted in the referendum – either for or against Brexit. In other words, the referendum constituted an inappropriate use of direct democracy. It overestimated the population’s ability to judge the matter of Brexit – not because they’re inherently stupid but because they lacked the baseline intellectual resources needed to judge critically the opposing campaigns. At the very least, I would hope my argument persuades people of the need for more secondary school civics education! Finally, the taboo against simply calling the Brexit voting populace ‘ignorant’ (and perhaps blaming PM Cameron for exposing that ignorance) comes from the basic Rousseauian assumption that the ‘general will’ is infallible in a democracy. But is this not to treat the people as Population Snowflake, a phrase I fashion from the leading free speech advocate Claire Fox’s[2]Generation Snowflake, which aims to complain about how young people today feel entitled to have protected spaces from opposing views (and perhaps even truths) that disrupt their world-view. Who could disagree with this premise? All that I’m saying is that the principle should extend to members of an entire society who have been flattered by politicians of various persuasions into thinking that they know more about their society’s existential conditions than they really do. In effect, I am calling for a two-step Popperian solution to the Brexit quandary. First, the politicians admit an error in holding a referendum, and then a referendum is held with people specifically instructed to learn something about the European Union before the campaign formally starts. Even if the first step is unlikely to happen, the second step could happen in some cleverly finessed way (perhaps once a Brexit strategy is available). If the UK’s sense of improvised constitutionalism got us into this mess, it may get us out of it!

I Read Some Marx (And I Liked It) (2016-10-16 08:00)

From TINA to TATIANA (2016-10-18 08:00)

A great rebuttal of the neoliberal insistence that There Is No Alternative, from loc 3840 of the [1]recent book by Yanis Varoufakis:

We were not naive enough to think that our blueprint would be implemented on the strength of its rationality. No, its purpose was simpler: to be able to counter official Europe’s doctrine with our own. To respond to Eurocrats insisting, ‘There is no alternative’ (TINA) that respects the treaties and the current rules with, ‘That, astonishingly, there is an alternative’ (TATIANA). Our TATIANA, entitled ‘A Modest Proposal for Resolving the Eurozone Crisis’, is a blueprint for addressing the crisis through Europeanizing its four components –the crises of public debt, banks, underinvestment and the poverty explosion –while decentralizing political power through a reduction in the discretionary power exercised illicitly by the Brussels–Frankfurt–Berlin triangle. Seen from another less politically charged perspective, the proposal’s greatest merit is that it offers a way to abandon the eurozone’s problematic principle of perfectly separable debts and banking sectors and to introduce the missing political surplus recycling mechanism without creating autocratic discretionary power at Europe’s centre and without any immediate need to rewrite the European Union’s existing rules and treaties.

The Practice of Public Sociology (2016-10-18 10:23)

The Practice of Public Sociology

Manchester Digital Laboratory

November 24

th

, Manchester, 9.30-18.00

For over a decade public sociology has been a mainstream topic of discussion within the discipline. While practiced prior to the 2004 address by Michael Burawoy to the American Sociological Association, its identification and elaboration on an intellectual level was crucial to its popularisation. But is it possible that the voluminous literature that emerged in the years following has left us with a public sociology that is overly-discursive? While undoubtedly important, is there a risk that theorising about public sociology gets in the way of its practice? This event organised by The Sociological Review’s Early Career Forum takes as its starting point David Mellor’s 2011 argument that “we don’t need to debate public sociology anymore; we need to get good at it”. We invite early career researchers who share this aim to join us for a day of workshops, discussion and debate about how we can collectively improve our practice of public sociology.

Confirmed Speakers

- Maddie Breeze, Queen Mary University
- Mark Carrigan, The Sociological Review
- Ipek Demir, University of Leicester
- Lambros Fatsis, University of Southampton
- Ruth Pearce, University of Warwick

Confirmed Workshops/Sessions

- Working with Print and Broadcast Media: Aaron Bastani, Novara Media
• Teaching Public Sociology: Maddie Breeze, Queen Mary University and Karl Johnson, Queen Mary University
• Working with Social Media: Mark Carrigan, The Sociological Review
• Working with Community Groups: Dan Silver, Social Action & Research Foundation
• Working with Photo Archives: Ben Kyneswood, Photo Mining

This event is free, but registration is compulsory. You can register here: [1]https://www.eventbrite.co.uk/e/the-practice-of-public-sociology-sociological-review-early-career-event-tickets-28652394082?utm_campaign=new_event_email&utm_medium=email&utm_source=eb_email&utm_term=viewmyevent_button

Places are extremely limited due to the size of the venue. Please do not sign up to this event unless you are sure you can attend. If you can no longer attend, please cancel your ticket asap by emailing Jenny Thatcher events@thesociologicalreview.com

For academic inquiries related to this event, please contact Mark Carrigan mark@markcarrigan.net

For all other inquiries related to this event, please email Jenny Thatcher events@thesociologicalreview.com

ECRs and PGRs Travel Bursaries

Sociological Review’s Early Career Board have a small number of travel bursaries available for early career researchers and postgraduate research student who would require assistant with travel costs. You can apply for by following this link: https://docs.google.com/a/thesociologicalreview.com/forms/d/e/1FAIpQLSfsrK7iyKth0WZMf-NJX7gKZ6ZWKnrUpqSZUWo5wLKOead3ZA/viewform

The deadline for travel bursary applications is Sunday 30th October 2016, 00.00 GMT

When YouTube bought Google (2016-10-19 08:00)

A fascinating snippet of tech history. The founders of YouTube talk about their recent sale to Google, back in 2006, back when each were seen as something other than the slightly menacing giants they are today:
Weapons of Math Destruction (2016-10-20 08:00)

A fascinating series of podcasts on this great new book [1]Weapons of Math Destruction:

Malgorzata (2016-10-21 08:13:03)
Have you read the book from Cathy O’Neil? Weapons of math desctruction?

Debate on Debate: Foucault v. Chomsky (1971) and the EU Referendum (2016) (2016-10-21 08:00)

By Rosie Smith

https://youtu.be/7TUD4gfvtDY
In 1971 a Dutch Television company ran a series of discussion panels with noted intellectuals on a wide range of issues both contemporary and philosophical. One of the most famous debates was between French philosopher Michel Foucault and American linguist Noam Chomsky who debated on the condition of human nature, power, and justice. I listened to this debate for the first time in the run up to the UK EU referendum, and have revisited it many times since UK citizens voted to leave the European Union. Watching the debate at a time of significant political uncertainty and widespread public engagement was fascinating. This is because the arguments made by both theorists on human nature, power, and knowledge, acted as lenses through which I observed and analysed the unfolding events. At its heart, the debate contests whether social structures, or free will and creativity, are the determinants of human action. A topic which also helps clarify the tempestuous Brexit vs. Remain campaign.

Let us begin with Foucault. Michel Foucault contends that there is no singular, fixed human nature that exists, and that the social world is made up of multiple schematisms (structures for understanding the world). These schematisms inform individuals on how to behave in different situations. According to Foucault these hidden structures, which dictate social action, are socially constructed. From this approach it is suggested that every aspect of an individuals’ life, and all surrounding social phenomena are products of their social, political, and cultural surroundings.

If we use this theory of human nature to unpack the voting behaviours in the EU referendum, it suggests that individuals interpret the arguments and evidence put to them, according to their position within wider social structures such as social class, ethnicity, gender, sexuality, and age. Accordingly, the politicians who put forward these arguments, evidence, and lobbied for either the ‘in’ or ‘out’ campaign, are also bound up by structural biases; neither individuals nor the knowledge they construct can escape the pull of social structures. Foucault’s structuralist theory, paints a picture of a political climate that is akin to a complex network of interwoven individuals, all trying to understand the ideas and arguments put forward by others, who too occupy a unique place in the social structure. Using this theoretical lens, it is perhaps clear why the debate surrounding the EU referendum was often cryptic and perplexing.

To further explain how knowledge can never be complete or transparent because of structural influences, Foucault draws on a grid metaphor. If one places a square grid on the floor and continues to place grids one on top of the other, then whilst a tower begins to grow (the accumulation of knowledge), each individual grid contains gaps, which instead of being filled, are covered up by those after it. Thus the tower of knowledge is never fully stable. In this case, Foucault’s theory suggests voters must always make a decision based on incomplete knowledge.

Are the foundations of the tower of knowledge under more strain when the stakes are heightened within a turbulent and enigmatic political climate?

However, this is arguably a negative and deterministic view of social action, as it denies individuals the capacity and intellect to act according to free will and make informed decisions. In comparison, Chomsky’s arguments, as put forward in the debate stand defiantly against behavioural determinism, and argues that variations in human nature and conduct (such as voting patterns) are products of creativity and free will, not the product of oppressive social structures:
“Human nature has many of the characteristics of what I think might very well be called creativity” (Chomsky, 1971)

These polarised arguments raise the question: when UK citizens went to the polls on 23 June 2016 did their decision reflect the social structures they are immersed in, (as Foucault purported), or an expression of linguistic and intellectual free-will and creativity, (the Chomskyan ideal), or both?

This is a difficult question to answer, but what is clear is that whether voters acted according to their position in social structures, or because of creativity and free-will, or maybe another factor all together, their decisions were influenced by those who are in power. Those who own the grids of knowledge; those who offer tools for creativity; and those who have the power to define concepts such as 'Britishness', immigration, control, risk, refuge, and austerity.

Chomsky explores this issue and suggests that power in its basic form is not conducive to justice or equality, and that power can be mechanised to enforce subjective rules. Chomsky uses the following, and arguably wonderful, analogy when commenting on the Pentagon Papers:

“If I had stopped my car in front of a traffic light which was red, and then I drove through the red traffic light to prevent somebody from, let’s say, machine-gunning a group of people, of course that’s not an illegal act, it’s an appropriate and proper action; no sane judge would convict you for such an action” (Chomsky. 1971)

Chomsky's traffic light metaphor can be applied to help unpack the EU referendum. If one accepts that the traffic lights represent the current system, in which the UK is a member of the EU. The red light implies that currently the UK cannot move past this status. Then the lights turn green and there is the option to cross the road, without the control of the traffic lights. There is now the option to progress without the supposed safety the traffic light structures offer.

The 51.9 % of voters who voted to leave the EU are representative of those individuals who, according to Foucault, want to overturn existing structures of domination to achieve socio-political change. For Chomsky, the decision to cross the road unaided by traffic lights, is a product of an individual's interpretation of information. In both cases the result is symptomatic of discontent with the structural status quo, and the need for a re-evaluation of those in power, and thus, those institutions which have the power to influence the lives of UK citizens.

Perhaps striving for full transparency of knowledge, and completeness of information is neither possible nor desirable. And so whether the decision to leave the EU is representative of a structural shift or of political free-will, or both, it was a decision for change, a decision for creativity, and a decision for choice.

Rosie Smith is a PhD student in Sociology at the University of York. Her research looks at 'spectacular justice' and challenges the Foucauldian panoptic privatisation theory of justice. She is interested primarily in crime, justice, media, and Foucauldian theory.
CALL FOR ABSTRACTS: ACADEMIC LABOUR, DIGITAL MEDIA AND CAPITALISM
SPECIAL ISSUE OF TRIPLEC: COMMUNICATION, CAPITALISM & CRITIQUE

GUEST EDITORS: Thomas Allmer and Ergin Bulut

Modern universities have always been part of and embedded into capitalism in political, economic and cultural terms. In 1971, at the culmination of the Vietnam War, the Chomsky-Foucault debate reminded us of this fact when a young student pointed a question towards Chomsky: ‘How can you, with your very courageous attitude towards the war in Vietnam, survive in an institution like MIT, which is known here as one of the great war contractors and intellectual makers of this war?’ (Chomsky and Foucault 2006, 63) Chomsky responded dialectically, but also had to admit that the academic institution he is working for is a major organisation of war research and thereby strengthens the political contradictions and inequalities in capitalist societies. Edward P. Thompson, one of the central figures in the early years of British cultural studies, edited the book 'Warwick University Ltd’ in 1970. Thompson was working at the University of Warwick then and published together with colleagues and students a manuscript that discovered, as the title suggests, the close relationship of their university with industry and industrial capitalism. The book also revealed some evidence of secret political surveillance of staff and students by the university uncovered by students occupying the Registry at Warwick at that time. The relationship between state control and global capitalism has intensified in the last decades. With the collapse of the welfare state and the drop of public funds, universities are positioning themselves as active agents of global capital, transforming urban spaces into venues for capital accumulation and competing for international student populations for profit. In this environment, students have to pay significant amounts of tuition for precarious futures. Similarly, teaching and research faculties across the globe have to negotiate their roles that are often strictly defined in an entrepreneurial manner. Increasingly, the value of academic labour is measured in capitalist terms and therefore subject to new forms of control, surveillance and productivity measures. As the recent cases of Steven Salaita (USA), Academics for Peace (Turkey) and the crackdown against students in India reveal, academic labour and academics in general are also facing immense challenges in terms of state control and freedom of speech. Situated in this economic and political context, the overall task of this special issue of tripleC: Communication, Capitalism & Critique is to gather critical contributions examining universities, academic labour, digital media and capitalism. We are thus particularly interested in articles focusing on (1) the context, history and theoretical concepts underlying academic labour, (2) the relationship between academic work and digital media/new information and communication technologies/the Internet/social media and (3) the political potentials and challenges within higher education. We welcome submissions that cover one or more of the following or related questions.

1) Contextualising and Theorising Academic Labour
* What is the historical role of universities and academic labour and how has it changed over time? * What is the role of universities for capitalist development in the age of neoliberalism and post-Fordism (e.g. employability, market-driven and industrial research)? * How far can the neoliberal university be considered as medium and outcome of informational capitalism? * How far can the university expansion be understood as a dialectic development of progress and regress, social achievement and advanced commodification? * What is meant by concepts such as Warwick University Ltd, McUniversity, academic proletarianisation, edu-factory, corporate university, academic capitalism, entrepreneurial university, university gamble, digital diploma mills, global university, DIY university, etc. in the context of academic labour? How are these concepts related to the wider social context and the existing capitalist order? How can a systematic typology of the existing literature be constructed? * What is the role of the concept of value for understanding academic labour? * What is the role of the concepts of the working class and the proletariat for theorising academic labour? * How should we define academic labour; who is included/excluded by this understanding? Where does adjunct labour stand? * What kind of workers are academics and how are they related to knowledge, informational and cultural workers? * How far can the outcomes of academic labour be considered as part of the information and communication commons? * To what extent rests informational capitalism on the commons produced at universities?
What are the important dimensions for constructing a typology of working conditions within higher education (e.g. new managerialism, audit culture, workload, job insecurity)? How do different working contexts and conditions in academia shape feelings of autonomy, flexibility and reputation on the one hand and precariousness, overwork and dissatisfaction on the other?

2) Academic Labour and Digital Media

Given that the academic work process is today strongly mediated through digital media, to what extent can academic workers be considered as digital workers, and academic labour as digital labour? In how far can digital education and online distance learning be understood as a new capital accumulation strategy that aims at attracting international students in a commodified and competitive higher education market? In how far can digital education be regarded as a response to neoliberal conditions within higher education?

How do digital media/new information and communication technologies/the Internet/social media frame the working conditions of academics?

How are the working conditions of academics characterised by intensification and extensification in the realm of the digital university (e.g. the blurring of working space and other spaces of human life, the blurring of labour and free time, fast academia, always-on cultures, deskilling, casualisation, electronic monitoring, digital surveillance, social media use for self-promotion, new forms of intellectual property rights)?

3) Politics, Struggles and Alternatives

How do the broader political realities and potentials in terms of solidarity, participation and democracy at universities look like? What is the relationship between the state and academic labour? What are some of the lessons that we can learn from global crackdowns on academic labour?

What are the challenges in order to reclaim the university as site of struggle for both academics and students? How far can the struggle at universities be connected to the global struggle against capitalism?

How do the political potentials of alternatives within higher education look like (e.g. informal learning processes, co-operative education, open education, open access, copyleft, creative and digital commons, Wikiversity)?

DEADLINES: Abstract submission: 31 October 2016 All abstracts will be reviewed and decisions on acceptance/rejection will be communicated to the authors by the end of November 2016. Full paper submission: 15 April 2017 Please submit article title, author name(s), contact data and abstract of 200-400 words to: Thomas Allmer, thomas.allmer@uti.at and Ergin Bulut, erginb@gmail.com ABOUT THE GUEST EDITORS: Thomas Allmer is Lecturer in Digital Media at the University of Stirling, Scotland, UK, and a member of the Unified Theory of Information Research Group, Austria. His publications include Towards a Critical Theory of Surveillance in Informational Capitalism (Peter Lang, 2012) and Critical Theory and Social Media: Between Emancipation and Commodification (Routledge, 2015). For further information, please see: http://allmer.uti.at Ergin Bulut is Assistant Professor of Media and Visual Arts in Istanbul. His research interests include political economy of media, digital media and politics, and media labor. Together with Michael A. Peters, he edited Cognitive Capitalism, Education and Digital Labor (Peter Lang, 2011). His work has been published in TV & New Media, Critical Studies in Media Communication, Communication and Critical/Cultural Studies, Media, Culture and Society, and Journal of Communication Inquiry. ABOUT THE JOURNAL: tripleC: Communication, Capitalism & Critique. Open Access Journal for a Global Sustainable Information Society.[5]http://www.triple-c.at Editors: Christian Fuchs, University of Westminster, UK, and Marisol Sandoval, City University London, UK tripleC is a journal that focuses on critical studies of communication in and beyond capitalism. Articles in it should employ critical theories and/or empirical research inspired by critical theories and/or philosophy and ethics guided by critical thinking as well as relate the analysis to power structures and inequalities of capitalism, especially forms of stratification such as class, racist and other ideologies and capitalist patriarchy. tripleC is indexed in the databases Communication Source, Scopus and Web of Science Emerging Sources Citation Index. — Chomsky, Noam and Michel Foucault. 2006. Human Nature: Justice vs. Power (1971): A Debate between Noam Chomsky and Michel Foucault. In The Chomsky-Foucault Debate: On Human Nature, edited by Noam Chomsky and Michel Foucault, 1-67. An Introduction to NodeXL for Social Scientists

9 January 2017 (1-4pm)

Leslie Silver Building G28, Leeds Beckett University

Confirmed speakers: Wasim Ahmed

BSA members - £15
Non-members - £20

Visit the BSA events page to register:

https://www.britsoc.co.uk/events/key-bsa-events/bsa-digital-sociology-group-workshop/

This workshop will introduce participants to some of the most important concepts, terminology, and methods of analysis for social scientists who want to work with social media data.

Social media have become an increasingly central part of many peoples' lives and now often play a prominent role in social, cultural and political discussion and debate. Twitter, Facebook, Instagram and other media are used for everyday interactions by many, some people also use them to build professional networks and to market themselves to potential clients or employers.

Social media are also often used by news services in order to gather opinion and information on stories which in some cases is replacing investigative journalism. Political parties now use social media to target voters with particular messages and to build their electoral strategies.

This session will focus on analyzing Twitter data with a hands-on overview of one of the most widely used software packages, NodeXL. Participants will get the chance to work on conducting some basic analysis of Twitter data with help from an expert in social media analysis. The registration fee for the workshop includes one day access to NodeXL.

No prior knowledge of social media analysis or quantitative research skills is required. A Twitter account is desirable to access some of the tools, but this can be created during the workshop.

The workshop will be delivered by Wasim Ahmed, a PhD researcher in the Information School and a Research Associate at the Management School at The University of Sheffield and also a social media analysis consultant. He has written about social media analysis tools on the [1]LSE Impact of Social Sciences Blog and on [2]his personal blog.

Venue: Leslie Silver Building G28, Leeds Beckett University, City Campus, Leeds, United Kingdom LS1 3HE

Call for papers: archives & traces of the past (2016-10-23 08:00)

A one-day conference will be held at the University of Edinburgh on Friday 13 January 2017, to explore the impact of new technological, conceptual and methodological ideas on how archives and their contents are now being used to 'research the past', and what claims can be made for the result. This call for is for papers regarding all forms of archival research, with 'the archive' cast wide to spread from National Archives, to local archives, to buttonboxes and photograph albums, to radical-archives-in-the-making, to digital collections and more, and how 'the trace' shapes up in relation to them. More information on the conference theme, papers and a registration form is in the attached file.

The idea of 'the trace' concerns the flotsam and jetsam of the things of the past that remain and which necessarily inform or shape present-time investigations of times gone by. Traces can be written, visual, oral, material, musical, digital... Currently 'the trace' is being multiply impacted at ontological, epistemological, methodological and material levels by a succession of developments - including new theory, expanded ideas about archives, innovative methodologies, and new technological developments around digital images and electronic forms of assemblage and representation. There are powerful reverberations resulting. For some, what is 'an archive', what is 'a collection' and what is 'a document' are now all up for grabs. For others, the trace remains at a kaleidoscopic core and has to be reckoned with. So let's stand back and talk about it!

Please send a title and an abstract of not more than 400 words with your offer of a paper as an email attachment to Liz Stanley, Sociology, University of Edinburgh, email address: [liz.stanley@ed.ac.uk]

Closing date for offers: The closing date for offers of papers is Monday 7 November 2016.

Registration for attendance: Registration for the event is open NOW! There is no charge. However, room capacity is limited and therefore early registration is encouraged. There is a registration form in the attached email - please complete and send the form to the email address above. The final date for registration will be 18 December, but numbers will be limited to 40, so please register asap to avoid disappointment.

Marx Reloaded (2016-10-24 08:00)

https://www.youtube.com/watch?v=9uYjQgpjOx0

Marx Reloaded is a cultural documentary that examines the relevance of German socialist and philosopher Karl Marx's ideas for understanding the global economic and financial crisis of 2008-09. The crisis triggered the deepest global recession in 70 years and prompted the US government to spend more than 1 trillion dollars in order to rescue its banking system from collapse. Today the full implications of the crisis in Europe and around the world still remain unclear. Nevertheless, should we accept the crisis as an unfortunate side-effect of the free market? Or is there another explanation as to why it happened and its likely effects on our society, our economy and our whole
way of life? Written and directed by Jason Barker - himself an experienced writer, lecturer, translator and doctor of philosophy - Marx Reloaded comprises interviews with the world’s leading philosophers of Marxism, including those at the forefront of a popular revival in Marxist and communist ideas. The film also includes interviews with skeptics of this revival as well as light-hearted animation sequences which follow Marx’s adventures through the matrix of his own ideas.

The exciting future of personal communications (2016-10-25 08:00)

From Fantastic Four #52 (July 1966):
The Shifting Sources of Hostility to the Accelerated Academy (2016-10-25 10:49)

The hostility to speed in the ‘accelerated academy’ predates the current fashion to complain about it and blame it on neo-liberalism. I was already reviewing a book by the Dutch sociologist and public intellectual, Dick Pels, on ‘fast science’ for the British Journal of Sociology in 2004, where he basically advocated ‘slow science’ on the model of ‘slow food’, something nowadays popular with the anti-accelerationists. (Unfortunately Pels used the stilted phrase ‘unhastening science’).
What people complain about – sorry I meant ‘critique’ – as the ‘accelerated academy’ is a personalization of a phenomenon that was already recognized at the aggregate level a half-century ago: namely, that the research frontier moves more rapidly as more people are brought into the knowledge production process. This is an idea that goes back to Condorcet and the Enlightenment and justified the promotion of education to unleash humanity’s hidden potential to build a Heaven on Earth. It was seen as a relatively good thing back then – a less science-fictional version of Ray Kurzweil’s visions of the Singularity today.

By the early 1960s the physicist-turned-historian Derek de Solla Price was charting the various acceleration curves based on citation counts in scientific journals, which had become easy to do with the creation of the Science Citation Index (now ‘Web of Science’). Indeed, Price was the first to use such counts to measure and evaluate knowledge production in general – and draw some interesting policy conclusions. It was the start of the field of ‘scientometrics’. On this basis Price coined the famous little/big science distinction, which continues to frame science policy discourse.

However, the sense of ‘acceleration’ of concern to Price and most policymakers ignored the micro level – that is, what effect it would have on individuals facing an already competitive world opening up to many more competitors. Economists know about this scenario, and reckon that to survive under such market conditions one needs to produce more efficiently. But they’re still looking at it from a macro-level because they imagine that this will drive down prices for existing products which in turn will draw in more consumers, which will enable everyone to live happily ever after.

But at a micro-level this means that you can end up driving yourself and others to ground. Even before neo-liberalism, a gender-based critique of the natural sciences emerged because if you need to spend 24/7 in the lab to get competitive results, then women with child-caring duties are disadvantaged. In any case, complaints about the mentality and lifestyle that it takes to survive in the highly competitive world of the natural sciences predate neo-liberalism.

What’s distinctive now about the ‘accelerated academy’ is less to do with people working more hours than that they need to divide those hours between doing the work and accounting for the work. That places the real psychic burden. In the past, the main regular accounting that academics had to do was in the form of peer reviewed publications, which to be sure can be a real psychic burden! But now add to it the need to write grant proposals – regardless of whether one truly needs them – and the periodic self-reporting of activities and achievements, often to more than one authority.

From Derek Price’s standpoint fifty years ago, this development would appear to be a wastage unleashed as a result of more people having been brought into the knowledge production process. But it’s not clear how he or his peers from the 1960s would have addressed the matter. It’s entirely possible that they would have simply called for the use of more ‘unobtrusive measures’ of accountancy, to use a phrase of the time. Nowadays we call it surveillance.

Postscript: When I reviewed Pels’ book, I observed that the sort of people he classed as ‘slow’ – e.g. Ludwig Wittgenstein – simply did not publish a lot in their lifetime. But after they died, it became clear that they had been writing quite a lot. In other words, the illusion of slowness in someone like Wittgenstein reflected Pels’ implicit association of speed of publication with speed of thought. What Pels valorized and others might abhor as ‘slow science’ was ultimately about slow accounting for science. It’s easy, then, to see how the neo-liberal style of knowledge production starts to get an intuitive hold.

Essay Competition: Crossing Disciplinary Borders and Into the Future (2016-10-26 08:00)

CfP - Contemporary Boys' Literacies / Boys' Literatures (2016-10-26 20:17)

Boyhood Studies: An Interdisciplinary Journal

Special Issue Contemporary Boys' Literacies / Boys' Literatures

For the Fall 2017 issue of Boyhood Studies: An Interdisciplinary Journal (Volume 10), the editors invite original contributions to the wide and dynamic fields of contemporary boys’ literacy and boys’ literature. Especially
welcomed are critical and international perspectives on current, global and digital landscapes of texts as they speak to, and are inhabited by, boys. Manuscripts focusing on boys’ reading/writing attitudes, preferences, practices, or performances, or on gender-focused/gender-critical literacy teaching practices or policy, will be considered as well. The following perspectives fall within the CFP scope but do not exhaust it.

- Boys and multi-media/cross-media multiliteracies
- Mobile/wifi literacies and boys' geographies; boys' literature in a changing landscape of e-books and e-readers; boys and/in the blogosphere
- Understanding literacies and gender gaps
- Boys and contemporary/emergent game literacies
- Contemporary literacy theories and/vs contemporary gender theories
- Boys and/in the (digital) literacy classroom
- A/S/L/P: Texting/sexting/cyberbullying/cyberromancing and young genders/maturities
- Affect/Script/Discourse and readerly/writerly boyhoods
- Boys’ engagement with "content" and news in times/spaces of newsfeeds, walls, timelines, YouTube, NetFlix, and multi-group chat socialities
- Privilege, gender and textual access/opportunities in childhood and adolescence
- Changing intersections and interfaces for boys’ literacy/literature & race, & class, & sexuality, etc.

Authors are encouraged to contact Guest Editor Garth Stahl (garth.stahl@gmail.com) with queries, ideas or abstracts.

Article Submissions

First drafts are due February 1st, 2017

Final accepted drafts are due July 1, 2017. Publication is in Fall 2017.

The standard length of articles is 6,500 words, although shorter or longer manuscripts will be considered. Please follow the Chicago Manual of Style, 16th edition.

Authors should submit articles electronically as attachments by e-mail (Microsoft Word file or equivalent).

Formal submissions to: boyhoodstudies@gmail.com

Boyhood Studies (BHS) is published and distributed in print and online by Berghahn Journals

Visit BHS online for further details, including submission guidelines:

http://journals.berghahnbooks.com/boyhood-studies/
This proposed edited collection draws on interdisciplinary perspectives of space and place in order to investigate young people’s identities. The goal is to assemble an international collection which enhances our understanding of the theories employed in the study of youth identity practices as they negotiate a sense of belonging. More specifically, we seek to understand the manner in which the practices, discourses and ethos of a particular locales, spaces and institutions shape the dispositions and ‘ways of being’ for young people (Stahl and Habib, 2016).

How young people’s negotiate belonging in everyday life remains an emerging area of scholarship, with conceptual overlaps in how youth come to understand their positions in fragmented societies (cf. Clayton, 2011;
Identity construction takes place in and through the making of places, defined by Relph (1976, 141) as “directly experienced phenomena of the lived-world” and “fusions of human and natural order [that] are the significant centres of our immediate experiences of the world.” Theories of social change such as those of Beck (1992) and Giddens (1991) have had a significant impact on the sociology of youth (Woodman 2009). However, as Farrugia argues: “‘The image of a homogeneous modernity must be replaced by a spatialised sociology of youth biographies that is open to the geographies of inequality that structure youth transitions” (2013, 300). Fundamental to research on youth, young people can construct status and meaningful identities for themselves through conceptions of belonging, investment in peer cultures and via relationships with ‘territories’ and places.

This proposed collection seeks theory-driven work on youth and belonging from diverse contexts. Empirical studies are welcomed but the emphasis should be on evaluating theoretical approaches to conceptions of youth and belonging. Submissions might consider: the rural, urban, the Global North/South, the local/national/transnational, and transitions, displacements and mobilities. Chapters could also reference key sites and institutions in young people’s lives: school/college, home, places of worship, community/cultural centres, sport/youth clubs, the street, spaces of consumption, juvenile detentions, refugee camps, the (territorial) army/cadets/scouts etc.

Indicative topics may include, but are not limited to, the following theoretical engagements with:

- The spatial dimensions of established themes in youth studies, such as youth transitions, cultures/subcultures;
- The spatial dimensions of social divisions such as class, gender or race in reference to belonging;
- Spatially informed local, national or international comparisons;
- Mobilities, immobilities and displacement/diaspora;
- Critical pedagogies of place;
- Neoliberalisation, glocalisation and superdiversity.

**Instructions for Submissions**

Authors are invited to discuss proposed chapters with the editors.

Interested scholars are encouraged to submit a 250 word abstract by **15th December 2016** to:
Dr Garth Stahl, University of South Australia - garth.stahl@gmail.com
Dr Sadia Habib - phdsadia@gmail.com
Dr Mike Ward - m.r.m.ward@swansea.ac.uk

We aim to submit full proposal to BSA Sociological Futures on Jan 15th 2017. **At this point in time though we only require abstracts.**
The Practice of Public Sociology (2016-10-27 08:00)

The Practice of Public Sociology

Manchester Digital Laboratory
November 24th, Manchester, 9.30-18.00

For over a decade public sociology has been a mainstream topic of discussion within the discipline. While practiced prior to the 2004 address by Michael Burawoy to the American Sociological Association, its identification and elaboration on an intellectual level was crucial to its popularisation. But is it possible that the voluminous literature that emerged in the years following has left us with a public sociology that is overly-discursive? While undoubtedly important, is there a risk that theorising about public sociology gets in the way of its practice? This event organised by The Sociological Review’s Early Career Forum takes as its starting point David Mellor’s 2011 argument that "we don’t need to debate public sociology anymore; we need to get good at it". We invite early career researchers who share this aim to join us for a day of workshops, discussion and debate about how we can collectively improve our practice of public sociology.

Confirmed Speakers

- Maddie Breeze, Queen Mary University
- Mark Carrigan, The Sociological Review
- Ipek Demir, University of Leicester
- Lambros Fatsis, University of Southampton
- Ruth Pearce, University of Warwick

Confirmed Workshops/Sessions

- Working with Print and Broadcast Media: Aaron Bastani, Novara Media
- Teaching Public Sociology: Maddie Breeze, Queen Mary University and Karl Johnson, Queen Mary University
• Working with Social Media: Mark Carrigan, The Sociological Review
• Working with Community Groups: Dan Silver, Social Action & Research Foundation
• Working with Photo Archives: Ben Kyneswood, Photo Mining

This event is free, but registration is compulsory. You can register here:[1]https://www.eventbrite.co.uk/e/the-practice-of-public-sociology-sociological-review-early-career-event-tickets-28652394082?utm_campaign=new_event_email&utm_medium=email&utm_source=eb_email&utm_term=viewmyevent_button

Places are extremely limited due to the size of the venue. Please do not sign up to this event unless you are sure you can attend. If you can no longer attend, please cancel your ticket asap by emailing Jenny Thatcher events@thesociologicalreview.com

For academic inquiries related to this event, please contact Mark Carrigan mark@markcarrigan.net

For all other inquiries related to this event, please email Jenny Thatcher events@thesociologicalreview.com

ECRs and PGRs Travel Bursaries

Sociological Review’s Early Career Board have a small number of travel bursaries available for early career researchers and postgraduate research student who would require assistant with travel costs. You can apply for by following this link: https://docs.google.com/a/thesociologicalreview.com/forms/d/e/1FAIpQLSfsrK7iy Kth0WZMf-NJX7gKZ6ZWKnUrppSUWo5wLKOead3ZA/viewform

The deadline for travel bursary applications is Sunday 30th October 2016, 00.00 GMT

BSA Early Career Forum Regional Events 2017 - Call for Proposals (2016-10-28 08:00)

Call for BSA Regional Early Career Event Proposals 2017

Launched in 2009, the BSA Early Career Forum (ECF) recognises the distinct set of challenges facing early career sociologists in the current academic and employment climate and aims to provide support and assistance to meet the specific needs of this community.

We are looking for early career academics willing to co-ordinate with speakers and the BSA to organise a day event at the applicant’s institution. The BSA will provide up to £1,000 support for the event and registration rates should be £10 for BSA members to attend and £25 for non-members.

The grant can be used to pay for room hire, speakers, lunch and refreshments. Organisers are encouraged to seek a contribution from the host institution, such as free meeting room or a financial contribution to refreshments.
The BSA Office will also promote and publicise the event through a number of outlets including flyers in membership packs, the BSA website and member e-newsletters.

Bids for the fund would need to provide a short justification and description of the proposed event, a budget, and an explanation as to how relevant for ECF members the proposed event is. The fund is available only for events outside of London, to support networking and events across the country.

Applications should be no more than 1,000 words. Please include your name, current position and years since awarded PhD or have been working.

Please email your proposal to the [1]BSA Events Team and address all correspondence: BSA ECF REGIONAL EVENT 2017.

All applicants must be a current BSA member. If you would like to become a BSA member visit our [2]website for more information.

The submission deadline for proposals is: 5pm on Wednesday, 10th November 2016. Late applications will not be considered.

Proposals should include the following details:

Name of organiser(s):

Institution(s):

Proposal for Regional Early Career Event:

- Proposed dates
- Proposed theme
- Potential speakers
- Anticipated costs
Please note the following criteria are used to judge applications

All applications will be considered by the membership services directors and an Early Career Forum convenor. A final decision is then made by the Trustees taking into consideration the feedback from the Early Career Forum convenor and based on the following selection criteria:

- Breadth of appeal beyond the organising group
- Centrality to sociological concerns
- Quality of information provided
- Geographical spread
- Distinctiveness from previous events and institutions
- Relevance to early career sociologists

Work, employment and society: join the associate board (2016-10-31 08:00)

Work, employment and society Associate Board
Call for Applications

Deadline: Thursday 10 November 2016, 17:00 (GMT)

Dear colleagues,

Work, employment and society invites applications to join its Associate Board. Successful candidates will become members of the Board from January 2017, for a period of three years.

The WES Associate Board is made up of 30 scholars, both junior and senior academics, who commit themselves to reviewing up to 10 papers a year for the journal. The Associate Board is open to both junior and senior academics with a PhD, or equivalent, in any area covered by the journal or in a relevant subject. International and UK applications will be considered. You do not need to be a member of the BSA to apply for a position on the Associate Board; however successful candidates are required to join the Association.

The Associate Board requires members with a broad range of expertise, although preference will be given to those whose expertise is in demand by the journal. The following areas of expertise are particularly needed:

- Gender, work and employment
- Labour markets
- Knowledge work/the professions
- International and comparative sociology of work and employment
- Unpaid, invisible and ‘non-standard’ forms of work and employment
- Migration
- Intersectionality
- Creative industries
- Economic/labour geography

The online application form and further information about applying to the Editorial Board can be found online at: [1]www.uk-engage.org/britsocwesab If you have queries about the application process, please contact UK Engage, who are running the election process at: [2]britsoc@uk-engage.org

If you would like further information about the role, please contact Professor Jacqueline O'Reilly (Chair of the Editorial Board) at [3]J.O'Reilly@brighton.ac.uk

2. [mailto:britsoc@uk-engage.org](mailto:britsoc@uk-engage.org)
3. [mailto:J.O'Reilly@brighton.ac.uk](mailto:J.O'Reilly@brighton.ac.uk)
The point of departure of this special issue for the Dutch Journal of Gender Studies (Tijdschrift voor Genderstudies) is the University of Amsterdam's student occupation in the spring of 2015 and the banner hanging from the front of its main administrative building, 'het Maagdenhuis', stating: 'No Democratization without Decolonization'. This local call for a decolonisation of education, the curriculum, and the University system connected contemporary voices and struggles in the city of Amsterdam to other voices in the margins of academic institutions both in the Global South and in Europe and the US asking: 'Why is my curriculum white? Why isn’t my professor black?' These powerful questions also brought to renewed visibility the long-term social political struggles and intellectual traditions within and outside the Dutch University, which have been critically engaging with racism, discrimination, and exclusion (Loewenthal, 1984; Essed, 1991; Essed & Hoving, 2014, Wekker, 2015). In Belgium, student activism is steadily growing, but remains as yet low profile. Nevertheless, universities and university colleges increasingly underwrite the importance of 'diversity' by implementing diversity policies and employing 'diversity officers'. It remains to be seen how such engagements translate into practice and relate to calls for a radical decolonisation of academic institutions.

For the editors of this special issue, these events not only point at the centrality of addressing colonial pasts of our academic institutions, but also present a broader invitation to ask how knowledge is produced and taught at universities and for whose benefits. This special issue seeks contributions that engage creatively with the various intellectual and/or activist traditions that are addressing these questions. Contributions can address the Dutch and Belgium context, but we also welcome articles from and about other countries and regions.

The question of decolonising the university speaks to debates and research on the politics of knowledge and the analysis of power relations, which have been profoundly shaped by critical feminist agendas. Black, Chicana, ‘First nations’/ Indigenous/communitarian, and decolonial feminisms have been at the forefront of the struggle to decolonise the university and the knowledge structures that remain complicit with intersectional forms of domination. To decolonise a modern/colonial institution such as the University and its curricula requires a politics of coalition building (Lugones, 2003, 2008), and a praxis of intersectionality (Bilge & Collins, 2016). While decolonial thought acknowledges gender as a key analytical category, it has also engaged with its coloniality and the need to develop new ways of embodied thought and praxis (Lugones, 2003, 2008; Icaza & Vázquez, 2016). This raises questions about the decolonisation of gender as an axial reflection for the transformation not only of women’s studies but of our practices of knowledge and the university as a whole. Furthermore, this encourages reflection on the invisible norms shaping universities as institutional spaces that assume certain bodies (white/male) as the norm, making the 'others' into 'space invaders', bodies out of place (Ahmed, 2012; Puwar, 2004).

This special issue seeks contributions that speak to one or more of the following agendas:

- reflect on/with movements and initiatives both in the Global South and in the Global North that are seeking to decolonise the University
- consider interventions across the world to decolonise learning and the University and their interconnections
- examine the specificities of local autonomous practices to decolonise knowledge and learning
- share pedagogical experiences with decolonising the curriculum, in gender studies and beyond
- develop conceptual and ethical articulations of decolonisation of learning and the University
- discuss the challenges of building political coalitions supporting the decolonisation of learning and the University

- trace the historical precedents and the local/national/international impulses moving these struggles forward

- reflect on the relevance of the decolonisation of gender as a turning point for the transformation of the University

Research articles are subjected to a double blind peer review process. Articles can be submitted in English or in Dutch.

As well as research articles, the journal welcomes essays, columns (short topical and polemical articles), interviews, and visual essays.

The Dutch Journal of Gender Studies (Tijdschrift voor Genderstudies) is published by Amsterdam University Press:

A New World...Out of Nothing (2016-11-02 08:00)

You are cordially invited to the workshop

**A New World... Out of Nothing**

(16th November 2016, University of Warwick, 1pm - 6pm)
A group of experts will guide our journey:

[1] Prof Jeremy Gray (University of Warwick and Open University), Historian of Mathematics

[2] Dr Mairi Walker (University of Edinburgh), Mathematics Engagement Officer

[3] Prof Robert Lambourne (Open University), Professor of Educational Physics

This interactive, interdisciplinary workshop will tell the story of how a Non-Euclidean Geometry was discovered in the 19th century and how this breakthrough has influenced work in the arts, literature and fiction, and is the basis of some fundamental discoveries in physics, such as relativity. There will also be a panel discussion about how to communicate science to non-experts. The workshop is open to everybody, and is ideal for anybody who wants to learn complex concepts in an informal fun way. No prior knowledge of mathematics is required. The event is organised by [6] Dr Francesca Iezzi - a mathematician who works on an interdisciplinary project at the [7] Warwick Institute for Advanced Teaching and Learning and is passionate not only about algebraic geometry, but also about communicating mathematics to non-mathematicians. Registration is free but required. Places are limited and allocated on a first come first served basis. For more information and to register visit: [8] www.warwick.ac.uk/iatl/new_world

Big Data and New Skills (2016-11-03 08:00)

A panel on the challenge of big data which took place at the International Sociological Association’s Logic & Methodologies conference.

https://www.youtube.com/watch?v=N51-LvKXr6g

Bringing together a panel of academic experts, this event calls upon the panelists to discuss the challenges and opportunities facing research and teaching skills in this new world of big data analytics. In this age of Big Data, new paradigms will be needed not only for research methodology, but also for study design and interpretation, cross-disciplinary collaboration, data curation and dissemination, visualization, replication, and research ethics.

This panel explores the various ways in which teaching and research methods are being adapted and influenced by the vast number of new data sources and methodological innovations, as well as the changing demands of the field.

What impact will the changing data environment have on social research?
How are research methods changing because of these influences?
What developments are being seen in qualitative, quantitative and mixed methods teaching as a result?
These topics are explored as panelists debate what the research of the future will look like and what teaching and research skills will be needed to address it.

The expert panelists for the debate include:

Professor Henrietta O'Connor
Professor Barbara Kawulich
Dr Mark Carrigan
Professor Nigel Fielding
Dr Kingsley Purdam
Dr Vera Toepool

The debate was chaired by:

Dr Jerry Coulton

Upcoming @BalanceNetwork events (2016-11-04 08:00)

An update on forthcoming events from this [1]fascinating interdisciplinary research network:
THREE CAFÉS: EXPERIENTIAL ARTISTIC RESEARCH EXPLORING INTER-RELATIONSHIPS BETWEEN DIGITAL TECHNOLOGY AND WELLBEING - 23 November & 28 November, Cambridge

Anglia Ruskin University’s Marina Velez, Davide Natalini, and Debby Lauder are leading a trio of experimental interventions, designed to open up discursive spaces for interactive and experiential research as to how digital technology increasingly serves to shape our perception, determine our communication, frame our identity, inform our self-awareness and underpin our social interactions. The three events will be "Embracing Technology" (23 Nov, 4-6pm, Espresso Library, Cambridge), "Refusal of Technology" (23 Nov, CB2 Cafe, 6-8pm, Cambridge) and "Discussion and Co-production" (28 Nov, 6-8pm, Thirsty, Cambridge). For more information contact [2]Marina.

ICT SKILLS AND ONLINE PLATFORMS FOR SOCIAL INCLUSION, workshop and evidence-based paper, workshop: 28 November afternoon, Coventry

Dr Sally-Anne Barnes and Professor Anne Green of University of Warwick and Professor Leela Damodaran of Loughborough University are drafting an evidence-based paper focusing on the skills and attributes needed to successfully gain and sustain work via online platforms. A workshop with experts and local/national policy makers will be held as part of this project. For more information, and if you are interested in contributing, contact [3]Sally-Anne.

THE ROLE OF MICRO BOUNDARIES FOR WORK-LIFE BALANCE, individual diary studies & intervention workshops, workshops: 1, 3 & 5 December, London,

Marta E. Cecchinato, PhD student, and Dr Anna L. Cox of UCL have received funding to gain insight into the use of "microboundaries" by knowledge workers who are experiencing work-life balance challenges. Microboundaries limit the negative effects of work-life cross-overs, such as the interrupting effect of notifications at inopportune moments. The diary studies will be organized in November with the Intervention workshops in December. There are websites set up to learn more about both the [4]diary studies and [5]workshops. For more information, contact [6]Marta.

[7]WORK-LIFE BALANCE WITHIN THE IT PROFESSION, half-day seminar with the British Computer Society, 7 December afternoon, Portsmouth

Dr Penny Hart, Dr Penny Ross and Dr Carl Adams of the School of Computing at University of Portsmouth received funding to attend the World IT project committee meeting in August. They will be running a Balance Network seminar co-hosted by the British Computer Society (BCS) on 7 December. The team will be analysing the World IT project’s extensive survey of IT professionals, which captured cultural and contextual differences across the technology workforce, from a work-life balance perspective. For more information, visit their [8]registration page or contact [9]Penny H.

[10]MANAGING TECHNOLOGY AROUND WORK AND LIFE: DESIGN CHALLENGES, design workshop, 13 December, Sheffield

Dr Luigina Ciolfi and Dr Eleanor Lockley of The Cultural Communication and Computing Research Institute at Sheffield Hallam University will design and lead research and networking activities regarding various strategies of technology appropriation that individuals implement to handle work and life demands. These activities will include a series of interviews followed by a design workshop on 13 December in Sheffield, featuring a keynote presentation by Professor Susanne Bødker (Aarhus University, Denmark). At the workshop participants will help create technology concepts to support work and home lives. Following the event, an interest group on work-life technology design will be established. For more
DIGITAL SCHOLARS IN A MOBILE WORLD, one-day research symposium exploring work-life balance in academic lifeworlds, 14 December, Kingston-upon-Hull

This symposium in early December, led by Josef Ploner & Anastasia Gouseti of the University of Hull, will gather UK-based early career academics from across the disciplines, working in the areas of higher education research, academic mobility and new/digital technologies within professional contexts. Speakers will include: Dr. Aparecido Fabiano Pinatti de Carvalho of Universität Siegen, Dr Jude Fransman of Open University, Dr Emily F. Henderson of University of Warwick and Prof Gail Kinman (University of Bedfordshire). At the event, participants will share current and ongoing research into work-life balance within academic contexts and begin to build a collaborative network in view of future research activities. For more information, contact [12]Josef.

[14]CONVERSATION PIECES, series of two-hour design workshops, 12, 13 or 14 December, 10 am to midday, London

A poster for this activity can be downloaded below. Paulina Yurman, a PhD Student in Goldsmiths Design Department, will be hosting a series of two hour workshops in early December. At each event, novel design proposals will be presented to participants, as semi-working artefacts or as images. The proposals will revolve around the tensions and ambivalences brought by digital devices in families with young children, as they blur the boundaries between work and play. For more information, contact [15]Paulina.

BALANCING WORK AND MILITARY SPOUSE LIFE IN THE DIGITAL AGE, 19 December, Northamptonshire

Dr Lisa Wood of Lancaster Medical School at Lancaster University, will lead a one-day workshop in collaboration with Tracy Hauver, a student at University of Liverpool. The workshop will explore opportunities and barriers in socio-digital support for military spouses and families. The hypermobility of this group provides a valuable site for exploration of new patterns of working and family life, the impacts of hyper mobility and the everyday use of digital technologies in family life. During the workshop, participants will discuss possible digital futures and help generate priorities for future research. After the New Year, Lisa and Tracy will continue the project with on-line focus groups. Spaces are extremely limited, but for more information, contact [16]Lisa.

[17]CO-DESIGNING SMART OBJECTS FOR HEALTHIER OFFICE WORK BEHAVIOURS, half-day workshop on 19 October in Nottingham

A poster for this activity can be downloaded below. Yitong Huang, a PhD student from the Horizon CDT, hosted a half-day workshop on October 19 to engage stakeholders of work health in co-designing novel behaviour change interventions, delivered with smart office objects that are digitally augmented with sensing and computing capabilities and connected to each. She introduced accessible tools for intervention development and rough prototyping techniques (e.g. ideation card, sketches, plug-and-play sensors) to facilitate collaborative thinking and exchange of multidisciplinary perspectives to this issue. For more information, contact [18]Yitong.

Social Media and Open Research: What Does ‘Open’ Mean? (2016-11-06 08:00)

In the not too distant past, the use of social media in higher education was seen as a curiosity at best. Perhaps something to be explained or inquired into but certainly not something deemed relevant to scholarship. Yet it’s now increasingly hard to move without encountering the idea that social media is something of value for academics. The reasons offered are probably quite familiar by now. It helps ensure your research is visible, both inside and outside the academy, helping build an audience for your publications and an impact for their findings. It expands your professional networks. It makes research more open and researchers more accountable to the people who ultimately fund their work.

If not quite at the level of ‘common sense’ yet, I suspect these points soon will be regarded as such, at least by young scholars. On the surface, we seem to have witnessed a fairly significant change, but is it a positive one?

In many ways I think it’s not because so much of this discussion is preoccupied by individuals and how social media can help their careers. It becomes one more facet in the ideal package of academic skills which are seen to be necessary to thrive in the contemporary academy. Bring in your grants. Publish highly cited papers in high impact journals. Get good teaching reports. Build an audience on social media. The unspoken corollary of social media helping build careers is how being unwilling or unable to engage in it might harm your career. Through their social media use, academics signal their orientation towards accumulating visibility for their institution and generating impact through their research.

At least this is how I think research mangers are beginning to see social media: as a signal for impact willingness and a proxy for impact capacity. A demonstrable capacity to build an audience with social media becomes just another characteristics of what Liz Morrish recently described as the upwardly mobile young ‘Trump academic’ liable to thrive under contemporary conditions.

This way of thinking about social media for academics positions it as ‘just one more thing to do’. You do your research and then you spend time ‘networking’, developing your ‘brand’, building an audience and disseminating your research. It’s seen as an additional demand, above and beyond the many other responsibilities people are already subject to. You do it as a means to an end, in order to help meet demands placed upon you at work.

On this level, it’s a clear example of what the anthropologist Melissa Gregg describes as ‘function creep’: the tendency of new technology to increase the demands placed upon people at work without any comparable increase in reimbursement or recognition. Bit by bit, the job gets more demanding, often in subtle ways which escape our notice on a day-to-day level. We have more to do. We feel tired more frequently. The bottom of our to-do list seems further each on each successive day. But the job market is unwelcoming and self-branding of this sort can feel ‘career protection in uncertain times’ as one particularly off-putting social media guru put it a few years ago.

This instrumental approach to social media is one which universities are beginning to encourage through the training they offer, their expectations of staff and the implicit messages which permeate institutions. It’s one which the rise of alt-metrics risks intensifying, as the responsibility increasingly falls to individual researchers to demonstrate that they’re able to win attention for their publications online (and empowers those journals who are able to help ensure this is the case, supplementing the existing hierarchy of ‘impact factor’ with a new hierarchy of ‘alt metric factor’, rather than breaking down these boundaries).
The problem is that winning attention for your work doesn’t take place in a vacuum. As Melissa Gregg puts it, “even uniqueness starts to sound the same when everyone is trying to perform”. If everyone is seeking to build an audience and stand out from the crowd then the challenge of achieving these aims spirals ever upwards, excluding ever more people from the process in gendered and classed ways while this subordination is masked by the powerful rhetoric of openness.

To give one example of trend, George Veletsianos found in a study of educational tweeters that “the top 1 percent of scholars have an average follower base nearly 700 times that of scholars in the bottom 50 percent and nearly 100 times that of scholars in the other 99 percent” ([1]loc 1162-1708). Rather than undermining old hierarchies, social media supplements new ones, with complex emergent effects: sometimes allowing the already celebrated to quickly amass a social media following or to allow those with a big social media following to translate this into academic capital.

The problem is that the encouragement to conflate value with popularity, as demonstrated through the metrics built into the platforms themselves, isn’t something new. It’s an extension of the endless metrics to which academics at UK are subject to in every other aspect of their working lives. This is ‘open’ in the sense of rendering individual workers transparent to their employers. Open in the sense of measuring all aspects of their performance in order to calibrate the precise balance of carrots and sticks they will be subjected to in their workplace. Open in the sense of holding them accountable if any of their actions reflect badly on the university or somehow run contrary to this month’s strategy for the corporate brand.

It’s not a desirable form of openness and we should be critical of it. We should be critical of an account of social media for academics which encourages behaviour that fits with it: using social media to signal your value to your institution, demonstrate your understanding of your employer’s priorities and to accumulate as much prestige for yourself as quickly as you can (obviously to be measured in terms of citation counts, alt metrics scores and follower counts).

But there’s another form of ‘openness’ we can see in how academics use social media. A relational, collaborative and solidaristic mode of engaging across boundaries. This is a mode of engaging which doesn’t see social media as ‘just another thing to do’ but rather as a way to do what we do anyway in a newly open and shared way. While the horizontal regulation of peer review, informal and otherwise, is increasingly being surmounted by the vertical regulation of metrics, there’s a possibility for new forms of shared engagement through social media that shouldn’t be dismissed. They may not change higher education but they can provide a bulwark against some of the more deleterious tendencies we see within it, at least if we resist the pressure to individualise and instrumentalise our use of it.

In a recent book called The Academic Diary, Les Back writes that Twitter sometimes facilitates our “inhabiting the attentiveness of another writer” by providing “signposts pointing to things going on in the world: a great article, an important book, a breaking story”. Through the things that others share, we sometimes enter into their world and participate in an economy of “hunches and tips” which is the “lifeblood of scholarship”. At risk of ruining a nice metaphor, a truly open approach to social media can help lifeblood of scholarship circulate much more widely and freely than it would otherwise. At a time of ever-increasing managerialism, intensifying demands and ever more granular monitoring this feels like something we need to try and protect.

**Dating on the Left (2016-11-07 08:00)**

A really interesting discussion of emotional labour and power dynamics within communities that regard themselves as politically radical:

https://soundcloud.com/novaramedia/dating-on-the-left

**Critical Realism & the Generative Structuralism of Bourdieu (2016-11-08 08:00)**

https://www.youtube.com/watch?v=2D5J6PamTv

Bourdieu has now become the hegemon in the field of social theory. Everybody knows the concepts of field, habitus, practice and symbolic violence by now. The common language even allows for discussion among colleagues and among disciplines. Commentaries on Bourdieu's critical sociology usually focus on the concept of habitus, but as everything else in his work, it is overdetermined by the field. The notion of field can be disclosed as a form of generative structuralism that is quite akin to critical realism. In this webinar, Frederic Vandenberghe analyzes the more epistemological parts of his work, show the influence of Cassirer and Bachelard with the intent to reclaim Bourdieu for critical realism.

**Inspiring Sociology (2016-11-08 11:58)**

This year I took over convening the Goldsmiths MA in Social Research. This degree has provided the place where we think about the craft of research. Initially, it was a degree set up by David Silverman and focused on qualitative research and provided a space to explore his development of ethnomethodology and conversation analysis. With the emergence of the new research training agenda in the 1990s the degree was expanded to include quantitative techniques in order to satisfy the Economic and Social Research Council priorities with regard to PhD Research Training.

Largely due to Aidan Kelly's expertise the degree became acknowledged as an innovative programme for the teaching quantitative methods. Aidan – who retired this year – has bequeathed a brilliant legacy of advanced quantitative methods training. In recent times we have balanced the quantitative courses with equally innovative approaches developed by Michaela Benson to teaching qualitative research including team-based ethnographies, training in qualitative analysis and writing journal articles and also using film reconstructions of fieldwork dramas reenacted by actors to bring research to life.

One of the dangers of teaching research methods is focusing on the practicalities rather than substance what we create in doing research. So this year we decided to ask our new students to choose their favourite pieces of research
and write a short review about it. Mark Carrigan has kindly offered to publish the best reviews of these examples of inspiring sociology included here.

Les Back
Convenor of the MA Social Research, Goldsmiths, University of London

The Extended Case Method by Michael Burawoy

MA Social Research Book Review (September 2016) by Zoe Walshe

In *The Extended Case Method*, Michael Burawoy brings together ethnographic field work that spans decades and continents to examine the intersection between theory and methodology. From his study of Zambian copper mines in the late 1960s, to a Chicago factory in the 1970s, to Hungary in the 1980s and a newly capitalist Russia in the 1990s, Burawoy has used the tools of participant observation to study workplaces during the great transformations of the twentieth century, taking the micro-processes of labour to develop macro-theory. Writing in the Marxist tradition, Burawoy’s case studies have addressed capitalist and socialist work practices, charting the demise of State socialism in eastern Europe, the marketisation of Russia, and decolonisation in Zambia. The methodological tradition of ethnography may not at first appear a conventional fit with the Marxist study of “great transformations”, but in this book Burawoy provides a compelling account of the particular insights that can be gained from the extended case method.

It is this extension from rich ethnographic micro-data to macro-forces, and furthermore, the extension of theory, that Burawoy is occupied with. Rejecting the singular dominance of positivist science, he calls for a dual approach including a reflexive science, where “the goal of research is not directed at establishing a definitive “truth” about an external world but at the continual improvement of existing theory” (2009: 68). Indeed, the constant reconstruction of theory is central to Burawoy’s vision for a sociological practice; “theory exists to be extended in the face of external anomalies and internal contradictions. We don’t start with data, we start with theory. Without theory we are blind - we cannot see the world” (Burawoy, 2009: 13). With Burawoy’s reflexive science, where ethnographic encounters can be extended and brought into dialogue with theory, data from local contexts can be used to support “exploration of broad historical patterns and macrostructures” (2009: 23). There is no need to only accept methods that fulfil the requirements of positivist science (e.g. surveys etc.), or to reject science completely as with postmodern approaches (2009: 23); Burawoy describes his theoretical positioning as “working on the borders of post-modernism, without ever overstepping the boundaries” (2009: 25). As sociologists, we use fieldwork to constantly refocus our lenses, to look at the world afresh, and this in turn is how we further science, “not by being right but by being wrong and obsessing about it” (2009: xiv).

I would recommend this book to other students of social research because it offers a detailed analysis of the meeting point between theory and methodology. Burawoy makes explicit the political implications of our choices as researchers, and in doing so, reminds us to be conscious of hegemonic methodological approaches. Sociology can be a space to challenge, or at least interrogate, dominant narratives but we will fail to do that unless recognise the operations of power and biases built into the tools of our trade. Burawoy’s argument that the extended case method:
In highlighting the ethnographic worlds of the local, it challenges the postulated omnipotence of the global, whether it be international capital, neoliberal politics, space of flows, or mass culture. Reflexive science valorises context, challenges reification, and thereby establishes the limits of positive methods. (Burawoy, 2009: 72)

Within this view, there is great potential in sociological practice, in the ethnographic encounter, and thus sociology is framed as a vital and necessary voice in the dialogues of our global society. Indeed, parts of the book feel like a call to arms to develop the sociological imagination. Burawoy writes boldly of the researchers need for courage:

We need first the courage of our convictions, then the courage to challenge our convictions, and finally the imagination to sustain our courage with theoretical reconstruction. If these reconstructions come at too great a cost we may have to abandon our theory altogether and start afresh with a new, interesting theory for which our case is once more an anomaly (Burawoy, 2009: 53).

As we begin on this course of study, these calls for absolute rigour combined with courage and imagination are perhaps a useful statement of intent to move forward with. The reminder of the need to, at times, abandon our theory is a valuable reminder of the importance of ‘getting it wrong’ - our complex, social world is constantly shifting and our methods and practice as researchers need to reflect that.

This book is a look back at how method and theory intertwine, and to his credit, Burawoy does not hesitate from critiquing earlier mistakes, or reflecting on the negative (as well as positive) outcomes of his research. He acknowledges he was “not methodologically self-conscious about theory extension in The Colour of Class”, however, it did underpin it. Elsewhere, he discusses the unforeseen consequences of his research in terms of the political fall out around Zambianization (see for example, pp 58-59, on ‘silencing’). In Chapter Three, Burawoy highlights the value of the “revisit” within the ethnographic process itself.

Out of Burawoy’s many published works, I chose The Extended Case Method to review because I admire its scale. This book in particular, published in 2009, is a culmination of Burawoy thinking and rethinking his work. Some of the chapters were first published as articles in 1989/1998/2003, and the research case studies themselves range from the 1960’s onwards. This perspective over time, the ability to look back and reflect on his earlier research with the benefit of hindsight, and also incorporate his later theoretical developments, is why I think the book may be of interest to other students of social research. Do read it.

Saskia Papadakis, MA Social Research summer assignment, September 2016
Reay's paper is an indictment of the English education system and its role over the past century in maintaining class structures which privilege the middle classes at the expense of the working classes. She takes Beck's (2004) claim that class is a ‘zombie category’ which has ceased to be relevant to current experiences of social stratification, and uses historical evidence and her own research on contemporary English schooling to show that class is a process which continues to shape students’ experiences, attainment, and trajectories.

Drawing on Bourdieu-influenced cultural class analysis expounded by Skeggs (2004), Savage (2000), and others, Reay argues that class is created and given value through cultural processes which result in the normalisation of the middle classes and the pathologisation of the working classes (Reay 2006: 289). She uses historical sources to show that the English education system has been both a product of a middle class concern with subordinating the working classes and a tool for the middle classes to accrue value through the privilging of middle class cultural capital. Reay then examines contemporary educational policy, stating that the extension of credentials to working class students has done little to address this inequality.

In the tradition of Willis' (1977) *Learning to Labour*, Reay uses ethnography to research working class experiences of education. As well as providing Reay with access to the natural context in which education takes place, ethnography allows her to privilege the voices of students whose opinions are not usually sought or valued. By combining focus groups, interviews, and class observations, Reay is able to analyse the role of class processes in student-teacher interaction and gain insight into student and teacher perspectives on the ways differing cultural backgrounds shape teaching and learning.

This article is compelling because of the strength of Reay's arguments, and the range and pertinence of the evidence she gathers to support her case. In the first half of the article, she marshals an impressive body of historical evidence to exemplify the influence of class concerns of the formation of the English education system. However, it is in the second half that the article comes into its own. Reay's judicious use of quotes from her data, alongside her own observations, vividly illuminates the pain with which working class students experience the daily inequalities and injustices of the education system. These inequalities may be engendered by education policies which favour the middle classes, but they are compounded by teachers’ inability to recognise class privilege. Reay gives working class students a voice, and in doing so shows that far from passively accepting the discrimination of their teachers, they are articulate, reflective, and critical.

I would recommend this article to anyone wishing to explore the position of class in the English education system, cultural class analysis and the concept of symbolic violence, and the use of ethnography to study institutions. It is an excellent example of how institutions legitimise the cultural values of a particular group, and in doing so position other groups as inferior.

Mitchell Duneier’s Sidewalk (1999) Review

Mary Bartlett MA SR.

Mitchell Duneier’s Sidewalk is a fascinating ethnography of poor ‘unhoused’ men, street vendors and panhandlers that work in the informal economy; which helps them to create their own society that can provide for their daily needs. Duneier writes with a skill that places you directly onto the streets of Greenwich Village, and it is that ability, to be transported into the events of the study that can capture a reader into valuing the informal social life of different groups within cities.

Not only that, ‘Sidewalk’ is complimented with photographs that were taken during the course of the study by the photographer Ovie Carter, and in a way, it is this photography that allows for other senses to be invited into the reading of the study. With Duneier’s prose and Carter’s photos, Sidewalk can additionally be experienced with Ludovico Einaudi’s album ‘I Giorni’. The track ‘Stella del Mattino’ takes you through the chaos of New York city life, and its links to all those that don’t participate in its conventional ways of living. Whilst the track ‘I Giorni’, brings you back to the ordeals of the informal economy; and it pieces Duneier’s theory together so eloquently alongside Carter’s visuals. The simplicity of the piano reminds you that the street vendors are just unordinary ordinary people.

Nevertheless, what’s mainly interesting about the book is Duneier’s use of a range of qualitative methods, which complement the aims of the interpretivist tradition, for the social understanding of Wilson and Kelling’s ‘broken windows’ theory and his own ‘fixed windows’ theory. His theory attempts to advocate for a ‘broken windows’ theory that respects the social actors who have retreated from conventional social norms.

‘Sidewalk’ also benefited from shared data collection responsibilities between the researcher and the participants. The people were able to become the participant observers in their own worlds, and they contributed in a way that makes it possible to analyse the methods of the social researcher. Consequently, one of the most thought provoking examples of this haphazard exchange in data collecting strategies can be found in part four of the book. The events of this section raise questions on research ethics and research methods. What is the right way to conduct research on social life without infringing on certain rights or overstepping on historical and societal tensions?

Is there a valid sociological case, for the differences in how multiple forms of power and historical tensions interacted with the black and white men on an intersectional level on Christmas day? Were the day’s events ones that raise
questions on research ethics and if so, how can social researchers distinguish between the different kinds of power that make up their subjects, and combine them with the nature of everyday intersectionality and rational ethics within sociological research?

The book leaves you asking whether or not Duneier breached experiments as a researcher on Christmas day, by setting up a stall in a vendor’s place and confronting a black police officer about the law that he attempted to enforce. This tense confrontation in the full view of the other participants shows that Duneier, was in part attempting to demonstrate that the informal way of living by the men in the study was justified by the law. But on the other hand, it also shows a situation of racial hierarchy that displaces power on a formal and racial level between the researcher and the researched.

Duneier’s 'Sidewalk' elicits new ways of thinking for approaching research methods and ethics, and it is a beautiful read for all new social researchers who wish to engage with multiple methods within social studies; especially methods that enable forms of “shared sociological authorship” within social research.

Conference Funding for ECRs from @TheSocReview (2016-11-08 16:26)

The Sociological Review
ECR Conference Funding Competition

Up to £1000 per applicant for unfunded PhD students and postdocs (within 3 years of completion) to facilitate their attendance and participation of conferences.

Deadline: January 31st 2017

See [1]here for full information and how to apply

Academia.edu: How to reproduce inequality in several easy steps (2016-11-09 08:00)

A study waiting to be done. Somebody? Here is the trigger:
So: how is academia.edu reproducing and reinforcing inequality?

- By spatially positioning the male academic above;
- By choosing an older male academic and a younger female;
- By listing the male as "faculty member" and the female as "graduate student", i.e. the female is subordinate in any academic hierarchy.
- the male is US, the female is UK. Both belong to the traditional "ivory stronghold" (Harvard, Oxford);
- By playing on the reader’s (un)conscious perception of elitism (see point above) and pandering to some readers’ desire to be accepted into such an elite club;
- By giving the male a generic name (John Smith, could have also been John Doe) but the female a somewhat more distinct and unusual name. While the first names, John and Mary, are both in the top 5 of common names in both the US and the UK, they remain just that: "white" and "Anglo-Saxon" names. However, compare their surnames: I cannot find data about the prevalence of surnames but I bet (on my own, extremely rare, surname) that Smith is more prevalent than Peterson. Peterson, by the way, is also an ironic surname. The son of Peter. The male child of a male person.
- Last but not least, and this bugs me most of all, though on its own it would be the least significant of all: the fictional female comes across as unprofessional. She has paid attention to her hair and necklace, but failed to notice the misspelt word “univeristy” on her profile listing. Which one would get the job? Well, that depends on whether you want someone interested in the history of Rome, or in the earth's magnetic field. Or does it also depend on whether you want a man or a woman? An older or younger person? Someone who can spell or someone sufficiently unfocused (or rushed) to misspell one of the key words on their CV? In the context of otherwise totally rigid adherence to the gender stereotype, the "reversal" of disciplines of each fictional academics’ bookmarked articles is particularly noteworthy. But actually this isn’t even a real reversal. The scholarship on the history of Rome is definitely dominated by the voices of people who look like our John Smith. And there are plenty of doctoral students and postdocs in geology and magnetospherics who look like Mary Peterson. But their post-PhD and post-first-postdoc drop-out rate from academia (known as “the leaky pipeline”) is [1]astounding - and very badly researched.

Perfect example of bias. So subtle it almost doesn’t matter. But every little adds up.
Oh, and don’t get me started on the "demonstrating your impact" thing. I’m fine with impact on its own. Impact is important. Well, positive impact is. Or disruption. Or preventing a negative impact. Generally, doing something worthwhile is important. But this...

CfP: Habit and Experience at the crossroads between Pragmatism, Neurosciences, and Social Ontology

Call For Papers

Conference: The Pragmatist Turn and Embodied Cognition: Habit and Experience at the crossroads between Pragmatism, Neurosciences, and Social Ontology, 6-7 April, 2017, University of Parma, Italy

Invited Speakers:

Vittorio Gallese (University of Parma)
Richard Menary (Macquarie University)
Daniel Hutto (University of Wollongong), TBC
Teed Rockwell (Sonoma State University)
Pierre Steiner (COSTECH/UTC, Paris)
Roberto Frega (IMM-CNRS, Paris)
Corrado Sinigaglia (Università di Milano)
Pentti Määttänen (University of Helsinki)
Arvi Särkelä (University of Luzern)

The aim of this conference is to account for the many facets of the role that pragmatism is nowadays playing as the main alternative to classical cognitive science, and the contribution that an interdisciplinary pragmatist approach could make to the renewal of social theory. The rediscovery of the contemporary relevance of classical pragmatist theories such as Dewey's, Peirce's, James', and Mead's will be a central issue. This topic will be addressed in a broad sense, dealing with the different aspects of the pragmatist turn involved by 4E cognitive science and their consequences for social sciences. A particular focus will be given to the fruitfulness of pragmatist notions such as 'habit' and 'experience' at the crossroads between social theory, neurosciences, and cognitive sciences.

The notion of habit and an understanding of experience as a process of habit formation constitute a major aspect of classical pragmatist approaches to cognition and social action. Still, since the middle of last century,
representational and intentionalist models have hegemonized cognitive sciences, action theory and social ontology. More recently, the importance of the notion of habit as a viable alternative to current paradigms in some of these fields is being rediscovered.

The aim of this conference is to evaluate in particular the contribution that the reconstruction of classical pragmatist approaches to habit and experience such as Dewey's, Mead's, Peirce's, and James' could make to current debates in cognitive sciences and social theory. Which role could pragmatist insights play in overcoming mind/body, mind/world, perception/action dualisms that have dominated research programs of the last decades and only recently are starting to be tackled?

In particular, we would like to explore how a habit based notion of experience inspired by pragmatism, could make it possible to appreciate the continuity between sensory, motor, and social aspects of action, and offer fruitful theoretical tools to embodied approaches to cognition, including mirror neuron-based research on embodied simulation. Could such a habit based understanding of social action offer also an alternative to socio-ontological models of action based on the notion of collective intentionality? And could the pragmatist naturalistic understanding of experience be implemented by experimental approaches to aesthetic perception? In addressing such question, the Parma Conference will gather philosophers, cognitive scientists and social theorists.

The conference is part of a joint research program organized in partnership with the conference Pragmatism, 4E cognitive science, and the sociality of human conduct (Paris, 7-9 december 2016).

Organizers: Fausto Caruana (University of Parma, Department of Neurosciences), Italo Testa (University of Parma, Department of Humanities - Philosophy).

We invite proposals for oral communications. Abstracts of 400 words should be sent to organizers no later than January 20, 2017. Acceptance will be notified before February 1th 2017. There are no registration fees; but selected participants will have to cover their travel and staying costs by themselves.

Any question should be addressed to one of the two organizers, Fausto Caruana ([1]fausto.caruana@unipr.it) or Italo Testa ([2]italo.testa@unipr.it)

Dates:

Call for Papers Deadline: January 20, 2017 (All day)

Acceptance Notification: February 1, 2017

Meeting: April 6, 2017 to April 7 2017

CfP: Theorizing the Web 2017 (2016-11-11 08:00)

Call for Papers

Theorizing the Web 2017*

April 7–8 in New York City*

At the Museum of the Moving Image, in Astoria, Queens

The submission deadline is January 22, 2017 (11:59 p.m. EST)

Started in 2011, Theorizing the Web is an annual event for critical, conceptual conversations about technology and society. Theorizing the Web begins with the assumption that to talk about technology is also to discuss the self and the social world. Debate around digital social technologies too often fails to apply the many relevant literatures of social thought. We do not think “theorizing” is solely the domain of academia, and we value clear and compelling arguments that avoid jargon. Here are some photos from last year’s event if you want to see the vibe of it all.

Theorizing the Web is a home for thinking about technology by people who may not think of themselves primarily as “tech” thinkers. Activists, journalists, technologists, writers, artists, and people who don’t identify as any of the above are all encouraged to submit. We especially invite submissions that engage with issues of social justice, power, inequality, and vulnerability from a diverse range of perspectives.

Submissions on any topic are welcome. Some general topical suggestions include the intersections between technology and identity, privacy, sexuality, the body, power, politics, surveillance, racism, sexism, ableism, harassment, space, code, design, knowledge, images, memes, attention, work, fiction, gaming, globalization, capitalism, and protest.

Submissions should be 300 to 500 words (only the first 500 words will be reviewed). The TtW Selection Committee will blindly review submissions and make decisions in early to mid-February. Space is limited, and our acceptance rate is typically 20-35%. The presentations themselves will be 12-minute talks in a panel setting. You will be speaking to a general audience who may not share your area of expertise.

The 2016 US Presidential Election Was Less about Populism than a Vote against Democracy
(2016-11-11 08:17)

Three facts are striking about the US presidential election:

1. Hillary Clinton won the popular vote, though she lost the Electoral College, which decides the presidency.

2. Voter turnout was much lower than initially expected, and this meant that especially Black voters – who overwhelmingly backed Clinton – came out in smaller numbers.

3. The pollsters got it wrong, and they especially got it wrong in places where the people who live there are most unlike themselves. And those people overwhelmingly voted for Trump. They've been called 'silent voters' in this election. Richard Nixon, following a rather similarly surprising victory in 1968, famously called them the 'silent majority'.

This doesn't look to me like populism but a loss of faith in democracy. And here perhaps the most brilliant move of the Trump campaign was to declare that the vote was rigged before most of the votes had even been cast. This effectively discouraged the people who had most relied on the ballot box as their means to salvation from casting their vote. It also added to the cynical 'politics as usual' attitude that Trump had sown by portraying Clinton as standing for everything that's wrong with the federal government. However, the people who supported Trump weren't necessarily great believers in democracy, given their high tolerance for Trump's anti-democratic statements (even if eventually modified or reversed). What Trump's supporters liked about their man was his resolve – and his seeming ability – to get things done, by whatever means it takes.

The moral of the 2016 election then is that democracy itself – especially in the complex representational form that it takes in the United States – is the big loser. Like Brexit, the Trump phenomenon was made possible by a rage that doesn't add up to a positive plan of action. But much more explicitly than Brexit, which actually was brought about by an opening up of democratic processes (through the use of referendum), the 2016 US presidential election was a vote against the democratic system itself – both in terms of who voted and who didn't vote.

The pollsters got all this wrong perhaps because they mistakenly presumed that the voters shared their own and the political class's belief that their problems can in principle be solved at the ballot box. It will be interesting to see just how much Trump is tempted to fiddle with the US Constitution. Watch out especially for his Supreme
Court nominees, who are capable of doing the most long-term damage to the system. In any case, it should give pause to those of us who still believe in democratic processes about whether much is to be gained by staging mass protests saying ‘Trump is not my president!’ and promising endless resistance to whatever Trump does. It seems to me that this will only reinforce the view of Trump supporters that democracy is a broken system and requires still more radical remedies. But it is not at all clear how true believers in democracy go from there.

Thomas (2016-11-11 11:53:00)
As Wyndham Lewis once put it, it is also a vote against [1]“all the boring and wasteful sham-sciences that have sprung up in support of the great pretences of democracy.”

Steve Fuller (2016-11-11 11:58:08)
That’s sociology told! Eek!

fernandoleanme (2016-11-11 16:09:21)
Sometimes things happen because a butterfly flaps its wings. I believe Hillary lost Florida’s 29 electoral votes because Obama issued an order allowing tourists to bring more cigars and rum from Cuba. This was followed by Trump’s meeting with Bay of Pigs veterans, and his pledge to review what Obama was doing. The Obama order, Trump's reaction, and Hillary’s arrogant attitude towards the Cuban American community caused a 20% swing in their votes, and thus she lost Florida. And you won’t hear it on CNN.

Thomas (2016-11-12 06:52:16)
I think we may have to face the fact that sociology and democracy are incompatible. Sociology is an undemocratic inquiry into society. Democracy is an unscientific way of governing it. It is because psychologists and sociologists have supplanted poets and novelists as experts on who "we" are that we have lost faith in democracy—at a deeper level, we have simply lost faith in each other. Democracy is possible only on a "humanist" foundation.

Thomas (2016-11-12 08:22:23)
It’s time to relearn [1]the liberal arts of being ruled.

**Digital Sociology vs STS (2016-11-11 12:01)**

A joint Digital Sociology Study Group and STS Study Group Event at the Oxford Internet Institute

**Wednesday 13 December 2016, 13:00**

The Oxford Internet Institute 1st Giles Oxford, OX1 3JS The concept of Digital Sociology has been in circulation for around five years now. But if the British Sociological Association's annual conference is anything to go by, ‘the digital’ is still on the periphery of British Sociology. Perhaps problematically, Digital Sociology shares a stream with STS at the conference. We are taking this marriage of convenience as an opportunity for anyone interested in the future of Digital Sociology and STS to get together and discuss the following questions: Why do we need Digital
Sociology when we have STS? What are their affinities and disaffinities? Are digital methods and digital ontologies transformative for STS? What distinguishes Digital Sociology from all the other disciplines that claim to study the relationship between society and social media, the Internet, the Web and digital data? What use is the concept of Digital Sociology? How can we join forces across institutions to progress the project of Digital Sociology? To help us address these questions and similar questions that may arise on the day we are very pleased to have presentations from: Professor Susan Halford, Director of Southampton University’s Web Science Institute; Professor Will Housley, Vincent Wright Chair, Sciences Po & University of Cardiff; Dr Mark Carrigan, Research Fellow in the Centre for Social Ontology at the University of Warwick and Digital Fellow at The Sociological Review; Dr Karen Gregory and Dr Kate Orton-Johnson Lecturers in Digital Sociology at the University of Edinburgh; Kate and Dr Des Fitzgerald Lecturer in Sociology from the University of Cardiff (with more speakers to be confirmed). Each speaker will talk for around 10-15 minutes before we open-up the discussion to the floor. If you have any thoughts on those questions above or would like to get involved in the study groups please come along. It’s our intention to solicit your input for a plan of action. The meeting will be followed by a free drinks reception. Spaces are very limited please reserve your place as soon as possible. **Booking your place** Booking is essential. Venue numbers are restricted and it is advisable to book early. Registration Fees: BSA member £10 / Non-BSA member £15 Register Online at [https://portal.britsoc.co.uk/public/event/eventBooking.aspx?id=EVT10616](https://portal.britsoc.co.uk/public/event/eventBooking.aspx?id=EVT10616) For administration enquiries, please contact **events@britsoc.org.uk**

### Towards a Pirate Sociology (2016-11-12 08:00)

While this phrase summons up images for me of C. Wright Mills in a pirate costume, it’s important to be clear about the sense of ‘pirate’ invoked. As Gary Hall puts it in his [1]Pirate Philosophy, the etymology predates our cultural figure of ‘the pirate’ such that “the pirate here is someone who makes an attempt, tries, teases, troubles, gets experience of, endeavours, attacks.” (pg 121).

The pirate is someone who forever acts experimentally, narrowing the gap between idea and activity in a radically open-ended way. The point is to intervene and learn from the intervention, growing through doing rather than indefinitely postponing the moment of action in the name of being adequately prepared. The pirate acts as opportunities present themselves, seeing plans as nothing more than navigational aids to be dispensed with when the terrain on which they operate changes.

This orientation may leave the pirate as appearing to accelerate, but only in the sense of their multiplying points of engagement with their environment. The process of developing ideas can be slow, instantiated through the rapidity with which those ideas lead to actions. A constantly expanding repertoire of action can give the appearance of hyperactivity while the purposes underlying their deployment can become steadily more focused with time. The being of the pirate emerges through their doing.

The experimentalism of the pirate leaves them hostile to received wisdom but also to established standards. Institutional obstacles are situational constraints, sometimes to be strategically negotiated but more often to be probed, pushed or attacked. They are concerned to “attempt new economic, legal, and political systems and models for the production, publication, sharing, and diffusion of knowledge and ideas.” (pg 121) The pirate doesn’t care about being ‘productive’ but does want to be effective.
The pirate, I wish to argue, represents a figure who can thrive in the accelerated academy without being beholden to its imperatives.

Claudia Kowalchyk (2017-01-04 21:56:54)
I find that I was so deeply moved by your piece that I can't express myself properly. Therefore, I hope a mere Thank You will do.

Mark Carrigan (2017-01-06 13:34:30)
Nice to hear! You should definitely read Gary's book then!

The Philosophical Sociology of Pierre Bourdieu (2016-11-13 08:00)

I’m at an interesting workshop being given by Loic Wacquant on the practical application of Bourdieu’s social theory. An aspect that has really stood out to me so far is Wacquant’s presentation of Bourdieu’s work as a philosophical sociology.

The point is partly biographical, with Bourdieu’s transition into social research being a response to his national service in Algeria. As Wacquant puts it, “What happens if a philosopher of science stops philosophy of science and goes to do empirical research?” His commitment to social research represents an “emotional coping mechanism” in response to what he witnessed in Algeria, leaving him unable to be content with what he saw as the apolitical quietism of the philosopher. This biographical movement shaped his intellectual trajectory because it left him drawing on classical sociology and anthropology as intellectual tools to inform the practice of social research, as opposed to a conceptual fund to be drawn upon in preparation for research. The result was, argues Wacquant, a disregard for the dichotomies and dualisms which loom so large in doctoral pedagogy.

The intellectual consequences of this are what fascinate me though. This is how Wacquant describes the approach that follows from this, uniting the incredible range of his empirical concerns through a shared meta-theoretical impulse:

Take a classical question of philosophy (e.g. where do categories of judgement come from?) and historicise it, by finding a particular setting where that question is raised in terms of the character of that setting and answer it in terms of the character of that setting.

I find this a compelling idea. This is a wonderfully succinct and compelling expression of how the interface between sociology and philosophy can be conceived. This is something I’ve thought about a lot, as someone who came close to doing a philosophy phd before moving into sociology and in some ways has never felt entirely at home on either side of that divide.

It also contrasts with Margaret Archer’s interpretation of the same question. In an interview I did with her recently, in which we discussed her time working with Bourdieu in Paris, she suggests that what unites his corpus is fundamentally methodological: he was a theorist who used empirical research to test and refine the core categories of his thought, a cluster of concepts ultimately centred around the notion of ‘habitus’.

4711
Regardless of which interpretation is accurate, I like the conception of theorising that Wacquant is offering. Bourdieu was both a philosophical sociologist (though Wacquant does not use this term) while also being an “anti-theoretical theorist”. He argues that people often deploy Bourdieu without using his ideas. If you can strip out the Bourdieusian language from a given paper without effecting the argument then his ideas have been used as a theoretical idiom rather than as conceptual tools. As he puts it, “if nothing has been lost by removing them then nothing has been gained by using them.”

Social Media and Open Research: What Does ‘Open’ Mean? (2016-11-14 08:00)

In the not too distant past, the use of social media in higher education was seen as a curiosity at best. Perhaps something to be explained or inquired into but certainly not something deemed relevant to scholarship. Yet it’s now increasingly hard to move without encountering the idea that social media is something of value for academics. The reasons offered are probably quite familiar by now. It helps ensure your research is visible, both inside and outside the academy, helping build an audience for your publications and an impact for their findings. It expands your professional networks. It makes research more open and researchers more accountable to the people who ultimately fund their work.

If not quite at the level of ‘common sense’ yet, I suspect these points soon will be regarded as such, at least by young scholars. On the surface, we seem to have witnessed a fairly significant change, but is it a positive one?

In many ways I think it’s not because so much of this discussion is preoccupied by individuals and how social media can help their careers. It becomes one more facet in the ideal package of academic skills which are seen to be necessary to thrive in the contemporary academy. Bring in your grants. Publish highly cited papers in high impact journals. Get good teaching reports. Build an audience on social media. The unspoken corollary of social media helping build careers is how being unwilling or unable to engage in it might harm your career. Through their social media use, academics signal their orientation towards accumulating visibility for their institution and generating impact through their research.

At least this is how I think research managers are beginning to see social media: as a signal for impact willingness and a proxy for impact capacity. A demonstrable capacity to build an audience with social media becomes just another characteristics of what Liz Morrish recently described as the upwardly mobile young ‘Trump academic’ liable to thrive under contemporary conditions.

This way of thinking about social media for academics positions it as ‘just one more thing to do’. You do your research and then you spend time ‘networking’, developing your ‘brand’, building an audience and disseminating your research. It’s seen as an additional demand, above and beyond the many other responsibilities people are already subject to. You do it as a means to an end, in order to help meet demands placed upon you at work.

On this level, it’s a clear example of what the anthropologist Melissa Gregg describes as ‘function creep’: the tendency of new technology to increase the demands placed upon people at work without any comparable increase in reimbursement or recognition. Bit by bit, the job gets more demanding, often in subtle ways which escape our notice on a day-to-day level. We have more to do. We feel tired more frequently. The bottom of our to-do list seems further each on each successive day. But the job market is unwelcoming and self-branding of this sort can feel ‘career
protection in uncertain times' as one particularly off-putting social media guru put it a few years ago.

This instrumental approach to social media is one which universities are beginning to encourage through the training they offer, their expectations of staff and the implicit messages which permeate institutions. It's one which the rise of alt-metrics risks intensifying, as the responsibility increasingly falls to individual researchers to demonstrate that they're able to win attention for their publications online (and empowers those journals who are able to help ensure this is the case, supplementing the existing hierarchy of 'impact factor' with a new hierarchy of 'alt metric factor', rather than breaking down these boundaries).

The problem is that winning attention for your work doesn't take place in a vacuum. As Melissa Gregg puts it, "even uniqueness starts to sound the same when everyone is trying to perform". If everyone is seeking to build an audience and stand out from the crowd then the challenge of achieving these aims spirals ever upwards, excluding ever more people from the process in gendered and classed ways while this subordination is masked by the powerful rhetoric of openness.

To give one example of trend, George Veletsianos found in a study of educational tweeters that "the top 1 percent of scholars have an average follower base nearly 700 times that of scholars in the bottom 50 percent and nearly 100 times that of scholars in the other 99 percent" ([1]loc 1162-1708). Rather than undermining old hierarchies, social media supplements new ones, with complex emergent effects: sometimes allowing the already celebrated to quickly amass a social media following or to allow those with a big social media following to translate this into academic capital.

The problem is that the encouragement to conflate value with popularity, as demonstrated through the metrics built into the platforms themselves, isn't something new. It's an extension of the endless metrics to which academics at UK are subject to in every other aspect of their working lives. This is 'open' in the sense of rendering individual workers transparent to their employers. Open in the sense of measuring all aspects of their performance in order to calibrate the precise balance of carrots and sticks they will be subjected to in their workplace. Open in the sense of holding them accountable if any of their actions reflect badly on the university or somehow run contrary to this month's strategy for the corporate brand.

It's not a desirable form of openness and we should be critical of it. We should be critical of an account of social media for academics which encourages behaviour that fits with it: using social media to signal your value to your institution, demonstrate your understanding of your employer's priorities and to accumulate as much prestige for yourself as quickly as you can (obviously to be measured in terms of citation counts, alt metrics scores and follower counts).

But there's another form of 'openness' we can see in how academics use social media. A relational, collaborative and solidaristic mode of engaging across boundaries. This is a mode of engaging which doesn't see social media as 'just another thing to do' but rather as a way to do what we do anyway in a newly open and shared way. While the horizontal regulation of peer review, informal and otherwise, is increasingly being surmounted by the vertical regulation of metrics, there's a possibility for new forms of shared engagement through social media that shouldn't be dismissed. They may not change higher education but they can provide a bulwark against some of the more deleterious tendencies we see within it, at least if we resist the pressure to individualise and instrumentalise our use of it.

In a recent book called The Academic Diary, Les Back writes that Twitter sometimes facilitates our "inhabiting the attentiveness of another writer" by providing "signposts pointing to things going on in the world: a great article, an important book, a breaking story". Through the things that others share, we sometimes enter into their world and participate in an economy of "hunches and tips" which is the "lifeblood of scholarship". At risk of ruining a nice metaphor, a truly open approach to social media can help lifeblood of scholarship circulate much more widely and freely than it would otherwise. At a time of ever-increasing managerialism, intensifying demands and ever more
granular monitoring this feels like something we need to try and protect.

Four year post doc on crowd sourcing #digitalsociology (2016-11-15 08:00)

The Technical University Berlin seeks a:

Research Associate (Post-Doc) – Salary Grade 13 TV-L Berliner Hochschulen
Part-time employment may be possible.

The Institute for Sociology is starting a research group on „Entrepreneurial Group Dynamics“, that is funded in the Freigeist-Programme by VolkswagenFoundation ([1] www.entrepreneurialgroups.org).

A subproject will build a multi-level dataset through crowdsourcing that allows to track changes in the constellation of entrepreneurial groups in the long-run. We are looking for a motivated and engaged individual leading this subproject.

Faculty VI – Institute for Sociology
Reference number: VI-580/16 (starting March 1, 2017 until August 31, 2021, closing dates for applications December 2, 2016)

Working Field: We are looking for post holders that combine passion and skills for the advancement of methods and methodology in organizational and economic sociology and do research on exploring uses of crowdsourcing in academia. The applicant shall develop a quantitative dataset capturing the dynamics of entrepreneurial groups using crowdsourcing. This includes the selection and testing of adequate data sources that shall be used via documentary analysis (such as newspaper articles, industry reports, business registries, websites); the development of a handbook documenting the steps of data collection process for the crowdsourcing process; coordinating the design of a crowdsourcing platform through external partners; and supervising the data collection process through crowdsourcing; validating the emerging dataset and independently analyzing the data using advanced statistical methods. The post holder will communicate the process of and findings of this project through academic presentations and publications as well as public relations. We offer a personal career development plan facilitating career goals within and beyond academia. Solo authored publishing and research is explicitly welcomed. Habilitation and a multi-week exchange with DUKE university may be possible.

Requirements: Successful candidates must have a completed university degree (Master, Diplom or equivalent) and a PhD (Dr.) in social sciences or a related discipline with the focus on methods of social research. You can prove very good skills in collecting, preparing and analyzing standardized data, especially process-oriented data (e.g. public administrative data, business data) and digital methods. You are experienced in the construction and handling of multi-level datasets and panel data and have very good knowledge of multivariate statistics (such as multilevel analysis, sequential analysis) and network analysis. You are academically self-reliant, skilled in the use of statistical
analysis software (such as STATA, R, SPSS), ideally skilled in CMS. Language skills in German and English are required. We welcome team players looking for collegial exchange.

Please email your application with the reference number and the usual documents (in particular letter of motiva-
tion, CV including a list of publications, research profile, credentials) preferably by email in a single pdf-file to [2] silke.kirchhof@tu-berlin.de

or in writing to Technische Universität Berlin – Der Präsident- Fakultät VI, Institut für Soziologie, Dr. Stamm, Skr. FH 9-1, Frauenhoferstrasse 33-36, 10578 Berlin.

To ensure equal opportunities between women and men, applications by women with the required qualifications are explicitly desired. Qualified individuals with disabilities will be favored.

Please send copies only. Original documents will not be returned.

This job posting can also be found online:

http://www.personalabteilung.tu-berlin.de/menue/jobs/

2. mailto:silke.kirchhof@tu-berlin.de

12-month postdoc: digital ethnography of climate change (2016-11-16 08:00)

12-month postdoc position now available on the Making Climate Social project at University of Sheffield. Details are here <[1]https://jobs.shef.ac.uk/sap/bc/webdynpro/sap/hrrcf_a_
posting_apply?PARAM=cG9zdF9pbnN0X2d1aWQ9NTgwODZCRDlCO

The Return of the Unabomber (2016-11-18 04:43)

Twenty years ago Theodore Kaczynski, a Harvard-trained maths prodigy obsessed with technology's destruction of nature, was given eight consecutive life sentences for sending letter bombs in the US post which killed three people and injured 23 others. Generally known as the [1]'Unabomber', he remains in a supermax prison in Colorado to this day.
It is perhaps easy to forget the sway that the Unabomber held on American society in the mid-1990s. Kaczynski managed to get a 35,000 word manifesto called [2]'Industrial Society and Its Future' published in both The New York Times and The Washington Post. It is arguably the most famous and influential statement of neo-Luddite philosophy and politics to this day. Now he is back with a new book, [3]Anti-Tech Revolution: Why and How.

Although both Kaczynski's family and the emerging Silicon Valley set were keen to cast the Unabomber as mentally disturbed, the FBI took his words seriously – so much so that they visited the annual meeting of the Society for Social Studies of Science (4S) in New Orleans in 1994 to see whether the Unabomber might have received assistance from science & technology studies (STS) scholars. In characteristic STS fashion, we observed at the time (I was a member of the 4S Council) that Kaczynski seemed overly reliant on 1960s-style critiques of technology (by thinkers such as Herbert Marcuse and Jacques Ellul), which were passé in our circles. So we washed our hands of him.

The fairest thing that can be said about Kaczynski's writings, both during his Unabomber period and his subsequent imprisonment, is that his comprehensive critique of modern technological society is recognizable to anyone who follows the more apocalyptic strand of [4]dark green philosophy and politics. It points to an almost inevitable self-destruction of the world as we know it through systemic abuses of nature, which no one currently in power is motivated to stop, let alone reverse. Instead of making a comfortable living as a radical academic, fiddling while Rome burns, Kaczynski took matters into his own hands, first with letter bombs and now – in this book – with a strategy for stopping the global system from collapsing.

Does Kaczynski advocate the violent overthrow of that system? No: he offers a subtler approach that draws on Trotskyite entryism and capitalizes on the opportunities afforded by disruptions that the system in its normal operation is bound to throw up over time.

Kaczynski believes that political do-gooders are pretty useless in themselves. But this is not due to the content of what they say and do – namely, an endless stream of critique and foreboding about a dystopic future. All of this helps to destabilize the system. The problem is that these people and organizations are themselves so heavily invested in the system that when the worst scenarios that they portray happen, they are in no position to capitalize on them. Their big mistake is to assume that the people in power will somehow listen to them before it is too late.

Nevertheless, people inspired by Kaczynski's neo-Luddite politics are advised to infiltrate such organizations because they provide legal cover for their activities and offer privileged access to the information flows needed to judge when the opportunity is ripe for intervention. He is clear that such people need to wear two hats at once. They have got to gain the confidence of the organization through hard work, while at the same time be ready to strike at the appropriate moment.

Kaczynski's model is Lenin's staging of the [5]October Revolution in Russia, which was less violent than both the Soviets and the West usually portrayed it, due to the high level of infiltration by Bolsheviks into key discretionary positions when the opportunity arose to overthrow the system. Kaczynski follows Lenin in thinking that when the moment strikes, ordinary people will simply try to save their skins and spontaneously gravitate toward those who seem to provide a safe haven, at which point any prior political loyalties will simply evaporate.

However, crucially lacking from Kaczynski's vision is a clear sense of which positions should be infiltrated, aside from mainstream environmental movements. The fact that he has been in prison for virtually the entire history of the web and smartphones is evident from these pages, though he has kept up in his own way. Kaczynski cleverly counters transhumanist Ray Kurzweil by arguing that even if computational power accelerates indefinitely, that simply means it is more likely to spin out of control. Yet he fails to provide any specific discussion of computer hacking, which one might have expected to figure prominently in the skillset of a neo-Luddite revolutionary. This is perhaps in keeping with Kaczynski's avowed aim to stay within the law.
My guess is that people reading this book who wish to follow in Kaczynski's footsteps would try to get hired by either private or public organizations associated with the production, distribution or regulation of energy. The point here would not necessarily be to arrest the rise in energy demand and use. Rather, one would be prepared to spring into action on the occasion of a major disturbance to the flow of energy, however it arises. In any case, such [6]'normal accidents' are bound to happen over time. Since this book is just the latest – but most articulate – installment of Kaczynski's strategy, such people may already exist.

None of the above should be understood as condoning in any way the crimes that Kaczynski committed twenty years ago. It is only to say that a rational mind is on display in this book.

Paranoia is eminently rational

Sociological Imagination & Financial Utopias (2016-11-18 08:00)

'Reclaiming Utopia: Challenging the Financial Imagination'

What types of imagination drive today's dystopian political & economic programmes? Why do counter-utopias lag behind (neo-)liberal and financial utopias?

Come to the Council Room, King's College London at 5pm on the 25th November, and hear provocative reflections from artists and theorists discussing the political imagination of Financial Capitalism, Donald Trump, and their (neo-)liberal intersections.

Panel participants:

Chiara Bottici, Associate Professor of Philosophy, The New School, New York
Max Haiven, Assistant Professor, Nova Scotia College of Art and Design, Canada
Cassie Thornton, Artist, The Feminist Economics Department

4718
Johnna Montgomerie, Senior Lecturer in Economics, Goldsmiths, University of London

Followed by a Wine Reception. All welcome - register for free at: [1]https://reclaiming_utopia.eventbrite.co.uk

You can find a fuller description of the talks and a programme here:

The Practice of Public Sociology, Nov 24th in Manchester (2016-11-18 15:19)

We've recently had some cancellations for the forthcoming event, The Practice of Public Sociology: Sociological Review Early Career Event.

If you would like one of these places, please register here: [1]https://www.eventbrite.co.uk/e/the-practice-of-public-sociology-sociological-review-early-career-event-tickets-28652394082

The Practice of Public Sociology

Manchester Digital Laboratory, November 24th, Manchester

For over a decade public sociology has been a mainstream topic of discussion within the discipline. While practiced prior to the 2004 address by Michael Burawoy to the American Sociological Association, its identification and elaboration on an intellectual level was crucial to its popularisation. But is it possible that the voluminous literature that emerged in the years following has left us with a public sociology that is overly-discursive? While undoubtedly important, is there a risk that theorising about public sociology gets in the way of its practice? This event organised by The Sociological Review's Early Career Forum takes as its starting point David Mellor's 2011 argument that "we don't need to debate public sociology anymore; we need to get good at it". We invite early career researchers who share this aim to join us for a day of workshops, discussion and debate about how we can collectively improve our practice of public sociology.
Engines of Knowledge in the First Information Age: The Factory and the Machine (2016-11-19 08:00)

By Hamish Robertson

Introduction

In this piece I ask the reader to consider the rise of the factory and its associated processes and systems as not just centres of early capitalist production or engineering and technical development, but as knowledge engines. We know that factories of many kinds, starting quite early on in the 18th century, were aiming for what we now consider quite modern concepts such as mass production and standardisation. These practices, as I have mentioned elsewhere in this series, developed their own conceptual schemata that influenced further developments in not only industry but society at large. The implications of this approach to knowledge...
production, its validation and institutionalisation had a variety of socially significant effects. We can see that these had transformational effects in the 19th century, becoming accepted forms of knowledge and also techniques for understanding the world more generally. The factory and its associated machine metaphors persist today as do many of their tangible effects.

**The Factory as Laboratory**

One of the crucial aspects of the 18th century factory that has become institutionalised as part of modern technology and manufacturing is its experimental nature. The owners of many factories, and many types of factories, were concerned with what we now think of as quite modern ambitions such as innovation, quality control, economies of scale and workplace efficiencies. The factory was often, in a very particular way, a laboratory in its own right because it produced products through people and processes which could all be observed, documented and measured. This pattern long precedes the locus of the university or similar institutional settings for what we now see as research and development activities.

The potter, dissenter and abolitionist Josiah Wedgewood is often credited with industrialising the manufacture of ceramics in the United Kingdom. He regularly introduced new glazes and forms, with his innovations being copied almost as soon as they became available. He also pioneered much of what we now think of as the marketing of luxury goods, by sending packages of new, and more expensive, settings to Europe's elite without prior payment. He also developed a series of show rooms before there were department stores so that potential buyers could view and order the goods they coveted. This was a logical but still innovative strategy in a time of rapid social change and financial expansion because the rich had the money to buy and the growing middle classes were sure to follow the trends set by their social 'betters'. In this we can see the precursor of modern marketing psychology.

Wedgwood researched advances in the emerging sciences and frequently followed his own manufacturing processes for data collection and analysis purposes. His Etruria laboratory was established expressly to permit this kind of flexibility and experimentation. He would run test firings of uniform pottery pieces with different glazes and at different temperature settings to determine the results. This became the norm in the 19th century but we can see here that the idea of experimentation was already forming in the early mass manufacturing sector. He also sought out new clays, both from within the UK and overseas, and would test their properties for use in the manufacturing process. And of course he corresponded with other interested parties about these knowledge development processes and his findings. He effectively used his potteries, design studios and kilns for knowledge production purposes.

**Mass Production and the Factory System**

Ken Alder's work on engineering in the French Revolution illustrates a variety of ways in which the design and manufacturing processes began working towards regulation and uniformity in, firstly, the industrial and then, secondly, the social spheres. Perhaps not surprisingly, a key origin point for this demand for regularity, uniformity
and reliability lay in demand for weapons, as the French Republic fought to defend itself against dynastic European armies and navies. This programme declined in France due to a conflict between different approaches to innovation – one promoting the ancient, established artisanal small-scale manufacture and one the emergent focus on uniformity, massive scale and

The ‘factory system’ emerged more fully formed in the United States because, in part, Thomas Jefferson had observed these French efforts at innovation during his posting to France and took the concepts home with him. The emphasis on measurement and uniformity in complex systems appealed to the ‘modernist’ American view of itself and, of course, because French military innovation was also directed at defending the Revolution against foreign powers. The logic of this form of production also extended to the workers producing the goods and often aimed at a reduction in artisanal or craft skills and an expansion in lower skilled work, and workers, where labour replacement was easier and faster. Many of these developments relied on the rise of engineering and its own instruments of regularisation and calibration.

Here too the maker and the machine metaphors began to converge. We can see this in such notions as defective manufacture, low productivity, inefficiency and so on – all generated from machine processes and subsequently applied to social domains. Prior to this many products were genuinely unique even when manufactured in large numbers. The logic of mass producing, say, swords in a village smithy is of a different order and type than in an industrial furnace environment. Similarities between the two obviously exist but the change in magnitude and scale make for a difference in the logic of production and the knowledge and understanding that logic produces.

We can perhaps more easily see a version of this distinction in the Japanese tradition, a nation that embraced modern industry at a phenomenal speed in the late 19th century (after an earlier attempt that was halted by the authorities), but which also maintained much of its own artisanal aesthetic (e.g. wabi-sabi and kintsugi) which readily accommodated uniqueness, imperfection and even breakage as aesthetic virtues. The virtues of the artisan are not the same virtues as those of the engineer or industrialist.

These processes were in turn supported by a growth in methods of and instruments for increasingly precise measurement. To ensure uniformity required a keener focus on calculation, measurement and active engineering than had been the norm. Armies and navies had previously often had to rely on the weapons they could get access to and not on a guaranteed source of supply producing uniform products with easily replaceable or even interchangeable parts. To ensure bullets were exactly the same calibre or that gun barrels were all rifled correctly requires a high level of acquired precision and consistency. Pivotal in these emergent processes was the idea and practice of quantification. This was a new way of thinking about production and, as with other aspects of the industrial revolution, it produced its own knowledge and, to paraphrase Hacking, ‘styles of reasoning’.

Modern management theory often references the railways as the mythical origin point for mass production manufacturing, standardisation and productive logics. Much of the US railway system was in fact pioneered by West Point graduates whose skills emphasised both civil and military engineering, and related activities, at what was the first engineering school in the United States. The truth also involves an earlier and more involved explanation.
Simplified piece-work, casual labour payment schemes and outwork long preceded the factory and existed alongside it for decades to come. The railway metaphor emphasises the technology of the track and the steam engine at the expense of the interconnections between the workforces that laid the track, excavated the tunnels, dug the cuttings and also who ultimately made the rails, spikes and steam engines themselves.

In the United States, the emergent production system of the slave plantation, especially in its continued [8]westward expansion, and engineering and industrial innovation in factories, created a system in the midst of massive population growth, acquisition of vast lands and natural resources, and a corresponding expansion of international trade. Foreign investors could and did finance various parts of this system, on top of which they participated in it as immigrants in its extension, development and administration.

Technological innovation was central to the expansion and profitability of this system and [9]factory models were increasingly central to its design and operation. As a knowledge factory in its own right, the plantation can be observed as not only a producer of knowledge about certain types of labour relations but also as one in which technology was gradually introduced to replace human tasks where more reliable or profitable.

The Slave as Machine

Even today the phrase ‘master and slave’ is still in common use in technology. The obvious nature of the relationship being expressed has a much longer history and one which is not quite as simple as the image of plantation field hand working under the whip might suggest. The slave was frequently characterised as a machine for work in general or specific tasks if more specialised (such as blacksmithing). This notion of the slave as machine had its own consequences on the plantation, and elsewhere, because it could and often did reduce work to the minimal skill level required to meet quantitative targets. Slaves shared some characteristics with what we now think of as machines: they were property and had owners; they could not leave their work by choice; they were unpaid; and their work could be and was monitored, often in great detail – especially their productivity.

The [10]slave codes actively worked to make slaves ‘things’ – less than people and subordinate to the socio-political system under which they laboured. Of course, slaves could and did resist their place in the plantation machine and elsewhere. This resistance was another managerial problem to be ‘overcome’ by various means and the methods for doing so constitute some of the earlier developments in what we now think of, more abstractly, as ‘workplace relations’ or ‘human resource management’. Fear of revolt drove much of this reaction, indicating that owners knew the repression their system truly involved.

The North American slave plantation system and the United Kingdom and its investors including individuals, banks, shipping companies, mill owners, brokers, and even churches, (many owners were absentee just as in the Caribbean plantations) were deeply enmeshed in the system even after the official cessation of the slave trade in the British Empire. This was promptly replaced, or at least supplemented, by the indentured labour system, which rose again to fill the cheap labour vacuum left by emancipation. The American plantations also introduced the concept of the field hand as an objective, quantifiable and calculable unitised measure of production. Counting and accounting were central to this system including the introduction of directories, periodicals and [11]forms for tracking and improving labour management and production.

Inventing Scientific Management
The appeal of data collection, quantification and experimentation is so marked in modernity that it needs to be remembered that this too was a development during a particular period in time. One outcome of the rise of quantification and related scientific undertakings was the rise of ideologies of production as a virtuous undertaking. The morality and political economy of the 19th century were no less deeply embedded than in our present neoliberal world. Ideas about the production of physical goods and financial surpluses would, as Marx illustrated repeatedly, produce their own particular ideologies because the values inherent in the approach replicate themselves (profit is good, so more profit is better and thus the promotion of profit as a virtue; slavery is highly profitable so slavery is good and so it goes). The process has the capacity to produce its own logic and once established can acquire social and political authority including ideas about the value and worth of different groups of people.

The clock was easily as important as the whip in ensuring measurable outcomes on the slave plantation which traditionally ran as seasonal, quasi-natural system. The introduction clock-time transformed this approach into a system to which both slaves and their owners became increasingly enmeshed. And this idea, linked as it was directly to productivity and profitability, could only expand in importance as society itself became more regulated by clock-time. Factories could operate for longer, workers could be made to work at set times, and the time required for tasks could be calculated, monitored and compared. Many factories had their own clocks towers to ensure conformity to this system. The clock, a product of growing technical experimentation and mass manufacturing, became a regulatory mechanism in its own right extending outwards to all, slaves, workers and management alike. The clock and the uniform time it enabled became central to related industries such as the railways but also a foundational component of modernity.

From Artisan to Worker

The control of the lower social orders was central to the English (and most others) social and political system regardless of historical period but especially in periods of rapid change. Feudalism might have given way to early modernity but social control remained central to both periods and one of the ways of achieving this goal was, and remains, limiting the skills, capacity and value of workers within the system (another is to dismantle alternatives but that is for another discussion). Whig theories aside, competition for available work and reduction in payment rates for skilled labour both served the factory system and its correlates very well indeed. Slavery, as discussed above, was one more laboratory in which theories of value, extraction and ‘motivation” could be trialled and tested. No wonder then that during the industrial revolution, many British factory unions and their members felt more in common with the enslaved than they did with the factory owners. They knew where the cotton came from and they could see for themselves the excesses of the system in their own factories and communities.

Conclusion

Understanding how we came to ‘progress’ through different forms of production and work to the situations we see today requires more than a linear, progressive view of history. The complexity of the past is easily as deep as that of our present time. The factory was a highly versatile creation and produced not only ideas about products, production and its management but transferable ideas that had a wider social, economic and political impact. The sociological perspective requires of us an understanding that the factory and the machine produced more than goods, they
produce social relations and, sooner or later, an increasingly naturalised way of viewing the world. The values of the factory system are obviously beneficial for some and the ideology of the factory has come to assert itself beyond its point of origin. Even now the factory remains a locus for innovation and industrial ‘progress’. It is in this sense, as with the hospital and the garden, that I propose we think of the factory and the machine not only as factual elements and metaphors but as engines of knowledge in their own right.

[16] **Hamish Robertson** is a geographer at the University of New South Wales with experience in healthcare including a decade in ageing research. He has worked in the private, public and not-for-profit sectors and he has presented and published on a variety of topics ranging from ageing, diversity, health informatics, Aboriginal health, patient safety and spatial science to cultural heritage research. Hamish is currently completing his PhD on the geography of Alzheimer’s disease and recently finished editing a book on museums and older people.

**The Everyday Life of Incipient Fascism (2016-11-20 08:00)**

I’ve long been fascinated by the question of what the descent into fascism feels like for those living through such a transition, how daily life changes (or fails to do so) as the fabric of the old order begins to unweave. There’s an insightful essay in the LA Review of Books which addresses precisely this question as it takes issue with a prevalent misunderstanding of Nazism:

> POPULAR CULTURE IS REPLETE with cartoonish depictions of Nazism. Hitler seems to emerge suddenly, as if he had been waiting in the wings as a *fait accompli*. One moment it’s Weimar decadence, really good art, and Stormtroopers and communists fighting in the streets. The next, Hindenburg is handing Adolf the keys to the kingdom and it’s all torchlight parades, *Triumph of the Will*, and plaintive Itzhak Perlman violins. Hitler rises above a reborn Reich as a kind of totalitarian god. All aspects of life come
under his control through the Nazi party’s complete domination of German life. Of course, this is not really how it worked.

Before Hitler achieved his genocidal powers, there were years of what we would now call "intense partisan bickering," decreasing prosperity, and violence in the streets. In the end, Hitler cobbled together a rickety coalition of business-minded technocrats, traditional conservatives, military interests, and his own radical ethno-nationalists into a plausible government. As the new government consolidated its power, thousands of communists and trade unionists were subjected to harsh suppression and were among the first to be shipped away to what would eventually become the concentration camps. And yet for a time, life for the overwhelming majority of Germans — even briefly for German Jews — went on largely as it had in the Weimar era. There was clearly a new regime in town, but most Germans got up in the mornings in the mid-to-late 1930s and went to work, just as they had in the 1920s. January through March of 1933 was not 1776, 1789, 1791, 1917, or even 1979. Far from the world turning upside down, things were strangely continuous for many Germans as though nothing much had happened at all. For a few Germans, things were astoundingly better.

A similar liminal reality can be seen in the Norwegian drama Occupied. A green-left government’s declaration that the ‘era of oil is over’ leads to a surreptitious occupation of Norway by Russian forces. For many reasons, not least of all the narratological demands of being a ten issue drama series, dramatic changes eventually come to Norway. But what fascinates me is what comes prior to this, as the everyday life of those in Oslo is strikingly unchanged despite the mammoth geopolitical upheavals underneath the surface.

These depictions interest me because they point to an aporia in how we see social change. Our experience of ‘social change’ is by definition retrospective. We may experience social changes in the present but what we grasp as ‘social
change’ is something we look back upon from the reality born through such transformation. We tell stories and sing songs about the most dramatic of these transformations, as collective recognition imbues that-which-has-unfolded with the appearance of inevitability. As [4]Graham Crow puts it:

2.8 Proposition 7: Accounts of change after the event are vulnerable to post-hoc rationalizations in which the confusion and indeterminacy of events as they unfolded is played down and inevitability emphasised. Aron’s remark about how the language of ‘apparent necessity... creates an illusion of fatality’ ([5]1961:178) is pertinent here. Burgoyne and Clarke’s respondents’ accounts of why their previous marriages ended contain a number of such rationalisations that reflected the ‘careful scripting’ ([6]1984: 76) that had gone into their construction. It is instructive that Game and Metcalfe also use the process of becoming divorced to illustrate their point that the beginning of a story ‘can only be seen in retrospect; when it was beginning people were unaware of its full significance... Beginnings are always written from hindsight’ ([7]1996: 70). The sense of predictability that such narratives convey often stands in stark contrast to the lack of certainty that people have while changes are unfolding about the direction in which they are heading.

2.9 Proposition 8: The popular metaphors through which ideas about endings are expressed have a bearing on how people respond to them. The ideas of reaching ‘the end of the line’, ‘the bitter end’, or a ‘point of no return’, ‘flogging a dead horse’, ‘giving something up as a bad job’, being on a ‘sinking ship’, ‘fighting a losing battle’, ‘throwing good money after bad’, ‘cutting one’s losses’, ‘writing something off’, and the proverbial ‘straw that breaks the camel's back’ have different implications from the ideas of a ‘turning of the tide’, ‘calling it a day’, ‘the darkest hour coming before the dawn’, or ‘one door closing and another opening’ which also mark end points but are less linear and more rhythmic in their understanding of time ([8]Young 1988). Modernity’s linear conceptions of time produce more final understandings of endings than the conceptions of ‘cycles of renewal and regeneration’ ([9]Adam 2004: 14) that characterise ancient perspectives on temporal processes.

The individual and collective stock of experiences of change which we draw upon when we imagine our future leave us systematically ill-equipped to elucidate the many potentialities latent with present circumstances. The tendency of fiction, particularly when it considers the macro-social, to explore the social change itself rather than the process through which the change unfolded aggravates this. I want to read stories and watch dramas about liminal transitions because this can sensitise us to the not-so-determined realities latently subsumed into what we call ‘present times’.

Please see below for the call for papers of the ECPR Joint Sessions Workshop on "Digital Media and the Spatial Transformation of Public Contention". The full description of the workshop can be found here: [1]https://ecpr.eu/Events/PanelDetails.aspx?PanelID=4836&EventID=104

CFP: The proposed workshop explores and theorizes how the rise of online platforms, such as Facebook, Twitter, YouTube, and Tumblr, is affecting the spatial configuration of public contention. The goal is to create a cross-disciplinary network of scholars to develop a new dynamic conception of publicness. Rather than simply situating contentious politics within a specific 'sphere' that serves as their container, we are interested in examining how contentious politics unfolds across different geographical, cultural, political and material configurations. The workshop specifically calls for papers that investigate and conceptualize how in contemporary protests relations of publicness are constantly redrawn across the 'local', 'national', and 'transnational'. Moreover, it aims to stimulate research on how the technological infrastructures of the emerging hybrid media system, in which digital platforms, broadcast media, and face-to-face communication are deeply entangled, shape the spatial trajectories of public contention. Finally, the workshop hopes to attract papers that critically examine how the intense use of digital media in public contestation, often in combination with alternative media, further confuses the traditional distinction between 'public' and 'commercial' space. In combination, the papers should enable a lively debate on how to research and theorize public contention in the new communication environment. Do we have to revise or even abandon dominant conceptualizations of publicness, like the public sphere, which are very much predicated on the nation state? And if so, what new concepts do we need to understand how the rapid development of digital platforms is transforming the spaces of public contestation? Joint Session Workshops of the European Consortium for Political Research (ECPR) include 15-20 participants and allow in-depth discussion on a specific topic. The 2017 Joint Sessions will take place in Nottingham between 25-30 April 2017. The deadline for submitting paper proposals is on the 1st December 2016. To submit your paper proposal please follow this link:[2]https://ecpr.eu/Login.aspx?ReturnUrl=%2fMyEcpr%2fForms%2fPaperProposalForm.aspx%3fEventID%3d104 &EventID=104 For any questions about this workshop please contact Anastasia Kavada (A. Evgeny Morozov & David Harvey on the end of neoliberalism (2016-11-25 08:00)

A fantastic discussion, [1]via Stuart Elden:
Donald Trump's Words of Power (2016-11-26 08:00)

In an old essay about Heidegger’s conception of language, the philosopher Charles Taylor invokes the notion of ‘words of power’ to explain the power of Hitler’s rhetoric. Once we move away from a sense of language as an expression of individual meanings and purposes, we find ourselves somewhere entirely differently:

The silence is where there are not yet (the right) words but where we are interpellated by entities to disclose them as things. Of course this does not happen before language; it can only happen in its midst. But within a language and because of its telos, we are pushed to find unprecedented words, which we draw out of silence. This stillness contrasts with the noisy Gerede in which we fill the world with expressions of our selves and our purposes. ([1]pg 124)

What Taylor calls ‘words of power’ are words which retrieve the inchoate from this silence, imbuing them with power because they so sharply contrast with the dull forgetfulness of our everyday use of language. To use a term Taylor adopts much later in his career, they resonate. Longings, fears, aspirations and resentments retrieved in this way have a charge because they’ve existed beneath the surface. Words of power give voice to them and, though simply
words, they’re qualitative distinct from the words we use in everyday life. They give reality and shape to something which has been latent within and between us, contrary to the relative superficiality and vacuity of much of our everyday use of language.

This is a power of words which standard theories of language struggle to make sense of. However Heidegger’s theory is oblivious to their dangerous uses because, as Taylor puts it, “Heidegger has no place for the retrieval of evil in his system”. Whereas as Taylor uses this concept to make sense of Hitler’s words of power:

The danger comes from the fact that so much can be retrieved from the gray zone of repression and forgetfulness. There are also resentments and hatreds and dreams of omnipotence and revenge, and they can be released by their own appropriate words of power. Hitler was a world-historical genius in only one respect, but that was in finding dark words of power, sayings that could capture and elevate the fears, longings and hatreds of a people into something demonic. ([2]pg 125)

The inability of liberal commentators to make sense of Trump’s rise necessitates that we take him seriously on a philosophical level. The implausibility of President Trump, I still splutter when I say or type this, reveal the faded frames within which we assess him and with which we must necessarily now dispense. He’s created a new frame and those faculties which render him obscene (the cruelty, the vulgarity and the absurdity) are both an obstacle to understanding him but also the necessary condition. What are Trump’s words of power?

We are led by very very stupid people. We cannot let it continue .... we lose everything, we lose military, we cannot beat ISIS, give me a break ... we can't beat anybody ... it will change. We will have so much winning, if I get elected, that you may get bored with winning ... We are going to turn this country around. We are going to start winning big league ... We are going to have such a strong military that no one is going to mess with us.
Trump speaks the language of individualism and meritocracy so familiar from the last few decades. But he does so in a way that gives voice to latent grievance, as opposed to the dull(ing) language of self-described progressives. There are ‘winners’ and ‘losers’, there are ‘smart’ people and ‘stupid’ people. The culture of meritocracy became manichean over time, while failing to offer the moral resources to interpret the position of the ‘losers’ and the ‘stupid’. This has happened in the UK as well, as I discuss with Will Davies in this podcast:

The idea that there are those ‘left behind’ who feel ‘ignored’ isn’t new. But as Steve Hall, Simon Winlow and co have pointed out in their work on the far right, a left captured by liberal professionals (a case also made powerfully by Thomas Frank about the Democratic party) has proven systematically unable to give voice to these experiences. The closest that the centre-left has come, in the guise of a Clinton or Blair, has been to offer more of the same: a reinforcement of the prevailing culture of meritocracy and a sterile language of opportunity. There is no necessity about how this injuries are expressed, though there is a path-dependency to how they have been articulated.

The darkness we can see emerging in the US and Europe has been growing throughout the seeming moderation, presaged by its easy and partial articulation into a preoccupation with borders or the radical Islamic threat which threatens to destroy us. To put it as straight forwardly as possible: resentments have been accumulating across large swathes of the population, without any cultural framework within which they could be meaningfully articulated. The cultural horizons of our political culture have narrowed precipitously while structural consequences have been germinating.

However it’s important not to reproduce the facile notion of the ‘left behind’ which is now entering into elite
discourse. The claim that the 'losers' of globalisation have been ignored and now must be attended to is a crucial component in the rise of what [7]Malcolm James calls popularist post-welfare capitalism. It imputes a homogeneity to experience, it naturalises the rightist articulation of that experience and it fails to address the underlying foreclosure which has been the creeping post-democratisation of the recent years. It also fails to recognise the role of the relatively affluent, those who do not look like losers, whose experience at the very least needs to be understood.

Rather than a construct like 'left behind', we should accept the descriptive and explanatory void that currently exists while looking to ethnographic and qualitative studies (existing and otherwise) in order to fill it. There are factors in play here which need to be attended to extremely closely, such as the rural character of Trump's working class support.

Meanwhile we need to find leftist words of power. Urgently.

Fidel Castro: A Quasi-Personal Perspective (2016-11-26 19:02)

Fidel Castro was one of the political giants of the 20th century. Indeed, he was a 'Great Man' of politics. However, the greatness of politicians can be easily lost if we look at their careers from where they end rather than from where they began. Cuba in 1959 had been a puppet state of the US for sixty years, relatively prosperous by Latin American standards, yet subject to much political corruption, economic exploitation and racial discrimination. US interest in Cuba dated to the mid-19th century as part of the same expansionist strategy that led to the annexation of Texas and California. In fact, the US offered to buy Cuba from Spain on five occasions, but it was only with Spain's final imperial withdrawal from the Americas in 1898 that it fell into US hands. The US military base at Guantanamo Bay dates from this period. My mother, who is Cuban by birth, is the same age as Castro. They share something else as well. Their parents were emigres from Europe (Castro's from Spain, my mother's from Spain and France) as part of the early 20th century policy of [1]Blanqueamiento – or 'whitening'. Inspired by eugenics, this policy aimed to attract relatively poor but aspirational Europeans to settle in various Latin American countries that were in 'danger' of being swamped by non-White peoples. (Incidentally, an interesting feature of the policy – given today's resurgence of 'epigenetic' thinking – is that the reinforcement of European cultural habits and foods on the non-White natives was included as part of the 'Whitening' process.) Whatever else one wishes to say about Castro, he broke with this history and replaced it with a radically egalitarian society which successfully overcame class and race barriers. Most of the million or so Cubans (about 10 % of the island's population) who migrated to Florida after Castro took over were themselves products of the Blanqueamiento process which had brought Castro's and my mother's family to Cuba. They are noticeably richer and Whiter than the people who remained in Cuba. My guess is that this is what these exiled Cubans find most galling about Castro: He was the ultimate class and race traitor – and more power to him for
it! (For what it’s worth, my mother left Cuba permanently in 1952, seven years before Castro’s revolution. She saw no future for herself in an increasingly volatile Cuba as it entered its final corrupt phase. She has always been a Castro sympathiser. My mother’s family left shortly after Castro took over and settled in Miami and were staunch supporters of Nixon and Reagan. We broke relations with them in the late 1980s.) Castro had a very keen sense of Cuba’s strategic political and economic significance on the world stage, and he leveraged that awareness to finance the most enduring welfare state outside of the developed world. We need to realize that Cuba with its natural resources – most famously cane sugar – was positioned like some of the oil rich countries. (Hugo Chavez’s Venezuela comes to mind as an obvious Castro emulator). However, when Cuba was 'liberated' from Spain in 1898 only to become a US protectorate for sixty years, it was prevented from fully developing as an independent nation. Basically, it was forced to give the US highly discounted prices on its resources in exchange for military protection. (We might call that 'extortion'.) While the US heavily invested in Cuba – with Havana becoming a combination of Miami and Las Vegas by the 1930s – it tended to support any regime that could keep the peace, which is to say, not disrupt the flow of trade between Cuba and the US. In short, Cuba had been the sort of place that Iraq would have become had George W. Bush, Dick Cheney and Donald Rumsfeld got their way and the US had won the peace in Iraq. The temptation to 'liberate' countries from political oppression simply to place them in perpetual economic debt to the liberators has been very strong over the past hundred years. Castro’s Cuba remains a striking example of how that tendency need not turn into a necessity, which is why it continues to provide hope across the developing world.

The bureaucratic origins of algorithmic authoritarianism (2016-11-27 08:00)

I just came across this remarkable estimate in an [1]Economist feature on surveillance. I knew digitalisation made surveillance cheaper but I didn’t realise quite how much cheaper. How much of the creeping authoritarianism which characterises the contemporary national security apparatus in the UK and US is driven by a familiar impulse towards efficiency?

The agencies not only do more, they also spend less. According to Mr Schneier, to deploy agents on a tail costs $175,000 a month because it takes a lot of manpower. To put a GPS receiver in someone’s car takes $150 a month. But to tag a target’s mobile phone, with the help of a phone company, costs only $30 a month. And whereas paper records soon become unmanageable, electronic storage is so cheap that the agencies can afford to hang on to a lot of data that may one day come in useful.

In reality, it is of course anything but, instead heralding a potentially open ended project to capture the world and achieve the [3]utopia of total social legibility. An ambition which always makes me think of this short story:

The story deals with the development of universe-scale computers called Multivacs and their relationships with [4]humanity through the courses of seven historic settings, beginning in 2061. In each of the first six scenes a different character presents the computer with the same question; namely, how the threat to human existence posed by the [5]heat death of the universe can be averted. The
question was: "How can the net amount of [6]entropy of the universe be massively decreased?" This is equivalent to asking: "Can the workings of the [7]second law of thermodynamics (used in the story as the increase of the entropy of the universe) be reversed?" Multivac's only response after much "thinking" is: "INSUFFICIENT DATA FOR MEANINGFUL ANSWER."

The story jumps forward in time into later eras of human and scientific development. In each of these eras someone decides to ask the ultimate "last question" regarding the reversal and decrease of entropy. Each time, in each new era, Multivac's descendant is asked this question, and finds itself unable to solve the problem. Each time all it can answer is an (increasingly sophisticated, linguistically): "THERE IS AS YET INSUFFICIENT DATA FOR A MEANINGFUL ANSWER."

In the last scene, the [8]god-like descendant of humanity (the unified mental process of over a trillion, trillion, trillion humans that have spread throughout the universe) watches the stars flicker out, one by one, as matter and energy ends, and with it, space and time. Humanity asks AC, Multivac's ultimate descendant, which exists in hyperspace beyond the bounds of gravity or time, the entropy question one last time, before the last of humanity merges with AC and disappears. AC is still unable to answer, but continues to ponder the question even after space and time cease to exist. Eventually AC discovers the answer, but has nobody to report it to; the universe is already dead. It therefore decides to answer by demonstration. The story ends with AC's pronouncement,

And AC said: "[9]LET THERE BE LIGHT!" And there was light

Digital Sociology vs STS (2016-11-28 08:00)

ISRF [1]Digital Social Science Forum participants Susan Halford, Will Housley and Mark Carrigan will be speaking at a joint Digital Sociology Study Group and STS Study Group Event at the Oxford Internet Institute on 8th December 2016.

An opportunity for anyone interested in the future of Digital Sociology and STS to get together and discuss
the following questions:

- Why do we need Digital Sociology when we have STS?
- What are their affinities and disaffinities?
- Are digital methods and digital ontologies transformative for STS?
- What distinguishes Digital Sociology from all the other disciplines that claim to study the relationship between society and social media, the Internet, the Web and digital data?
- What use is the concept of Digital Sociology?
- How can we join forces across institutions to progress the project of Digital Sociology?

Other speakers will include Karen Gregory and Kate Orton-Johnson (Lecturers in Digital Sociology at the University of Edinburgh), and Des Fitzgerald (Lecturer in Sociology from the University of Cardiff).

Booking is essential. Venue numbers are restricted and it is advisable to book early.

Registration Fees: BSA member £10 / Non-BSA member £15

The class politics of innovation and the new digital elite (2016-11-29 08:00)

In his remarkably prescient *Listen Liberal*, Thomas Frank describes the rapid capture of the Democratic Party by the professional class which took place during those decades when economic transition left them ascendent within the country as a whole. This was originally a predominance of financiers within the party but, with a transition marked by the defection of finance to Romney in the 2012 election, it’s more recently been a matter of Silicon Valley.

As a striking example of this, on loc 2742 he describes the innovation mania sweeping a city like Boston,

Back in Boston, meanwhile, there is meaning and exciting purpose wherever you look. When I visited, in the spring of 2015, I found a city in the grip of a collective mania, an enthusiasm for innovation that I can only compare to a religious revival, to the kind of crowd-passion that would periodically sweep through New England back in the days when the purpose of Harvard was to produce clergymen, not startups. The frenzy manifests itself in countless ways. The last mayor of Boston was mourned on his passing as a man who “believed in innovation”; who “brought innovation to Boston.” The state’s Innovation Institute issues annual reports on the “Massachusetts Innovation Economy”; as innovation economies
go, they brag, this one is "the largest in the U.S. when measured as a percent of employment." And of course there are publications that cover this thrumming beehive of novelty: "BostInno," a startup website dedicated to boosting startups, and "Beta Boston," which is a project of the more established but still super-enthusiastic Boston Globe.

Meanwhile those outside these 'innovation hubs' struggle across the state. The self-confident creative class march ever onwards, supported by municipal and state governments for whom subsiding innovation is axiomatic, while inequality soars in a state ranked amongst the most unequal in the United States on common measures. It’s in this schism that we can see what Harris Gruman describes as a “liberalism of the rich” (loc 2928).

If we see this 'innovation liberalism' in terms of its class politics, the growing revolving door between Silicon Valley and government becomes much more than a matter of curiosity. As he describes on loc 2918-2934:

By that time, the place once filled by finance in the Democratic imagination had begun giving way to Silicon Valley, a different "creative-class" industry with billions to give in campaign contributions. Changes in the administration's personnel paralleled the money story: at the beginning of the Obama years, the government’s revolving doors had all connected to Wall Street; within a few years, the people spinning them were either coming from or heading toward the West Coast. In 2014, David Plouffe, the architect of Obama's inspiring first presidential campaign, began to work his political magic for Uber. Jay Carney, the president's former press secretary, hired on at Amazon the following year. Larry Summers, for his part, became an adviser for an outfit called OpenGov. Back in Washington, meanwhile, the president established a special federal unit that used Silicon Valley techniques and personnel to revolutionize the government’s web presence; starstruck tech journalists call it "Obama's stealth startup."

The whole tenth chapter of Listen Liberal explores this issue and I can't recommend it highly enough. I'm increasingly convinced that we can't understand the failings of the contemporary Democratic party without an adequate account of the rise of digital elites within them, as the latest turn in a much long-standing process of capture by professionals. On loc 3184 he describes how talk of 'innovation' serves to prop up this accelerating inequality:

Technological innovation is not the reason all this is happening, just as the atomic bomb was not the cause of World War II: it is the latest weapon in an age-old war. Technological innovation is not what is hammering down working peoples' share of what the country earns; technological innovation is the excuse for this development. Inno is a fable that persuades us to accept economic arrangements we would otherwise regard as unpleasant or intolerable—that convinces us that the very particular configuration of economic power we inhabit is in fact a neutral matter of science, of nature, of the way God wants things to be. Every time we describe the economy as an “ecosystem” we accept this point of view. Every time we write off the situation of workers as a matter of unalterable “reality” we resign ourselves to it.
The pace of critique in a world of accelerating upheaval (2016-11-30 08:00)

There’s a pervasive idea that social critique must be slow, necessitating withdrawal from the world in order to carefully pierce through the veil of appearances. There’s a kernel of truth in this, in so far as that hasty analysis risks both superficiality and the reproduction of dominant frames of reference.

A whole sequence of events have illustrated the necessity of moving beyond these faded frames. The financial crisis, the Arab Spring, Brexit, the rise of the far right in Europe and Trump have all been to various degrees unthinkable within the confines of established frames of reference. The dominant reaction in response to them has been, at least initially, “what on earth is going on?”

There’s a huge opportunity for critical intellectuals here to occupy the civil and political attention space when it is characterised by pervasive bewilderment. Taking it will involve abandoning slow critique and taking up the affordances of digital media to intervene at speed. There are intellectual*, practical, ethical and personal challenges involved in doing this. But it’s necessary we meet them because the pace of frame-breaking events is increasing and there’s a path dependency to their unfolding. There’s a unprecedented opportunity to establish a new salience for critical thought but it will not last for ever.

To what extent do institutionalised practices of ‘critique’ merely reproduce the faded frames we need to move beyond?

The savagery of the political discourse emerging since the EU Referendum vote, in the election of Donald Trump and the explosion of nouveau fascism across Europe has led to a preoccupation that there might be something amiss in our societies on a psychosocial level, something that might be summarized as an absence of empathy. This article explores the social problem posed by sociopaths, why our society struggles with empathy, and what we can do about it.

We think of social conflict as a clash of class, social group or political ideology, rarely as that which occurs between personality or psychological types, embodied in the terms psychopaths, sociopaths and narcissists. It is easy to understand why. We feel discomfort at applying impermeable labels to people, a feeling deeply embedded by anti-psychiatry writers such as Ronald D. Laing and Michael Foucault and sociologists such as Howard Becker and Erving Goffman, whether this was their intention or not.

These writers were part of a broader countercultural movement in the 1960s and 1970s that questioned our tendency to assign character traits to statuses such as gender and race and in doing so, create 'outsiders.' Further,[1] they saw mental illness as no good reason for lifelong incarceration. Across many spheres of society, no one was to be judged irredeemable. The problem of applying labels to personality types has been underpinned by the bewildering array of diagnostic criteria in the ever-growing Diagnostic and Statistical Manual of Mental Disorders (DSM).

Yet phenomena such as workplace bullying and domestic violence, far from rare, point to the need to develop awareness of the kinds of havoc those with particular kinds of personalities cause. Let’s look at the statistics.

The extent of workplace bullying is hidden, given that people leave or come to a settlement before anything is recorded and shame does the rest of the work. Research estimates of the number of victims show the prevalence of workplace bullying ranges from 1 in 10 people experiencing bullying over the previous six months (with half having witnessed bullying over a period of five years), to 1 in 3 in a survey of city workers. Bullying is reported to be higher in the public sector than the private sector (though there may be a ‘dark’ private sector figure). The extent of domestic abuse is also subject to a high dark figure, though Refuge estimated that one in four women are affected by it in their
lifetime.

Routinely, bullying and domestic violence are discussed as a by-product of a possible personality disorder on the part of the perpetrator, though this does not account for all cases. It is perhaps telling that controlling and coercive behaviour in intimate relationships or families, the hallmark of personality disordered behaviour, has been criminalised in the Serious Crime Act 2015 (though there is no law criminalising workplace bullying).

Meanwhile, books, articles and blogs are written casually mentioning terms such as psychopathy, sociopathy and narcissism as being implicated in these kinds of abuse. Films and other popular media have made the sociopath the stuff of legends and folklore. We have a morbid fascination about these creatures with no conscience.

But in our everyday interactions, we have been slow to catch on. It is almost as if, in our rush to disavow our instincts, feelings and judgments when we encounter others, lest we label them unwittingly, we have left ourselves defenseless when we meet these ‘charming monsters’. Potentially understanding our problem as being caused by a sociopath is almost a whispered secret and a source of silent shame. We blink and go back to the socially acceptable route of self-blame.

But are sociopaths possible to identify, and can we understand their social impact or see them as part of a structure of broader social conflict (as something those interested in social and cultural change should be interested)?

I’m going to argue for a not-so-tentative yes...next I’ll explain why.

Sociopaths and the 'empathy trap'

One of the best accounts of sociopathy I have come across is in a book by Jane and Tim McGregor called, The empathy trap: understanding antisocial personalities, because it focuses on their ‘relationality’ to the two other key personality groups in society – empaths and what they call apaths. I’m going to spend a bit of time outlining these terms because it points to what I would call a major social problem and a possible cultural solution.

It is not clear how many sociopaths walk among us, but the writers suggest it is anything between 1 in a 100 of the population to 1 in 25. They argue that while there is a variety of diagnostic criteria listing their so-called traits, they believe (or hope) that these will be abandoned and redefined as ‘conditions of low or zero empathy’. There are of course a list of traits associated with sociopathy: superficial charm or superciliousness, dishonesty, thrill-seeking or a need for stimulation (because there are no emotions to preoccupy them), egocentricity, absence of guilt, impulsive risk-taking, a lack of emotions, tendency to ‘gaslight,’ cool under pressure, and an inability to respond to punishment (but they do respond behaviourally to rewards).

Some traits can be culturally specific, meaning that different countries or social groups may express low empathy in distinct ways. As a consequence, sociopaths, as McGregor and McGregor note, can be very hard to spot, and the cod checklists you find on the Internet may not be helpful. They can also be hard to spot because sociopaths have an uncanny ability to make others carry their affects, so that, when you meet a person displaying some of the above traits, they may simply be close to a sociopath (but not be one).

Empaths, on the other hand, account for a surprising 40% of the population, they say. They are not people with extraordinary powers, but merely:

"...ordinary people who are highly perceptive and insightful and belong to the 40% of human beings who sense when something's not right (those who respond to their 'gut instinct'). A particular attribute of empaths is that they are sensitive to the emotional distress of others. Conversely they have trouble comprehending a closed
mind and lack of compassion in others."

Empaths are people who are able to grasp what another person is feeling and 'walk a mile in their shoes'. They are much more likely to act on their conscience, which makes them a potential obstacle for the sociopath. Sociopaths also derive pleasure from tormenting and thwarting empaths - it is good sport for the sociopath. Sociopaths also want to take from the empath, take everything that is lacking within them.

Empaths are makers of social change, opening up spaces for experimentation and freedom. But, as the writers note, while our culture superficially celebrates those who do so, the reality is quite different:

"It was interesting to discover, when doing the research for this book, how often people referred to empathetic types as fearful, too sensitive and vulnerable. In other words, many people see empaths in problematical terms."

The authors note that highly empathic people can develop problems, and the reality is that empathic ability is a gift of thorns and a walk of pain. They can be overcome by emotional stimuli and have difficulties in maintaining boundaries between themselves and others. It makes them particularly susceptible to the psychological violence of sociopaths.

Which brings us to apaths, who could help, but must be willing to move...

[2]We all remember (don't we?) those highly controversial experiments by Milgram and Zimbardo, showing us how easy it is to persuade people to collaborate in violence and abuse. Those highly suggestible people are the apaths. Apaths are just normal and perfectly decent people, who nevertheless lack the insight or highly developed conscience to stand up for what is right (though they may do so in particular circumstances). They may simply be so fearful that they collude with practices they know to be wrong, or refuse to believe what they are seeing. The apath, according to the authors, can be persuaded to be the sociopaths ally in destroying the empath, particularly if they have a reason to dislike them (because of envy, for example).

So how are all of these relational? The authors say this:

"For a sociopathic transaction to be effective it requires the following threesome: a sociopath, an empathy, and an apath...The usual set up goes something like this: the empath is forced to make a stand on seeing the sociopath say or do something underhand. The empath challenges the sociopath, who straightaway throws others off the scent and shifts the blame on to the empath. The empath becomes an object of abuse when the apath [who has been thoroughly worked over by flattery, lies and inducements - my words] corroborates the sociopath's perspective. Ultimately the situation usually ends badly for the empath, and sometimes for the apath (if his conscience comes back to haunt him, or subsequently he becomes an object of abuse himself). Frustratingly, however, the sociopath often gets off scot free."

Anyone who has been embroiled in a familial or workplace dispute may find this pattern all too familiar. If so, it is worth reading McGregor and McGregor's book to confirm that you are not going crazy - the dynamic is real. But are there any implications in all of this for society?

Sociopaths in social context

Robert Hare's book, Snakes in suits: when psychopaths go to work, illustrates the interactions between corporate culture and psychopathy. He graphically describes the havoc they cause through their low-conscience and zero-empathy behaviours, such as lying, manipulation and ruthlessly dealing with perceived competitors or obstacles to their power-grab. Will Black, author of the book Psychopathic Cultures and Toxic Empires, points out that groups
and institutions – such as families, paedophile rings and political organisations - can incorporate and perpetrate psychopathic behaviours, such that those behaviours can become permanent, even if there are no psychopaths in the organisation anymore.

Both of these authors illustrate that sociopathy can be supported by prevailing culture and serve to reinforce that culture. Hare shows that there is a strong correlation between sociopathy and the values of corporate culture, so that sociopaths may be able to slide through the door or even celebrated. Black demonstrates that sociopathic values can be transmitted to others through social, political and organisational structures. Indeed, it might be useful to observe that the first task of political and religious cults is to lower the empathy of its members through various means.

So sociopathy is a social and cultural problem. What’s the answer? Lock everyone up who displays sociopathic tendencies? Probably not. Nor is it a good idea to start doing sociopath spotting, because that could have destructive social consequences alongside making the amateur sociopath spotter quite paranoid. It is no surprise that Jon Ronson started questioning his own premise half way through his book The Psychopath Test. It is undeniably useful though to become familiar with some of their key traits, so you have an awareness of who or what you may be dealing with, whether it’s personal or institutional. It’s just that you can’t do anything with that, except run.

There is another way of looking at the problem though; one that doesn’t involve examining everything through the lens of the sociopath. McGregor and McGregor argue that the problem is not so much with sociopaths, who are after all in the minority and unlikely to change (except if you catch them early in their life). The problem is that our society is not supportive enough of empaths, and is too supportive of sociopaths and apaths. Society is supportive of sociopathy because the values of aggressive competitiveness and ruthlessness are mainstream, and those with sociopathic tendencies are sometimes knowingly employed by companies and institutions to shake ‘dead wood’ out. It is supportive of apaths, because fear, capitulation and the denial of reality are viewed as acceptable and normal pathways through life.

Think about how empathic people are treated. Through our schools and workplaces, we train people to buckle down and toughen up. Our favourite phrase is ‘suck it up,’ which must have been invented by a sociopath, because it serves them perfectly. We tease children for being too sensitive or crying when they are hurt, physically or emotionally. We slap down resistance and celebrate ‘going with the flow.’ We turn away when children and adults are bullied, feeling that somehow they deserve it. We don’t teach emotional complexity in schools, colleges or universities. We teach people to value competition rather than cooperation and understanding of ‘the other.’ Intuition is ridiculed and dismissed, which is crazy because we don’t just learn through our intellect and great innovation is born from intuition. In short, we bruise people until they are emotionally numb. We don’t protect empathy, we resent it, and in rejecting the empath, we allow ourselves to become fodder for sociopathic ways of being.

It is possible that creating new alignments where the empath is supported and the apaths move to support them is intimately connected to social structures. Existing in a society that is segregated along class, gender, ethnic and ideological lines does not create the culture of openness, fluidity, and engagement with creative differences in which the empath is likely to thrive.

Also, social change is not just a matter of rational politics, as the counterculture realised. The war between sociopathic and empathetic values speaks to a symbolism of wider social conflicts, and illustrates that social change is an emotional and psychological (in other words, psychosocial) problem. So what would it take to swing the balance, I wonder, and let the empath roam free?

[3] Deborah Talbot is a freelance qualitative researcher and journalist, writing about society, culture and all things urban. She has recently set up a new blog[4] Interurban Lines.

Sean Corbell (2017-01-29 12:42:43)
Thank you so much for this. Coming late in life to emotional intelligence and involvement, I'd been starting to feel like a crazy person seeing how much the denial of emotional awareness is woven into everything from patriarchal standards of "strength" to the insistence that consumer capitalism is a meritocracy.

Conference Funding for ECRs from @TheSocReview (2016-12-02 08:00)

The Sociological Review
ECR Conference Funding Competition

Up to £1000 per applicant for unfunded PhD students and postdocs (within 3 years of completion) to facilitate their attendance and participation of conferences.

Deadline: January 31st 2017

See [1]here for full information and how to apply

Next week in Oxford: Digital Sociology v STS (2016-12-04 19:33)

Wednesday 7th December 2016, 13:00
The Oxford Internet Institute 1st Giles Oxford, OX1 3JS

The concept of Digital Sociology has been in circulation for around five years now. But if the British Sociological Association’s annual conference is anything to go by, ‘the digital’ is still on the periphery of British Sociology.
Perhaps problematically, Digital Sociology shares a stream with STS at the conference. We are taking this marriage of convenience as an opportunity for anyone interested in the future of Digital Sociology and STS to get together and discuss the following questions:

Why do we need Digital Sociology when we have STS?

What are their affinities and disaffinities?

Are digital methods and digital ontologies transformative for STS?

What distinguishes Digital Sociology from all the other disciplines that claim to study the relationship between society and social media, the Internet, the Web and digital data?

What use is the concept of Digital Sociology?

How can we join forces across institutions to progress the project of Digital Sociology?

To help us address these questions and similar questions that may arise on the day we are very pleased to have presentations from:

Professor Susan Halford, Director of Southampton University’s Web Science Institute; Professor Will Housley, Vincent Wright Chair, Sciences Po & University of Cardiff; Dr Mark Carrigan, Research Fellow in the Centre for Social Ontology at the University of Warwick and Digital Fellow at The Sociological Review; Dr Karen Gregory and Dr Kate Orton-Johnson Lecturers in Digital Sociology at the University of Edinburgh; Kate-and Dr Des Fitzgerald Lecturer in Sociology from the University of Cardiff (with more speakers to be confirmed).

Each speaker will talk for around 10-15 minutes before we open-up the discussion to the floor. If you have any thoughts on those questions above or would like to get involved in the study groups please come along. It’s our intention to solicit your input for a plan of action. The meeting will be followed by a free drinks reception.

Spaces are very limited please reserve your place as soon as possible.

**Booking your place**

Booking is essential. Venue numbers are restricted and it is advisable to book early.

Registration Fees: BSA member £10 / Non-BSA member £15

The @TheSocReview Seminar Series Competition (2016-12-05 08:00)

See [1]here for more information and how to apply.

Call for Applications: 2017-2018 Research Associate Program - Five College Women’s Studies Research Center (2016-12-06 08:00)

The Five College Women’s Studies Research Center

2017-2018 Research Associate Call for Applications

DEADLINE FEBRUARY 15, 2017

- The Center is located in a geographic area with one of the largest concentrations of scholars dedicated to feminist scholarship in the world.
- As of 2016, the Center has hosted close to 400 researchers from more than forty-four countries and thirty-five states across the United States.
- Given an office with access to extensive consortium resources, Associates gather regularly to discuss their research with each other and local faculty in a variety of settings.

Applicants should complete an online application that includes a project proposal (up to three pages in length), curriculum vitae and contact information for two professional references. Project proposals should include 1) a statement about the contribution to and significance of the project or dissertation for women and gender studies, 2) a detailed description of the project or dissertation and timeline, 3) how a stay in the Five Colleges will advance the project or dissertation.

Travel, housing and living expenses are the responsibility of Associates in this unpaid residency. It is important that Associates remain in residence for the duration. Beyond this requirement for the facilitation of community, Associates define the scope of their research program for the semester or year. The Center’s Director will help identify conversation partners and resources as requested.

To apply: apply.interfolio.com/38611

Wolfgang Streeck on The Five Disorders of Capitalism (2016-12-07 08:00)

In this talk at Goldsmith PERC, Wolfgang Streeck discusses 'How Will Capitalism End?':

4748
A conversation with Gary Hall about pirate philosophy, academic celebrity and social theory (2016-12-08 08:00)

In this interview, Gary Hall argues that if we are to move to a post-capitalist society, we need to experiment with new ways of being and doing that are based less on ideas of self-centred individualism, competition and celebrity, and more on openness, collaboration and the gift. The university, he suggests, is somewhere we can actualise such alternative modes of thinking and working, as it is one of the few spaces in post-industrial society where the forces of contemporary neoliberalism are still being overtly opposed, to a certain extent at least. A persona he proposes we adopt in order to do so is that of the pirate, this being for him someone who tries, teases and troubles as well as attacks our existing economic, legal and political models.

Sociological Catalysts and Operationalising Theory in Practice (2016-12-08 16:50)

by Yusef Bakkali

Life as an academic can be a lonely and alienating calling at the best of times; lots of time spent inside one’s own head reflecting on a world playing out someplace beyond the indiscernible turrets and bulwarks of the University. Coming from a less-conventional academic background this almost Cartesian split between thought and reality has had existential implications.

The reality of free school meals, failing comprehensive schools, racial injustice and community violence was a real one during my formative years, yet the most valuable gift my (rather expensive, but fortunately subsidised) post graduate education bestowed upon me was to understand these things in new ways. When given the freedom to ask
questions and exploit university resources in the pursuit of my passions I was able to make sense anew; hybridise abstract ideas with lived experiences. This gave fresh perspective which changed the ways which I felt about my life and situation, although perhaps not relieving me of what I've felt as a 'legitimate rage' (Bourdieu, 1998), but instead politicised it. This has redirected and helped me to work towards forgiveness and empathy in many instances, whilst increasingly feeling the need for commitment to cultivating social conditions which serve the interests of those outside of the elite.

This has helped me understand what I feel is a crucial role for sociology in society, one that does not fit neatly in to our hierarchical understanding of social order. It is one which does not necessitate the sociologist to become a leader but instead act as a **catalyst**. This does not negate the requirement for leaders in our world, or sociology’s role in informing them, but it promotes its role in creating democratic conditions for their production and accountability. This is something which is increasingly crucial in the current conjuncture.

In a time where leaders (such as Trump and Farage) who have little authentic credibility in promoting the interests of the many, have perpetuated and manipulated public anxieties, sociologists must do the opposite. We must offer our services to help provide a catalyst helping to promote informed debate and participation in society. Bringing people, events, ideas and experiences together to help inform our futures; for me this is sociology’s role in the world. So what might this process of ‘catalysation’ look like in practice?

**Doing Things in Practice**

In my work as a student, citizen and educator I have sought to ‘operationalise theory’ and in doing so actively reconnect it with civil society. Coming from academic research backgrounds we must recognise the importance of making sense of the world around us, yet much of the fantastic work going on at universities often seems remote to people who do not inhabit the world of academia.

This gulf between academe and the many, is a real problem. Funding bodies and universities try to address this by demanding that research gives rise to ‘impact’, something that can be hard to make tangible. There is no quick fix for such a broad and problematic issue, however, I advocate for the use of innovative methods in order to help inform and empower people in our communities as an initial step.

My approach has been to use my experience as a researcher to help facilitate groups in the community to create knowledge and encourage people to take ownership of their local understandings. We believe those with lived experience are amongst those best placed to speak on issues facing their communities but to make this possible we need to spend time reflecting on and thinking through these issues –we need theory!

**Thinking with Freire**

The work of celebrated Brazilian educator and intellectual Paulo Freire provides much of the inspiration for this approach. His emphasis on Praxis; the continued reflection on experience, with a view to constantly reconceptualise and improve understanding and practice lies at the heart of this approach. Good theory should be easily operationalised within the framework of everyday experience; meaning that rather than descending from the ivory tower in the form of some kind of curriculum; theory should be utilised, combined and adapted to meet the needs of the community. This synthesis of theory and praxis is what makes such projects unique - but what does this look like in practice?

The first stage in any knowledge creation process is to identify the issues that are of particular importance within the collective we are collaborating with. Proper time and consideration has to be taken to hash these out in order to understand their significance. This Freirian practice is central to the process:
Educators need to know what happens in the world of [students] with whom they work. They need to know the universe of their dreams, the language with which they skilfully defend themselves from the aggressiveness of their world, what they know independently of the school, and how they know it (Freire, 1998: 72).

Operationalising Ideas – Re-tooling

Facilitators also need to find relevant theoretical streams to inform the debate and broaden or define the scope of the discussion. During the course of a previous project; one particularly poignant issue was stigmatisation, with many of the young people participating in the group expressing concern about with the way in which they are depicted in the media. There are many theoretical contributions which can help to explain processes involved in stigmatisation, such as Sticky Identities:

The impressions we have of others, and the impressions left by others are shaped by histories that stick, at the same time as they generate the surfaces and boundaries that allow bodies to appear in the present. The impressions left by others should impress us for sure; it is here, on the skin surface, that histories are made (Ahmed, 2004: 39).

As facilitators we designed activities to help deploy theory in action; one activity used post-it notes to embody the process of stigma utilising Sara Ahmed’s notion of sticky identities. It involved a facilitator first introducing and identifying himself, along the lines of his personal identity. The group then began to attach labels (quite literally) to how he may be perceived by those in power, including the police and educators. The group then stripped him of the identities which those in power would not see or maybe care about. The contrast was telling, he was stripped of his identity as an educator, academic, even brother and son; instead finding labels such as jihadi and IC3 (the code name used by police to describe a black male) attached to him. Though this exercise worked on the group’s perceptions of the attitudes of those in power it also demonstrated the brutal effects stigmatisation can have on personal identities’ well-being.

On the basis of this work we were able to develop a model which explained how ‘indomitable narratives’ come into being, often via the observations and projections of those not immediately involved in events (such as politicians and journalists). We linked these indomitable narratives to the idea of canonical narratives (Bruner, 1990; 2002); showing how they become a part of the ‘stock of stories’ which people use to make meaning. This provided us with a framework to explore and create ‘counter narratives’ that would disrupt and enrich the stock of stories about young people in our communities. Though the chosen topic was education the group seeks to examine it through multiple lenses; stigma, justice and love.

In this way the utilisation of research methodologies, theory and praxis contribute to a powerful strategy for advocacy and empowerment within the community. Our group was not a talking group it was a space where constructive discussion and theoretical reflection took place in order to create new working knowledge. These new understandings are tested and communicated via various mediums including; academic interviews, questionnaires, art, music and prose, among others. I believe that these ‘outputs’ express authentic ideas to the world, challenge pre-existing stereotypes and recommend better practice.

It is my firm belief that people should have access to and be included in the process of active knowledge production. Theory and research can be powerful tools for empowerment, encouraging people to critically reflect on and understand issues which effect themselves and others. Many people speak of apathy amongst the young; what my experience as a facilitator shows me is that if apathy exists it is not among those who are said to be ‘not participating’. If there is a deficit, it is a deficit within the democratic process that fails to capture their voices and imaginations.
It is the job of academics, educators, politicians and journalists to incorporate the voices of young people in our communities in key decisions over the future of our democracy, yet we see too few genuine attempts to empower people to contribute, reflect and be intellectually challenged on their perspectives. It should be our mission as sociologists to help to ‘bring the noise’, as Stuart Hall and Kobina Mercer so eloquently put it. The noise which serves as the lifeblood of a healthy democracy; comprised of a wide array of voices, constantly negotiating and renegotiating meaning in search of a better world.

He is strongly committed to exploring and running projects on alternative forms of community based learning. You can contact him on yb35@sussex.ac.uk or yusefbakkali@gmail.com.

Squeezing Us ‘Till It Hurts: Motherhood, Discrimination, and Universities (2016-12-08 17:58)

by Deborah Talbot

4752
The Final Report of the Equalities Review, published by Equalities Commission in 2007, reviewed a range of persistent inequalities including those that affect women. It argued that, ‘...new research reveals clearly that there is one factor that above all leads to women's inequality in the labour market – becoming mothers’.

Employment discrimination is also an austerity problem, reported the Fawcett Society more recently, with women being more likely than men to be made redundant and targeted when pregnant. [1]The processes in which being a working mother are viewed as a burden by employers were outlined well by Madeleine Bunting in the Guardian, shortly after the Equalities Review report was published. They include being on call in case of sickness or problems at the nursery, finding it difficult to work late or do essential networking, and finding travel more difficult.

While employers expect things to change as children get older, the reverse is true. Once children hit school age, the responsibilities of parenthood escalate, as does the difficulties of finding childcare that fits around school times and holidays. [2]A TUC Report called Age Immaterial found that women were more, not less, likely to go part-time, once their children went to school.

The difficulties of sustaining work alongside motherhood is a problem across the class divide, and each has its unique set of tensions. In this article, however, I’m going to focus on the professions, and in particular – largely because I used to be one – the problem of combining motherhood with being an academic.

Until recently, there has been very little written about what happens when women try and, y’know, ‘engage with life’ by having children when they are academics. There has been a smattering of blog posts, more so in the US than the UK. For example, [3]one quite funny blog in the Guardian by an academic at UCL revealed that you need a supportive ‘work at home’ partner, a cleaner, and nearby grandparents, to manage an academic career. She didn’t work on weekends, meaning that her journal and grant production might have been affected (she doesn’t say). [4]Another blog from the US pointed to the ‘vita gap’ that affects tenure progression. The ‘vita gap’ is what happens to your research production when you take a year off to raise your child and over the long-term, produce slower research results and publications. Mothers are often found in much lower status academic work, while academic men who have children and stay at home partners were more likely to find themselves on the tenure track.

However, two relatively recent articles (and I’m sure there are more) have added to the debate in quite important ways. [5]One article in the Times Higher reported on research from Kings College, which explored the problems mid-career women experience with recognition and advancement. Female academics with children said that juggling
the demands of childcare with writing academic papers – the only activity that led to prestige and promotion – was particularly acute:

"That particularly affects mothers with young children...because this is one area where you need to sit down and be able to think," said one academic quoted in the report, who added, "when you're very exhausted, you do the easy tasks".

Another article is by Professor of Sociology Angela McRobbie, who comments eloquently on the clash between the demands of children and the contrary demands of the unsullied intellectual life in which a 70-80 hour week is the norm. As she notes of the rigours and hours of academic life:

"As an academic I could hardly disagree, this is indeed what is required to do the job properly, as a feminist I thought that this working day surely relied on high levels of unseen support to shop, cook, and attend to the various aspects of domestic administration so that bills are paid, food is bought, clothes are collected from the dry cleaners, parents nights are attended and so on...it may seem banal but the ideal career track in the academy especially one which carried all the laurels of prizes, awards, fellowships and a high volume of grants seemed to have been tailored around the image of the brilliant young man untrammelled by any of the fine details of domestic life."

It seems that issues of gender inequality, and work/life balance, have been creeping up on the sector. All while they are busy being awarded 'kite marks' for success in achieving gender and other forms of equity.

As McRobbie rightly points out, the sector has not adjusted or thought about issues of gender and work-life balance in the wake of the Research Assessment Exercise (RAE) and its new iteration, the Research Excellence Framework (REF). It is unlikely to do so in response to the Teaching Excellence Framework (TEF).

The RAE/REF have conspired to propel academics to publish in journals or be damned. They "pathologise failure," says McRobbie. Academics who do not keep up on the research publication and grant scorecard, for whatever reason, are being actively discriminated against and sidelined. They find it more difficult to move institutions and remain locked into their current job, while being undervalued and under threat. I was very amused to see that during the last REF, maternity leave meant that you could submit one less publication than the four expected. Now for those existing outside the peculiar world of academia, that might seem reasonable – one less publication for the nine months to a year spent away. Until you factor in the REF's criteria of impact and citations, and the level of networking, research grants, and publishing frenzy you need to achieve the requisite impact and citation score. You just can’t get off the train.

We can add into this mix recent research on the US creative sector by Devon Proudfoot, Aaron Kay, and Christy Koval from the Fuqua School of Business, which found that there was a gender bias in how people perceive creativity. Not surprisingly, in various studies, the researchers identified that women were being assessed as less original, creative and innovative, except in the field of fashion. They conclude that this bias might explain why women were less likely to occupy professions in the upper echelons of the creative sector, science, architecture and mathematics, to name a few. They conclude:

"Our findings complement research examining reasons why women may not want to enter these fields, suggesting that biases about the cognitive processes women adopt can pile up on other impediments."
This bias will be no surprise to academic women.

[8]The university sector is dominated by pernicious administration and management, seeking to impose management systems long since rejected by the most progressive elements of the private sector. Add to this a government, which insists that universities should not be a burden on the ‘public purse’, and you have a recipe for academics in general, and academic mothers, in particular, to be squeezed until it hurts.

McRobbie argues that moving to a new university, with less pressure to do research, was her solution. That solution may not exist now. However, she does point to the need to resist both the claims of the REF and contemporary notions of work:

"Often I have thought surely it should be enough to spend a morning teaching, an afternoon doing supervisions and some marking of essays and then go home and switch off and enjoy the children or indeed grandchildren, and help with home-work rather than feeling the need to return late night to the computer and to the completion of yet another peer-reviewed journal article."

This writer can’t disagree with that portrayal, though I’m not sure the majority of academics would buy it, as the culture of the REF is too engrained. It’s as though everyone is suffering from the Stockholm Syndrome and is just lovin’ their chains. There’s moaning, for sure, but moaning is not the same as resistance. The reality is of course that the REF works well for many, allowing them to beat back competition for promotion.

Until the system of assessed and competitive research activity is abolished, there will never be an appropriate balance between teaching and scholarship, work/life balance. Those with family responsibilities will be disproportionately affected.

The problems don’t begin and end with research and teaching assessment. There are other issues to consider.

Universities have been very bad at offering permanent part-time contracts or assessing appropriate career paths for those who are part-time. The lack of permanent part-time options matters, not just to parents, but also to carers and those who want to combine academia with other intellectual and creative pursuits. Too often, institutions, like universities, see flexible working as a burden, rather than an opportunity to build a diverse workforce with a range of skills and social connections.

Universities have also been slow to encourage and professionalise new forms of intellectual representation, including the digital, which ironically can help women network when they can’t be there in person (ever wonder why digital start-ups are so intertwined with employment for mums?). Finally, universities must simply get past the myth that they are good at managing discrimination. Kite marks look great on the marketing materials, but the reality is that they are just a slick layer of corporate advertising hiding a wealth of problems and discriminatory processes.

Universities should be places of intellectual and social innovation, at the forefront of tackling workplace discrimination. Sadly, they are trailing behind the hipster private sector, which has experimented with alternative systems of networking, female networks and collaborations, and flexible working.

Time for an employment revolution, ye scholars.

Call for papers: Research Methods for Digital Work (2016-12-11 08:00)

Call for participation
As digital technologies have matured, various forms of distributed working have become commonplace. The contemporary workforce includes many people who move between different sites during the course of a working day or week, and who switch between offline working and diverse forms of online work and mediated communication. Virtual teams coordinate activities across geographic locations, using multiple channels of communication to organize their work and to build identity as a team. Organizationally-sanctioned online communications and digital repositories are used alongside extra-organizational resources such as social media and informal face-to-face conversations. Professional and personal activities share communication channels, and boundaries between work and non-work can become blurred. Work is thus both spatially and temporally complex. This complexity provides many challenges for the researcher aiming to capture and understand these practices, tracking activities - and their meanings for participants - across multiple formats connected in an unpredictable fashion. This meeting focuses on a key question for studies of contemporary work across disciplines: how can we combine methods or devise new methods to capitalise on diverse forms of data to build rich and theoretically-fruitful understandings of digitally-suffused working life?

This meeting focuses on methods to study distributed and multi-modal working practices drawing on expertise across a range of disciplines, including management and organization studies, sociology, anthropology, Science and Technology Studies, work psychology, design informatics and HCI. Each of these disciplines has a theoretically-motivated need for detailed insight into what people do in their working lives and a distinctive set of methodological expertise in capturing working practice. By focusing on innovative methods for the study of work across disciplines, we aim to promote cross-fertilization of approaches across disciplines and to instigate conversations on the theoretical purchase offered by different ways of studying work.

We are inviting contributions that present innovative methods for the study of working practices, particularly those that present the method in the context of successful use within a research project. We welcome papers that involve practical demonstration of an approach to data capture or an analytic technique.

Key themes at the meeting are likely to include:

- capturing transitions between modes of work: what methods can we use to explore how, when and why people switch between online and offline?

- capturing experiences of fluid, unpredictable work: how can we employ observational and diary-based techniques effectively under such circumstances?
· quantitative approaches and logging across media: how can we build approaches that exploit the richness of data provided by individual media but also recognise the complexity of transitions between media? Where are "Big Data" approaches helpful?

· how to research screen-work: what new methods for understanding what is happening when a worker engages with a screen have become available?

· private and professional social media: how can our research methods enable us to understand transitions between formal work-spaces and personal online interactions?

· mixing methods for study of work: what challenges and opportunities emerge when we attempt to combine different methods for capturing the experience of work?

Extended abstracts of no more than 1500 words should be submitted by 31st January 2017 using the online submission form at http://www.ias.surrey.ac.uk/workshops/workpractices/cfp.php Following the meeting we anticipate production of an edited volume drawing on papers presented at the meeting. Contributions from international scholars and early career researchers are particularly welcomed. Participation will be limited to 50 attendees. Registration fees are £60 (£40 for students/unwaged). Attendees will be responsible for their own travel and accommodation – links to local accommodation will be available at the time of registration via the event website http://www.ias.surrey.ac.uk/workshops/workpractices/ The meeting is being organized by Christine Hine (University of Surrey), Katrina Pritchard (Open University) and Gillian Symon (Royal Holloway, University of London) in association with the Digital World Research Centre at the University of Surrey. The meeting has received funding from the Institute of Advanced Studies at the University of Surrey and the RCUK-funded NEMODE Network Plus.

Understanding Brexit: Inequality, Inclusion & Social Justice (2016-12-13 08:00)

THURSDAY 26th JANUARY, 6-8pm

Impact Hub Birmingham,
An open town hall event to understand 'Brexit' in terms of issues of inequality, inclusion and social justice.

Panellists:
Kehinde Andrews (Birmingham City University)
Gurminder K Bhambra (University of Warwick)
Omar Khan (Runnymede Trust)
Karen Rowlingson (University of Birmingham)
Richard Seymour (Salvage)

Chairs:
John Holmwood (University of Nottingham)
Robbie Shilliam (Queen Mary University of London)

Entry is free, but please register here:

Living with theoretical pluralism (2016-12-14 08:00)

How do we live with theoretical pluralism? It’s too often a matter of ‘peace treaties’, avoiding fights by moving disagreements off-stage. But if we do this then are we really occupying the same argumentative space? I don’t think
we are and the intellectual value of theoretical pluralism is lost if we find ourselves in such a situation.

But this intellectual value challenges us to engage across boundaries, recognising differences as a resource for dialogue rather than simply a constraint. It necessitates a sense of the other’s motivations, avoiding getting hung up on the wider network of disagreements by focusing only on those that are relevant to the topic at hand. Not objecting to the fact someone’s starting points are different to ours but rather trying to understand how our different routes to overlapping topics can be mutually enriching.

This requires a sensibility which seems far too rare in the academy. Pablo Boczkowski and Ignacio Siles describe the danger as "a sort of intellectual insularity (or provincialism) that privileges a certain inwards-looking commitment to a particular paradigm, set of ideas, or mode of inquiry without considering work done in other fields that might significantly enrich or transform it". Instead they argue for an intellectual cosmopolitanism that "promotes the crossing of territorial scholarly quadrants in the study of media technologies to rethink assumptions and normalized processes" (pg. 58).

Social theory has generated widespread intellectual provincialism and we urgently need to move beyond it. The poverty of meta-theory plays a role by robbing us of higher level languages in which disagreements could be negotiated. But there's also a sensibility engendered by the ensuing fragmentation which I find deeply problematic.

Steve Harris (2017-08-20 06:07:58)
Interesting I am currently endeavouring to avoid pluralism within my data by analysing indentity through a range of different lenses, each are either Venn diagrams or a continuum with added complexity, ala Bourdieu and Stanley's (2014) 'fractured foundationalism'. These lenses and associated research questions were drawn from the data, which in turn informed my 'movement of thought' chapter.

Steve Harris (2017-08-20 06:08:50)

No longer praying at the altar of virality (2016-12-15 08:00)

An important idea offered by [1]Mike Caulfield. The embrace of frictionless sharing and the relentless pursuit of engagement have created the problems which are now being naturalised by the emerging 'did Facebook lead to Trump' discourse:

We have prayed at the altar of virality a long time, and I'm not sure it's working out for us as a society. If reliance on virality is creating the incentives to create a culture of disinformation, then consider dialing down virality.

We know how to do this. Slow people down. Incentivize them to read. Increase friction, instead of relentlessly removing it.

Facebook is a viral sharing platform, and has spent hundreds of millions getting you to share virally. And here we are.
What if Facebook saw itself as a **deep reading** platform? What if it spent hundreds of millions of dollars getting you read articles carefully rather than sharing them thoughtlessly?

What if Facebook saw itself as a **deep research** platform? What if it spent its hundreds of millions of dollars of R & D building tools to help you research what you read?

---

**Digital Objects, Digital Subjects: An Interdisciplinary Symposium on Activism, Research & Critique in the Age of Big Data Capitalism. The 6th ICTs and Society Conference (2016-12-16 08:00)**

Digital Objects, Digital Subjects: An Interdisciplinary Symposium on Activism, Research & Critique in the Age of Big Data Capitalism

The 6th ICTs and Society Conference

[1]http://www.icts-and-society.net May 20-21, 2017 University of Westminster, London Hosted by the Westminster Institute for Advanced Studies, [2]http://www.westminster.ac.uk/wias Pre-announcement. More info to follow. Sign up to the Westminster Institute for Advanced Studies’ newsletter to receive further info: [3]https://www.westminster.ac.uk/newsletter Conference location: University of Westminster, 4-12 Little Titchfield Street, London W1W, UK. Map: [4]https://www.westminster.ac.uk/about-us/our-locations/maps-and-directions/little-titchfield-street Conference Co-Convenors and Chairs: Christian Fuchs, University of Westminster, Westminster Institute for Advanced Studies & Communication and Media Research Institute David Chandler, University of Westminster, Department of Politics and International Relations, Centre for the Study of Democracy Many claims have been made about the emergence of a digital turn that is said to have radically transformed the possibilities for politics through undermining traditional modernist binaries of subject/object, state/society, politics/economics, public/private, consumption/production, time/space, mind/body, labour/leisure, culture/nature, human/posthuman. This turn has run through several phases, including cybernetics, automation technologies, mainframe computers, databases, artificial intelligence, personal computers, the World Wide Web, smart phones, geographical information systems, social media, targeted digital advertising, self-quantification, big data analytics, cloud computing, and the Internet of Things. This conference will develop interdisciplinary assessments of the digital’s impact on society. It will interrogate the claims of both digital optimism and digital pessimism. Digital optimists assert that digital technologies have radically transformed the world; promising new forms of community, alternative ways of knowing and sensing, creative innovation, participatory culture, networked activism, and distributed democracy. Digital pessimists argue that digital technologies have not brought about positive change, but have rather deepened and extended domination through new forms of control. They speak of networked authoritarianism, digital de-humanisation, alienation 2.0, networked exploitation, or the rise of the surveillance society. Presenters at the symposium will engage with questions of the digital in respect to activism, research and critique. The conference will engage with the possibilities, potentials, pitfalls, limits, and ideologies of digital activism. It will reflect on whether computational social science, the digital humanities and ubiquitous datafication enable new research approaches or result in a digital positivism that...
threatens the independence of critical research and brings about the death of the social sciences and humanities. The conference will explore the futures, places and possibilities of critique in the age of digital subjects and digital objects.

The Return of School Discipline - why children should be free. (2016-12-16 16:25)

by Deborah Talbot

No, not canes and shouting, but something altogether more subtle and certainly troubling. [1]It has been reported that St George the Martyr Primary School in London has a policy whereby children, when they walk in corridors, have to clasp their hands behind their backs. The headteacher, whose inspiration it was, calls in the 'university walk', which is odd because these are children and students at university don't walk in this way. It has about as much logic (that is, none) as hearing a teacher shout at a five-year-old for having his hands in his pockets. What is it all about?

It has long been an observation of theorists of social control – I’m thinking here of people like Stan Cohen, David Garland, Loic Wacquant - that social insecurity breeds punitivity. In our society, after the most recent slump, insecurity has been rife, fear set loose, and under these conditions rationality and liberality slip away.

In our schools, currently, there is a creeping normativity afoot. I’m not talking about the endless testing and
exams, although these set the frame for what happens in schools. Nor am I talking about the seeming endless desire
to make former army personnel teachers, although I’m sure that is simply a symbolic expression of the normative
environment. [2]This is not a reference to the bizarre and punitive performance management systems that seem to
be the vehicle for bullying and eradicating talented and independent teachers.

What I’m talking about is the weird behavioural modification techniques being applied to very young children,
without so much as a half-hearted assessment of their impact. The paraphernalia of control includes the traffic light
system, rainbows, clouds and thunderclouds, and other forms of reward and shaming systems that get dangled
in front of primary school children. [3]There is also the ‘habits of mind’, the kind of panorama of psychological
management that would make Foucault turn in his grave. Then there are a series of low-level inducements – taking
home the teddy bear if you did something good, certificates, stickers, and even sweets.

The traffic light cum sun and thunderclouds system was an offshoot of the Golden Time method of behaviour
management. Predicated on the idea that children need visual clues to understand ‘good’ behaviour, it shows a sun
and clouds, and children stay in the sun if they are good, and start moving to the clouds if they aren’t following the
rules. There is much about this on the net,[4] but this example shows its intent:

>This behaviour chart encourages consistency of sanctions. The behaviour is noted and immediately dealt
with. There is an opportunity to correct and reverse and we start afresh every day with all the children in
the sun section. The children can see their decision visually and do something about it. The responsibility
is theirs and they strive to stay near the sun. Over the six weeks the change in behaviour during input
time has been measurable. The children are much more engaged and we do not have to spend lots of
time with interruptions as simply walking towards the chart with your eyes looking at a particular child is
sometimes enough!

Teachers often argue that they need these forms of behaviour management to control behaviour in large class sizes,
particularly in inner city areas (the ‘problem’ kids and their ‘problem’ families). However, it is a system based on
public shaming, fear and competitive rewards. The charts and the children’s names are pinned up on a wall for
everyone to see. The kids fear dropping down to a cloud, particularly if they have no behaviour problems to start
with, and the impending fear of public shaming can, in my view, produce anxiety and other emotional difficulties. We
might argue that competition is good, but it also stresses people out, including and perhaps particularly so, young
children. Finally, the rules are often uncertain, meaning that children are constantly reaching for the ‘out of reach’
(hmm, much like the consumer society?). I also guess it’s pretty time-consuming for teachers to work out when to re-
ward behaviour or not, and what kinds of behaviour, and for whom. Perhaps that’s why it’s so inconsistently applied?

It is also necessary to ask, why all the fear about ‘bad’ behaviour? Behaviour is partly a developmental issue
and partly about social values as to what constitutes ‘normal’. It carries constructions about societies fears about
itself, which are then put on our children. It is also about parent’s time, and it is easy enough, as a stressed parent,
to reach for a reward system when things seem out of control, as they so often do with very young children (as well
as older ones). It sometimes seems as if children’s ‘bad’ behaviour is more about how much time we have to invest
in them and their rhythms than anything being intrinsically amiss.

Most fundamentally, however, I would argue that such behaviour management systems are about creating
one form of model citizen for advanced capitalist economies. A reflection can be found in performance management
for teachers in school, where compliance is valued over competence. Increasingly, it seems our society values
above all else a standard of normativity that is about non-resistant, passive consumerism. It wants us to be suitable
and prepared for a world of work that aims at obedience, not ingenuity and critical thinking. And while this
pattern of compliance rolls itself out through all our institutions of society, it ironically is self-defeating, because
it stands in direct contradiction to everything advanced capitalist societies are supposed to excel at – creativity, innovation, entrepreneurism, all of which requires critical thinking and risk taking. Put simply, a certain amount of acting up and general cheekiness is a symptom of a lively and free mind. Perhaps our anxiety is getting the better of us? Or maybe it is simply a reflection of inequality, with compliance for the ‘plebs’ and critical thinking for the elite?

I recently read a book called *Nurture Shock* by Po Bronson and Ashley Merryman. It had the rather off-putting subtitle of ‘Why everything we think about raising our children is wrong’, although I assume that was the marketing people talking, because it was a fairly good review of recent research in child development and neuroscience. It made a pretty convincing case for thinking that education needs to be orientated around self-motivated systems of effort. It argues that children need more sleep. That aggression is often expressed by very socialised kids and is just their way of making it in the world (so why stymie their efforts?). It explains why programmes for gifted students are pointless (because they haven't finished developing yet). Finally, that if kids are self-directed in their learning they are less disruptive (the authors site the TOOLS programme, but it is much like the Montessori system, which eschews behavioural modification systems). [5]Or, as AA Gill argues, we could just leave children alone.

I don't know if the research in Nurture Shock is right, but if it is, we are on an odd track in education policy currently, along with some of the ideas that seem to dominate within it, almost by default and contingency. Ideology aside, our schooling system seems beset with panic. Perhaps we all need to relax, not worry quite so much about behaviour, focus instead on engaging children with stuff they are interested in, and give them freedom. The evidence supports this approach, it seems, and it is one that seems best calculated to meet the social challenges of a changing world.

Deborah Talbot is a freelance qualitative research and journalist, writing about society, culture and all things urban. She has recently set up a new blog [6]Interurban Lines.

How to improve school discipline? | Learning Flourishes in an Environment Free of Racism (2017-04-11 03:44:00)
[...] The Return of School Discipline – why children should be free. [...]
even bother to engage with Peter’s [3]published paper (co-written with David Lehmann) detailing his findings.

It’s always seemed obvious to me that this was interesting work in the sociology of intellectual life, motivated by a genuine curiosity concerning the figure of the ‘academic celebrity’ and what it means for the future of social theory. Furthermore, I remain convinced this is an important conversation for us to have and it is not, as yet, being had in any meaningful way.

Therefore I recorded a podcast with Peter about these issues. Apologies for the sound quality, I hadn’t expected that a light wind could cause such problems for a discussion we recorded outside.

Towards a sociology of Pikettyville (2016-12-18 08:00)

From this fascinating paper by Roger Burrows, Richard Webber and Rowland Atkinson:

To talk of 'Pikettyville' is then to conjure up an image of an urban system that has become hardwired to adopting, channelling and inviting excesses of social and economic capital in search of a space in which the rich not only find safe haven but are also privileged by the kind of property and income tax regimes and wider economic climate that allows them to thrive on their capital investments, while the wider city experiences some of the most challenging economic conditions since the early 20th century (Atkinson et al., 2016b).

Call for Abstracts: Research Impact and the Early Career Researcher (2016-12-19 08:00)

The incorporation of impact into the UK’s Research Excellence Framework (REF) has led to a step change in the way in which much research is now approached in the UK.

With a focus on demonstrating the cultural, economic, and social benefits of research, academics face the challenge of not only delivering high quality research but connecting this with lay beneficiaries and demonstrating non-academic effects. Research impact is characterised by unique paths and varied outcomes, highlighting how impact may not be easily defined, described, or evidenced. This complex impact landscape can be intimidating for new and early-career researchers, who may question how they can meaningfully contribute to the impact agenda, how they develop realistic yet ambitious pathways to impact, how they can build capacity and skills in research impact and how this can be aligned with academic career progression.
Post-REF

2014

, there is an opportunity to rethink our approach to research impact and, in particular, to question what impact means for the new or early-career researcher and how to support the development of research capability in this area. For this edited collection, we are hoping to bring together two types of content. The first is a series of reflective narratives and think-pieces on research impact written by new and early career researchers to capture the diverse experiences, concerns, challenges, and opportunities research impact presents. The second is a series of critical and research-informed essays from all those working in the area that interrogate, question, and discuss research impact in connection to new and/or early career researchers. Chapters may focus on, but are not limited to, the below list of topics:

1. Career development and capability development for early career researchers
2. Promotion and developmental frameworks
3. International and transnational perspectives on research impact
4. Interdisciplinarity and liminal spaces for impact
5. Critical mass and the weight and depth of evidence
6. Cross-institutional impact
7. Conceptual impact and the impact of ideas
8. Negative impact and detrimental impact
9. Team and collaborative impact
10. Doctoral research and impact
11. Impact, policy, and politics
12. Ownership and management of impact
13. The ethics of impact
14. Impact and infrastructures
15. Discipline specific issues pertaining to research impact on early-career researchers.

If you are interested in submitting an essay or a new/early-career researcher narrative or reflection, please send an abstract of 200-300 words to researchimpact2016@gmail.com by Monday 28th November.

It is estimated that narratives will be no more than 3000 words and essays no more than 6000 words. Once we have all the abstracts after 28 th

, the editorial team will review submissions to determine the strongest content for the book. We expect this to be a period of feedback and discussion with potential authors to finalise the types of pieces for inclusion. We anticipate
then a period of 6 months to complete contributions.

The book will be edited by:

The Affectivity of the Nascent Tyrant (2016-12-20 08:00)

By far the best film I’ve seen this year was The Childhood of a Leader. It recounts a number of episodes in the life of a nascent tyrant, exploring the emergence of what is hinted to be a boundless rage that might one day transform the world:
I’ve been thinking about this film since encountering Auden’s *Epitaph on a Tyrant* yesterday:

Perfection, of a kind, was what he was after,
And the poetry he invented was easy to understand;
He knew human folly like the back of his hand,
And was greatly interested in armies and fleets;
When he laughed, respectable senators burst with laughter,
And when he cried the little children died in the streets.

What makes a potential tyrant? It’s the most obvious question to ask when history presents us with towering, pathological and destructive figures who have seemingly remade the world in their image. It’s one sociology is instinctively sceptical towards, given the risk that we uncritically adopt a ‘great men’ theory of history and obscure the social and cultural forces which allowed any such figure to assume the power that they did. But it’s one which I think can be legitimately asked, from a *psychosocial perspective*, without lapsing into reductive individualism.

This must surely involve resisting simplistic applications of labels. As Jon Ronson points out in his new book on Trump, there's something that could be seen as a tad psychopathic about arm-chair diagnoses of psychopathy from afar. From loc 538:

A FEW WEEKS BEFORE I flew to Cleveland, I sat in the Green Room at the Pasadena Convention Center. I was there to give a talk entitled “Is Donald Trump A Psychopath?” All year, people had been asking me my opinion on that topic. (This wasn’t random: I had written a book about psychopaths.) I consider it somewhat psychopathic to label someone from afar as a psychopath. We love nothing more than to declare other people insane, especially people we don’t like. Diagnosing people as psychopaths from
afar, I'd say, speaks to Items 2, 8 and 15 on the Psychopath Checklist —Grandiose Self-Worth, Lack of Empathy and Irresponsibility. You might even add Item 9, Parasitic Lifestyle, if you consider diagnosing Donald Trump from afar as a psychopath to be a parasitic lifestyle.

But can we nonetheless try and imaginatively enter into the affectivity of nascent tyrants? I have no idea of how to begin this process in a systematic way but there are cultural resources which might offer us hints. Two songs I've always liked came immediately to mind when I had this thought:

One concerns rejection and the other mastery. In the first case, we can imagine a refusal to accept rejection and an absolute mythologisation of self that emerges from this. In the second case, a preoccupation with the pleasures of mastery and where this might ultimately lead someone in how they orientate themselves to the opportunities they see in the world to assume further control.

They both suggest the sheer potentiality inherent in raw emotion, how this is usually canalised in predictable patterns but the terrifyingly open-ended possibility of where certain individuals might under certain conditions be led in their coming-to-terms with what they confront.

Has anyone got suggestions of further pieces of music that explore these themes?

Essay Competition: Crossing Disciplinary Borders and Into the Future (2016-12-21 08:00)

The Sociological Review is running an essay competition for early career researchers. See [1] here for more details.

Integration, British Values and the Genealogy of Norms (2016-12-21 10:41)

by Tanzil Chowdhury
Dame Louise Casey’s recent independent [1]review ‘into integration and opportunity in our most isolated and deprived communities’ has been [2]widely criticised, primarily for focussing its lens on Muslim ‘immiscibility’ rather than [3]structural racism and regurgitating old orientalist-stereotypes of hostile diaspora communities. Off the back of the report, the Communities Secretary, Sajid Javid, proposed an oath for civil servants and others holding public office that would commit them to ‘British Values.’ Relatedly, a central tenet of the Government’s Prevent Strategy and the [4]problematic ‘conveyor belt’ theory (which presupposes ‘extremism’ as the exclusive cause of terrorism) defines extremism as the ‘vocal or active opposition to fundamental British Values, including democracy, the rule of law, individual liberty and mutual respect and tolerance of different faiths and beliefs.’ Ignoring the Tory MPs whom [5]voted against same-sex marriage, the very real problem of [6]white-flight from multi-racial communities, and the many on social media aligning British Values with war, imperialism and colonialism, integration through submission to these values (widely, and thus problematically, defined) is hailed as the antidote to Britain’s social malaise.

Integration (or assimilation) presupposes a hegemonic or dominant normativity. A norm governs the behaviour or thinking of an individual, collection of individuals or society. At one end, you may have a norm amongst your friends that dictates you go to the cinema each Saturday evening, wherein non-compliance may invite derision from your friends. At the other end, other types of norms, such as prohibitions against murder or how to establish a contractual relationship with someone, would invite stronger recriminations (or invalidations as would be the case for contracts) if there is deviation from the norm. Norms therefore can be developed on both macro- and micro- levels; within society at larger, or within workplaces, teams or groups of friends. Integration requires subsumption by individuals, groups of individuals or society to that norm. The question then becomes how are these norms created and/or determined?

Unlike what we may think, norms do not exist in nature which are then transcendentally adduced; nor are they discovered through reason. Norms are socially constructed. In other words, as well as constituting beings, norms are also constituted by them. Importantly however, just because norms are contingent upon the societies that create them, their constitution is not democratically determined as we may hastily (and optimistically) think. In fact, norms are subject to the maldistributions of power within society. In other words, norms will often be constituted by those that are privileged with power in society. This means that they are not static but dynamic. This also means that norms will favour those that are in power or who identify (and are able to) with those in power. History therefore, or more accurately genealogy, is important in understanding the content of norms and integration more generally.
Michel Foucault's genealogical approach rejects history as a chronological pattern of events emanating from a determinate point of departure and attempts to identify underlying 'discontinuous systematics'. These discontinuous systematics highlight the contingency of systems of thought which are the product of 'the accidents, the minute deviations – or conversely, the complete reversals – the errors, the false appraisals, and the faulty calculations that gave birth to those things that continue to exist and have value for us' (Foucault, 1949). Genealogy attempts to ascertain the power relations operating in particular events and historical developments, identifying and analysing these and the ideas they give rise to. The rules (or norms) that emerge from 'rituals of power' are passed into laws, moral or social conventions and these sustain particular configurations of power and their diffusion within society.

Genealogy demonstrates the interplay of power which necessary shapes norms. Far from 'developing' as a norm, the implication being that norms 'improve' or 'get better' (as a product of reason and rationality) as time goes on, the dynamic construction of norms is in fact contingent on the formulations and re-formulations of power. Contrary to a conventional 'historical analysis' therefore, the genealogical approach observes the interplay between power and the norms which are contingent upon them. In displacing the presumption that norms are the product of rational individuals, a genealogical analysis demonstrates how power constitutes and is constituted by the engagement of power of the prevailing group.

Norms, and by extension integration, are both politically expedient and constituted by the prevailing distribution of power. Rather than being determined through intersubjectivity, as is more likely to be the case among friends (or the micro-level), norms at the macro-level will often favour one group of people above another. Values, norms and integration therefore, illustrate a pathological problem with the way that Britain has always had with difference. In the eyes of the hegemon, difference is understood as deviation from the norm and therefore subversive to its power. This underwrites many different discourses which have existed throughout history, from the 'civilising mission' of European colonialism to the 'Clash of Civilisations' thesis popularised by the likes of Samuel Huntington.

Integration can therefore be understood as a form of social control - what has earlier been referred to as subsumption - or specifically subsumption of the other. The problem therefore is less to do with minority communities but those that define the dominant normativity (or identify with it) and the collective hostility toward difference.

Tanzil Chowdhury recently completed his doctorate and lectures at the School of Law, University of Manchester. His research centres around the UK's legal power to declare war and commit troops abroad. He also co-founded the Northern Police Monitoring Project and help set up the Greater Manchester Law Centre. **Social Media and Public Sociology** *(2016-12-23 08:00)*

It can seem obvious that there’s some relationship between social media and public sociology. After all, these are platforms which offer free, instantaneous and immediate access to audiences ranging from the tens of millions to the billions. However unpacking the relationship between social media and public sociology requires we be careful about exactly what we see social media as allowing us to do. Social media platforms allow us to publish in a way that bypasses traditional intermediaries. It facilitates new forms of multimedia engagement. It allows us to do this with an immediacy which couldn’t be further removed from the time-consuming process of traditional scholarly publishing.

However this isn’t necessarily doing public sociology. Communicating sociological ideas doesn’t entail that anyone hear or responds to them. We can publish work without necessarily making it public. Being clear about the sense in which we’re trying to do public sociology is crucial if we’re going to take advantages of the opportunities
it offers us. In our current climate, universities are expecting academics to embrace social media to indicate their capacity for impact, creating a risk that we embrace these platforms without any clear purpose in mind. Without serious thought, there's a real possibility that, as Bourdieu once put it, we confuse “verbal sparring at conferences for ‘interventions’ in the affairs of the polis”.

An obvious question then: for what sort of purposes might we use social media as public sociologists?

- As an extension of traditional public sociology: using social media to try and enter into public conversations, increase the influence of sociological ideas and ensuring sociological findings are prominent within public debates. I paraphrased John Holmwood's keynote at the BSA a few years ago as advocating that we “occupy debate and make inequality matter”. This has traditionally been through writing books for a wider audience, opinion columns in newspapers and making appearances on national media. Social media can support this activity by making sociologists more easily discoverable by journalists and producers. It’s also extending the range of online outlets, with newspapers and magazines having large digital sections and new online-only publications opening up which specialise in academic content. But it creates new opportunities for narrow-casting rather than broad-casting, connecting with specific audiences who might previously have been marginalised within mainstream media. For this reason, writing for specialised blogs and engaging with niche social media forums can be an effective form of traditional public sociology if the publics you want to engage with are pre-constituted and specific.

- As an extension of organic public sociology: working in a scholar-activist capacity with groups, organisations, campaigns and movements. Social media offers new ways of identifying and beginning to engage with groups, it offers new ways of supporting groups (albeit ones that might often blur into the category of traditional public sociology) and it offers new ways of making this activity visible within the academy in a way that might draw others into their remit. Social media is changing how such groups can come together, particularly in their initial stages, by offering new opportunities and challenges for assembling similarly-concerned people in time and space. But the very fact of these changes also transforms the relationality of how digital public sociologists engage with them over time. Though we should of course be wary of overstating the point, with the risk that we license a lapse into slacktavism.

There are important new challenges public sociologists face in both cases. **Traditional public sociology** may be easier than ever but it creates the problem of being heard above the noise. How do we ensure that our attempted interventions have an effect? Existing academic platforms like The Conversation, The Sociological Review, Discover Society and the LSE Blogs serve a purpose here by pre-assembling a public and mediating engagements with them. It can be difficult to assemble your own audience, unless you invest a lot of time and energy in regularly engaging on social media, have a pre-existing reputation to leverage or are seeking to communicate with a very specialised public. Learning about platforms like these helps you identify which, if any, seem right for your purposes. They all offer clear guidelines about how to submit material and are edited by people who are used to working with academics in this capacity.

**Organic public sociology** may be more visible but with this too comes hazards. When it is informed by our own research, the gap between researcher and researched narrows precipitously. For instance, my own experience of researching asexuality was that I very readily got drawn into doing media and campaigning work as an ally. But this also meant that many people in the asexual community were reading and engaging with material I was sharing online, as well as sometimes criticising it. In one case, this was a really informative critique that changed my mind on a specific issue. In another, it was a quote taken out of context which got circulated widely on Tumblr. These are examples of new challenges which we’re not trained for and we need to consider carefully

There’s a risk that the style of communication we’ve all been traded in proves utterly ineffective for digital
public sociology. One of my favourite passages by C Wright Mills concerns the tendency of academics to “slip so readily into unintelligibility”. An “elaborate vocabulary” and “involved manner of speaking and writing” become props for a professional self-image which defines itself, in part, through the inaccessibility of the work being produced. If that work is now accessible then it holds this writing up to scrutiny. It may seem absurd, it may provoke offence but it’s perhaps much more likely to simply fail to gain any purchase and leave us talking amongst ourselves.

We also need to be careful about the climate within which we’re trying to do digital public sociology because it’s so dominated by a competitive individualism in which people are seeking to win attention for their work. The problem is that winning attention for your work doesn’t take place in a vacuum. As the digital anthropologist Melissa Gregg puts it, “even uniqueness starts to sound the same when everyone is trying to perform”. If everyone is seeking to build an audience and stand out from the crowd then the challenge of achieving these aims spirals ever upwards, excluding ever more people from the process in gendered and classed ways while this subordination is masked by the powerful rhetoric of openness.

To give one example of trend, George Veletsianos found in a study of educational tweeters that “the top 1 percent of scholars have an average follower base nearly 700 times that of scholars in the bottom 50 percent and nearly 100 times that of scholars in the other 99 percent” ([1]loc 1162-1708). Rather than undermining old hierarchies, social media supplements new ones, with complex emergent effects: sometimes allowing the already celebrated to quickly amass a social media following or to allow those with a big social media following to translate this into academic capital. This is part of the reason why I think community-orientated platforms such as The Sociological Review and Discover Society are likely to prove so important in mitigating the ‘celebrity’-generating effects of social media.

But hopefully if we focus our discussion of digital public sociology on specific aspirations, projects and publics then we can negotiate these institutional difficulties. There are real opportunities here but also profound challenges.

What is ‘the literature’? (2016-12-24 08:00)

My experience of watching the literature on asexuality spiral from a handful of papers ever through to new ones each month has left me fascinated by how quickly ‘the literature’ can become unmanageable. Within a relatively small and nascent field, it’s possible to grasp ‘the literature’ as a totality. But past a certain point, circumscribing it becomes an inevitability for purely practical reasons: focusing on this, ignoring that, excluding material from different disciplines.

At what point does it become impossible to represent ‘the literature’ as a totality? The impulse to do this doesn’t cease but with its growth these depictions are increasingly performative rather than representational. Demonstrating mastery of ‘the literature’ entails authoritatively circumscribing large chunks of the total knowledge stock within the field, naturalising these occlusion in a way liable to influence others.

Furthermore, ‘the literature’ as a totality necessarily eludes depictions of it because each of these claimed attempts to represent the object in fact contribute to that object’s spiralling complexity.
The way we talk and think about ‘the literature’ is unsuited to the realities of publishing in the accelerated academy.

Benny Goodman (2017-04-14 07:58:23)
An important question, and one which will only become more salient. Perhaps there needs to be research stream that focuses only what is currently published to produce ironically one more paper. A systematic review and synthesis? It would be a hard task. We also have the issue of quality given multiple platforms for knowledge dissemination. Some of us may have to stop writing new papers and instead garner resources to sift the current, if a reference to ‘the literature’ is going to have validity. Or we accept the claim of ‘the literature’ is flawed from the outset. In my own field of interest, health illness and nursing the ‘literature’ is so vast that it would probably take a research team to revisit and review.

Chronosolidarity (2016-12-25 08:00)

In *Work’s Intimacy*, Melissa Gregg pays much attention to the challenge faced by part-time workers in knowledge industries. Many of her participants within this category reported regularly finding themselves checking e-mail outside of their paid hours, something they saw as necessary to ensure they were ‘prepared’. In this way, ‘catch up days’ become an unpaid accompaniment to the hours part-time workers are actually paid for. These activities were often explained in terms of personal autonomy and choice, sacrificing free time in the name of professional performance on work days. But as Gregg writes on loc 1273:

```
Even though their language speaks of personal preference and exceptionalism, their consistent stories point to a clear problem in the way part-time work is recognized in information and communication jobs. No formal policies existed for them to manage online obligations; nor were there guidelines for appropriate response times. Employees operated on the basis of vague and self-imposed ideas about what management would or wouldn’t expect. In each case, there was simply no framework for discussing how part-time work was repositioned in light of the widespread reliance on online technologies in team-based office cultures (see chapter 4). Technology served to confirm, when it did not also accelerate the temporality of the workplace. Improvised and makeshift arrangements left many part-timers feeling apologetic for their so-called “flexible” positions.
```

I agree this is a failure of management. But it’s also a failure of colleagues, in terms of what we might call *chronoimagination* (recognising that someone else’s temporal experience might be different to yours) and *chronosolidarity* (identifying a common interest in sustainable temporalities of work in spite of these differences). Chronosolidarity is easy when people are obviously in a similar position to yourself, though small communicative acts of reassurance and understanding are no less valuable for the fact they come easily. But the challenge comes when temporal positions work rather differently, too easily giving rise to the assumption someone else’s working life is easier or perhaps not giving rise to thought at all.

Under working conditions which are informal, flexible/precarious and desynchronised, chronoimagination and chronosolidarity should be regarded as important factors in shaping the experience of work. Doing so should not blind us to the structural origins of these problems, such that they are reproduced to interpersonal challenges susceptible to a technical fix. But we need to recognise the imagination relating to converging/diverging experiences
of time which we bring to bear, or fail to, in our dealings with others who are differently placed in relation to organisational hierarchies.

Anthony J Hammond (2016-12-26 23:08:41)
I saw an article on a European court case a few months ago. It related to a company dismissing an employee for reading personal email during working hours and on company property, i.e. desktop. In light of this, should companies be invoiced for works completed at home in order to 'professionalise' the job done during the part time hours?

Mark Carrigan (2016-12-28 10:02:37)
I love the idea, can see little hope of it being implemented though :-(

Five propositions about #publicsociology (2016-12-26 08:00)

1. The meaning of 'public sociology' is not always self-evident and the enthusiasm of the impulse expressed through the term can cloud its meaning yet further. We need to be clear about what we are doing and why.

2. This clarity can help us negotiate the ambivalent spaces for public sociology created within institutions that speak the language of 'impact', 'public engagement', 'knowledge exchange', 'enterprise' and 'outreach'. There are opportunities for public sociology here but also dangers.

3. The competitive individualism of the academy risks being reproduced in a discourse of 'public sociology' dominated by white, male professorial public sociologists. We need to celebrate the practice of public sociology, rather than the academic brands of the most prominent public sociologists. [[1]thanks to the res-sisters and Lambros Fatsis for making this point so clearly, in slightly different ways]

4. Our prevailing systems of scholarly communication risk canalising the impulse towards 'public sociology' into abstract reflection upon what should ultimately be a practical activity. Sustaining employment in the academy necessitates 'outputs' of a certain restricted kind but we must avoid letting these define what we take public sociology to be.

5. We can take these limitations of existing systems as an inspiration to build new systems. How do we create platforms for public sociology that facilitate and encourage it as a collective endeavour, rather than the lone pursuit of isolated individuals within an accelerated academy?

*Call for Papers: The Politics of Gender*

Accepted for the Teaching Gender Series at Sense Publishing.  

Adrienne Trier-Bieniek, Ph.D., editor.*

This book will serve as a primary or supplementary text for courses focused on the ways gender and politics intersect. Each essay will address the ways gender has become embedded in politics, often to the detriment of women who are in pursuit of power. Essays for the book will be academic in terms of structure but contributors will be encouraged to write them with a more "reader friendly" perspective in mind. In other words, shorter, less academic essays will be considered. Each chapter will end with pedagogical tools such as classroom discussion topics and supplemental reading. Chapters will address gendered politics by covering areas such as:

· The place of gender in U.S. politics

· The place of gender in international politics

· Relationships between social movements, gender and politics

· Social inequality and gendered political institutions (particularly intersectional inequality)

· Intersectional perspectives on the political

· The role of technology

· The effect of media

· Body politics (particularly as it relates to gender, race, class, sexuality, age, disability etc.)

· Transgender rights

· Local politics

Other potential topics will be considered.

The collection will be guided by two overarching questions:

1. How do political institutions reinforce gendered approaches to politics?

2. What role does intersectionality play in politicizing gender?

I am looking for highly student-friendly writing (jargon-free whenever
possible). To this end, essays which follow less traditional academic formats will be considered. (For example, essays and stories in which authors share personal experiences or observations, and then apply these experiences to theoretical perspectives, data, terminology etc.)

Please email submissions to Adrienne Trier-Bieniek, Ph.D. at [1]Adrienne.mtb@gmail.com by February 15, 2017. Proposed chapters should be at least 500 words in length, full-length submissions are preferred but not required. Final chapter drafts will need to be between 5000-8000 words, depending on the number of chapters accepted.

1. mailto:Adrienne.mtb@gmail.com

'Transhumanism and the Future of Capitalism' (2016-12-29 08:00)

On Wednesday 11th January 2017 the [1]Contemporary Philosophy of Technology Research Group are hosting the following event:

'Transhumanism and the Future of Capitalism'

[2]Prof. Steve Fuller (Warwick University)

4 - 6pm, Wed. 11th January 2017, 112 Muirhead Tower,

University of Birmingham.

Abstract:

There is more than a grain of truth to the claim that transhumanism is somehow complicit in today’s advanced form of capitalism. Taken on its own terms, ‘transhumanism’ is about extending human capacities indefinitely, typically by biological and/or technological means. There is good reason to think that this ideology will acquire greater prominence in the coming years, as it tracks the increasing proportion of wealth being generated by bio- and information technologies. In this respect, transhumanism is to Silicon Valley as classical liberalism was to Manchester 200 years ago, which provided the backdrop for Marx’s original critique of capitalism. But what would Marx 2.0 look like vis-à-vis today’s high-tech Capitalism 2.0 and its Humanity 2.0 ideological offspring?

Chris Cooper (2017-01-03 14:10:06)
Hi, How do I register for this conference, if that’s necessary?

Ioana Cerasella Chis (2017-01-06 14:50:11)
Hi Chris, You don’t need to register for the event - just turn up! Best, Ioana (CPT committee member)

Queering Social Media Research - ICWSM Workshop (2016-12-30 08:00)

***CALL FOR PARTICIPATION***

In occasion of the International Conference on Web and Social Media (ICWSM), we invite position papers and statements of interest for the workshop QUEERING SOCIAL MEDIA RESEARCH – ENGAGING WITH SEXUAL, GENDER, AND RELATIONAL DIVERSITY.

This full-day workshop will take place on May 15, 2017 in Montreal, Canada.

The deadline for application is March 4, 2017.

For more information, please visit the workshop webpage: [1]http://queeringsocialmediaresearch.blogspot.ca/2016/12/workshop-queering-social-mediaresearch.html Please send papers and questions at this address: [2]qsmr2017@gmail.com For more information about the ICWSM, please visit: [3]http://www.icwsm.org/2017/index.php We hope to see you in Montreal this Spring! The organizing committee: Mélanie Millette, Université du Québec à Montréal David Myles, Université de Montréal Anna Lauren Hoffmann, University of California, Berkeley

Digital Capitalism and Guard Labour (2017-01-01 08:00)

An interesting thread I’m following up from Four Futures: Life After Capitalism. This is [1]Samuel Bowles and Arjun Jayadev on ‘guard labour’:

Another dubious first for America: We now employ as many private security guards as high school teachers — over one million of them, or nearly double their number in 1980.

And that’s just a small fraction of what we call “guard labor.” In addition to private security guards, that means police officers, members of the armed forces, prison and court officials, civilian employees of the military, and those producing weapons: a total of 5.2 million workers in 2011. That is a far larger number than we have of teachers at all levels.

What is happening in America today is both unprecedented in our history, and virtually unique among Western democratic nations. The share of our labor force devoted to guard labor has risen fivefold since 1890 — a year when, in case you were wondering, the homicide rate was much higher than today. [2]http://opinionator.blogs.nytimes.com/2014/02/15/one-nation-under-guard/?_r=0

How widespread could this become in the event of mass technologically-induced unemployment? One of my favourite dystopian fictions, Lazarus, imagines a world in which great status accrues to a warrior-class of guards amongst a population of citizens, living besides a vast population of non-persons:
I find this interesting because it suggests Guard Labour could (does?) serve a socio-cultural function, as well as a structural one. It inculcates a mentality of guarding ‘us’ against ‘them’, offering opportunities to achieve status within the social order to those who might otherwise struggle to do so. But how would this intersect with the practical reality of actually guarding the wealthy elites? After all, military robotics is advancing at a remarkable pace:
Bernard Marszalek (2017-01-01 20:12:45)
New Year's Greetings! I just happened upon your site via Naked Capitalism (but not directly!) You may be interested in my review of Four Futures. http://newpol.org/content/our-postwork-future-prospect-win-or-lose

Mark Carrigan (2017-01-08 12:11:44)
I am and don't think I knew new pol either, thanks!

Bounded autonomy in the workplace (2017-01-02 08:00)

In John Thompson's Merchants of Culture, he describes what might be termed the bounded autonomy enjoyed by some editorial teams within publishing houses. From pg 128:

the devolution of editorial decision-making to small editorial teams operating with a high degree of autonomy within certain financial parameters is the best way to maximize your chances of success. As one senior manager in a large corporation put it, 'We're giving somebody a playing field and we're putting fences around the edge of it and saying, "If you want to cross one of those fences, you have to ask a question. But if you're playing in the field you can do what you like." You give people a lot of scope, but you provide a framework within which they operate.'
I was struck by how absent this seems in (British) academia, with the possible exception of some business schools. Rather than seek to return to a full system of collegial self-regulation, does this provide a model for arguing for autonomy within managerial structures? E.g. Scholarship is something which needs autonomy to flourish but this can be bounded in terms of outcomes and rules?

It’s worth noting that there’s a brutally instrumental attitude which underwrites this bounded autonomy. From pg 131:

‘There is an unspoken rule,’ explains one senior editor who has worked at Star for some 30 years, ‘put one toe out of the elevator to interfere with us and we will cut you off at the knees. And the only thing that enables us to take that attitude is profitability. As long as we make the money, we can tell them to go fuck themselves. It’s as simple and as old-fashioned as that. The second that goes wrong, we’ve had it. If we stop being profitable, the incursions will start.’

And underlying this dynamic is a certain ineffable trait, a resistance to quantification amidst demonstrable sources of profit and gain to the organisation. From pg 131-132:

This is part of the mystique of the imprint, ‘and the one thing corporate owners are scared shitless of is messing with mystique,’ said another senior editor. ‘Mystique is what they don’t understand. All they know is, if it works, don’t break it.’

Thompson later offers counter-examples to this. I’m intrigued by the analogy between high prestige imprints and successful research groups. How does the negotiation of bounded autonomy empower group leaders? The figure Milena Kremakova calls ‘the troll on the bridge’ could become very powerful here: mediating pressures towards granular control within the group and negotiating bounded autonomy for the group as a whole.

John McCreery (2017-01-02 20:55:34)
I am reminded of Kimoto Kazuhiko, the Japanese Senior Creative Director who hired me as an English-language copywriter at one of the two largest Japanese ad agencies. A day came when the agency was going through one of its periodic attempts to enforce rules requiring creatives to adhere to a 9-to-5 workday. I asked Kimoto-San about what was going on. He replied, “In our business there is only one rule. If the clients give the agency business because you are here, you can ignore the other rules.” The implicit alternative was, of course, that if you weren’t a rainmaker, if you didn’t bring in business, then you had to follow the rules.

Mark Carrigan (2017-01-08 12:12:37)
That’s a really nice account - could I quote if/when I write formally about this?

John McCreery (2017-01-08 16:33:57)
Of course. I would be tickled pink. Please let me know if you do.
2017 Denver CFP: Where is the Journalist in Social Media? (2017-01-03 08:00)

Centre for Ecological, Social, and Informatics Cognitive Research (ESI.CORE)
Inaugural International Conference
Moving Forward: Where is the Journalist in Social Media?
SpringHill Suites Downtown Denver
Metropolitan State University of Denver
Denver, Colorado USA
June 23-24, 2017

Call for Papers:

In the current political climate, the constructions of celebrity leaders and popular forms of mediated truths, especially with the recent "fake" internet news, have raised questions about journalism. Tabloid and other forms of popular journalism use narrative devices of gossip, rumor and scandals while many news media have abandoned facts and intelligent analysis in favor of spectacular outrage and incivility, both situations acting as testaments to the lack of informed opinions. Although scholars and journalists work together during news reporting, investigations/documentaries, and on other issues that are covered by news media, scholars are often confined to academic research and disconnected from the realities faced by journalists. Can citizen journalists and journalism scholars help move forward with progressive research and practice? What are the qualifications and definitions of a 'journalist?' Is this someone who is employed professionally - or someone who has received an academic certification (degree) to be qualified? Or can anyone today be a journalist?

Citizen participation has been seen as essential in the democratic processes of production, distribution, and reception of news. Online participatory media such as blogs, comments and videos offer a democratic platform for the expression of alternative ideas that may otherwise be filtered by traditional journalism. Yet, citizen journalists need critical media literacy that is often lost in the lure of visibility. How can journalism scholars creatively and critically engage citizen journalists in the dissemination of their research, informed opinions and cultural productions?

The Centre for Ecological, Social, and Informatics Cognitive Research (ESI.CORE), in association with sponsors Centre for Media and Celebrity
Studies (CMCS) and WaterHill Publishing, invites academics, journalists, publicists, producers and guests to attend, speak and collaborate at the inaugural international conference Moving Forward: Where is the Journalist in Social Media? Join us in Denver, Colorado where the conference will uniquely combine vibrant roundtable and media workshop panels in a collaborative network.

The format of the conference aims at being open and inclusive ranging from interdisciplinary academic scholars to practitioners involved in all areas of print, broadcast and online journalism. Working papers and media productions will be considered for the conference.

Extended versions of selected best papers will be published in an edited book.

Registration includes: Your printed package for the complete conference, professional development workshops, coffee / tea breaks, access to evening receptions, complimentary evening drinks, consideration for publication.

Submission guidelines:

250-word abstract or workshop / roundtable proposal
Include a title, your name, e-mail address, and affiliation if applicable
Submit to conference Chair Dr William Huddy at email address:
|submit@esi.core.org
Deadline for abstract submission: February 15, 2017
Notification of acceptance: March 15, 2017
Early bird registration deadline: April 30, 2017
Full registration deadline: May 30, 2017
Conference reception and presentations: June 23-24, 2017
Topics include but are not limited to:
Communication
Media
Journalism
Photojournalism
Television and Radio
Social Media
Informed Opinions
Infomercials
Advertisement
Publicity and Promotion
News
Interviews
Audience
Race
Gender
Environment and species

The Impact Agenda as Paradigm Shift (2017-01-04 08:00)

In advance of running my first impact and social media workshop on Tuesday in Ghent, I've been working through some of the literature on impact. One book that's proving more thought-provoking than I expected is [1]Achieving Impact in Research by Pam Denicolo. It's an edited collection that emerged from a symposium in Warwick in 2012 that I wish I'd attended.

In the first chapter Colin Chandler makes a case that the impact agenda is part of a paradigm shift in how research is viewed:

---

BOX 1.1 CHANGES IN THE WAY RESEARCH IS VIEWED

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implicit</td>
<td>Explicit</td>
</tr>
<tr>
<td>Research – an end in its own right</td>
<td>Focused and forward-looking research</td>
</tr>
<tr>
<td>Curiosity driven</td>
<td>Targeted</td>
</tr>
<tr>
<td>Academic freedom</td>
<td>Constrained</td>
</tr>
<tr>
<td>Self-regulated</td>
<td>Governance</td>
</tr>
<tr>
<td>Serendipity</td>
<td>Investment</td>
</tr>
<tr>
<td>Academic excellence</td>
<td>Excellence with impact</td>
</tr>
</tbody>
</table>

---

I have many problems with this account. Viewed by whom? How does the perception match up with the reality? How has this been contested? Are all these points of transition part of the same process? In reality, it's obviously the case that many factors are at work here.

But as a sensitising device, I find this table extremely useful. Much of the work I've been doing in the last year (distraction about my distraction book notwithstanding) has been about trying to understand how social media
is implicated in the changing character of research and academic labour.

The Gender Pay Gap (2017-01-04 15:05)

by Deborah Talbot

In the last half-century, advanced industrial nations have seen immense changes in the position of women in society. They have caught up or overtaken boys in educational achievement. They have joined the labour force and all other facets of public life.

As analysts, we have a tendency to focus on the negative. Sexual harassment, rape, domestic violence and general objectification still go on and are mostly unpunished. Women are thrown out of work easier than men. They take the lion’s share of domestic work and childcare compared to men. But compared to women around the globe, and our recent ancestors, we have unprecedented freedoms.

So the question becomes, with all this freedom and advancement, why do women still end up earning less than men and occupying positions of less prominence in public life and corporations? The answer to that can be found in the process by which women are converted into ‘lesser mortals’ once they have children. When women give birth, they are ‘mummy-tracked’. They can’t put in the hours needed to keep up high-profile careers, and they are gradually sidelined. When that happens, they then become the main carers for children, and later, even elderly relatives. A woman could start off at the peak of her career, have children, and then, within a few years, find herself living the life of her mother.

Some argue, like the Women’s Equality Party, that the problem is men. Indeed, when I wrote about how women balance childcare and work, I was criticised by one of their leaders for not mentioning men. It’s true, men
have some part to play, but, unfortunately, people tend to adapt their behaviours to their context, not the other way around. Men will change when ‘the conditions of life’ change, though we do have some outliers.

Some argue we need more legislation to enforce equality. Sure, that helps, but mostly it’s symbolic and difficult to enforce, as the grim statistics that emerge from workplace tribunals suggest. I’d like to see some legislation on discrimination against women because they are mothers, as they have in the States, if only to make a point (“ah ha, see”, I’d say). But as yet it doesn’t seem to have done American mothers much good.

So I found reading the research and writing of Claudia Goldin, Professor of Economics at Harvard University, pretty much a eureka moment. In her paper [1]A Grand Gender Convergence: Its Last Chapter she argues that the problem is not so much men or a lack of law. The problem is the way the labour market is structured, which is what I’ve been arguing for a while...but she does it much, much better.

Her analysis illustrates that men and women have experienced a historic ‘gender convergence’ in pay. This is a controversial point to make, given the slogan ‘77 cents on the dollar’ seems to summarise women’s position so well. However, Goldin argues that there is very little difference in pay (although still some) between men and childless women in equivalent professions. The pay gap emerges when there is a demand for workplace flexibility and, therefore, availability and the pay gap with childbirth varies across occupations. It is important, Goldin argues, to look at the features of particular occupations as a human resources problem, and whether they negatively punish a need for flexibility.

Goldin looks at the particular characteristics of jobs and what they mean for pay parity. Some jobs place a high value on workplace involvement, which is a detriment to flexibility, while others do not. Science and technology jobs are examples where flexibility does not engender huge pay inequalities:

“...in comparison with business occupations those in technology and science have far greater time flexibility, fewer client and worker contacts, fewer working relationships with others, more independence in determining tasks, and more specific projects with less discretion over them. Each of these characteristics should produce a more linear relationship between hours and earnings and the greater linearity should produce a lower residual difference in earnings by sex.”

She argues that there is a link between occupations that tag earnings to the number of hours worked, such as business and law...."Individuals who work long hours in these occupations receive a disproportionate increase in earnings."

But, the employer might say, our job demands that you be present. How can you, as a solicitor, barrister, MP, CEO, and so forth, clock off at 5pm? They say they need certain tasks done as part of the job, and the employee needs to be around for these. In a position where one individual holds complete responsibility for the fulfillment of certain tasks, a demand for flexibility will lower the value of that employee. However, some professions or workplaces enable substitutes for particular tasks, so that any qualified person can do this. In these positions, flexibility is not punished, and pay parity is greater. The pharmacy industry in the US is one positive example of a profession that has greater equality of pay along with flexibility, and it was a change that occurred as a result of other structural changes in the profession, rather than as a result of demand for flexibility.

She concludes:

“A gender gap in earnings exists today that greatly expands with age, to some point, and differs significantly by occupation. The gap is much lower than it had once been and the decline has been largely
due to an increase in the productive human capital of women relative to men. Education at all levels increased for women relative to men and the fields that women pursue in college and beyond shifted to the more remunerative and career-oriented ones. Job experience of women also expanded with increased labor force participation. The portion of the difference in earnings by gender that was once due to differences in productive characteristics has largely been eliminated...What, then, is the cause of the remaining pay gap? Quite simply the gap exists because hours of work in many occupations are worth more when given at particular moments and when the hours are more continuous. That is, in many occupations earnings have a nonlinear relationship with respect to hours. A flexible schedule often comes at a high price, particularly in the corporate, financial, and legal worlds."

In short, women are penalised in the workplace for having children (or indeed, anyone demanding flexibility, but it is still mostly women) because of the way that employment is structured in particular professions and workplaces. If professional success is decoupled from the amount of hours worked, and employers can find ways to allow employees to act as substitutes for each other, then we might go some way to alleviating the pay gap. We could also, in theory, advise men and women much earlier on the professions most likely to accommodate lifestyle changes and needs. Interesting stuff.

Deborah Talbot is a freelance qualitative research and journalist, writing about society, culture and all things urban. She has recently set up a new blog [2]Interurban Lines.

------------------

The challenge of writing in the accelerated academy (2017-01-05 08:00)

In the nine years since I first entered a Sociology department, I’ve had a deep interest in academic writing that has only increased with time. In my past life as a philosophy student, writing had never occurred to me as a topic of intellectual interest. Despite having once aspired to be a writer before concluding that I wasn’t good enough at writing political polemics to stand much chance of joining that small class of people who write them for a living. This self-critical concern with the quality (or otherwise) of my writing has perhaps been more of an animating force than I’ve tended to admit to myself. But the other driver was the inspiration I derived from [1]’On Intellectual Craftsmanship’, the appendix to The Sociological Imagination, the first book I read as a Sociology postgraduate. As Mills puts it on pg 217-218:

I know you will agree that you should present your work in as clear and simple language as your subject and your thought about it permit. But as you may have noticed, a turgid and polysyllabic prose does seem to prevail in the social sciences ... Such lack of ready intelligibility, I believe, usually has little or nothing to do with the complexity of subject matter, and nothing at all with profundity of thought. It has to do almost entirely with certain confusions of the academic writer about his own status.
I'm fascinated by what sociological writing can reveal because of where it sits at the intersection between sociologists, sociology, higher education and the wider world. In such writing we find an (often unintended) disclosure of sociologists, the discipline they have been socialised into, its status within the wider academy and their conditions of labour within it. All while purporting to be an examination of the world 'out there'. In fact, it's through concern for how we can produce knowledge of this world, as well as put it to work in changing that world, that it becomes imperative to address writing in a diagnostic mode. How does actually existing sociological writing impede knowledge production? Can we strive to ameliorate these pernicious effects? As [2]Andrew Sayer has put it, the alienated writing of social scientists reflects their own alienation. In addressing one, we unavoidably encounter the other.

One of the most striking things about contemporary scholarly writing is how obviously rushed some of it is. We can read this back from quantitative measures, looking at the increasing rate at which individuals publish, as well as the aggregate growth of publications as a whole. Though there are other factors at work (e.g. digital technology offering time savings in the writing and research process) the basic trend is clearly one of acceleration. We can recognise it qualitatively in a lack of innovation across publications and the well-recognised tendency towards 'salami slicing'. But as Michael Billig points out in his [3]Learn to Write Badly, we can also recognise it in the texts themselves. From pg 133:

The trouble is that the specialists do not handle their big nouns with care, but they rush to use them, knocking over verbs in their haste and barging other parts of speech out of the way. In their rush, they fail to tie the big words firmly to the grounds of human actions, leave them flapping loosely, but flamboyantly, in the wind.

Rushing does not create this tendency towards vague, grandiose and depersonalised language. As [4]this interview with Howard Becker rather beautifully illustrates, we can find intellectual roots for these tendencies in the world views of prominent and influential theorists:

“Bourdieu’s big idea was the champs, field, and mine was monde, world—what’s the difference?” Becker asks rhetorically. “Bourdieu’s idea of field is kind of mystical. It’s a metaphor from physics. I always imagined it as a zero-sum game being played in a box. The box is full of little things that zing around. And he doesn’t speak about forces. He just speaks about forces. There aren’t any people doing anything.” People in Bourdieu’s field are merely atom-like entities. (It was Bourdieu’s vision that helped inspire Michel Houellebecq’s nihilistic novel of the meaningless collisions of modern life, “The Elementary Particles.”) ...

As Becker has written elsewhere, enlarging the end-credits metaphor, “A ‘world’ as I understand it consists of real people who are trying to get things done, largely by getting other people to do things that will assist them in their project. . . . The resulting collective activity is something that perhaps no one wanted, but is the best everyone could get out of this situation and therefore what they all, in effect, agreed to.”

But we can find the conditions within which these ways of writing and speaking propagate in the academy itself (as a corollary, in the work of the great theorists themselves). One thing I’d like to explore much further with the [5]Accelerated Academy project is how we can use tempo as a way to understand the organisational influences upon scholarly writing. Billig rather persuasively diagnoses how the intensification of academic labour, particularly in relation to securing a position when facing competition on all sides, incentivises self-promotional writing. This is how I do things, it’s better than how they do things, join my club. But in reality, most of us are likely to join someone’s
else club... taking shelter from the cold winds of an organisation undergoing rapid deprofessionalisation by huddling together around a camp fire of shared certainties (not to mention opportunities for networking, publication and engagement). I was struck by the contrast Billig draws between how a figure like Foucault innovated and the contemporary realities of scholarship. From pg 148:

There is something very old-fashioned about Foucault’s lectures to the Collège de France. It is not just that he cites obscure writers from the early modern period and that he presents no 'literature reviews', in which he positions his own work in relation to the approaches of his contemporaries. His lectures were lectures: he did not seem eager to rush them into print to boost his tally of publications. Nor did he place key lectures –such as that on ‘governmentality’ –in influential sociological journals. Instead, he addressed his audience directly. And most importantly, he addressed them as individuals, who might be interested in his ideas, rather than as potential academic producers whom he wishes to recruit to a new mode of enquiry. In this regard, Foucault was not a Foucauldian, spreading the Foucauldian message and seeking to promote a Foucauldian subdiscipline.

It reminded me of David Graeber’s argument about the dead zones of the imagination in higher education. Has rampant scholasticism coupled with inane managerialism destroyed the conditions under which the objects of that scholastic zeal were able to thrive?

The explosion of paperwork, in turn, is a direct result of the introduction of corporate management techniques, which are always justified as ways of increasing efficiency, by introducing competition at every level. What these management techniques invariably end up meaning in practice is that everyone winds up spending most of their time trying to sell each other things: grant proposals; book proposals; assessments of our students’ job and grant applications; assessments of our colleagues; prospectuses for new interdisciplinary majors, institutes, conference workshops, and universities themselves, which have now become brands to be marketed to prospective students or contributors. Marketing and PR thus come to engulf every aspect of university life.

The result is a sea of documents about the fostering of “imagination” and “creativity,” set in an environment that might as well have been designed to strangle any actual manifestations of imagination and creativity in the cradle. I am not a scientist. I work in social theory. But I have seen the results in my own field of endeavour. No major new works of social theory have emerged in the United States in the last thirty years. We have, instead, been largely reduced to the equivalent of Medieval scholastics, scribbling endless annotations on French theory from the 1970s, despite the guilty awareness that if contemporary incarnations of Gilles Deleuze, Michel Foucault, or even Pierre Bourdieu were to appear in the U.S. academy, they would be unlikely to even make it through grad school, and if they somehow did make it, they would almost certainly be denied tenure.

The Utopia of Rules: On Technology, Stupidity, and the Secret Joys of Bureaucracy pg 134

In what I’ve discussed so far, there are a number of distinct (overlapping?) factors which these thinkers have diagnosed as harmful to academic writing:

- Status insecurity of social scientists, particularly vis-a-vis natural scientists.
• The time pressures of the accelerated academy and increasing tempos of expected publication.
• Competition in the academic labour market and the imperative to achieve security through publication.
• Managerialism and metricisation creating an organisational environment within which marketing and PR have engulfed even scholarship.

At the risk of stating the obvious, what each of these factors have in common is the scholar. Note that when I write 'the scholar', I abstract from actually existing embodied persons. This carries the same cost that Billig notes of 'the subject':

It sounds much grander, more official, and less personal. The definite article – the 'the' – adds cachet. By using 'the subject', the authors turn 'people' into another theoretical thing. (pg 158)

I'm not trying to write about a category. I'm trying to write about the people who occupy that category. The living, breathing, hoping, despairing, finite beings for whom 'academic' is one social role amongst others occupied in their lives. Furthermore, within the confines of that role, they might aspire to 'scholar' and feel constrained by the realities of the organisations within which they work. Writing offers an interesting route into 'the scholar'. A way to diagnose what troubles them so. Another way of exploring the 'deep somatic crisis' that critics like Roger Burrows and Ros Gill have claimed afflicts the contemporary academy. But this is a much bigger project than one blog post can contain.

John McCreery (2017-01-05 22:35:07)
Mark, I like very much what you have written here, but I have a disagreement with one of the sources you cite. While myself a great admirer of Howard Becker, I would argue that his reading of Bourdieu's "field" is mistaken. Bourdieu's primary reference for field is not physics but (I learned this reading Louis Wacquant) football, the game called soccer in the USA. His actors are not particles, they are players. Their "habitus" is the dispositions that allow them to respond instantly to the state of play and the movements of other players and the ball, to which they must respond without time for rational calculation of costs and benefits.

Mark Carrigan (2017-01-08 12:14:06)
I think it's totally fair and you're certainly correct about the source of the metaphor. But is it unfair to say Bourdieu thought in terms of forces?

John McCreery (2017-01-10 20:40:53)
First, a confession. I am not a deep scholar of Bourdieu. That said, in my shallow reading, all in English translation, I have never seen him use "forces" in a well-defined technical, as opposed to metaphorical, sense. Imagining that human behavior is shaped by economic, political, social or cultural "forces" is commonplace and in no way implies conformity...
with mathematicall laws like \( f=ma \) or the ability to calculate the result of converging vectors. Neither is it equivalent to a tally of the troops and equipment available to a nation about to go to war. That is why I see it as so important to pay close attention to the root metaphor. In football, there is no equivalent of turning a dial to increase electrical current and strengthen a magnetic field in a precisely predictable manner. The perspectives of players, coaches and umpires attending to the state of play and disposed to respond in one way or another cannot be comprehended in any simple mechanical way.

Mark Carrigan (2017-01-13 14:50:44)

Hi John, I agree it’s commonplace to talk in this way, but that’s exactly what Becker is getting at I think. His argument about Bourdieu might not be genealogically accurate, as a statement about the origins of his ideas, but it might still be conceptually fair. It reduces the complexity of human beings to see them as players of the game and nothing more. This is what I think Becker’s critique shares with those of people like Andrew Sayer, Margaret Archer and Jeffrey Alexander.

**On Academic Productivity** (2017-01-06 08:00)

Some great ideas about academic productivity offered by Fabio Rojas at OrgTheory, based on conversations he has had with ultra-productive academics. Read it [1]in full here:

- **Team work**: Almost every star I’ve asked works in large groups. If you look at the CV’s, they have tons of co-authors.
- **Division of Labor**: A lot of them have told me that they are very good at assigning tasks. One of them told me he *never* does fund raising. He works with another prof who in a medical school who has access to funds.
- **Shamelessness**: Most academics sulk over rejections. These folks don’t. Soon as a paper gets rejected, they send it out ASAP.
- **Recognizing diminishing marginal returns**: A paper will improve between first and second drafts. These folks understand that obsession over the 20th and 21st version is pointless.
- **Attitude**: Sounds corny, but every single one of these folks has an amazing forward looking attitude. They love what they do and they see the future as bright.
- **Minimizing junk work**: Some probably shirk teaching or admin work, but what I have observed is that they are ruthlessly efficient. They reuse course materials, borrow syllabi, and use teaching to deepen their knowledge of a topic.
- **Recognizing the randomness of reviews**: Most people complain about the randomness of reviewers. The star publishers draw the logical conclusion. If you can get random negatives, you get random positives. So just keep submitting until it you randomly pull positive reviews. Burnham (2017-01-07 13:01:38)
This is very dangerous and unreflective advice. Lethal especially for early careers. It has neo-liberal subject written all over it, rather disgusting, to be honest

The Silicon Valley of Hardware (2017-01-07 08:00)
https://www.youtube.com/watch?v=SGJ5cZnoodY

Future Cities, a full-length documentary strand from WIRED Video, takes us inside the bustling Chinese city of Shenzhen.

We examine the unique manufacturing ecosystem that has emerged, gaining access to the world’s leading hardware-prototyping culture whilst challenging misconceptions from the west. The film looks at how the evolution of "Shanzhai" – or copycat manufacturing – has transformed traditional models of business, distribution and innovation, and asks what the rest of the world can learn from this so-called "Silicon Valley of hardware".

Metrics and the death of imagination (2017-01-09 08:00)

In John Thompson's *Merchants of Culture*, there's an interesting remark about the structural position of first time authors which I think has wider purchase. From pg 200:

Ironically, in a world preoccupied by numbers, the author with no track is in some ways in a strong position, considerably stronger than the author who has published one or two books with modest success and muted acclaim, simply because there are no hard data to constrain the imagination, no disappointing sales figures to dampen hopes and temper expectations. The absence of sales figures sets the imagination free. The first-time author is the true tabula rasa of trade publishing, because his or her creation is the book for which it is still possible to imagine anything and everything.

A world where metrics are ubiquitous is a world where imagination has died. When everyone has a track record, the space to imagine someone's future as radically different from their past collapses.

[...] was recently reading a blog post from Mark Carrigan at The Sociological Imagination about how data can hold back imagination. He uses a quote from John Thompson's Merchants of[...]

Open Access Archive SocArXiv Launches (2017-01-10 08:00)

A very exciting [1]announcement:

[2]SocArXiv, the open archive of social science, has just launched in beta version. Led by a steering committee of [3]sociologists and librarians, SocArXiv is a free, open access repository for prepublication versions of papers. Created as a not-for-profit alternative to sites like Academia.edu, ResearchGate, and SSRN, SocArXiv is built in collaboration with the [4]Center for Open Science and supported by the Open Society Foundation and the Alfred P. Sloan Foundation.

“Brassing off” Against Post-Democratic Non-Citizenship. Or, What to Learn from the Second Line Culture of New Orleans (2017-01-11 08:00)

By Lambros Fatsis

Following the Brexit referendum and the recent US presidential election, our current political and socio-cultural climate has often been described as quintessentially ‘[1] post-truth’. This newly coined term, much like the phenomenon it describes, rapidly gained traction as a warning about the danger of sacrificing facts on the altar of opinion, or simply preferring emotiveness to judgement. As its usage spread, its popularity grew and post-truth politics soon became a cipher for the populist campaigning tactics of [2] Brexiteers and [3] Trumpists alike, due to their blatant disregard for the validity and consequences of their deceitful, divisive, irresponsible, and often toxic rhetoric. Transcending its inauspicious origins as a fanciful neologism, however, ‘[4] truthiness’ gradually became something more alarming than a mere descriptive term; it raised unsettling questions about our relationship with and attitude towards political engagement and democratic citizenship altogether.

What is citizenship made of?

The casualty of such a shift is not simply "truth" itself as a process in which we, emulating Aristotle, say ‘[5] of what is that it is and of what is not that it is not’. We were also painfully reminded that we have yet to learn how to counter and encounter each other’s arguments in a nuanced, moderate, cautious, and evidence-based manner; thereby allowing political deliberation and civic engagement to happen in an atmosphere of considered dialogue, where finding common ground through disagreement is crucial. Following this logic, truth becomes something more than the property of our worldview, but rather depends on the outcome of our exchange with our fellow citizens. What both citizenship and the pursuit of truth require from us, however, are more than ideological reflexes or emotional reactions to issues we feel strongly about. Truthful democratic citizenship involves the capacity to speak as equals (isigoria), but also candidly and freely (parrhesia); provided that we do so from a desire to act towards the common public good, rather than as an exorcism ceremony in which we curse our political opponents away, having learned nothing from our interaction with others (un)like us.

Are we all post-democratic non-citizens now?

What this unflattering picture of our public selves reveals is a gradual process of what Albert O. Hirschman called ‘[6] shifting involvements’; where private interests, convictions, and wants replace public participation as an exercise of tuning into collective needs. But to prioritise what we deem desirable at the expense of what is essential to all is to choose 'absolutes' over 'imperatives', as "the Father" of the Harlem Renaissance [7] Alain Locke would have it. Such complete withdrawal into and interaction only with whatever/whomever we agree with, however, is a form of retreatism not democratic advancement. To make matters worse, this silo mentality corrodes what public life and democratic citizenship are all about: a combination of conflict and dissensus with a recognition that, as democrats, we are responsible for and accountable to each other whether we like it or not. To shy away from this fact, is to prolong a process in which disagreement begets dislike, dislike begets social distance, social distance
begets polarisation, and polarisation eventually causes the break-up of politics as a form of exchange, transforming it instead into an empty shell where incomprehension and separation reign supreme.

As [8] W.E.B. Du Bois put it a century ago, 'herein lies the tragedy of the age: not that men are poor,—all men know something of poverty; not that men are wicked,—who is good? not that men are ignorant,—what is Truth? Nay, but that men know so little of men'. What the reality of "post-truthpolitik" confronted us with was the painful realisation that we have strayed away from truthfulness because we refuse to engage (with) each other as citizens, preferring instead to stereotype, patronise, browbeat and call each other names from encamped positions. Yet, between "liberal elites" who are hated for their social advantage and "frustrated" outsiders who are derided for serving as populism's pawns lies a greater divide; between citizens and non-citizens, and that's the one that really matters. For all our righteous rage against "others" who know and understand nothing, we are all guilty for using the tools of and forums for democracy against its content. Voting has recently become little more than a charade where the electorate can have its say by throwing a tantrum without due regard for what happens when any action is separated from its consequences, not just for oneself but for the entire political community in which we all ostensibly participate. Ironically, this sets off a process where irresponsible non-citizens install the architects of post-truth theatrical trumpery as the guardians of democracy within parliament. The tragedy of it all is that those who have insulted democracy by lying their way into power will now betray their voters too, given that in representative democracies like ours, the voice of "the people" resonates through parliament rather than residing in a populist bubble where the electorate's vice is entertained with no holds barred.

**Becoming citizens again**

Democracy is more than the servant of our little foibles or our individual will. In fact, it is a form of government which protects us from ourselves by educating us on how to tolerate each other in the process of negotiating collective needs though persuasive argument and evidence. Democracy, therefore, needs our involvement to survive, and that requires more than casting a vote and letting a government "rule" until the next election is announced. To do so is to fulfil only a tiny fraction of our civic duties. We do not become citizens by merely deploying an "X" in the ballot box or by dutifully paying tax, but by being attentive to and communicative towards each other; drawing on truth and logic as the basis for making rational decisions, while practising openness and civility as the moral prerequisite for our encounters. The more we keep to ourselves and talk only to people who we like and/or agree with, the more "post-democratic" and "non-citizen-like" we become; extricating ourselves from difficult encounters with others, in favour of the comfortable, the predictable, and the self-referential. Such a mentality does not augur well for the flourishing of democracy, given that the latter draws its strength partly from its formal institutions and partly from the informal exercise of citizenship as a form of '[9] communicative action', rather than a ritual of civic inattention (not to be confused with Goffman's '[10] civil inattention').

**What has New Orleans' Second Line Culture got to do with democratic citizenship?**

https://www.youtube.com/watch?v=xJ_fXelisi8 &feature=youtu.be

Although it may seem odd at first to enlist parading jazz ensembles as instruments of civil society or introduce music as a technology for assembling people for a common purpose, it would be foolish to dismiss them outright as irrelevant forms of public expression, interaction and involvement without facing accusations of [11] intellectualist bias.
especially when the dream of social media as assembling devices has lost much of its gleam. In our trying times where fragmentation, individualism, retreatism, and withdrawal patrol our public interactions, often replacing dialogic exchange with a flurry of angry social media posts, more sociable forms of public exchange are urgently needed as 'cooling devices' in a 'hot climate' as [12] Loader and Sparks rightly insist. The parading brass bands of New Orleans, which accompany various Social Aid and Pleasure Clubs (SA &P), serve as an embodiment of how to use public space for creating opportunities for social interaction between citizens.

With their roots in the early 19th century, SA &Ps developed in the Black communities of New Orleans to pool resources and provide financial assistance for their members in the form of medical insurance, funeral costs, disaster relief, and other difficulties. But they also offered "pleasure" in the form of street parades which snake through the neighbourhoods where club members live. On any Sunday afternoon from September to June, SA &P clubs dance their way through the city; performing not just their allegiance to their respective club, but acting out citizenship in a live(d), grounded manner which is so sorely missing in our "connected" but essentially fragmented times. On a recent visit to New Orleans, in the immediate aftermath of the Trump victory, I was fortunate enough to witness the joyous, creative, and publicly-situated riot that second line parades are, while at the same time feeling brassed off about how much of that spirit of public culture is lacking as a regular, not an episodic, feature of everyday social life in our part of the world. To try to embed ourselves firmly and deeply in the public realm however, we have to learn how to turn sociability into what [13] Georg Simmel called the 'art or play form of association', as the ferment out of which active democratic citizenship can emerge.

Dr. Lambros Fatsis is Lecturer in Sociology and Criminology at the University of Southampton.

sylvia hammond (2017-01-11 09:09:38)
In South Africa, relevant comparisons are the Kaapse Klopse marching bands through the streets of Cape Town - arising from slave heritage, and also the large football clubs, which provide similar benefits of association, and particularly in the Johannesburg area represent a meeting point for migrant mining workers.
All the open culture you could ever need (2017-01-12 08:00)

CfP: Migration and Crisis in Europe (2017-01-15 08:00)

Sociology 2018 Special Issue — Still time to submit!

Sociology’s 2018 special issue will be on the theme of Migration and Crisis in Europe. The issue will be guest edited by Nick Dines, Nicola Montagna and Elena Vacchelli, all at Middlesex University, UK.

The editors are currently calling for papers to be submitted to the issue and relevant topics might include the following:

- Response of migrants and migrant organisations to the economic crisis.
- New forms of labour mobility and the transformation of migrant labour markets.
- Border struggles, migration solidarity movements and/or anti-migration politics in light of the current ‘humanitarian crisis’.
- Migration and social reproduction in a context of economic crisis and welfare restructuring.
- Interpreting the transformation of EU migration and border management through the perspective of crisis.
- Changing internal and external borders in the light of current migratory flows.
- The politics of humanitarianism and/or securitization.

For more information on the aims and scope of the special issue, please see the full call for papers [1]on the BSA website. To submit your article please visit: [2]http://mc.manuscriptcentral.com/soc. The submission deadline is 13 March 2017.

China’s Millionaire Migration (2017-01-16 08:00)

An interesting documentary about the migration of wealthy Chinese to Vancouver:

https://www.youtube.com/watch?v=Izs2i3Bpxx4
With the success of the Ford Model T after its introduction in 1908, Ford Motor Company became the leading manufacturer of automobiles in the world. By 1914, the integration of the progressive assembly line made high-volume and efficient production at Ford Motor Company plants an exemplary model for mass production. Ford’s demand for cheap labor and the lure of high wages—with the $5 day profit sharing plan—drew thousands of immigrants and migrants to Detroit.

In order to manage and control such a large and diverse workforce, John R. Lee, Head of Personnel, created the Sociological Department in 1914. The Sociological Department established a system of rules and codes of behavior for Ford employees that they had to meet, in order to qualify for the $5 day pay rate. The Sociological Department monitored employees at home, as well as on the job. Investigators made unannounced visits to employees’ homes and evaluated the cleanliness of the home, noted if the family had renters, checked with school attendance offices to determine if children were attending school and monitored bank records to verify that employees made regular deposits. Sociological Department investigators also assisted workers' families by teaching wives about home care, cooking and hygiene.

Mark Corbett Wilson (2017-01-17 18:29:27)
I can’t imagine the mindset of the non-profit directors and managers at the Henry Ford Museum. How could they approve this explanatory text from the same webpage: “Students dressed in costumes reminiscent of their native homes stepped into a massive stage-prop cauldron that had a banner across the front identifying it as the AMERICAN MELTING POT. Seconds later, after a quick change out of sight of the audience, students emerged wearing “American” suits and hats, waving American flags, having undergone a spiritual smelting process where the impurities of foreignness were burnt off as slag to be tossed away leaving a new 100 % American.”? The turn to end all turns (2017-01-18 08:00)

The upwards trajectory of publication poses an obvious problem for the aspiring academic. It is one familiar from other fields of cultural production. How to be [1]heard above the din? If ever more publications are being produced each year, commanding ever less attention from a peer group increasingly consumed by the imperative
to publish, vast rewards are liable to be gained by those able to capture the intellectual attention space. This situation can incite great aspirations, something Liz Morrish has written about in terms of the rise of the 'Trump academic':

Equally, in a world where academics are obliged to offer up each piece of work to be evaluated as internationally significant, world leading etc., they will seek to signal such a rating discursively. A study by [2]Vinkers et al. in the British Medical Journal uncovered a new tendency towards hyperbole in scientific reports. They found the absolute frequency of positive words increased from 2.0 % (1974-80) to 17.5 % (2014), which amounts to a relative increase of 880 % over four decades. 25 individual positive words contributed to the increase, particularly the words “robust,” “novel,” “innovative,” and “unprecedented,” which increased in relative frequency up to 15 000 %”). The authors comment upon an apparent evolution in scientific writing to ‘look on the bright side of life’.

Bullshit proliferates under these circumstances. Metricised evaluation demands the performance of ‘excellence’, something to be enacted through the ritualistic assertion of innovation and the sustained quest to ensure it is demonstrable in narrow metricised terms. Capturing the attention of one’s peers demands big, bold and memorable claims, preferably ones that break with what has gone before and position oneself as the start of something new. Each innovation heralds the recruitment of potential followers. After all, each piece of work holds the promise of being the start of something big.

But as Randall Collins has convincingly argued, there can only be so many viable positions within the intellectual attention space. Most innovations, in the entrepreneurial sense undertaken by the Trump academic, remain doomed to fail. For the self-confident and upwardly mobile aspiring star this failure is nothing but a challenge. After all, failure
is in keeping with the spirit of the age. Move fast and break things. If today's innovation doesn't catch hold, throw something else against the wall and continue to do so until it finally sticks.

One of the most frequently used devices in the humanities and social sciences to perform such 'innovation' is the invocation of the turn. When I went counting a few years ago, I found 47, but there are certainly more:

1. the linguistic turn
2. the cultural turn
3. the affective turn
4. the sensory turn
5. the reflexive turn
6. the digital turn
7. the participatory turn
8. the narrative turn
9. the biographical turn
10. the spatial turn
11. the social turn
12. the interpretive turn
13. the ontological turn
14. the postmodern turn
15. the practice turn
16. the pragmatic turn
17. the historical turn
18. the discursive turn
19. the cognitive turn
20. the critical turn
21. the computational turn
22. the transnational turn
23. the emotional turn
24. the practical turn
25. the neuroscientific turn
26. the complexity turn
27. the nonhuman turn
28. the ethical turn
29. the argumentative turn
30. the action turn
31. the animal turn
32. the gender turn
A turn is a claim about orientation. To invoke a turn plays off the authority of others while positioning oneself as leading the group in a new direction. But the limitations of the attention space obtain here as well. Most turns are doomed to failure. Likely to be ignored, rather than even marginalised. Or perhaps to be reiterated endlessly, with each new ‘turn’ largely or entirely ignorant of that which has gone before.

These discursive strategies for career advancement would merely be annoying if they didn’t have such harmful aggregative consequences. The discipline beset by turns is the discipline which is in chaos. Turn! Turn! Turn! Constantly spinning round and round, called forth in all directions while being vaguely aware of countless others calling for one’s attention if only they could cut through the thickets of busyness and anxiety, the outlines of the knowledge system become ever more foggy. What are we doing? Why are we doing it? For the trump academics, the answer is simple: we/I are promoting ourselves and trying to ensure our upwards mobility by capturing the intellectual attention space as efficiently as possible while performing in a way that meets the ever changing demands placed upon us by managers and their metrics.

What about for everyone else? It becomes decreasingly possible to undertake serious intellectual work outside of often insular communities of practice. A self-serving conservatism afflicts the major journals which are the cyphers of established quality in so far as anything remains conclusively ‘established’ beyond the brute facts of institutional power and well-honed networks. A pragmatic eclecticism afflicts the minor journals, as they provide shelter for those seeking some kind of communal focus from the incessant attempts to claim the spotlight that proliferate throughout ever more disorganised disciplines. This system of scholarly communication intensifies the trend towards our working in what Billig (pg 5) describes as “smaller and smaller circles”. When this happens, we lose any sense of the centre. Perhaps the centre was always in some sense imagined. But relations with proximate rivals to our own academic tribes take on the appearance of existential disputes over the soul of a shared project. Our imaginations contract and this invariably finds reflection in thought and expression.

If the career strategies of the Trump academics are at the root of this. If they represent what I’ve elsewhere
taken to calling ‘distraction engines’, socio-technical mechanisms actively serving to hinder the capacity for sustained focus of other actors, we need to delegitimise them. We need to stop taking ‘turn’ talk seriously. But we also need to recognise how we ourselves are implicated in this process. See what I did earlier in the paragraph? I’ve introduced a concept, ‘distraction engines’, on one level useful to me but on another one offered in the hope it might prove catchy. The same criticism can be directed at the notion of the ‘accelerated academy’ itself. I find it disturbingly hard not to do this and the reflexive challenge it poses for me is to justify it. In these cases, because the new term performs some function that alternatives might not. A claim I’m willing to defend about ‘accelerated academy’ but not, perhaps, about ‘distraction engines’.

Deadline soon! @TheSocReview ECR Essay Competition (2017-01-18 14:39)

We invite essays exploring the future of sociology in its relationships with other cognate disciplines such as anthropology and geography. Echoing The Sociological Review’s Manifesto, we seek to encourage reflections on ‘what could be thought differently, and how that creates possibilities for what could and should be done next’. We are particularly interested in contributions from graduate and early career researchers working with novel theoretical and methodological approaches, oriented towards understanding emerging issues through an interdisciplinary lens.

The theme invites discussions that look at research objects from new angles or at research objects that have absconded from more conventional modes of inquiry. It encourages reflections that challenge taken for granted theoretical or methodological assumptions, hoping to draw essays that push the boundaries of sociology as a discipline and that open new avenues for creative and critical inquiries. Thinking about the future also asks that we think about the contributions that early career researchers are bringing to sociological disciplines, and the challenges they face in doing so.

One essay will be selected for the quality and the creativity of its argument. The prize awarded to this essay will be £500. The same criteria of quality and creativity will be used to select an additional 10 essays, which will be published by The Sociological Review on its Website, Blog, and through a specially prepared zine distributed by the end of 2017.

Participation is limited to early career researchers who are currently writing their thesis and those who were awarded their PhDs in the last 3 years. Submissions should not exceed 1200 words. The deadline to submit an essay is February 10th, 2017.

Essays should be submitted online through the following Google Form: [1]https://goo.gl/forms/hqfwRfdUZbDkZZHp2

Questions regarding this call for essays can be sent to AH.Truong@gold.ac.uk.
Incidentally, there are almost as many horses today as there were in the eighteenth or nineteenth centuries, but they have all been reassigned. They are almost all leisure horses, hardly any workhorses nowadays. Isn’t it an odd comment on today’s society that only horses have achieved emancipation? Humans are still work animals just as they always were, even if they are miserable jobless people, but the horses standing in German paddocks today are all horses of pleasure, post-historic horses. Children stroke them and adults admire them, and we feel very sorry for the last workhorses we see now and then at the circus and at racecourses. Some are used in psychotherapy for children with behavioural problems, but they are treated well and respectfully. All the other European horses have managed to do what humans still dream of – horses are the only ones for whom historical philosophy’s dream of a good end to history has become reality. They are the happy unemployed that evolution seemed to be moving towards. For them, the realm of freedom has been reached, they stand in their paddock, are fed, have completely forgotten the old drudgery and live out their natural mobility.

Sharon (2017-01-19 20:51:38)
Hi Mark, The 'happy unemployed' horses that have achieved emancipation must be the lucky privileged and well resourced ones as there are currently an estimated 7,000 horses and ponies in the UK suffering from neglect or abuse. The picture is much worse worldwide. Please see: http://media-cache-ak0.pinimg.com/736x/be/8e/cd/be8ecd9a82a0b0159e8eaf47805a78f2.jpg http://www.all-creatures.org/anex/horse-abuse-08.jpg Best wishes, A horse lover

On Teaching Theory (2017-01-20 08:00)

This short exchange with Michael Burawoy offers some thought-provoking reflections on teaching social theory. He identifies the major traditions of teaching theory within American sociology, before outlining his own ethnographic approach:

1. **The Survey**: surveying extracts from a comprehensive range of social theorists, each one treated as an instance of a broader category. Essentially disconnected and decontextualised. Teaching theory in an essentially general way.
2. **The Interpretative**: placing theory and theorist in their life and times, seeing the specificity of their work as a response to equally specific circumstances. Teaching theory in a essentially *particular* way.

3. **The Synthesis**: selecting extracts based on a distinctive theoretical vision, using those selections to articulate a theoretical approach which presents itself as grounded in the classics. Teaching theory in an *closed but generative* way.

4. **The Ethnographic**: using shorter extracts from a selected range of limited texts in order to facilitate reconstructive critique. The students are gradually encouraged to situate themselves in relation to the theory, criticise it from the inside-out, learn to apply it to the world around them and relate it to other such theories.

There are interesting critiques that can be made of how this approach works in practice (see the response from Alan Sica in the attached article) but I love the exercise he uses:

Apart from the classroom discussion, there are also discussion sections, 20 students in size, led and organized by brilliant, devoted and above all creative teaching assistants who have collaborated with me in developing this approach to theory. Along with one-page reading memos due every week, each semester we assign a “theory in action” paper (no more than a thousand words) that requires students to choose current events or their own experiences to illustrate a theorist of their choice. In addition mid-term and final exams consist of three short 750-word take-home papers (once again less is more) that assume the form of an exegesis of a given theorist, a comparison of theorists, or an application of theory to real live situations as defined by an article from a newspaper or magazine.

The course culminates in a 20-minute oral examination with their teaching assistant in which each student has to reconstruct the entire course as a conversation among the theorists, again in answer to a specific question given ahead of time. They are encouraged to include images, pictures, drawings, in what essentially is a poster presentation. The posters they produce amply demonstrate to what extent the various theorists have become part of them, whether theorists have become different mindsets that they will take with them into their future lives.

Lost governments of fragile reason (2017-01-21 12:31)

by Deborah Talbot

In the eve of the US election result in which Senator John Kerry lost to George Bush in 2004, Jonathan Raban wrote the following in his essay America's Reality Check:

"More than any other election in recent history, this one has become a referendum on what it means to be American, and half of the country detests the idea of living in the other half’s America."

Prophetic words, and ones that define our political landscape. Raban was referring to the battle between evidence and ideology. The Democrats represented long-winded 'Aristotelianism' seeking to evidence policy and social change. The Republicans, were they 'Platonists'? Well, he cites an article published in the New York Times Magazine on October 17th, which quotes comments made by a Bush aide to Ron Suskind, author of the article. The aide says the following:
“The aide said that guys like me were “in what we would call the reality-based community,” which he defined as people who “believe that solutions emerge from your judicious study of discernible reality.” I nodded and muttered something about enlightenment principles and empiricism. He cut me off. “That’s not the way the world works anymore,” he continued. “We’re an empire now, and when we act, we create our own reality. And while you’re studying that reality – judiciously, as you will – we’ll act again, creating other new realities, which you can study too, and that’s how things will sort out.”

Wondering why we continually go to war without any evidence that it will work? Wonder no more. Perplexed that governments continue with welfare cuts when there is no evidence it makes any difference to the ‘deficit’? Confusion over. Alarmed that the government is attacking education, quite against everything we know about why it’s important? Alarmed by the post-truth reality of Brexit and Trump?

Now you know. The right has become revolutionary, aiming to overthrow reason itself in the name of power. The truth is irrelevant. Facts are a product of a forgotten world. Bush won the election in 2004. The UK Leave vote won in 2016. Trump won the American election in 2016.

We currently have a government that is no friend to fact and evidence. Read one of its policy documents, and it resembles the ramblings of an unpleasant undereducated relative who corners us drunkenly at weddings, who hasn’t bothered reading anything for years. Fiction is alluring, and the Tories continue to make strides? Why? Perhaps it is because large portions of the political scene never liked the slow drift towards realism and reason that symbolised the 1990s. Early New Labour, then in power, was the face of the modernising state, the purveyor of evidence-based policy and one-nation Labourism, and they were hated for it. Elements of old England affective politics despised them way before Iraq.

Like any movement, however, New Labour too moved toward ossification and the canonisation of their mobile perspectives. In declaring the ‘end of history,’ they fell victim to hubris. While proclaiming the need to evidence policy change, the frequently disregarded evidence when it suited them, most spectacularly in the example of the ‘Dodgy Dossier’ which justified the case for the war against Iraq. And so they too become pushers of ideology rather than evidence, one that says that spin is everything and that anything is justified, as long as it appeals to a fictional public seeking ‘centrism’.

So now we have it, a resurgent populist right seeking to remake reality, amidst a world slowly descending into blood and guts violent fantasy. There has never been a time when we are so desperately in need of the slowing hand of reason. As Raban said, just before anyone knew who had won the 2004 US election:

“One can only pray that on Monday morning sobriety will return, and, with it, a regard for the grim facts of the case - and that the chastened mood will last through Tuesday. Fingers crossed.”

Engines of Knowledge: The Museum and the Exhibit (2017-01-22 08:00)

by Hamish Robertson

My focus is on what I have termed, after Ian Hacking’s idea, engines of knowledge. This notion of engines includes not just tools and methods but institutions and processes that we have come to take for granted, even, in sociological terms, naturalised. The machine metaphor refers to the capacity of these things, singularly or taken together, to produce new practices, concepts and ideas. Amongst these knowledge factories were the institutional formats of the university, museum, library, the hospital and, in organisational formats, the many associations and societies that emerged to formalize, authorize and regulate knowledge development and outputs. In this piece I look at the museum as an archetypal knowledge factory of the Victorian era that formalised, institutionalised and then diversified itself on the basis of a range of earlier prototypes. The normalization of the museum and its role in modern state formation have become so commonplace that it was only with the emergence of museological theory from the 1970’s onwards that the sector began to unpack its own forms of knowledge production and validation.

From Curiosity Cabinet to Knowledge Factory

The museum is both an ancient idea and a relatively modern institutional form. The original museum in classical thought referred more to a place for philosophical contemplation and discussion, more university than a collection of artifacts or exhibit space. Early modern examples include Ole Worm’s (1588 –1654) scientific curiosity collection in Copenhagen or the opening of the Ashmolean art museum in Oxford (1683). The British Museum was established in the 1750’s based on Hans Sloane’s collection of curiosities. Diderot proposed a national museum for France in his *Encyclopédie* in the 1760’s. This 18th century developmental phase became an increasingly international phenomenon in the 19th century as the growth of knowledge expanded at a phenomenal rate, and the instruments and methods for knowledge production were increasingly universalised. We also need to consider the variety of museums that has emerged since this time with a small number of types expanding into dozens of variations and thousands of institutions worldwide. The International Council of Museums ([2]ICOM) currently lists 20,000 formal members and many more institutions qualify as informal museums. People are familiar with the *wunderkammer* or curiosity cabinets that preceded what we now think of as the modern museum. These were often collections of interesting objects that had their own story but did not follow what we now think of as a modern taxonomical logic. While some debate exists on this transition from curiosity cabinet to museum, what I suggest here is that a formalization, even regularisation, of the entity known as the museum began to take place during the 19th century, and with that formalization, a specific understanding emerged of the kind of knowledge produced in and through museums and their activities, including the individuals who produced and authorized that knowledge. In addition, the formalisation of the purpose or role of the museum as a producer and authorizer of specific knowledge types emerged at this time. The idea that nature and society could not only be captured and inventoried but that they could be scientifically classified, ordered and divided into every finer sub-domains was central to the structure and operation of museums, and especially science and natural history museums, as we now know them. These ideas of classification, taxonomies and specialization within discrete domains were central features in the rapid development of human knowledge generally and the sciences more specifically, right down to the present day. The rapid growth in museums and in the size and scope of museum collections also fed into the processes of taxonomy, themselves based on the practice of expert judgement rather than quantitative analysis. Expert judgement obviously requires experts who do the judging and this was another feature of emerging specialization and forms of expertise in the 19th century. One of the features of the museum as an institution was that the basic archetype rapidly diversified to include a wide, and still increasing, variety of institutional types based on the general format. This diversification initially followed the development of the sciences and associated cultural domains – the natural history museum, the art gallery, the ethnographic museum, the science museum and so on. Characterised by an almost unbelievable scale of collection and associated indexing practices, the museum was focused on material objects as its fundamental cultural currency. If the library has books and the archive has documents, the museum has objects and it has them in abundance, so
much so that often only a small fraction is (or even can be) on display at any one time. One of the issues here is that there is an assumption, as [3]Nélia Dias has remarked, that the objects collected are (a) scientifically neutral and that (b) they tell us things about themselves. This position becomes more problematic in the human cultural domain and especially so when we consider the role of the museum in the context of the emergence of the modern state. State Formation and the Museum Museums have acted as formalizing institutions for a great deal of social and cultural knowledge, and the period in which their expansion accelerated was that of the rise of nationalist state ideology - the singular people with a single language (often the dominant group’s dialect), a national anthem and a flag – so beloved by Europeans and others. To produce this kind of uniformity of identity and processes of identification requires institutions to promulgate the illusion of sameness, to historicise it, and to develop a neat linear narrative arc from the messiness of normal human societies and their complicated histories. For a long period of time the museum, like the school, was a key focus for the articulation of the nation-state mythos. The [4]national museum, for example, is usually located in a nation’s capital and its near neighbours are often institutions with a similarly emblematic role. It is no surprise then that museum visits for school children were and still are almost mandatory in many societies, because they are not only ‘educational’, they also affirm membership and participation in a particular vision of the nation state and a commitment to a particular narrative presented as historical fact. Problematic in some of these scenarios was the implicit and even explicit hierarchies that social and material taxonomies tended to produce. One of the areas where this was most complicated and also had major implications was in the area of ethnographic museums which undertook the emerging scientific study of human beings and their societies. The ethnographic museum emerged at a time when anthropology and the other social sciences were in a formative state. In addition, technical developments such as photography, and more dubious constructs such as [5]phrenology and [6]eugenics, emerged and were frequently applied to ethnographic work. The results included extensive collections and displays of purportedly primitive cultures (and classes, once transferred from the colonial periphery to the metropole) often including not only their material artifacts but even their skeletal remains. The varied racisms of this period became scientific and were harbingers of much of the racial violence of the 20th century, from [7]Namibia and beyond. The emergence of “[8]human zoos” tended to place cultural and ethnic minorities on a similar footing to carnival freak shows and wildlife exhibits. What we have seen as a consequence, especially since the late 1970’s has been a series of renegotiations between museums and various marginalised groups, particularly indigenous peoples in colonial settings. This includes the return of some artifacts and more particularly bodily remainders. Some of the knowledge domains and curatorial processes of the 19th century museum are gradually being renegotiated and rewritten. An enduring problem is the idea that it is sameness that defines us (religion, state, language etc.) and here of course it has to be someone's version of sameness, singular and dominant. Critical museology, beginning in the 1970’s and gaining momentum through the 1980's and 1990's, has revised much of the 'givenness' of the traditional institutional museum in its wider social and political role. In addition, the establishment of alternative types of museums and cultural institutions has opened up the authoritative nature of the ‘museum’ in a singular sense to the variety of alternatives that exist in any society, especially for more marginalized groups and their histories. The newly opened [9]National Museum of African American History and Culture in Washington DC illustrates how powerful the symbolism of the institution itself remains in modern society and the enormous effort it can take to have alternative views authorized in the cultural spaces of the nation state. So while the museum itself has undergone considerable change as an institution it remains that many of these changes are very recent. Indexing the World One of the roles of the museum has been to help index both the natural and social worlds. The sheer scale of biological, zoological and geological data emerging from the new sciences was so great during this time that more than mere taxonomies were required. One of the problems in this first information age was the volume of data (artifacts, samples etc.) being collected and the availability of categories with which to meaningfully index them, since so much material was so utterly new. In addition, the diversity of human cultures and their artifacts has also challenged the museum to produce meaningful understandings that do not entirely abstract the knowledge of those groups that actually produced the collected artifacts. The classic knowledge problem of over-generalisation versus extreme particularisation (every artifact is after all genuinely unique) proved a challenge then and still does. And part of this problem resolves to two issues – adequate physical space and the contemporary shift to digital or virtual environments. Supply rapidly exceeded ready display space in a problem which, even with contemporary digital methods, remains a significant issue – there is usually not enough space for the display of complete collections even
where there is sufficient room for storage. While contemporary digitization makes virtual versions of the original objects more accessible in theory, there is still the issue of knowing what to look for and where and how to find it. In this sense the epistemic versus the ontological distinction remains a persistent problem for us even as we cross from the analogue to the digital domain. The claim to a space of knowledge and the processes developed in the museum were co-productive, generating a place, a profession and a discipline. The museum is not only an active agent in knowledge production but its activities generate new problems for it to resolve. The massive analogue collections of the 19th and 20th centuries will necessarily become supplemented by their digital versions in the 21st century. **Conclusion** As the 19th century progressed a broad repertoire of techniques and technologies emerged, often mutually constitutive, that formalised a variety of organisations and institutions as places for the production of particular forms of knowledge. Institutions were central to these processes and their related outcomes providing both focus and legitimacy. In this piece I have begun the process of exploring some of the foundational engines of knowledge that the 19th produced. The concept here is not simply to identify the ‘factories’ themselves but also their corresponding intellectual and physical technologies, many of which persist into the present day. It is these inheritances that interest us in particular. In a time when ‘big data’ is increasingly pervasive as a concept, a marketing slogan and an increasingly formalised set of practices, it is even more important to examine those things we are carrying forward from the past. To identify those factories, to examine the engines of knowledge they gave rise to and to critically review their tangible and intangible products all help us in critiquing and unpacking the conceptual heuristics we live by. Institutions formalize their authority by circumscribing not just their knowledge products but their right to authorize knowledge within their domains of activity. The museum’s knowledge claims are as various as there are types of museum and as a result we are now in the fourth century of expansion and diversification in the knowledge claims of the museum. Our present information age is a product of these early knowledge factories including their concepts and methods for understanding the world. **Hamish Robertson is a geographer at the University of New South Wales with experience in healthcare including a decade in ageing research. He has worked in the private, public and not-for-profit sectors and he has presented and published on a variety of topics ranging from ageing, diversity, health informatics, Aboriginal health, patient safety and spatial science to cultural heritage research. » Engines of Knowledge in the First Information Age: The Laboratory and the Experiment The Sociological Imagination (2017-03-08 08:00:30)

 [...] archetypal dualisms. Early laboratories often started as adjuncts to museums (discussed in a previous piece) and experimentalism had been gaining ground as a virtuous form of knowledge production since [...]
The ontology of data, the ideology of data (2017-01-23 08:00)

In a recent post, I expressed my discomfort with how Nick Srnicek invokes the notion of data as a raw material in his *Platform Capitalism*. In a footnote on loc 1102-1121, he offers a Marxist justification for this use:

I draw here upon Marx's definition of raw material: ‘The land (and this, economically speaking, includes water) in the virgin state in which it supplies man with necessaries or the means of subsistence ready to hand, exists independently of him, and is the universal subject of human labour. All those things which labour merely separates from immediate connexion with their environment, are subjects of labour spontaneously provided by Nature. Such are fish which we catch and take from their element, water, timber which we fell in the virgin forest, and ores which we extract from their veins. If, on the other hand, the subject of labour has, so to say, been filtered through previous labour, we call it raw material; such is ore already extracted and ready for washing’ (Marx, 1990: 284–5, emphasis added).

The distinction between *natural* and *processed* helps address the charge that data-as-raw-material naturalises data but it doesn’t avoid it all together. It recognises that *usable* data is always processed and cleaned prior to use, ‘filtered through previous labour’ both directly (wrangling etc) and indirectly (socio-technical systems of generation, capture, storage and analysis).

But does it obscure the character of its applications? The original sources of this ‘raw material’ are intensely social, unlike that extracted from nature, arising from the digitalisation of action and transaction within a market economy. The applications of this ‘raw material’ are intensely variable, with data sometimes being a direct source of value that can be realised through a linear activity, other times being an informational good that can be used to coordinate and calibrate and perhaps more often being a source of confusion and speculation.

It would take constructionism too far to deny the ontology of data. Indeed, I think a concern for the ontology of data is a crucial vector through which we can understand the ideology of data. But we nonetheless need to carefully unpick the way ‘data’ is represented by social actors, the interests served by this and the discursive architecture through which these interests are advanced in different organisational settings.

There’s a fascinating example of this ideology which Srnicek quotes on loc 1296:

If collecting and analysing this raw material is the primary revenue source for these companies and gives them competitive advantages, there is an imperative to collect more and more. As one report notes, echoing colonialist ventures: ‘From a data-production perspective, activities are like lands waiting to be discovered. Whoever gets there first and holds them gets their resources –in this case, their data riches.’ For many of these platforms, the quality of the data is of less interest than their quantity and diversity. Every action performed by a user, no matter how minute, is useful for reconfiguring algorithms and optimising processes. Such is the importance of data that many companies could make all of their software open-source and still maintain their dominant position due to their data. Unsurprisingly, then, these companies have been prolific purchasers and developers of assets that enable them to expand their capacity for gaining information. Mergers relating to big data, for instance, have doubled between 2008 and 2013.

How seriously should we take this? My instinct is to say ‘not very’. The notion that *all* data is of potential value is licensing massive investment and expansion, entrenching the position of precisely those who are speaking most authoritatively in relation to this transition. To be sceptical of a gold rush doesn’t mean you’re denying the existence...
of gold, it just means you’re sceptical about the exuberance surrounding the search and how it is being deployed by some to benefit their own self-interest. The distinction between the ontology of data and the ideology of data matters.

CfP: Social Media Technology Conference & Workshop (2017-01-24 08:00)

*Social Media Technology Conference & Workshop*

Call for Papers, Workshops and Panels

October 5-6, 2017

Howard University Washington, D.C.

Social Media: Culture and Identity*

The 7th Annual Social Media Technology Conference & Workshop is a two-day intensive conference combining panel discussions, paper presentations and workshops designed to enlighten attendees about new scholarship, professional practices and pedagogical approaches to teaching social media. Interested individuals can send in papers, workshop ideas and panel proposals that address a myriad of topics surrounding the theme - Social Media: Culture and Identity. This year’s theme focuses on dissecting how social media work to celebrate and heighten cultural differences and practices as well as provide a space for individuals to shape or have their identities shaped by social media usage. The goal is to bring scholars and professionals together to share their perspectives on how social media are utilized by various individuals, groups, cultures or entities to create agency, share voices and impact cultures and identities.

Paper Submissions*

Respondents should submit a 3- to 5-page proposal that includes an overview of the study as well as research design that includes brief review of the literature, methodology and findings, if possible. All respondents in this category should clearly identify the submission type on their proposal and send the proposal through EasyChair by June 30, 2017 at the following site: [1]https://easychair.org/conferences/?conf=smtc2017. In addition to the proposal, a file should be uploaded with a 100-word abstract of the proposed paper as well as a 100-word biography for each author. Submission without the biography will be rejected. Presenters will be notified by mid-July of the status of their submissions and should register to attend the conference by September 1, 2017. *Panel Submissions* Respondents should submit a 3- to 5-page proposal addressing the purpose of the panel and specific issue(s) to be covered. The proposal should include a list of the confirmed guests or those who will be solicited for the panel as well as their brief biographies. All respondents in this category should send the proposal through EasyChair by June 30, 2017 at the following site:
The lost socio-technical architecture of qualitative research (2017-01-25 08:00)

I’ve long been fascinated by how rarely qualitative researchers talk about the equipment they use in their research. I love it when I see exceptions to these trend, such as Les Back’s [1]chapter in this volume, because they highlight the tools of the trade in a way conducive to discussions about craft. However if we have accumulated methodological discourse over many decades, it’s hard to reverse prevailing trends through isolated acts of critical reflection. The socio-technical architecture of qualitative research gets lost, while concepts conditioned by it nonetheless circulate, floating free of the technological affordance and constraints which shaped their emergence.

For this reason I think technological innovations offer opportunities for broader projects of methodological reclamation. The risk is that we become preoccupied with shiny new technologies, leaving us so enamoured with new techniques that we circumscribe the ‘new’ from the ‘old’. But if we can get beyond this tendency, changes in this socio-technical architecture offer us opportunities for a renewed reflexivity about the purposes, techniques and tools of research.

What does this mean in practice? We need to reflect seriously on the fact there’s much more to digital qualitative research than digital qualitative research methods. The tendency of the former to be crowded out by the latter reflects what Rob Kitchin describes in the Data Revolution as “the pace of technical change and the roll-out of ad hoc and pragmatic approaches”. But conceptualisation, operationalisation and analysis should be treated as a unified whole alongside methods, using the opportunity of technological change to rethink qualitative research as a
whole, rather than restricting this activity to new methods.

1. http://inventive%20methods/

Rachael Kiddey (2017-01-26 11:54:33)
Interesting post, Mark. I agree that there's more to qualitative research than just the methods we use to collect data. I also think it's easy to overlook and take for granted the ongoing usefulness of traditional ways that we've been collecting data for hundreds of years. Most of us also still write notes, even if on a computer, we doodle, draw, take photo's etc. Here's a link to an article I published recently about cultural heritage methodologies as tools for empowerment. Simple stuff, but effective, inexpensive and accessible. http://www.tandfonline.com/eprint/9QAedy3sAnVunqy5PVlv/full

Mark Carrigan (2017-01-29 18:06:20)
this looks great, thanks Rachael (nice it's open access too)

The self-importance of researchers (2017-01-25 08:00)

This interesting aside in Jamie Woodcock's superb Working The Phones is worthy of further discussion. From loc 2698:

Researchers often attribute a level of importance to their own research that is not shared by others, assuming that because they spend so much time on it others will want to know all about it too.

How does this attitude develop? How widespread is it? How is it connected to how people see their occupational roles?

My hunch is that it's absolutely central to academic exceptionalism: the notion that academic labour is intrinsically different to other forms of labour. The (self) importance of the scholarship goes hand-in-hand with a mystification of the conditions under which their scholarship is enacted.

Stephen (2017-01-25 12:20:58)
Maybe some answers in "The Invention of Creativity: Modern Society and the Culture of the New" Andreas Reckwitz, 5 May 2017.

Mark Carrigan (2017-01-25 12:49:48)
that looks really interesting thanks

I posted this on Steve Blank's blog post celebrating recent legislation, the American Innovation and Competitiveness Act, to help researchers monetize their results: "The next step is to use evidence based research and agile development to identify and promote academic research projects that benefit 'we the people' that fund them, not just for corporations that benefit from
bringing new technologies to market." https://steveblank.com/2017/01/15/23047/ #comment-433560 A self described 'spook' (intelligence officer) that arrived in Silicon Valley in 1978, he "moved from being an entrepreneur to teaching entrepreneurship to both undergraduate and graduate students at U.C. Berkeley, Stanford University, Columbia University, NYU and UCSF." He has promoted Lean and Agile development strategies to the National Science Foundation, the National Institutes of Health and Imperial College in London. His insight? Stop building the next new thing. Get out of your office and ask people (customers) what they need. I think this could work for academics too, after they get over their delusion of being exceptional.

BREAKING NEWS: Social Science Faculty at Humboldt-University Berlin occupied! (2017-01-25 12:00)

Well, this is not breaking news. The occupation of the Social Science Faculty of the HU-Berlin started last Wednesday, 18 January, but I only found out about it today.

Although I work in an institute which is part of the HU, no one mentioned it. I have not read anything in the news.

So today at noon I wandered into the main building of the University to a attend a seminar given as part of the Science and Education Policy Masters programme.

The students are protesting against the university president's decision to dismiss of[1] Andrej Holm, lecturer of urban and regional sociology, and well-known political activist who has protested against the gentrification of Berlin. He was recently appointed Minister for urban development and housing for the State of Berlin, but it turned out that he had been linked to the Stasi, the East German Secret Police, as a teenager. He resigned as Minister, but the university also decided to dismiss him, citing as a reason the fact that when he applied for the position of lecturer in 2005 he had lied by omission, by not mentioning his involvement with the Stasi in his application form. He - and the students, as well as over 350 academics and housing campaigners - argue that this dismissal is a political decision.

The few English newsitems talk about the scandal but the occupation of the university is very oddly not mentioned anywhere that Google can find!

[3]Here is a link to the alternative curriculum. The occupation is going to continue indefinitely.

CfP: The Digital Everyday Conference (2017-01-26 08:00)

The Digital Everyday: Exploration or Alienation?
Centre for Digital Culture at King’s College London
CALL FOR SUBMISSIONS

This international conference aims at exploring the digital everyday, understood as the transformation of everyday life practices brought about by digital technology. From how we buy, walk around, get a cab, love, break up, go to bed, meet new people and sexual partners to the way we rate services, turn on the fridge, exercise and eat, social media, apps, and Big Data are reshaping some of the most basic activities in our lives.

The conference will explore these digitally enabled transformations by looking at a number of domains affected by these shifts, for instance: of work and leisure, of friendship and love, of habits and routines. We will also explore a number of overarching dynamics and trends in the digital world that contribute to these transformations, including: processes of digital individualisation and aggregation; the elisions of spatial and temporal barriers; trends towards quantification and datafication; and the dialectic between control and alienation.

We invite participants from various intellectual traditions and streams of research including media studies, sociology, psychology, information science, computing and anthropology. Together, we will explore a number of key questions. How, for example, is digital transformation affecting everyday life? To what extent is this process one of increasing individualisation of social experience? Or might there be something more complex happening? What are the new psychological and social pathologies that result from the digital transformation of everyday life and from processes of datafication and quantification? Is digital technology allowing for new forms of control over our everyday life or is it increasing alienation, making us overly dependent on infrastructures beyond our grasp? Is digital technology contributing to extending our freedom to choose, or is it stifling us with an overabundance of options? Is it guiding us towards who we ‘really’ are or want to be, or is it plunging us into a hall of mirrors that only reinforces our isolation and narcissism? Is it facilitating exploration, serendipity and curiosity, or is it installing us into a pre-programmed and predictable world, into a filter bubble where choices can be more easily measured and manipulated?
Proposed paper abstracts may address the following topics: transformations of work patterns; changes in everyday life routine (sleep, meals, etc.); fitness and sport activity; love and sexual interactions; friendship and acquaintanceship; consumption and entertainment; sense of place and time; transportation and tourism; play and leisure.

The conference will comprise two plenary sessions and 4 breakout panels, and will host internationally acclaimed scholars as keynote speakers.

The conference will take on Saturday, 6th May 2017.

Abstract are due by 31 January 2017.

Abstracts should be 250 words maximum, and include the author(s) name and position, and a short title. They should be submitted via EasyChair [1]https://easychair.org/conferences/?conf=digitaleveryday17 Acceptance notices will be given on 28 February 2017. Extended abstracts of 1,500 words are due on 15 April 2017 to be sent [3]digitalculture@kcl.ac.uk

(1)Making Europe: Capitalism, Solidarities, Subjectivities (2017-01-27 08:00)

"(1)Making Europe: Capitalism, Solidarities, Subjectivities"
13th European Sociological Conference
European Sociological Association
Athens, Greece, 29 August to 1 September 2017
Solidarities, Subjectivities" Europe can be made or unmade, and this is especially true since the 'Great Recession' of 2008. European society, and even the very idea of Europe, is under threat. First, the inherent contradictions of capitalism are obviously stronger than we thought: Greece, where the emphatic idea of "Europe" originated, has experienced severe austerity measures; Europe has seen a deepening of neo-liberal politics, threats to what remains of the welfare state and increasing inequality. Second, solidarities are fragmented in and between societies across Europe. The new world economic crisis formed a context for both the constitution and the undermining of solidarities. On the one hand, from the Arab Uprisings to the various Occupy and Indignados movements and their manifestations at the level of political parties we have seen rebellions by citizens demanding political change. On the other hand, refugees fleeing wars have been denied human rights and their lives have been threatened by the closure of borders and the lack of a coordinated European strategy. Third, subjectivities are formed that do not only result in resistance and protest, but also in apathy, despair, depression, and anxiety. Authoritarianism, nationalism, racism, xenophobia, right-wing extremism, spirals of violence, and ideological fundamentalisms have proliferated throughout the world, including in Europe. As a result, the promise of Europe and the geographical, political, and social borders of Europe have been unmade and this 'unmaking' poses a profound challenge for sociology and the social sciences more generally. It is in this context that the European Sociological Association's 2017 Conference takes place in Athens at the epicentre of the European crisis. The underlying question for the conference is: How and where to should a sociology that matters evolve? How can sociology's analyses, theories and methods, across the whole spectrum of ESA's 37 research networks and various countries, be advanced in order to explain and understand capitalism, solidarities and subjectivities in the processes of the making, unmaking and remaking of Europe?

An interview with Jamie Woodcock about Working the Phones (2017-01-28 08:00)

https://www.youtube.com/watch?v=Yu7KgDP-ABg

Find out more about the book [1]here

How did call centre emerge and proliferate? Would it be a mistake to see this as solely a matter of technological feasibility?

The growth of call centres in the UK is a result of two factors. The first are the technological possibilities offered by the combination of computers and telephones. The meshing of the two allows for an extraordinary level of electronic surveillance and control, along with the automation of the pace of work through the automatic dialling software. These make the call centres an appealing way for capital to organise communication, particularly in relation to sales. However, before the technology allowed this phone rooms (with workers dialling the calls themselves) were widespread. It is therefore important to see what kind of roles (and therefore labour processes) call centres are replacing, because there is not only one type of call centre.

The second is the set of broader political economic factors that have developed since the 1980s. The privatisation of British Telecom and the deregulation of financial services in the 1980s were important catalysing changes.
The use of call centres in these new sectors provided examples of low-cost and highly profitable use of new technology. This was followed by a rush from others under competitive pressure to copy the organisation and techniques of call centres, both within these sectors and more broadly in the economy. The problem here is identifying exactly what is meant by a call centre. The book focuses on high-volume sales call centres, but there are a wide range of other inbound and outbound applications, from local government, advice lines, to booking services. The intense pressure of sales means that these are the first to adopt new technologies and management strategies that then become used more broadly.

How has the spread of call centres changed the internal operations of corporations?

Call centres have allowed a centralisation of particular internal operations of corporations. Rather than having people to contact across various sites, the call centre format allows for communication to be routed through a single site. This provides opportunities for greatly reducing costs and increasing pressure on individual workers. Alongside the broader competitive pressures of reducing backroom costs, call centres have therefore become one way to reduce or outsource parts of a corporation. This is most often represented in the tropes about Indian call centres, although in reality a comparatively small amount of call centre operations have been outsourced to this degree. Large organisations have consolidated their call centres, while many choose to outsource parts or all of this. Charity fundraising provides an interesting example, with a new industry emerging of separate companies that provide fundraising as a service to charities – while not having anything to do with charity themselves. This is mirrored by many insurance sales call centres that simply repackage insurance products from existing companies – they sell them to consumers and then any issues with the policy or potential pay-outs are handled by the insurance company. This is a sign of the sclerotic nature of contemporary capitalism: using call centres to try and further reduce costs or to realise profits from other company’s products and services through cold calling.

Work in a call centre is often presented as akin to work in a factory? Is this analogy accurate?

The factory analogy for the call centre is useful, particularly as across the UK many call centres have been established in areas that used to have heavy industry. This decline in manufacturing has been replaced for many people with low paid work in the service industry, of which call centres have become emblematic. However, there are important differences. Unlike the assembly line with its physical demands, the requirements of a call centre are quite different. It is not the same repetitive movement, but the demand to repeat an ephemeral performance that tries to part customers from their money of the phone. Workers are required to do more than just go through the motions at work. Instead a complex package of affects is required to make sales, bringing with it further pressures and stresses for workers. Call centres are therefore a new kind of work, different to the factory in many respects – but still subject to regimented work, technologies of control and managerial supervision.

How many people work in call centres in the UK? How does this compare internationally? How do pay and conditions vary?

There are estimates of over a million people working in call centres in the UK. It is difficult to gain exact figures for total numbers or pay and conditions because they are not a single industry, but often attached to an integrated into others. It is certainly true that conditions vary inside the UK, with some inbound types of work having comparatively better pay or conditions. The global spread of call centres involves similar forms of organisation, use of technology, and management techniques. Unlike manufacturing, the spread of call centres follows lines of imperialism and common language, resulting in geographically specific patterns. This means that call centres take on national characteristics, but like the UK are shaped by low pay, precarious conditions, and features like high turnover.

You’ve talked about this electronic surveillance and control as "computerised taylorism". How does this differ from older forms of Taylorism? Is it continuing to develop and mutate? For instance the role of gamification in call centres seems sinister and interesting in equal measure.
Call centres are particularly susceptible to the introduction of digital technologies for surveillance as the labour process is organised over telephones integrated with computers. This produces easily quantifiable outputs that can easily be collected, stored, and analysed. There are clear similarities here with Taylor’s desire to eliminate ‘soldiering’ (slow-down from workers) by understanding, measuring, and controlling the labour process. However, unlike the figure of the technician with the white coat and stopwatch, the computerised methods automate much of the process. This strict monitoring of exactly what workers are doing provides a powerful way for managers to deal with the indeterminacy of labour power, the difference between what capital (the purchaser of labour power) expects and the worker selling their labour power is prepared to do.

It is important to remember that technology is only one response to this. The collection of data alone is not enough, it needs to be parsed and acted upon by human agents (at least for now). This addresses the quantitative demands of the labour process (the number of sales), but creates problems for the qualitative demands (the customer experience and so on). In addition to these monitoring methods, other approaches like buzz sessions were used to motivate workers at the start of a shift, various incentives were offered, and the introduction of gamification. The gamification starts early on in the call centre, and is pushed through the targets and incentives. Above the call centre floor hung a large TV that displayed live sales statistics, comparing the performance of every worker in the shift. This approach of gamification is an attempt to take elements of play – or at least game design – to convince workers to motivate themselves. Another form of gamification took place in the call centre from the workers themselves, seeking to make the work fun – or at least less onerous – by playing word games while on calls, for example. The persuasiveness of the former, along with the existence of the latter, makes gamification a far from straightforward phenomenon. We should celebrate the moments of gamification-from-below (those used by workers as a practice of resistance), but further critiques are required of managements attempts to co-opt these impulse to exploit workers, particularly when it starts from neo-Taylorist and technofascist impulses.

Could we imagine the digital technologies of performance monitoring and surveillance seen in call centres spreading to other forms of work? Would it be overstating matters to see the call centre as a testing ground for new ways of exploiting the minds of workers as a productive resource?

It is interesting to see how quickly technological methods of performance monitoring and surveillance have been taken up in call centres across the world. In this context it is attractive and relatively cost effective for management to employ these methods, despite the ramifications it has for worker’s experience of the labour process and the high turnover. Call centres are particularly well suited to this kind of performance monitoring as the labour process has a clear and quantifiable output. The conceptualisation of this mode of surveillance and control as an electronic Panopticon is an important way of understanding this and call centres have proven successful testing grounds for this method. In increasingly broader contexts, new methods of management to control and exploit labour are being experimented with, often including the introduction of metrics. However, unlike call centres, examples of digital labour, teaching (in both schools and universities), care work, and so on are much harder to boil down to comparable metrics. This comes back to the key problematic of management, the indeterminacy of labour power discussed earlier. Increasingly, the demands of new performance management systems are brought in by layers of bureaucracy that are removed from the work and the labour process. This represents an attack on the autonomy of workers as performance is reduced to metrics which remove the complexities and nuances of cognitive, emotional, or affective labour. These kinds of measurements need to be contested and opposed, something which so far has not been successful in call centres.

You find methodological innovation for your study in Marx’s early work, as well as the autonomist tradition. Could you say a little about these influences and how it shaped your approach?

The study draws on a methodological approach of workers’ inquiry, a disparate tradition of researching work. This starts with Marx’s call for a workers’ inquiry, published after – and possibly a corrective to the one-sidedness of
The ideas of connecting a process of knowledge production to one of workplace organising was taken up by the Johnson-Forest Tendency in the USA, Socialisme ou Barbarie in France, and then later by the Italian Workerists and Autonomists. This approach gives primacy to the experience of workers, situating them as able to both provide an understanding of the work and conditions, but also capable of transforming these. This involves a focus on the labour process and resistance, or examining class composition at different points. The development in the Italian tradition involved conceptualising the inquiry as a kind of co-research, breaking down the distinction between activist researchers and workers. This takes the moment of organising at the factory gates and seeks to develop it into a longer project of organisation. In an ideal situation, this co-research unfolds into an inquiry-from-below, but this requires existing contacts and workers that are self-organising. In other contexts, it is suggested that sociological tools can be adapted in an inquiry-from-above, gaining access and contacts in the workplace with the intention to move into a -from-above approach. Although now the factory gates are no longer so easy to find, I took up these inspirations and combined them with examples from the sociology of work to undertake a study of call centre work.

Was the decision to do an undercover ethnography a difficult one to make? How did this shape your approach to the research? It sounds like your PhD experience was perhaps atypical in some respects.

The decision to go undercover was not a difficult decision at first, because there would be no other way to gain access to the workplace in this way. There is a long and rich tradition of undercover research into work in sociology (and more broadly) that has justified this approach, and contemporary analysis has suffered from this becoming less common. It is important to note that this is more the result of the institutional fear of litigation than a concern for research methodology. I had very supportive supervisors and a department, without whom it would have been very difficult to carry out a project like this. The experience of going undercover did shape the experience in particular ways, however I was very clear that I would not lie to people I met during the research. It may come as a surprise (although perhaps not) that no one in the call centre was particularly interested when I said I was doing a PhD, particularly as many people had other projects they would rather be doing. The only question I was asked was what discipline the PhD was in, and this was more than a month in. As we began to organise in the call centre – something that I was careful not to lead, but engaged in as part of the research intervention – I discussed the project with some of my co-workers. This was met with disbelief at first: why would someone choose to study call centres? I offered to send parts of my writing with other workers, but no one wanted to read about call centres after a shift. Instead, we discussed ideas and arguments that later went into the book, along with the writing up our collective experiences. The approach of workers’ inquiry has always been about more than just producing knowledge of workplaces or the experiences of workers. I positioned the project from the beginning as an intervention, understanding work, practises of resistance, and forms of organisation. The book is a thorough re-write of the PhD, trying to make it accessible outside of academia. I also hope that the PhD and the book shows the importance of this kind of method and can act as a call for more workers’ inquiries, both inside and outside of the university.

Do we know who works in call centres in demographic terms and what does this tell us about contemporary capitalism? It was striking how prominently the employer in your study seemed to accept the extremely high turn over rates for the job.

The focus of my research was call centres in London, which have different demographic characteristics to other call centres across the UK. In particular, the workforce was young and predominantly female. As with many low-paid and casualised jobs in London, many were current students, recent graduates, or had moved to London from either the UK or other countries. The main requirement for working in the call centre was a high level of spoken English, and while this was not necessarily with English as a first language, there were certain accents that were valorised as being particularly suited to sales. The high turnover is a problem across high sales call centres, again like with many low-paid and casualised jobs. What was particularly remarkable in this call centre was that the high turnover was not only accepted, but turned into a motivating incentive. Supervisors would let workers leave early once they had reached their sales targets. This was the most popular incentive, proving far more motivating than shopping vouchers or anything else. This created problems with the management in the call centre when
they discovered that only 79% of paid time was actually spent on the phones. This a clear indication of how many people feel about the stressful, low quality, and emotionally draining work, supervisors included. This widespread refusal in the workplace signals the need for a broader discussion, which is starting to begin, about the future of work.

---

**Was Sloterdijk an early originator of contemporary right populism? (2017-01-29 08:00)**

Reading the excellent *Selected Exaggerations*, a book of interviews with Peter Sloterdijk, I was struck by his remarks about taxation and the state in an interview from 2001. He bemoans the punitive taxation he claims exists in Germany, arguing that it reflects a broader domination of society by the state. German citizens are “punished for success” and the trust society is based on gradually finds itself eroded. On loc 1798-1813 he goes on to call for a ‘social movement of entrepreneurs’:

SLOTERDIJK: Precisely. There are countless areas of redistribution that could be organized much more intelligently and efficiently by alternative means. I am thinking of unemployment benefits, of the whole welfare state that should be organized more in terms of incentives, much more in terms of entrepreneurship and less in terms of the consumer state.

METHFESSEL/ RAMTHUN: Are you saying that entrepreneurial thinking is supposed to save the welfare state?

SLOTERDIJK: Yes, entrepreneurs will raise the banners of hope again. Without a movement of entrepreneurs, as there was once a workers’ movement, the economy can no longer explain itself adequately to society.

METHFESSEL/ RAMTHUN: And what will be written on the banners?

SLOTERDIJK: ‘Entrepreneurs of the world, unite’—what else? At the moment only entrepreneurs can convincingly represent the interests of the industries and services that produce the hardware, that is, the real value of productive industry, against the phantom superstructure of speculative finance economy. Only an entrepreneurs’ movement can act in the anti-capitalist way that is needed now. It is time for entrepreneurial anti-capitalism.

METHFESSEL/ RAMTHUN: The entrepreneur as alternative to the distorted picture of globalization, of the anonymous flow of money around the globe?

SLOTERDIJK: Entrepreneurs must show that an operative economy, not the dictatorship of the lottery bosses, is the foundation of the market economy. Entrepreneurs are the social democracy of tomorrow.

METHFESSEL/ RAMTHUN: Are you serious?

SLOTERDIJK: Of course. At the moment entrepreneurs may describe themselves in neoliberal terms, but
this is becoming increasingly false as the years go by, because in the end they can only justify themselves as producers of the net value that serves the other side of redistribution.

It’s a fascinating interview, filled with remarks I object to deeply. What struck me was the parallel to the themes (though not their articulation) of the contemporary populist right, both in the US and the UK. The awkward combination of populism and capital, [1]fulminating against the 47 % while framing it as a progressive revolt in the universal interests against a overweaning state captured by dependents. Genealogically speaking, it’s obvious that Sloterdijk was not a progenitor of the Anglo-American populist right. But philosophically speaking, it’s perhaps meaningful to suggest that he was. At least in so far as what he’s doing here can be classified as philosophy, though that’s perhaps a topic for another post.

1. [https://www.youtube.com/watch?v=M2gvY2wqI7M](https://www.youtube.com/watch?v=M2gvY2wqI7M)

Daniel Schut (2017-01-29 08:10:43)
I find myself touched by this post. Negatively, to be sure. Sloterdijk explicitly rejects ‘neoliberalism’, and gives a pretty reasoned explanation of ‘entrepreneurship’. Your knee-jerk reaction: "oh bah! He’s saying something the NeoMarxian Orthodoxy would disagree with - Therefore he’s a...wait for it.... gasp: POPULIST!" That’s not the level of academic reasoning you should expect for yourself - in fact, I’m not even sure whether it’s reasoning at all.

Mark Carrigan (2017-01-29 08:22:21)
Hi Daniel, engage with what I actually said and I’m happy to talk to you.

Steve Fuller’s Guide for Teaching Social Theory (2017-01-29 19:04)

January seems to bring out the social theorist in me. My last direct contribution to this topic was around this time last year, when a conversation with a graduate student at Warwick inspired me to propose [1]a guide to reading social theory. A couple of days ago I returned from Edinburgh, where in just under a day I had several conversations with staff and students about different aspects of social theory. It led me to think about the best way to teach the topic, since I learned theory quite differently from how it seems to be taught today.

When I first studied what we now call ‘social theory’ at Columbia in 1976, the phrase had no clear meaning, other than perhaps a synonym of ‘sociological theory’. A standard reference work of the period that I remember consulting was A History of Sociological Analysis, edited by Tom Bottomore and Robert Nisbet, one of my teachers at Columbia. We would now say that this was a book of social theory.

However, I associate the popularisation, if not coinage, of ‘social theory’ in its current usage with Anthony Giddens, who (I think) first dubbed Habermas a ‘social theorist’ because of the way he straddled philosophy and sociology, especially after The Theory of Communicative Action.

Of course, most of what is now called ‘social theory’ has this character too, but it also has another, less admirable feature: scholasticism. Habermas’ magnum opus is basically a replay of what Talcott Parsons did in The Structure of Social Action and which Giddens would do throughout the 1980-90s in his ‘structuration’ period. All
these works basically construct social theory by a ‘syncretistic’ reading of a few so-called classic texts.

Syncretism is a medieval approach to knowledge that involves presuming that there are some master thinkers who nevertheless contradict each other in ways that require some sort of textual harmonization. Thomas Aquinas was the great master of syncretism in the Middle Ages. Parsons’ syncretism provided sociology with its first proper disciplinary foundation, the basis for all subsequent alternative theoretical foundations, including those of Habermas and Giddens. The debates associated with ‘structure-agency’ and ‘micro-macro’ are artefacts of this approach that persist to this day.

An interesting feature of sociology as a discipline is the extent to which the empirical side of the discipline has simply seceded from this scholastic project. Indeed, the various breaks with Parsons that one already sees in the 1960s – be it Robert Merton’s call for testable ‘middle range’ theories, Alvin Gouldner’s refashioning of Marx as a ‘critical sociologist’ or Harold Garfinkel’s radically bottom-up ethnomethodology – were basically against the very idea of sociology needing to have theoretical foundations in the Parsonian sense. For all these thinkers, ‘sociology’ was more about adopting a certain attitude to the social world than building an edifice of knowledge from a secure set of master concepts.

Nevertheless, even social theorists who would never think of themselves as ‘Parsonian’ still teach the subject in the scholastic mould. They organize the course around a set of ‘master theorists’, each of whom is presented as possessing a coherent world-view, the mastery of which will partially unlock the secrets of the social universe. In that case, The Grand Prize for the student is to mix and match these world-views in a way that opens up new insights. And indeed, sometimes ‘new insights’ are generated. Unfortunately they probably could have been generated more straightforwardly, had the student greater knowledge of empirical social reality and not had to circumnavigate around the twists and turns of the master theorists’ reading habits.

Luckily I wasn’t taught social theory this way, which simply mystifies the so-called master theorists, turning them into celebrities, the secular equivalent of saints. Instead the emphasis was placed on looking at how a range of thinkers with overlapping lifetimes responded to events that would have been common to their existential horizon. This was the original context in which ‘modernity’ was presented to me as a focal point for sociology.

Thus, people like Marx, Durkheim and Weber were 1-2 generations removed from the Industrial Revolution’s take-off and were living in the midst of rapid urbanisation, legalisation, capitalisation, etc. There were also particular events, associated with, say, 1789, 1848, etc. Theorists responded differently to these things, and their distinctive concepts and theories were presented as grounded in their interpretation of this history. A brilliant book from my university days in this vein was Lewis Coser’s Masters of Sociological Thought, which treated each of the ‘masters’ as a case study in how one might abstract from personal biography to true sociological insight – a potential model for the student to adopt vis-à-vis his or her own position in history.

What the student of theory learns is how to articulate different attitudes to the world one inhabits. Unsurprisingly, my former teacher Robert Nisbet – nowadays remembered as a founder of modern neo-conservatism – was perhaps the first to stress the cognitive significance of style in sociological writing: Is the author approving, disapproving, ironic or indifferent to what s/he is writing about? To become a good social theorist is thus to adopt a style appropriate to the manner in which one encounters the social world. Knowledge of the literary humanities becomes an essential component of the sociological imagination.

This pedagogical approach of social theory proved to be short-lived. It was partly spurred by the inclusion of Georg Simmel in the sociological canon during the 1970s. Simmel first presented much of his notable work as popular talks, which in writing retained much of his arch presentational style. Perhaps the most interesting work in this vein was Richard Harvey Brown’s A Poetic for Sociology, which was originally a Ph.D. written under Herbert Marcuse. In more recent years the German sociologist Wolf Lepenies has probably carried the torch for this approach most

In practice, then, social theory should be taught first by setting down some common historical touchstones, which students would try to grasp comprehensively but in some relatively theory-neutral way – typically by reading historians’ accounts of the relevant events and movements. Then, the student would look at various theorists who developed their thinking in relation to these touchstones. When I was a student, it was common to focus on the French or Industrial Revolution, since virtually every classical sociologist had something to say about them. Nowadays we might focus on the end of the Cold War, the decline of social democracy, the rise of neo-liberalism, and so forth. Students should compare what theorists say about them: which features do they take as salient for their thinking, which do they downplay if not ignore, etc.

Again, all of this would be in the spirit of getting the student to cultivate their own original theoretical imagination rather than simply acquire a facility in mixing and matching texts, which in the future we might happily assign to an artificial intelligence programme.

**Postscript (2 July 2017):** The death of Peter Berger reminds me that he authored the first sociology textbook I read, in high school. I still recommend [2]*Sociology: A Biographical Approach*.

Karl (2017-02-09 22:27:21)
Regards for helping out, excellent info. I really like your writing style, excellent info, regards for putting up : D

Ed (2017-03-23 19:56:05)
Does grounded theory present an example of an empirical approach that does retain associations with the scholastic project?
The methodological scrutiny applied to grounded theory (an edifice of concepts) seems to have something of the tone of social theorizing. Its foundations were also provided by master thinkers who later diverged...so synthesis can now be pursued by others.

Sylvester (2018-05-15 05:15:48)
Quality content is the secret to attract the viewers to pay a quick visit the website, that’s what this web page is providing.

**Academic exceptionalism and the black-boxing of academic labour (2017-01-30 08:00)**

This introduction to *Conflict in the Academy*, by Marcus Morgan and Patrick Baert, nicely captures something I’ve been preoccupied by recently. From loc 63:

> we would like to suggest that tired clichés of ‘ivory towers’ and ‘dreaming spires’, or even more self-complementary myths of universities as platonic institutions directed towards disinterested enlightenment lead to an unhelpful black-boxing of these zones of social life from attentive sociological enquiry,

4840
usually on the odd assumption that the 'real world' is somehow always going on elsewhere. This book intends to contribute toward a growing literature that refuses to content itself with such popular accounts of academia as a withdrawn and therefore somehow asocial zone, and which instead takes the reflexive academic analysis of the social processes of academic life seriously.

What comparable myths are there? I’m interested in how these notions of academic exceptionalism inculcate a blindness about the character of academic labour.

It’s an argument that needs to be made carefully, but I suspect entrenched stereotypes prop up this exceptionalism. From loc 933:

a fusty character, whose eccentricities depend upon the removal from practical necessity that his (the classical stereotype remains almost invariably the unmarried male) cloistered archaic existence affords him, and who treats any prospect of ‘progressive development’ in the running of university or college affairs with the utmost suspicion. Again, whether or not it bears any resemblance to reality, the popular cynical image of the Oxbridge don (much of which seems to have arisen from a period prior to the reforms of the 19th and early 20th centuries, Roach, 1959: 235–6) is of an individual comfortable in his sinecure, perhaps more interested in the quality of the college claret than in the quality of their own research, let alone the quality of an undergraduate’s education (e.g. Rose & Ziman, 1964).

The MOOC as a trojan horse (2017-02-01 08:00)

I’ve long had an ambivalent relationship to MOOCs. In principle, I don’t see anything wrong with the idea of distance learning of this sort and they are something that I’ve personally enjoyed in the past. This is far from a ringing endorsement, in fact MOOCs leave me lukewarm in many respects, but I think it’s important to be clear about what exactly we’re opposed to when we oppose the MOOC.

The hype surrounding them is a good place to start. The absurd overstatement of their implications, as well
as the wilful disregard for history which critics like Audrey Watters have ceaselessly pulled apart. These ‘groundbreaking innovations’ can only be constructed as *groundbreaking* and *innovative* by systematically obscuring a longer and messier history of educational technology which there is value in our recovering. But as Aaron Bady [1] points out, what’s offensive about the hype is the way it gives voice to speculative interests seeking to ‘disrupt’ higher education:

In the last year, MOOCs have gotten a tremendous amount of publicity. Last November, the New York Times decided that 2012 was “the Year of the MOOC,” and columnists like David Brooks and Thomas Friedman have proclaimed ad nauseam that the MOOC “revolution” is a “tsunami” that will soon transform higher education. As a Time cover article on MOOCs put it—in a rhetorical flourish that has become a truly dead cliche—“College is Dead. Long Live College!”

Where is the hype coming from? On the one hand, higher education is ripe for “disruption”—to use Clayton Christensen’s theory of “disruptive innovation”—because there is a real, systemic crisis in higher education, one that offers no apparent or immanent solution. It’s hard to imagine how the status quo can survive if you extend current trends forward into the future: how does higher education as we know it continue if tuition fees and student debt continue to skyrocket while state funding continues to plunge? At what point does the system simply break down? Something has to give.

At the same time, the speed at which an obscure form of non-credit-based online pedagogy has gone so massively mainstream demonstrates the level of investment that a variety of powerful people and institutions have made in it. The MOOC revolution, if it comes, will not be the result of a groundswell of dissatisfaction felicitously finding a technology that naturally solves problems, nor some version of the market’s invisible hand. It’s a tsunami powered by the interested speculation of interested parties in a particular industry. MOOCs are, and will be, big business, and the way that their makers see profitability at the end of the tunnel is what gives them their particular shape.

The ideology of innovation obscures the interests vested in what is deemed to be innovative. Not only is it dishonest, shutting down debate through the breathless invocation of technological inevitability, it also crowds out earlier and worthier experiments in digitally mediated distance learning. These communal and collaborative projects were focused on empowering networks rather than facilitating individuals. As Bady goes on to compare:

The MOOCs that emerged in 2012 look very different, starting with their central narratives of “disruption” and “un-bundling.” Instead of building networks, the neoliberal MOOC is driven by a desire to liberate and empower the individual, breaking apart actually-existing academic communities and refocusing on the individual’s acquisition of knowledge.

These connective technologies have been pushed out by what Audrey Watters describes as a ‘content-delivery model’. On loc 2256 of her *The Monsters of Educational Technology*, she describes what it is like to be on the receiving end of such a model, having content delivered to you as a distance learner:

Receiving this box of materials in the mail was a literalization of the idea that education involves “content delivery.” That is, the courseware for Intro to Statistics was quite literally delivered to my doorstep. I’d
insert the videotapes into the VCR, and the content would be delivered to my living room and purportedly into my brain. “Content delivery” is not always quite so literally enacted, of course, but it’s still the paradigm education largely operates within. This is not a new paradigm, of course. But for me this was the moment —looking with frustration at this this box of videotapes —in which I realized that that’s what education privileges. Whether it’s in a textbook or in a video-taped lecture, it’s long been the content that matters most in school. The content is central. It’s what you go to school to be exposed to. Content. The student must study it, comprehend it, and demonstrate that in turn for the teacher. That is what we expect an education to do, to be: the acquisition of content that becomes transmogrified into knowledge. (The focus is certain content, of course and thus certain knowledge —that which has been decreed significant by a host of institutional, cultural, historical, political, intellectual forces.)

The MOOC dresses up the most uninspiring and uninspired aspects of actually existing educational initiatives in the cloak of technological progress. As Bady puts it, these start-ups “aim to do exactly the same thing that traditional courses have always done—transfer course content from expert to student—only to do so massively more cheaply and on a much larger scale”. These are technologies of modernisation rather than progress, intended to lock in existing arrangements in a way that disempowers those who might impede their smooth operation. They are technologies of scale and control, masquerading as tools of liberation. They represent, as Audrey Watters puts it on loc 3443, a trojan horse which we need to resist:

Education technology is the Trojan Horse poised to dismantle public education, to outsource and unbundle and disrupt and destroy. Those who tell you that education technology promises personalization don’t actually care about student autonomy or agency. They want surveillance and standardization and control. You have been warned. Education technology is full of monsters. We’ve given birth to some of them. We’ve given birth to the “everyone should learn to code” narrative. We’ve given birth to the “everyone should be online” story too. We’ve demanded that everyone have their own device. Education technology requires our love and our care so as to not become even more monstrous, so that it can become marvelous instead. It demands we resist and we fight and we build and tell a different story. Folks like Seymour Papert started a powerful storytelling for us. We just need to pick up that tale.

But doing so effectively necessitates unpacking the technology, the interests expressed through it and the context within which these are being pursued. We can still reclaim educational technology, but doing so necessitates that we don’t condemn technology by the uses to which it is being put.

Online Harassment (2017-02-02 08:00)

In the last few months, I’ve been thinking a lot about online harassment. Even writing that sentence, I come face-to-face with my own privilege, as ‘online harassment’ is something I’m able to elect to think about rather than
an unavoidable feature of my use of the internet. But the evidence is clear that online harassment is ubiquitous. A 2014 Pew Study found that [1]73 % of adult internet users have seen someone be harassed in some way online and 40 % have personally experienced it:

- 60 % of internet users said they had witnessed someone being called offensive names
- 53 % had seen efforts to purposefully embarrass someone
- 25 % had seen someone being physically threatened
- 24 % witnessed someone being harassed for a sustained period of time
- 19 % said they witnessed someone being sexually harassed
- 18 % said they had seen someone be stalked

The witnessing figure from this US study interests me because it suggests that most internet users must be aware of the reality of online harassment, even if they seek to explain it away to whatever extent. The study makes a distinction between two categories of online harassment:

In Pew Research Center’s first survey devoted to the subject, two distinct but overlapping categories of online harassment occur to internet users. [3]The first set of experiences is somewhat less severe: it includes name-calling and embarrassment. It is a layer of annoyance so common that those who see or experience it say they often ignore it.

The [4]second category of harassment targets a smaller segment of the online public, but involves more severe experiences such as being the target of physical threats, harassment over a sustained period of time, stalking, and sexual harassment.

The Pew study found the distribution of these experiences to be structured by gender and age. Young adults (18-29) as a whole are more likely to experience either category of harassment but young women (18-24) are overwhelmingly the targets of the more extreme behaviours:
But the gendering of these experiences, shouldn’t lead us to dismiss the ‘lesser’ category of harassment. This too can be gendered, in its cumulative and ubiquitous character, as Audrey Watters conveys on loc 1771 of her *Monsters of Educational Technology*:

I speak from experience. On Twitter, I have over 26,000 followers, most of whom follow me, I’d wager, because from time to time I say smart things about education technology. Yet regularly, men –strangers, typically, but not always –jump into my "@-mentions" to explain education technology to me. To explain open source licenses or open data or open education or MOOCs to me. Men explain learning management systems to me. Men explain the history of education technology to me. Men explain privacy and education data to me. Men explain venture capital funding of education startups to me. Men explain online harassment to me. Men explain blogging to me. Men explain, they explain, they explain. It’s exhausting. It’s insidious. It doesn’t quite elevate to the level of harassment, to be sure; but these microaggressions often mean that when harassment or threats do occur, women like me are already worn down. Yet this is all part of my experiences online. My experiences. Women's experiences. My friends' experiences.

There’s a complexity to this behaviour which the Pew study doesn’t capture. It recognises that these behaviours are much more common on such platforms than others, but it doesn’t attempt to look at these divergences demographically in terms of use of platforms. It’s important to recognise that certain online environments are what we might think of as ‘harrasogenic’ in a way that’s susceptible to explanation, including though not limited to deliberate choices by the companies in question to calibrate the architecture of their platforms to maximise attention, engagement, return etc in line with commercial incentives:
66% of internet users who have experienced online harassment said their most recent incident occurred on a social networking site or app
22% mentioned the comments section of a website
16% said online gaming
16% said in a personal email account
10% mentioned a discussion site such as reddit
6% said on an online dating website or app[6]http://www.pewinternet.org/2014/10/22/online-harassment/

The mechanisms available within a platform to respond to harassment are a clear function of those choices, as well as shaping the character of the platform through parameterization of harassment and responses to it. The Pew study found that low-level harassment tended to lead to single-step responses and high-level harassment tended to lead to multi-step responses. Surprisingly, 75% of those who responded thought their decision made the situation better, though it raises an obvious question of the distribution of this experience between the two categories.

47% of those who responded to their most recent incident with online harassment confronted the person online
44% unfriended or blocked the person responsible
22% reported the person responsible to the website or online service
18% discussed the problem online to draw support for themselves
13% changed their username or deleted their profile
10% withdrew from an online forum
8% stopped attending certain offline events or places
5% reported the problem to law enforcement http://www.pewinternet.org/2014/10/22/online-harassment/

When seen against this background, the drive within universities to incite academics to engage online can seem rather problematic. As Tressie McMillan Cottom[7] puts it “the risks and rewards of presenting oneself to others over the Web using tools typically associated with celebrity promotion” (Barone 2009) are not the same for all academics in the neo-liberal “public” square of private media.” The increasing levels of political polarisation, as well as the specific problem of organised conservative and alt-right groups seeking to highlight what they deem to be problematic academic speech online, reveal how this issue is intensifying. Given, as Tressie observes, universities use “engaged academics as an empirical measure of a university’s reputational currency” online harassment must be seen as a central issue of academic freedom and academic labour.
We need to understand this issue in terms of broader structures of oppression, while also recognising the specific characteristics of digital environments that set the parameters of its online manifestations. From loc 1677 of The Monsters of Educational Technology by Audrey Watters:

Harassment – of women, people of color, and other marginalized groups – is pervasive online. It's a reflection of offline harassment, to be sure. But there are mechanics of the Internet –its architecture, affordances, infrastructure, its culture –that can alter, even exacerbate what that harassment looks like and how it is experienced.

From loc 1843-1865 she takes apart some of the facile responses this issue can receive:

The answer can’t simply be to tell women to not use their real name online. If part of the argument for participating in the open Web is that students and educators are building a digital portfolio, are building a professional network, are contributing to scholarship, then we have to really think about whether or not promoting pseudonyms is a sufficient or an equitable solution. The answer can’t be simply be “don’t blog on the open Web.” Or “keep everything inside the ‘safety’ of the walled garden, the learning management system.” If nothing else, this presumes that what happens inside siloed, online spaces is necessarily “safe.” I’ve seen plenty of horrible behavior on closed forums, for example, from professors and students alike. I’ve seen heavy-handed moderation, where marginalized voices find their input is deleted. I’ve seen zero moderation, where marginalized voices are mobbed. The answer can’t simply be “just don’t read the comments.” I would say that it might be worth rethinking “comments” on student blogs altogether –or at least questioning the expectation that students host them, moderate them, respond to them. See, if we give students the opportunity to “own their own domain,” to have their own websites, their own space on the Web, we really shouldn’t require them to let anyone that can create a user account into that space. It’s perfectly acceptable to say to someone who wants to comment on a blog post, “Respond on your own site. Link to me. But I am under no obligation to host your thoughts in my domain.”

‘Disruption’ as the last refuge of the Third Way (2017-02-03 08:00)

A couple of months ago, The New Statesman carried an interview with Tony Blair for the first time in a long time. Leaving aside how haunted the man looked in the portrait accompanying it, what stood out to me about it was how readily he had incorporated techno-speak into the language of the third way. Here are some examples:

One advantage of today’s social media is that you can build networks. Movements can begin at scale and build speed quickly. You’re not going to relate the answers to the challenges that we face by a Twitter exchange, so what I’m interested in doing is asking: what are the types of ideas that we should be taking forward? How do we provide a service to people who are in the front line of politics, so that we can provide some thinking and some ideas? The thing that’s really tragic about politics today is that the best ideas about politics aren’t in politics. I find the ideas are much more interesting in the technology sector, much more interesting ideas about how you change the world.-

I know we talk about this as a new thing, but many of us grew up with Enoch Powell. I mean, you remember the "rivers of blood" [speech], and black people were welcomed into the country and weren’t expelled, and that Britain was going to fall apart as a nation. I mean, these people are always on the wrong side of history, they always are, because that’s not the way the world is today. The world’s going to integrate more. It may integrate fast or slow, but it will integrate. Because technology, travel, migration, trade are bringing the world closer together. If you take a step back and you look at the broad sweep of history, this is actually a great time for humanity in many ways. You’ve had more people out of poverty than ever before in human history.-

I think what the Leave campaign created was a really interesting machine. You should learn from that. One of the things you have got to be able to do in modern politics is to build that platform of connections and networks. On the other hand, never ever forget that it starts with the right policies.

Open v closed is a really important debate today, because in a curious way the populism of the left and the populism of the right – at a certain point they meet each other. They tend to be isolationist. OK, the left is more anti-business, the right is more anti-immigrant, but they tend to be protectionist and they have an attitude to the process of globalisation that says this is a policy that is given by government and we can stop it and should stop it. Whereas my view about globalisation is that it’s a force essentially driven by people, by technological change, by the way the world has opened up. You’re not going to reverse that. The question is: how do we make that just and fair? That is the big question of our times. The centre left does not provide an answer to that, and we can and should.
This reflects something I've been noticing for some time: the similarity of 90s globalisation discourse to contemporary technology discourse. In fact, in many cases you can replace the word 'globalisation', from these 90s accounts, with 'technology' and there's no semantic loss whatsoever. This is why we need to be deeply sceptical about, for instance, the automation debate. There's clearly a real change underway, but it's framed in a manner which sees the unfolding of technology as an inexorable process, one which offers the possibility of adaptation or displacement. What Morozov calls \[2\] solutionism ("The belief that all difficulties have benign solutions, often of a technocratic nature") can be seen as a particular kind of cultural response to this view of technology.

Amongst political actors, we should understand this rhetoric as emerging against a long-term trend towards depoliticisation. It discursively unites the 'centre ground' of career politicians, members of what George Osborne calls 'the guild', concerned with winning power in order to manage the unfolding of technological change. Amongst economic actors, we should understand this rhetoric as a way of legitimising one's own work, deployed to win venture capital and to narrate the increasingly hegemonic character of the technology sector within capitalism as a whole. In the interaction between politics and economics, we should see this as a class project, as Thomas Frank argues in his Listen Liberal. From loc 2918-2934:

By that time, the place once filled by finance in the Democratic imagination had begun giving way to Silicon Valley, a different "creative-class" industry with billions to give in campaign contributions. Changes in the administration's personnel paralleled the money story: at the beginning of the Obama years, the government's revolving doors had all connected to Wall Street; within a few years, the people spinning them were either coming from or heading toward the West Coast. In 2014, David Plouffe, the architect of Obama's inspiring first presidential campaign, began to work his political magic for Uber. Jay Carney, the president's former press secretary, hired on at Amazon the following year. Larry Summers, for his part, became an adviser for an outfit called OpenGov. Back in Washington, meanwhile, the president established a special federal unit that used Silicon Valley techniques and personnel to revolutionize the government's web presence; starstruck tech journalists call it "Obama's stealth startup."

My argument is that we need to see the rhetoric of 'disruption' and 'innovation' in systemic terms. We need to historicise these cultural forms and \[3\] link their claims to the core questions of sociology inquiry. We need to update our theories of social change to better take account of socio-technical 'innovation'. For instance, if we accept the construct of 'late modernity', are we seeing a radicalisation of it or are we in the process of transcending it? Should we dispense with 'modernity' talk altogether, however qualified, instead moving to talk of 'platform capitalism' or 'digital capitalism'? These are key questions for social theory and ones which I'm increasingly gripped by.

A useful way to approach these is to scale down from the system level and look at particular spheres of life in which innovation talk is at its most pronounced. I'm currently reading a \[4\] book of keynotes by the education writer \[5\] Audrey Watters which reflects on these issues in terms of educational technology. One of her foremost concerns is the tendency of educational technology start-ups to exhibit a studied ignorance of the history of educational technology. Each putative innovation is presented as ungrounded, emerging from outside education to disrupt a fundamentally broken system, with only the recalcitrance of educators standing in its way:

And okay, in fairness, these folks are not historians. They're computer scientists, artificial intelligence experts, software engineers. They're entrepreneurs. But their lack of knowledge about the history of education and the history of education technology matters. It matters because it supports a prevailing narrative about innovation – where innovation comes from (according to this narrative, it comes from private industry, and not from public institutions; from Silicon Valley, that is, not from elsewhere in the
world) and when it comes (there’s this fiercely myopic fixation on the future). The lack of knowledge about history matters too because it reflects and even enables a powerful strain in American ideology and in the ideology of the technology industry: that the past is irrelevant, that the past is a monolithic block of brokenness—unchanged and unchanging until it’s disrupted by technological innovation, or by the promise of technological innovation, by the future itself. (loc 326)

However, as she argues, this isn’t simply a forgetting of the history of education or the history of educational technology. Rather “It’s a rewriting of history, whether you see it as activist or accidental” (loc 351) and one which serves private interests. When history is reluctantly allowed on stage, it is inevitably couched in narrowly technological terms. Reflecting on the failure of the largely forgotten AllLearn initiative, opened in 2001 and closed in 2006, the economist Richard Levin, ascribed the problem to a lack of bandwidth:

It was too early. Bandwidth wasn’t adequate to support the video. But we gained a lot of experience of how to create courses, and then we used it starting in 2007 to create very high quality videos, now supported by adequate bandwidth in many parts of the world, with the Open Yale courses. We’ve released over 40 of them, and they gained a wide audience. (loc 471)

The reality is that broadband penetration had only increased by 8% between the end of AllLearn and the time of this interview. It was also the case that AllLearn sought to distribute materials via CD, as well as allowing users to switch off streaming video content that might be overly-testing for their internet connections. Given he was now speaking as Coursera’s CEO, presiding over a comparable initiative which had failed under his stewardship as Chair, we could perhaps see this as simply self-serving. Not unlike the erasure from history of past educational technology initiatives by start-up founders eagerly touting the ‘next big thing’. But I think Watters is right that this reflects something deeper about contemporary ideologies of ‘innovation’ and ‘disruption’.

Could we build up a systemic account of ‘disruption’ and ‘innovation’ by looking at the particular discursive strategies used across a number of domains, as well as the material implications of their use. What would these other domains be?

A Bleak Social Theory For Bleak Times (2017-02-04 08:00)

Given the number of times I’ve argued with him on Twitter, it was a surprise to discover quite how much I like Steve Hall’s work. There’s an unapologetic bleakness to it which I find appealing, not as a matter of aesthetics but rather because it serves an important conceptual function. As he recounts [1]here,
‘The growth and concentration of a shared sense of suffering and dissatisfaction has throughout history driven progressive politics, and it can do so again. However, these same sentiments have often been perverted and knocked off course to descend into regressive nationalism. There are already signs throughout Europe of strange, postmodern nationalisms developing as post-political populations experience a profound sense of social anxiety and loss.’ (Winlow and Hall, 2013: 110)

This was written in 2013. It’s fair to say the argument in Rethinking Social Exclusion has proved rather prescient. He and his co-authors developed this approach in a number of books, including Riots and Political Protest and Rise of the Right. The latter books are every bit as bleak, presenting the results of an ethnography which illustrate the arguments they’d earlier made on a more abstract level. The bleakness, I think, helps unsettle the conceptual comforts which afflict contemporary sociology. I largely agree with his account of how recent events have wrong-footed the discipline:

Over the years social science has made a lot of noise about its ability to shatter the myths that constitute popular common sense. It has been a little quieter, however, about shattering the myths that have come to constitute its own common sense. Across Europe and the USA social scientists looked on horrified as the Brexit drama unfolded, Marvel-comic villain Donald Trump – resplendent in his very own urban tower with its gold-plated elevator and other tasteful soupsçons of interior design – was elected to the White House, and far-right parties increased their popular support in Europe. Social media was full of perplexed liberals firing off missives to scold the Brexit voters for their senseless decision. It was like watching irate 1950s schoolmasters using morning assembly to tell off the kids who had had a food-fight in the dinner hall the day before. Over the past thirty years social scientists have been highlighting creativity, resilience, resistance, progress and so on. Looks like something went badly wrong.

I don’t agree with all aspects of their diagnosis, but this disagreement is as much a matter of emphasis as fundamental difference. They’re doing social theory with a hammer. I don’t agree with all their targets or all their arguments, but I agree with the intention. Bleakness can be a tool and a resource. It can be what motivates us to question what is settled, reconsider the ends which our activity serves and to look back out towards a world beyond the fog of words and concepts which sociology spews forth on a daily basis.

CfP: Manchester Social Movements Conference (2017-02-05 08:00)

SOCIAL MOVEMENTS CONFERENCE - FINAL CALL FOR PAPERS

Dates: Conference 10th-12 April Abstracts by Monday 20th March Papers by Friday 31st March From 1995 to 2016, Manchester Metropolitan University hosted a series of very successful annual international conferences on ‘ALTERNATIVE FUTURES and POPULAR PROTEST’. We’re very happy to announce that the Twenty Second AF &PP
Conference will be held between Monday 10th and Wednesday 12th April 2017. The Conference rubric will remain as in previous years. The aim is to explore the dynamics of popular movements, along with the ideas which animate their activists and supporters and which contribute to shaping their fate. Reflecting the inherent cross-disciplinary nature of the issues, previous participants (from over 60 countries) have come from such specialisms as sociology, politics, cultural studies, social psychology, economics, history and geography. The Manchester conferences have been notable for discovering a fruitful and friendly meeting ground between activism and academia. **PRELIMINARY CALL FOR PAPERS**

We invite offers of papers relevant to the conference themes. Papers should address such matters as: * contemporary and historical social movements and popular protests * social movement theory * utopias and experiments * ideologies of collective action * etc. **To offer a paper**, please contact either of the conference convenors with a brief abstract:

**EITHER** Colin Barker, email: [1]c.barker@mmu.ac.uk OR Mike Tyldesley, Politics Section, HPP, Manchester Metropolitan University Geoffrey Manton Building, Rosamond Street West Manchester M15 6LL, England Tel: M. Tyldesley 0161 247 3460 email: [2]m.tyldesley@mmu.ac.uk Fax: 0161 247 6769 [3](+44 161 247 6769) *(Wherever possible, please use email, especially as Colin Barker is a retired gent. Surface mail and faxes should only be addressed to Mike Tyldesley)*

**CONFERENCE PAPERS**

One way we organise this particular conference is that we ask those giving papers to supply them in advance, for inclusion in a Dropbox folder of the complete papers which will be available to all delegates from the conference opening.

**Preferred method:** send the paper to Colin Barker as an email attachment in MS Word or .pdf format. Any separate illustrations etc. should be sent separately, in .jpg format. * if this is impossible, post a copy of the text to Mike Tyldesley on a CD disk in MS Word or .pdf format * Final date for receipt of abstracts: Monday 20th March 2017 * Final date for receipt of actual papers: Friday 31st March 2017 * Final date for receipt of abstracts: Monday 20th March 2017 * Final date for receipt of actual papers: Friday 31st March 2017 These are final dates. The earlier we receive abstracts, and actual papers, the better.

**CONFERENCE ARRANGEMENTS AND COSTS**

The conference will run from lunch-time Monday 10th April until after lunch on Wednesday 12th April 2017. The conference cost will be inclusive of three lunches, teas/coffees. The full cost is £145.00, with a cost of £85.00 for students and the unwaged. Please register online at [4]https://www.kxregistration.mmu.ac.uk/alternativefutures2017 Hotels, hostels and dining out We can supply information about relatively cheap local hotels and hostels. Let us know if you would like this information. We cannot do hotel or hostel bookings for you. Conference participants will be invited to dine together at two local (and not too expensive) restaurants on the two conference evenings. Payment for dinners should not be made in advance, but directly to the restaurants on the night. Please feel free to circulate this to anyone who might be interested.

1. mailto:c.barker@mmu.ac.uk
2. mailto:m.tyldesley@mmu.ac.uk

The ontology of data, the ideology of data (2017-02-06 08:00)

In a post yesterday, I expressed my discomfort with how Nick Srnicek invokes the notion of data as a raw material in his Platform Capitalism. In a footnote on loc 1102-1121, he offers a Marxist justification for this use:

I draw here upon Marx’s definition of raw material: ‘The land (and this, economically speaking, includes water) in the virgin state in which it supplies man with necessaries or the means of subsistence ready to hand, exists independently of him, and is the universal subject of human labour. All those things which labour merely separates from immediate connexion with their environment, are subjects of labour spontaneously provided by Nature. Such are fish which we catch and take from their element, water,
timber which we fell in the virgin forest, and ores which we extract from their veins. If, on the other hand, the subject of labour has, so to say, been filtered through previous labour, we call it raw material; such is ore already extracted and ready for washing’ (Marx, 1990: 284–5, emphasis added).

The distinction between natural and processed helps address the charge that data-as-raw-material naturalises data but it doesn’t avoid it all together. It recognises that usable data is always processed and cleaned prior to use, ‘filtered through previous labour’ both directly (wrangling etc) and indirectly (socio-technical systems of generation, capture, storage and analysis).

But does it obscure the character of its applications? The original sources of this ‘raw material’ are intensely social, unlike that extracted from nature, arising from the digitalisation of action and transaction within a market economy. The applications of this ‘raw material’ are intensely variable, with data sometimes being a direct source of value that can be realised through a linear activity, other times being an informational good that can be used to coordinate and calibrate and perhaps more often being a source of confusion and speculation.

It would take constructionism too far to deny the ontology of data. Indeed, I think a concern for the ontology of data is a crucial vector through which we can understand the ideology of data. But we nonetheless need to carefully unpick the way ‘data’ is represented by social actors, the interests served by this and the discursive architecture through which these interests are advanced in different organisational settings.

There’s a fascinating example of this ideology which Srnicek quotes on loc 1296:

If collecting and analysing this raw material is the primary revenue source for these companies and gives them competitive advantages, there is an imperative to collect more and more. As one report notes, echoing colonialist ventures: ‘From a data-production perspective, activities are like lands waiting to be discovered. Whoever gets there first and holds them gets their resources –in this case, their data riches.’ For many of these platforms, the quality of the data is of less interest than their quantity and diversity. Every action performed by a user, no matter how minute, is useful for reconfiguring algorithms and optimising processes. Such is the importance of data that many companies could make all of their software open-source and still maintain their dominant position due to their data. Unsurprisingly, then, these companies have been prolific purchasers and developers of assets that enable them to expand their capacity for gaining information. Mergers relating to big data, for instance, have doubled between 2008 and 2013.

How seriously should we take this? My instinct is to say ‘not very’. The notion that all data is of potential value is licensing massive investment and expansion, entrenching the position of precisely those who are speaking most authoritatively in relation to this transition. To be sceptical of a gold rush doesn’t mean you’re denying the existence of gold, it just means you’re sceptical about the exuberance surrounding the search and how it is being deployed by some to benefit their own self-interest. The distinction between the ontology of data and the ideology of data matters.
Public sociology and the role of the researcher: engagement, communication and academic activism (2017-02-07 08:00)

29 March 2017
De Montfort University, Leicester - [1]FULL DETAILS & PROGRAMME

What is the role of the researcher outside the academy? This event invites Postgraduate and Early Career Researchers to innovate and critically reflect on three related areas of public sociology: academic activism, public engagement, and participation and co-production. It encourages researchers to articulate and address diverse challenges, such as neutrality, networking, and whether activism can be considered a form of public engagement.

This event includes a keynote lecture from distinguished speaker Dr Mark Carrigan, Digital Fellow, The Sociological Review, presentations by invited speakers, a film created using participatory methods, a participatory session, and the chance to network and discuss work with fellow researchers. The aim is to provide an environment in which participants have the space to be questioning, to have a lively exchange of ideas, and to be inspired to explore the potential of these ideas in their own research.

Call for Abstracts and Posters

We would like to invite Postgraduates to take part in a five-minute PechaKucha presentation and/or a poster presentation: the call for abstracts is now open. Given the brevity of the presentations, abstract submissions should be no longer than 200 words. Abstracts for presentations are due on 24 February 2017 and poster confirmation is needed by 1 March 2017. There are small prizes for the best poster and the best presentation.

Oral presentations and posters may cover any aspect of Public Sociology, including, but not limited to:

- dissemination of knowledge beyond academia;
- participatory research methods and challenges;
- positionality of the researcher and relationships of power;
- approaches and practice in the co-production of knowledge;
- academic activism.

Competitions

4854
Participants are encouraged to submit a poster for a poster competition, which will be judged by the conference organisers. All posters will be accepted. Please contact the organiser for details.

There will also be a small prize for the best PechaKucha/Standup presentation, selected by a ballot of the conference participants.

Getting to De Montfort University

The venue is the Queen’s Building room 0.15, on the ground floor (LE2 7DR). It is building 29 on the campus map, and is situated in the centre of campus, next to the Kimberlin Library on Mill Lane, and opposite the Food Village.

- Directions to Leicester and to De Montfort University
- Information about the accessibility of the building

For further information, please contact Sasha Loyal P11238742@my365.dmu.ac.uk

Out trolling the trolls (2017-02-08 08:00)

I've just finished reading the excellent This Is Why We Can't Have Nice Things by Whitney Phillips. It offers fascinating insights into the evolution of 'trolling' as a practice, leading from its original form of sub-cultural self-identification to the diffusion of the label across the entire spectrum of online activities deemed to be anti-social. Her overarching thesis is that trolling is framed as an aberration relative to the mainstream culture, when in fact it represents the logic of that culture taken to its extreme. Trolling only makes sense against a background that facilitates it, such that trolls should be read as an indictment of contemporary culture rather than a threat to it. This diagnosis is most acute when it comes to broadcast media, with trolls expertly hacking the media for their own amusement in a way that takes advantage of the media's propensity for those very things (misleading information, lack of understanding, morbid preoccupations and a deep need for attention) which trolls are seen as embodiments of.

Her operationalisation of 'troll' as a self-identity is an important part of the book. The problem I have with the contemporary use of troll is that it subsumes a wide range of behaviours into a singular pathologised description. To point this out is not to defend any of these behaviours, only to remind that we should not assume people do similar,
or even the same, things for the same reasons. The diversity of trolling behaviours gets obliterated by the seemingly straight-forward designation of ‘troll’, something which I suspect many people now think they unproblematically recognise when they see it. But underlying ‘trolling’ we might find the urge to incite and manipulate for amusement (i.e. ‘troll’ in the self-identifying sense), online activists who see themselves as fighting a culture war through their keyboards, outpouring of hatred reflecting a generalised contempt for other human beings, the desperate externalisations of someone unable to cope or any number of other things. We need to recognise this variety at an ontological level while nonetheless remaining attentive to the epistemological and methodological problem of how, if at all, we are able to read back ‘offline’ motivations from ‘online’ behaviour.

Towards the end of the book, Phillips talks about her experience of out-trolling trolls. She recognises that this runs contrary to familiar advice “don’t feed the trolls”, something which I’ve always found to work just as well as face-to-face as on the internet:

This strategy—of actively trolling trolls—runs directly counter to the common imperative “don’t feed the trolls,” a statement predicated on the logic that trolls can only troll if their targets allow themselves to be trolled. Given that the fun of trolling inheres in the game of trolling—a game only the troll can win, and whose rules only the troll can modify—this is sound advice. If the target doesn’t react, then neither can the troll. But even this decision buys into the trolls’ game. The troll still sets the terms of their target’s engagement; the troll still controls the timeline and the outcome. (pg. 160)

I don’t quite follow the reasoning here. A refusal to engage only leaves the troll in control in a formal sense of the term. In practice, there isn’t a timeline or an outcome, with an enormous caveat I will get to later in the post. Instead, she details a strategy of out-trolling the trolls, performing an earnest response to their attempts at engagement in a way which reveals their own investment in trolling.

The dynamic shifts considerably if the target counters with a second game, one that collapses the boundary between target and troll. In this new game, the troll can lose and, by taking umbrage at the possibility, falls victim to his or her own rigid rules. After all, it’s emotion—particularly frustration or distress—that trips the troll’s wire. In most cases, the troll’s shame over having lost, or merely the possibility that he or she could lose, will often send the troll searching for more exploitable pastures. I frequently utilized this strategy in my own dealings with random anonymous trolls, particularly on my quasi-academic blog. (pg. 160)

I’d like to have seen more example of what she means here but I find it an intriguing idea. As I understand it, her notion of ‘trolling rhetoric’ entails seeking to provoke another person to express their concerns in a way deemed to be excessive, revealing what is taken to be their over-investment in their online activity. Underlying this is a belief that “nothing should be taken seriously, and therefore ... public displays of sentimentality, political conviction, and/or ideological rigidity” are seen as a “call to trolling arms”, with the ensuing trolling often understood in an explicitly pedagogical way. The lulz enjoyed through this represent a "pushback against any and all forms of attachment" but, as she notes, trolls themselves are deeply attached to lulz (p. 25). There’s a power in revealing this attachment, inciting trolls to perform it through the very rhetorical strategies through which they seek to dominate others. Ignoring them leaves the troll unmoved, engaging in this way reveals the deep paradox at the heart of their behaviour.

Phillips recognises how contentious such a strategy can appear, honestly recounting her own ambivalence about the possibility. It nonetheless has a certain appeal though, specifically the idea that we might [2]“troll better, and to smash better those who troll us”. But there are two huge caveats to its employment in the academic context
within which and for which I’m writing. Firstly, how would university departments and communications offices respond to examples of ‘out trolling’? The evidence we have suggests not very well. Secondly, do we have any reason to assume that those who are increasingly targeting academics online represents trolls in this self-identified sense? I think the argument offered by Phillips is deeply plausible but suspect it only holds true for those who share this sub-cultural identity. Those who, for instance, see what they do as activism are much less likely to be moved by it and engagements of this could be deeply counter-productive.

Social Media For Academics: Things To Try (2017-02-09 08:00)

Quit social media! (2017-02-10 08:00)

A provocative argument put forward by someone who’s built a [1]high-profile secondary career through blogging:
In the last few months, I've begun to seriously plan a much more sophisticated follow-up to Social Media for Academics, investigating the implications of social media for academic labour. A crucial aspect of this, which seems likely to become much more so with each passing year, concerns the toxicity of many of the online environments in which academics are participating. If academics increasingly find themselves expected to use social media as a means of demonstrating engagement or at least signalling engagement-willingness then the toxicity of these environments will become an increasingly central labour issue.

My fear is that we will have the worst of both worlds. Academics will be coerced outwards into these online environments under the sign of 'impact', while finding themselves blamed if anything they do online attracts disapproval for their employer. It's easy to imagine how the moralism we see lurking beneath the impact agenda (those who claim not to 'get it' should be 'ashamed' as I recently heard an extremely senior person say) could find similar expression in managerial expectation of social media use. On our present trajectory, the likely outcome will be an individualised one: take responsibility for your own engagement and take the blame if you bring about any perceived damage to the corporate brand. This problem is compounded because, as Tressie McMillan Cottom [2] puts it "the risks and rewards of presenting oneself "to others over the Web using tools typically associated with celebrity promotion" (Barone 2009) are not the same for all academics in the neo-liberal "public" square of private media." Far from counteracting exclusion in higher education, social media for academics is amplifying the risks for those already marginalised.

As an example of how this is developing, consider this dispiriting reflection on being an academic video blogger on YouTube which Philip Moriarty passed on to me:

One of the main reasons why I think the promise of YT as a place where intelligent life might flourish is failing is the well-documented level of trolling and hatred that permeates the site, and which threatens
to silence any but the most obnoxious or innocuous voices. I stopped making regular videos a couple of years ago when the vitriol I was receiving for having the temerity to make unpopular content spilled over into my personal life. In addition to receiving the usual grammatically-challenged insults and thinly-veiled threats the university I was working at was also contacted several times by folk demanding my removal. Eventually these ‘downsides’ to being an academic on Youtube outweighed the benefits and I gave up making public videos entirely.

And it isn’t just me. Over the past three years I have known four other academics leave Youtube for reasons very similar to my own. These were folk who were similarly motivated to bridge the gap between ‘town and gown’, between universities (which are often seen as elitist) and the wider world represented on social media. These people wanted to contribute their knowledge and also to learn from the contributions of others. They wanted to find ways to speak and to listen in ways which were more inclusive, and which the diverse communities on Youtube seemed to be able to offer. These fine people, like myself, became disheartened by the inability of YT to foster anything but the lowest common denominator, the most clickbaity, the most provocative, the most crudely entertaining, and the failure of the platform to support those who wanted to raise the bar.

Some might say (and indeed have said) that this toxicity is just a natural part of the online ecology and we should grow a thicker skin, or not feed the trolls, or any of the other platitudes that are trotted out to excuse bad behaviour, but I don’t think that’s good enough. When the comment section under a video is two thirds insult or threat then the value of that comment section drops to zero. No one with anything to contribute wants to be part of it. When you have to wonder if your latest video will prompt some faceless anti-intellectual gonk to contact your employer then the chilling effect takes hold and you censor yourself, (God forbid you should talk positively about feminism, or BLM, or the representation of women in video games). The number of eyeballs on the site might increase but the I.Q. of the site goes down.

The architecture of these platforms militates against their sustained pedagogical use. It might be that, as [4]Pausé and Russell put it, “Social media enables scholarship to be publicised more widely within the academy, and in addition to that, it enables scholarship to become part of broader social conversations”. The problem is that the incentives of these platforms have over time proved to be generative of a dialogical toxicity which tends to be obscured by the high-minded rhetoric of public engagement. The promise that social media might “bridge the gap between ‘town and gown’” is proving to be rather misleading. A large part of my new project will be exploring the implications of this at the level of the institutional politics of the university, with a particular focus on what it means for academic labour.

The role of social media for academics discourse in obscuring these issues, mystifying the complex politics of social media in the university through breathless reiteration of the individual benefits to be accrued through engagement, means it will be a central object of critique for the project. But I want to avoid slipping into utopian/dystopian, pro/anti framings of social media for academics. I still believe in its scholarly importance and it’s capacity to inculcate solidarity and (in limited ways) flatten hierarchies. There’s a great example of the latter in this paper by [5]Pausé and Russell which I’m otherwise pretty critical of:

Accessibility means individuals who are not academically trained are able to learn about a field of research and contribute to it, bringing their own ideas and experiences to the table.† And accountability has enabled greater criticism of the process of scholarship and research. Through connecting on social media, marginalised people have been able to gather sufficient force to challenge the conventions of research; to insist on an intersectional perspective. The lived experience of a Māori woman living in Aotearoa
New Zealand can challenge the theorised understanding of an academic.‡ People have objected to being studied, and have demanded the right to participate in framing the discussion. For example, the Health at Every Size® (HAES) movement has largely been led by advocates from within what is known as the Fatosphere (Harding, 2007), prompting research that questions the basic assumptions made about the relationship between body size and health by health scholars and those working in the health field. This both challenges and enriches scholars' research. There is now a rich empirical literature on the efficacy of HAES (Burgard, 2014).

Karen Price (2017-02-11 11:11:11)
Really interesting discussion Mark. Thank you for those perspectives. The capacity for both the common community good and for disheartening soul-destroying trolling is a wide pendulum of possible responses. Even in professional closed spaces on social media there is a capacity for horrendous misunderstanding and conflict riven discussion. The ability to slip into tribal discussions and ad hominem attacks is not limited to the wider public but even in moderated professional groups. I am constantly reflecting upon the capacity for this and have wondered about the use of largely text. The anonymity and protected virtual space from the usual social modifiers. We are safer from the consequences of our less than honourable behaviour than in the face to face setting. It’s almost like a giant Stanford Prison experiment. Not sure how to best manage it and so far in my online community Gender has been the most difficult compared with race or religion. This could reflect the nuances of my local context of course but I am still ruminating on that. I’m not sure if it is fair that we expect the world online to be any different from the real world tension and divisions that simmer. Perhaps the medium just allows what is ever present to be made more visible to more witnesses. Interesting times.

Mark Carrigan (2017-02-14 16:09:53)
I like the idea of the giant Stanford prison experiment!

Denial and the Antinomies of (Post)Truth (2017-02-12 08:00)

Rarely can a film have been as timely as Denial. It tells the story of the libel action the holocaust denying historian David Irving took against [1]Deborah Lipstadt and her publisher, alleging that she had damaged his professional reputation as a historian by claiming he had wilfully distorted evidence. The film recounts the events leading up to the trial, before focusing on the trial itself and ending with the judge’s ruling that:

Irving has for his own ideological reasons persistently and deliberately misrepresented and manipulated historical evidence; that for the same reasons he has portrayed Hitler in an unwarrantedly favourable light, principally in relation to his attitude towards and responsibility for the treatment of the Jews; that he is an active Holocaust denier; that he is anti-Semitic and racist, and that he associates with right-wing extremists who promote neo-Nazism...[2][4][3][65] therefore the defence of justification succeeds...[4][5] It follows that there must be judgment for the Defendants.[5][66]
The film seems remarkably salient at a time when the liberal punditry seems to have uniformly endorsed the notion that we have entered a post-truth era, concisely [6]defined as "relating to or denoting circumstances in which objective facts are less influential in shaping public opinion than appeals to emotion and personal belief". The importance of truth, the urgency of fighting for it, runs through the film and is explicitly invoked in the framing of it as a cultural product, as Rachel Weisz makes clear here: "It's a true story, it's a fight for truth and justice".

The writer David Hare expands on this point in the same clip, explaining how "it's not based on a true story, it is a true story ... the words from the trial are the exact words. I don't attribute to David Irving any line that he is not on record as having said, everything he says, we know he said". It was great to discover this because I found the trial scenes riveting, though found it hard to wonder if the whole thing would have worked better on stage. The film seems to have underwhelmed critics, rather unfairly from my point of view, perhaps suggesting it was motivated by a commitment to realism of a sort liable to prove underwhelming on the big screen. However what struck me most about the film was the epistemological confusion underlying it, something which I think reflects a lot about the contemporary discourse of ‘post-truth’ and its limitations.

The avowed realism of the film obscures the inevitable cuts that the constraints of story telling necessitate. Irving had [8]sued another historian at the same time, though the case did not go to court. He threatened a further historian with libel if passages concerning him weren’t removed from an upcoming book, prompting an American edition to be published with them but their erasure from the British edition. My point is not to criticise the film for excluding these details, despite their obvious relevance to the story, as much as to highlight the exclusions inherent in narrative. Likewise, with the court case itself, where the selection of a few incidents from a long trial were expertly used to dramatic effect. Again, these aren’t criticisms, just a reminder that even factual narratives (a term I prefer to ‘true story’) inevitably entail selecting from the pool of available facts, within the (media and genre specific) constraints of effective story-telling.

Much of the film can be read in terms of rallying forces for a defence of truth. The drama of the film rests on
success in this endeavour, after overcoming much initial adversity. But framing the hard-drinking, hard-thinking Scottish barrister as a hero sits oddly with the commitment to truth in the film. After all, he’s lionised for his rhetorical skills, his capacity to pick apart the authority of Irving in a performatively compelling way. His most successful tactics have nothing to do with the presentation of evidence, but rather involve getting under Irving’s skin in order to unsettle and undermine him. The concern here is not truth but persuasion. Specifically, the persuasion of a solitary judge, after Irving the litigant was persuaded to dispense with the jury because both sides agreed that the common folk could not be trusted to adjudicate on the truth when the relevant facts were as complex as they were in this case. Furthermore, the only thing that ensures the barrister is not cast as a mercenary is his deep commitment to this truth. This is slowly established over the course of the film, with Lipstadt eventually discovering that this is not just ‘another brief’ for him after all.

What made this film impressive to me was the way in which it explored the mechanics of persuasion in court, specifically how it was established convincingly that Irving had wilfully misrepresented evidence in order to establish the case for holocaust denial. In other words, it concerned the discursive machinery through which facts are consecrated and rendered socially efficacious. The apparent narratological inevitably of this being accompanied by a paean to truth speaks volumes about what has come to be accepted as ‘post-truth’. We might speak more accurately of post-fact. This is how Will Davies framed it in a New York times essay:

Facts hold a sacred place in Western liberal democracies. Whenever democracy seems to be going awry, when voters are manipulated or politicians are ducking questions, we turn to facts for salvation.

But they seem to be losing their ability to support consensus. [9]Politifact has found that about 70 percent of Donald Trump’s “factual” statements actually fall into the categories of “mostly false,” “false” and “pants on fire” untruth.

For the Brexit referendum, Leave argued that European Union membership costs Britain 350 million pounds a week, but failed to account for the money received in return.

The sense is widespread: We have entered an age of post-truth politics.

As politics becomes more adversarial and dominated by television performances, the status of facts in public debate rises too high. We place expectations on statistics and expert testimony that strains them to breaking point. Rather than sit coolly outside the fray of political argument, facts are now one of the main rhetorical weapons within it.

The declining efficacy of facts is understood to be problematic because it undermines appreciation of truth. But reality always permits of multiple characterisations. As Roy Bhaskar put it on pg 55 of Reclaiming Reality, “facts are things, but they are social not natural things, belonging to the transitive world of science, not the intransitive world of nature”. Facts are produced through interventions in the world, drawing on the labour of others and applying conceptual tools we rarely built ourselves. This is why a serious discussion of someone like Irving cannot avoid interrogating his proclaimed status as a professional historian, what this means and how it should shape our assessment of his capacity to marshal facts in authoritative ways. Indeed, this was crucial to making the case against
him.

But if we see facts as self-grounded things, already made and waiting in the world to be discovered, it becomes difficult to acknowledge this. This might not matter when ‘our’ facts are socially efficacious, happily endorsed by all those we encounter and reflected back to us as common sense in the culture we engage with. But when these start to break down, the construction of ‘truth’ faces a fundamental tension: if facts are given then conflict over them must in some way reflect non-factual considerations, but if non-factual considerations consistently influence ‘matters of fact’ then facts cannot be given. This creates a crisis when we reach a situation in which facts have been ubiquitously weaponised. As Davies put it, “If you really want to find an expert willing to endorse a fact, and have sufficient money or political clout behind you, you probably can”.

This inconvenient truth could be ignored as long as there was a consensus in place. One which has now broken down, with the apparent mystery of our ‘post-truth’ era going hand-in-hand with a profound mystification of the political dimensions to how the consensual era of ‘truth’ preceding it was established. My point in writing this isn’t to preach constructionism. I share the ethos of Bhaskar’s book, one of the most powerful works of philosophy I’ve read: reclaim reality. Reclaiming reality involves recognising the reality of social construction, but resisting the dissolution of ‘truth’ into this. Figures like Irving thrive in the space opened up by the antinomies of (post)truth. If we reclaim reality, we can starve them at an epistemological level, before defeating them at a political level.

7. https://www.youtube.com/embed/tTZnDXVKC9A?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent
Ten years ago, the so-called 'Invisible Committee' urged that 'It is useless to wait…. To go on waiting is madness. The catastrophe is not coming, it is here. We are already situated within the collapse of a civilization. It is within this reality that we must choose sides.' Over a decade before, Leonard Cohen had written; ‘This is the darkness, this is the flood. The catastrophe has already happened and the question we now face is what is the appropriate behaviour.’ The 2017 Critical Legal Conference thus calls for streams, panels and papers that reflect upon ‘catastrophe’; on the catastrophes of our time and upon their interrelations; upon the questions of appropriate behaviours that might emerge and sides that might be taken. In particular we hope to encourage streams on:

- Increasing brutality and violence of the carceral and security state;
- War, migration, and refugee crises;
- Racism, xenophobia, misogyny, transphobia, homophobia and countless forms of day to day violence;
- On the atmospheres of violence under regimes of Modi, Temer, Trump, Brexit or Erdogan
- Natural disasters and the effects of climate change in the anthropocene;
- Forms of colonialism, neocolonialism and economic imperialism driven by capitalism and neoliberal ideologies;
• Crises of care and depletion of the social reproductive capacities under global capitalism;
• Rampant fear-mongering and the political exploitation of deprivation.
• Catastrophe, disaster and crisis as modes of biopolitics, governance or accumulation

However, these catastrophes are only the most obvious effecting us today. Catastrophe does not necessarily imply a sudden fright or a grand world-historical moment that is evident to all. We also want to emphasise: the slow violence of catastrophe; the gradual and often imperceptible disintegration that is neither spectacular nor instantaneous; the ‘human catastrophes’ fostered by capitalism in its crises of social reproduction; intimate catastrophes, moments of collapse and calamity that concern the subject and the psyche, as well as the domestic.

Taking a cue from Bonnie Honig, we might identify the genre of this mode of critique as containing something of the dark romantics. The catastrophe is that chasmatic void into which we are about to fall (or perhaps we have already fallen). We are pervaded by a sense of the coming (or already arrived) doom. But despite this, catastrophe also suggests an opening to something beyond. It creates new spaces for resistance and solidarity, while potentially strengthening old ones. Catastrophe names the end in ancient Greek music and theatre, an unravelling and return to context. It was coupled with ana
crousis – a sonorous explosion that was played at the beginning of a performance to clear the ears and so make space for a cosmos to be created. Catastrophe announced the overturning of that world and prepared the listeners to leave the theatre, to return to the street and to the context of popular life. Tolkien coins the term Eucatastrophe to signify the sudden positive resolution of a seemingly impossible situation. Thus, continuing from the hugely successful 2016 CLC focus on ‘turning points’, the theme of catastrophe asks us to consider the day after the moment of rupture, the period after the turning point.

What are the traps of thinking through ‘catastrophe’? Does catastrophe require redemption? Certainly modes of Christian theology imagine the katechon – the worldly suspension of the end times in which we are situated – as the holding-off of the justice of the end of the world. But by thinking our situation in other cosmologies, does the question of the catastrophe disappear, or appear differently? Or in a more profane sense, what are the problems of thinking through the lens of the catastrophe – is there a catastrophe (for us) in thinking catastrophe? Should we move away from the thought of the catastrophe and think more hopefully or joyfully?

Finally, we hope the question of catastrophe also invites a certain critical self-reflection. In liberal accounts, law seems to stand out against the catastrophe: the catastrophe is the perversion of legal rationality or the inability of pure legal norms to reach their proper context. Critical fields seek to undermine this claim, but to what extent and what effect? And what of the left’s own catastrophes, what of the co-option of resistance in human rights or development, or of the various collapses or exhaustions of left political and legal projects?

So we invite participants to the coming Catastrophe of the 2017 Critical Legal Conference at the Warwick Law School and in conjunction with the Social Theory Centre. It will take place on the 1st-3rd of September. Further details can be found on the [1]conference webpage (Link). Please send your [2]stream proposals to [3]clcwarwick@gmail.com. The closing date for streams will be the 28th of February, the call for papers will open after that.

**Writing prompts for a PhD journal (2017-02-14 08:00)**

http://gty.im/56172327

I'm a big advocate of the research journal as a key part of doing a PhD. I think blogs are wonderful for this but I realise this might not be for everyone. The important thing is uniting reflection and engagement as an habitual part of the research process. Patter has some great ideas here about topics and prompts to help get this process started in the early stages.

---

**The Unreality of Reality TV: From "After Dark" towards Twitter, Big Data, and "Big Brother" (2017-02-14 15:10)**

The Unreality of Reality TV: From "After Dark" towards Twitter, Big Data, and "Big Brother"
Organised by the Westminster Institute for Advanced Studies and Open Media
Fri, March 3, 17:00
309 Regent Street
Boardroom (RS117)
W1B 2HW London

Registration:

High-velocity media, superficial news and sound bite-driven debates are increasingly shaping our public discourse. The Brexit referendum and the 2016 U.S. election are cases in point. In the age of social media and digital television, what potentials and limits are there for strengthening constructive public debate? What are the roots of the present crisis and what can be done to fight back? Sebastian Cody (Open Media) and Christian Fuchs (University of Westminster) will discuss transformations of television and digital media and how they impact the possibilities for public debate. Sebastian Cody will focus on the technical and historical context as a practitioner; Christian Fuchs will discuss the acceleration of the public sphere and its impacts on society. Alternatives to superficial television are possible. The series "After Dark" – described in the television trade press as defining "the first 10 years of Channel 4, just as "Big Brother" did the second" – ran between 1987 and 2003. Based on principles developed for "Club 2", a debate programme broadcast by the Austrian Broadcasting Corporation ORF, "After Dark" was unique in the history of British television. The programme's ground rules of absolute live broadcasting (no editing or delay) and open-ended intimate discussion meant that guests' utterances were uncensorable. Roly Keating, former BBC controller and current Chief Executive of the British Library, described it as "one of the great television talk formats of all time". The subjects discussed ranged widely across national and international news events, while also exploring personal and private matters. As the programme faced challenges from broadcasters, government, the legal system and various vested interests, it was often a source of controversy. Later iterations of 'reality TV' have shaped the current media culture, which is dominated by commercial logic. News and debate are served up as fast-paced entertainment on social media, and big data exacerbates the speed and superficiality of news, undermining possibilities.
for controversy and fruitful communication. Sebastian Cody has been responsible for the production of “After Dark” throughout its history. As CEO of the production company Open Media, he has made many dozens of network television programmes, from game shows to investigative documentaries. In 2010 his company launched an online social history of Britain for the academic community alongside the BFI, BBC, The National Archive and others. He acts as a consultant for companies and NGO’s and has been attached to the University of Oxford since 2001. Christian Fuchs is Professor at the University of Westminster, Director of the Westminster Institute for Advanced Studies, and Director of the Communication and Media Research Institute. His research focuses on critical theory of society and the critical study of the media, communication(s), and digital media’s role in society. His most recent publications are the monographs “Critical Theory of Communication” (University of Westminster Press, 2016) and “Social Media: A Critical Introduction” (Sage, 2017; 2nd edition, forthcoming). – Forthcoming conference: The 6th ICTs and Society Conference: Digital Objects, Digital Subjects: An Interdisciplinary Symposium on Activism, Research & Critique in the Age of Big Data Capitalism [2]http://icts-and-society.net/events/digital-objects-digital-subjects-a-symposium-on-activism-research-critique-in-the-age-of-big-data-capitalism-the-6th-icts-society-conference/ With Antonio Negri, Antoinette Rouvroy, Christian Fuchs, David Chandler, Etienne Turpin, Jack Linchuan Qiu, Jodi Dean, Kylie Jarrett, Orit Halpern, Paolo Gerbaudo

The Sociology of Predatory Publishing (2017-02-15 08:00)

In a recent article on [1]Derivace, Luděk Brož, Tereza Stöckelová and Filip Vostal reflect on the case of Wadim Strielkowski, whose over-enthusiastic game playing was the subject of extensive debate within the Czech academy. There are many factors which have, as a whole, led his prolific rate of publication to be regarded with deep suspicion, such as the self-publication of his monographs, typos in his journal articles, extensive recycling between papers and a continuously rotating cast of co-authors:

Strielkowski, then a junior lecturer at the Faculty of Social Sciences, Charles University in Prague, first attracted the attention of colleagues in early 2015, when it was discovered that he had published 17 monographs and more than 60 journal articles in just three years. It is probably not surprising that a number of these texts were published in a rather unconventional way: Strielkowski’s monographs, with one exception, were in fact self-published and self-illustrated, even though each appeared to have been published by [2]the Faculty of Social Sciences. A substantial amount of his articles were published in journals that could be described, following Beall’s terminology, as “[3]potentially, possibly or probably predatory”. Since many of his articles were skilfully placed in dubious journals that were featured in SCOPUS or even in the Web of Science’s databases, they were recognised by the Czech evaluation system as research outputs. As a result, Strielkowski’s employer was awarded the appropriate amount of funding, and Strielkowski himself, [4]according to the Czech media, received bonuses to his salary as a result.

What makes his case interesting is how skilfully these articles were placed. As the authors note, a substantial number

4867
of his articles were placed in journals that could be described as “[6]potentially, possibly or probably predatory” while nonetheless being included in relevant indexes which meant they counted as research outputs for formal evaluation, with all the advantages that entails. Not only was he skilfully navigating the publishing environment to facilitate his own rapid ascent, he made a business out of helping others do the same thing:

In addition to being a prolific author, Strielkowski also happens to be a globetrotting entrepreneur. [7] Through his companies, he has offered courses on how to publish in academic journals, with special emphasis on SCOPUS and the Web of Science. Participants primarily hailed from the countries of the former USSR; if they paid conference fees, they were [8] guaranteed publication of their text(s) in one of the journals that Strielkowski himself (used to) publish and which Beall monitored until January 2017 (such as Czech Journal of Social Sciences, Business and Economics, and International Economics Letters). For those ready to pay €3,000, Strielkowski, referring to himself as “professor” and “[9]Vice-Chancellor”, even offered academic degrees. His Prague University of Social Sciences and Humanities Ltd. offered not only MBAs (apparently without an accreditation in the Czech Republic) and postdoctoral positions one had to pay for, but also a [10] “MAW” degree, which stood for “Master of Academic Writing”.

The case is a fascinating one because it illustrates how metricised evaluation and predatory publishing cannot simply be regarded as imposed from outside, leaving academic victims with no choice but to adapt or be left behind. Strielkowski is an extreme example but his case illustrates how the opportunities these systems create for advancement are drawn upon and engaged with knowingly by scholars, in a way that is always implicitly (and sometimes explicitly) orientated to the others embedded within them.

We do not simply ’internalise’ these imperatives or find ourselves moulded to become ‘neoliberal subjects’. The exercise of agency to be found here is varied, complex and confusing. Denunciations of individual cases, which I don’t think Luděk et al are doing in this case, doesn’t help matters. I’d argue that what often understands itself to be theorisations of such cases, invoking the idea of the neoliberal subject etc, in reality more often represents a thematisation of them.

How do we counter this though? At one point, the authors write of Strielkowski’s papers that “they have hardly any readership to speak of to notice such a statement in the first place”. Similarly, when I read this article, the second thing I looked at after Strielkowski’s personal website was his Google Scholar profile, immediately noting that he has relatively few citations for someone who has published so prolifically, with a majority seeming to be self-citations. I wonder if there is an element of bad faith in finding reassurance in such things, an invocation of readership and citation as a quality threshold, when we know that the systemic problems preclude the reliability of such standards? I wonder if this represents a unacknowledged attempt to evade the vertigo of the accelerated academy:

I feel like I am drowning in knowledge, and the idea of further production is daunting. Libraries and bookstores produce a sense of anxiety: the number of books and journals to read is overwhelming, with tens of thousands more issuing from the presses each day. Moreover, there is no real criterion other than whim for selecting one book or article over another. To dive into one area rather than another becomes a willful act of blindness, when other areas are just as worthwhile and when every topic connects to others in any number of ways. The continual press of new knowledge becomes an invitation to forgetfulness, to lose the forest for the trees.

From Sustainable Knowledge by Robert Frodeman, loc 1257:
We have more room for manoeuvre then we acknowledge. Strielkowski’s game playing represents what Ruth Müller calls [12] anticipatory acceleration taken to an unprecedented extreme: mindlessly speeding up the rate of publication in pursuit of competitive advantage within an overcrowded field. But if [13] Trump academics are in the ascendancy, we’re liable to see more of this. The system is fucked and all the evidence suggests it is becoming more so with each passing year.

We need a honest account of our investments within the system of scholarly communication, building from the basic constraints which the requirements of pursuing an academic career impose. Looking at extreme cases like Strielkowski can help us doing this, by providing prompts to elucidate our assumptions and concerns about scholarly publishing that we might not otherwise feel the need to put into words.

Laura Servage (2017-05-27 16:42:13)
Love the Frodeman quote. Resonates. Not sure if I follow the final proposition here though: does honesty within constraints mean accepting the constraints? What is it we’re to be honest about? Our varying degrees of complicity in a perverse system?

Mark Carrigan (2017-05-28 16:26:41)
Recognising the nature of that constraint & why we’re liable to continue acting within them, rather than endlessly regurgitating the same ‘critique’ while continuing to act in more or less the same way we always have.
In Platform Capitalism, [1]Nick Srnicek seeks to address what he sees as a profound oversight in the existing literature on digital capitalism. One set of contributions focuses on emerging technologies and their implications for privacy and surveillance but ignores the economic analysis of ownership and profitability. Another set critically analyses the values embodied in corporate behaviour but neglects the broader context of a capitalist system. A further set addresses the ills of the ‘sharing economy’ but fails to situate these in terms of broader economic trends. Finally, there are those which analyse the emerging economic trends in the technology sector but treat them in a way which is decontextualised from wider historical changes.

In contrast, he intends to offer "an economic history of capitalism and digital technology, while recognising the diversity of economic forms and the competitive tensions inherent in the contemporary economy" (loc 155). This involves "abstracting from them as cultural actors defined by the values of the Californian ideology, or as political actors seeking to wield power" (loc 166) and instead simply taking "major tech companies" as "economic actors within a capitalist mode of production". Such an undertaking requires that we distinguish the technology sector from the digital economy. The former is relatively small, employing around 2.5 % of the US labour force and contributing around 6.8 % of the value added by private companies (loc 157). In contrast, the digital economy has taken on a systemic importance that is obscured if we analyse it on a sectoral basis:

we can say that the digital economy refers to those businesses that increasingly rely upon information technology, data, and the internet for their business models. This is an area that cuts across traditional sectors –including manufacturing, services, transportation, mining, and telecommunications –and is in fact becoming essential to much of the economy today. Understood in this way, the digital economy is far more important than a simple sectoral analysis might suggest. In the first place, it appears to be
the most dynamic sector of the contemporary economy—an area from which constant innovation is purportedly emerging and that seems to be guiding economic growth forward. The digital economy appears to be a leading light in an otherwise rather stagnant economic context. Secondly, digital technology is becoming systematically important, much in the same way as finance. As the digital economy is an increasingly pervasive infrastructure for the contemporary economy, its collapse would be economically devastating. Lastly, because of its dynamism, the digital economy is presented as an ideal that can legitimate contemporary capitalism more broadly. The digital economy is becoming a hegemonic model: cities are to become smart, businesses must be disruptive, workers are to become flexible, and governments must be lean and intelligent.

Loc 157-178

His analysis locates the nascent importance of the digital economy against a backdrop of a "long decline in manufacturing probability" across a "sluggish production sector". Digitalisation has been seized upon a set of mechanisms through which these problems might be ameliorated, leading to the growth of the platform as the business model best able to ensure returns from these emerging opportunities (loc 178). This represents a historicisation of the platform, drawing out the linkages between the contemporary platforms which dominate the breathless discourse of 'disruption' and earlier upheavals in capitalism which digitalisation played an (often under-acknowledged) part in. For instance, consider the technological prerequisites which allowed a transition from Fordism to post-Fordism, driven by a crisis of overcapacity and overproduction in global markets:

Companies were increasingly told by shareholders and management consultants to cut back to their core competencies, any excess workers being laid off and inventories kept to a minimum. This was mandated and enabled by the rise of increasingly sophisticated supply chain software, as manufacturers would demand and expect supplies to arrive as needed. And there was a move away from the mass production of homogeneous goods and towards increasingly customised goods that responded to consumer demand.

Loc 294

The point is not that technology was the agent of these changes but rather that it facilitated new ways of organising production in time and space. Recognising the political agency involved in the onset of neoliberal 'reforms' shouldn't detract from an appreciation of the role technology played in allowing the reorganisation of production. Historicising the digital economy necessitates that we understand this interplay between digitalisation and financialisation from the outset, something which of course came to the fore with the dot com boom.

Astonishingly, nearly 1 % of US GDP consisted of VC invested in tech companies at the height of the sector in the late 1990s, with 50,000 companies formed and over $256 billion invested in them. This influx of capital facilitated a 'growth before profits' model which is still familiar today, licensed by the expectations of immense wealth to be generated if enough market share was captured in a still hazily envisioned digital economy. This speculative boom led to a vast investment in digital infrastructure through which our contemporary digital economy was able to emerge:

This excitement about the new industry translated into a massive injection of capital into the fixed assets of the internet. While investment in computers and information technology had been going on for decades, the level of investment in the period between 1995 and 2000 remains unprecedented to this day. In 1980 the level of annual investment in computers and peripheral equipment was $ 50.1
billion; by 1990 it had reached $154.6 billion; and at the height of the bubble, in 2000, it reached an
unsurpassed peak of $412.8 billion. 16 This was a global shift as well: in the low-income economies,
telecommunications was the largest sector for foreign direct investment in the 1990s –with over $331
billion invested in it. Companies began spending extraordinary amounts to modernise their computing
infrastructure and, in conjunction with a series of regulatory changes introduced by the US government,
18 this laid the basis for the mainstreaming of the internet in the early years of the new millennium.
Concretely, this investment meant that millions of miles of fibre-optic and submarine cables were
laid out, major advances in software and network design were established, and large investments in
databases and servers were made.

Loc 314-333

Coping with the eventual crash through lowering mortgage rates in turn sowed the seeds of the future housing bubble. The story is one of a continued ‘asset-price Keynesianism’ where interest rate reductions were used to encourage continued rises in asset prices, seeking to encourage investment and consumption in the absence of deficit financed stimulus or any resurgence in the manufacturing sector. This low interest rate environment within the global economy has, argues Srnicek, provided “a key enabling condition for parts of today’s digital economy to arise” (loc 377) by reducing returns on a range of assets and encouraging investors to seek higher yields elsewhere. This is the context within which platforms emerged and were readily able to find vast investment, even in the absence of profitability. But what are platforms?

What are platforms? At the most general level, platforms are digital infrastructures that enable two or more groups to interact. They therefore position themselves as intermediaries that bring together different users: customers, advertisers, service providers, producers, suppliers, and even physical objects. More often than not, these platforms also come with a series of tools that enable their users to build their own products, services, and marketplaces. Microsoft’s Windows operating system enables software developers to create applications for it and sell them to consumers; Apple’s App Store and its associated ecosystem (XCode and the iOS SDK) enable developers to build and sell new apps to users; Google’s search engine provides a platform for advertisers and content providers to target people searching for information; and Uber’s taxi app enables drivers and passengers to exchange rides for cash. Rather than having to build a marketplace from the ground up, a platform provides the basic infrastructure to mediate between different groups. This is the key to its advantage over traditional business models when it comes to data, since a platform positions itself between users, and as the ground upon which their activities occur, which thus gives it privileged access to record them.

Loc 596-618

He identifies three key characteristics of platforms which are interconnected:

1. Platforms mediate interaction between groups, providing an epistemic privilege in relation such interactions (and their potential monetisation). They are a mechanism for producing and extracting data from interactions.

2. Platforms are reliant on network effects, such that their value to users grows in line with the number of such users. This leads to a ‘winner-takes-all’ or ‘winner-takes-most’ dynamic. The more a platform grows, the easier it is for it to grow more and the potential value of its epistemic privilege increases in line with this.
Platforms often use cross-subsidisation to encourage more users on to the network, exhibiting a dynamic pricing structure often entailing free products and services because of the gains that can be made elsewhere. This helps encourage more users on to the platform.

The mediating character of platforms means they "gain not only access to more data but also control and governance over the rules of the game" (loc 636). With this comes the challenge of facilitating continued growth within a competitive environment, using cross-subsidisation and leveraging network effects to position oneself as the central platform within a domain of activity. However in spite of these shared characteristics, different types of platform have emerged within different spheres of social life. Srnicek identifies 5 types:

The first type is that of advertising platforms (e.g. Google, Facebook), which extract information on users, undertake a labour of analysis, and then use the products of that process to sell ad space. The second type is that of cloud platforms (e.g. AWS, Salesforce), which own the hardware and software of digital-dependent businesses and are renting them out as needed. The third type is that of industrial platforms (e.g. GE, Siemens), which build the hardware and software necessary to transform traditional manufacturing into internet-connected processes that lower the costs of production and transform goods into services. The fourth type is that of product platforms (e.g. Rolls Royce, Spotify), which generate revenue by using other platforms to transform a traditional good into a service and by collecting rent or subscription fees on them. Finally, the fifth type is that of lean platforms (e.g. Uber, Airbnb), which attempt to reduce their ownership of assets to a minimum and to profit by reducing costs as much as possible.

Much of his subsequent analysis concerns the competitive conditions under which each type of platform operates, as well as how this is shaping the emerging field and platform capitalism as a whole. I don’t agree with all of it but it’s definitely worth reading in full. I understand his core points to be the following:

1. The necessity of ‘data extraction’ has a basis in a longer term crisis of profitability within capitalism. These are, in effect, technical fixes for a systemic deterioration afflicting manufacturing and platforms represent a formalisation of these into a new emergent form.

2. The financial conditions under which this platform economy has been able to emerge were historically specific and should not be assumed to continue indefinitely. The infrastructure through which ‘data extraction’ become technically viable, as well as the emergence of platforms as operating businesses were deeply dependent upon this.

3. Platforms as emergent forms exhibit characteristics which shape competition between them, as well as guiding the unfolding of the digital economy as a whole. The fierce competition between them, the competitive challenges specific to categories of platforms, the dynamics of network effects and the affordances of their cash hoarding are leading to platform isomorphism. They have an inevitable drive towards monopoly, further incentivised by the dynamics of accruing investment, which leaves them orientated towards becoming owners of the infrastructure of society.

The analysis of platform tendencies is probably my favourite part of the book. He talks about expansion of extraction,
positioning as a gatekeeper, convergence of markets and enclosure of ecosystems. These are analysed in the final chapter in some detail and offer a convincing meso-level account of the claimed macro tendency towards monopoly or oligopoly.

Al Jazeera's 'The Crusades: An Arab Perspective' (2017-02-16 21:36)

by Dr Z.A.

In the West, one of the most decisive battles ever fought is the Battle of Tours, in 732 France. This moment is considered the turning point where Arab expansion into western Europe was forever halted. It is commemorated in books and mythology to this day as the moment Europe was saved.

For the Arab chroniclers, however, this moment is barely mentioned. It was at best a small raid gone wrong. Such is the power of historical perspective.

As someone with an amateur interest in history, I was looking forward to the [1]Al Jazeera documentary "The Crusades: An Arab perspective" for this very reason.

I thought for a moment that I would see an insightful challenge to the traditional modern Western centric view of the Crusades.
Instead what I saw was for the large part a disappointing rehashing of what is a well trodden path albeit with more Arab "talking heads".

Let me explain.

History is ultimately dependent upon one's frame of reference. So when Al Jazeera talked about the Crusades, so the western narrative is referenced by certain events. That is the first crusade and the conquest of Jerusalem, Richard the Lionheart and Saladin, the sacking of Constantinople and Baibars and the final Mamluk push that recaptured the coast of Palestine from the Crusaders.

The documentary essentially repeated all those events in its description (only partly saved by the final episode’s insight) but by adding a few stories from the Arab perspective and including a few Arab analysts.

What they were saying in essence was that they agree with this western narrative of what is important in that era, but disagree with which talking heads they used and which modern parallels they wishes to invoke.

What they should have done was to emphasise how the Crusades were seen as a major but peripheral conflict in the Muslim world of that era. What was bigger was the rivalry between the Turkish dynasties and the Fatmids, how the Mongol threat was seen as more existential, how barely any of the Crusader leaders registered in Arab chronicles accounts, also how the last calls for Crusades were done against the Ottoman Turks as late as the 17th century. More importantly the truth was that the Crusades were for forgotten for centuries by both sides.

The West's rediscovery of it was used to boast their empire's historical roots. A vague and difficult point to prove in reality.

What should have happened amongst Muslim and Arab historians is that the Crusades longer term impact should've been shown, but the focus should have been about the broader story of Muslim history.

With this programme, all that we saw in the end was the same story with a different storyteller and a different set of biases.

Dr Z.A. is a GP, and a passionate amateur Historian, with a BA in Islamic History and a Masters in International Relations.

As an amateur student of medieval history, I really enjoyed it. You’re right, it could have been a LOT more, but with the current offerings on the topic available to the English speaking world, this was pretty refreshing. You’re correct that it’s just different storytellers and biases, but as someone who has heard this story so many time, I appreciate that we’re moving towards a more comprehensive understanding of the events of the crusades. I study medieval history in order to recreate it in the SCA. I found this documentary very illuminating. As our society grows we have many Arab personas in our ranks, as well as Eastern Orthodox personas. Documentaries like these will help us better understand how those cultures interacted and how our various personas could feel about each other. I thought it was very interesting that they shied away from portraying the really shocking things Latin crusaders may have engaged in, including cannibalizing fallen enemies. Those things make it into many of the ‘English-speakers for English-speakers’ programs, so their absence was noticeable I feel like, for all the flaws, I’m still
hungry for the dialogue and appreciative that it’s starting to take shape. Especially in light of current events, I think we could all use better understanding of the past.

Ravi Mathew (2018-01-12 08:54:27)
It’s a pretty shoddy documentary which doesn’t mention battles that the Muslim sources have also mentioned. Jaffa, Arsuf & Dorylaeum aren’t mentioned at all. The armor and characterisation are utterly amateurish.

Creative Dark Matter Rising? Struggling Over the Future of Alternative Cultural Spaces in the City of Geneva (2017-02-16 22:02)

by Robert Hollands

When I recently mentioned to some friends that I was going to Geneva, Switzerland to conduct some sociological research into alternative cultural spaces, most shook their heads in disbelief. ‘All I think of when I hear the word Geneva’, one of them exclaimed, ‘is rich people, watch-making, non-tax paying corporations, and the Red Cross’. I think this is probably a fairly popular stereotypical view of the city. However, underneath its multinational headquarters and gentrified ‘picture postcard’ exterior, lies an impressive counter-cultural legacy. Once described as the most squatted city in Europe in the mid-90s, Geneva is currently in the midst of a battle to retain its autonomous cultural heritage, and in doing so, is simultaneously challenging the dominant neo-liberal urban development model.

From nightlife to declining alternative cultural spaces

I initially encountered the city of Geneva in 2011 when I was asked to give a keynote presentation on my research into nightlife in the UK. It was at a high profile event, sponsored by the department of culture, entitled ‘Etats Généraux de la Nuit’ (which translates as ‘General State of the Night’). Nightlife had become a significant political issue in 2010 with the production of an important research report ‘Journey to the End of the Night’ which suggested, amongst other things, a lack of diverse and affordable nightlife venues in the city. Street protests also erupted when the closure of two mainstream nightclubs, over supposed health and safety issues, led to one of Geneva’s alternative cultural venues, L’Usine, to go on strike in response to the overcrowding of its premises. Over the course of two weekends, these ‘night strikes’, involving around 5000 young people, took the form of carnivalesque late night street parties, complete with sound systems, dancing and protest banners, with the aim of demanding more varied and affordable nightlife venues. Subsequently, I, together with some activist-colleagues from Geneva,[3] have written a forthcoming book chapter, trying to theorise and make sense of these events through ideas associated with urban social movements.

During this time, I also learned a lot about Geneva’s impressive counter-cultural history and the ongoing struggles of artists, musicians, and alternative cultural organisations to survive in the city. This work linked up with my new research project entitled ‘Urban Cultural Movements and the Struggle for Alternative Creative Space’, a two-year Major Research Fellowship funded by the Leverhulme Trust, whose aim is to see how alternative cultural production can begin to challenge how we live, work and play in the neo-liberal city. The term ‘alternative’ remains a difficult concept to define, due to its pliability and tendency to get incorporated into the mainstream. I use it here to signal cultural forms that attempt to remain autonomous and self-managed, and which oppose or challenge the market-based domination of culture (below I use the term interchangeably with ‘autonomous’ and ‘independent’ cultural producers).

Geneva forms an excellent case study for such research. For instance, in 1995, it was a heavily squatted city, with an estimated 120 buildings occupied by some 2800 inhabitants. In the last twenty years, however, its vibrant
artistic counterculture, like many other global cities, has been challenged by corporate and entrepreneurial urban development, including soaring property prices-rents, increased gentrification of cultural life, and draconian legislation preventing the illegal occupation of buildings. Iconic buildings like Artamis (literally meaning 'friends of art'), an emblematic occupied industrial space that was home to over 200 artist/ artisans, and Rhino, primarily a housing squat opened in 1989 (although it also provided space for independent cinema, music, and a bar and restaurant), were forced to close, despite significant protests, in 2008 and 2007 respectively.

Some resisters began to talk of the 'cultural sterilisation' of alternative Geneva. In many cities, property-led urban speculation and housing shortages may have signalled the end of the autonomous cultural sector altogether as it relies heavily on the availability of unused buildings. However, a number of factors have mitigated against this happening in the city. First, it appears that numerous state and city councillors either were former squatters or were people who understood the contribution such spaces made to the city, in terms of cultural activities and affordability, diversity, and accessibility. Second, the Genevan state appears wealthy enough not to be forced to sell off all its public assets to 'balance the books', unlike Greece, Spain, the UK, and even Germany to some extent. It has meant that, in some cases, public buildings and land have not necessarily been auctioned off to the highest private bidder or developer, but rather at least can be considered as spaces for local independent cultural producers. Third, many artists and cultural actors have maintained squatting traditions like self-management (autogestion as it’s referred to in Switzerland) and collective decision-making within their organisation, and have mostly been in solidarity with one another when conflictual issues have arisen (see below for example). Finally, through a combination of its own resistant ethos (for example, most venues and festivals seem relatively immune to private sponsorship), and due to the city of Geneva’s lack of interest, or need, to target bohemian types of tourism (like Berlin does), the alternative cultural sector has been relative immune to incorporation into urban branding strategies.

**Alternative Geneva fights back**

Returning to the city four years later, it was evident that there were new seeds of dissent and organisation
happening amongst the autonomous cultural sector. For example, I was pleasantly surprised to see that a handy map of alternative cultural spaces in Geneva had been produced on the occasion of the first [4]Biennial of Independent Art Spaces (BIG), entitled 'Carte Des Lieux Culturels Independants A Geneve' - complete with a short write up of forty-four venues across the city. How many cities its size (population 200,000) can boast this array of alternative places? I was also lucky enough to be able to visit some of those spaces and talk to various people in this movement, and what I found, was indeed, quite inspiring.

For example, I spent a day in Theatre du Galpon (which was formally housed in the squat Artamis), a wonderful (but apparently temporary) theatre space constructed in a wooded area of natural beauty. They, in conjunction with a new group of activists/artists/academics calling themselves G.R.E.C. (ironically translated as Greece, but standing for Groupe de Reflexion sur l'Economie de la Culture or Think Tank on the Economy of Culture), were hosting a debate about the future of alternative cultural space in the city. Some two-hundred and fifty people showed up to participate in a four-hour debate. It included an inspiring presentation by the Berlin-based collective Stadt von Unten (translated as City From Below), [5]a group of radical architects, artists, tenant and community groups, who recently successfully blocked a gentrified urban development in Kreuzberg. The panel consisted of an array of speakers such as numerous state politicians in urban development and culture planning, artists, academics, and ex-squatters. [6]While it was reported in the press that the politicians in attendance were generally supportive of the cause, there was, in fact, quite a 'lively' debate around who should be responsible for making the case for more alternative space, and whether there really was the political will to support such demands.
The evening also included its own ‘mini-protest’ over who was responsible for, and how to resolve, a new political conflict over alcohol and food licensing affecting the alternative sector. Not surprisingly, L’Usine was again at the sharp end of this protest. In response to State demands that they comply with licensing laws by having an alcohol license for each of the different venues within the cultural centre (including the theatre, cinema, nightclub and bar), L’Usine has stood firm by striking once again, this time concerning the ‘over-regulation’ of the alternative sector. They argue that as a collective of collectives, they should only be required to have one alcohol license, and that it is the collective, not named individuals, that should be held responsible for when the terms of the licence are breeched. While in private I heard differing views about the situation from other independent cultural producers, in public all were in solidarity with L’Usine’s stance as it represented a potential threat to the entire alternative sector. In an interview with one of their employees, it was clear that the dispute was taking its toll on people working in alternative cultural venues; they admitted they might have to leave the sector in the future because ‘we spend more time fighting with the state to comply with bureaucratic regulations, then we do creating an alternative cultural experience’.
In addition to Theatre du Galpon and L’Usine, I also was able to visit two other venues in the city. One was the intriguingly titled Embassy of Foreign Artists, a lovely state-funded space for artists outside of the country to experience a residency in Geneva, and Le Velodrome, a public housing block with artistic and industrial spaces in the basement of the building. Both spaces represent some of the other challenges facing the alternative cultural sector – namely the temporary nature of the spaces and the contradiction of being either state-funded or state dependent (in terms of space granted). For instance, the future of the Embassy was clearly dependent on future funding and whether the state might require the building for some other purpose. Additionally, an artist at Le Velodrome said to me that they might just be viewed simply as ‘state tenants rather than alternative cultural producers’, despite the fact that this cultural space was run largely on a self-managed basis. Both places reveal the problem of how to create an enduring and lasting autonomous cultural infrastructure when this sector is unable to have permanent control or ownership of their premises.

Artistic ‘dark matter’ and urban creative struggles

These kinds of debates and issues are currently being mooted academically in fields like Geography, Sociology, and Cultural Studies, particularly in discussions around the political role cultural producers might play in the re-making of urban space. For instance, the well-known [7]Marxist Geographer David Harvey, in his book Rebel Cities, has argued that the contradictions of the current neo-liberal city for the artistic community means that the struggle to distinguish places through specific reference to ‘symbolic forms of culture’ can open up new spaces for alternative activities and political struggle. He suggests that: ‘...there are plenty of dissident sub-currents and discontents to be detected among cultural producers’ (p. 89).

Similarly, [8]Margit Mayer in a seminal article in 2013 ‘First World Urban Activism’ has suggestively written that the current struggle over the creative city, and who is included in it, is helping to form significant new movements and sites of protest. These, in combination with anti-austerity movements, will likely form an important part
of future urban struggles. Finally, I have been intrigued by a book I have recently come across by Gregory Sholette, in which he argues that ‘creative dark matter’ (essentially the activities of the alternative sector) that undergirds the art world, is beginning to ‘seep out’ of its historically hidden archive. He calls for artists (via Walter Benjamin) to not only create, but to begin to transform ‘...the very means of their artistic production’ itself (p. 5). For me, that includes challenging the current urban fabric and the way in which our current capitalist cities do not work well for many cultural producers.

So, despite the problems and dilemmas faced by alternative cultural producers in Geneva, I was heartened by the sheer talent and tenacity of this ‘post-squat’ movement. Despite the odds, their activities and fighting spirit gives one pause for hope for the beginnings of a different kind of city to the corporate neo-liberal model that appears to be dominant everywhere. Let us hope that ten years from now, that my friend, and many others, will know Geneva as a vibrant city of alternative urban culture, rather than just a repository for global capital and one of the most expensive cities in the world.

Robert Hollands is a Professor of Sociology at Newcastle University, and his most recent research project is on urban cultural movements and the struggle for alternative creative space in cities.

The Eschatology of Technology (2017-02-17 08:00)

In the last couple of days, I’ve been reading this book of talks by the ed-tech writer Audrey Watters. There are many things to recommend about it but the one that interests me most is its focus on the narrative of innovation. Perhaps reflecting her academic background in folklore, her interpretations of the mythical character of the stories that circulate within technology are really acute. These are forms of story-telling which urgently need to be identified and critiqued. As she writes on loc 1969:

Ed-tech now, particularly that which is intertwined with venture capital, is boosted by a powerful forms of storytelling: a disruptive innovation mythology, entrepreneurs’ hagiography, design fiction, fantasy. A fantasy that wants to extend its reach into the material world. Society has been handed a map, if you will, by the technology industry in which we are shown how these brave ed-tech explorers have and will
conquer and carve up virtual and physical space. Fantasy. We are warned of the dragons in dangerous places, the unexplored places, the over explored places, the stagnant, the lands of outmoded ideas—all the places where we should no longer venture. Hic Sunt Dracones. There be dragons.

We can see expressions of this when reading and listening to corporate speeches within the sector. Leaders of technology firms tell stories about the battles they fought, how they rallied their troops and sought to smite their enemies. But these are the more individualised narratives. On loc 951, Watters discusses the narratives of social transformation in which technology and its putative capacity for ‘innovation’ and ‘disruption’ has become embedded:

What interests me are the stories that the businesses tell about “disruptive innovation” because this has become a near sacred story to the tech sector. It’s a story of the coming apocalypse—destruction and transformation and redemption, brought to you by technology. Again, these cultural remnants of an older meaning of “innovation,” a process of transformation or renewal that has religious implications. Perhaps the salvation. Perhaps deception by false prophets. The Battles of the End Times, and you must decide which side you’re on.

Should the sociology of religion treat this seriously as a religious form that’s arisen amongst a particular powerful group within extremely specific conditions? As Emilie Whitaker pointed out in a recent essay for The Sociological Review, “there is significant scope to explore the being/becoming of the transhumanist” through ethnographic and anthropological means. Perhaps these represent the leading edge of a broader-based religious form arising under nascent digital capitalism. What Audrey Watters writes on loc 975 could easily be the starting-point for an empirical study:

The structure to many of these narratives about disruptive innovation is well-known and oft-told, echoed in tales of both a religious and secular sort: Doom. Suffering. Change. Then paradise. People do love the “end of the world as we know it” stories, for reasons that have to do with both the horrors of the now and the promise of a better future. Many cultures—and Silicon Valley is, despite its embrace of science and technology, no different here—tell a story that predicts some sort of cataclysmic event that will bring about a radical cultural (economic, political) transformation and, perhaps eventually for some folks at least, some sort of salvation. The Book of Revelations. The Mayan Calendar. The Shakers. The Ghost Dance. Nuclear holocaust. Skynet. The Singularity.

Steve Fuller (2017-02-24 19:38:21)
In the last few weeks, I’ve written a few times about the epistemological questions posed by post-democracy. This notion put forward by Colin Crouch sees transitions within mature democracies as involving a hollowing out of democratic structures rather than a dramatic shift to non-democracy. As he described it in a [1]recent interview I did with him:

I defined post-democracy as a situation where all the institutions of democracy – elections, changes of government, free debate, rule of law – continue, but they become a charade, because democratic institutions have been surpassed as major decision-making entities by small groups of financial and political elites. I argued, not that we had reached such a situation in most western countries – there is far too much lively politics for that – but that we were on the road towards it.

This runs contrary to many folk theories of democracy’s death, tending as they do to associate the end of democracy with a sudden seizure of power. It would be foolish to deny this as a possibility, not least of all because political scientists have ably theorised this as ‘authoritarian reversion’:

We think that comparative experience demonstrates that there are two distinct forms of backsliding, each with its own mechanisms and modal end-states. We call these authoritarian reversion and constitutional retrogression. The basic difference between reversion and retrogression as we use the terms is how fast and how far backsliding goes. Authoritarian reversion is a wholesale, rapid collapse into authoritarianism. Such a wholesale movement away from democracy most often occurs through the mechanism of a military coup d’état or via the use of emergency powers.

[2]https://balkin.blogspot.co.uk/2017/01/what-is-shadow-on-democracy.html ?m=1

One of the reasons conversations about post-democracy have entered the mainstream is the number of unfolding cases we can see at present. The authors of the aforementioned blog post cite Hungary and Poland but we could just as easily point to Brazil or Turkey:

Examples of retrogression abound. In both Hungary and Poland, for example, elected governments have recently hastened to enact a suite of legal and institutional changes that simultaneously squeeze out electoral competition, undermine liberal rights of democratic participation, and emasculate legal stability and predictability. In Venezuela between 1999 and 2013, the regime established by Hugo Chávez has aggregated executive power, limited political opposition, attacked academia, and stifled independent
media. Crucially, across these examples and others, democratic decay is catalyzed incrementally and under the "mask of law": It is a death by a thousand cuts, rather than the clean slice of the coup maker.

The extent to which our democratic imaginary is dominated by examples of such authoritarian reversion works to squeeze out constitutional regression. This is further compounded by what I've argued are pronounced tendencies in how we conceive of social continuity:

1. We tend towards a generic assumption of the durability of social structures.
2. We tend even more strongly towards a generic assumption of the durability of social formations (i.e. assemblages of social structures)
3. We tend to miss the origins of social formations in the intended and unintended consequences of deliberate action, as well as the interactions between them.
4. We tend to reason inductively and, in doing so, miss the possibility that the future will be radically distinct from the past.
5. Even if we deny it intellectually, we tend towards exceptionalism in how we see social formations which are deeply familiar to us.

What capacity we have to recognise the possibility of large scale change reduces it epochal transitions. We have one social formation then we have another, with a detailed conception of the process of change being subsumed into the (inflated sense of the) agency of some macro-actor whose machinations account for the real or imagined transition. This is why a gradual process of retrogression struggles to register at the level of political experience:

Retrogression, on the other hand, is a more subtle and insidious process. It involves a more incremental, but still ultimately substantial, decay in the three basic predicates of democracy, namely competitive elections, liberal rights to speech and association, and the rule of law necessary for democratic choice to thrive.

One of our core claims is that scholars have largely focused on the possibility of swift autocratic reversions such as a coup d'etat (as in Thailand, Mali, and Mauritania) or via the use of emergency powers (most famously, in Weimar Germany). But we think that threat of constitutional retrogression—a more insidious form of institutional erosion—is more substantial.

The threat is indeed more substantial and our awareness of it is limited by many factors. But some of these, I wish argue, should be understood as epistemological. A process of this sort is harder to conceive of because many of the
ways in which we tend to think of social change militate against it.

What I have written so far is prospective, concerning how we imaginatively orientate ourselves to a future possibility. But the same issue confronts attempts to conceive of what is ongoing because such a retrogression is, as these authors describe it, “a death by a thousand cuts, rather than the clean slice of the coup maker”:

Each of the individual changes may be innocuous (or even) defensible in isolation. But a sufficient quantity of even incremental derogations from the democratic baseline, in our view, can precipitate a qualitative change that merits a shift in regime classification. Understanding where, how, and whether that happens in the United States, we think, is furthered by a close study of experience of other countries.

A sufficient quantity of isolated occurrences across the system can cumulatively constitute a qualitative change in the system itself. Democracy can unravel around us, without any grand announcements of its death. Recognising the epistemological obstacles to acknowledging this unraveling can help us appreciate the urgency of the situation we are beginning to face.

The Banal Reality of Democracy’s Death (2017-02-19 08:00)

There are two issues which have long fascinated me that seem more salient with each passing day. Our [1]struggle to conceptualise long term social change from within (particularly the [2]possibility of civilisational collapse) and the [3]transition away from democratic government. Cinematic spectacle dominates the imaginary through we conceive of either, whether this is our imagery of what a collapsed social order would look like or our bleak authoritarian dystopias. As Thomas Pepinsky observes in this [4]excellent article:

The mental image that most Americans harbor of what actual authoritarianism looks like is fantastical and cartoonish. This vision has jackbooted thugs, all-powerful elites acting with impunity, poverty and desperate hardship for everyone else, strict controls on political expression and mobilization, and a dictator who spends his time ordering the murder or disappearance of his opponents using an effective and wholly compliant security apparatus. This image of authoritarianism comes from the popular media (dictators in movies are never constrained by anything but open insurrection), from American mythmaking about the Founding (free men throwing off the yoke of British tyranny), and from a kind of “imaginary othering” in which the opposite of democracy is the absence of everything that characterizes the one democracy that one knows.

Our images of collapse are perhaps no more veridical. We imagine post-apocalyptic scenarios where we entirely descend into chaos while stuck on an earth we have ruined. Or finding salvation through technology in an escape to space. But as Peter Frase argues in Four Futures, the substantive questions posed by crises of this severity are much more complex. From loc 1103:

The real question is not whether human civilization can survive ecological crises, but whether all of us can survive it together, in some reasonably egalitarian way. Although the extinction of humanity as a result of climate change is possible, it is highly unlikely. Only somewhat more plausible is the collapse of society and a return to some kind of premodern new Dark Ages. Maintaining a complex, technologically advanced society no doubt requires a large number of people. But it does not necessarily require all 7 billion of us, and the premise of this book is that the number of people required is on the decline because of the technical developments outlined in Chapter 1.

Our social imaginaries of crisis and collapse are depoliticising. They obscure questions of distribution, interest and power. They embody what the late Mark Fisher called capitalist realism: a putatively gritty look at the ‘reality’ of a situation, real or imagined, which in actual fact mythologises the system within which this representation is constructed. This is perhaps not surprising because much of the explosion of social representation has taken place roughly alongside the onset of post-democracy. We’re now seeing a deepening of the post-democratic tendency at a time of social crisis. This is why it’s crucial that we begin to think more deeply about how we represent crisis and the implications this has for our politics.

One way of doing this is to look at examples of systemic change that are presently taking place. Owen Jones has an excellent (in a depressing way) report from time he’s spent in Turkey recently:

Turkey’s regime is fast degenerating into outright dictatorship, emboldened by the imminent ascent of Donald Trump to the most powerful position on Earth. I spent last week with Turkey’s beleaguered opposition parties, newspapers and activists. Their courage is inspiring, their plight distressing.

Last July an attempted military coup failed to dislodge the autocratic president, Recep Tayyip Erdoğan. The backlash was swift. As Human Rights Watch reported, the regime took advantage of the moment “to crack down on human rights and dismantle basic democratic safeguards”. More than 120,000 Turks have been sacked, nearly 90,000 detained, and more than 40,000 have been arrested, 144 of them journalists. Turkey is a world leader in jailing media workers, with some 160 outlets closed.

The human rights situation is appalling. Those journalists and opposition activists not arrested are harassed en masse. The opposition is accused of terrorist links and subject to furious marginalisation. It’s becoming a crime to ‘insult’ the President. And something akin to an enabling act is on its way. As Jones goes on to argue, there are obvious affinities to other national contexts:

The west is largely silent. And Erdoğan is triumphalist. Last July Trump praised Erdoğan for “turning it around” after the attempted coup. And Erdoğan cheered Trump’s car-crash press conference
last week: Trump, who told a CNN reporter that the organisation he worked for produced fake news, had – according to Erdoğan – put the reporter "in his place" because media organisations such as CNN "undermine national unity".

Turkey’s fragile democracy is being bled to death. It is dusk for democracy in Poland and Hungary too, as populist rightwing governments keep the superficial trappings of democracy for appearance’s sake but hollow it out in practice. Now that the demagogue Trump is about to become the world’s most powerful man, the authoritarians believe history is on their side.

Turkey is a warning: democracy is precious but fragile. It underlines how rights and freedoms are often won at great cost and sacrifice but can be stripped away by regimes exploiting national crises. The danger is that Turkey won’t be an exception, but a template of how to rid countries of democracy. That is reason enough to stand by Turkey. Who knows which country could be next?

But how seriously do we take that possibility? We need to be careful of what Cory Robin describes as the ‘politics of fear’ reaching the left: “a politics that is grounded on fear, that takes inspiration and meaning from fear, that sees in fear a wealth of experience and a layer of profundity that cannot be found in other experience”. Such a politics of fear denies agency as well. The point is not that these changes are inexorable but that the window of opportunity, given the prevailing balance of forces, might be contracting precipitously as darkness looms on the horizon. If we conflate non-democracy with totalitarianism, we’re liable to entrench this lack of sensitivity to the possibilities now ahead of us. The reality of Democracy’s death would be banal for the majority, at least most of the time:

The reality is that everyday life under the kinds of authoritarianism that exist today is very familiar to most Americans. You go to work, you eat your lunch, you go home to your family. There are schools and businesses, and some people “make it” through hard work and luck. Most people worry about making sure their kids get into good schools. The military is in the barracks, and the police mostly investigate crimes and solve cases. There is political dissent, if rarely open protest, but in general people are free to complain to one another. There are even elections. This is Malaysia, and many countries like it.

Everyday life in the modern authoritarian regime is, in this sense, boring and tolerable. It is not outrageous. Most critics, even vocal ones, are not going to be murdered, as Anna Politkovskaya was in Russia; they are going to be frustrated. Most not-vervocal critics will live their lives completely unmolested by the security forces. They will enjoy it when the trains run on time, blame the government when they do not, gripe about their taxes, and save for vacation. Elections, when they happen, will serve the "anesthetic function" that Philippe Schmitter attributed — in the greatly underappreciated 1978 volume Elections without Choice — to elections in Portugal under Salazar.

The point is that, as Pepinsky puts it, “Life under authoritarian rule in such situations looks a lot like life in a democracy”. The sooner we realise that, the easier it is to acknowledge that people can tolerate non-democracy because democratic governance can become a low priority. This has important implications for our political orientation to the apparent fragility of democratic structures, as Pepinsky argues in the culmination of his essay:
It is possible to read what I've written here as a defense of authoritarianism, or as a dismissal of democracy. But my message is the exact opposite. The fantasy of authoritarianism distracts Americans from the mundane ways in which the mechanisms of political competition and checks and balances can erode. Democracy has not survived because the alternatives are acutely horrible, and if it ends, it will not end in a bang.

It is more likely that democracy ends with a whimper, when the case for supporting it — the case, that is, for everyday democracy — is no longer compelling.

CfP: Forced Migrants in Higher Education (2017-02-20 08:00)

Please distribute in your networks

Forced Migrants in Higher Education: Challenges and Opportunities for Visibility and Participation

A one day conference on 6th September 2017 at The University of Warwick, UK

With increasing attention being paid to refugee reception, especially within Europe in the wake of the Syrian refugee crisis, higher education institutions around the world have been turning their attention to the contribution that they might make to welcoming and supporting sanctuary seekers. The past two years have consequently seen a proliferation of 'sanctuary scholarships', and in turn researchers have started to turn their attention to the experiences of forced migrants in higher education as well as institutional responses to the refugee challenge. This one day conference at the University of Warwick, part of the annual Article 26 conference, will bring together researchers working in this burgeoning field to present and discuss new work on asylum seekers and refugees in higher education. To submit an abstract please send a 200 word (max) abstract plus a short bio to Rebecca Murray ([1]remurray1@sheffield.ac.uk) by March 1st 2017. Topics of interest may include, but are not limited to:

- The experiences of asylum seekers and refugees in higher education institutions in different host country contexts

- Institutional responses to the refugee challenge –are they adequate to the task?

- Universities of Sanctuary

- Sanctuary scholarships, widening participation and broadening access

- Hospitality and cultures of welcome

- Xenophobia, racism and feeling unwelcome on campus

- Immigration status and the experience of deportability while studying at university

The Article 26 conference will cover 3 days 4th-6th September 2017. Day one will be for sanctuary scholars to get together and discuss the challenges that they face at university, as well as take part in training workshops focussed on their needs; day two will be for administrators supporting sanctuary scholars and will be focussed on the particular challenges that they face; day three will be an academic conference where research expertise in this area will be shared. This call for papers it intended as an invitation for researchers to attend day 3 only. The fee for this one day conference will be £50. Information on the location of Warwick University can be found here:[2]http://www2.warwick.ac.uk/about/visiting/directions/. More information will follow on organisational arrangements and how to book your place at the conference. In the meantime, do contact Lucy Mayblin ([3]l.mayblin@warwick.ac.uk) at the University of Warwick with any logistical questions.

The Founder (2017-02-20 10:18)

https://www.youtube.com/watch?v=AX2uz2XYkbo

The Founder tells the story of Ray Kroc, the driven yet craven man who was the first owner of McDonalds. Not the founder, the first owner. The distinction is a crucial one and the plot of the film hinges on how it became possible for Kroc to be one but my the other. While side stepping the question of whether a historically accurate description can constitute a spoiler, I don’t want to ruin the plot of the film. Suffice to say, it revolves around the relationship between the dour though respectable McDonald brothers and the aggressively upwardly mobile Kroc who eventually elbows them out. He neither invents nor builds anything. The innovations are all theirs, from the abolition of at-car service to the carnivorous choreography of the burger assembly line. Yet it is Kroc who initiates the franchising system, bringing about a McDonalds in every state while getting rich off the speedee system developed by the two brothers.

https://www.youtube.com/watch?v=cSduLFWWnJQ

It’s in this way that The Founder is a film of the moment, a dark fable about the triumph of aggression and acquisitiveness over creativity and graft. It would have been easy to play the McDonalds brother for comic effect, reducing them to superficial anachronisms to be pushed around by the aspirational Kroc on his trajectory to being a man of the future America. But the portrayal of them is complex and multifaceted, even if it is perhaps too prone to positioning them in a way which avoids engaging with the complexities inherent in the labour relations of capitalism. Small business owners are still nonetheless business owners, even when they’re being cast in a narrative of opposition against the coming corruption that Kroc represents.

It would also have been too easy to cast them as forerunners of rationalisation, initiating a process which it took the over-weening ambition of Kroc to bring to fruition. But the reality is more complex, with their commitment to their initial project being a moral one: a commitment to rationalist choreography, the excellence that becomes possible through careful practice of a collective activity until it is as elaborately routinised as can possibly be. The reality is mundane, involving stop watches and clipboards. But they believe in what they are doing. Unlike Croc who merely sees it as a route away from his own inadequacies, an escape from the turgid rhythms of life as a traveling salesman and the possibility to win the esteem he has always craved.

It’s this representation of upwards mobility that I found really powerful. A willingness to dispense with everyone and everything on the way to the top. His job, his collaborators and his wife are all pieces of furniture to be cast off when attempting to rearrange them has grown tiresome. Slights and insults are fuel to this fire, underscoring the promise that one day he will have accumulated enough power and status to show everyone. One day no one will ever mock or deride him again. It’s a fragile self, driven by what the psychoanalyst and social theorist Ian Craib describes as fantasies of omnipotence: the inevitable disappointments of life do not give cause for reflection but rather fuels the drive towards accumulation. This self denies limits, it denies boundaries, it denies reality. All that ultimately exists is ‘I’ and woe betide those insubstantial players upon the stage of the world which happens to get in its way.

The Unreality of Reality TV: From "After Dark" towards Twitter, Big Data, and "Big Brother" (2017-02-21 08:00)

The Unreality of Reality TV: From "After Dark" towards Twitter, Big Data, and "Big Brother"
Organised by the Westminster Institute for Advanced Studies and Open Media
Fri, March 3, 17:00
309 Regent Street
Boardroom (RS117)
W1B 2HW London

Registration:

High-velocity media, superficial news and sound bite-driven debates are increasingly shaping our public discourse. The Brexit referendum and the 2016 U.S. election are cases in point. In the age of social media and digital television, what potentials and limits are there for strengthening constructive public debate? What are the roots of the present crisis and what can be done to fight back? Sebastian Cody (Open Media) and Christian Fuchs (University of Westminster) will discuss transformations of television and digital media and how they impact the possibilities for public debate. Sebastian Cody will focus on the technical and historical context as a practitioner; Christian Fuchs will discuss the acceleration of the public sphere and its impacts on society. Alternatives to superficial television are possible. The series "After Dark" – described in the television trade press as defining "the first 10 years of Channel 4, just as "Big Brother" did the second" – ran between 1987 and 2003. Based on principles developed for "Club 2", a debate programme broadcast by the Austrian Broadcasting Corporation ORF, "After Dark" was unique in the history of British television. The programme's ground rules of absolute live broadcasting (no editing or delay) and open-ended intimate discussion meant that guests’ utterances were uncensorable. Roly Keating, former BBC controller and current Chief Executive of the British Library, described it as "one of the great television talk formats of all time". The subjects discussed ranged widely across national and international news events, while also exploring personal and private matters. As the programme faced challenges from broadcasters, government, the legal system and various vested interests, it was often a source of controversy. Later iterations of 'reality TV' have shaped the current media culture, which is dominated by commercial logic. News and debate are served up as fast-paced entertainment on social media, and big data exacerbates the speed and superficiality of news, undermining possibilities for controversy and fruitful communication. Sebastian Cody has been responsible for the production of "After Dark" throughout its history. As CEO of the production company Open Media, he has made many dozens of network television programmes, from game shows to investigative documentaries. In 2010 his company launched an online social history of Britain for the academic community alongside the BFI, BBC, The National Archive and others. He acts as a consultant for companies and NGO's and has been attached to the University of Oxford since 2001. Christian Fuchs is Professor at the University of Westminster, Director of the Westminster Institute for Advanced Studies, and Director of the Communication and Media Research Institute. His research focuses on critical theory of society and the critical study of the media, communication(s), and digital media's role in society. His most recent publications are the monographs “Critical Theory of Communication” (University of Westminster Press, 2016) and "Social Media: A Critical Introduction" (Sage, 2017; 2nd edition, forthcoming). – Forthcoming conference: The 6th ICTs and Society Conference: Digital Objects, Digital Subjects: An Interdisciplinary Symposium on Activism, Research & Critique in the Age of Big Data Capitalism [2]http://icts-and-society.net/events/digital-objects-digital-subjects-a-symposium-on-activism-research-critique-in-the-age-of-big-data-capitalism-the-6th-icts-society-conference/ With Antonio Negri, Antoinette Rouvroy, Christian Fuchs, David Chandler, Etienne Turpin, Jack Linchuan Qiu, Jodi Dean, Kylie Jarrett, Orit Halpern, Paolo Gerbaudo

Migration and Crisis in Europe Special Issue - Last Call for Papers (2017-02-22 08:00)

Sociology 2018 Special Issue — Last Call for Submissions!

Sociology’s 2018 special issue will be on the theme of Migration and Crisis in Europe. The issue will be guest edited by Nick Dines, Nicola Montagna, both at Middlesex University, UK and Elena Vacchelli, University of Greenwich, UK.

The editors are currently calling for papers to be submitted to the issue and relevant topics might include the following areas:

- Response of migrants and migrant organisations to the economic crisis.
- New forms of labour mobility and the transformation of migrant labour markets.
- Border struggles, migration solidarity movements and/or anti-migration politics in light of the current ‘humanitarian crisis’.
- Migration and social reproduction in a context of economic crisis and welfare restructuring.
- Interpreting the transformation of EU migration and border management through the perspective of crisis.
- Changing internal and external borders in the light of current migratory flows.
- The politics of humanitarianism and/or securitization.

For more information on the aims and scope of the special issue, please see the full call for papers [1]on the BSA website. To submit your article please visit: [2]http://mc.manuscriptcentral.com/soc. The submission deadline is 13 March 2017.

For any queries regarding the special issue, please contact:
Nick Dines ([3]nick.dines@uniroma3.it)
Nicola Montagna ([4]n.montagna@mdx.ac.uk)
Elena Vacchelli ([5]E.Vacchelli@gre.ac.uk).

The Sociological Review Early Career Researcher Event: Senior Seminar with Rivke Jaffe

The Manchester Museum
Friday 28th April 2017
10.00-17.00

The Sociological Review Foundation invite applicants to take part in a workshop with Rivke Jaffe (University of Amsterdam) taking place in advance of our Annual Lecture.

If your research involves thinking and dealing with ethical, political, positionality issues in ethnographic writing while focusing on ‘sensational’ topics, such as crime, violence, homelessness, this workshop offers a fantastic opportunity to work through critical issues in your work with Rivke Jaffe.

Rivke Jaffe is Professor of Cities, Politics and Culture in the Department of Human Geography, Planning and International Development Studies at the University of Amsterdam. Her research focuses primarily on intersections of the urban and the political, and includes an interest in topics such as organized crime, popular culture and environmental pollution, drawing on fieldwork in Jamaica, Curacao and Suriname. She is currently leading a major research program on public-private security assemblages in Kingston, Jerusalem, Miami, Nairobi and Recife, studying transformations in governance and citizenship in relation to hybrid forms of security provision. Her publications include Concrete Jungles: Urban Pollution and the Politics of Difference in the Caribbean (Oxford, 2016) and Introducing Urban Anthropology (with Anouk de Koning, Routledge, 2016).

Successful participants will also have the opportunity to talk about publishing from your thesis with our managing editor, Michaela Benson and senior commissioning editor for social sciences at Manchester University Press, Tom Dark is a senior commissioning editor at Manchester University Press (MUP).

Format
The day is organised so as to allow discussion between delegates and workshop leaders. All participants will be supplied with preparatory reading, and will be expected to contribute actively towards discussion and we expect successful applicants to attend the whole day. Places for delegates will also be reserved at our Annual Lecture following the workshop.

Application
This event is FREE but places are limited to 18 people. To apply for a place, please fill in this online application form by 17.00 on 24th February 2017: [1]https://docs.google.com/a/thesociologicalreview.com/forms/d/e/1FAIpQLSde0IC_tAT-agCcApOE8_6c9_ckrNyiEu6ia98i5ewwGYDyw/viewform Applicants will be notified by 13th March 2017. All inquiries about this event should be directed to Jenny Thatcher: [2]events@thesociologicalreview.com This Early Career Researcher event will be followed by The Sociological Review Annual Public Lecture: ‘Cities and
the Political Imagination’ which will be delivered by Rivke Jaffe. You can register for the Annual Lecture here: [3]https://www.eventbrite.co.uk/e/cities-and-the-political-imagination-the-sociological-review-annual-lecture-2017-with-rivke-jaffe-tickets-31372245230

Reflective Practice and Interdisciplinary Approaches to ‘Digital Social Research’ (2017-02-23 15:34)

By William Housley

Reflecting on interdisciplinarity in the context of digital social research is a worthwhile exercise. There is a significant discrepancy between the rhetoric of interdisciplinarity and its actual practice and accomplishment. Sociology, as a global disciplinary enterprise, has participated in and studied interdisciplinarity and collaboration across a number of fields, through a number of topics, in a variety of ways and in relation to a range of problems. One field that has routinely confronted matters of interdisciplinarity and collaboration is computer supported co-operative work, which has turned these and other practices into research problems and topics of inquiry in their own right alongside other concerns and preoccupations.

In recent years sociologists (and social scientists in general) have been working alongside computer scientists in what has been assumed to be in increasing numbers, or at least greater regularity, than previously. This is explained in part by the explosion of interest in social media-as-data (Housley et al, 2014, Edwards et al, 2013) and a cross-disciplinary interest in the emerging contours of digital, networked and automated societies as a key aspect of social change and transformation at the beginning of the C21st. It is often assumed that an interdisciplinary approach is required, due to the need to scope and understand these changes and related phenomena through a range of methods, theories and data and in ways that synthesize a firmer grasp of current social and computational realities. Consequently, interdisciplinarity is conceived as an epistemological enterprise, but, as I will attempt to tentatively outline in this blog, it is also has ontological features and consequences.

Questions of interdisciplinarity within digital social research contexts have recently identified language as a key area through which collaboration can be hindered and the realization of interdisciplinary working between sociologists, say, and computer scientists impeded. Of course language, as a communicative practice, is key. As are the practical means through which theorization, methodological strategies and the collection and curation of data are accomplished; in ways that can answer jointly identified problems and questions e.g. whether social media data can be used to augment traditional social scientific methods for understanding public reaction to signal events? However, the tools and framework for interdisciplinary working require reflection and work by those who wish to participate. The problems and challenges associated with interdisciplinary collaboration are not merely those associated with translation and are therefore not reducible to a single fix. There is no interdisciplinary Babel Fish; and no single solution that stands outside a range of practices that are built through interaction in interdisciplinary settings and contexts.

For example, we might wish to consider the ways in which teams are organized, how the choice architecture of collaborative tools that we develop or use are shaped, how we foster the ability to take another disciplines ‘point
of view' and how we participate in and attend to the negotiation and accomplishment of both a shared perspective and our own disciplinary awareness at one and the same time.

A key issue here is the ways in which core disciplinary concerns and questions coalesce and shape how, for example, an interdisciplinary research group may approach a specific research problem. This is more than language and more akin to a requirement to spend some time immersing oneself or at least systematically reflecting on different disciplinary forms of life and the social life of paradigms. Whilst I am looking at a problem or phenomenon in terms of prosaic questions such as social organization my computer scientist friend maybe viewing these through the lens of information and dreams of automation.

A useful resource here can be found in Schön's ideas surrounding 'the reflective practitioner' (1983). This was a popular trope in the late 1980's and 1990's for developing the knowledge capacity of key professional groups such as nurses, social workers, engineers, architects and teachers as they confronted new problems, institutional structures and the reorganization of working life around teams and inter-professional working and delivery. I re-introduce it now as it might be an effective starting point for thinking about how we might promote reflective engagement by participants within interdisciplinary contexts such as 'digital social research', 'computational social science' and related fields such as 'social media analytics'; betwixt and between different academic groups and aligned 'knowledge agents' often collaborating and competing, working and fighting, in liminal, status poor spaces.

Schön (1991:269) in his discussion of reflective practice argues that variations between professions (as the modern 'knowledge agent' ideal type) can be contrasted with specific constants. He argues that these constants provide for a means of considering the variation of practice between different professions. Members of disciplinary cultures are readily socialised into patterned forms of knowledge, interpretation and practice. The academic tribes of 'sociologists', 'computer scientists' or 'discourse analysts' and 'social statisticians' are anthropologically consistent in this regard. Whilst wider institutional and socio-technical forces are revolutionising knowledge work in ways not anticipated twenty to thirty years ago, distinct 'professional groups' remain with new ones emerging on the horizon e.g. the data scientist.

According to Schön (1983:270) these constants or 'patterns' associated with knowledge groups and agents can be described in terms of the following:

- The media, languages, and repertoires that practitioners use to describe reality and conduct experiments
- The appreciative systems they bring to problem setting, to the evaluation of inquiry, and to reflective conversation
- The overarching theories by which they make sense of phenomena
- The role frames within which they set their tasks and through which they bound their institutional settings

Perhaps these four phenomenological constants could form a matrix through which we can begin to link reflection with a more mindful form of reflective practice within interdisciplinary research contexts. In terms of the case being considered, perhaps collaboration between computer scientists and sociologists (and other social scientists) might benefit from some form of systematic training for those embarking on cross-disciplinary engagement in the hope of charting new territory and understanding new things through innovative theoretical, methodological and data driven interdisciplinary strategies. At the very least it is worth thinking about as a means of informing the process through which we become practical interdisciplinarians.

Interdisciplinarity defines us as medical educators (2017-02-23 15:36)

By Mairead Corrigan, Jenny Johnston and Helen Reid

We are a small research group working in medical education ( #meded), a job which entails embracing and challenging subject, epistemological and methodological boundaries. One of us is a sociologist and two of us are academic GPs. We are fortunate to benefit from institutional support and wonderful colleagues. Even so, we still find ourselves frequently engaging in explanations of our research methods and epistemology to someone’s polite bafflement. Medical education is a broad church, drawing its membership from a diverse band of (among others) psychologists, sociologists, ethicists, clinicians/healthcare professionals and educational scientists. Each subgroup of medical educators brings their own understandings and cultural traditions to play. Even within the subset of clinical academics, there is a great variety of cultural norms and social practices, with identity based on specialty background. For two of us (H and J), our clinical background as GPs forms the bedrock of our educational work.

This polyglot mix makes the field of med ed research something of a patchwork, but also allows those within to draw great strength from its diversity. Coming together as a research group, we have realised that we work in a young and highly contested field. We are constantly learning to locate ourselves, and our relationships to each other, within competing epistemic traditions. We have begun to appreciate tensions and synergies, and to identify key assumptions in the literature which sometimes made no sense at all because they were written in an opposing tradition. Epistemological divisions are written large in our field, becoming a deeply personal matter of identity as people choose to embrace social scientific roles, or to align themselves with the world of clinical medicine. The dominant paradigm in biomedical research is strongly positivist. Medicine itself, in theory and practice, still builds on strongly dualist foundations. What Foucault termed ‘the clinical gaze’ is still highly influential; that is, a highly rational scientific and technological practice. Power is afforded to the clinician and the patient narrative is suppressed in
favour of objectively elicited signs of illness.

For both of us who are clinicians, there is a deep tension between this worldview and our lived experiences of life and work as general practitioners. Such experiences inevitably raise questions about the constructed nature of illness, stigma and healthcare provision which inform our practice, teaching and research in medical education. A constructive dialogue is created between educational work and our similarly vocational clinical practice, deepening and enhancing both. For M, the sociologist amongst us, the strong emphasis on reliability and standardisation within medical education work against a lived understanding of illness experience. Here there is no right or wrong answer, only multiple shades of grey. In our experience, students sometimes may regard the sociology of health and illness and public health as of lower status than anatomy, physiology and clinical skills. As a sociologist, M works hard to keep the patient voice alive by exposing students to patient narratives.

It is clear that medicine’s positivist hegemony translates into medical education. Our constructionist research perspective jostles for position with an influential post-positivist psychology based on measurable traits and behaviours. This is not in any way to demean the large contribution of these scholars; rather, we want to highlight that benefits accruing from different epistemological perspectives have not always been well recognised. Journals often reflect these tensions. A reviewer from an alternate tradition can easily result in paradigm misunderstanding and friction. Existing as a boundary object between academic disciplines is a challenging situation for a researcher. There is a serious risk that neither tradition takes your work seriously. Interdisciplinarity is hard. Yet as educationalists, we believe our own careers are about lifelong learning, and we have a lot to learn from each other. As a team, we have all travelled on an epistemological journey. Ultimately, we have to produce work which can be translated into hard educational or patient outcomes, and as a group, we currently occupy a strongly constructionist and critical position.

Challenging a dualist, Foucauldian view of medicine is a prime concern for all three of us. Embodied illness experience and patient voice are powerful teachers, and critical perspectives have much to offer the developing doctor. Given that we train doctors, it is not surprising that discourses of accountability and technical practice are dominant. Sometimes our work counters these assumptions. More subtly, sometimes we choose instead to work with this dialectic to push two paradigms closer together, and so create new possibilities through symbiosis. We use the dialogue between our different experiences and perspectives to better use the cultural affordances of our field. Interdisciplinarity is a dynamic process of co-construction, of negotiation with diverse colleagues, of creating useful dialogues which benefit patients and doctors, of challenging cultural boundaries. Medical education is a grounded, pragmatic social science. We are critical researchers. We do things for the betterment of patient care and patient experience, and to improve the work and wellbeing of doctors.

Margaret Cupples (2017-02-27 20:47:32)
Very interesting and thought-provoking discussion - demonstration of super interdisciplinary work. I look forward to reading/hearing about the real world impact of interdisciplinary working on patient care and experience, and the work and wellbeing of doctors.
The lived experience of interdisciplinarity in social research

By Murray Goulden

My first experience of interdisciplinarity was genuinely exciting to be a part of. To some degree of course the quality of the experience was shaped by the particular focus of research, and the characters of those on the team. But fundamentally, the work of attempting to understand a shared problem, and enact a shared solution, was deeply satisfying, often surprising, very difficult in usually a good way, and only on occasion terrifyingly overwhelming.

As the talk of ‘solution’ suggests, this was interventionary project, tasked with achieving ‘impact’. Public Access Wi-Fi Service (PAWS) was an Internet access model by which existing domestic broadband connections could securely share a small slice of connectivity (2mb) with others living close by. In doing so it would address one barrier to online access, that of cost (and/or credit worthiness). It was never intended to address absences of relevant skills or positive meanings, but previous work suggested that cost was a big enough hindrance for enough of those categorised as ‘digitally excluded’ that it was worthwhile to tackle on its own.

At the time, and still today, this struck me as a noble goal to pursue. We cited a UN report that spoke of digital access as a human right, and whilst acknowledging the limitations imposed by today’s privatised market orthodoxy, spoke of the possibilities of a National Broadband Service. To be genuinely invested in the social value in your project is enormously beguiling, perhaps dangerously so in hindsight.

Our approach felt resolutely socio-technical. Computer scientists would create the software which carried this transformational potential; two sociologists (of which I was one) would study its deployment in a real world setting. We would do it at scale - up to 50 installations - and at the margins – a socio-economically troubled inner city estate. This was ‘in-the-wild’ research of a kind that simply isn’t done (perhaps with good reason given what followed). The ‘wild’ of technology deployments is often rather tame – it is outside the lab, but it’s a world conterminous with the white, middle class and educated inside. By necessity of seeking out the digitally excluded, we had to go further, venturing “across the parking lot” (Kjeldskov & Skov 2014) and beyond.

In hindsight it is easy to disassemble this endeavour and critique the techno-utopianism which lay at the heart of it. That though is not what I want to write about, certainly not directly, not least because PAWS still feels to me to have been genuinely brave, and if it was flawed, it tried. The detachment of side-line critique is easy by comparison.

What I do want to write about is the experience of doing PAWS. Judged by its starting goals, PAWS ultimately failed. We – the sociologists – never really got to study PAWS in its intended setting. Instead, we worked, endlessly, at embedding it in the setting. We rarely got to step back and observe. The work of embedding a research technology in a setting is little spoken of. Rare exceptions include Peneff’s (1988) study of French fieldworkers carving out the necessary agency to adapt formalised, large scale survey instruments to localised conditions, and Tolmie et al. (2009) on ‘digital plumbing’, that is of reconciling deployed technologies with the social worlds in which they are to be set loose. Here I want to highlight three challenges that emerged from this work of embedding. These are discussed in detail in our paper ( [1] Goulden et al 2016

4898
Problems of time: When, as sociologists, we approached this collaboration with computer scientists, we were aware of a long history of ethnographic work within CS, primarily in the form of the subdiscipline of Computer-Supported Cooperative Work (CSCW). We failed to appreciate that PAWS was different from the canonical CSCW study, in which an existing or novel technology is studied within an organisational setting. Perhaps the single most important difference was this question of embedding – in the typical CSCW study, the embedding is being done by the organisation, and the ethnographer is there to study it. We were attempting to do both, simultaneously. Furthermore, our setting – a marginalised inner city estate – was significantly more socially 'distant' from us, as middle class white-collar professionals, than any typical office might be. The result of these differences was that the work was slow. There was not prospect here of 'quick and dirty' ethnography of the kind which is commonplace is traditional technology-led projects.

The cadence of the work was entirely out of kilter with that of computer science. This is a field in which talk of iterative, "agile" development abounds, where ‘Moore’s Law’ dictates that the capacity of the underlying technology doubles every 18 months, where Mark Zuckerberg extols the mantra of “move fast and break things”. As strangers, and guests, in a foreign land, we could not afford to break anything. It wasn’t that the computer science work was constantly ahead of us. Rather that the development cycles of the two disciplines were rarely in sync, which greatly complicated everything else.

Digital plumbing: in turning attention to the work of installing deployed research tech in homes and other non-lab settings, Tolmie et al. (2009) were drawing attention to how fundamentally socio-technical this work is. This was all the more so in PAWS, where the division of the work into lab-based ‘technical’ labour, and real world ‘social’ labour was split cleanly between technologists and sociologists. The work of doing the embedding of technology was all our own then. The task did not appear overly complicated – plugging-in additional routers in the houses of those ‘sharing’ their signal, and installing software on the devices of those making use of this signal. The latter commonly threw up all kinds of errors and snags which slowed us down, but in and of itself was rarely insurmountable.

What was more so was the range of the Wi-Fi which underpinned the entire system. Huge amounts of additional labour were generated by the fact that Wi-Fi signal strength was highly unpredictable. Sometimes, due to the specific local material circumstances – the positioning of walls, trees, inclines etcetera – it travelled far further than anticipated. More often it didn’t come close. We had been caught out here not by the labour which falls between disciplines, but by the knowledge. It turns out that real world Wi-Fi performance is a poorly understood phenomenon, beyond perhaps very specific niches. As one of the computer scientists on the team summarised:

Radio physicists know what the answer is in theory; the lab engineers know what the answer is by simulation; computer scientists don’t care what the range is, they care what the throughput or latency is.

The greatest challenge for our fieldwork came when this technical labour combined with the demand for emotional labour. Peneff (1988) speaks of the means by which fieldworkers “cope” with the many ambiguities and tensions of fieldwork, in a setting in which they must execute a formalised task in manner naturalistic enough that the human participant might engage as if it was a conversation with a trusted acquaintance. Trying to deduce why an iPad was refusing to connect to PAWS – instead complaining of an ‘Out of date security certificate’ – whilst simultaneously presenting the required attention and sympathy towards a participant met five minutes earlier, who was now relating her recent ordeal at the local hospital following a heart scare, it was difficult for us not to look on Peneff’s fieldworkers with envy. This simultaneous performance of emotional and technical labour, orientating to both
human and non-human, is a challenge particular to this form of fieldwork.

**Going native:** Doing interdisciplinarity means stepping outside traditional discipline boundaries and making a commitment to meaningful engagement with what may be very different logics of enquiry. There is a balancing act to be done here. As social scientists we should maintain a critical appraisal of the technological programme and its conception of the setting. Perhaps too enamoured by the laudable goals of PAWS, we did not always do this, becoming too close to the project’s “technical boosterism” (Savage 2015).

Within PAWS this was realised in how our original plan constituted its participants. During these initial stages, the greatest concern amongst the project team was that PAWS might fail to find enough residents willing to act as sharers. It was easy to adopt the computer scientists’ concerns that the notion of sharing a resource with strangers would be rejected by many, or that security fears might prove insurmountable. Those using the system were less of a concern: it was thought that the combination of free access to the Internet and a £50 voucher for participating in the research would be sufficiently compelling for those with limited resources.

In hindsight it became clear that in buying into PAWS’ technological programme we had been insufficiently sensitive to the social orientations of those we were seeking out. We were appraising the project through the eyes of the technologists not the members of the setting. Those using the system were liable to be amongst the most marginalised of a marginalised community. The implications of this for the door-to-door recruitment we conducted are made clear in McKenzie’s (2015) ethnography of life on inner city estates (actually conducted on another Nottingham estate just 3 miles away from ours). She writes

> it was actually very impolite to turn up unannounced. This practice was always about risk management - there was a lot of fear and suspicion on the estate, fear of the unannounced visitor, which meant the police, the ‘social’, the TV licensing people. It always meant problems, and doors would not be opened if they didn’t know who was on the other side of it. (p. 89)

Our experience of going door-to-door seemed to support McKenzie’s account: potential users of the system were hard to find, and many properties never answered the door, despite knocking on more than one occasion, and often when it was clear someone was home. The result was that we never recruited anything like as many users as we hoped for, and this was ultimately where the project failed to achieve its original goals.

---

Where PAWS succeed was in demonstrating some of the challenges to be overcome if we are to become serious about doing ‘in the wild’ research. In turning increasingly towards applied, technology-led research, directed towards specific ‘social problems’, we overlook at our peril the work of embedding, both as a task in itself, and in what it implies for interdisciplinary collaboration.

A few years ago I would confidently have said that I am a sociologist, and nobody would have been able to tell me otherwise. My BA in sociology was followed by an MA in Social and Cultural Geography (after a year of dabbling in the “real-world” of course). I was fascinated by the engaging work done in critical geography, and the potential to mix sociological perspectives on social practice within the gamut/realm of space. This distanced me a little from Sociology, but I thought nothing of it seeing as the work I hoped to do was often covered by ‘Development studies’ and other such departments employing sociological frameworks. At the moment, I am based in a Physics department, exploring the practices and motivations of students in undertaking employability development opportunities.

My current project is supported by the department in which I function alongside supervision in the university’s education department. The aim of funding such a project was to enquire into factors that influence the employment prospects of physics graduates. There is a considerable amount of the literature that suggests that disparities in engagement with employability development prospects and in employment can be understood through a Bourdian understanding of the reproduction of class privilege. To take this further, I attempt to argue that in order to understand whether employability truly can be developed is by understanding motivation, practice, values and in combination, presentation (of self). It is safe to say that my project is largely within the realm of the social sciences.
Of late, there has been a keen interest in the work done in social science by those in the natural sciences, particularly within the context of Higher Education increasingly stressing on the need to consider “Learning, Teaching and Assessment excellence”. Physics has been relatively late to the party, but they are making considerable strides in the ‘pedagogy’ direction. Being a researcher within 'Physics Education Research' (PER) groups, I find myself in a situation that can be liberating yet at times particularly challenging. It is liberating because it permits me to explore and almost re-discover Sociology and the social sciences. In having to explain sociological concepts the fears of my education serving no particular purpose (a Sociology degree is often wrongly seen as ‘the easy way out’) are eliminated. I am confident in who I am as a social scientist. This does not give me a free pass however. It motivates me to maintain the importance of being rigorous and critical in research, and thus I take it on myself to improve my understanding where needed.

The challenges I have faced have been both personal as well as external. Personally, I wonder if my dabbling in different disciplines has left me homeless in academia. When interacting with some social scientists who have taken a relatively consistent disciplinary trajectory, I have had to respond to reactions of surprise and sometimes condescending irritation expressed for my having ‘gone to the dark side’. But I have not changed. I am a social scientist. Simultaneously, when conversing about my project on student motivation and practice in Higher Education, I must endure expressions of a preference for quantifiable truths from natural scientists whom themselves undertake pedagogic research. There are no truths. Neither in the social sciences, nor in the natural sciences. There are only ideas and speculations – the best probable explanation. It is for these reasons that I find interdisciplinarity both an enrichening and frustrating experience.

Another observation I have made from my work thus far is the appropriation of social science terminology. I suspect that much of what we do today in the knowledge society requires some amount of sophistication; at least we hope to present ourselves thus. To this end, we adopt scientific terminology be it from the social sciences and/or natural sciences. However, these terms when flowing in daily parlance may lose their essence. When they are reproduced in this way an academic environment, semi-detached from its originating conceptual framework, this becomes problematic. Take my area of study for example. Certain forms of presentation that become acceptable and normalised when apparently "developing” employability skills are really a reflection of cultural capital developed through social reproduction of privilege. I have heard (and sometimes read) propositions that students need to embrace their social and cultural capital to help them become employable. Others have suggested that there be a measure for cultural capital. It becomes fairly challenging to respond to these perceptions because the concept of cultural capital emerged as an explanation of how class reproduces itself through 'cultured' practice, sustaining social stratification. Further, to an extent the concept tends to explain non-quantifiable aspects of self that sustain said stratification.

The topic of methods can also be a double-ended sword sometimes. Inclusion of a social scientist in discussions around methods to explore education practice is helpful; it is a fact that we have dedicated years to studying social phenomena and behaviour. Yet, when suggestions are made to adopt qualitative research to enquire into persistent problems, an automatic dismissal of such suggestions because the "efficacy of the tool" is not quantifiable does little to support interdisciplinary research. True, methods need to be adopted where appropriate to get the best possible explanation for our questions. Therefore, while on the topic of methods, statistics is not a solution to problems – whether through questionnaires or surveys or through the quantifying of qualitative data. However, it is also wrong to presume that statistics do not have a place in social science research. Unless we are willing to learn from each other, progress in interdisciplinary work will be slow.
In everyday life, from my experience as a PhD researcher I have found that being persistent in negotiating your own space is integral to ensuring your project does not face threatening challenges. At the start of my project, I found it surprisingly difficult to explain (or perhaps to have my explanation understood) that my background made some of the required training and procedures in Physics irrelevant to me, such as with teaching assistance training. In this case, although the department offers training, I could not possibly support teaching – unless of course I could lead a tutorial on phenomenological understandings of perceptions of star formation. Yet other social science departments too did not know how to react to my situation. I have yet not received training for reasons that relate to structural changes as well as the time at which I began my research. However, I have found it particularly helpful that my supervisor is supportive and proactive. Further, by taking the time to explain my position, and taking my concern to a higher level when relevant/indicated, I have found myself in a fairly comfortable niche, only 8 months in.

Relevant to this, it would appear to me, is the role of process-establishment. Very often, the interdisciplinary researcher may find themselves in situations that do not have straightforward answers. Here, we must ask the right questions and eventually come to a mutually-beneficial conclusion. For example, as there have been no social science-driven postgraduate research in my department in Physics previously, those of Education have been adopted – the department with which my project is collaboratively supervised. Often overlooked however is the role of the individual in this process – how does their background and sense of (academic) self interact with the processes with which they are expected to engage? I find myself in tense moments of conflict owing to my prior experience in other departments – why should I not be stressing on my conceptual framework when that is what I would do otherwise? – and having a limited understanding of what I do need to do was a concern that was fortunately addressed early on in my course.

I suspect some of these experience may seem disjointed, but the problems that interdisciplinary researchers face can range from mundane, everyday bureaucratic processes to essential philosophical praxis. There are challenges that exist and some that lie ahead. All the while, we need to also consider the purpose of the research that we do, without presuming that interdisciplinary enquiry is inherently less than or better than straightforward trajectories of enquiry into knowledge.

» A new project on the lived experience of interdisciplinarity The Sociological Imagination (2017-02-23 15:48:44) 
[...] Negotiating spaces of interdisciplinarity by Sinead D'Silva [...]

Afra (2017-02-23 16:52:29)  
This could not have been written at a better time! I am going through a similar yet more complex dilemma. In Fairclough’s terms, the “transdisciplinary” nature of my work within Discourse Analysis has created an endless struggle for me since the beginning of my PhD journey! My initial proposal was referred to the School of Education, since the domain of my interest is higher education and have since been battling my way back into linguistics! What makes things more complicated is that different schools within different universities approach ‘fields of knowledge’ or ‘disciplines’ in different ways. Thus, in my case, I am a ‘proper linguist’ in some places and a very ‘odd linguist’ in others!! Basically, a homeless linguist at the moment until I find myself a school that appreciates the kind of work I am doing! :(  

Sinead (2017-02-24 14:31:02)  
Hi Afra, I actually met someone in a similar situation as you the other day - they consider themselves a linguist, but has been put in an Education department! I have personally come to terms with being based in Physics as a Sociologist (I’m now 14
months into my PhD), but I do feel homeless in academia. I suspect the only thing we can do is rely on our own resilience, which is a little grim as I would have expected academia to be more understanding of non-normative realities!

Afra (2017-03-01 11:00:07)
Yeah, resilience is key. I’m afraid though that I would have to take a detour to achieve resilience! I’ve decided to transfer for the second time; this time to another institution.. hopefully I’ll get to call it home and conclude my PhD in a more a stronger stance! Good luck with your studies and I really hope you’ll get to feel more at home.

A new project on the lived experience of interdisciplinarity (2017-02-23 15:48)
We’ve launched a new project on the lived experience of interdisciplinarity with these four pieces:

- [1]Negotiating spaces of interdisciplinarity by Sinead D’Silva
- [2]The lived experience of interdisciplinarity in social research by Murray Goulden
- [4]Interdisciplinarity defines us as medical educators by Mairead Corrigan, Jenny Johnston and Helen Reid

Doing Social Media Analysis with Free Tools (2017-02-24 08:00)

Doing Social Media Analysis with Free Tools

A Digital Sociology Study Group Event

28 April 2017, 10:00-13:00
Leeds Beckett University, UK

[1]https://www.britsoc.co.uk/events/key-bsa-events/doing-social-media-analysis-with-free-tools/ Analysing Data from Twitter, Youtube, Facebook and Smartphones Social media are now a central part of many people’s lives. When we send messages, comment, upload photographs and make connections with others we are creating new kinds of networks. This creates vast amounts of data which hide valuable insights. This workshop will introduce a range of free tools which can help you to collect and analyse these data. It will also help you to tackle the even
thornier issue of how to interpret these data as a sociologist. We will engage in hands-on workshop activities on data-driven digital methods and their research applications in relation to people’s lives. The aim is to introduce critical engagement with the digital tools as well as the application of these tools to research questions. The workshops will be conceptually grounded in the problems of public communication and privacy, digital media production and consumption, and the ethical issues associated with big/social data and digital methods in the context of digital media environments. Outline of the event Tools to be introduced will enable researchers to collect data from Smartphones; Twitter; Youtube; Facebook as well as visualise and export the data for publication without any programming skills required. Asking questions regarding every decision in these processes is a necessary component of thinking sociologically while archiving, visualising and interpreting the data being collected. We will work through four main themes: - Social Media Data Collection - Social Media Data Analysis - Visualisation and Presentation - Ethics of Mapping Social Media Convened by Dr Steven McDermott <[2]http://www.arts.ac.uk/lcc/people/school-of-media-teaching-staff/dr-steven-mcdermott/> who lectures on contemporary developments in media and communications at the University of the Arts London. Booking Open BSA Member: £5 Student: £7 Non-Member: £10 Book now! <[3]https://portal.britsoc.co.uk/public/event/eventBooking.aspx?id=EVT10625>

Digital Methodologies: Beyond Big & Small Data (2017-02-25 08:00)

The Sociological Review Foundation is delighted to announce that after the success of last year ECR writing retreat we have commissioned Rowena Murray to deliver another Writing Retreat for social scientists in 2017. We anticipate that this will become an annual feature of our offer for ECRs. You can find out more about Strictly Come Writing [1]here.

Murray has devised and delivered structured writing retreats to support academics by providing dedicated writing time done in a group setting. To find out more about this approach see [2]here.

On Social Acceleration (2017-02-27 08:00)

IFRAME: [1]https://www.youtube.com/embed/VHk1iPvujic?version=3 &rel=1 &fs=1 &autohide=2 &showsearch=0 &showinfo=1 &iv_load_policy=1 &wmode=transparent
Earlier on this month, Hartmut Rosa gave a fascinating lecture at the LSE, marking the launch of this new book on the Sociology of Speed. It’s a great overview of his theory of acceleration, but it also included some things I hadn’t encountered before:

1. His intellectual trajectory was shaped by encountering Charles Taylor’s work while at the LSE for two terms at the age of 23. I knew Taylor was a huge influence, given Rosa’s PhD was devoted to his work, but I hadn’t realised how linked to speed his interest was. As he describes it in the lecture, he was fascinated by Taylor’s focus on the role of strong evaluations in structuring how people orientate themselves to their lives but felt it lacked an important temporal dimension. Evidently, people often address the urgent rather than the important, suggesting temporal constraints subordinate ultimate concerns to practical considerations. My reaction to reading Taylor as a philosophy student was an overwhelming desire to sociologize his work, something Rosa does with an astonishing degree of systematicity, though of course there are alternative ways we could approach this task. Consider Doug Porpora’s wonderful Landscapes of the Soul.

2. I recall the ‘contraction of the present’ from Social Acceleration but I’m unsure if it is the framing that has changed or my response to it. Rosa’s argument is that patterns of association and social practices change at an increasing rate. This means that the “decay rates of knowledge increase”: the purchase of our knowledge about the world and how it works degrades at an increasing rate because the reality of that world and how it works undergoes change at an increasing rate. The period of stability when “you know how the world works, who is where and how one does things” is contracting. If one accepts this claim, it has huge ramifications for how we engage with the idea of “information overload”. There’s a temporal dynamic to the overproduction of facts which is too little analysed.

3. I like his description of the subjective side of the accelerating pace of life as mysterious. We respond to this challenge by attempting to speed up life, seeking more episodes of action per unit of time. We multi-task, speed up each action and try to eliminate pauses and intervals. I like his example of taking the last possible train to an event, in order to avoid waiting once there. This is something I do entirely habitually, such that I rarely even consider allowing for contingencies unless there’s some reason to expect them. But when it goes wrong, the time saving action gets revealed as a false efficiency. There are so many examples like this, where what feels like saving time in fact costs us more time at some unpredictable point in the future. I’d like to hear more from Rosa on the ‘mysterious’ character of the subjective side of the accelerating pace of life because I think it suggests something important about chronoreflexivity: the limited scope of how we orientate ourselves to time & the way in which habitual orientations circumscribe considered decision making about efficiencies.

4. He offers the useful trajectory of the downwards escalator which I don’t recall encountering before. This is a metaphor for how we find ourselves compelled to “run faster and faster to keep pace with the world”. Rosa suggests we stand on a downward escalator relative to every system we’re embedded within and that we stand on many overlapping escalators. Furthermore, “functional differentiation increases the number of escalators on which we stand”, proposing that this issue can be placed at the heart of sociological analysis. Every change within each system necessitates action from us in order to cope. As Rosa puts it “we have to run faster and faster, on more and more escalators, just to stay in place” and the “feeling that time is scare commodity” leads us to seek faster technologies. What Ruth Müller describes as [4]anticipatory acceleration in the context of careers could be extended into a general theory of the relative autonomy of agency vis-a-vis temporal structures i.e. when the necessity of ‘running faster and faster’ becomes sufficiently engrained, we begin to accelerate in an open-ended way as a taken for granted approach to life. I’m very interested in the cultural role played by productivity discourse, life hacking etc in encouraging and consolidating such a response to the world. Plus technology is embedded in this discourse at the cultural level (it’s a central focus of discussion) and the agential level (the solutions offered are often technological).
5. He stresses that we are not just victims of the speed logic, identifying how it is tied to our notion of freedom. Drawing on Blumenberg, he stresses how death comes too early, before we have completed the world and the possibilities it offers for us. The fast life on this view represents the full life. This is a familiar argument of Rosa’s but I’d previously read it as an inditement of acceleration, rather than an analysis that is appreciative of the promise while remaining sceptical about its viability.

6. He has a greater emphasis upon what has not speeded up than has previously been the case. He talks about five dimensions of deceleration: natural and anthropological limits, cultural practices that could speed up but haven’t, territorial zones insulated from speed up, segmental pockets of deceleration under pressure to speed up and intentional deceleration. This latter category is one which fascinates me and am writing about as ‘triaging strategies’ used to cope with acceleration. As Rosa describes it, these strategies pursue “slow down in order to keep up the high pace of life”. They are ways to cope with acceleration rather than challenges to the temporal structures of digital capitalism. He also recounts being told that the average speed of traffic in London has been going down for decades, representing an example of collective slow down as individuals seek to go fast. He claims that these five dimensions of deceleration are either residual or reactions. He argues there’s an asymmetry between deceleration and acceleration, grounded in the different mechanisms producing each.

These ideas made me think of one of my favourite genres of YouTube videos:
 Alternatives to neoliberalism: towards equality and democracy  (2017-02-27 21:32)

PUBLICATION LAUNCH

--- ALTERNATIVES TO NEOLIBERALISM: TOWARDS EQUALITY AND DEMOCRACY
This is a book aimed at researchers, commentators, activists and left politicians looking for new ideas to challenge and replace neoliberal political economy and neo-populist politics.

LAUNCH DETAILS: Tuesday 14th March 2017. Room USG 19, University of East London, Stratford E15 1NF

Full details attached or on Eventbrite:

Hope you can make it.

Bryn Jones and Mike O'Donnell Co-editors

Contributors include: Ted Benton, Anna Coote, Colin Crouch, Andy Cumbers, Jeremy Gilbert, Zoe Irving, Grahaame Thompson, Karel Williams

NEW Publication

Alternatives to Neoliberalism.
Social media and populism (2017-02-28 08:00)

This excellent essay by Jan-Werner Müller in the London Review of Books raises an important issue about the forms of political mobilisation facilitated by social media:

Trump has called himself the Hemingway of the 140 characters. He has ‘the best words’. He loves Twitter, he says, because it’s like having one’s own newspaper, but without the losses. Twitter shares something of the echo-chamber effect of Facebook, but it also makes possible a form of direct identification between the individual citizen and the supposedly sole authentic representative of the people. It is hard to see how this might have been possible before, at least as a matter of daily experience: perhaps going to a party rally and feeling a direct connection with the leader while surrounded by others who feel exactly the same thing. Now, that sense of a direct link is just a click away, day and night: ‘Hey, I’m up at 3 a.m., and so is he, and he’s thinking exactly what I was just thinking!’

This is an illusion, but it is a powerful one. Media-savvy politicians can exploit it in unprecedented ways. For instance, in Italy the anti-establishment Five Star movement emerged from Beppe Grillo’s blog. ‘Hey folks, it works like this: you tell me what’s going on and I will play the amplifier,’ he’d written to his followers. Grillo had been a well-known comedian before entering politics. He has never merely amplified the concerns of ordinary people; the way il popolo speaks is decisively shaped by his leadership even though he has no official position of authority. Trump of course had also been a TV star, someone partly famous for being famous. But the peculiarity of Trump is that he seems the equivalent of Grillo and Silvio Berlusconi merged into one person. Whenever he was accused during the campaign of being just an entertainer, he could point to his competence as a businessman; whenever it was pointed out that his ventures mostly went bankrupt, he could respond that he was primarily a media star.

What forms of political organisation emerge from such a dynamic? Fleeting and fragile ones, predicated on imagined links with the leader rather than relational bonds between the followers. This gives reason to be hopeful but it also creates dangerous incentives for the leader, inviting them to escalate their rhetoric in order to mobilise a base over whom, at least as a collective, their hold remains unreliable. The problem is, as he puts it later in the essay, “The supply of enemies is inexhaustible.”

This is why it’s so important to refuse the story such populists tell about their own success. They ascribe an outcome with complex origins to their own quasi-magical powers to connect with ‘the people’:

Liberals have been wringing their hands at their seeming inability to reach citizens with ‘fact-checks’ and incontrovertible demonstrations of Trump’s continual self-contradictions. It’s curious that in their despair they have resurrected some of the clichés of 19th-century mass psychology. While disputing virtually every claim made by populists – especially their supposedly simplistic policy solutions – they buy without question the story that populists sell about their own successes. When Arron Banks proclaims that ‘Facts don’t work ... You’ve got to connect with people emotionally,’ they just nod. But it isn't true that ‘the masses’ are emotional basket-cases ready to be seduced by a charismatic demagogue. For a start, the neat distinction between reason and emotion is misleading. People are angry for a reason, and usually they can articulate that reason, as part of a larger story about what went wrong in their lives. Trump gained some trust as an outsider and, even more, as a credible exemplar of what it means to be unprofessional in politics. Some trusted him because he told it like it is; but in other cases the trust came first, and led them to believe that he was telling them the real story.

8.3 March

The embedded digital economy (2017-03-01 08:00)

One of the things that I liked about _Platform Capitalism_, by Nick Srineck, was its concern to avoid analysing the tech sector as sui generis. By situating it in social and economic history, we are left with a much richer account of where it came from, why it is the way it is and where it is going. The myth of exceptionalism concerning technology militates against this, as the protagonists of grand disruptive projects don't take kindly to being regarded as mundane organisations driven by environmental constraints and enablements like all others.

The consequences of this exceptionalism aren't just analytical though. Exceptionalism licenses a view of the digital economy as disembedded, obscuring the manifold ways in which it is dependent on the wider context. This section from _Uberpaid and Underworked_, by Trebor Scholz, loc 1014 illustrates this powerfully:

Rarely acknowledged are also the networks of care that sustain contingent workers. Just for one moment, think about the families that are paying the price for just-in-time scheduling of work hours. Who is caring for their children when they face unpredictable work schedules, often decided only days or hours in advance? And let’s not forget that government programs like the Food Stamp Act of 1964, introduced by President Lyndon B. Johnson, are essential in providing subsistence for crowdworkers and Walmart ”associates” alike. In this way, personal networks of care, global supply chains, American taxpayers, academia, and the military sustain the digital economy.

Recognising this context makes it easier to see the grim reality underlying the lofty rhetoric of the sharing economy. From loc 1290:
What if the engine of the "sharing economy" is not the instinct to share, but rather economic desperation? Just consider the 8–10 million Americans who are unemployed and the almost eight million who are working part-time because they cannot find full-time work, according to the Bureau of Labor Statistics. They are piecing together a living wage by working with companies like Uber but only few make a good living in the Hunger Games.

John McCreery (2017-03-02 03:28:22)
Re Uber. My wife and I are immensely satisfied customers after using Uber several times in and around Washington, D. C. From a customer perspective the pricing and service were excellent. What about drivers? In every case our driver was not attempting to make a living working for Uber. They were, instead, using their cars, otherwise an idle asset, to supplement incomes from other sources. One was a restaurant owner driving full time while in the process of shifting his business to the West Coast. Would our drivers like to earn more? Of course. Were they engaged in Hunger Games? No.

UCU from Cradle to Grave (2017-03-02 08:00)
An interesting video from this year’s conference:

Alistair (2017-03-02 10:22:12)
Well, tongue in cheek, there's been one or two times when I've thought it's sending me to my grave! :-)

Feminist Reflections On Law, Society and Care (2017-03-03 08:00)
Call for Papers

Date: 21 July 2017

Venue: Manchester Law School, Manchester Metropolitan University, Manchester UK

Contributions are invited to the event, "Feminist Reflections On Law Society and Care", to be held on Friday 21st July 2017 at Manchester Law School.

We are pleased to announce the following speakers:

Donna Dickenson, presenting on, “Property in the Body: Feminist Perspectives”; Alison Jaggar, presenting on, “Gendered Perspectives on Global Justice”; and Marian Verkerk, presenting on “Family Ethics of Care".
This event aims to bring together individuals working within feminist frameworks to address contemporary societal issues. This could include (but is not limited to) contributions in the areas of:

Ethics of Care
Technologies
(Global) Justice
Community / Activism
Health Care
Feminist Methodologies
Law Reform

Categories of submission
Submissions can be made in the following categories:

Panel Session Papers: speakers will be allocated 15 minutes for presentation, leaving time for discussion. Please submit a 200 word abstract of your presentation, specifying your area of interest.

Emerging Perspectives Session: the afternoon will have space for individuals stepping into the academy, to workshop their current research ideas in the form of a PechaKucha style presentation, with time for Q&A and discussion following. Please submit a 200 word abstract of your PechaKucha presentation, specifying Emerging Perspectives Session. [1]http://www.pechakucha.org/

Poster session: posters will be displayed during the day, with prizes awarded for the best of these. Poster presenters should be available to talk briefly about their research.

Submission of abstracts and posters should be made to [2]feministreflections@gmail.com

Deadline for submission of abstracts and posters: Friday 31st March 2017.

Programme and venue details will follow.
Queries about the event should be made to [3]feministreflections@gmail.com

We look forward to seeing you all there! Thanks from the team – Melanie Latham, Kelly Dannielle, Aysha Mazhar.

2. [mailto:feministreflections@gmail.com](mailto:feministreflections@gmail.com)
3. [mailto:feministreflections@gmail.com](mailto:feministreflections@gmail.com)

Liberating discretionary effort by robbing your staff of a personal life (2017-03-04 08:00)

There's an interesting extract in The Upstarts, by Brad Stone, concerning discretionary effort: what could your employees do if they were properly motivated? I'm fascinated by this concept because of its open-ended character. Once one begins to think like this, it's always possible to imagine your employees doing more. The full actualisation of discretionary effort is a vanishing point and this creates a space in which bullshit thrives: lionising managers for
Kalanick simply directed his team to work harder. “Never ask the question ‘Can it be done?’” he was fond of saying at the time, recalls one employee. “Only question how it can be done.” Kalanick left for LeWeb but stayed in touch from his hotel room over Skype video chat, his disembodied head still a loud, demanding presence in the office. Everyone was working around the clock, on little sleep and ebbing patience. “Someone turn Travis off!” yelled the new chief of product, a former Google manager named Mina Radhakrishnan, when Kalanick berated them for not having the service ready in Paris on time. Conrad Whelan, the company’s first engineer, recalls spending every day in the office, from 7:30 a.m. to midnight, including weekends, for three weeks straight before the Paris launch. “This is the biggest thing I will say about Travis,” he told me years later. “He came to us and said, ‘Look, we are internationalizing and launching in Paris,’ and every single engineer was saying, ‘That is not possible, there is so much work, we will never be able to do it.’ But we got it done. It wasn’t perfect. But that was one of those moments where I was like, ‘This Travis guy, he is really showing us what is possible.’”

IFRAME: [1]https://www.youtube.com/embed/r8miwsWtzRw?version=3 &rel=1 &fs=1 &autohide=2 &showsearch=0 &showinfo=1 &iv_load_policy=1 &wmode=transparent
Scholars have warned that there is an uncertain chance of runaway climate change that could devastate the planet. At least since Hans Jonas’s The Imperative of Responsibility, some have argued that even low-probability existential risks should be treated in a fundamentally different way. How should we act when we believe that there is a chance of a catastrophe, but cannot make reliable probability estimates? How much should we worry about worst-case scenarios? What should we do when experts disagree about whether catastrophe is possible?

These are some of the questions we will be posing at the fifth of six ESRC-funded workshops exploring issues where the ethics and economics of climate change intersect. It will be held at the University of Cambridge’s Centre for the Study of Existential Risk.

We are seeking both paper givers and discussants from philosophy, economics and other disciplines. Funds

CfP: Workshop on Climate Ethics and Climate Economics (2017-03-05 08:00)

1. https://www.youtube.com/embed/r8miwsWtzRw?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent

**TODAY: Teach-in on Violence in Universities in India at Columbia University (2017-03-05 15:51)**

**Teach-in on Violence in Universities in India**

**In Solidarity with Delhi University**

**Room 227, Mudd Building, Columbia University**

**Sunday, March 5, 2017**

**3:00 – 4:30 PM**

On February 22, the teachers and students of Ramjas College in Delhi University were beaten up by the right-wing student group Akhil Bharatiya Vidyarthi Parishad (ABVP) for organizing a conference on ‘Culture of Protest’. In the last three years, there has been an escalation in violence carried out by right-wing student groups on other students, faculty members and workers in universities across India. This escalation has been enabled by violence outside universities as well, that target especially gender, caste and religious minorities. The clamp down in HCU following the death of Rohith Vemula, arrest of students in JNU, silencing and suspension of faculty members in JNVU Jodhpur, and most recently the sheer violence on students and faculty members in Delhi University indicate a pattern of organized violence in university spaces. The silencing of dissent is orchestrated through right-wing student groups, thereby obfuscating the responsibility of the state in protecting the fundamental right to freedom of speech and expression. The police remain a mute spectator. The regime in power has either remained silent or actively endorsed the hooliganism. We have seen the emergence of the ‘ideal nationalist’ as a new norm of doing politics. The words ‘nation’ and ‘nationalism’ have become a tool to control and censor critical discourse across the country.

In defiance, the academic community in India has come together under a common cause of reclaiming their right to debate. With every stifling of dissent, new cultures of protest have emerged. Students, faculty, workers of universities and concerned citizens are coming out on the streets in huge numbers vociferously asserting their right to critical thought. Voices from different countries are pouring in against the violence. They are not just reclaiming
their right to the university space, but also re-imagining the idea of the university in India. We are congregating to express support, to contribute to this critical moment in Indian history, and to explore the idea of academics in the university space. Do participate, spread the word, and join us in large numbers for discussions and posters.

Program:

3:00 PM - Introduction

3:10 PM - Talk by Dr. Rohit, Prof. Anupama Rao, and open session for speakers from fellow friends and comrades, followed by discussion.

4:00 PM - Show of Solidarity with #FightBackDU Campaign in India - posters, songs, slogans. We have posters, but please feel free to bring in your creative posters as well!

The Future of the REF (2017-03-06 08:00)

Uber as a moral project (2017-03-07 08:00)

When the Uber co-founders recount the story of their project, they stress the importance of the consumer to it. This might seem like familiar rhetoric but I want to suggest it reflects a deep (and problematic) commitment. In The Upstarts, by Brad Stone, we see how the early idea for Uber came to Garrett Camp when he was a young multi-millionaire living in San Francisco. After StumbleUpon was acquired by eBay, he found himself young, free and wealthy. From loc 617-632:

Camp continued to work at eBay after the sale, and he was now young, wealthy, and single, with a taste for getting out of the house more often. This is when he ran headlong into San Francisco’s feeble taxi industry.
For decades, San Francisco had deliberately kept the number of taxi medallions capped at around fifteen hundred. Medallions in the city were relatively inexpensive and couldn’t be resold, and owners could keep the permit as long as they liked if they logged a minimum number of hours on the road every year. So new permits usually became available only when drivers died, and anyone who applied for one had to wait years to receive it. Stories abounded about a driver waiting for three decades to get a medallion, only to die soon after. The system guaranteed a healthy availability of passengers for the taxi companies even during slow times and ensured that full-time drivers could earn a living wage. But demand for cars greatly exceeded supply and so taxi service in San Francisco, famously, sucked. Trying to hail a cab in the outer neighborhoods near the ocean, or even downtown on a weekend night, was an exercise in futility. Getting a cab to take you to the airport was a stomach-churning gamble that could easily result in a missed flight.

He was, as Brad Stone puts it, "habitually restless, frustrated by inefficiencies, and armed with a willingness to challenge authority". He contrived an initial solution of calling all yellow taxi companies when he needed a cab, in order to take the first one that arrived. He quickly found himself blacklisted (loc 647). He further explored how to game the existing system, learning about the mechanisms which frustrated him in the process. He developed an extensive working knowledge of how the collective interests of taxi drivers frustrated his interests as a wealthy young consumer. This generic propensity of the taxi industry to frustrate was coupled with the capacity of individual taxi drivers to fail to show such young consumers the respect they felt they deserved. From loc 771-786:

On a separate night in Paris, the group went for drinks on the Champs-Élysées and then to an elegant late-night dinner that included wine and foie gras. At 2:00 a.m., somewhat intoxicated after a night of revelry, they hailed a cab on the street. Apparently they were speaking too boisterously, because halfway through the ride home, the driver started yelling at them. McCloskey was sitting in the middle of the backseat, and, at five feet ten inches tall, she’d had to prop her high heels on the cushion between the two front seats. The driver cursed at them in French and threatened to kick them out of the car if they didn’t quiet down and if McCloskey didn’t move her feet. She spoke French and translated; Kalanick reacted furiously and suggested they get out of the car. The experience seemed to harden their resolve. "It definitely lit a fire," McCloskey says. "When you are put in a situation where you feel like there's an injustice, that pisses Travis off more than anything. He couldn't get over it. People shouldn't have to sit in urine-filled cabs after a wonderful night and be yelled at." That cantankerous Paris taxicab driver may have left an indelible mark on transportation history.

The instinct here is framed in terms of ‘disruption’ and ‘innovation’ when it is articulated. But the basic moral sentiment is how dare they put their interests over ours? It’s a consumerist entitlement rooted in the extremely specific experience of affluent young consumers. Once embedded, every attempt to preserve the status quo can be experienced as an extension of this basic affront to self-importance. What appears to regulators as an incomprehensible disregard for legality ("You can’t just open a restaurant and say you are going to ignore the health department" as they were told in an early clash, reported on loc 1693) is experienced by ‘the upstarts’ as a commendable failure to be bullied, a refusal to take shit from anyone, whether it’s haughty French taxi drivers or municipal bureaucrats serving their interests. Their professed concern for regulation can be explained away as an allegiance to taxi drivers who don’t know their place. From loc 2348:

Still embittered by his experience with Christiane Hayashi and the SFMTA, Kalanick instructed Kochman to ignore New York’s Taxi and Limousine Commission and its rules, reasoning that its regulations, under the guise of consumer safety, were really there to protect entrenched taxi interests.
What I’m describing as a moral project operates on two levels: an intellectual critique of entrenched interests and their failure to adequately serve consumers, as well as an underlying affectivity generated when entrenched privilege meets perceived wrong-doing. The former derives its shoving power from the latter. This is why I suspect the Uber co-founders might not simply be driving towards automation out of economic interest, but rather actually be able to take some perverse delight in rendering taxi drivers redundant as a category. As the Uber CEO excitedly put it when presented with a self-driving car for the first time: “The minute your car becomes real, I can take the dude out of the front seat” (loc 3657).

And this moral project is one it’s demonstrably possible to enlist others into. From loc 2467:

After Tusk joined as a consultant, Uber executives started meeting regularly with Ashwini Chhabra and his boss, David Yassky, chairman of the TLC. Officials in Bloomberg’s business-friendly administration, it turned out, were inclined to look favorably on a technology startup trying to change New York’s crusty taxi industry, which had resisted modernizing its vehicles and installing electronic credit card readers. But Uber first needed to play by the rules. To truly appeal to New York drivers, Uber was going to have to register as a base.

Pity those who find themselves on the wrong side of the great disruptive project:

When asked about driverless cars, he said that he was excited for the technology because it could bring prices down, but he didn’t express concern about unemployment for drivers. “The reason Uber could be expensive is because you’re not just paying for the car, you’re paying for the other dude in the car,” Kalanick said. As for the tens of thousands of drivers who relied on his company to support their families, he shrugged. “This is the way of the world,” he said, “and the world isn’t always great. We all have to find ways to change.”

Engines of Knowledge in the First Information Age: The Laboratory and the Experiment (2017-03-08 08:00)

by Hamish Robertson

This series of pieces has focused on the concept of exploring a number of ‘engines of knowledge’ that emerged in the first ‘big data’ information age of the 19th century, which have since gradually institutionalised themselves into the forms we recognise today. One of the consequences of the developments that emerged from 18th
The 18th century experimentalism was the idea of the laboratory. I have already suggested that many engines of knowledge, such as the scientific garden, supported the development of the idea of ‘natural’ experimentation and that the loci for such experiments became increasingly seen as laboratories in their own right. From the pottery factories of Josiah Wedgwood, the slave plantations of the American South and on to Darwin and Mendel’s experimental gardens – the early laboratories of experimentation were numerous and varied.

One thing they had in common was the development of relatively closed systems or micro-systems within which experimentation became possible, usually involving some form of separation from the natural world and its totalising complexity. The documentation of the elements under observation and the ability to manipulate the ingredients or resources needed for experimental approaches all supported the production of new knowledge, its theorisation and testing. From this emerged much of what we now think of as modern scientific knowledge and its methods of production. In particular, the idea of experimentation as an epistemic virtue also gradually entered not only the practice of science but the broader culture of modernity. It has remained a virtuous form of knowledge production ever since. Esteemed to the point where some scientists will, even now, \[1\] knowing fake their own results in order to (appear to) meet their experimental goals in the approved manner.

This piece examines the laboratory and the experiment as one of modernity’s archetypal dualisms. Early laboratories often started as adjuncts to museums (discussed in a \[2\] previous piece) and experimentalism had been gaining ground as a virtuous form of knowledge production since at least the 18th century. But in the 19th century the variety and scale of laboratories took on a much greater momentum, driven by the expansion of tertiary education and the mix of rise of chemistry and medical teaching laboratories, to be followed by physics and physiology laboratories. These were often paralleled by \[3\] industrial laboratories associated with the development of modern manufacturing methods. Huge growth in the university systems of Europe and North America saw not only the rise of bourgeois values (formal education and qualifications, including the PhD, as a social differentiator) but a rapid growth in university-trained scientists of various kinds. The laboratory became a central part of the training aspect of universities, such that not only the social sciences copied it but that it has endured as a teaching format into the 21st century.

**Calculable Spaces**

The logic of experimentation, sacred or secular, requires a special location – some specific space set aside for its undertaking. Human beings have always invested in the design and construction of special places for the manufacture of particular kinds of knowledge. This series is essentially focused on a set of such places. Processes of calculation almost always require not only methods and technologies but dedicated sites for the collection of what we now think of as ‘primary data’. The astronomical monuments of the Middle East or the \[4\] Americas were both symbolic and practical places for the collection of observational data, its recording, calculation and subsequent theorisation. The early laboratories of the alchemist or the apothecary were also built around the idea of locating specialist knowledge production in special places. Such places often took on an aura of their own, separating them from the mundane world of everyday life.
Early modern medical practitioners were highly likely to provide their patient’s with an astrology reading in conjunction with their diagnosis and treatment schedule. Isaac Newton was as interested in the occult as he was in what we now think of as science. The separation of ‘magic’ and science was as much an epistemic break as a practical or evidence-based one, with the break from organised religion taking even longer to achieve due, in part, to its much greater social authority. New concepts and explanations replaced old (consider phlogiston in chemistry, Galenic theory in medicine or miasmal theory in public health) in science, while many cultural residuals persisted. And we live with the consequences of the way in which these processes took place, with claims to truth still often hinging on the epistemic commitments of the claimant.

In the context of this discussion, the idea of calculable spaces took on a new and highly dynamic character in the 19th century in particular. There was a temporal geography to laboratory science, with the focus shifting from country to country (France, Britain, Germany etc.) as developments gained momentum and the sciences expanded. This idea emerged especially in the knowledge contexts of the chemist’s laboratory and the hospital (and its allied laboratories – anatomy, phlebotomy etc.). These became, and largely remain, places in which specific types of replicable experimentation could be conducted. The laboratory became its own kind of knowledge factory because it not only formalised processes of knowledge production but in effect, developed a culture around the related practices, processes and outcomes of experimentation. In both of these locations, the esteem in which experimentation was held has endured down to the present day. Laboratory experimentation is the fieldwork equivalent for disciplines that need to partition their slice of nature in order to better understand it.

Geographer David Livingstone has identified that it is not only the process of sequestered space that defines many scientific undertakings but that this spatial manifestation extends even to the location of equipment, activities and staff within such spaces. The arrangement of such spaces and the activities within them also have their own consequences for the types of knowledge able to be produced. Ordering space, in this sense, helps to order both practice and process, and consequently, the boundaries of what is both possible and acceptable in such spaces. More recently still, geographers have begun to develop and extend a theoretical approach to information geographies . The fundamental concept being that information, analogue or digital, exhibits a variety of geographical characteristics. These include features such as particular points of origin, specific destinations, temporal and spatial degrees of mobility (diffusion, transmission etc.), networks by which such transmission occurs and so on. So, even here, we can see the concept of the laboratory as a space-place nexus for particular kinds of knowledge production and as points in a network for its distribution.

In addition to this, many early laboratories were established in quite mundane environments such as people’s homes, businesses or even local pubs . Wealthy or middle class researchers, professional or amateur, male or female (often couples), could build on to or convert part of their properties to become laboratories. Many did just this, making the laboratory a far more varied space than the ‘cathedrals’ of science model that gradually infused the culture as the 19th century segued into the 20th
and the large university and industrial laboratories became the dominant form. Even Marie Curie’s laboratory annex was housed in a perfectly ordinary domestic building in Arcueil to the south of Paris where many of her possessions remain radioactive. And radium was promoted as a medical cure-all (science and medicine continued a secular version of the Christian miracle tradition) before its potential effects were fully understood. It also needs to be remembered that active self-promotion and fund-seeking from governments and sponsors are not unique to modern research institutes, with many Victorian researchers, including the likes of Charles Babbage, actively engaged in these processes as advocates for their research programmes. The rise of the laboratory was not simply a ‘natural’ consequence of the success of the science being practiced but directly connected to the active promotion of those sciences by emerging science professionals and their supporters.

Abstracting Nature

One of the successes and limitations of the experimental approach championed in the laboratory has involved a need to abstract from the inherent complexity of nature. This involved segmenting out the biological or chemical experiments from their natural contexts and the attempt to isolate their processes and results in laboratory environments. Chemistry in particular was the first science to take this to the levels we typically associated with the experimental laboratory science. This changed not only the European university education systems but also the definition of the laboratory itself. In close association with rapid industrial developments, it became increasingly common for industrial plants and complexes to set aside spaces for experimentation. Edison did this, for example, by differentiating between paying and non-paying research activities, with some projects part of the immediate commerce of applied science and others done for their own sake or with the potential of future reward.

Measurement and quantification proved to be essential aspects of the new laboratory science. In order to create replicable experiments, much more precise levels of measurement were required for not only the elements that went into chemical and related experiments but also in quantifying the results. And if other laboratories were to copy or replicate such activities, then they too needed to share the same approach to the experimental processes and protocols. Being able to abstract from nature and to, in effect, isolate various complex naturally occurring processes (as well as to attempt new or novel ones) provided a basis for a new and expanding approach to scientific knowledge production as the 19th century progressed. At the same time, the sciences of measurement themselves, including mathematics, statistics and engineering all grew rapidly too. Measurement precision, quantification and replicability became mutually reinforcing touchstones of modern science and technology.

Of Facts and Fetishes

The currency of laboratories and a variety of other sites of scientific inquiry rapidly emerged as ‘facts’. In the English language in particular, the ‘fact’ and its emergence as a virtuous epistemic base point has a long and somewhat convoluted history. Mary Poovey, for example, has written on the development of the fact as the common currency of an increasingly inductive knowledge system. While Barbara Shapiro points to the legal tradition as a source for the conceptual origins and growing social authority of the ‘fact’ as modernity progressed. The sciences, in separating themselves form more traditional forms of knowledge and its production, began to use the ‘fact’ as an authorising currency of knowledge. To do this, measurement became an increasingly important concern. If the fact was to be a bedrock concept, then it had to rest on verifiable evidence and this called for the rise of and in precision measurement. This in its turn led to the production of many new and improved measuring instruments in science and
technology, with a growing concern over standardisation. [14] Hasok Chang has written extensively about the effort involved, sometimes even required, in attempting to replicate the processes and results of a number of classic 19th century scientific experiments. His work indicates that some scientific certainties were manufactured out of complexity rather than fully resolving the problems they examined.

**Laboratory Facts and Fictions**

The trope of the laboratory entered the literature very early in the 19th century including, amongst others, Mary Shelley’s *Frankenstein*, or the Modern Prometheus in 1818, Stevenson’s *The Strange Case of Dr Jekyll and Mr Hyde* in 1886 and, of course, Bram Stoker’s [15]*Dracula* in 1897. The genre only continued to grow and diversify as science itself gained momentum. This was partly because the image of the laboratory was already long familiar from the early modern period alchemists and apothecaries but also because 18th century industry had given rise to a variety of applied laboratory contexts, such as those mentioned earlier. Many representations were negative, railing against the unnaturalness of the laboratory and what was perceived to take place within its confines. Others, such as H. G. Wells loathed the laboratory teaching model that gained ascendancy by the latter part of the 19th century.

Older constructs, such as the monster, found new forms in what we now think of as the science fiction genre, shifting from the social to the scientific domains for their inspiration. Wells’ morlocks in *The Time Machine* are a later example of this intersection of the monster with science and emerging anthropology. Science fiction became a social and literary parallel of techno-science in a time of phenomenal change and development with its many associated human costs. The Enlightenment and ‘age of reason’ were paralleled by the rococo, romanticism and Victorian gothic with corresponding new ideas about ‘nature’ and the natural. The traditional laboratory has remained a powerful image in this domain while science and industry have moved on into more varied and digital environments. The sociological study of laboratories flourished in the 1970’s and 1980’s with [16]*Latour* and the Scottish STS programme but this initial interest has since waned somewhat.

**Conclusion**

Obviously there is neither laboratory nor experiment without the scientists themselves. Their commitments to the laboratory and its processes are a key part of the continuing validity of the knowledge produced in such places. Deviations from this formalised script are quite naturally seen as undermining science itself since all scientists cannot personally witness every experiment – the early modern ‘gentleman’s agreement’ endures in the sciences. Success, however, is so greatly valued that forging results is sometimes seen as better than experimental ‘failure’, potentially compromising the reliability of the knowledge produced in the laboratory. This is a problem for science that [17]*Ioannidis* has commented on in a paper that was almost as contentious as [18]*McKeown* ’s assessment of medicine’s role in rising life expectancies. The culture of science produces its forms of logic and its own epistemic
values but popular versions and historiographies emerge which cannot always be entirely validated. In this piece, the focus has been on the varied development of what has become an iconic ‘factory’ of scientific knowledge production, the laboratory. It remains a remarkably enduring, if malleable, institution.

[19]Hamish Robertson is a geographer at the University of New South Wales with experience in healthcare including a decade in ageing research. He has worked in the private, public and not-for-profit sectors and he has presented and published on a variety of topics ranging from ageing, diversity, health informatics, Aboriginal health, patient safety and spatial science to cultural heritage research. Hamish is currently completing his PhD on the geography of Alzheimer’s disease and recently finished editing a book on museums and older people.

**Epocchal theorising and business bullshit (2017-03-08 08:00)**

I've always had an ambivalent relationship to the idea of *late modernity*. It was the work of Bauman, Beck and Giddens which drew me into Sociology, presenting a till then cynical philosophy student with the possibility that one could meaningfully engage with the world and diagnose the times in a philosophical register. But coming to recognise the conceptual and empirical limitations of these accounts, as well as the methodological dangers which flow from them, profoundly shaped my subsequent trajectory as a sociologist. The [1]first article I ever had published in a journal was a critique of a particularly weak instance of such theorising, suggesting that it was interesting because its ostentatious failings revealed problems that were more deeply concealed in more sophisticated examples of this approach. The broader tendency at work here has been incisively critiqued by Mike Savage as *epocchal theorising*:
The social sciences, and especially sociology, abound with epochalist thinking (see generally Savage 2009). We are seen to have moved, variously, to a globalised, post-modern, neo-liberal, informationalised, cosmopolitan, (and so forth) world order. Such thinking saturates debates about social change and incites an almost constant agitation for detecting new kinds of epochal change and transformation which makes our contemporary times different from anything that comes before.

This is how I address the issues in my PhD, arguing that the canonisation of this work is something which invites explanation. Why have so many statements of epochal change emerged within British sociology? What was it about Britain and its sociology which engendered this tendency? Why have they proved so influential? Why have these accounts proved so mobile, circulating across fields and subdisciplines which would likely otherwise prove disconnected? As I put it in the thesis, it "serves as a conduit linking a range of sociological sub-disciplines, ensuring that they can, at least in principle, be reincorporated in a substantive way into the same intellectual typology":

To this end it takes the work on late modernity by Giddens (1990, 1991, 1992) as its foil, treating it as emblematic of a broader trend within contemporary social theory. Metaphors abound readily within this now canonical literature (Archer 2013a, Outwaite 2009) as all manner of empirical phenomena are incorporated into a dazzlingly panoramic frame of reference and presented as manifestations of the leading edge of social change. However for all its preoccupation with the new, there is something oddly dated about such work, with its apparent prospectiveness belying underlying continuities with long-standing traditions within British sociology (Savage 2010a, Savage and Burrows 2007). In spite of its self-styled epochal novelty, it can easily be read as a peculiarly a priori manifestation of a much broader preoccupation with ' endings' within contemporary sociology (Crow 2005). On such a view, the popularity of this work constitutes a puzzle which demands explanation and the opening chapter of this thesis aims to provide precisely this.

In an earlier article, Savage and Burrows describe this as a “kind of sociology which does not seek to define its expertise in terms of it empirical research skills, but in terms of its ability to provide an overview of a kind that is not intended to be tested by empirical research”. This claim is one which can be explored at the level of individual careers: how does a practice with such an obviously rhetorical dimension, in terms of offering panoramic visions of social change that prove persuasive, become a viable career strategy? It’s an argument for another blog post, but I believe the success of epochal theorising can be explained in terms of the incentive to monopolise the intellectual attention space that emerges within the accelerated academy. These attention-grabbing, non-empirical accounts constitute ascension strategies through which theorists ensure their incorporation into the intellectual landscape in a sustained way. Epochal theorising is a way to make yourself a reference point.

When we see it in these terms, the comparison to management literature comes to seem less unfair than might otherwise be the case. This is a summary of one such management theorist offered in One Market Under God, by Thomas Frank, loc 4595:

In 1989, Handy was already comparing the “change” of our time to the experiences of the Incas when the conquistadors showed up. The One to One Future, a 1993 book by consultants Don Peppers and Martha Rogers that hails the rise of individualized marketing through fax machines and direct mail, begins by declaring that “we are passing through a technological discontinuity of epic proportions,” a "paradigm shift" that will unleash "cataclysmic changes." In 1994, Competing for the Future held that we are on the
verge of "a revolution as profound as that which gave birth to modern industry." In more recent years, of course, the rhetoric has only escalated. The Dance of Change, a 1999 compendium of big thoughts on the subject, has by its fifteenth page referred to "change agents," "change agendas," "change initiatives," "change programs," "top-down change" (which is bogus change indeed), "inner" and "outer change," "deep change processes," "significant change," and has settled on one term as more meaningful than all others: "profound change." To illustrate the failure of rival theorists' "change programs," the book's authors offer what may be the most pointless graph in the entire history of business thought: Without benefit of notation, figures, or sources we are shown how an arrow marked "Time" bucks and subsides on its way to the future while another marked "Potential (unrealized)" ascends tragically to the heavens.32

My provocative claim is that the epochal theorising which dominated British sociology in the 1990s and 2000s could be construed as nothing more than management theory. In fact perhaps it could even be regarded as less than management theory, in so far as that management theory enjoys a great degree of influence over the wider world. It could be said that British epochal theorising exercised such an influence over party politics, but I'm reminded of Tony Benn describing in his penultimate diaries how "Anthony Giddens just hovers round trying to put an ideological cloak around whatever is being discussed". Is epochal theorising often just business bullshit without the social influence?

“Open, good. Closed, bad. Tattoo it on your forehead”: Placing the technology sector in social and economic history (2017-03-09 08:00)

I'm currently reading Thomas Frank's One Market Under God, a remarkably prescient book published in 2000 which has a lot of insight into contemporary cultures of technological evangelism. The book is concerned with what Frank sees as a transition in American life from a form of populism predicated on cultural reaction to one grounded in the worship of the market. It's possible I'm primed to see this analysis as prescient because I'm working my way backwards through his books and One Market Under God contains the seeds of an analysis that he developed over the next sixteen years.

Nonetheless, I think we can learn much about our present circumstances by looking back to this transitional point in the roaring 90s which saw the origin of the rightward turn of social democratic parties, mass digitalisation and the first Silicon Valley gold-rush. What I'm increasingly preoccupied by is how these events were intimately connected. In other words: how do we place the ascendancy of the technology sector in social and economic history? To my surprise, Thomas Frank's book actually addresses this question more straight-forwardly than any other I can think of apart from Platform Capitalism, though of course many accounts address these issues without systematically investigating them.

Despite the 1990s being hailed as an era of democratisation driven by a booming economy, Frank insists that we recognise that "The booming stock market of the nineties did not democratize wealth; it concentrated wealth" (loc 1973). But this chimera of continually ascending stock prices, grounded in the rampant speculation of the dot com boom, helped license an ideological transition that Frank describes on loc 2027:
both parties came around to this curious notion, imagining that we had somehow wandered into a sort of free-market magic kingdom, where ever-ascending stock prices could be relied upon to solve just about any social problem. Now we could have it all: We could slash away at the welfare state, hobble the unions, downsize the workforce, send the factories to Mexico—and no one would get hurt!

The ideological work involved in maintaining we had entered a new era of perpetual growth, beyond boom and bust, relied upon the mystique of the internet. It heralded the dawn of a new world, the end of old certainties and a constant horizon of possibility to be invoked in the face of those exhibiting an anachronistic scepticism. From loc 1659:

And yet, since the moment the Internet was noticed by the mainstream media in 1995, it has filled a single and exclusive position in political economy: a sort of cosmic affirmation of the principles of market populism. “Think of the Internet as an economic-freedom metaphor for our time,” wrote bull-market economist Lawrence Kudlow in August 1999.45 “The Internet empowers ordinary people and disempowers government.” And we were only too glad to do as Kudlow instructed us, to think of it in precisely this way. In fact, so closely did the Internet and market populism become linked in the public mind that whenever a pundit or journalist mentioned the Web, one braced oneself for some windy pontification about flexibility, or the infinite mobility of capital, or the total and unappealable obsolescence of labor, government, and any other enemy of the free-market enterprise.

Somewhat more prosaically, the companies of Silicon Valley became emblems of a new anti-elitism, with the old formalities of corporate life being replaced by a hierarchical ethos that lionised the entrepreneur for their authentic living, often expressed in 'working hard and living hard'. The practice of paying stock options in lieu of wages became a cypher for shareholder democracy, an idea which was seized upon as legitimating what were in reality vicious attacks upon the security of labour. However as Frank points out on loc 2063, the reality of this in Silicon Valley was presented misleadingly as a sign of a brave new workplace culture rather than a familiar self-interest:

It may have been fun to imagine what these enchanted options could do in the service of economic democracy, but in point of fact their powers were almost always directed the other way. Options did not bring about some sort of “New Economy” egalitarianism; they were one of the greatest causes of the ever widening income gap. It was options that inflated the take-home pay of CEOs to a staggering 475 times what their average line-worker made; it was options that made downsizing, outsourcing, and union-busting so profitable. When options were given out to employees—a common enough practice in Silicon Valley by decade’s end—they often came in lieu of wages, thus permitting firms to conceal their payroll expenses and artificially inflate the price of their shares, pumping the bubble still further.17 Options were a tool of wealth concentration, a bridge straight to the nineteenth century.

What seems hugely important to me here is the recognition that the vast concentration of wealth that took place in the 1990s was deeply tied up, structurally and culturally, with the first wave of mass digitalisation brought about by the dot com bubble. The nature of that entanglement still isn’t as clear to me as I would like, but I’m increasingly confident in my claim that the analysis of digitalisation needs to be an integral part of the analysis of capitalism from the 1970s onwards.

As important as economic history is though, it’s crucial that we also understand the cultural dimensions to this process. What I really like about Thomas Frank is his commitment to taking business bullshit seriously. From loc 1787:
It is worth examining the way business talk about itself, the fantasies it spins, the role it writes for itself in our lives. It is important to pay attention when CEOs tell the world they would rather surf than pray, show up at work in Speedos rather than suits, hang out in Goa rather than Newport, listen to Stone Temple Pilots rather than Sibelius. It is not important, however, in the way they imagine it is, and for many Americans it is understandably difficult to care very much whether the guy who owns their company is a defender of family values or a rave kid. But culture isn’t set off from life in a realm all its own, and the culture of business in particular has massive consequences for the way the rest of us live.

Our contemporary discourse of ‘disruption’ and ‘innovation’ was nurtured in the business commentary of the late 1990s. By examining its origins, we can see the political context of this way of thinking and speaking about technology much more transparently than is the case if we examine contemporary instances of it. To close with a quote from Peter Schwartz, quoted on loc 1321:

Open, good. Closed, bad. Tattoo it on your forehead. Apply it to technology standards, to business strategies, to philosophies of life. It’s the winning concept for individuals, for nations, for the global community in the years ahead.

The ‘Sharing Economy’ as Disembedding Mechanism (2017-03-10 08:00)

As some reading this may be aware, I’m fairly critical of the account Giddens gives of late modernity, seeing it as a wrong-turning for many qualitative researchers who sought to situate their findings in a socio-historical context. Nonetheless, I’ve been thinking recently about the concept of the disembedding mechanism and how it might allow us to theorising the ‘sharing economy’. This is how Rob Stones summarises the concept in the abstract for an encyclopaedia entry:

Disembedding refers to the way in which contemporary social practices can no longer be primarily defined by their grounding, or embeddedness, in the local context of a restricted place and time. Social practices are now, in large part, removed from the immediacies of context, with the relations they involve typically being stretched over large tracts of time and space. Local experiences and events are shaped by processes taking place on the other side of the world, and vice versa. These are processes, moreover, that are primarily impersonal and abstract.

What Giddens describes as “the ‘lifting out’ of social relations from local contexts and their rearticulation across indefinite tracts of time-space” give rise to a “tremendous acceleration in time-space distanciation” which he sees as characterising modernity. He identifies two types of disembedding mechanism, symbolic tokens and expert systems. The former are mediums of exchange which have a standard value across contexts, thus disembedding valuation from a local context and fixing it in terms of much broader processes, as well as disembedding obligation from
temporal unfolding within that context by facilitating credit. The latter are forms of expert knowledge and technical capacity which have validity independently of those who make use of them, leaving situated interaction shaped by processes of knowledge production and specialisation far away from it.

It strikes me that the ‘sharing economy’ represents a new form of disembedding mechanism. The business model here seems reasonably clear: find a social interaction which already is or could be monetised, develop a digital platform which can be inserted as an intermediary within that interaction and rely on network dynamics to scale the new model in a way that will ultimately squeeze out any instances of the interaction which are unmediated or reliant on an older form of mediation e.g. local taxi dispatchers. With the growth of the ‘sharing economy’, larger tracts of human interaction are governed by the technical architecture and social imperative of large corporations based many thousands of mile away, whose local operations are concerned at most with recruiting new workers & safeguarding the platform against regulatory pushback.

It’s useful to consider the ‘sharing economy’ in these terms because it takes us away from a fixation on technological possibility. Certainly, we could not have had Uber and Airbnb without a particular configuration of mobile computing, cloud computing and ubiquitous social networking. But we also need to consider why these platforms are capable of scaling in the way they do. Part of the issue is undoubtedly about coordination, with a technical capacity to identify resources and make them accessible in an unprecedentedly precise way. However the more interesting issue concerns trust, or rather its decline in late modernity. Trust in the platform becomes plausible when trust in each other begins to break down. What will the political consequences be of the radicalisation of disembedding which the sharing economy represents & the new orientation towards trust which participation in it begins to engender?

Social media didn’t create the ambition to rethink scholarly communication, it gave us the tools to do it effectively (2017-03-11 08:00)

When we talk about the possibilities which social media offer for rethinking scholarly communication, it’s easy to slip into the trap of thinking this ambition is a new one. We counterpoise the ‘new’ and the ‘old’, the innovative and the traditional, the digital and the analogue. In doing so, we obscure past projects which sought to rethink how scholarly ideas are disseminated. These are projects from which we could learn much. The Actes de la Recherche en Sciences Sociales, created by Pierre Bourdieu in 1975, is one such project:

We shall present here, side by side, texts differing very greatly in their style and function: ‘finished’ texts, on the one hand, as they are called by academics journals, but also short notes, accounts of oral presentations, work in progress such as interim research projects and reports, in which theoretical intentions, empirical procedures of verification, and the data on which these are based, are all that much more visible. The desire to provide access to the workshop, which has different rules from those of method, and to present archives of a work still under way, implies a rejection of the most clearly ritual formalisms: justified typography, standard rhetoric, articles and issues of similar length, and more generally, everything that leads to the standardisation and ‘normalisation’ of the products of scholarship. Recognising no other imperative than those imposed by the rigour of demonstration, and secondarily by the aim of visibility, will mean freedom from the censorships, artificial devices and perversions generated by a concern to conform to the established customs and good manners of the university field:
a rhetoric of caution or false prediction, with the apparatus and panoply of celebrity discussion that is never more than self-celebration, the ostentatious displays of signs of belonging to the most selective and select groups in the intellectual universe.

**Political Interventions: Social Science and Political Action, pg 90**

The ambitions here are familiar ones from discussions about what social media means for scholarly communication:

- Diversifying the types of scholarly output in circulation.
- Sharing work-in-progress, revealing the scaffolding that lies behind the carefully crafted reality of journal articles and monographs.
- Rejecting scholarly formalities where these operate as rituals, marking inclusion and exclusion, rather than contributing to the intellectual endeavour.
- Rethinking the norms of scholarly communication with an aim of improving visibility, overcoming self-serving control of ideas (and the evaluative practices which constitute their proxies) in order to liberate scholarly communication.

The ambition was to “make visible, sometimes by a simple graphic effect, what is generally hidden” (p. 91) and doing this was seen to involve manifesting in its own representational activity the demystification which was its ambition in relation to the social world. If I’ve understood correctly, Bourdieu’s point was that sociological reflexivity has to extent to the communication of sociological knowledge, as well as to its production, if its critical value isn’t to be lost at the point of dissemination.

The value of social media lies in the tools it offers to these ends, understood in terms of their practical utility in specific organisational contexts, particularly in the absence of significant resources. But in overcoming the trite distinction between analogue and digital, between traditional publication and contemporary innovation, we need to be alive to the myths of social media which are in circulation, particularly as they manifest themselves in the academy.

John McCreery (2017-03-12 02:09:43)

These are admirable aims, but one question remains. “Rejecting scholarly formalities where these operate as rituals, marking inclusion and exclusion, rather than contributing to the intellectual endeavour” leaves open the question of scholarly formalities that do contribute to the intellectual endeavour. In an era when a Google search may produce millions of hits for any give topic and misinformation is rampant, filtering and assessment functions are, if anything, more important than ever.

Mark Carrigan (2017-03-19 17:35:11)

I agree but how effective are academics at performing that role?

John McCreery (2017-03-19 22:41:29)

“How effective?” may be the wrong question. Suppose we take as our premise Sturgeon’s law, that most of what gets published is crap. In school we are taught to look for flaws and take what are, at the end of the day, cheap shots. Suppose, instead, we adopted Japanese advertising critic Amano Yukichi’s approach, in which the critic’s most essential role is to
Margaret Archer and Bernard Lahire as post-Bourdieuian social theorists (2017-03-12 08:00)

In an interesting chapter Frederic Vandenberghe explores the role of the individual in Bourdieu’s Sociology, as well as the critiques which Margaret Archer and Bernard Lahire make of it. His intention is to respond to a sociology he sees as *hegemonic* by developing a post-Bourdieuian theory of the social world that is not anti-Bourdieuian. His project, as I understand it, derives from a sense that Bourdieu’s sheer influence is distortive, polarising debate in a way that steers it away from concern with *better or worse sociology* to *more or less accurate interpretations of the master*.

How accurate is Vandenberghe’s account of Bourdieu’s influence? His 536,230 citations certainly offer quantitative evidence of this influence, but the claim that Bourdieu’s sociology is hegemonic seems more contentious to me. Nonetheless, he’s surely correct that the combination of its influence, diffusion and systematicity make it a force to be reckoned with. Or rather a force that *must* be reckoned with, a reference point that is difficult, if not impossible, to ignore.

Both Archer and Lahire were deeply influenced by Bourdieu. My interview with her in here explores his influence on her thinking, as well as her time working with him as a post-doc in the early 60s. While, as Vandenberghe puts it, Lahire’s sociology is so “thoroughly Bourdieusian that he could well be considered the heterodox successor to the master (Loïc Wacquant being the official one)”. Both have worked at the intersection of sociology and psychology in recent years, with Lahire taking inspiration from Durkheim while Archer has looked to American pragmatism for intellectual resources. Vandenberghe argues that their work represents a *social psychology of a new kind*: orientated to “how groups, large and small, behave within in the individual mind” rather than “how individuals behave in small groups”. Their shared unit of analysis is *the life*, understood biographically, as a movement through the world constituted through choices. But the dissimilarity arises because Archer’s focus concerns how future projects shape present actions, whereas Lahire explains the present and the future in terms of past “dispositions and their activation in particular contexts in the present”. As he puts it, “His actors are pushed by their dispositions, while hers are pulled forward by their projects”.

From Vandenberghe’s exposition, it seems that Lahire’s critique of the concept of habitus resembles Archer’s in some ways: he “accuses Bourdieu of abusively generalising a particular model that only holds in exceptional situation (such as traditional societies and total institutions)”. But he make the same critique of the concept of field, “accusing Bourdieu of transforming a regional model into a general theory of the social world”. Instead he offers an account of the individual as “like a crumpled sheet or a rumpled rag”, with social space in all its dimensions unevenly folded up inside of them. Not unlike Archer, he sees what Bourdieu regarded as a marginal condition ([4] the cleavage of the habitus) to instead be a general characteristic, at least under certain social and cultural conditions.

His exposition of Archer is excellent, rather unsurprisingly as one of the theorists most deeply conversant with her body of work as a whole. The slight exception to this is the latent teleology he reads into the concept of reflexivity, ignoring the extent to which we *all* practice each of these modes to varying degrees in everyday life. Oddly, he offers precisely this recognition as a suggestion of how her account of reflexivity can be improved, with his accusation of a “kind of disguised personality test” being an incisive critique of how her work on reflexivity is chronically misread, even by its advocates.

I agree with him however that Archer downplays the role of cultural structures, seeing them as something which “structures the situation from outside, not from inside in the form of subconscious schemes of perception, judgement and interpretation that prestructure the world and canalize action, excluding some options even before the actor becomes conscious of the situation”. His suggestion that we investigate empirically how the relative...
balance of reflexivity and disposition operates in particular action situations is one I find extremely plausible, perhaps demanding that we need methods other than the interview, as well as overcoming the relative neglect of situated embodied action within Archer's work.

It's an interesting chapter which I highly recommend. It's left me wanting to return to my PhD, as well as investigating Lahire in greater depth. It strikes me that I've actually done something akin to what Vandenberghe advocates, synthesising Archer and Lahire, without actually having read Lahire. My curiosity demands that I establish whether or not this is the case.

_______________

Public sociology and the role of the researcher: engagement, communication and academic activism (2017-03-13 08:00)

A Postgraduate Forum Regional Event

29 March 2017
De Montfort University, Leicester - [1]FULL DETAILS & PROGRAMME

What is the role of the researcher outside the academy? This event invites Postgraduate and Early Career Researchers to innovate and critically reflect on three related areas of public sociology: academic activism, public engagement, and participation and co-production. It encourages researchers to articulate and address diverse challenges, such as neutrality, networking, and whether activism can be considered a form of public engagement.

This event includes a keynote lecture from distinguished speaker Dr Mark Carrigan, Digital Fellow, The Sociological Review, presentations by invited speakers, a film created using participatory methods, a participatory session, and the chance to network and discuss work with fellow researchers. The aim is to provide an environment in which participants have the space to be questioning, to have a lively exchange of ideas, and to be inspired to explore the potential of these ideas in their own research.

CfP: Watchful Citizens: Policing from Below and Digital Vigilantism Université de Montréal, 2-3 November 2017 (2017-03-14 08:00)

CfP: Watchful Citizens: Policing from Below and Digital Vigilantism
Université de Montréal, 2-3 November 2017

4934
works have focused on vigilante practices and activities on the field (Favarel-Garrigues & Gayer, 2016; Pratten &
with classical forms of citizens' involvement in denunciation, law enforcement and vigilante justice. One of the most
wrongdoing by other citizens. Digital media cultures facilitate the sharing of evidence of offensive acts, but also the
(Walsh, 2008). Autonomization also refers here to a context in which an ideal-typical state claims to monopolize law
vigilantism represents an outgrowth of state activity” (2014: 249). According to Walsh, “while operating without
official authorization, the organizations do not perceive their actions as overriding or transgressing the local order but construct themselves as self-anointed guardians rescuing national sovereignty, citizenship and the law’s moral sanctity, from cultural elites, moneyed interests, inept bureaucrats and a sclerotic state” (2014: 249). According to Favarel-Garrigues and Gayer, vigilantism may be defined as “collective coercive practices undertaken by non-state actors in order to enforce norms (social or judicial) and/or to take the law in their own hands – a term that mostly refers to punishing, but also to societal ideals. In targeting the offenders that are external to their community, but also their own offenders, vigilantes are both involved in the fight against crime and social control. Their activities are known because they either are conducted in public, in the name of a community of reference, or because the witnesses to more secretly conducted punishing expeditions spread the information and nourish the group’s reputation” (Favarel-Garrigues & Gayer, 2016: 17). If pioneers’ work established a first definition of vigilantism based on history (Brown, 1975; Abrahams, 1998; Johnston, 1996), more recent sociological and anthropological works have focused on vigilante practices and activities on the field (Favarel-Garrigues & Gayer, 2016; Pratten & Sen, 2007). More specifically, and considering the recent developments in media and communication, we want to focus on the impacts and interactions between vigilantism and the digital sphere. On this matter, Daniel Trottier defines digital vigilantism as "a process where citizens are collectively offended by other citizen activity, and respond through coordinated retaliation on digital media platforms, including mobile devices and social media platforms. The offending acts range from mild breaches of social protocol to terrorist acts and participation in riots. These offensive acts are not meant as a provocation in the context in which vigilantism is situated. Therefore, the targets of digital vigilantism are typically unaware of the conflict in which they have been enrolled" (Trottier, 2015: 218). Digital vigilantism refers, but is not limited, to a basic principle of “naming and shaming”, or through a ‘weaponisation of visibility’, that is sharing the target’s personal details by publishing/distributing them on public sites (‘doxing’). According to Trottier: “The visibility produced through digital vigilantism is unwanted (the target is typically not soliciting publicity) intense (content like blog posts, photos and videos evidence circulate to hundreds of thousands or even millions of users within a few days) and enduring (the vigilantism campaign may be the first item to appear
when searching the individual's name online, and may become a cultural reference in its own right)" (Trottier, 2015: 219). He then argues that: "the emergence of social, geolocated, ubiquitous media has led to a dissolution to any such barrier, to the extent that digital media activity can have lasting consequences in both a local and global context" (Trottier, 2015: 220). Digital vigilantism implies a paradigm shift with regard to the context in which digital media are used, pointing to the end of a yet well-established distinction between online activity and offline consequences (Trottier, 2015; 2016; Reagle, 2015). Digital communication comes with "context collapse", where the "lack of spatial, social, and temporal boundaries makes it difficult to maintain distinct social contexts" (boyd, 2008: 34). As Reagle puts it: "Comment's reactivity, shortness, and asynchronicity mean that it is especially contextual but that its context also is easily lost as it is forwarded and retweeted" (Reagle, 2015: 79). The coming workshop, which will launch the International Center for Comparative Criminology's 2017-2018 scientific season, will focus on digital vigilantism. Considering both the raising of the autonomization paradigm and the digital sphere, we will address the impacts of such dimensions on the practices, activities and dynamics of vigilantism, but also how vigilantism and the autonomization of societal practices with regard to gatekeeping and social control impacts vigilantism. As examples of communications, we would welcome propositions addressing (but not limited to) the following issues: - How do vigilantes promote and enforce their norms and/or values in practice using digital media? - How do digital media help, transform and contribute to the coordination of embodied activities in the context of vigilante activities? - How do digital media contribute to the renegotiation and reassertion of collective (ex: nationalist) identities in the context of vigilante activities? - How can scholarship contribute to a better understanding of the relation between on- and offline in the context of vigilante activities? - What link can we draw between digital vigilantism and the social, political and economic discourses of the vigilantes? - Aside from mediated visibility as social harm, what other outcomes might targets or participants of digital vigilantism face in consequence? - How can we (re)imagine relations between states (broadly defined to include law enforcement agencies) and vigilant(e) citizens beyond frameworks of contestation/substitution/complementarity? - How are digital vigilantism initiatives related to official law-enforcement institutions (cooperation/challenge/conflict)? - How is mediated visibility understood by vigilantes (but also other relevant social actors such as states, journalists and digital media platforms) as a means to combat criminal and otherwise offensive acts? - How are specific mediated acts such as online shaming and 'doxing' both leveraged and rendered meaningful in the context of vigilante activities? - How can we articulate social control (low crime) and societal control (high crime) with regard to digital vigilantism? - What do we know about the commercial dimension of digital vigilantism? - How are digital vigilantism initiatives related to existing political parties, social movements, associations, lobbying or private firms? - How do the vigilantes communicate about their activity on the web? How do they show their campaigns on Youtube? How do they edit the videos they post? - What do vigilantes defend? Legal norms, moral prescriptions, own values and interests? Practical information The workshop will take place at Université de Montréal, 2-3 November 2017. Proposals should include a title, a clear identification of the author(s), as well as an affiliation and should be no longer than 500-600 words. Proposals may be grounded in different academic and disciplinary perspectives including, but not limited to sociology, political science, anthropology, criminology, media studies, history. They should be sent to [2]samuel.tanner@umontreal.ca by 22nd May 2017. Authors will receive an answer by 1st July 2017. Organizers Gilles Favarel- Garrigues (SciencesPo – CERI) Daniel Trottier (Erasmus University Rotterdam) Samuel Tanner (Université de Montréal – International Center for Comparative Criminology)
International Journal of Social Research Methodology Seminar Competition (2017-03-15 08:00)

The Board of the International Journal of Social Research Methodology (IJSRM) is pleased to announce the launch of the 2017 Seminar Competition. Our aim is to support the development of critical and innovative approaches to on-going and emerging methodological debates across a range of approaches, both qualitative and quantitative, and including mixed and comparative methods, as these relate to philosophical, theoretical, ethical, political and practice issues. Seminars may consist of single or multiple day events. Topics can include any area of social research methodology.

• Available funding £3500

Guidelines for Applicants

We are seeking proposals that are concerned with debate and critical development of original cutting edge work of methodological significance. Seminars may bring together established and new researchers. They should be collaborative in approach across different institutions and disciplines and may include colleagues from relevant, non-HE, organisations.

Proposals should have clear goals and outcomes with evident concern to the methodological contribution of the Seminar. In addition, a core purpose of the Seminar series is to engage with, and contribute to the development of an international community of social researchers. Accordingly, proposers may consider how their events can be recorded for non-participants and posted on the IJSRM multimedia site. Proposers should also consider the development of a paper (papers) or a special issue for IJSRM. These would then be subject to the normal refereeing process.

Format

We are open to suggestions for format either in the form of a single day seminar or in the form of multiple days across the academic year 2017-18. Applicants may find it advantageous to organise their event adjacent to another similar event (conference, seminar).

It is expected that the funding will be used towards meeting the cost of room and equipment hire, hospitality, consumables and travel for speakers. It is expected that there are no costs for delegate attendance.

How to Apply

Further details and an application form can be obtained from Alice Edwards, Journal Administrator, tsrm-editor@tandf.co.uk.

Closing date for applications: 30th April 2017

Assessment Criteria

All submissions will be reviewed by a Committee drawn from the Board of IJSRM and will be assessed against the following criteria:

• Contribution to the development of methodological innovation and debate;
• Relevance to the aims and scope of IJSRM;
• Projected outputs and impact;
• Value for Money
Notes

- All successful seminars will have a named Principal Organiser and named Co-Organiser. The Principal Organiser will be responsible for all promotion and management of the programme of work, including arrangements for the venue, rooms, facilities, dealing with expense forms, submitting claim forms for event costs to IJSRM.
- Travel, at standard return rail fare rates and reasonable subsistence for speakers is permissible. Fees will not be paid to speakers.
- Delegates will not be paid expenses for attendance.
- Seminars would be expected to take place during the 2017 – 18 academic year.
- The events will be promoted by the Principal Organiser and co-organisers through their research networks, institutions and departments. All communications with participants and publicity of events will acknowledge sponsorship by the International Journal of Social Research Methodology.
- Further promotion will be undertaken by Taylor & Francis as appropriate.

Social Media Training Workshop (2017-03-16 08:00)

Social Media Training Workshop

Led by Holly Powell Jones

City University, London EC1V 0HB

Monday 8 May 2017, 12.30 – 4.00 pm
This workshop will be of interest and assistance if you wish to use social media to disseminate your work, identify and share relevant opportunities, communicate a cause, or promote an organisation, charity, or business services.

Call for Applications: Visiting Postdoctoral Fellowships “Algorithmed Public Spheres” (2017-03-17 08:00)

***Visiting Postdoctoral Fellowships “Algorithmed Public Spheres”
(Deadline: April 1st)***

SUMMARY:
The Hans Bredow Institute for Media Research in Hamburg, Germany, invites applications for international postdoctoral research fellows who will conduct innovative research on the social and cultural impact of algorithms during stays of 3-12 months in Hamburg in the academic year 2017/2018.

DESCRIPTION:
The Hans Bredow Institute for Media Research is a publicly funded research institute that focuses on the study of mediated public communication. Its research encompasses both broadcast and digital communication from an interdisciplinary and comparative perspective.

The postdoctoral research network Algorithmed Public Spheres was established to study the relevance of algorithms for the constitution of the public sphere. We emphasize in particular the importance of algorithms for filtering, ranking and selecting media content and for structuring digital communication. In contrast to the use of data mining in areas such as healthcare, credit scoring and general business analytics, where such techniques have a long tradition, the impact of algorithms on the public sphere poses novel challenges. How are communication, media, and public discourse impacted by transferring the dominant logics of consumption from other industries to news, information, and political deliberation,
implemented in social media platforms, search engines, and on news websites?

Research in this area could include:
- Measurement of algorithmic bias and discrimination
- Feedback effects in recommender systems
- Assessment of potential filter bubbles
- Algorithms in news production, distribution and consumption processes
- User interaction with and rationalization of algorithms

We invite applications for international postdoctoral research fellows from fields including, but not restricted to, computer and information science, communication and media studies, law, sociology and philosophy, who will conduct innovative research on the social and cultural impact of algorithms during stays of 3-12 months in Hamburg in the academic year 2017/2018. We particularly welcome cross-cutting research proposals that integrate technical and social perspectives and result in concrete outcomes, for example in the form of peer-reviewed research articles or proposals for externally funded projects.

Up to two funded fellowships will be awarded as result of this call. The fellowships cover airfare and a contribution to the accommodation and subsistence in Hamburg. In specific cases, we may offer a temporary employment contract instead of a scholarship.

To apply, please send a cover letter (one page), a project proposal (up to three pages) and your CV (up to four pages), including a list of your most relevant publications (maximum of five), to Cornelius Puschmann (c.puschmann@hans-bredow-institut.de). Please note that applications submitted after the deadline will not be considered. IMPORTANT DATES: Application deadline: April 1, 2017 Announcement of 2017/2018 Fellows: May 1, 2017

1. mailto:c.puschmann@hans-bredow-institut.de

Donald Trump: Everyday Tactics of Post-Truth (2017-03-18 08:00)

In *The Making of Donald Trump*, David Johnston identifies the tactics used by Trump to deflect inquiries into his many shady dealings and questionable decisions. Sometimes this is a matter of outright threats, with an enthusiasm for litigation ([1]1,900 suits as plaintiffs) coupled with an explicitly articulated philosophy of vengeance proving a dangerous combination for any who dare to cross him. But somewhat contrary to his public image as a blundering fool, he is often much more subtle than this, engaging in strategies of deflection and misdirection with all the deftness of the most accomplished public relations manager. In other cases, it just becomes weird, with Trump willing to publicly deny that a recording he had previously admitted to be of his own voice was anything other than a hoax:
This combination of viciousness, skilfulness and brazenness has left him insulated from meaningful scrutiny. But what has he averted in this way? What might have happened but hasn't? On page 154 Johnston offers a description which has caught my imagination:

Together, these strategies – muddying the facts and deflecting inquiries into past conduct – help ensure that Trump's carefully crafted public persona will not be unmade. He will not suffer the curtain to be pulled back to reveal a man who tricked society into thinking he was all wise and all powerful.

This public persona which has been crafted, sometimes deliberately while at other times impulsively, remains intact. I'm interested in what such a 'pulling back of the curtain' requires to be effective: the sustained attention of an audience, a sufficient familiarity with the person(a) in question, a prolonged campaign to sort fact from fiction and a lack of contestation concerning this process of sorting.

What is being framed somewhat unhelpfully as a 'post-truth era' are the conditions under which this ceases to be possible. There's lots of ways in which we could try and explain them, not all of which are necessarily mutually exclusive. The collapse of authority in late modernity. The acceleration of communication. The weakening of journalism and the dominance of public relations. Theories of social change should be able to account for the specifics of such cases, rather than simply allowing them to be rendered thematically.

In his *InfoGlut*, Mark Andrejevic takes issue with the assumption that fostering 'disbelief' or 'challenge' is necessarily subversive. As he puts it, "strategies of debunkery and information proliferation can work to reinforce, rather than threaten, relations of power and control" (loc 293). Recognising this in the abstract is important but I intend to read more about the specific cases in which these tactics are used regressively, as I'm increasingly fascinated by the extent to which these tactics are informed (or not) by epistemological and ontological understandings (even if these words are not used).
Under these conditions, what Andrejevic describes as the ‘big data divide’ seems ever more prescient by the day. From loc 464:

The dystopian version of information glut anticipates a world in which control over the tremendous amount of information generated by interactive devices is concentrated in the hands of the few who use it to sort, manage, and manipulate. Those without access to the database are left with the "poor person's" strategies for cutting through the clutter: gut instinct, affective response, and “thin-slicing” (making a snap decision based on a tiny fraction of the evidence). The asymmetric strategies for using data highlight an all-too-often overlooked truth of the digital era: infrastructure matters. Behind the airy rhetoric of "the cloud," the factories of the big data era are sprouting up across the landscape: huge server farms that consume as much energy as a small city. Here is where data is put to work – generating correlations and patterns, shaping decisions and sorting people into categories for marketers, employers, intelligence agencies, healthcare providers, financial institutions, the police, and so on. Herein resides an important dimension of the knowledge asymmetry of the big data era – the divide between those who generate the data and those who put it to use by turning it back upon the population. This divide is, at least in part, an infrastructural one shaped by ownership and control of the material resources for data storage and mining. But it is also an epistemological one – a difference in the forms of practical knowledge available to those with access to the database, in the way they think about and use information.

Pierre Bourdieu, post-war Algeria and the existential conditions for collective action (2017-03-19 08:00)

In an early essay on post-war Algeria, Pierre Bourdieu reflected on the existential experience of the urban sub-proletariat and its political significance. This is reproduced on pg 16 of Political Interventions: Social Science and Political Action:

Habituation to prolonged unemployment and the most casual and poorly paid work, along with the lack of any regular employment, prevent the development of a coherent organisation either now or in future of a system of expectations towards which all activity and existence can be orientated. For want of possessing this minimum grasp on the present that is the precondition for a deliberate and rational effort to grasp the future, all these people are prey to incoherent resentment, rather than inspired by a genuine revolutionary consciousness; the lack of work, or its instability, go together with the absence of perspective on hopes and opinions, the absence of a system of rational projects and forecasts of which the will to revolution is an aspect. Enclosed in a condition marked by insecurity and incoherence, their own vision is generally itself uncertain and incoherent.
I’m immediately struck by the parallel between the experience he describes and what I write about as distraction in digital capitalism. As he puts it on pg 17, “Everyday life is experienced as the result of a kind of systematic plan dreamed up by a malign will”. People become objects to which things happen. Life becomes episodic, lacking in continuity. What narrative unity people experience is one of frustration, recurrent attempts to exercise agency being denied by forces that are simultaneously everywhere and nowhere. The tempo of life undermines the capacity to gain purchase upon the conditions of existence, impeding any capacity to reliably pursue a change in them, let alone overcome the obstacles inevitably encountered in such a pursuit. From pg 17:

With steady work and a regular age, with the appearance of real perspectives of social advance, an open and rational awareness of temporality can develop. At that point, the contradictions between over-ambitious expectation and available possibilities, between opinions offered on an imaginary level and real attitudes, disappear. Action, judgements and aspirations arrange themselves as a function of a plan of life. It is then, and then only, that the revolutionary attitude takes the place of escape into dreams, fatalist resignation, or a raging resentment.

Could anyone recommend material I could read which explores this issue in greater depth? I’m immediately struck by how Archerian this Bourdieu seems. Or perhaps how much Archer was influenced by the Bourdieu of this period. But my broader interest is in how "disintegration and disarray supply a favourable soil for ideologies of passion, and possibly retrograde ones" (pg 19). How can distracted people be mobilised?

What I take Bourdieu to be saying is that collective action, if it is to be sustainable, necessitates a grounding in a degree of regularity within everyday life. The existential conditions of individual life, in a way shaped by but irreducible to the material conditions, provide a basis upon which different forms of collective action become more or less feasible.

University College London, Institute of Advanced Studies

Conveners: Aris Komnopoulos-Atanasiu (University College London) and Chiara Bortoli (New School for Social Research, New York)

Keynote Speakers:
Professor Jens Beckert (Director of the Max Planck Institute for the Study of Societies, Cologne)
Professor Ruth Leavas (Department of Sociology, University of Bristol)

More Speakers TBC

How do the fictitious operations of financial markets shape our perception of the future? Are they opening up or rather foreclosing radical imagination? How is debt shaping individual as well as state imaginable trajectories? How do contemporary technologies of the future proliferate through real-estate imaginations? What futures are inscribed by the merger of financial and populist imaginaries in the West?

We welcome contributions that engage with the following themes, among others:
- the social production of financial futures
- economics & science fiction
- microcredits and neoliberal imagination
- state debt and development
- fictional expectations
- real-estate utopias
- feminist finance and economics
- utopian realism and realist utopias

Please email your abstract (up to 300 words) to reclaimingutopia@gmail.com by 1 May 2017.

The conference organisers will publish a selection of the papers as a Special Issue in Public Seminar (www.publicseminar.org) and other prominent peer-reviewed journals.

---

CfP: A dialogue between STS and Political Communication (2017-03-19 19:36)

CfP: Panel: Automated social-media bots and the non-human: opening a dialogue between Political Communication and Science and Technology Studies

CfP now open for the 11th Annual Science in Public Conference, 10th-12th July, at the University of Sheffield.
Call for Panel Papers

The social and political effects of new media, social networks and technological innovation are important and pressing areas of academic inquiry for both Science and Technology Studies (STS) and Political Communication scholarship. However, interdisciplinary work between these two fields of study is uncommon, despite many confluences in theoretical and methodological approaches. This panel seeks to open a dialogue between STS and Political Communication scholarship. We offer to do so in the context of an emergent area of inquiry in Political Communication: the rise of automated social-media bots and algorithmically-controlled communication.

In recent years, Political Communication scholarship has responded to some of the empirical challenges it has faced by adopting conceptual themes and approaches from STS (in particular from Actor-Network Theory), such as in Chadwick’s *Hybrid Media System* (2013) and Kleis Nielsen’s *Ground Wars* (2012). As a sub-field of Political Science, Political Communication theory opens up new opportunities to engage with STS’s desire to “promote conversation of the conceptions of politics that animate social studies of science and technology” (Brown, 2015,p.3) and speaks to the ‘engaged program’ of STS that is “converging on the democratisation of technoscience” (Sismondo, 2008, p.21).

We invite papers on topics including, but not limited to:

- Understanding the conceptual applicability of STS to other fields, and in particular the success of ANT
- How ‘social-media bots’ can be and/or are understood by STS scholars, especially as non-human actors?
- What it means for communication to be ‘political’ – how can this be challenged?
- Likewise, what are the predominant conceptions of politics in STS, and how can they be challenged?
- Why do both STS and Political Communication place such normative value on democracy?
- The conceptual, methodological, and empirical horizon of STS – what’s coming next?

CfP: Third International Cultural Political Economy Conference, University of Lancaster, 6-8 September 2017 (2017-03-20 08:00)

Third International Cultural Political Economy Conference

Call for Papers

Taking Issues In/With Cultural Political Economy: Neoliberalism, Democracy and Crises

6-8 September 2017 at Lancaster University, UK

Plenaries: Jonathan Joseph (Sheffield), Bob Jessop and Ngai-Ling Sum (Lancaster)

Cultural Political Economy (CPE) is an emerging approach with post-disciplinary horizons. It engages with ‘cultural turns’ in the study of political economy to enhance its interpretive and explanatory power. Intellectually it arose from a synthesis of critical discourse analysis, critical political economy, neo-Gramscian state theory, neo-Gramscian International Political Economy, feminism, post-colonialism, governmentality and governance studies. This three-day conference and associated workshop gives researchers and post-graduate students an opportunity to take issues in/with CPE in philosophical, methodological and empirical terms. It invites discussions at the interface of ‘cultural turns’, critical realism, critical discourse analysis and political economy. Specifically, it focuses on the cultural (and semiotic) dimensions of political economy considered both as a field of inquiry and as an ensemble of social relations. In the light of multiple crises at many sites and scales in the global economic, political, and social order, the organizers invite papers that address theoretical or substantive aspects of the changing nature and dynamic of neoliberalism and democracy.

Potential topics might include, but are certainly not limited to:

- Cultural Turns and Critical Realism
- Critical Discourse Analysis and Political Economy
- Cultural Political Economy and Critical Policy Studies
- Marx, Gramsci and Foucault
- Social Relations, Everyday Life and Subjectivities
- Intersectionalism and Political Economy
- State, Governance and Governmentality
- Discourse, Power and Space
- Global Capitalism, Crises and New Imaginaries
Abstracts of 200-250 words should be sent to n.sum@lancaster.ac.uk on 30th June 2017 (Friday)

1. n.sum@lancaster.ac.uk
2. http://wp.lancs.ac.uk/cperc-conf/

Work, Employment and Society Journal - Seeking New Editors (2017-03-21 08:00)

Invitation to edit BSA Journal Work, Employment and Society 2018-2020

Dear colleagues,

Work, Employment and Society (WES) is reopening the call for Editors and invites applications from individuals
(who would be prepared to work as part of a team) as well as Editorial Teams interested in editing the journal, for a 3-year period from January 2018 to December 2020.

WES is currently in its 30th successful year and is a highly respected journal with an international profile. The journal is very strongly grounded in the sociological tradition, drawing upon adjacent disciplines to make an original contribution to issues and debates in the sociology of work and employment in all countries. It receives approximately 400 submissions a year, has an Impact Factor of 2.153 and is ranked 4 in the Chartered Association of Business Schools Academic Journal Guide.

The BSA is looking for a strong, diverse team of Editors to shape and sustain the journal’s leading position in the field. We particularly welcome expressions of interest from individuals, multi-institutional teams and those in sociology departments in partnership with business schools. Applicants must be based in the UK.

Individuals or teams who wish register an Expression of Interest should complete a short proforma application, accompanied by a 2-page CV, which will be considered by the Recruitment Committee.

To read the full Call for Editors and to download the application forms, please visit: [1]https://www.britsoc.co.uk/opportunities/publications-opportunities/

Interested teams and individuals are encouraged to contact Tracey Warren (chair of the Recruitment Committee) and Alison Danforth at the BSA to discuss details of the role: [2]tracey.warren@nottingham.ac.uk and [3]alison.danforth@britsoc.org.uk

Deadline for Expressions of Interest: 6 April 2017, 5pm GMT

Deadline for Full Proposals: 15 May 2017, 5pm GMT

1. https://www.britsoc.co.uk/opportunities/publications-opportunities/
2. mailto:tracey.warren@nottingham.ac.uk
3. mailto:alison.danforth@britsoc.org.uk

The Technology of Intellectual Work (2017-03-22 08:00)

In 1988 Pierre Bourdieu chaired a commission reviewing the curriculum at the behest of the minister of national education. The scope of the review was broad, encompassing a revision of subjects taught in order to strengthen the coherence and unity of the curriculum as a whole. In order to inform this work, the commission early on formulated principles to guide their endeavour, each of which were then expanded into more substantive observations concerning their implications.

One of these stood out to me as of great contemporary relevance for the social sciences in the digital university. Their principle considers those “ways of thinking or fundamental know-how that, assumed to be taught by everyone, end up not being taught by anyone”. In other words, what are the elements of educational practice which are integral to it and how can we assure their succesful transmission in training? These include “fundamental ways of thinking” such as “deduction, experiment, and the historical approach, as well as reflective and critical thinking which should always be combined with the foregoing” and “the specific character of the experimental way of thinking”,
"a resolute valuation of qualitative reasoning", a clear recognition of the provisional nature of explanatory models" and "ongoing training in the practical work of research". It extends this discussion to the technologies used in practice:

Finally, care must be taken to give major place to a whole series of techniques that, despite being tacitly required by all teaching, are rarely the object of methodical transmission: use of dictionaries and abbreviations, rhetoric of communication, establishment of files, creation of an index, use of records and data banks, preparation of a manuscript, documentary research, use of computerised instruments, interpretation of tables and graphs, etc.

*Political Interventions: Social Science and Political Action, pg 175*

This concern for the "technology of intellectual work" is one from which we could learn a lot, as well as the importance placed upon "rational working methods (such as how to choose between tasks imposed, or to distribute them in time)". It maps nicely onto what [1]C. Wright Mills described as *intellectual craftsmanship*. When we consider the technologies of scholarly production – things like notebooks, word processors, index cards, post it notes, print outs, diagrams and marginalia – our interest is in their *use-in-intellectual-work*. The technologies become something quite specific when bound up in intellectual activity:

But how is this file – which so far must seem to you more like a curious sort of 'literary' journal – used in intellectual production? The maintenance of such a file "is" intellectual production. It is a continually growing store of facts and ideas, from the most vague to the most finished.

*The Sociological Imagination, pg 199-200*

If we recognise this, we overcome the distinction between theory and practice. The distinction between 'rational working methods', 'technology of intellectual work' and 'fundamental ways of thinking' is overcome in *scholarly craft*. The role of the technology is crucial here: if we suppress or forget the technological, transmission of these practices is abstracted from their application, leaving their practical unfolding to be something which has to be discovered individually and privately ("ways of thinking or fundamental know-how that, assumed to be taught by everyone, end up not being taught by anyone"). But places for discussion of craft in this substantive sense have been the exception rather than the rule within the academy.

Perhaps social media is changing this. It is facilitating a recovery of technology, now finding itself as one of the first things social scientists discuss when they enter into dialogues through social networks and blogs. But it also facilitates what Pat Thompson has described as a [2]feral doctoral pedagogy:

Doctoral researchers can now access a range of websites such as [3]LitReviewHQ, [4]PhD2Published and [5]The Three Month Thesis youtube channel. They can read blogs written by researchers and academic developers e.g. [6]Thesis Whisperer, [7]Doctoral Writing SIG, [8]Explorations of Style, and of course this one. They can synchronously chat on social media about research via general hashtags #phdchat #phdforum and #acwri, or discipline specific hashtags such as #twitterstorians or #socphd. They can buy webinars, coaching and courses in almost all aspects of doctoral research. Doctoral researchers are also themselves increasingly blogging about their own experiences and some are also offering advice to others. Much of this socially mediated DIY activity is international, cross-disciplinary and all day/all night.

[9]https://patthomson.net/2014/06/16/are-we-heading-for-a-diy-phd/Doctoral researchers
There can be problematic aspects to this. But when it’s valuable, it’s at the level of precisely the unity of thinking, technology and activity which the commission advocated. Social media is helping us recover the technology of intellectual work and it’s an extremely positive development for the social sciences.

dmf (2017-03-22 13:42:32)
anyone beta testing these technologies?

The Ontology of Fateful Moments (2017-03-22 08:00)

In his On the Ontological Mystery, Gabriel Marcel describes the experience of “an irresistible appeal which over turns the habitual perspectives just as a gust of wind might tumble down the panels of a stage set”. He is talking of a chance meeting with a stranger, but the image is a powerful one which characterises many episodes of what I think of as personal morphogenesis. Fateful moments, turning points and critical junctures often involve profound changes in the scenery of our lives. Things which we thought were solid fall apart. Suddenly what was fixed is revealed to be malleable. We realise that the background to our lives is not immutable, rather it was simply what had faded into the background. It is a sudden, dramatic and painful overturning of the strangely subtle process through which we ‘die a thousand deaths’, to use Roberto Unger’s phrase, as congealing layers of habit obscure our own agency.

I’m fascinated by these fateful moments because they are central to understanding agency. Their mysterious dynamics hold the secrets of our dual nature, free but always constrained, capable of choice but driven by automaticity. To adequately address the ontology of such fateful moments entails that we are careful about their epistemology. The mere fact of a moment being deemed fateful by a subject does not make it so. The poetics of ‘turning points’ often blind us to the mundane realities that preceded them, as the dramatic moment when the sense of our life ‘tumbles down like the panels of a stage set’ only came about because of many unnoticed gusts of wind that gradually eroded the foundations of this experienced order.

It might sound voluntaristic to be concerned with these sudden dizzying encounters with freedom, but it’s precisely in such moments when we can be face to face with the recalcitrance of reality. Best laid plans go awry, people and things resist our demands and the order we sought to impose on the world proves to be a hope, rather than a blueprint. An adequate phenomenology of ‘fateful moments’ must be orientated to the past, as well as the future. What renders these moments fateful is being torn between the two, rather than habitually chugging along as past
investments propel us through present circumstances and into an expected future.

Investigating fateful moments can help elucidate this strained character of agency, forever caught between past and future, blind to the full range of opportunities and constraints confronted in the present. But fateful moments aren't reducible to agency. They are something relational, multifaceted and dynamic. For this reason, they can also be profoundly macro-sociological in origin. Reading Sarah Bakewell's wonderful *At the Existential Cafe*, which incidentally introduced me to the Marcel text I opened this discussion with, offers a wonderful account of how the grand sweep of historical events can reshape the lives of those caught within them. At risk of stating the obvious, wars are amongst many other things a terrifying social machinery for generating fateful moments. A concern for fateful moments does not represent a personalist myopia, but rather an ambition to stitch together the tapestry of social explanation from the most intimate aspects of personal experience through to the most dramatic instances of systemic change.

The Porous University – A critical exploration of openness, space and place in Higher Education

(2017-03-22 18:17)

Call for participation Monday 8th and Tuesday 9th May 2017 University of the Highlands and Islands, Inverness Campus

This two-day symposium arose out of a series of conversations and reflections on the nature of openness within Higher Education. It started with the observation that openness is increasingly seen as a technical question, whose solution lies in employing the low transaction costs associated with digital technologies with open licences to open up academic content to new groups of learners.

Where critical voices have engaged this partial reading they have often rightly critiqued the degree to which this is truly open, for example, drawing on older traditions of open to question the freedoms free content allows for those already distanced from education.

However, other questions also arise in a critical reading of open, and these include:

- What does open mean beyond releasing content?
- What is the role of open academics in dealing with problems 'in the world'?
- How should staff and students become learners within community contexts, developing and negotiating the curriculum based on those contexts?
- What would it mean for openness as a way to allow new voices into the academy, to acknowledge knowing and ways of knowing outside the academy, and where can and should our open spaces – both digital and physical – intersect?
- If we are to advocate allowing learners' experiences and organisations to inform the academy how open should academics be to the influence of private capital?
These are the kinds of questions, amongst others, that we want to explore in this symposium.

CfP: Queer Studies Conference (2017-03-22 19:49)

Looking Back, Looking Forward

Friday 30th June 2017, University of Surrey, Guildford

BSA Early Career Forum Regional Event

Contemporary queer studies increasingly focus on broad areas of sociological concern. It is therefore common to find early career researchers working on issues relating to sexuality across the humanities and social sciences. This interdisciplinarity leads to exciting new areas of research. However, early career researchers can often find it difficult to connect with other researchers.

This one-day workshop event will provide a forum for discussing the past, present and future of queer research, with an emphasis on the challenges and opportunities faced by early career researchers. This broad theme will allow for discussions to take in theoretical issues, methodological problems and structural challenges that face the early career researcher working in areas of queer and sexuality studies.

We are delighted to announce our keynote speakers:

Dr Zowie Davy, De Montfort University

Dr Yiu-Tung Suen, Chinese University of Hong Kong

Call for papers

4952
The event is limited to 20-30 people, and is structured as a participatory workshop with sessions designed to foster discussion and networking.

Attendees at the event will have the opportunity to present research in a "lightning" session of a limited number of short, 5 minute presentations. This will allow you to briefly present your research with the emphasis on meeting and networking with other researchers. We also invite applications for poster presentations at the event.

We want to focus on your research and interests. We therefore welcome the participation of all our fellow early career researchers in queer and sexualities research to this exciting event. We hope to bring together a wide range of perspectives in order to create a community of innovative research.

We invite early-career and postgraduate researchers who would like to present at the event to submit titles and abstracts of 100-150 words, to queers@surrey.ac.uk by 28th April 2017. Please specify talk and/or poster in your email application.

**Registration Costs:**

- BSA Members £10
- Non Members £25

There will be a limited number of free spaces for unwaged or unaffiliated individuals. Please contact queers@surrey.ac.uk for more details.

**Organising committee:** Kirsty Lohman, Katherine Hubbard, Andrew King

**Cities and the Political Imagination (2017-03-23 08:00)**

*The Sociological Review Annual Lecture 2017*

How can we recognize the political in the city? How might social scientists engage with forms of politics outside of
established sites of research such as those associated with representative democracy or collective mobilizations?

This presentation suggests that new perspectives on urban politics might be enabled by revisiting the connections between sociology and cultural studies, and specifically by combining long-term urban ethnography and cultural analysis. Reading forms of creative expression in relation to power struggles in and over urban space can direct our attention towards negotiations of authority and political belonging that are often overlooked within the social sciences. I explore the possibilities of such an approach by focusing on the idea of the political imagination, and in particular on how everyday practices are informed by imaginations of urban rule and citizenship.

Expressive culture generates both analytical and normative frames, guiding everyday understandings of how power works, where and in whose hands it is concentrated, and whether we see this as just or unjust. Such frames can legitimize or delegitimize specific distributions of resources and risks, and can normalize or denaturalize specific structures of decision-making.

Through a discussion of popular music (hiphop, reggae and dancehall) and visual culture, I consider how these forms of the imagination allow new political subjectivities and actions to emerge and consolidate.

**Time:** 5:45pm - 9:00pm, Friday 28th April, 2017

**Location:** Manchester Museum, Oxford Road, Manchester M13 9PL

**Pierre Bourdieu, liberal thought and the ontology of collectives (2017-03-24 08:00)**

Well over a decade ago, I was due to start a PhD in Political Philosophy looking at ideas of the individual within liberal thought. There are many reasons why I ultimately moved into a Sociology department instead, though my lack of regrets about this choice hasn’t stopped me occasionally wondering what might this thesis might have looked like. It occurred this morning when reading a collection of Bourdieu’s political writings (Political Interventions: Social Science and Political Action) that one likely outcome would have been a subsequent study on liberalism’s difficulty with *collectives*. As Bourdieu writes, reproduced on pg 58:

> Liberal philosophy identifies political action with solitary action, even silent and secret action, its paradigm being the vote ‘acquired’ by a party in the secret of the polling booth. In this way, by reducing group to series, the mobilised opinion of an organised or solidaristic collective is reduced to a statical aggregation of individually expressed opinions.

The difficulty posed by *collectives* concerns the empirical refutation of this often unstated principle. Actually existing collectives, with all their emergent mess, make it difficult to *reduce group to series* by methodological slight of hand. The noise and assertion which characterise them challenge us to treat them as *collectives*. But the broader edifice of
liberal thought is dependent on melting collectives into aggregates:

Political action is thus reduced to a kind of economic action. The logic of the market or of the vote, in other words, the aggregation of individual strategies, imposes itself each time that groups are reduced to the state of aggregates – or, if you prefer, demobilised. When, in effect, a group is reduced to impotence (or to individual strategies of subversion, sabotage, wastefulness, go-slows, isolated protest, absenteeism, etc.), because it lacks power over itself, the common problem of each of its members remains in a state of unease and cannot be expressed as a political problem.

How should we conceive of the relationship between individuals and collectives? Much of what I’ve done in the last ten years is ultimately motivated by this question. This paper last year explored the biographical constitution of social movements under digital capitalism, arguing that ‘distracted people’ have much more inconsistent trajectories of participation, with implications for the emergent characteristics of social movements themselves:

Social movements often make an important contribution to the normative order within social life but how are their dynamics changing under conditions of social morphogenesis? It is clear that the emergence and normalisation of social media entail affordances for mobilisation that have important implications for social movements. However there is little agreement upon precisely what these implications are and whether they can or should be evaluated in general terms. This chapter takes a novel approach to this question, exploring the technological dimensions of social morphogenesis and their consequences for the ‘distracted people’ who comprise social movements. Using the relational realist theory developed by Margaret Archer and Pierpaolo Donati, I offer a novel account of the constitution of social movements that invites us to ask questions about the emergence and durability of new movements that are obscured by alternative theoretical approaches which fail to recognise both the emergent and relational constitution of collectives.

At some point I’d also like to pursue these issues at the level of cultural representation. For instance in the representation of mindless hoards posing a threat to the liberal order:
The relation between individuals and collectives plays out at many levels. My concern is to reclaim it as a meta-categorical feature of discourse, such that the connections between these different levels can be explored. I'm still rather far away from doing this, but at least the ambition is relatively clear to me now.

**To understand social media for academics, we have to kill the idea of social media for academics**

(2017-03-25 08:00)

In the 30+ talks I have done about social media in the last year, I have discussed many things. But the one theme that has been most prominent is the extrinsic, rather than intrinsic, complexity of the subject matter. There is nothing inherently challenging about how to use social media. Any practical or technical difficulties are well within the realm of what has become habitual for most within late modernity. What creates the challenge is negotiating the novelty of its enablements and constraints within a particular context.

However it is this novelty which also makes it difficult to exercise our reflexivity in the way we would about any comparable matter. This novelty gives rise to a species of what [1]Jacob Silverman describes as ‘internet exceptionalism’:

> What we call the Internet—and what web writers so lazily draw on for their work—is less a hive mind or a throng or a gathering place and more a personalized set of online maneuvers guided by algorithmic
recommendations. When we look at our browser windows, we see our own particular interests, social networks, and purchasing histories scrambled up to stare back at us. But because we haven’t found a shared discourse to talk about this complex arrangement of competing influences and relationships, we reach for a term to contain it all. Enter “the Internet.”

The Internet is a linguistic trope but also an ideology and even a business plan. If your job is to create content out of (mostly) nothing, then you can always turn to something/someone that “the Internet” is mad or excited about. And you don’t have to worry about alienating readers because “the Internet” is so general, so vast and all-encompassing, that it always has room. This form of writing is widely adaptable. Now it’s common to see stories where “Facebook” or “Twitter” stands in for the Internet, offering approval or judgment on the latest viral schlock. Choose your (anec)data carefully, and Twitter can tell any story you want.

Much as “the Internet” gives us “a rhetorical life raft to hang onto” when discussing a subject that is vastly overhyped and invested with all manner of hopes and fears, so too does “social media” become a semantic crutch when making sense of the complex changes being brought about by digital communications within a particular institutional sphere. It’s similarly “easy, a convenient reference point” through which we gloss a complex set of changes in which technological possibilities are only one causal factor. By exceptionalising social media in this way, we “fail to relate this communication system, and everything that happens through it, to the society around us”.

This tendency seems even more pronounced when we talk about something as specific as the academy. The more we talk about “social media” as something which all academics should (or shouldn’t do) the more we obscure the changes it entails for academic labour and the organisations which academics work within. My ambition as someone who has written a book called Social Media for Academics? To get academics to stop talking about social media.

A fabulous talk about a subject that has always fascinated me. Perhaps there should be a word for the pleasure that comes from remembering that not all TED talks are overhyped nonsense? There's much more here on [2]The Dictionary of Obscure Sorrows. There's a book coming later this year and I can't wait to read it.

What is ‘Post-Truth’? What Can We Do About It? (2017-03-27 08:00)

Youth employment in the ‘gig’ economy, isolation and @youthloneliness (2017-03-27 10:40)

Isolation at the beginning of working lives

As part of the @YouthLoneliness project ([1]Twitter/[2]Tumblr), we are interested to find out more about young people’s working lives, their casual employment, their experience of self-employment and their involvement in the ‘gig economy.’

The Co-op Movement (like the Trade Union movement) was a movement that brought people facing harsh conditions together in search of ways of improving lives. What networks of connection can we imagine that will do that today?

We are offering 3 workshops on Wednesdays 1.00pm to 3pm (with a Tuesday evening option too) in May
based at the People's History Museum and will be looking at archive material in the museum to inspire print making, documentary work and photography and ideas for today.

There is also the option for the same sessions to run on the preceding evenings at The Space, Great Ancoats Street, from 5.00-7.00pm.

The workshops will run on the following dates: May 3rd; May 17th; May 24th They will have the following format:

Workshop One: Starting a documentary process. Focussing on issues facing young people in employment and using the Museum archive to prompt ideas, this session will share learning about audio, photographic and video collection using a smartphone, all these things can be used to document youth employment over the following two weeks.

Workshop Two: This session will draw together what has been collected and involve the production of a multi-media, mixed art form, collage or mosaic piece based on the research done in the previous 2 weeks.

Workshop Three: A panel lead discussion and debate about isolation, loneliness and young people in the workplace.

To book your place, register here. Priority booking will be given to people aged between 16 and 25 but the events are open to all.

Hi, this may be of interest. My speculative comments on gig-economy and health: http://www.cost-ofliving.net/gig-economy-gig-health/

The Future of ‘Impact’ in the UK (2017-03-28 08:00)

I'm reading through the Stern review in preparation for various impact related things I'm doing in the next few weeks. It takes the view that the 6,975 impact case studies produced and £55 million estimated to have been spent on the impact element of the last REF has clearly contributed to "an evolving culture of wider engagement, enhancing delivery of the benefits arising from research". These costs could be mitigated in future because "participating institutions now have processes in place to capture the information required". Or perhaps they might expand, as the infrastructure surrounding the assessment described here by Les Back seems likely to grow, even if the number of case studies does not increase much as per Stern's recommendations.

Offering institutions more flexibility in the distribution of case studies (as opposed to requiring a certain number of case studies proportionally to the number of staff submitted to a unit of assessment) could have interesting
results. As will the recommendation for ‘institutional level’ impact case studies, both in terms of identifying cross-disciplinary impacts which might otherwise fall between the cracks and perhaps justifying institutional level investments in impact capacity:

Some of these aspects of environment reflect the strategy, support and actions of the institution as a whole. This has not been assessed in REF2014 and we recommend that this should be captured in a new Institutional Environment Statement, which complements the Unit of Assessment Environment Statement.

Environment and impact are mutually supportive and should be seen together. The strategy and support of impact are closely linked to the environment for research at both Unit of Assessment and institutional level. Therefore, it is also recommended that the aspects captured by the Impact template of REF2014 should be incorporated into both the Unit of Assessment and Institutional level Environment statement.

This will involve recognising:

- the features of the research environment that are the product of institutional level activity, including steps taken to promote interdisciplinary and other joint working internally and externally and to support engagement and impact, beyond that which is just the aggregate of individual units of assessment
- the future research and knowledge exchange strategy of the HEI, as well as the individual Units of Assessment, and the extent to which both have delivered on the strategies set out in the previous REF
- the individualism of the HEI and the eclecticism of academic life within it
- the contribution that its academics make to the wider academy (‘academic citizenship’).

Each statement would focus on how the institution or Unit of Assessment enhances the development of research capability within it, how it provides opportunities for high quality research and related activities, how it motivates and rewards researchers, and the contributions made to the wider academic community.

Additionally, weakening the link between impact and research outputs could have interesting implications for social media activity, expanding the range of activity which can be measured and argued to lead to impact.

The review suggests that the potential range of impacts possible to record was made narrower by the assessment process. It also advocates emphasising cultural impact and now recognising impact internal to higher education, including though hopefully not limited to teaching:

We recommend that impacts on public engagement and understanding are emphasised and that impacts on cultural life be specifically included. Better to align the REF with the TEF, we also recommend that
research leading to major impacts on curricula and/or pedagogy within or across disciplines should be included; and in order to encourage long-term, interdisciplinary research endeavours, we recommend that groundbreaking academic impacts such as research leading to the creation of new disciplines should be included.

The Sociological Review Annual Lecture 2017
Friday 28th April, 2017
Time: 5:45pm - 8:00pm, followed by wine reception

Location: Manchester Museum, Oxford Road, Manchester M13 9PL

Cities and the Political Imagination
Keynote Speaker: Professor Rivke Jaffe
Responses by Professor Claire Alexander Dr. Emma Jackson

How can we recognize the political in the city? How might social scientists engage with forms of politics outside of established sites of research such as those associated with representative democracy or collective mobilizations? This presentation suggests that new perspectives on urban politics might be enabled by revisiting the connections between sociology and cultural studies, and specifically by combining long-term urban ethnography and cultural analysis. Reading forms of creative expression in relation to power struggles in and over urban space can direct our attention towards negotiations of authority and political belonging that are often overlooked within the social sciences. I explore the possibilities of such an approach by focusing on the idea of the political imagination, and in particular on how everyday practices are informed by imaginations of urban rule and citizenship. Expressive culture generates both analytical and normative frames, guiding everyday understandings of how power works, where and in whose hands it is concentrated, and whether we see this as just or unjust. Such frames can legitimate or delegitimize specific distributions of resources and risks, and can normalize or denaturalize specific structures of decision-making. Through a discussion of popular music (hiphop, reggae and dancehall) and visual culture, I consider how these forms of the imagination allow new political subjectivities and actions to emerge and consolidate.

Rivke Jaffe is Professor of Cities, Politics and Culture in the Department of Human Geography, Planning and International Development Studies at the University of Amsterdam. Her research focuses primarily on intersections of the urban and the political, and includes an interest in topics such as organized crime, popular culture and environmental pollution, drawing on fieldwork in Jamaica, Curacao and Suriname. She is currently leading a major research program on public-private security assemblages in Kingston, Jerusalem, Miami, Nairobi and Recife, studying transformations in governance and citizenship in relation to hybrid forms of security provision. Her publications include Concrete Jungles: Urban Pollution and the Politics of Difference in the Caribbean (Oxford, 2016) and
Introducing Urban Anthropology (with Anouk de Koning, Routledge, 2016).

This event is free, but registration is required. Click here to book now: [1]https://www.eventbrite.co.uk/e/cities-and-the-political-imagination-the-sociological-review-annual-lecture-2017-with-rivke-jaffe-tickets-31372245230

The ambivalent promise of higher education (2017-03-29 08:00)

In the latest collection of talks from Audrey Watters, The Curse of the Monsters of Educational Technology, she addresses an uncomfortable issue in higher education: the unrealistic claims made about the transformative aspect of university attendance. From loc 397-413:

These questions get at what is an uncomfortable and largely unspoken truth about education. That is, education, for its own part, makes all sorts of claims—sometimes, let’s be honest, fairly wild and unsubstantiated claims—about amazement, achievement, and transformation. These promises may well reveal that our field is full of Sea Monkeys—colorful promises of becoming that we might not actually be able to or even intend to honor. As we reconstitute technology-enhanced learning, are we simply reconstituting Sea Monkeys?

This is one of those issues that fascinates me because I can’t help but see it in ambivalent terms. On the one hand, the relative advantage of a university degree is manifestly in decline due to credential inflation and opportunity hoarding, such that to deny this would be fundamentally dishonest. On the other hand, this point is often made in a way that reduces the value of higher education to instrumental advantage accrued by individuals. On the one hand, the interventions of the Competition and Markets Authority within higher education further the commodification of universities in a way which corrodes the intrinsic value that can be found through participating in them. On the other hand, it seems absurd to suggest that students don’t have a right to expect that the understanding upon which they took a university place is accurate, particularly as participation becomes ever more financially and personally onerous.

The more diffuse promises of education are even more thorny. My PhD was a study of personal change (and stasis) in the lives of 18 undergraduate students across a range of disciplines, during their first two years of university. One of the most important findings I took from this research was how rapidly the evaluation of our own lives and aspirations can change, particularly as we enter a new environment into which we have invested our hopes. My point is not to say that ‘false promises’ made concerning the university experience is necessarily a problematic category, only that it becomes ontologically rather messy once we move beyond the straight-forward level of what students were told about courses, facilities and workload etc.
But it is nonetheless crucial that we have these conversations. What is the value of an undergraduate degree? What expectations do students have of it? What qualitative and quantitative evidence is there to support those expectations? If expectations are inflated, can we identify particular groups who are perpetuating these and the interests at work in their doing so? I can’t help but feel that Watters is correct, higher education is full of “colorful promises of becoming that we might not actually be able to or even intend to honor”. We urgently need to learn how to counteract this while still resisting the commodification and bureaucratisation which action taken in the interests of the consumer will likely entail.

The centralisation of the web and the constraints on academic speech (2017-03-30 08:00)

A great essay by Ethan Zuckerman, which raises the crucial question of infrastructural dependency within the digital university. We can overcome this partly through cultural change (e.g. the importance of a domain of one’s own and boycotting companies like academia.edu) but there are institutional factors limiting the potential reach of these strategies. To what extent is mandated engagement expected to proceed through these channels? How do procurement and provision decisions made at an institutional level lock scholars into these systems?

Early proponents of the power of digital publishing celebrated the ways in which the Internet, and in particular the world wide web, democratized both access to information and the ability to disseminate knowledge to wide audiences. News organizations might evade government controls of the press by publishing on servers outside their nations’ borders. Dissidents could organize in the digital public sphere, evading controls that prevented freedom of assembly in the physical world. Scholars could disseminate work in progress directly to the web either outside of the process of peer review or under the aegis of new types of online journals.

It’s possible this utopian vision reigned for at least the early years of the consumer web, when independent online publishing was common. It’s also arguable that this has always been a fantasy, and that chokepoints like the domain name system and large internet service providers have always had the power to control speech. But since 2010, publishing online has centralized on a few commercial platforms, notably Amazon Web Services (which provides hosting and backend for over a million different websites, including those for publishers like Netflix, Instagram, and [GitHub]); Facebook, which hosts content produced by over 1.7 billion people; Google, whose YouTube service hosts a significant portion of the web’s video content; as well as smaller players like WordPress and Wikimedia.

These platforms have immense power over what speech is possible, and their decisions are opaque and not subject to external review. When Facebook decided to prohibit Nick Ut’s Pulitzer-winning photo of Kim Phúc running from a napalm attack, public shaming was the only option Norwegian newspaper Aftenposten found for appealing the decision. Publishing platforms face intense pressure from governments to block controversial content, from Israeli government pressure to remove critical content from Facebook to the “blockade” against Wikileaks that caused the leaks organization to lose web hosting, domain name services, and services to accept donations. Examples abound of Google’s power to discriminate through indexing of information, and the results merit close study. Far more subtle forms of content control happen every day, from organized campaigns to “flag” and demand removal of content a group of coordinated individuals find offensive, from Buddhist Burmese flagging
pro-Rohingya content to Palestinian and Israeli activists attempting to silence each other.

There are many ways to publish without these centralised systems but we remain dependent upon them for discovery. Unfortunately, as he puts it, “the ability to publish without the ability to be discovered is an empty promise” and “In a world of scarce attention, those who control curation and discovery systems control what we encounter and what we know.” This is bringing about a radical transformation of the knowledge system:

As we consider the transformations in the production, publication, and archiving of social research under digital conditions, it is essential that we understand that scholarly publishing and discovery, a space traditionally controlled by university presses and scholarly peers, is now centralizing around a small number of technically sophisticated commercial firms. The good news in this development is that we have the opportunity to make collective cause with those seeking to ensure online publishing and discovery systems are transparent, fair, auditable, and distributed. The bad news is that we find ourselves joining a profoundly uphill battle, where many of our goals are merely infeasible and others may be technically impossible.

Social Imaginaries: The re-invention of social research (2017-03-30 11:21)

Social Imaginaries: The re-invention of social research

Panel discussion and book launch of Digital Sociology by Noortje Marres
Date and Time: 9 May, 5-7pm
Location: Central Saint Martins, Granary Building, Granary Square, London N1C 4AA

Hosted by:

- Innovation Insights Hub, University of the Arts London
- Centre for Interdisciplinary Methodologies, University of Warwick
- Warwick in London.

With: Les Back (Goldsmiths), Lucy Kimbell (UAL), Hannah Knox (UCL), Noortje Marres (Warwick), Mike Savage (LSE), and Amanda Windle (UAL)

The digital makes possible new ways of monitoring, analysing and intervening in social life. Critics have pointed at the new forms of surveillance and control that this makes possible, and to new types of data economies. But the creation of new forms of knowledge about social life is central to efforts to implement digital infrastructures: they enable the introduction of new kinds of actionable insight into society. At the same time, however, the liking-and-sharing economy has recently been exposed to serve power more than truth. In this context, how can we communicate the constructive potential of the insight that knowing is a social process? What can be the role of social research in digital societies? This is the issue that Digital Sociology (Marres, 2017) examines, and one that this event will explore by way of a panel discussion about the following proposition: in a digital age, "knowing society" becomes an inherently interdisciplinary undertaking, one that requires mutual engagement, and thrives on creative exchange, between computing, social sciences, and the arts.

Places are limited, so please register at [1]digitalsociologylaunch@gmail.com
The (Coming) Crisis of Free Speech in the Digital University (2017-03-31 08:00)

In the last couple of years, prominent commentators have increasingly claimed there is a crisis of free speech in higher education. Well meaning participants in reasoned debate are apparently unable to move without being accosted by left-wing activists keen to shut them down or move them on. As I [1]wrote a couple of years ago, the timing of this putative crisis is interesting, given it coincides with what I think are unprecedented intrusions of the state into university life in the United Kingdom:

We've already seen the police ask a university for [2]attendees of a fracking debate. The president of the Lancaster Student's Union was warned by police, [3]who she discovered taking photos of her office, that she may have been committing a public order offence by displaying a poster in her office window. Police used CS gas and pulled a taser on Warwick students who were screaming in terror. They launch [4]secret operations to spy on peaceful student protestors. University staff are increasingly expected to function as [5]proxy border guards. Police violence is increasingly an expectation at student protests, including some astonishing and egregious instances of brutality. Punitive bail conditions are becoming the norm for student activists and some university managements have gone out of their way to exclude and persecute 'trouble makers'.

Where could it lead? In Turkey, we've seen a purge of the academy, with [6]over 7000 academics dismissed. There's little sign of any comparable action on the horizon in the United Kingdom, though it's a salutary reminder of how far such intrusions can go and an obvious incitement to international solidarity. The more salient comparison is with the United States, where Donald Trump's recent threat to Berkeley neatly illustrates how attacks on the public university and opposition to the gains made by 'political correctness' are being linked by contemporary conservatism:

https://twitter.com/realDonaldTrump/status/827112633224544256

The notion of political balance is being used as a (superficially liberal) stick to impinge upon the intellectual autonomy of the academy, something already in a state of disrepair after many years of the culture wars and managerial attacks on pay and conditions. It seems likely that attempts to enforce this legislatively are going to become a recurrent feature of the policy landscape.

https://twitter.com/RaleighReporter/status/833848109071474688

When we look at the situation in America, it becomes easy to see the parallels to how the 'crisis in free speech' is being presented in the United Kingdom. Take for instance, this morning's Times article about a meeting which took place at the University of Sussex:
Academics were accused of intellectual vandalism yesterday after it was revealed that lecturers at a university advertised a seminar on how to respond to right-wing attitudes among students.

Researchers and lecturers at the University of Sussex held a departmental meeting entitled "dealing with right-wing attitudes and politics in the classroom". Critics accused them of seeking to suppress free speech and said that the episode reflected a climate on university campuses where student unions, and increasingly universities themselves, were curbing free expression.

Who are these critics? What's their stake in this debate? Their position remains fascinatingly opaque. The ideological character of universities is changing, with anything that can be construed as a left-wing bias being a potential basis for attack. But attempts to manage that change, to find ways to sustain existing practices in the face of disruption, are vulnerable to attack as well. This [8]thread by Alison Phipps is worth reading in full:

https://twitter.com/alisonphipps/status/834079901640699908

There are multiple things going on here. The crisis of free speech in higher education is overdetermined. For instance we can identify a [9]managerial interest in curbing the freedoms of academic labour, a concern for crisis management as university communications change, a long-term agenda to shift the ideological tenor of the university system, an intrusion of the surveillance state licensed by Prevent, a broader hardening of protest policing, the politicisation of foreign student numbers and the expanding frontiers of Border Force, a more grass roots upsurge in far-right activism on university campuses and many others factors besides.

We need to be careful not to fall into a simplistic analysis which sees this as a right-wing plot in the face of which we must immediately defend ourselves. But we urgently need to reject the idea that the crisis of free speech is a matter of censorious millennials undermining the institutional culture of the university. This is such obvious nonsense as an account of the change underway in our universities that it wouldn't even be worth engaging with, if it were not promulgated with such vigour by so many influential outlets.

My particular professional interest in this concerns social media. Firstly, the digital university is a transparent ivory tower, such that it has become inordinately more susceptible to (low cost) surveillance while failing to have undergone the democratisation which digital communications was expected to bring. It’s a toxic brew, which leaves those within it naive about the tendency of those outside it to scrutinise and intervene, as well as poorly equipped to respond effectively. Secondly, the intense politicisation of academic speech we’re seeing is only inadequately recognised at best in invocations to public engagement and impact. We need to recover public speech as a labour issue, particularly if the tendency of universities to force people into the public square is going to increase.
These problems are manageable but the prevailing language of social media for academics, in which ‘social media’ is seen as something everyone ‘should use’ (or shouldn't) does nothing but hinder us in this endeavour. There’s a great field of conceptual detritus concerning ‘impact’, ‘engagement’, ‘social media’, ‘academic freedom’ and ‘free speech’ which we need to clear, if we want to have any hope of recognising the complexity of our present circumstances or responding adequately to them.

Creative Methods for Research and Community Engagement Summer School (2017-04-01 15:47)

Creative Methods for Research and Community Engagement Summer School

6-8 July 2017, Keele University

PhD students and Early Career Researchers are welcome at this event organised by the Community Animation and Social Innovation Centre ([1]CASIC) at Keele University.

The Summer School will be held in central England at the [2]New Vic Theatre, Newcastle-under-Lyme (6-7 July) and [3]Keele University campus (8 July), where you will experience the KAVE ([4]https://www.keele.ac.uk/pharmacy/digital/kave/) and our Makerspace facilities ([5]https://www.keele.ac.uk/make/).

The facilitator will be Dr Helen Kara, author of Creative Research Methods in the Social Sciences: A Practical Guide. Speakers will include:

- Professor Mihaela Kelemen – CASIC Director
- Dr Lindsay Hamilton – Keele Management School, Keele University
- Véronique Jochum – Research Manager, National Council for Voluntary Organisations
- Dr Emma Surman – Keele Management School, Keele University
- Dr Ceri Morgan – School of Humanities, Keele University
- Professor Rajmil Fischman – School of Music, Keele University
- Sue Moffat – Director of New Vic Borderlines, New Vic Theatre

The Summer School will enlighten, inspire and guide ECRs and students at all stages of scholarly or professional doctorates. Each day will be packed with interactive hands-on sessions addressing six broad topics:

- Arts-based research
- Transformative research frameworks
We are offering an "early bird" price of £230 for bookings received and paid by 21 April. After that date the price will be £270. The cost includes refreshments and lunches and a complimentary copy of Dr Kara's book on creative research methods.

There will be a dinner and performance of 'Around the world in 80 Days' at the New Vic Theatre on July 6th, at an extra cost of £20.

For more information go to [6]https://www.keele.ac.uk/casic/summerschool2017/

Please follow #CRMSS17 on Twitter for pre-event updates.

Does Sociology need more systematic review? (2017-04-02 08:00)

A really [1]interesting discussion here from Patrick Dunleavy:

There are also now some very specific and increasingly influential methods for re-aggregating and re-understanding what whole literatures tell us. '[2]Systematic review' is an especially key approach now across the social sciences, spreading in from medicine and the health sciences. It starts by the reviewer clearly delineating (i) the subject, focus and boundaries of the review; and (ii) explicit criteria to be applied in evaluating sources and texts as being high value, medium value or low value. The review begins by considering the full pool of sources, leaving nothing out. The reviewer then systematically applies the criteria already set out, filtering down the studies progressively to focus on the higher value materials. Within the high value studies alone, those with the best evidence or methods employed, the systematic review considers what exactly are the strength of any evidential connections made and tries to reconcile as far as possible any divergences in estimating effects across the high value studies. Finally the conclusions (a) sum up the central findings; (b) make clear and assess the level of evidence and weight of the materials underpinning the findings; (c) give a sensitivity analysis of how far the conclusions might differ if the assessment criteria used for focusing down on key studies had been different.
We face a problem here though. The disciplines which would benefit most from systematic review are the ones least likely to have clearly agreed upon standards about what constitutes 'better' or 'worse' scholarship. Without this, the systematic review then starts to involve precisely the contentious implicit judgements which it’s intended to address. Nonetheless, I find it hard to deny the value here. How could we encourage more systematic review in Sociology?

Pedro Alemán (2018-12-08 19:39:54)
Doing them, I think it’s the only way. And we have to go through it, because maybe we are working with the same content saying different things and in the end it harms our discipline.

**Metaphysical matters in post-truth cultures (2017-04-02 21:55)**

by Joshua Stein

In the early months of the Trump administration, and even the late months of the Presidential campaign, social theorists and commentators started to write Jeremiads on the death of truth and its relata, knowledge and disagreement and accuracy. Most of these characterizations focus on a range of questions about the status of knowledge and disagreement. [1][2][3] I do not want to disparage these sorts of characterizations, but many of them (as well as conversations with my colleagues and friends) has led me to suspect people are missing the point in disagreements about the important questions, though often they rub elbows in the course of the analysis.

My colleague Aaron Thomas-Bolduc made the following observations in his discussion of the issue. “… facts are true things or facthood is a property of truth things.” [4, emphasis in original] Those who think that this is a sort of naïve, arcane metaphysical claim detached from the modern intellectual realization of the importance of context and contingency, I’ll have words for that in a bit. But the goal here is just to lay out a foundation for the discussion of a standard metaphysical view. Thomas-Bolduc’s observation is supposed to be a triviality about the relationship a fact and a statement being true. A sentence is made true by its disquotation. If I say, “it’s raining outside,” then that sentence is true if and only if it is, in fact, raining outside. These sorts of straightforward observations will seem boring to the philosophically uninitiated, but they get important quickly when we dive into the modern conventions around truth.

Consider the fascinating and oft repeated claim, recently crystalized by Hugh Hewitt, “[The Affordable Care Act] is in a death spiral.” [5] The category “death spiral” describes a set of conditions; the claim is true or false if the Affordable Care Act meets those conditions. It doesn’t seem that complicated. It can be complicated, of course. Perhaps it meets some conditions and not others; perhaps there are borderline cases, or interpretations of “death spiral” that allow for the statement to be, or at least be read as, not straightforwardly true or false. In the case of Hewitt’s statement, it seems to be straightforwardly false, but there are others that are not so straightforward.

Historically, it is so-called “postmodern” or “continental” critics who are taken to advance this sort of claim, sometimes to the celebration or lament of academics. [6][7] It has a place in Anglophone metaphysics as well. There is a doctrine, that still has its defenders, that every sentence (barring, perhaps, a few exceptions) is either true or
false; a number of prominent philosophers have suggested that this can’t possibly be right, that certain statements can be more or less true than others, either by more or less accurately tracking the facts or by getting more of a compound set of facts right.

In his seminal paper “Vagueness, Truth and Logic,” the British philosopher Kit Fine proposes an account where interpretations of a sentence can determine an intermediate truth-value for that sentence. Consider the sentence, “Trump was surveilled by the Obama Administration.” On many, even most, interpretations of this sentence, it seems to be false; interpreting the sentence as a direct action, where Trump was targeted, or where the behavior was intentionally directed at Trump, seems to be false. There are some very minimal interpretations, though, where the sentence counts as true. If “was surveilled by the Obama administration” simply describes some parts of the intelligence community gaining some information about the subject in the course of general surveillance efforts, then it is true. On Fine’s view (though his views have evolved considerably since this paper) we might represent a truth-value as a number between (1) and (0), where (1) is true on all interpretations and (0) is false on all interpretations. The closer the truth value of the statement “Trump was surveilled by the Obama Administration” is to (1), the truer it is.

Sociologists and anthropologists, as well as social critics, are fascinated by the term “ontology,” though they rarely use it all that well. Here’s the simple series of moves that get from the ontological (properly, metaphysical, though that word is scarier) claim to the epistemological claim; the rapid-chess version, if you will. For any sentence, there are a range of possible interpretations of that sentence, and for each interpretation there are facts in virtue of which that interpretation is true, false, or some value in between. The sentence, then, gets to be true or false based on the aggregation of the value of those interpretations. We evaluate a sentence as true or false based on whether the range of possible interpretations tends to be true or false. A sentence where all of the interpretations come back true is a sentence we know to be true, and the same for falsity.

I’ve become fond of a particular locution in the Trump era. “There is no interpretation of that statement that’s true.” This is how I regard Hewitt’s “death spiral” claim, and those relevantly similar. Similarly, “that’s mostly false” approximates my evaluation of the surveillance claim; there are some minimal interpretations that come back true, but for the most part, the sentence is false.

One of the hot takes around this issue is that we live in a world where critics have made void the notion of truth, that “it is all relative” now, and that is responsible for the inexorable tide of bullshit filling our living rooms through television sets and facebook feeds. This is only true for those with un-nuanced stories about truth and facts. Relativism, post-modernism, or whatever label the hot taker sticks on the perceived destroyer of facticity is this evil culprit; but, in reality, it is hard to find well-interpreted versions of the account offensive. The problem isn’t a particular philosophically salient ideology, but the combination of lazy interpretations of an ideology with political inclinations, malice, ignorance, greed, or some combination.

This is not to say that the philosophically oriented writing dog-eared as “relativism,” “post-modernism,” or whatever reapropriated academic term is dredge up in these commentaries is particularly good, or even benign. (Surely, there are a lot of writers with philosophical predilections who are quite bad along nearly every imaginable axis of evaluation, but that is another tangent.) That said, the hot takes are, themselves, illustrations of the same intellectually lazy claims about truth and relata that are getting us here. Reductive analyses of anything are weak; even the expedited analysis of truth I’ve offered is only a preface to a much longer set of interlocking discussions. There are lots of reasons we’ve wound up in the political and moral vacuum, but clawing our way out requires more work, rather than less.

The seventh annual Theorizing the Web is April 7 & 8 at the Museum of the Moving Image. That’s in almost two weeks! We hope to see old friends and new faces so if you think you’ll be in the NYC please stop by! Register and pay our whatever-you-want registration fee by April 5 to attend the conference and get full access to the Museum of the Moving Image: [1]http://theorizingtheweb.tumblr.com/2017/registration

If you don’t think you can attend in NYC there’s always the internet! To join us remotely, visit [2]http://theorizingtheweb.tumblr.com/2017/livestream during the conference and you’ll see all the streams. Ask the panelists questions and contact other attendees through the conference hashtag #TtW17. Each panel has its own dedicated hashtag too, so you can interact with specific panel sessions. If you’re a part of a watch party, cool! Please drop us a line and let us know.

Thank you and hope to see lots of you next month!

-David Banks / @da_bank / co-chair

About Theorizing the Web:

Theorizing the Web is an inter- and non-disciplinary annual conference that brings together scholars, journalists, artists, activists, and technology practitioners to think conceptually and critically about the interrelationships between the Web and society. We deeply value public engagement, and consider insights from academics, non-academics, and non-"tech theorists" alike to be equally valuable.

The first Theorizing the Web conference was held in 2011 at the University of Maryland, as was the second in 2012. In 2013, the conference moved to New York, where it was hosted by the CUNY Graduate Center in Manhattan. In 2014 we moved outside of institutional settings into a Windmill Studios warehouse in Brooklyn and expanded to two full days of programming. The 2015 event moved back to Manhattan, on the Bowery, to the then-unfinished new International Center of Photography space. In 2016 and 2017, we're at our third borough, in the beautiful spaces within the Museum of the Moving Image in Queens.

The Friday and Saturday daytime sessions feature 18 panels created largely from the competitive submissions we received at the beginning of the year, and the evenings conclude with four keynotes that will take place in the museum's Redstone Theater. Keynote panelists include Adrian Chen, Jay Rosen, Zeynep Tufekçi, Sharon Zukin, and many more.

CfP: Digital Culture meets data: Critical approaches (2017-04-04 08:00)

CALL FOR PAPERS
Digital Culture meets data: Critical approaches

ECREA Digital Culture and Communication Section Conference.

6th 7th November 2017, University of Brighton, UK

Abstract deadline: 20 May 2017
Keynote speakers:

€ Rob Kitchin, Maynooth University, Republic of Ireland  
€ Helen Thornham, University of Leeds, UK

Conference theme:

Algorithms and big data are today shaping our sociocultural and technical relations and our everyday experiences. Digital culture and communication are inevitably changing as media infrastructures, media practices and social environments become increasingly ‘datafied’. We may think of surveillance, algorithmic profiling and self-tracking for example. Wearable technologies such as fitness trackers allow people to understand the body as a data-producing object. Our use of commonplace media technologies is mediated by data in ways that we do not ask for, nor even necessarily know about or consent to. Data interpellate us. Yet data are obscure and enigmatic.

But what does this turn to data mean for our research, scholarship and pedagogic practice? Has the data paradigm arrived as an unquestionable unifying concept for studies of digital culture and digital media, communication, technology? It may be that a shift of focus on algorithms and data is fundamentally disruptive to the ways in which we see our research and disciplines. It may even appear to limit the theoretical and methodological tools through which we increasingly try to understand mediation, the formation of identity, social life, politics and the creative industries. To others, the ‘datalogical turn’ may be plainly repeating the processes of earlier instances of technological innovation. And for some, it may provide an opportunity to frame new theoretical concepts and methodological tools for a whole new set of social, cultural and political phenomena.

The ECREA DCC Conference ³Digital Culture meets data: Critical approaches² asks the question: what theoretical and empirical perspectives on data and the digital can be used to augment and diversify our research and educational approaches? And how might we challenge data paradigms or aim to show alternative or complementary ways to address digital culture and communication? We invite empirical and theoretical research papers and panels that address themes such as:

- Media studies and datafication
- Researching media and culture using data methods
- Data visualisation, art and design
- Data and the role of the imaginary, fantasy and myth
- Data cultures and neoliberalism
- Data activism and citizen engagement
- Data and critical literacy
- Data and gender, race, class inequalities
- Datafication and the creative industries

4976
The Conference will also host a YECREA Workshop entitled: The ambitious early-career scholar in an age of precarity: questions, challenges, opportunities (Organised by Ysabel Gerrard, University of Leeds). This workshop will facilitate open discussion between academics at various stages in their careers about some of the issues confronting ambitious early-career scholars in an increasingly competitive international job market.

Submission details, individual papers:

Please submit abstracts of 250-350 words, written in English. Abstracts should contain a clear outline of the argument, the theoretical framework, methodology and results (if applicable), and how this links to the theme and topics of this conference, or to the general concerns of digital culture and communication. Please include 3-5 keywords that describe your work, and a Bio note (max 100 words, stating affiliation).

Submission details, panels:

We welcome panel submissions, numbering 4 speakers. Please submit abstracts of 250-350 words per paper, plus a 250-350 word rationale for the panel. Individual abstracts should contain a clear outline of the argument, the theoretical framework, methodology and results (if applicable), and how this links to the theme and topics of this conference, or to the general concerns of digital culture and communication. Please include 3-5 keywords that describe each individual abstracts, plus 3-5 keywords that describe the panel, and Bio note for each individual abstract (max 100 words, stating affiliation).

All abstracts and rationale should be sent together as a single document by the panel proposer.

Details for abstract submission:

Please provide abstracts as .PDF, .DOC or .DOCX file types. Abstracts should be emailed to brightondcc@gmail.com. Deadline for paper and panel submissions is May 20, 2017. Notification of acceptance: June 20th, 2017.

You do not need to be an ECREA or DCC section member to apply.

For updates, please visit https://dccecrea.wordpress.com
For CFP http://dccecrea.wordpress.com/call-for-papers-2017-conference/
The [1]Central European University (CEU) is an English-speaking, postgraduate private university in Budapest, Hungary, specialising in the humanities and social sciences. It was established in 1991 by, among others, George Soros, its most important donor. The university is accredited in both Hungary and the USA.

On March 28th, on the pro-Hungarian government website Origo an article appeared, alleging that the CEU was in violation of Hungarian laws regulating higher education. The article referred to a Law Proposal submitted by the Minister of Human Resources, Zoltan Balogh. The Proposal would amend Hungary higher education law in a way which would make it impossible for CEU to operate within the country independently.
March in support of the CEU in Budapest, 2 April 2017

The day after Michael Ignatieff, the University rector, issued a statement declaring the Proposal an attack to free and independent higher education not only in Hungary but around the world. Over the last days, around 40,000 people signed an international petition calling upon the Hungarian Parliament to reject the Proposal. In addition, tens of Universities around the world, from Princeton to Oxford and the European University Institute, as well as international academic associations including the American Sociological Association, have expressed their solidarity with CEU and condemnation of the Hungarian Law Proposal.

It is today, 4 April 2017, in these hours, that the Proposal, dubbed as "lex CEU" by the media, is being voted upon in the Parliament. Disregarding a massive international uprising in only 7 days, MPs will likely vote in favour of the proposal.

Giovanni Picker is a Marie-Skłodowska Curie Research Fellow at the University of Birmingham School of Social Policy, UK. He recently published the book "Racial Cities: Governance and the Segregation of Romani People in Urban Europe".
Kieran Hamilton (2017-04-05 08:02:42)
I attended a course at the CEU in Budapest a few years ago. It’s a great institution, I don’t understand why the Hungarian parliament would do this, other than the critical thinking of the CEU possibly coming into conflict with current discourses in Hungary around welfare etc. and right wing policies that the government has enacted in recent years. Such a shame, hopefully the parliament sees sense.

The Impact of Social Theory (2017-04-05 08:00)

The Sociological Review has just published a thought-provoking review of Doug Porpora’s Reconstructing Sociology: The Critical Realist Approach. It gives a lucid, though brief, overview of the book’s core arguments: seven myths which afflict American sociology and seven philosophical counter-points. But what caught my attention was the account of how theoretical work can increase the discipline’s capacity for impact:

Porpora shows how critical realism adjudicates across the plethora of sociological paradigms to create new consistency, which can strengthen the validity and usefulness of our discipline. Imagine governments redefining obesity or poor mental health from medical problems into social problems, to be tackled by wide-ranging interdisciplinary research coordinated through a coherent framework of sociology and covering, for example, the related economics and politics, industries and services, healthcare and urban planning, with studies of the complex everyday life of the groups and individuals concerned.

The point is overstated but it’s nonetheless important: the internal dissensus of sociology militates against policy impact. The meta-theoretical (dis)orderliness of disciplines underpins the inarguable reality that “economists and psychologists are introduced as self-evidently respected scientists, whereas sociologists, if they are included at all, seem more likely to evoke scepticism than respect”. Rather than theoretical work being a distraction from aspiring
to this status, it is in actual fact a condition for it:

One defence of our discipline's diversity is that its adaptable rich variety can embrace numerous theories, methods and topics. However, variety does not preclude coherence, and coherence does not demand narrow uniformity - like the neoclassical mantras that now monopolise economics. Medicine is a hugely varied discipline yet, fortunately for society's healthcare, it is unified by powerful common values and theories about causal realities. By contrast, and unfortunately for society's wellbeing, sociology is split not only by disagreements but, more seriously, by basic contradictions: positivism accepts pristine independent social facts and aims to discover general laws, whereas interpretivism sees only local contingent variety; statistics and experiments are set against ethnography; sociology is variously taken to be value-free, relativist or a moral endeavour.

Bringing meta-theoretical order to sociology doesn't entail imposition of a unified paradigm on the discipline. It simply necessitates that we "position its many valuable insights and methods in relation to one another, showing how they connect and interact within larger relations, to be more like a coherent jigsaw puzzle in progress, rather than a heap of pieces". Can we find unifying principles, providing standards by which we might draw out connections between otherwise isolated outputs of the discipline, which respect the intellectual diversity of the sociological enterprise? Can we begin to agree on standards about what constitutes 'better' and 'worse' sociology?

The problem is that disciplines most in need of such standards, in order to provide a centripetal mechanism, prove least able to establish them. Calling for such standards doesn't entail a final resolution of theoretical questions, as if we all have to agree on the same answers in order to move forward as a collective project. But it does entail clarity about why we are asking the questions to which we are offering different answers.

The Uberfication of the University: the Digital Studienbuch and the 21st Century Privatdozent (2017-04-06 08:00)

In my copy of *The Vocation Lectures*, edited by David Owen and Tracy B. Strong, the editors helpfully annotate Weber's description of the occupational realities of the German academic. From pg 2:

German students used to have a *Studienbuch*, a notebook in which they registered the courses they were taking in their field. They then had to pay a fixed fee for each course. For staff on a full salary - that is, professors - these tuition fees were a welcome extra. For the unsalaried *Privatdozent*, these fees were the sole source of income. *Science as a Vocation, pg 2.*
Is this where the Uberfication of the University could lead? I find it easy to imagine a Digital Studienbuch, the killer app of educational disrupters, dispersed throughout the university system. Universities would still exist to manage the 'student experience', control the academics and provide infrastructure. Perhaps there would still be paid professors to replenish the knowledge system and train the Privatdozent. But the university wouldn't be the platform, instead it would be a whole series of arenas (with declining influence as the system became embedded), facilitating extraction from a relationship between teacher and taught on the part of a distant technology company.

Weber's description of the academic career in Germany, "generally based on plutocratic premises", seems eerily familiar from a contemporary vantage point:

For it is extremely risky for a young scholar without private means to expose himself to the conditions of an academic career. He must be able to survive at least for a number of years without knowing whether he has any prospects of obtaining a position that will enable him to support himself. Science as a Vocation, pg 2.

The Technology of Intellectual Work (2017-04-07 08:00)

In 1988 Pierre Bourdieu chaired a commission reviewing the curriculum at the behest of the minister of national education. The scope of the review was broad, encompassing a revision of subjects taught in order to strengthen the coherence and unity of the curriculum as a whole. In order to inform this work, the commission early on formulated principles to guide their endeavour, each of which were then expanded into more substantive observations concerning their implications.

One of these stood out to me as of great contemporary relevance for the social sciences in the digital university. Their principle considers those “ways of thinking or fundamental know-how that, assumed to be taught by everyone, end up not being taught by anyone”. In other words, what are the elements of educational practice which are integral to it and how can we assure their successful transmission in training? These include “fundamental ways of thinking” such as “deduction, experiment, and the historical approach, as well as reflective and critical thinking which should always be combined with the foregoing” and “the specific character of the experimental way of thinking”, “a resolute valuation of qualitative reasoning”, a clear recognition of the provisional nature of explanatory models” and “ongoing training in the practical work of research”. It extends this discussion to the technologies used in practice:

Finally, care must be taken to give major place to a whole series of techniques that, despite being tacitly required by all teaching, are rarely the object of methodical transmission: use of dictionaries and abbreviations, rhetoric of communication, establishment of files, creation of an index, use of records and data banks, preparation of a manuscript, documentary research, use of computerised instruments, interpretation of tables and graphs, etc.

Political Interventions: Social Science and Political Action, pg 175
This concern for the “technology of intellectual work” is one from which we could learn a lot, as well as the importance placed upon “rational working methods (such as how to choose between tasks imposed, or to distribute them in time)”. It maps nicely onto what [1]C. Wright Mills described as intellectual craftsmanship. When we consider the technologies of scholarly production – things like notebooks, word processors, index cards, post it notes, print outs, diagrams and marginalia – our interest is in their use-in-intellectual-work. The technologies become something quite specific when bound up in intellectual activity:

But how is this file – which so far must seem to you more like a curious sort of ‘literary’ journal – used in intellectual production? The maintenance of such a file *is* intellectual production. It is a continually growing store of facts and ideas, from the most vague to the most finished.

_The Sociological Imagination, pg 199-200_

If we recognise this, we overcome the distinction between theory and practice. The distinction between ‘rational working methods’, ‘technology of intellectual work’ and ‘fundamental ways of thinking’ is overcome in scholarly craft. The role of the technology is crucial here: if we suppress or forget the technological, transmission of these practices is abstracted from their application, leaving their practical unfolding to be something which has to be discovered individually and privately (“ways of thinking or fundamental know-how that, assumed to be taught by everyone, end up not being taught by anyone”). But places for discussion of craft in this substantive sense have been the exception rather than the rule within the academy.

Perhaps social media is changing this. It is facilitating a recovery of technology, now finding itself as one of the first things social scientists discuss when they enter into dialogues through social networks and blogs. But it also facilitates what Pat Thompson has described as a [2]feral doctoral pedagogy:

Doctoral researchers can now access a range of websites such as [3]LitReviewHQ, [4]PhD2Published and [5]The Three Month Thesis youtube channel. They can read blogs written by researchers and academic developers e.g. [6]Thesis Whisperer, [7]Doctoral Writing SIG, [8]Explorations of Style, and of course this one. They can synchronously chat on social media about research via general hashtags #phdchat #phdforum and #acwri, or discipline specific hashtags such as #twitterstorians or #socphd. They can buy webinars, coaching and courses in almost all aspects of doctoral research. Doctoral researchers are also themselves increasingly blogging about their own experiences and some are also offering advice to others. Much of this socially mediated DIY activity is international, cross-disciplinary and all day/all night.

[9]https://patthomson.net/2014/06/16/are-we-heading-for-a-diy-phd/Doctoral researchers

There can be problematic aspects to this. But when it’s valuable, it’s at the level of precisely the unity of thinking, technology and activity which the commission advocated. Social media is helping us recover the technology of intellectual work and it’s an extremely positive development for the social sciences.

---

The Porous University - A critical exploration of openness, space and place in Higher Education
(2017-04-08 08:00)

Call for participation Monday 8th and Tuesday 9th May 2017 University of the Highlands and Islands, Inverness Campus

This two-day symposium arose out of a series of conversations and reflections on the nature of openness within Higher Education. It started with the observation that openness is increasingly seen as a technical question, whose solution lies in employing the low transaction costs associated with digital technologies with open licences to open up academic content to new groups of learners.

Where critical voices have engaged this partial reading they have often rightly critiqued the degree to which this is truly open, for example, drawing on older traditions of open to question the freedoms free content allows for those already distanced from education.

However, other questions also arise in a critical reading of open, and these include:

- What does open mean beyond releasing content?
- What is the role of open academics in dealing with problems 'in the world'
- How should staff and students become learners within community contexts, developing and negotiating the curriculum based on those contexts?
- What would it mean for openness as a way to allow new voices into the academy, to acknowledge knowing and ways of knowing outside the academy, and where can and should our open spaces – both digital and physical – intersect?
- If we are to advocate allowing learners’ experiences and organisations to inform the academy how open should academics be to the influence of private capital?

These are the kinds of questions, amongst others, that we want to explore in this symposium.

Public engagement, social media and university boundaries (2017-04-09 08:00)

In her wonderful *Lower Ed*, Tressie Cottom describes how her public profile led to her being in contact with someone who was enormously relevant to her ongoing research. From pg 103:

Aaron found me through my public writing and blogging and social media and decided that speaking to me might be interesting. He emailed me and kept emailing me over the course of a year. Eventually, I was giving a lecture in the same state where he lived, and he invited me to have coffee.

One of the most fascinating conversations I ever had while doing asexuality research was with a woman in her 80s who found out about me through an interview in a newspaper. She was unwillingly to be formally interviewed but an extensive phone conversation was enormously useful to my attempts to understand the changing social conditions in which being asexual is rendered problematic or otherwise. In both cases, we can see visibility facilitating people coming to us, creating opportunities if we are open to them but also complicating habitual expectations about how we manage relationships with groups external to the academy.

I'd love to hear other people's experiences of such encounters. It strikes me that this is an advantage to public engagement which is rarely recognised. I suspect it's a relatively common experience amongst people who engage in a lot of this activity and it's one we should recognise and explore in a systematic way. The focus of a lot of what I'm doing over the next few months will be university boundaries and how they're being changed by new technology. The role of public engagement in narrowing the gap between researchers and the researched is an important aspect of this. But there's a theoretical complexity to how we conceptualise these boundaries which [1] engaging with the work of Jana Bacevic has left me newly aware of.

Recognising such a benefit is interesting if we frame public engagement in terms of academic labour. It's often cast as another thing to do, adding additional items to already over long to do lists. This implicitly conceives of it as something extrinsic to the research process, as if everything else about the professional practice of those involved remains fixed, only to be supplemented by these additional activities. But in reality public engagement is something relational, both in terms of the working patterns of the engaged and [2] their relationship to the wider community of their research and 'wider society'. It changes both in a way which complicates the initial comparison one made in which a working life without public engagement is compared to one which includes such activity.

My discussion so far has been about public engagement in general rather than social media in particular. However the opportunities and problems of the former are increasingly being forced as an issue by the widespread adoption of the latter. The boundary between the researcher and wider society is being changed by the uptake of new communications technology, making it more likely that the people we research and write about will talk back to us about what we say. Embracing this relationality can bring great benefits to the research process, with the the potential for important new connections being just one example of this. But there are liable to problems created if we ignore it. My suggestion is that what at present seem like outliers (people who are extremely visible through public engagement activity) represent the future normal, one which researchers will urgently need to adapt themselves too.

Keeping the conversation going in an age of scholarly abundance (2017-04-10 08:00)

In the last few years, I've become increasingly preoccupied with the notion of 'the literature' and how it is invoked by scholars. I'm now rather sceptical of the way in which many people talk about 'the literature' and the role it plays in scholarship. It's not that I don't think it’s important to identify, engage with and record the existing work that has been done on a topic you're working on. Rather I'm concerned that the invocation of its necessity serves a disciplinary function when scholarly literature proliferates at the speed which it now does, with an [1]estimated 28,100 journals publishing 2.5 million articles a year. The problems which those who enthusiastically invoke the importance of 'the literature' are concerned with, such as perpetual reinvention of the wheel and a failure to recognise relevant work taking place in adjacent fields, have such [2]obviously structural roots that to frame the solution in terms of personal practice seems to accord almost magical powers to the intellectual discipline of individual scholars.

My concern is that invoking 'the literature' increasingly functions as a conversation-stopper: it’s a disciplinary action which serves to curtail, though rarely halt, a line of inquiry. If we are inclined, as Richard Rorty once put, “to keep the conversation going” then we need to “protest against attempts to close off conversation by proposals for universal commensuration through the hypostatisation of some privileged set of descriptions” ([3]377). Or in other words, we need to reject the idea that there’s only one way to talk about the topic in question. This is what the invocation of 'the literature' does, usually implicitly though sometimes explicitly. It implies a unified body of work which must be the reference point for scholarship on a given topic, even if the intention is to break away from it. In many cases, there's perhaps no such unity in the first place, with its apparent coherence being underwritten by the most influential figures within the field have talked about 'the literature' in a way which performatively brings it into being by justifying the implication that much (potentially relevant) material exists 'outside'. Judgements of salience aren't written into the fabric of the knowledge system, they're suffused with epistemic relativism: made from a particular standpoint, by a person with their own interests, reliant upon their own conceptual apparatus. Instead, behind apparent coherence, we have a complex network of citation cartels, [4]'unread and unloved' publications and influential beneficiaries of Matthew effects.

My point is not to dispute the value of reading and engaging with literature. I only want to situate invocations of 'the literature': made by people struggling with the problems of scholarly abundance, in relation to others similarly struggling with these problems. The idea of one definitive point of orientation becomes fetishistic when we all suffer from the vertigo of the accelerated academy. From Sustainable Knowledge by Robert Frodeman, loc 1257:

I feel like I am drowning in knowledge, and the idea of further production is daunting. Libraries and bookstores produce a sense of anxiety: the number of books and journals to read is overwhelming, with tens of thousands more issuing from the presses each day. Moreover, there is no real criterion other than whim for selecting one book or article over another. To dive into one area rather than another becomes a willful act of blindness, when other areas are just as worthwhile and when every topic connects to others in any number of ways. The continual press of new knowledge becomes an invitation to forgetfulness, to lose the forest for the trees.

Under these circumstances, our concern shouldn’t be to ensure everyone pays allegiance to 'the literature'. We can
assume this will continue to grow continuously while everyone feels compelled to write hyperactively, continually churning out publications with more hope that they are counted rather than that they are read. Instead, we should be asking how do we sustain the conversation under these circumstances? What kinds of conversations should we be having? What purposes do they serve? The well known problems of scholarly publishing mean traditional exchange in journals is becoming progressively less amenable to productive conversations, particularly across boundaries of field and discipline. How do we have conversations which serve, as Nicos Mouzelis puts it, to build bridges?

To be specific, there is little satisfaction with the present status quo where the boundaries between economics, political science, sociology and anthropology have become solid blinkers preventing interdisciplinary studies of social phenomena. But such compartmentalization will not be transcended by the facile and mindless abolition of the existing division of labour between disciplines.

[Instead we need] a painstaking process of theoretical labour that aims at building bridges between the various specializations. Such a strategy does not abolish social science boundaries: it simply aims at transforming them from impregnable bulwarks to transmission belts facilitating interdisciplinary research ... what is badly needed today are more systematic efforts towards the creation of a theoretical discourse that would be able to translate the language of one discipline into that of another. Such an interdisciplinary language would not only facilitate communication among the social science disciplines, it would also make it possible to incorporate effectively into the social sciences insights achieved in philosophy, psychoanalysis or semiotics.

Sociological Theory: What went Wrong?: Diagnosis and Remedies, By Nicos Mouzelis

A large part of my enthusiasm for social media comes from the possibilities it offers for having these kinds of conversations. But trying to resolve the problems of the accelerated academy through an invocation of the need for disciplined practice is taking us in the wrong direction.

There's a powerful counter-argument that can be found [5]here by Patrick Dunleavy, concerning the importance of citation. I want to think carefully about this but my instinct would be to add two additional columns: "how scholarly abundance complicates this role" and "how might this lead us to change practice".
<table>
<thead>

Benny Goodman (2017-04-10 08:46:33)

If you add related issues of publication bias, and non replicability to the mix, the picture becomes fuzzier. Graham Scambler I believe argued recently that we already have enough of a body a literature already that requires careful, critical immersion.

4988
Not that this was a call for a halt on producing more, rather that we have a rich seam to mine. Your interdisciplinary point is vital, as the problems of the world require interdisciplinary systems thinking. The facilitating of conversation in ‘the paraversity’ is a political project requiring the support for encouragement of early years academics to challenge the corporate university agendas. Social media does indeed connect and allows the conversation, as this post testifies, but we will need robust structures to defend against accepted practices for recognition which include certain uses and invocations of ‘the literature’.

Mark Carrigan (2017-04-12 13:28:42)
Really interesting take - fancy writing it up into a blog post for us?

benny Goodman (2017-04-12 14:16:30)
...and why not? :)

On Irritation, Or, How Social Networks Tend To Make Us Slightly More Assholic (2017-04-11 08:00)

In the last couple of months, I’ve found myself reflecting on irritation. What is it? It’s one of our most recognisable reactions to the world, yet it’s hard to be precise about what it is. Is it an emotion? Is it a state of mind? Is it a reaction to the world? This is the definition which Wikipedia offers:

Annoyance is an unpleasant mental state that is characterized by such effects as irritation and distraction from one’s conscious thinking. It can lead to emotions such as frustration and anger. The property of being easily annoyed is called irritability.

There’s a whole model of the person implicit within this which I’m sceptical of. The idea that mental states manifests themselves in effects with implications for cognition, generated by propensities and generating emotions. It’s an individualised account, even if a multifaceted one, concerning something that’s deeply relational.

The most straight forward definition of irritation would be ‘something which irritates’. In one sense it’s circular, telling us nothing about what irritation is, but it captures the relationality of the reaction. We are irritated by something. We find something irritating. It involves an evaluative relation to the world, but one which, as it were, goes wrong. Far from the smoothly hermeneutic world of the post-Aristotelian philosophers, we have the Goffmanian reality of living together (in a world which frustrates our purposes).

So if irritation is being irritated by something, what is it to be irritated? To be " angered, provoked,
or annoyed" or "inflamed or made raw, as a part of the body". The second definition concerns the resolutely physical but I think it captures something important. We are irritated when we are inflamed by the world, made raw by its recalcitrance. People or circumstances irritates us when they impede our routine movement through the world. Things are not as we expect. We’re forced to calibrate ourselves in relation to the world, pushed back into ourselves confronted with a world that resists us, rather than easily making or way through it.

We get irritated by others when they do not act as we expect them to. We get irritated by others when they
do not act as we think they ought to. In this sense, I would argue that irritation tracks declining social integration: the less agreement there is about how we ought to comport ourselves, the more likely we are to experience irritation in daily life.

What interests me is how we respond to this. If we simply make internal allowances for the fact that others may have different expectations and aspirations to ourselves, it’s easy for the irritation to dissipate. A trivial example: I find it irritating when people talk loudly in the steam room at my gym. But I also recognise that some people go there to socialise, whereas for me it’s a resolutely individual activity. Reminding myself of that fact usually leads the irritation to subside.

On the other hand, if I seek external confirmation for my reaction, it’s unlikely to subside. This is where social media comes in: the imagined interlocutor (what Danny Miller calls the 'meta best friend') can serve as a outlet, without the possibility for censure that arises when you share with a concrete individual who’s liable to tell you to stop obsessing and let other people be. It’s even more effective when an agent of this imagined interlocutor, someone who emerges from the background to respond definitively before fading back into it and propping up an imagined consensus, confirms that they too find this behaviour irritating.

Sharing irritation through social networks can facilitate an extreme form of what critical realists call communicative reflexivity. We find confirmation of our immediate reactions in others, rather than further interrogating our reaction internally, leading to a hardening of our reaction and a disposition to act similarly in future. I don’t think digital technology straight forwardly causes a decline in social integration but I do think social networks can amplify personal reactions which entrench the decline by, as it were, depleting the reserves of tolerance we have for others who think about and approach life in a different way to us. This is connected to the [10]paradox of incivility and it’s something I'd like to come back to in greater depth.

Social Media Training Workshop (2017-04-11 11:49)

Social Media Training Workshop
Led by Holly Powell Jones

City University, London EC1V 0HB

Monday 8 May 2017, 12.30 – 4.00 pm

This workshop will be of interest and assistance if you wish to use social media to disseminate your work, identify and share relevant opportunities, communicate a cause, or promote an organisation, charity, or business services.

Marketing the Digital University (2017-04-12 08:00)

In the excellent *Lower Ed*, Tressie McMillan Cottom reflects on the market-orientation of for-profit colleges, tending to seek a continual growth in student numbers. This growth imperative can manifest itself in marketing and recruitment outstripping teaching in institutional spending. From pg 20:

> If budgets are moral documents, the fact that some financialized for-profit colleges reportedly spent 22.4 percent of all revenue on marketing, advertising, recruiting, and admissions staffing compared with 17.7 percent of all revenue, on instruction speaks to the morals of financialization.

Since the previous Labour government [1] kicked off the radical changes in higher education in the UK, I’ve been interested in the transformation of university marketing. The reforms created a pressure to differentiate but to what extent did that incentivise the growth of marketing and communications at the (potential) expense of investment elsewhere? I hadn’t thought about this issue for a while but it occurs to me that the extreme end of the US for-profit sector represents an exemplar of where the market logic now taking hold in the UK could lead, in so far as that linking financial performance to student numbers increases the structural importance of marketing and communication functions. How this logic plays out in practice depends on many organisational and sectoral factors which I’d like to understand better than I currently do.

How do we characterise the broader change in the sector? Cynics would see it as a distraction from the core functions of the university, with increasing resources being directed to marketing exercises with a possibly uncertain payoff in terms of recruitment. What concerns me is the competitive escalation that can arise in a (relatively) undifferentiated sector where actors compete for scarce attention: how can universities be heard above the din? One way is to accelerate the investment in marketing and communications, expanding into new arenas and further investing in staffing and systems. This is something which those staff are liable applaud, a message that might have particular force when their function is on the ascendency within the university and they can speak with authority gleamed from work outside the sector.

But others would argue that any uncertainty could be overcome by instilling a “marketing culture” in which “return on investment of each activity is carefully weighed up”. This is how Communications Management, ‘the education specialists’ report on findings of a project they were involved on:

**Key findings**

- Over two-thirds (69%) of UK marketing directors have seen an increased investment in marketing over the past three years
- Branding is often still not understood within the higher education sector
- Modern students are ‘demanding customers’ looking for a response 24/7, meaning that a shift in marketing techniques is crucial
- Social media must be handled in the right way to avoid “pushy communications” and encroaching on student space
- Increase in senior strategic marketing appointments in Higher Education Institutions

However survey respondents – a third of the UK’s HE marketing directors – also stated that though
budgets still rarely approach those in the private sector, they consider short term funding to be less important than moving to such a "marketing culture," in which return on investment of each activity is carefully weighed up.

[2]http://www.communicationsmanagement.co.uk/blog/he-marketing-has-become-more-credible/

There are many things to explore here. What particularly interests me is the role of professionalisation (within the sector) and external agencies (from outside the sector) in shaping the new common-sense concerning marketing in the digital university.

Digital labour and the epistemic fallacy (2017-04-13 08:00)

One of the arguments which pervades Uberworked and Underpaid, by Trebor Scholz, concerns the materiality of digital labour. As someone whose back and neck start to ache if I spend too much time at a computer, I’ve always found the tendency to assume there is something mysteriously immaterial about using computers to be rather absurd. But there’s more to Scholz’s argument then this generic tendency to fail to recognise the embodied character of digital engagement. From Loc 4103

It’s worth remembering that whether a worker toils in an Amazon warehouse or works for crowdSPRING, her body will get tired and hungry. She’ll have to take care of car payments, medical bills for her children, and student debts, not to mention saving for retirement. Digital work makes the body of the worker invisible but no less real or expendable.

It strikes me that what we are talking about here is the epistemic fallacy: taking what we know to exhaust what is. The mediation involved in digital labour impedes or entirely prevents knowledge of the material circumstances of the worker. The disaggregation and workflows facilitated by data infrastructures similarly obscure knowledge of the many workers whose efforts combine, in enormously complex way, to produce discernible outcomes. The political economy and social-technical infrastructure of digital labour is certainly complex, but it’s nonetheless useful to recognise the underlying epistemological issue at work here.

____________________
The cultural significance of blogging (2017-04-14 08:00)

In his *Uberworked and Underpaid*, Trebor Scholz offers an important reflection on the cultural significance of blogging. While its uptake has been exaggerated, dependent upon questionable assumptions concerning the relationship between users and blogs, it nonetheless represents a transformation of and expansion of cultural agency which needs to be taken seriously. From loc 3825:

Web 2.0, to be fair, was incredibly successful as an ideology, a meme, and a marketing ploy with global effects. Already by 2004, the industry claimed that there were some 100 million weblogs. One didn’t have to be a skeptic of numerical reasoning to understand that the claim that everybody on this planet was blogging was based on shaky statistics. Clearly, some of these projections were blind to the digital divide, and overlooked the fact that many weblogs were set up but then never used again. But still, we need to acknowledge that more than a decade after its emergence, blogging had roped millions into a daily writing practice; it made them walk through their lives with the eyes of a participant, somebody who could potentially participate or insert her own perspective.

This is reminiscent of the appendix to *The Sociological Imagination*, in which C Wright Mills offers practical advice about ‘keeping one’s inner world awake’. It would be overstating matters to claim blogging is intrinsically tied to the sociological imagination, but the propensity to “insert her own perspective” in a life more likely to be lived “with the eyes of a participant” is something we should take seriously, while refraining from assuming that this flows inexorably from the adoption of blogging as a regular activity.

John McCreery (2017-04-16 02:17:23)

We should all become what business anthropologists call “observant participants” in life. The trick is moving from blogging as venting to blogging as offering, at least we hope, insight.

Call for special issue proposals: International Journal of Social Research Methodology (2017-04-15 08:00)

The *International Journal of Social Research Methodology* publishes up to two guest-edited Special Issues per volume. The *IJSRM* editorial board welcomes proposals for Special Issues for volume 18, to be submitted to the Journal editors by Friday 14th July 2017 for consideration at the September editorial board meeting. Proposals should be submitted via email to [tsrm-editor@tandf.co.uk](mailto:tsrm-editor@tandf.co.uk). Potential guest editors should submit a proposal of no longer than 3 pages covering:

- Rationale. The timeliness, importance and international interest of the methodological topic and methods addressed.

- Fit with the *IJSRM* remit. See the Journal’s statement of aims and scope on its website: [http://www.tandf.co.uk/journals/tf/13645 579.html](http://www.tandf.co.uk/journals/tf/13645 579.html), or on the back inside cover of hard copies of *IJSRM*.

- Indicative contents. Indicative titles, authors and abstracts should be provided, including an editorial. Contents should demonstrate an international orientation, including through the range of contributors. If this is not the case, then a rationale should be provided.
• Reviews. IJSRM publishes review articles of several publications from a single reviewer, or multiple reviews of a single publication by several reviewers. If you would like to include book reviews in your special issue, they should be of this type of format.

Each Special Issue should amount to 45,000 words in total, which includes the editorial, abstracts, papers, references and reviews. The editorial should provide a ‘state of play’ introduction to methodological issues and methods addressed. **Responsibilities of guest editors:**

• ensure manuscripts are in keeping with IJSRM guidelines (see website)
• ensure articles are peer refereed (such as by setting up a refereeing panel), with a list of reviewers either provided to the Journal editors or thanked in the editors’ introduction
• deal with all correspondence with the contributors, Journal editors and Routledge production editor
• provide a ‘state of play’ editorial
• liaise with the editors and, if required, the reviews editors
• ensure timely delivery of the final manuscript to the editors

**Responsibilities of Journal editors:**

• facilitate the preparation of the Special Issue
• provide final quality control for the Issue
• forward the Special Issue to the Journal’s production editor

**Do academics write badly because they’re rushing? (2017-04-16 08:00)**

I saw the science journalist [1] Simon Makin give an excellent talk yesterday on how social and natural scientists can make their writing clearer. He offered some excellent tips to this end, including assuming your reader is exactly as intelligent as you are, but has absolutely none of your knowledge. For this reason, clarity isn’t about being simplistic: aim to clarify without simplifying.

What struck me in the discussion of **drafting and redrafting** was how likely this is to fall by the wayside when rushing. If you’re working to a deadline, particularly when other deadlines immediately follow them, it’s unlikely you’ll invest the time needed to do this. His description of drafting involved careful tinkering, picking and poking at a text in a way which leads to incremental improvement. As opposed to simply trying to get it out of the door so you can move onto the next demand.
This isn’t simply a matter of time. It also reflects the moral psychology of rushing. When we rush, we close down our engagement with the objects of our attention. Things that might have been deeply meaningful to us instead become obstacles to surmount. We simply can’t care about the clarity of our writing in the same way when we’re rushing.

Alicia (2017-04-16 12:32:47)
I totally agree. I sometimes find that with procrastination comes the adrenalin pressure thrill, yet the rush produces poor writing. I a mature aged undergraduate student, and I have recently submitted a research essay. It was the first time I rushed with an essay, I sat up until 2.30am writing and felt so disappointed. I await the results.

John McCreery (2017-04-17 04:23:31)
For those who wish to pursue these thoughts further. https://www.amazon.com/Writing-Learn-Write-Clearly-Subject/dp/B000OEVVL4

Stephen Norrie (2017-04-20 01:40:21)
I agree to an extent, but I also think it’s important not to imagine that academics should ideally be writing like journalists, or in imitation of ordinary speech. Especially in sociology the complexity of processes seems to demand a level of qualification that is only possible through multi-clause "long sentences". At least, I can’t imagine writing what I want to write without them.

Mark Carrigan (2017-04-26 09:31:51)
I take your basic point but don’t understand why it means long sentences are necessary. The very fact some manage without them without lapsing into platitudes surely illustrates it’s possible.

Madelon van Oostrom (2017-05-14 22:03:32)
So surprised to hear that from an English scholar. I work in Spain where I fight every day against my acquired (national) academic habits: endless sentences everywhere. Especially in sociology it seems practitioners and scholars are in need to convert every sentence into a paragraph.

**Rethinking Digital Media and Citizenship: Conditions, Contexts, and Consequences** (2017-04-17 08:00)

American Behavioral Scientist (ABS)

Special Issue Call for Papers (CFPs)

Rethinking Digital Media and Citizenship:

Conditions, Contexts, and Consequences

Guest Editors:

Seungahn Nah (University of Kentucky)

4996
Masahiro Yamamoto (University at Albany, State University of New York)

Description:*

A substantial body of scholarship has long tackled how traditional and newly emerging information and communication technologies (ICTs) foster an informed, efficacious, and engaged citizenry. Despite prolific literature on digital media and citizenship, theoretical approaches and conceptual and operational definitions still diverge in different disciplines and schools. What seems particularly missing in the literature is an examination of structural conditions and/or contexts that may facilitate or hinder the role of digital media in civic engagement. Therefore, the goal of this special issue is to call for theoretically and methodologically sound scholarship that examines causes, components, and civic consequences of digital media use. Such an examination presents important practical implications and policy applications.

This special issue addresses the following major questions:

1) How can digital media use and civic engagement be conceptualized, operationalized, and theorized across various theoretical perspectives in the convergence and divergence of digital media environment?

2) To what extent do digital media (social and mobile), along with traditional media, influence civic engagement and how such an influence varies across communities of places, interests, practices, and beyond, as well as different ethnic groups and those who hold different socio-economic status?

3) How do social contexts and conditions promote or impede the role of digital media in civic, political, and community life at multiple levels?

The special issue editors would welcome submissions addressing the following topics:

1) Theoretical advancement on digital media and civic engagement in offline and online communication environments;

2) Integrated theoretical framework concerning digital media and citizenship

3) Innovative conceptual and operational definitions (measurements) of digital media across various platforms;

4) Social structural contexts and conditions (e.g., race, class, gender, family, school, organization, neighborhood, etc.) that affect digital media use and its effects on civic engagement;

5) Linkage between online and offline civic engagement from networked community perspectives.
Submission Guidelines:

Submitted manuscripts must be in MS Word (.doc) format with a title page that includes the title of the paper, full names, affiliations, email addresses, telephone numbers, complete addresses, and biographical sketches of all authors.

Manuscripts must adhere to the APA (6th ed.) style and should contain between 6,000 and 8,000 words, including a 250-worlds abstract with 5-6 key words, all references, and notes.

Manuscripts must contain original material which has not been previously published elsewhere or is not currently under consideration by another journal.

All manuscripts should go through a blind, peer-reviewed process so no indicators of authorship should appear in the texts.

Manuscripts should be submitted directly via email to seungahn.nah@uky.edu

Timeline:

- Submission deadline: April 30, 2017
- Editorial decision: June 30, 2017
- Anticipated publication date: January/February 2018

1. seungahn.nah@uky.edu
Using graphic novels to communicate your research (2017-04-17 18:32)

Manchester Digital Laboratory
Thursday 8th June 2017
09.00-17.00

The Sociological Review Foundation is delighted to announce our forthcoming workshop using graphic novel methods to present social research.

We invite applications to take part in a Graphic Novel Workshop with Tony Lee. If your research involves incorporating graphic methods or you are simply interested in doing this to present future research, this workshop will be of interest to you.

**Workshop Format**
- Introduction on graphic novels: how the medium works, different genres, how they’ve changed and the design & production process
- Story telling through graphic novels: how to develop the story, what works and what doesn’t, constraints of the medium etc
- Delegates introduce their ideas for graphic novels and get feedback
- General discussion & advice about next steps

This event is FREE but places are limited to 25 people.

This event is brought to you by The Sociological Review Early Career Researcher Board. We welcome applica-
tions for this workshop from people in all stages of their careers. However, should we receive significantly more applications than available places – priority will be given to ECRs and PGRs.

Application deadline is 17.00 GMT, Monday 2nd May 2017. Please ensure to outline your research interests in the relevant section.

Sine Anahita (2017-04-18 01:22:05)
Awesome! Wish this workshop would be live-streamed!

Queer Circuits in Archival Times (2017-04-18 08:00)

*QUEER CIRCUITS IN ARCHIVAL TIMES: PERFORMANCE, NETWORKED DATA, DIGITAL CULTURE* *[1](https://www.womenandperformance.org/submit/current-cfps/)* *Guest Editors*: *Benjamin Haber*, PhD Candidate Sociology, Graduate Center, CUNY + *Daniel J Sander*, PhD Candidate Performance Studies, NYU

*Submission Deadline: June 1st 2017* *We live in an increasingly digital world, where conflicts over control, violence, and centralization play out in computational landscapes. The conscious and unconscious activities of queerly entangled bodies are archived for speculative monetization by a variety of proprietary digital networks, whose central motivation is to serve advertisements and measure populations rather than to promote vibrant and just social life. Racialized and gendered violence operates at queer timescales, distributing life chances outside of representational frames. At the same time, queer digital culture is providing new openings for Donna Haraway’s vision of “transgressed boundaries, potent fusions, and dangerous possibilities.” Haraway’s “A Cyborg Manifesto: Science, technology, and socialist-feminism in the late twentieth century” remains one of the most influential predecessors for the lines of thought animating this special issue. It is important to remember that in articulating her vision of a thoroughly postmodern feminism, Haraway was primarily drawing on two bodies of work — feminist science fiction and women of color feminism in the work of Octavia E. Butler, Samuel R. Delany, Audre Lorde, and Cherrie Moraga, for example. That is, the cyborg is an inherently intersectional figure. If queer culture is to self-critically engage with the digital, then it will have to take into account the much vaster and more complicated gridlock of identity and affiliation, in which sexual practices and orientations are but one factor. While “Queer Circuits in Archival Times” builds on this lineage and the groundbreaking work of Sandy Stone, Patricia Clough, Jasbir Puar, Kara Keeling and many others, we recognize that these abnormal times require queer departures from the limits of form, history, and epistemology. As new media studies and the digital humanities continue to be established as academic disciplines, we look to inf(l)ect this scholarship with the insights of feminist and queer knowledge production. We are interested in digital performance and inventive critique to theorize LGBTQ lives in a strikingly fluid legal, media, and political landscape. Just as important, however, we see queer thought playing an essential role in analyzing digital life beyond marginalized sexual cultures. How might we queer these digital networks that are increasingly constitutive of how we understand and witness the social? How can we reflexively and critically engage with queer social formations that seem to resonate with data capitalism? What archival practices and performances can help reinvigorate the queer histories forgotten in the linear narratives of gay progress? This special issue was inspired by the conference “Queer Circuits in Archival Times: Experimentation and Critique of Networked Data” *[2](http://queercircuits.com/)*, co-sponsored by “Women & Performance”, which took place across CUNY, the NYPL, and Kilroy Metal Ceiling in 5000
May of 2016. This special issue looks to expand on these interdisciplinary conversations while inspiring new creative and critical interventions. “Queer Circuits in Archival Times” aims to bring together an array of both established and emerging scholars and artists working at the intersections of new media studies, performance studies, queer theory, feminist theory, and aesthetics. “Topics of consideration and points of departure may include, but are not limited to: * - Affect, identity, and representation after the internet - Critical reflections on queer theory in light of the digital - Digital performance of/and gender and sexuality - Hacked software and dubious hardware - Haptic reorganizations of boundaries between body/world and body/mind - Intimacy and alienation and/of (queer) digital culture - Monstrous digital assemblages across space/time/identity/species - Online queer collectivity, alternative kinship, and activism - Quantification of sex/sexuality/self - Queer race/Racialized queerness online - Queer (social) media - Queer theoretical frames and uses of digital media and archiving - The queer biodigital/ data and the queer inhuman/nonhuman

Social Morphogenesis: Five Years of Inquiring Into Social Change (2017-04-18 14:41)

Postmodernity. Second modernity. Network Society. Late modernity. Liquid modernity. Such concepts have dominated social thought in recent decades, with a bewildering array of claims about social change and its implications. But what do we mean by ‘social change’? How do we establish that such change is taking place? What does it mean to say that it is intensifying? These are some of the questions which the Social Morphogenesis project has
sought to answer in the last five years, through an inquiry orientated around the speculative notion of 'morphogenic society'.

In this launch event, contributors to the project discuss their work over the last five years and the questions it has addressed concerning social change. The day begins with an introductory lecture by the convenor of the project, Margaret S. Archer, before a series of thematic panels presenting different stands of the project. It concludes with a closing session in which participants share three issues the project raised for them, as well as a general discussion.

At the end of the day, there will be a wine reception to which all participants are invited. There will also be an opportunity to purchase discounted copies of the books from Springer.

Participants:
Ismael Al-Amoudi
Margaret S. Archer
Mark Carrigan
Pierpaolo Donati
Emmanuel Lazega
Andrea M. Maccarini
Jamie Morgan
Graham Scambler (Chair)

More speakers to be confirmed.

The Social Morphogenesis project was funded by the [2]Independent Social Research Foundation through six years of support for the Centre for Social Ontology. This support was generously extended to enable this book launch.

The Morphology of Public Engagement (2017-04-19 08:00)

In recent weeks I’ve become fascinated by what I’ve thought of as the [1]poetics of impact and engagement. What linguistic techniques can we identify in how ‘impact’ and ‘engagement’ are written about? What work do they do in terms of foregrounding and backgrounding the issues entailed by this [2]paradigm shift within the university? This [3]fabulous essay by Audrey Watters has left me thinking about the morphology of impact and engagement: the “functions” we can identify within these narratives and the "pieces that moved the stories forward".

This is the [4]wikipedia overview of the meaning of morphology within the study of folklore:

5002
Antti Aarne’s theories, enlarged and expanded by American folklorist Stith Thompson in 1961 and by Hans-Jörg Uther in 2004, look at motifs rather than actions – for example, “a soldier makes a deal with the devil” or “a soldier marries the youngest of three sisters.” More than 2500 folk and fairy tales have been cataloged under this taxonomy; the AaTh or Aarne–Thompson number is as well-known to folklorists as Francis James Child’s identification of ballads are to scholars of folk songs.

Vladimir Propp was a Russian structuralist scholar. He criticized Aarne’s work for ignoring what motifs did in a tale, and analysed the basic plot, or action, components of Russian folk tales to identify their simplest irreducible narrative elements. His *Morphology of the Folk Tale* was published in Russian in 1928 and influenced Claude Lévi-Strauss and Roland Barthes, though it received little attention from Western scholars until it was translated into English in the 1950s.

In the Afanasyev’s collection of Russian fairy tales, Propp found a limited number of plot elements or “functions” that constructed all. These elements occurred in a standard, consistent sequence. He derived thirty-one generic functions, such as “a difficult task is proposed” or “donor tests the hero” or “a magical agent is directly transferred.”

In this way, we can identify an emerging morphology to impact and engagement. The engaged academic who lives for their public, prospering as both scholar and public figure. The recalcitrant stick-in-the-mud who refuses to recognise the necessity of change. The earnest research managers who must shepherd such folk along as the environment changes around us all. These are just some initial speculative thoughts but I’d like to pursue this idea in a systematic way.

Why it’s fine to broadcast on Twitter (2017-04-20 08:00)

Foremost amongst the guidance offered about Twitter is the claim that it is fundamentally a conversational platform. One shouldn’t simply ‘broadcast’. It’s for discussion and engagement. There’s an element of truth in this but it’s one which can be lost through repetition, as the status of received wisdom stops us from thinking critically about why everyone agreed with it in first place.

Rather than seeing Twitter as conversational, we should perhaps see it as connective. Connectivity in this sense in something automated, it’s a technology for sorting people in a way that encourages interaction between them. Connectivity in this sense is, as Jose van Dijck puts it, “a quantifiable value, also known as the popularity principle: the more contacts you have and make, the more valuable you become, because more people think you are popular and hence want to connect with you.”

Connectivity presupposes interaction. Unless people interact on platforms, connectivity is thwarted. In this limited sense, it is true to say that someone is not using Twitter correctly if they are not interacting. The value in the platform simply won’t be realised by them because they won’t make new contacts, they won’t increase the visibility of their action on it and they won’t accumulate ‘popularity’. But why does popularity matter? Unless there’s a clear answer to this question, one possibility for which is simply that “it doesn’t”, it’s likely the platform incentives are substituting for the reflexivity of the user.

My concern is that invocations of Twitter as conversational help naturalise this architecture. They promulgate the idea that one is ‘doing it wrong’ unless they are tweeting hyperactively, precluding the possibility of each user coming to their own assessment about the utility or otherwise of the platform for them. This is important because there are some really profound limitations to Twitter as a platform, as Richard Seymour usefully recounts:

Of course, it is established by now that the ambiguities of language are always exaggerated in the 140 character format. Polysemy catches people out all the time on Twitter, something we all have to be on guard about. But it does so all the more because quite a large number of people are only paying attention to the extent that it enables them to say something in turn, however inventively disingenuous, which will generate ‘likes’ and ‘retweets’. [1]This is how the Twittering machine works, and people use it at their own peril. Nonetheless, unless we make some fairly authoritarian/paranoid assumptions, users also have to be responsible for their own readings.

The ritual incantation that Twitter is for conversation functions as the faith which keeps the great Twittering machine in operation. Unless we’re willing to abandon it entirely, we need to have serious discussions about what Seymour calls ‘coping strategies’ to obviate its more undesirable characteristics from creating problems. Part of this involves recognising [3]pseudo-catharsis and trying to distinguish ranting at someone from something which can provide the basis for a productive discussion, in spite of the profound channel constraints. Otherwise, I think we’ll ultimately be pushed towards something more akin to Seymour’s approach, which is pretty much as far as I think you can go before you’re effectively giving up on the platform.

I don’t want to tell Jacobin what to do about all this but, in general, it seems to me that the only sensible policy with regard to Twitter is one of disciplined refusal to debate, argue, or even engage beyond at most light conversation or minor clarifications. It can be used for narrowcasting, advertising events, and sharing links, but if people lose their shit, they should simply be ruthlessly ignored, as difficult as that is.
If mistakes are genuinely made, they should be deleted and briefly acknowledged. If longer responses are called for, they should be written later, and not published in the form of a Twitter thread, on a separate ‘timeline’. But the ‘mentions’ column should be ignored, and no one should be treated as if they’re entitled to a response. People should be told in the bio line that if they want a response on a substantive issue, they have to email — meaning, they have to put some effort and thought into what they say. This is not a long-term solution, but a coping strategy.

Glen Cochrane (2017-04-20 16:02:54)
This is a great post, I tend to agree with it from a personal perspective. Yet, an additional hurdle I’ve noticed in using Twitter is that it’s extremely difficult and unfair to use the pronoun "we" when referring to Twitter use (as in the "we’ll" of your last sentence here before the final quote). Twitter for me seems to break down when users start having expectations about how their followers should be, about how others should respond to their tweets, about what others should tweet about, about who should respond, about how the platform should be used, etc. Twitter space is an intersection of public and private space, like someone's front yard - some people maintain a yard, some people play all over it, some people pave it and put down turf, some people have yard sales. There are limits to what we can do with our yard, yet it would be impossible to tell a neighborhood "ok, we all have to use our yard in this specific way." (Admittedly, yards are less connective than twitter, although connective potential doesn’t mean that potential needs to be fulfilled to the utmost). Thanks for posting this.

Mark Carrigan (2017-04-26 09:29:31)
I’ve used exactly that analogy to describe a blog and why how people respond to a blog can feel oddly intrusive sometimes - perhaps Twitter is the patch on the pavement immediately outside the front yard? I completely agree about the intersection of public and private, plus really like the application of that analogy to telling other how to use the space

Glen (2017-04-26 15:04:26)
Another useful metaphor I just remembered is the 'engawa' (sorry, long): "The Japanese house has another important feature that intermediates between inside and outside - the engawa verandah. The engawa runs around the house as a projecting platform under the eaves. It is different from the terrace in Western architecture in that it serves as an exterior corridor...But in addition to that, the engawa possesses its own meaning as a third type of space, an intermediary space, in addition to interior and exterior space. In that it is beneath the eaves, the engawa is interior space; but in that it is open, it is part of the exterior space, the garden. In the country house that I lived in during the war, special and formal guests would be received in the guest room, but local merchants and neighborhood friends would come cooling to the engawa, sit down there, and have a cup of tea and chat. Thus the way of receiving guests wad distinguished spatially according to the meaning and the role of the guest." (http://www.kisho.co.jp/page/305.html)

Mark Carrigan (2017-04-30 14:17:44)
Ah, whenever I’ve seen representations of those, they’ve always instinctively appealed to me but I had no idea of the word for them! Would you fancy writing a short blog post about how this could be applied to making sense of social media?
Call for Proposals: Netflix at the Nexus: Content, Practice, and Production in the Age of Streaming Television (2017-04-21 08:00)

Call for Proposals
Netflix at the Nexus:
Content, Practice, and Production in the Age of Streaming Television

Netflix’s meteoric rise as an online content provider has been well documented and much debated in the popular press and in academic circles. It has been praised as the future of television (Auletta, 2014) and as “the most feared force in Hollywood” (Villarreal & James, 2016), while also decried as the end of “TV’s Golden Age” and blamed for ushering in an era where “TV shows may be briefer, lower-budget and filled with the kind of product-placement ads that audiences hate and advertisers pay for” (Thielman, 2016). Interestingly though, amongst the academic inquiry thus far, much of this research has dealt primarily with the algorithmic culture and nature of Netflix (Hallinan & Striphas, 2016; Gomez-Uruibe & Hunt, 2016; Amatriain, 2013), binge watching (Jenner, 2015, 2016; Pittman, & Sheehan, 2015), engagement, (Groshek, & Krongard, 2016; Matrix, 2014); and the future of television, (Auletta, 2014).

The editors seek contributions to this collection that will broaden this discussion greatly, focusing on Netflix in three specific ways:

• platform - How does the nature of Netflix streaming change our relationship to media? How does Netflix’s interface design impact media consumption? How does Netflix change our media consumption in mobile contexts? What are the cultural implications of Netflix’s business model?

• content – What kind of content does Netflix privilege? How does the streaming model change serialized programming? What are these effects on narrative? Does Netflix’s streaming model prelude a more diverse offering for consumers interested in “quality TV?” Do representations in Netflix offerings differ from traditional broadcast programming? Is there a “Netflix genre,” shows produced by Netflix can be recognized as such?

• viewer practices – What kind of viewing practices does Netflix encourage? What is the nature of viewer discourse surrounding bingeing and other streaming viewing practices? How do fans discuss and build community around Netflix programs? How do fans incorporate social media into their viewing habits? Do users utilize social media as a second screen when discussing their favorite programs?

Submission Process:
Interested authors should submit an initial proposal of 500 words (exc. references) by July 15, 2017. This should be sent as a Word or PDF document to editors Theo Plothe ([1]tplothe@walsh.edu) and Amber M. Buck ([2]ambuck@ua.edu) for consideration.
What is 'Fake News'? (2017-04-22 08:00)

What we are seeing with the growth of ‘fake news’ is perhaps the weaponisation of epistemology. In other words, ‘fake news’ as a construct is becoming a discursive component of our repertoire of contention. Far from entering a post-truth era, we are seeing truth becoming a mobilising device in a new way, encouraging ‘us’ to defend ourselves from ‘them’ predicated on the absolute falsity of their worldview. It’s the playing out in an epistemic register of what Chantal Mouffe, drawing on Carl Schmitt, describes as a friend/enemy distinction. Rather than the political other being an adversary to be struggled against, nonetheless regarded as legitimate, they are cast as an enemy to be destroyed. Rush Limbaugh offered a pure expression of the epistemological logic of the friend/enemy distinction in this 2009 rant:

What this fraud, what the uncovering of this hoax, exposes," he said, "is the corruption that exists between government and academia and science and the media. Science has been corrupted. We know the media has been corrupted for a long time. Academia has been corrupted. None of what they do is real. It’s all lies!

We live in two universes. One universe is a lie. One universe is an entire lie. Everything run, dominated, and controlled by the left here and around the world is a lie. The other universe is where we are, and that’s where reality reigns supreme and we deal with it. And seldom do these two universes ever overlap.

The origins of this can be understood [2]agnotologically: [3]neo-sophists, with corporate funding, seeking to manufacture doubt where none previously existed. What’s being described as post-truth emerges at the intersection between corporate agnotology, political polarisation and post-democracy. The possibility to weaponise epistemology emerges coterminously with the breakdown of social solidarity. Agnotology contributes to the erosion of shared certainties in cumulative ways. It creates the conditions for what David Roberts calls [4]tribal epistemology:

Over time, this leads to what you might call tribal epistemology: Information is evaluated based not on conformity to common standards of evidence or correspondence to a common understanding of the world, but on whether it supports the tribe’s values and goals and is vouchsafed by tribal leaders. "Good for our side" and “true” begin to blur into one.

Now tribal epistemology has found its way to the White House. 
What I’m suggesting is that at this point we see epistemology move from being an elite weapon of war to part of the repertoire of contention. Once Trump begins to seriously struggle, how easy is it to imagine Whitehouse statements being dismissed as ‘fake news’ by the grassroots they used this notion to mobilise? How effectively could a nascent leader use this epistemic playbook against those who have brought it into the mainstream? As Roberts points out, this is a cultural tendency which has been present in American politics for quite some time:

That is the classic, some might say naive, view. But there has always been a powerful strain in conservatism (think the [6]John Birch Society) that resists seeing itself as a participant in the game at all. It sees the game itself, its rules and referees, as captured by the other side, operating for the other side’s benefit. Any claim of transpartisan authority is viewed with skepticism, as a kind of ruse or tool through which one tribe seeks to dominate another.

That’s the view Limbaugh and others in right-wing media have consistently articulated. And it has found an increasingly receptive audience. Over time, the right’s base — unlike the left’s fractious and heterogeneous coalition of interest groups — has become increasingly homogeneous (mostly white, non-urban, and Christian) and like-minded (traditionalist, zero-sum values).

The friend/enemy distinction is, for lack of a better term, viral. At least under current conditions. Once people begin to think in these terms, it’s hard to counter it. Not least of all because reluctantly accepting the ‘rules of the game’ inevitably comes to be coded as either giving up or buying in. The reason for this is in part epistemological because tribal epistemology destroys the possibility for syncretism: people can no longer see A and B as elements that can be combined, even if unstable and contested ways. Instead A and B become an absolute disjunction. One sees the social world in terms that allow for no choice other than to choose between positions. The playing out of this, in the digital capitalism of 2017, rather terrifies me.

After Positivism (2017-04-23 08:00)

https://www.youtube.com/watch?v=Fvp6HAWA19k

5008
In this talk where he discusses previous presentations, Professor Daniel Little talks about what should come after positivism for social sciences. He argues that social sciences have suffered heavily from the twin pillars of positivism and naturalism. The question that we face now, Professor Little claims, is what should be our new direction.

The discussion is from History and Philosophy of the Social Sciences Symposium that took place at University of Michigan on September 29, 2016. The symposium examined the history and philosophy of the social sciences, bringing together lines of inquiry that often exist separately. Symposium participants included philosophers, historians, and sociologists. What is shared by the disciplines and methods represented in the symposium was a turn inward, to treat intellectuals, disciplines, institutions, and systems of ideas in the social sciences as objects of research in themselves.

In defence of ‘curation’ (2017-04-24 08:00)

The term ‘curation’ has got a bad press in recent years. Or rather the use of the term beyond the art world has. To a certain extent I understand this but I nonetheless always feel the need to defend the term. There are a few reasons for this:

• In a context of cultural abundance, selection from variety becomes important within a whole range of contexts. Inevitably, it is something most people within these contexts will do most of the times. But ‘curation’ is becoming a specialised activity, even if detached from a specific social role.

• I’m prone to thinking of what I do, at least some of the time, as curation. I spend quite a lot of time each week sorting through mailing lists, newsletters, websites, blogs and social media to identify relevant content for The Sociological Review’s Twitter and Facebook feeds. This is 46 social media posts per day. I’ve also shared something on Sociological Imagination daily for almost seven years. I don’t particularly care what anyone else calls it but, as far as I’m concerned, doing it effectively is a skilled activity and ‘curation’ is the term I’ve taken to using.

• The modern sense of the word ‘curation’ rests on a specific set of institutional arrangements which are themselves relatively recent. The word has a longer history, emerging from the Latin curator (“overseer, manager, guardian”) and what many construe as a misapplication could just as easily be taken as a further shift in its use. Language is dynamic and the anti-‘curation’ rhetoric is an attempt to police its change, albeit not a particularly significant or pernicious one.

Ultimately, I don’t care if people reject this use of the term ‘curation’. I do care if people reject what the term ‘curation’ comes to designate. I don’t dispute it is often used in a vacuous way, but it is not always used this way. It is nebulous and modish but the terms which emerge in relation to socio-cultural transformations often are.

It’s the socio-cultural changes which interest me, the abundance digitalisation is giving rise to and the epistemic fog which emerges as a result. To talk of ‘curation’ is a facet of that conversation and if people want to reject
its use, I hope they’ll offer an alternative language for talking about selection from abundance as an institutionalised function within digital capitalism.

**A Nobel Peace Prize for Sublimation** (2017-04-24 23:03)

*I originally wrote the following in October 2012, just after the European Union was awarded the Nobel Peace Prize.*

Awarding the Nobel Peace Prize to the European Union makes the most sense when you consider the front-runners, which included Julian Assange. No sensible person can deny that the European Union has done more on the ground for peace than whatever Assange’s cyber-gestures are supposed to point toward. Still, it does make you wonder what ‘peace’ means these days. After all, a not unreasonable interpretation of the postwar European project has been to sublimate military conflict into economic struggle. Put that way, we are presented with a neo-liberal wet dream of world peace, which continues to make life difficult for people but without explicitly destroying the ‘human capital’ contained in their bodies. Indeed, with a bit of luck, these subtly tortured bodies – through loss of welfare benefits or endless demands for ‘upskilling’ – might actually enhance the value of their capital through some mysterious feat of ‘entrepreneurship.’

---

**“A new kind of intellectual”: Pierre Bourdieu’s tribute to Michel Foucault** (2017-04-25 08:00)

After Michel Foucault died in 1984 at the age of fifty-seven, Pierre Bourdieu wrote a tribute in *Le Monde*, reflecting on his life and what could be learned from it. Bourdieu attributed to his former colleague at the Collège de France a great consistency in his intellectual work, much more than is often assumed:

The consistency of an intellectual project, and of a way of living the intellectual life. Starting with the desire to break – which explains and excuses some of his famous apothegms on the death of man – to break with the totalizing ambition of what he called the ‘universal intellectual’, often identified with the project of philosophy; but to do so in the sense of escaping the alternative between saying nothing about everything or else everything about nothing.

*Political Interventions: Social Sciences and Political Action, Pg 138*

To become what Foucault described as the ‘specific intellectual’ required foregoing the temptation to speak on behalf of others. What Bourdieu admired was his ambition to “substitute for the absolutism of the universal intellectual, specific works drawing on actual sources ... without abandoning the broadest ambitions of thought”
The point was not to counterpoise a neutral expertise, content only to make claims comprehensively licensed by agreement within the community of inquirers, against the sweeping grandiosity which characterised the pronouncements of a figure like Sartre.

The specific intellectual existed in a new space, beyond this dichotomy between the epistemically timid expert working in obscurity and grandiose celebrity forever on an epistemic rampage in the name of truth and justice. As Bourdieu put it, Foucault “always stubbornly rejected the division between intellectual investment and political commitment that is so common and convenient” (p. 138). In this he represented a new kind of intellectual:

For him, the critical vision was applicable first of all to his own practice, and in this respect he was the purest representative of a new kind of intellectual who has no need to mystify himself as to the motives and themes of intellectual acts, nor to foster illusions about their effect, in order to practice them in full knowledge of their cause.

Political Interventions: Social Sciences and Political Action, Pg 139

This entailed a remarkable humility, at least relative to the general intellectuals of the previous generation. His political action, "conducted with passion and rigour, sometimes with a kind of rational fury, owed nothing to the sentiment of possessing ultimate truths and values" (p. 138). He embodied the possibility of commitment without dogmatism, action without certainty. Bourdieu described how Foucault not only "rejected the grand airs of the great moral conscience" but also found them a "favourite object of laughter" (p. 138).

This was a repudiation of the universal intellectual in terms of both politics and intellectualism. The specific intellectual rejected lofty rhetoric of truth and justice for the contingent realities of situated struggles. The specific intellectual rejected generality for specificity, forsaking an assumed right to speak for a methodologically grounded sense of what one can bring to the conversation. But crucially this was done while sustaining commitment, pushing against the boundaries of received wisdom. The specific intellectual remains orientated towards the universal, while always remaining embedded within the specific.

This Week: Cities and the Political Imagination (2017-04-25 11:18)

Keynote Speaker: Rivke Jaffe (University of Amsterdam)
The Manchester Museum
Friday 28th April 2017
17.45-20.00, followed by wine reception at 20.00

Cities and the Political Imagination

How can we recognize the political in the city? How might social scientists engage with forms of politics outside of
established sites of research such as those associated with representative democracy or collective mobilizations? This presentation suggests that new perspectives on urban politics might be enabled by revisiting the connections between sociology and cultural studies, and specifically by combining long-term urban ethnography and cultural analysis. Reading forms of creative expression in relation to power struggles in and over urban space can direct our attention towards negotiations of authority and political belonging that are often overlooked within the social sciences. I explore the possibilities of such an approach by focusing on the idea of the political imagination, and in particular on how everyday practices are informed by imaginations of urban rule and citizenship. Expressive culture generates both analytical and normative frames, guiding everyday understandings of how power works, where and in whose hands it is concentrated, and whether we see this as just or unjust. Such frames can legitimize or delegitimize specific distributions of resources and risks, and can normalize or denaturalize specific structures of decision-making. Through a discussion of popular music (hiphop, reggae and dancehall) and visual culture, I consider how these forms of the imagination allow new political subjectivities and actions to emerge and consolidate.

Rivke Jaffe

Rivke Jaffe is Professor of Cities, Politics and Culture in the Department of Human Geography, Planning and International Development Studies at the University of Amsterdam. Her research focuses primarily on intersections of the urban and the political, and includes an interest in topics such as organized crime, popular culture and environmental pollution, drawing on fieldwork in Jamaica, Curaçao and Suriname. She is currently leading a major research program on public-private security assemblages in Kingston, Jerusalem, Miami, Nairobi and Recife, studying transformations in governance and citizenship in relation to hybrid forms of security provision. Her publications include Concrete Jungles: Urban Pollution and the Politics of Difference in the Caribbean (Oxford, 2016) and Introducing Urban Anthropology (with Anouk de Koning, Routledge, 2016).

Using graphic novels to communicate your research (2017-04-25 12:09)

Graphic Novel Workshop
A Sociological Review Event

Manchester Digital Laboratory
Thursday 8th June 2017
09.00-17.00

The Sociological Review Foundation is delighted to announce our forthcoming workshop using graphic novel methods to present social research.

We invite applications to take part in a Graphic Novel Workshop with Tony Lee. If your research involves incorporating graphic methods or you are simply interested in doing this to present future research, this workshop will be of interest to you.

**Workshop Format**
- Introduction on graphic novels: how the medium works, different genres, how they’ve changed and the design & production process
- Story telling through graphic novels: how to develop the story, what works and what doesn’t, constraints of the medium etc
- Delegates introduce their ideas for graphic novels and get feedback
- General discussion & advice about next steps

This event is FREE but places are limited to 25 people.

This event is brought to you by The Sociological Review Early Career Researcher Board. We welcome applications for this workshop from people in all stages of their careers. However, should we receive significantly more applications than available places – priority will be given to ECRs and PGRs.
Social Morphogenesis: Five Years of Inquiring Into Social Change (2017-04-25 12:10)

Postmodernity. Second modernity. Network Society. Late modernity. Liquid modernity. Such concepts have dominated social thought in recent decades, with a bewildering array of claims about social change and its implications. But what do we mean by ‘social change’? How do we establish that such change is taking place? What does it mean to say that it is intensifying? These are some of the questions which the Social Morphogenesis project has sought to answer in the last five years, through an inquiry orientated around the speculative notion of ‘morphogenic society’.

In this launch event, contributors to the project discuss their work over the last five years and the questions it has addressed concerning social change. The day begins with an introductory lecture by the convenor of the project,
Margaret S. Archer, before a series of thematic panels presenting different stands of the project. It concludes with a closing session in which participants share three issues the project raised for them, as well as a general discussion.

At the end of the day, there will be a wine reception to which all participants are invited. There will also be an opportunity to purchase discounted copies of the books from Springer.

Participants:
Ismael Al-Amoudi
Margaret S. Archer
Mark Carrigan
Pierpaolo Donati
Emmanuel Lazega
Andrea M. Maccarini
Jamie Morgan
Graham Scambler (Chair)

More speakers to be confirmed.

The Social Morphogenesis project was funded by the [2]Independent Social Research Foundation through six years of support for the Centre for Social Ontology. This support was generously extended to enable this book launch.

How should we attribute authorship on our blog? (2017-04-26 08:00)

I just came across this [1]student essay in which a blog post written by Les Back was attributed to me. This isn’t the first time it’s happened and I’m unsure how to respond to it. The backlist of posts on [2]Sociological Imagination is sprawling by this point, numbering in the low thousands. Most of these were written by me, though they vary between simple sharing of material elsewhere and substantive writing.

Regular guest-writers all have their own accounts so their authorship has been clearly marked. Our settled practice for irregular guest writer has been to have “by x x” in bold at the top of the piece, followed by a biography in bold at the bottom.
Unfortunately, it still indicates the name of the person who published the guest post on the blog, in this case Sadia Habib. Does this attribute authorship clearly enough? I'm starting to wonder if we need a different system. But I'm reluctant to create a new account for each guest author, both because it would add to the time demands of a website I already don't have enough time for and I really don't want to have to go back and manually add these for every previous guest post. Any alternative ideas would be much appreciated.

1. http://7%20of%2011%20%20%20%20%20print%20all%20in%20new%20window%20https//researchingsocietyblog.wordpress.com/2017/04/16/the-art-of-listening/

Fuck virality, I want my ideas to be radioactive (2017-04-27 08:00)

There’s a fascinating footnote in [1]Radio Benjamin, loc 395-410, discussing Adorno’s description of Benjamin’s ideas as ‘radioactive’:

5016
The full sentence reads, "Everything which fell under the scrutiny of his words was transformed, as though it had become radioactive," ... Although Adorno’s metaphor uses a different register of boundary crossing, the German radioaktiv, like the English radioactive, shares with Rundfunk, or radio, a connotation of atmospheric spreading, dispersal, and uncontrolled movement across and within borders and lines of containment; the airwaves, like the air or the atmosphere, represent a quasi-invisible scene or medium of transmission. While the German does not directly imply the coincidence of these two (roughly contemporary) modes of radiality, the notion of Benjamin’s gaze, and from there his work, effecting a radioactive transformation suggests the potentially dangerous, if also exciting and new, power of radio and its power to broadcast.

Radioactive ideas effect a transformation. Viral ideas simply pass through. The logic of social media platforms too easily inclines us towards a concern for virality. What we should aim for is to use their affordances to ensure radioactivity, even if this registers much less impressively on a numerical level.

What does it mean to be a public sociologist in an age of Donald Trump? (2017-04-28 08:00)

From the [1]Public sociology and the role of the researcher: engagement, communication and academic activism postgraduate conference a couple of weeks ago:

Social Morphogenesis: Five Years of Inquiring Into Social Change (2017-04-29 08:00)

Postmodernity. Second modernity. Network Society. Late modernity. Liquid modernity. Such concepts have dominated social thought in recent decades, with a bewildering array of claims about social change and its implications. But what do we mean by ‘social change’? How do we establish that such change is taking place? What does it mean to say that it is intensifying? These are some of the questions which the Social Morphogenesis project has sought to answer in the last five years, through an inquiry orientated around the speculative notion of ‘morphogenic society’.

In this launch event, contributors to the project discuss their work over the last five years and the questions it has addressed concerning social change. The day begins with an introductory lecture by the convenor of the project, Margaret S. Archer, before a series of thematic panels presenting different stands of the project. It concludes with a closing session in which participants share three issues the project raised for them, as well as a general discussion.
At the end of the day, there will be a wine reception to which all participants are invited. There will also be an opportunity to purchase discounted copies of the books from Springer.

Conservatism eats itself: An irreverent look at the conservative mind by Deborah Talbot (2017-04-29 09:10)

by Deborah Talbot

Conservative politics are everywhere, but what is it, and what are they really like?

In the cities, you don’t notice conservatism. It’s there, for sure, but is pretty quiet about itself. Political parties of a more left persuasion don’t get a chance to do a bit of intense political ethnography, so we assume that everyone is pretty much on the same page, despite differences of opinion over issues.

It was only when I moved to one of England’s Southern regions that my immersion in political and social conservatism began. And I realised then what the Brexit culture wars were all about. Forget Cameron, Johnson, and Osborne. They are just metro decadents and a bit like us – conjured up to lull us into thinking the socially liberal consensus was here to stay.

Because real conservatism is not just a difference of opinion about issues (I support welfare; you think the poor should be made to work in chain gangs, kind of thing). It’s embedded in who they are – their psychology and identity. Which then dictates how they respond to issues.
So I thought it would be helpful to employ my ethnographic skills and do an eight-month investigation into the conservative mind - as it really is, not how it likes to portray itself in the media. Here are my results.

*Conservatism is more than party politics*

Conservatism is pretty wide ranging, though sometimes it does settle on a political party or perspective, like at the moment with the Conservatives, UKIP and Brexit.

But it doesn’t have to. People that have stayed in the same place for decades, haven’t experienced the significant changes over the past 40-50 years occurring in cities or just don’t get out much, tend towards the conservative. Being creates consciousness, and all that.

Even if they may have traditionally voted Labour for years, their prevailing attitudes to women, immigrants or any local thing they don’t like, makes them easy prey for the right-wing sociopaths.

*They don’t like change*

That’s right. Any change is met with a wall of muttering and complaint. It could be a good change, like a new building, or trying to sort out a failing transport system.

And despite having acres of space around them, they definitely don’t like change that involves new housing. Or immigrants coming in. Or Londoners. Or the post office down the road changing its sign. Or temporary road works. Or a new cycle lane.

It’s all the same. Change is bad.

*Keeping it simple*

There’s the sketch that Stewart Lee does about UKIP’s anti-immigration policy, where he says, for racists, ‘reality is too full, isn’t it....’

It’s truer than Lee knows. Conservative people just don’t get complexity, whether this is multi-causal chains of reasoning, evidence-based policy or large conurbations.

I guess it’s why change confuses them...because it adds a new variable.

*Despite what they say, they don’t like community*

Conservatives will make a song and dance about community, but mostly what they mean is that they want to keep it for people exactly like themselves, and to act with impunity.

Because contrary to what they say, conservatives are more likely to engage in anti-social acts, like leaving dog poo in the streets and speeding. Because it’s all about them - hang everyone else.

*They parade family like a banner but don’t like children*

You’d think conservatives, being all family, nation and work, would like children. But they don’t. Children, in their eyes, need to know their place. Be quiet, stop crying, man up.

Teenagers and even worse, youths, for your average conservative, are evil and it would be better if they were 5020
all locked up or forced to join the army (same thing).

Conservatives provide nothing for children and particularly teenagers to do and then castigate them for taking the initiative. Conservative areas are high on vandalism and street drinking (and even so, 99 % of young people are lovely). Do they see the relationship? Not at all.

They do love babies though, probably because they are helpless and can’t talk back, which is just how conservatives like ’em.

They never experienced identity politics

Conservatives of all hues just never went through the identity revolution that hit most cities in the UK and beyond. Because they never experienced it, they don’t understand it, and believe the Daily Mail when they are told it’s ‘political correctness gone mad’ and a ‘threat to the social order’.

The idea that it’s about giving people equality and respect, and not being abusive to people who aren’t like you, seems to have passed them by. Conservatives lack basic good manners, except when it comes to people just like them. Which brings me to...

Patriarchy reigns

Both men and women in conservative areas support a set of social practices and policies that perpetuate the oppression of women. In conservative areas, it’s not sexist to bully and troll women on social media, fail to provide job flexibility and childcare and shut women out of work and professional networks.

‘Her indoors’ gets to stay indoors.

I once innocently asked a local male politician from the ‘Independents’ (closet conservatives) how he could attend so many meetings when he has small children. He said, without batting an eyelid, “My wife does all of that.” There was no shame or irony.

Little provision is made for women who have small children and who want to go to work or meetings. In The Patriarchy, women need to know their place, which is firmly latched to the kitchen sink.

Call attention to it, and it’s very much a case of ‘calm down dear’, or you are called a raging fantasist.

Dislike of the arts and psychological sensitivity

Offered a choice between, say, an art gallery and a bus station, conservatives will opt for the bus station.

The arts are a threat to their narrow social order and need to be marginalised or if possible, crushed. They aren’t beguiled by the success of the creative industries; that’s just a liberal plot to shake them out of their boring shires and give it to young people and immigrants.

And you can’t have a world with things in it, remember?

Similarly, conservatives are very anti-emotion. Sensitivity is tortured out of children by bullying at schools and general ostracism. Because emotion is pinko stuff and real men don’t cry. But, and here’s a big but, some of them invite social media abuse. They are less comfortable with understanding and empathy. Hmm...
**Difference, what difference?**

Conservatives lack empathy. They simply can’t feel the presence of other humans and assume that those objects moving close to them (people) are simply inanimate or just an extension of them.

I think this is why in conservative areas people lack spatial awareness. Despite all the space they have around them, they simply don’t hear you coming or bump into you because they haven’t seen you. Weird right?

**Aggression, anxiety and fear**

Road rage, tailgating, noisy neighbours, train noise – the list of things people in conservative areas find annoying and anger provoking is extensive. One gets the impression if they moved to a city they’d have an aneurysm within a year. Or chill the hell out.

Beneath this lies a deep anxiety and fear. The world is a scary place for conservatives. Whatever bad things happen, the government had better do it to someone else rather than them. This is probably why they are so enthusiastic about folk devils and punitive policies.

“Do it to them, not me” should be the conservative motto.

**Dislike of public anything**

Public transport, public sector, public housing – these all strike fear into the heart of your average conservative. Because they are scared of what they’ll find in public spaces (they might stumble across, say, a person unknown to them personally), they want to destroy it for everyone else.

Conservatives are all about private spaces, first class carriages on trains, cars and roads, where they can pay to keep themselves separate - anything to avoid having an unpredictable encounter with another human.

**Obedience is safer**

I had a strange conversation with a conservative type who said that they’d voted for Brexit and now they had to go along with whatever May wanted. Anything she wanted, because they had to agree with it (sold their soul, was my interpretation). Conservatives love obedience because they are too scared to be independent. Rather than face that, they try and force everyone else to be obedient too.

But get this, conservatives. Some of us have gone and grown up and can cope with ambiguity and freedom. And do it with other people. We’re not pretending. We really can.

The love of obedience makes their pretend notion of taking back control completely fatuous. What they mean, of course, is hand control to their leader. And then shut your mouth, because the exercising of your democratic rights is making them uncomfortable.

**It’s not the economy, stupid**

Walking around a small local town with an avid conservative, he looked at all the shops and small business, and sneered, “It’s a bit commercial, isn’t it?”

And here’s the shocker. Your average conservative type doesn’t like economic growth and commercial activity.
They don’t. They just pretend to in their manifestos and propaganda.

That’s because they are either retired, independently wealthy, employing other people to run things for them, living off rent, or unemployed. They are not even that keen on volunteering anymore, though remnants of an older conservatism are still out there. Working, volunteering or building a business requires engagement with human normality. Moreover, you need a functioning economy to thrive.

I bet if anyone did a calculation they could correlate declining economic participation with the rise in conservatism.

Think about Brexit. It’ll by all accounts tank the economy and push the UK into long-term shrinkage. Do Brexiteers care? No, because they don’t need an economy. So they believe. Obviously their savings would tank too, but that’s a while off. And remember, they can’t handle a multi-causal chain of reasoning - it’s all about that direct relationship between them and their personal pot of gold.

Their lack of caring about the economy and their dead-eyed love of authority is expressed in the continued conservative support for a hard Brexit. And no wonder they don’t like immigrants, who are generally entrepreneurial and energetic.

Conservatives are more like to say, “Where’s my deckchair?” than “This great new café has opened; let’s go.”

It’s Labour that has become the party of enterprise, which is all over the cities. Conservatives are disengaged. Surprising, eh?

More than any of the other self-defeating psychological dispositions I’ve talked about, the lack of enthusiasm for economic issues shows us that conservatism is eating itself.

*Pea sized imaginations*

Anyone that wants to hand this lot the reins of power needs to think again. They are myopic, careless and stuck firmly in a past that more suited their narrow-minded fear-obsessed world.

They don’t want to lead us into a new productive and democratic reality. They want to shrink the world, so it fits their pea-sized imaginations.

So if you are thinking about voting Conservative, but you don’t want people in power who have these traits, have another think. Conservatism is eating itself. Let’s just let it die.

Benny Goodman (2017-04-29 10:50:23)  
I need to read David Goodhart’s book on ‘somewheres-anywheres’ which this seems to resonate with. There’s also an implied nod to Haidt’s moral foundation theory as well. A great read, and although irreverent (good) I’m going to use this as discussion
with my students.

Deborah (2017-05-01 08:05:30)
Thank you for your comments. I'd love to see how that goes. This is definitely just one of my contributions to the election battle out there, so I hope it gets circulated. I've used some of these ideas to inform political debates, and it does work.

The Colonel (2017-04-30 20:30:45)
What utter nonsense. Self indulgent echo-chamber liberal elitist bull crap.

Deborah (2017-05-11 12:08:49)
Why thank you sir.

Conservatism eats itself – Deborah Talbot – Politics and Insights (2017-05-14 18:02:54)
[...] This article is also published on The Sociological Imagination. [...]
The Sociological Review Foundation is delighted to announce our forthcoming workshop using graphic novel methods to present social research.

We invite applications to take part in a Graphic Novel Workshop with Tony Lee. If your research involves incorporating graphic methods or you are simply interested in doing this to present future research, this workshop will be of interest to you.

**Workshop Format**
- Introduction on graphic novels: how the medium works, different genres, how they've changed and the design & production process
- Story telling through graphic novels: how to develop the story, what works and what doesn’t, constraints of the medium etc
- Delegates introduce their ideas for graphic novels and get feedback
- General discussion & advice about next steps

This event is FREE but places are limited to 25 people.

This event is brought to you by The Sociological Review Early Career Researcher Board. We welcome applications for this workshop from people in all stages of their careers. However, should we receive significantly more applications than available places – priority will be given to ECRs and PGRs.

Application deadline is 17.00 GMT, Monday 2nd May 2017. Please ensure to outline your research interests in the relevant section.

Apply here: [1](https://www.thesociologicalreview.com/events/using-graphic-novels-to-communicate-your-research.html)

8.5 May

**Slavoj Žižek presents (2017-05-01 08:00)**

It was only a matter of time really. A new front has just been opened in the Žižek publishing machine:
Speaking and listening on social media (2017-05-01 08:00)

What does it mean to speak and listen on social media? It’s a question which might seem to invite a platitudinous response but it’s one which increasingly concerns me. In the last couple of years, I’ve found myself increasingly sceptical that a platform like Twitter facilitates meaningful debate given the constraints it imposes on expression. I largely avoid comments discussions on blogs and websites. I won’t go anywhere near YouTube comments threads, even though I sometimes find myself drawn uncontrollably to read them, like a moth to the flame. In short, I’ve largely lost what faith I had in social media as a means to facilitate debate. The constraints of these channels multiply misunderstandings while the culture they have given rise to encourages intemperate reactions.

However debate doesn’t exhaust speaking and listening. I’m aware that much as I increasingly avoid debate, I also spend less time listening on social media than I used to. In part this is down to abundance. When I dip into my Twitter feed, I can usually find 10 strands I want to follow up within a few minutes. When I do follow these up, I immediately find even more strands to follow. The escalation dynamics of social media, if your use is calibrated to maximise access to variety, constitute a recipe for productive distraction that can at times be overwhelming. My means of processing this productive distraction is largely through writing, hence social media sends me from listening to speaking.
There’s more to it than this though. The architecture of social media rewards speaking but doesn’t reward listening. To speak and win attention for those speech acts, either positively or negatively, increases the visibility of subsequent speech acts. To listen carefully can be akin to invisibility. Hence perhaps the almost apologetic tones in which people who prefer to listen describe themselves as lurking. But what happens if ever fewer people are listening? My increasing fear is that social media too often facilitates only the pseudo-catharsis described by Winlow and Hall:

The political protest ends up continuing only for a short time as an online blog or a Twitter post, offering nothing more than a cathartic opportunity to vent one’s spleen accompanied by the sad recognition that in all likelihood no one is listening, and no one really cares.

Rethinking Social Exclusion, Pg 73

What does this mean in the context of the university? In a [1]thoughtful essay, Jana Bacevic argues that by “sticking to critique on social media, intellectuals are, essentially, doing what they have always been good at – engaging with audiences and in ways they feel comfortable with.” But to what extent are those audiences imagined? To what extent are they ‘external’ or ‘internal’? They register numerically as ‘followers’ but the metrics of engagement often tell another story. Is this even engagement? To what extent is anyone listening? Are we simply talking amongst ourselves? Or even simply talking to ourselves and occasionally overhearing each other’s chatter?

There are many responses to these concerns. One might be to call for more organisation of this space, to provide platforms for robust and productive debate. This would be a mistake. But we do need to think seriously about what the public expression of academics and intellectuals means in an age of social media. I found this section of [2]Lambros Fatis’ PhD thesis rather inspiring (pg 246):

The fourth precondition here offered for the rejuvenation of public-spirited citizenship, as opposed to self-interested demagoguery, rests on a fundamental change of approach in the way we understand public expression, suggesting that a shift from the acclamation and assertiveness of speaking to the compromise and attentiveness of listening is as vital, as it is systematically sidelined. Making our thoughts known and conveying them successfully in conversation so that they come to mean something to us depends not only on what and how something is being said, but also on what and how something is being heard, listened to and understood. Public expression therefore does not rely solely on speaking our minds, but also involves the manner in which information is taken in, and it is precisely the balance between those two communicative faculties that allows for dialogic negotiation as opposed to monologic recitation.

If we move away from ‘speaking our minds’, seeing social media as a window to the world through which we can channel our many discontents into an imagined public sphere, we can begin to preserve social media as a space for speaking and listening. It encourages us to examine our assumptions about our audience, something which can be done quantitatively (through metrics provided by platforms) and qualitatively (through assumptions we make about them and its congruence with our prior knowledge).

In fact, it can move us away from thinking in terms of ‘audience’ at all, rejecting a view of social media as a platform for speech in which we ‘earn’ visibility, instead seeking technologies for interlocution. Such technologies offer powerful affordances for what Lambros describes as a shift from intellectuals-as-speakers (“an exclusive class
of spokespeople who give voice to our grievances and concerns”) to intellectuals-as-listeners.

"Let no thought pass incognito, and keep your notebook as strictly as the authorities keep their register of aliens" (2017-05-02 08:00)

This is the fifth of Walter Benjamin’s thirteen rules for writing. I would love to know more about what this meant in practice to him. How often did he record his ideas? Where did he record them? How did their quantity and quality wax and wane in different circumstances? My conviction that blogging constitutes a technology of scholarly attentiveness rests on its capacity to habituate this practice.

“Let no thought pass incognito, and keep your notebook as strictly as the authorities keep their register of aliens” – always be aware of sth (2017-05-03 07:22:27)

 [...] from the post by Mark Carrigan (http://sociologicalimagination.org/archives/19290) [...] 

Call for Papers: The Journal of Repressive Social Theory (2017-05-03 08:00)

In recent years, calls for a reconsideration of critique, its place and value, have multiplied. The proposition that critique has run out of steam took on a new urgency with the vote for Brexit and the election of Donald Trump. The doxa of progressive academia has found itself repudiated by these events, as conceptions of the social world universally assented to within the left-liberal academy have been revealed as phantasmic remainders from an older period of capitalist development.

This new journal calls for a reorientation of social theory towards the reality we now reluctantly confront. Regressive times call for a repressive social theory, attuned to the contracting horizons of public life and the death of progressive futures into which we once invested so much. Contributions for this inaugural issue might include:

- Nationalist populism and the challenge it poses for democracy
- The inadequacy of leftist critique in the face of reactionary class politics
- The difficulty of persuading people they should listen to when we say things
- How irritating we find it when people don’t agree with the things we say
- The professional anxieties lurking behind the twists and turns of our run-on sentences

5028
• The necessity that our words become more obscure and our run-on sentences longer to cope with the spiralling complexity of late neoliberalism

• The value of critique as the temporal horizon of viable employment within the critical social sciences contracts

• The performativity of criticality and how it no longer makes us feel better about the world or ourselves

At this stage, we invite titles and abstracts from potential contributors to the first issue. Final contributions should be between 8000 and 10000 words, articulated in a suitably dense and impenetrable style. Please e-mail [1]TheFutureIsNotWhatItUsedToBe@Gmail.com to informally discuss a contribution.

1. TheFutureIsNotWhatItUsedToBe@Gmail.com

well......if you are serious........

Digital Scholarship and Why It Matters (2017-05-04 08:00)

https://www.youtube.com/watch?v=o5qfKfdWy70

In a world where so many aspects of our lives are becoming increasingly digital, it is not surprising that academia has also been influenced. University of Canberra Centenary Research Professors Patrick Dunleavy and Deborah Lupton join Swinburne University of Technology’s Professor Lisa Given, and Roxanne Missingham from ANU to discuss how modern scholars are adopting and adapting to new technologies.

CFA Postgraduate Conference - Digital Communities: interdisciplinary perspective (2017-05-05 08:00)

Post-Graduate Conference

Digital Communities: interdisciplinary perspective

Monday 3rd July 2017, Cardiff

We look forward to welcoming you to our first Postgraduate Interdisciplinary Conference!
"Digital Communities: interdisciplinary perspectives" postgraduate conference will be organised by PhD students from the schools of Social Science, Computer Science, Law and Politics in Cardiff University, supported by the ESRC Wales Doctoral Training Partnership (DTP). It will bring together PhD students and academics from different disciplines interested in studying the implications of the digital on society.

The principal aim of "Digital Communities" is to encourage doctoral researchers to consider how the concept of digital communities is applied inside and outside of their own subject areas.

Overview

How are digital technologies impacting upon, and affecting the lives and relationships of people and things? How are communities developed and maintained in these contexts? How are they, and how could they be, governed and threatened? How can they be researched? Through this conference we will provide a space for discussion around emerging and pertinent issues faced by people and communities in their interactions with the digital, as well as the opportunities and barriers that face researchers studying the digital.

Students at all levels of postgraduate study, as well as early career researchers, are invited to give presentations on their own research (ongoing or completed) as well as various aspects of their study and experience, including but not limited to: complete and preliminary findings, insights and observations, theoretical/methodological/ethical issues and approaches, problems and challenges, personal/professional interests and experiences related to the digital, and so on. Given this open and inclusive scope, we especially welcome contributions that have relevance across different academic and professional disciplines. Keynote Speakers Presentation groups will be bookended by two academic keynote speakers: Dr Athina Karatzogianni, Associate Professor in Media and Communication at the University of Leicester: "The Problem of Trading Discursive for Affective Power in Digital Political Communities". Dr Suzy Moat, Associate Professor of Behavioural Science at Warwick Business School, co-director of Data Science Lab: "Sensing human behaviour with online data". Call for Abstracts Presentations will be 15-20 minutes, organised into three topical blocks, with Q & A sessions at the end of each block, and extensive networking and discussion opportunities later in the day. We encourage a wide range of submissions involving, but not limited to, the following thematic topics: Identity, subjectivity and digital communities: What kind of human subject is enabled by the digital? How does this affect people’s lives within and outside of their digital communities? How are interactions and expressions mediated by the digital? How are forms of activity and organisation privileged and stifled? Topics appropriate for submission include but are not limited to: “old and new” communities, community development and digital technologies, urban and rural communities, migrants, refugees, LGBTQ, activism and social movements on social media, influence on media and policies). Threats, antagonism and digital communities: How is problematic activity and speech (un)regulated? What old and new antagonisms propagate online? How are technologies used to disrupt, manipulate and antagonise digital communities and individuals? Topics appropriate for submission include but are not limited to: developing and supporting digital communities, cyberconflict and digital communities, technological threats, such as phishing/scam/privacy related issues, problems of governance and regulation of online spaces and communities). Study of digital communities: What is the ontological and epistemological status of the digital? To what extent are digital communities "new" or novel? What are the opportunities and affordances of different methods of research into the digital? What is digital data? How do the actions and structure of digital platforms and their operators constrain and influence methodological development? How can digital research draw from micro and macro approaches to research? What are the ethical challenges involved in the study of the digital? Topics appropriate for submission include but are not limited to: methodological and ethical considerations in the study of digital communities, different types of research: participatory approaches, community-centred design, case studies of communities, computational social science (e.g. digital communication dynamics, text analysis and natural language processing of social phenomena, network analysis of social systems, large-scale social experiments and/or phenomena, causal inference and computational methods for social science, novel digital data and/or computational analyses for addressing societal challenges, methods and analyses of biased, selective, or incomplete observational
social data, social news curation and collaborative filtering, methods and analyses for social information). Abstracts should be 300 words, indicating name, institutional affiliation and title of presentation. Abstracts should be submitted no later than 15/05/2017 to this link: [1]https://easychair.org/conferences/?conf=dc2017 You will have to create an account in EasyChair in order to submit. We will notify you of acceptance by June 7. For further details please visit: website [2]https://digitalstuffcardiff.com/ or write to [3]CardiffDigitalStuff@gmail.com

How can the social sciences keep up with socio-technical change? (2017-05-06 08:00)

At a recent symposium I saw [1]Ben Williamson give an excellent lecture about the rapidly developing field of educational data science and how it is reshaping educational practice. Some of the material is summarised [2]here for those interested. It was a really broad overview of these developments and the theoretical challenges we face in trying to make sense of them. However what his lecture left me pondering most was the practical challenge of keeping track of these developments. There is so much happening, at such a rapid pace, it becomes hard to see how the critical social sciences can keep up with these developments.

Someone like Ben is doing it successfully within one field but this demands specialisation in a way that sits in tension with theorisation and contextualisation. To put it bluntly: how does collaboration happen when most of your colleagues know much less about these developments than you do? How do you engage with important philosophical, ethical and political questions posed by these developments when you have to spend at least half an hour describing to an audience what is actually happening? How do you have conversations with those working in comparable fields, drawing out connections and identifying similarities and differences between what you are studying?

My point is not that it is impossible. Far from it. Or even that it is new, as it’s clearly a particular manifestation of the broader epistemic challenge of specialisation. Only that it is hard. Furthermore, it is this difficulty which compounds the specialisation dynamic because the people you inevitably find yourself working with face the same practical challenge in relation to the broader disciplinary community, increasing your epistemic reliance upon one another to develop your research in a collaborative way.

One obvious impediment to addressing this problem is the journal system. If it takes six months to write a journal article, another year to get it published and another two years before responses to what you’re written begin to appear (if indeed they ever do) then subsequent developments might well have rendered what you’ve written partially redundant. Factor in the bias towards length within journals that publish critical social science, as well as the low status accorded to descriptive or review pieces, to discover a publication infrastructure that systematically undermines our capacity to cope with the pace of socio-technical change. The fact it’s one most, if not all, find themselves bound into through the logic of career development entrenches the problem only further.

It won’t surprise anyone that I think research blogging can be a partial solution to this problem. It can accelerate scholarly dialogue in a way that mitigates, without overcoming, the decelerative effects of the journal system. So too could more attention to information-searching and information-storage practices within the critical social sciences. But perhaps we need to think more broadly than this. My developing conviction is that we need to create systems
for networked horizon scanning in a way that complement, rather than seek to replace, the existing journal system:

Horizon scanning is a technique for detecting early signs of potentially important developments through a systematic examination of potential threats and opportunities, with emphasis on new technology and its effects on the issue at hand. The method calls for determining what is constant, what changes, and what constantly changes. It explores novel and unexpected issues as well as persistent problems and trends, including matters at the margins of current thinking that challenge past assumptions.

Horizon scanning is often based on desk research, helping to develop the big picture behind the issues to be examined. Desk research involves a wide variety of sources, such as the Internet, government ministries and agencies, non-governmental organisations, international organisations and companies, research communities, and on-line and off-line databases and journals. Horizon scanning can also be undertaken by small groups of experts who are at the forefront in the area of concern: They share their perspectives and knowledge with each other so as to 'scan' how new phenomena might influence the future.

A solid 'scan of the horizon' can provide the background to develop strategies for anticipating future developments and thereby gain lead time. It can also be a way to assess trends to feed into a scenario development process.

It’s important to recognise that these changes aren’t simply a matter of technical developments. There are a vast array of actors with a vested interest in pursuing these developments, encompassing policy makers, think tanks, foundations, entrepreneurs, data scientists and corporations. They proceed through a dizzying array of projects, intervening in every facet of each sector of social life. Such actors enjoy an obvious epistemic priority over those who seek to (critically) study them, inhabiting a rich web of assumptions, meanings and relations which those from the outside must come to inhabit while retaining distance. They also enjoy a temporal privilege, working in collectives towards these ends, creating a challenge for those who seek to track and analyse their endeavors either individually or within small teams, often while juggling a whole array of other demands.

The challenges we face in researching such developments are continuing to grow while we remain locked into individualising and decelerative modes of working that are wholly inadequate to them.

Recently, the British Sociological Association organised a postgraduate and early career researcher regional event - Public sociology and the role of the researcher: Engagement, communication and academic activism on 29th March 2017, at the DeMontfort University, Leicester.

The format of presentation was a five-minute PechaKucha presentation (20 slides-20 seconds each- so 400 seconds). Given the time constraint, I decided to do mine in the form of a poem! I was a bit apprehensive, but the poem was well received by the academic audience and I won the prize for the best presentation.

My research explores the employment challenges for Pakistani men in the UK and why a quarter of them work as taxi drivers? Nestled in a social constructivist paradigm, within the structure agency debate, mine is an ethnographic study drawing upon Bourdieusian concepts- habitus, doxa, illusio and the various capitals.

As a qualitative researcher I have often comes across this call for reflexivity or being reflexive. Michael Buroway calls ethnography to be a ‘reflexive science’; Finlay says its ‘a difficult path’ yet ‘essential for all research’; Some call it ‘elusive and poorly described’; and others see reflexivity as a major strategy for quality control. Baffled with all these propositions, I sometimes find myself at a loss when trying to ‘be reflexive’ and had the same question as Pillow - is reflexivity ‘a reflection, confession or a cathartic outburst?’

The following poem is an expression of real questions I faced while writing my methodology chapter (which I am still struggling with!).

1 in 4 Pakistani men in the UK, drive taxis for a living

Is it a choice or constraint, their fortune’s misgiving?

How free are they to choose a job? do they really have a choice?

Or do their class, religion, and ethnicity take away their own voice?

How does being a Pakistani man in UK, affect their life chance?

What options do they get, in a society of white dominance?

Economists have sought to answer these questions in many ways

Through human capital theories, or the role an ‘ethnic penalty’
plays

Many a studies have pointed to the disadvantage of Pakistanis in this land

Poor education, rural backgrounds, often push them to the lowest band

Discrimination is still rampant, in spite of all the laws,

How fair is Britain, boasting of its equality vows?

But then, these penalties are not the same across all groups that dwell

Indians & Chinese, in the same British labour market have done pretty well!

Is education then the emancipator, the key to success?

Yet, why do some second generation Pakistani boys to taxi driving recess?

Unable to find an answer, I turned to sociology too!

To Giddens, Archer
, and Pierre Bourdieu

I found Bourdieu closest to explaining the reproduction of class

Of habitus,
doxa
and
illusio
, how they affect our life, alas!

A habitus is formed, as a ‘mental structure’ which guides our minds

A perception of only this or that could be done, which a
illusio
binds

The habitus is reproduced generations after generations

Yet, between structure and agency lie man's deliberations!
Or is it the various capitals he says, that create this doxic structure

Social capital?, religious?, symbolic?, or culture?

So our C lass, A ffiliations, G ender, and E thnicity form a certain CAGE, A structure one is born in, as we enter life’s stage.

We do not choose these for ourselves, but they yield their power on us

Reproducing the habitus affecting our long term prospects thus

But man is born free, a rational thinking being!

How does one negotiate this CAGE? when does agency kick in?

Faced with these questions, I took a social justice stance

An ethnographic study, an interpretivist dance

What counts can sometimes not be counted, and what’s counted doesn’t count,

So I am presenting their voices qualitatively, in their own account

But wait, who am I in this entire scheme of things?

What’s my positionality? a question of reflexivity rings!

Am I an insider or outsider here?

What common sense of my participants do I actually bear?

I am a contrast to them in many a way

What role does my own background here play

I am an educated, Hindu, Indian, woman from the middle class

They are taxi drivers, Muslim, Pakistani, men from a working class

So, how does one research these subjective questions of the mind?

How will I unearth the habitus of being a minority in the grind?
How do my own assumptions affect what I say and ask?

How in the glory of my own habitus does my research bask?

Is reflexivity a reflection, confession, or just a cathartic outburst?

If we all affect our research uniquely, then what epistemology do we trust?

Where does the researcher draw the line to remain objective?

Between the study and real people who are subjective?

Whose story is it anyway, mine or theirs?

Am I their true representative as someone who cares?

How will this help policy and practice? what impact will it make?

Finding social justice for the community, I wish to awake

I have more questions than answers at this stage,

Perhaps I am bound unknowingly, by my own CAGE!

But these questions, however painful need to be asked for sure

Only then will I as an impactful & reflexive researcher mature

Email: [1]M.Sarkar@leeds.ac.uk; TWEET: @meenakshisarkar

Currently in her 3rd year of PhD at the University of Leeds, Meenakshi is a Learning and Development professional with over 20 years of experience from India where she worked with various organisations such as Procter & Gamble, Bausch & Lomb, Oriflame, Metlife Insurance and New York Life Insurance as a L &D lead, leadership coach and facilitator for behavioral skills. She came to the UK as a matured student to pursue her second masters in Human resource management (the first being in English Literature) at the University of Leeds in 2012. Her research started from a simple observation that many of the taxi drivers she met during her stay at Leeds, Bradford and Manchester were of Pakistani origin. As per the EHRC (2010), 1 in 4 Pakistani men in the UK drive taxis for a living. Is it a choice or constraint? Meenakshi set out to explore. As she is writing her thesis, she is also exploring issues around reflexivity, role of the researcher in public sociology.

The above poem was presented at a Public Sociology conference in Leicester this March.

Appliances, check if they are part of the house inventory, or if previous tenants left them behind.

Security cameras - Many people are currently quite informed about security cameras because they often see these installations in banks, buildings, malls, groceries, and even in houses. They're Easy To Use While spy gadgets might seem hi-tech and difficult to use, they've become a lot more easy to use within the years. The most advanced universal remotes can even control up to 15 different gadgets.

"Not being a philosopher or a physicist, I'm not planning to learn about that subject in print, but I can let you know that, from your marketing standpoint, the internet marketing effect towards the business stated previously would have been a big fat zero. You feel when you had given your relationship more time and effort it might been employed out. Possible complications include drug reactions, infection, bleeding, or perforation of the digestive system which can require surgery.

Your style is very unique in comparison to other people I have read stuff from. Many thanks for posting when you have the opportunity, Guess I will just bookmark this page.

Urgency in the spirit. They do this in two ways.

Love fashion? It's just realistic to help them out.

Hi, this is Covet Fashion hack generator.

I don't even understand how I stopped up right here, but I thought this put up used to be good. I do not realize who you are but definitely you're going to a well-known blogger should you are not already. Cheers!
Postmodernity. Second modernity. Network Society. Late modernity. Liquid modernity. Such concepts have dominated social thought in recent decades, with a bewildering array of claims about social change and its implications. But what do we mean by ‘social change’? How do we establish that such change is taking place? What does it mean to say that it is intensifying? These are some of the questions which the Social Morphogenesis project has sought to answer in the last five years, through an inquiry orientated around the speculative notion of ‘morphogenic society’.

In this launch event, contributors to the project discuss their work over the last five years and the questions it has addressed concerning social change. The day begins with an introductory lecture by the convenor of the project, Margaret S. Archer, before a series of thematic panels presenting different stands of the project. It concludes with a closing session in which participants share three issues the project raised for them, as well as a general discussion.

At the end of the day, there will be a wine reception to which all participants are invited. There will also be an opportunity to purchase discounted copies of the books from Springer.

Participants:
Ismael Al-Amoudi
Margaret S. Archer
Mark Carrigan
Pierpaolo Donati
The Social Morphogenesis project was funded by the Independent Social Research Foundation through six years of support for the Centre for Social Ontology. This support was generously extended to enable this book launch.

Public Sociology as Pedagogy, Research and Practice: Threats and Opportunities Today (2017-05-08 08:00)

Public Sociology as Pedagogy, Research and Practice: Threats and Opportunities Today

[1]https://www.britsoc.co.uk/events/key-bsa-events/public-sociology-as-pedagogy-research-and-practice-threats-and-opportunities-today/ An Early Career Forum Regional Event 29 June 2017 (10am-4pm) Nottingham Trent University, Department of Sociology, Newton Building, Goldsmith Street, Nottingham This symposium will bring together early career sociologists, postgraduates, undergraduate students, and community partners, to explore the challenges and opportunities of practicing public sociology. Through the course of this one-day event we will discuss and test out the suggestion that public sociology can be a form of critical dialogue that connects teaching, research and practice. The incorporation of public sociology into aspects of teaching and student research is of particular relevance for early career sociologists, many of whom spend a large part of their time in student-related activities. Burawoy (2004) notes that students are academics' 'first public'; they are also sociological practitioners in their own right, and are embedded in a wide range of publics. Public sociology practiced by academics, students and practitioners is often discussed in isolation from one another: this event is distinctive in bringing them together. The event will address the question of what public sociology should mean in Britain today, in a context marked by multiple forms of crisis, including: the global capitalist crisis; crises of the environment, ecology and sustainability; mass forced migration coming up against restrictions imposed by nation states widespread war and terrorism; social crisis within Britain and many other countries involving an increasingly precarious existence for millions of people; deep-rooted political uncertainty about the nature of the British state and its relationship to Europe and the rest of the world in the context of Brexit. We will ask what kind of public sociology we need today, in such an uncertain and rapidly changing context? Learning from past and current examples we will discuss practical visions for a public sociology of the future. The symposium will include a series of interactive sessions, focusing on research, teaching, and practice. Speakers in each session will offer short introductions followed by open group discussions. Confirmed speakers include: Malia Bouattia, National Union of Students Dr Kehinde Andrews, Birmingham City University Daniela Scotece, Prostitution Outreach Workers, Nottingham Service Learning Students, Nottingham Trent University Andrea Lyons-Lewis and Sharon Hutchings, Nottingham Trent University Dr Lucy Mayblin, University of Warwick Bea Giaquinto, Renewal Trust Everybody is invited to join us for drinks and a meal at a nearby establishment following the event, if you would like to join us for food please let us know so we can book enough places (the cost of the evening meal is unfortunately not included in the event booking). Call for Posters Participants are welcome to present
An Interview with Patricia Leavy about Research Design in Contemporary Times (2017-05-08 19:18)

Your main areas of interest are research methodology and public scholarship. How did you become interested in these topics and how, if at all, do you think they’re linked?

When I was a sophomore in college I took a required survey of research methods course. That’s when my passion for research methodology began, and when I started to see the importance of textbooks for influencing the field. I loved the book used in that class, which I think was probably used in just about every methods course in the social sciences at that time. To me, that textbook outlined the ways that knowledge comes to be and how we might each be a part of creating new knowledge. I found that quite profound and I still do. When I tell people I write about research methodology they might think, goodness that sounds boring. But I’m obsessed with it. This is an important subject that impacts the work done in all fields from the social sciences to education to health studies. It’s the invisible framework for all knowledge production. Research methodology is about how we conceive of and carry out research projects including what we study, how we study it, with whom, for what purpose, and with whom we share the potential benefits of that knowledge. It’s in the latter part of that statement that there is a connection to public scholarship.

When I entered the academy I was stunned to learn some of the realities surrounding academic research. Peer-reviewed journal articles are the primary format for publishing academic research. As a result, most academic research is totally inaccessible. It’s inaccessible in two ways. First, no one outside of the academy has access to peer-reviewed journals. Second, they’re loaded with jargon and prohibitive language. So people don’t want to read this stuff, nor can they. As a result, the average peer-reviewed article has an audience of 3-8 readers according to some. That’s astounding. When you consider the human and other resources put into research. I believe there is an ethical, moral, and practical mandate to make research more widely available both inside and outside of the academy. Research should be of some value in real-world contexts. Public scholarship is that which reaches relevant stakeholders outside of the academy.

So let me crystalize the relationships between public scholarship and methodology. Researchers develop a methodology for each study or project. That methodology is a plan for how the research will proceed. If we’re committed to making our research matter to relevant stakeholders, decisions need to be made regarding how we will identify...
and reach them. Audience should be considered as one develops a project, regardless of the design used. Our methodological possibilities impact our ability to contribute effectively to public scholarship. This is one reason methodological innovation matters. The more tools we have available, the greater the possibilities for knowledge production and dissemination.

**What connections do you see to the sociological imagination?**

The sociological imagination centers on understanding the connections between our individual biographies, or micro-level experiences, and the larger socio-historical context, or macro-level. In other words, it's about the link between our own individual lives and the larger contexts in which we live. Research projects can be designed to explicitly explore, describe, explain, or otherwise illuminate those connections. The more methodological options we have at our disposal, the more we can investigate.

**Your new book *Research Design* offers an alternative to the methods literature. How would you describe the book? What was your goal writing it?**

[1] *Research Design* is a step-by-step guide to designing research using the five approaches to research: quantitative, qualitative, mixed methods, arts-based, and community-based participatory. It’s a one-stop shop to research design. It’s intended for use as a primary or supplemental textbook. A course could be designed around it. It's also intended to be a resource for individual students and researchers. The first part of the book reviews the different sources from which we gain knowledge in daily life, how social research is a unique form of knowledge-building, the main elements of a research project, ethics, and the nuts-and-bolts of designing a research project from selecting a topic to developing research questions and/or hypotheses, conducting literature reviews, and locating participants for research studies. The second part of the book reviews the five approaches to research, each in their own chapter. The chapters cover what you need to know to develop a research proposal and design a project. Each chapter presents a template for writing a research proposal and then follows a unique format whereby the chapter fills in each section of the proposal. So readers can learn the details of each approach to design and simultaneously learn how to create a research proposal. I would also describe the book as pedagogically rich. There are numerous features intended to make it user-friendly. For example, there are in-chapter "Review Stops" which are quick quizzes intended to test new learning, with end-of-chapter answer keys, tables, graphs, charts, bold terms, research and writing activities for further engagement, suggested resources, and a glossary of key terms.

This book lived in me for many years. It was a major undertaking and I wanted to be ready for it. My goal was to create a highly user-friendly textbook that reviews the five available approaches to research design, instead of the three covered by most texts. I wanted to offer an alternative to the current methods texts. There are many great methods texts, several of which I have taught with over the years and that I regularly pull off my bookcase for personal reference. So I had no desire to attempt to replicate what is already out there. However, I did see the need for a book that offers equal treatment to five approaches, even if some readers choose to omit some of the chapters. I also approached chapters about the standard three approaches differently than other books, again, in order to produce an alternative. For example, the quantitative chapter follows a deductive model and the qualitative chapter follows an inductive model. There’s content that you don’t always find too. For example in the quantitative chapter there's discussion of replication studies, data sharing, and survey question construction. Attention is also paid to contemporary issues, including the role of technology in some research.

That's a long answer so to summarize, the book is meant to be a contemporary one-stop guide to research design across five approaches with pedagogical features. I hope it’s of value to professors, students, and researchers.
The coverage of arts-based research (ABR) and community-based participatory research (CBPR) approaches is unique. Why is it important to include these approaches?

These new approaches have developed at a time when there is more diversity and inclusion in academia and the field of research methods. This makes for a much richer array of perspectives on knowledge-building including philosophical assumptions we have taken for granted for many decades, and corresponding methods practices. Revisiting the methods terrain is vital. If we don't, we continue to work nearly exclusively with ideas and tools created at a time when women and people of color were excluded or radically marginalized. For example, scholars of color routinely engage with community-based and participatory research, and contribute to our methods knowledge in this area. Consider the effect of failure to give equal credence to these methods in our teaching, awards, publishing, and funding practices. Arts-based research has grown over the past couple of decades in concert with the push toward public scholarship. As the academy wrestles with issues of impact, it's prudent to share the tools of ABR and learn from arts practitioners for whom audience has always mattered. It's also important to give equal treatment to all five approaches to design because failure to do so can result in a host of misunderstandings in the literature. For example, when CBPR is reviewed, it's usually in brief in the context of a chapter on qualitative research. However, CBPR can be conducted with quantitative methods or mixed methods, and frequently is. There's a documented history of community surveys in CBPR. Qualitative researchers have greatly advanced the practice of CBPR but that does not mean it is only within the purview of qualitative research. It isn't. This is one example of why each approach needs equal coverage.

What do you think CBPR offers sociology in particular?

Sociologists frequently engage in different kinds of social action research. Meaning, there is the intent to have real-world impact and help foster positive social change. CBPR offers a host of tools for creating projects based on needs identified by relevant stakeholders and then implementing effective strategies to reach goals. It also goes back to the earlier question about the public scholarship. We typically use that term to talk about distributing the products of social research. But what about a public sociology from the ground up, in which relevant publics are involved during all phases and are the beneficiaries of the research process? In short, there's a justice imperative.

Social justice and ethics are strong themes in the book. How are these topics pertinent to research methods education and practice?

Social justice and ethics have a central role in both research methods education and practice. Let's take practice first. Why do we carry out a particular study? For what purpose? Toward what end? With benefits to whom? From the topic we decide to investigate, to how we go about designing and implementing a project, and how and with whom we share our results, social justice imperatives can drive research agendas. Research can be carried out with the intent of, in some way, making the world more just. Whether it's including previously excluded populations and asking new questions in survey research around a particular phenomenon, implementing an arts-based design in order to jar people into self and social reflection around a justice-themed topic, or something else, research can be underscored with, if not explicitly driven by justice goals. Even when this is not the case, social justice values should be present in every research project, even those with other kinds of objectives. Researchers need to engage with these values.

Likewise, ethics are central to research practice. While institutional and regulatory obligations are in place to protect
research participants in some basic ways, such as making sure participation is voluntary, confidential, understood, and can be withdrawn without penalty, there are a host of other issues to consider. Depending on the project a few other issues may include the relationship between the researchers and participants, the use of culturally sensitive language and practices, going into communities in which the researcher isn't otherwise invested, and accounting for one's own role in the project. I always say, ethics are not a checklist only to be dealt with at the beginning of a project. Ethics must be considered throughout the entire research process, including representation and dissemination.

Because social justice and ethics are central to research practice, they must be given sustained attention in our methods education. I actually think the way we choose to teach methods perhaps has the greatest impact of any factor on how we see these principles enacted in actual practice. Emerging researchers need to be sensitized to these issues and provided with strategies for best practices in they are going to be able to successfully design studies. For these reasons, I paid extra attention to ethics and justice issues in Research Design. There's a robust chapter on ethics placed after the introductory chapter, as well as “ethics in practice” notes placed in each of the five design chapters which highlight key moments of ethical decision-making as they occur. I also offer a range of interdisciplinary examples of research studies conducted on justice-related topics, such as racial inequality.

Language is also given attention in the text. Can you explain that?

When using each of the five approaches to research, one tends to use different language. For example, to describe those from whom we learn we may use the word subject, participant, or, collaborator, among other words. These distinctions are important as they speak to larger philosophical differences. When writing a research proposal or final write-up it's necessary to show competence with appropriate language so I model this in each of the five approaches chapters.

There's also discussion of culturally sensitive and culturally competent language. Research may involve those with whom we share differences. Finding effective ways to respectfully communicate with people and to sensitively portray people in their multi-dimensionality in our write-ups is a part of ethical practice. This issue comes up at numerous times in the book. Strategies for determining culturally sensitive language are noted. For example, establishing community advisory boards and how one might do that.

How do you see Research Design impacting the field of research methods?

That will be for others to determine, over time. My hope is that professors will consider the book for their courses and that ultimately it will be a useful resource for students and researchers at various career levels. In the act of writing it, and offering equal guidance in each of the five approaches to research design without privileging any of the approaches, I feel I've made a contribution to the field. It would be wonderful if standard methods teaching expanded to cover four or five approaches in full, instead of the three typically covered. If so, the publication and funding landscapes might also shift over time.

Anything you’d like to add?

I want to thank the entire team at Guilford Press for their outstanding work on Research Design. Authors’ names appear on front covers but books represent the labor of many. I was fortunate
to work with a world-class team. And thank you for the opportunity to talk about this. I know the term research methodology doesn't sound very sexy, and so the subject often goes under the radar. But our methods practices are complicit in knowledge production world-wide with pervasive real-world implications. These issues ought to be brought into the light. Thank you for being a part of that.

About the Patricia Leavy

Patricia Leavy, Ph.D.,

is an independent scholar (formerly Associate Professor of Sociology, Chair of Sociology & Criminology, and Founding Director of Gender Studies at Stonehill College). She is an internationally recognized leader in the fields of research methodology and arts-based research. The author or editor of twenty-two books, she has earned critical and commercial success in both nonfiction and fiction, and her books have been translated into many languages. Her latest book, Research Design, was the number one new release on Amazon in seven categories for eight consecutive weeks. She is also series creator and editor for seven book series with Oxford University Press and Sense Publishers, including the ground-breaking Social Fictions series. Known for her commitment to public scholarship, she is frequently called on by the US national news media and has regular blogs for The Huffington Post, The Creativity Post, and We Are the Real Deal. She has received career awards from the New England Sociological Association, the American Creativity Association, the American Educational Research Association, and the International Congress of Qualitative Inquiry. In 2016 Mogul, a global women’s empowerment network, named her an “Influencer.” For more information please visit [2] http://www.patricialeavy.com/

I visit every day some web sites and websites to read content, but this blog offers quality based posts.  

knowledge vine (2018-10-24 19:27:02)  
It may seem acceptable forr a government to demand that an internet service provider (ISP) repot any customer who might download child pornography. Every sngle cents that you simply share will come back to you in thousand fold. If you just spend time doing research, it’ll be easier to comprehend a subject.  

gadget change (2018-10-28 13:57:20)  
Yes, they keep getting introduced and people carryy on and replace and build-up huge collections of those accessories. So, in ways gaming can be a teenagers orr anyone's friend behause it entertains there youg brains as long while they are playing good games. With these i - Pad giveaways, the consumers get their hands around the llatest gadgets as the manufacturers can easily get their products tested.  

citywideblog.ir (2018-11-13 17:20:46)  
Can I simply say what a relief to discover an individual who actually knows what they’re talking about on the internet. You certainly realize how to bring a problem to light and make it important. More and more people should read this and understand this side of the story. It’s surprising you’re not more popular because you most certainly have the gift.  

timesblogfa.ir (2018-11-13 17:24:43)  
Very good info. Lucky me I recently found your blog by accident (stumbleupon). I've book marked it for later!  

weblogdivide.ir (2018-11-13 17:56:57)  
Link exchange is nothing else however it is only placing the other person’s blog link on your page at appropriate place and other person will also do similar in favor of you.
Have you ever thought about publishing an ebook or guest authoring on other blogs? I have a blog based on the same subjects you discuss and would really like to have you share some stories/information. I know my subscribers would appreciate your work. If you’re even remotely interested, feel free to send me an email.

Precious (2019-03-13 06:40:29)
I really wanted to compose a brief message to be able to express gratitude to you for the superb tips and hints you are sharing on this site. My extended internet look up has now been rewarded with excellent knowledge to exchange with my friends and family. I would assert that we site visitors actually are very blessed to be in a perfect website with many lovely people with insightful points. I feel really blessed to have used your website page and look forward to tons of more awesome minutes reading here. Thank you again for all the details.

**Darwin's Dilemma (2017-05-09 07:20)**

- Science is the epitome of human achievement, whereby we distinguish ourselves most clearly from other animals.
- Yet, our best science says that our sense of superiority from other animals is false and quite possibly self-deception.
- Either we have misunderstood human nature all along or our best science is bound to be superseded by one more attuned to our true nature.

People of the Abrahamic faiths (Judaism, Christianity, Islam) believe that science is about enabling humanity to make it worthy of its divine origins, but Darwinists deny the premise and so they are left to explain the grandiosity of humanity’s commitment to science. ‘Darwin's bulldog’, Thomas Henry Huxley, first broached the point [1]here.

**Feminist Reflections on Law, Society and Care (2017-05-09 08:00)**

21st July 2017

09:30 – 17:30 BST

Room 2.10 Sandra Burslem Building

Manchester Law School, Manchester Metropolitan University

We would like to invite colleagues to this prestigious event who share a keen interest in addressing feminist ethics and feminist frameworks in relation to contemporary societal issues. Your interests might fall into a range of categories, broadly defined, including Ethics of Care; Global Justice; Health Care; Technologies; Community activism and Feminist Methodologies.

This one-day event consists of a mix of keynote speakers, and smaller panel and workshop sessions with brief papers.

Our three keynote speakers comprise of:
• **Donna Dickenson**, Research Associate, HeLEX Centre University of Oxford, Emeritus Professor of Medical Ethics and Humanities, and Honorary Senior Research Fellow at University of Bristol, presenting on *Property in the Body: Feminist Perspectives*.

• **Alison Jaggar**, College Professor of Distinction at the University of Colorado at Boulder and Distinguished Research Professor at the University of Birmingham, presenting on *Gendered Perspectives on Global Justice*.

• **Marian Verkerk**, Professor of Ethics at the University of Groningen, presenting on *Family Ethics of Care*.

Panel sessions will cover a wide range of topics: Family Law and Ethics, Global perspectives on issues of Gender and Justice, Abortion Law and Reproductive choice, the Female Body, and Constructions of Women.

This event is sponsored by the **Sylvia Pankhurst Gender Research Centre** - here is the URL if you would like to follow the blog: [1]https://mmusylviapankhurstgenderresearch.wordpress.com/

Organisers: Dr Melanie Latham, Kelly Dannielle, and Aysha Mazhar

Any queries please contact: [2]feministreflections@gmail.com or [3]kelly.dannielle@stu.mmu.ac.uk

Register your place using the Eventbrite link: [4]https://www.eventbrite.co.uk/e/feminist-reflections-on-law-society-and-care-tickets-34272828954

Making an Impact with Social Media, July 5th in Manchester (2017-05-09 14:40)
Many researchers are excited about the potential social media offers for making an impact with their work. However, 500 million tweets per day, 3 million blog posts per day and over a billion websites poses an obvious challenge: how can you ensure you are heard above the din? How can social media be used by busy researchers in an effective and efficient way?

This workshop offers a practical introduction to these challenges, exploring how to use social media to engage with groups beyond the academy and ensure the impact of research. The session will include an overview of key considerations and group discussion of practical problems. The focus throughout will be on practical and sustainable techniques to build ongoing relations with publics outside the academy.

At the end of the day, participants will have learnt about the opportunities and challenges posed by social media for researcher impact, as well as having designed a bespoke impact strategy relevant to their own projects. Participants also have the option of purchasing five hours of coaching via Skype to support the implementation of this strategy. This includes a free copy of [1]Social Media for Academics.

Mark Carrigan is a Digital Sociologist and Social Media Consultant. He is Digital Fellow at The Sociological Review and recently completed three years as Research Fellow in the Centre for Social Ontology at the University of Warwick. He is the author of Social Media for Academics, published by Sage in early 2016. This is the first book length guide to the use of social media within higher education and has been widely praised across a diverse range of reviews.

The technocratic oath (2017-05-10 08:00)

In his political memoir, *Adults In The Room*, Yanis Varoufakis recounts a meeting with Larry Summer which took place in April 2015. Only months into his tenure as Finance Minister, he looked to this architect of the neoliberal world order for support as hostilities with European leaders over Greece’s fiscal future rapidly intensified. Coming straight from a meeting at the IMF in Washington, Varoufakis was met with an immediate warning from Summers that he had “made a big mistake”. This began a long conversation which ended with a fascinating warning. From loc 1050:

Finally, after agreeing our next steps, and before the combined effects of fatigue and alcohol forced us to call it a night, Summers looked at me intensely and asked a question so well rehearsed that I suspected he had used it to test others before me.

‘There are two kinds of politicians,’ he said: ‘insiders and outsiders. The outsiders prioritize their freedom to speak their version of the truth. The price of their freedom is that they are ignored by the insiders, who make the important decisions. The insiders, for their part, follow a sacrosanct rule: never turn against other insiders and never talk to outsiders about what insiders say or do. Their reward? Access to inside information and a chance, though no guarantee, of influencing powerful people and outcomes.’ With that Summers arrived at his question. ‘So, Yanis,’ he said, ‘which of the two are you?’

When reading of this exchange in a review of the memoir, I immediately thought back to a story Elizabeth Warren had told about an encounter with Summers in a Washington curry restaurant early in her move from academia to politics. Upon purchasing Varoufakis’s book, I found that I wasn’t the only person to notice this parallel and be fascinated by it. As he recounts in an end note to the book:

A few months after I had resigned the ministry, my good friend and academic colleague Tony Aspromourgos, upon hearing about my exchanges with Larry Summers, confirmed my suspicion when he sent me this quotation from Senator Elizabeth Warren, documented in 2014:

*Late in the evening, Larry leaned back in his chair and offered me some advice ... He teed it up this way: I had a choice. I could be an insider or I could be an outsider. Outsiders can say whatever they want. But people on the inside don’t listen to them. Insiders, however, get lots of access and a chance to push their ideas. People – powerful people – listen to what they have to say. But insiders also understand one unbreakable rule: they don’t criticize other insiders. I had been warned. John Cassidy (2014), 'Elizabeth Warren’s Moment’, New York Review of Books, Vol. 61 (no. 9), 22/ 5–4/ 6/ 14, pp. 4–8.*

Could this be seen as the professional socialisation of technocratic elites? Does Summers engage in a particularly practiced and performative example of something which takes a cruder form elsewhere? Does he particularly focus on those like Varoufakis and Warren who have moved from the academy to politics? As he reflects on loc 156, the technocratic oath is something which transcends agreements of strategy and analysis:
We spoke the same economic language, despite different political ideologies, and had no difficulty reaching a quick agreement on what our aims and tactics ought to be. Nevertheless, my answer had clearly bothered him, even if he did not show it. He would have got into his taxi a much happier man, I felt, had I demonstrated some interest in becoming an insider. As this book’s publication confirms, that was never likely to happen.

Benny Goodman (2017-05-10 08:16:59)
Well, I was shocked to read this as it hits home in a visceral way what many already believe we know. That not only do men of wealth buy men of power, but that there is indeed an insider elite? Is this ‘insider group’ also what Margaret Archer called a ‘contextual resource’ - ’similars and familiars’? (Focused) Autonomous reflexives when confronted with this ‘enablement and constraint’ thus really have to choose whether to be in the tent pissing out....? Corbyn of course is an outsider...and if he actually became PM, he would be forced to stay there given his record. I suspect May would be given the same chat...but she may well be ‘on message’ in any case and perhaps not need it.

Anticipatory Urgency (2017-05-11 08:00)

Earlier this morning, I found myself impatiently waiting in my local petrol station to purchase a drink before I went swimming. The woman in front me in the queue was rather slow. Initially seeming surprised that money would be required for the transaction, she proceeded to initiate an entirely different process to locate her coins after handing over the necessary notes. Having completed the exchange, she gathered her things with a similar lack of pace, slowly preparing to leave the shop. It was at that point that she gently chided me for rushing her, suddenly leaving me aware that this was in fact what I was doing by impatiently lingering while effectively pointing towards the cashier with my drink.

With this newfound awareness, my irritation at her transmuted into an irritation with myself. Why was I being so impatient? Why was I being needlessly rude? It immediately occurred to me that this was an example of what I mean by cognitive triage. Having woken up later than planned, I started the day with a vivid sense of all the tasks I had to complete, with one leading in sequence to the next. There were a couple of things that had to be done today but this sense of urgency mostly reflected a desire to be on top of things before I headed off to the midlands for the rest of the week.

It was an anticipatory urgency: a haste animated by the fear of falling behind in the future. This can be distinguished from rushing to meet a deadline. The imminent arrival of a deadline offers a fixed temporal horizon for an activity. One rushes and then ceases to rush. In contrast, anticipatory urgency is potentially open-ended. If an upcoming event is a threat to ‘being on top of things’ then where to draw the line in terms of what is required to be prepared? My suggestion is that anticipatory urgency engenders a peculiarly hasty form of haste. It involves rushing in a rushed way. Not simply speeding up to meet a deadline but trying to speed up one’s speeding up. How much can I get done before I go away? How prepared do I need to be? It’s a reflexive orientation that can bring out the worst in people, as my rudeness in the garage illustrates.

There is a pleasure in speed, as Milan Kundera powerfully captures in his Slowness. There is the possibility of transcendence. On pg 3-4 he describes the inner experience of a man on a motorbike:
the man hunched over his motorcycle can focus only on the present instance of his flight; he is caught in a fragment of time cut off from both the past and the future; he is wrenched from the continuity of time; he is outside time; in other words he is in a state of ecstasy. In that state he is unaware of his age, his wife, his children, his worries, and so he has no fear, because the source of fear is in the future, and a person freed of the future has nothing to fear.

In contrast, I’d argue, anticipatory urgency precludes this. One is not cut off from past and future but profoundly implicated in the relationship between the two. The present is subordinated the future, with the usual texture of temporality being reduced to an endless sequence of moments. Each one is simply a challenge lying in the way of reaching the next. It creates flat time. This suppression of relationality is licensed by the promise that the important events will come and our anticipatory urgency will have left us properly open to them. But the more time we spent in a state of anticipatory urgency, the less likely it is that this promise will ever be realised.

The ennui of the academic celebrity

In Solar, by Ian McEwan, we encounter the weary figure of Michael Beard, the nobel laureate and serial womaniser who has long lived off his early contribution to theoretical physics. By the time he approaches his 60s, he is a chaotic and directionless man, nonetheless ubiquitously affirmed within the academy and beyond:

He held an honorary university post in Geneva and did no teaching there, lent his name, his title, Professor Beard, Nobel laureate, to letterheads, to institutes, signed up to international ‘initiatives’, sat on a Royal Commission on science funding, spoke on the radio in layman’s terms about Einstein or photons or quantum mechanisms, helped out with grant applications, was a consultant editor on three scholarly journals, wrote peer reviews and references, took an interest in the gossip, the politics of science, the positioning, the special pleading, the terrifying nationalism, the tweaking of colossal sums out of ignorant ministers and bureaucrats for one more practical accelerator or rented instrument space on a new satellite, appeared at giant conventions in the US – eleven thousand physicists in one place! – listened to post-docs explain their research, gave with minimal variation the same series of lectures on the calculations underpinning the Beard-Einstein Conflation that had brought him his prize, awarded prizes and medals himself, accepted honorary degrees, and gave after-dinner speeches and eulogies for retiring or about-to-cremated colleagues. (pg. 14)

This is a man who enjoys celebrity, “in an inward, specialised world”, leaving him able to drift “from year to year, vaguely weary of himself, bereft of alternatives” (pg. 14). He remains blissfully ignorant of the post-docs who work with him, neither having the inclination nor the energy to learn to differentiate them. He reasons that it is “better to treat them all the same, somewhat distantly, or as if they were one person” rather than “insult one Mike by resuming a conversation that might have been with the other, or to assume that the fellow with the ponytail and glasses, Scots accent and no wrist string was unique, or was not called Mike” (pg. 20). It was only after half a dozen trips to his research centre that he realised that the same post-doc had acted as driver each time. As he awaits the end of his fifth marriage, he relies on the incoming mail to offer him escape from the peculiar turgidity that privilege has brought to his life:
After morosely clinging to stupid hopes, he began to watch the post and emails for the invitation that would take him far away from Belsize Park and shake some independent life into his sorry frame. About half a dozen a week arrived throughout the year, but so far nothing had interested him among the inducements to give lectures on the shore of a plutocratic north-Italian lake, or in an unexciting German schloss, and he felt too weak and raw to discuss the Conflation before one more colleague-crowded conference in New Delhi or Los Angeles. He had no idea what he wanted, but he thought he would know it when he saw it. (pg. 22-23).

He often felt he had "coasted all his life on an obscure young man’s work, a far cleverer and more devoted theoretical physicist than he could ever hope to be" (pg. 50). Ironically, it was this very talent and devotion which led him to become the middle man plagued by “a certain mental deficiency, an emptiness, a restless boredom” that could only be obscured “by the daily round or sleep” (pg. 49). His intellectual engagement now more often entailed flipping through the Scientific American, perpetually distracted by his "lifetime's habit" of being “inconveniently watchful for his own name” (pg. 49).

Iain MacLaren (2017-05-12 09:29:50)
cheering us up for the weekend, Mark?

Mark Carrigan (2017-05-16 10:27:14)
Yes. Did it work?

nasza strona internetowa (2018-04-17 16:33:20)
It’s a shame you don’t have a donate button! I’d definitely donate to this fantastic blog! I guess for now i’ll settle for bookmarking and adding your RSS feed to my Google account. I look forward to new updates and will talk about this site with my Facebook group. Chat soon!

mabosbet alternatif (2018-05-25 10:31:10)
Thanks in favor of sharing such a pleasant thought, post is nice, thats why i have read it entirely

Spencer (2018-05-31 06:51:26)
Please let me know if you're looking for a writer for your site. You have some really good posts and I believe I would be a good asset. If you ever want to take some of the load off, I'd love to write some content for your blog in exchange for a link back to mine. Please send me an email if interested. Cheers!

Rise, a new mobile app for dieting and health, aims to connect users with their own personalized diet plans and daily feedback from nutrition coaches for a fraction of the usual cost.

taxi services (2018-10-15 12:36:39)
Excellent blog! Do you have any hints for aspiring writers? I'm hoping to start my own website soon but I'm a little lost on everything. Would you suggest starting with a free platform like Wordpress or go for a paid option? There are so many options out there that I'm completely confused .. Any ideas? Many thanks!
And, think about it: by refusing small things in your lifetime, like a compliment or someone holding the entranceway to suit your needs once your arms are packed with packages, actually makes it harder to get even larger gifts that may present themselves. You've likely heard that the roadside assistance plan is recommended, however, if you think that it is just about getting towed, you ought to please take a closer look. Reverse mortgages would be the easy and effective way to have a residence over the last phase of your life.

Fuck (2018-10-19 18:34:38)
You actually make it seem so easy with your presentation but I find this matter to be really something which I think I would never understand. It seems too complex and very broad for me. I am looking forward for your next post, I'll try to get the hang of it! https://adrianbuzan.com/

My family members always say that I am killing my time here at web, except I know I am getting familiarity every day by reading these pleasant articles or reviews.

Drew (2018-12-07 16:37:24)
Oh my goodness! Impressive article dude! Thank you so much. However I am encountering difficulties with your RSS. I don’t understand why I can’t join it. Is there anybody having the same RSS issues? Anyone that knows the answer can you kindly respond? Thanks!!

Terrence (2019-01-21 10:47:19)
Excellent post. I’m facing some of these issues as well..

agen sbobet bonus new member (2019-03-17 19:47:35)
I’ve read several excellent stuff here. Certainly price bookmarking for revisiting. I surprise how much effort you put to create any such fantastic informative website.

https://jpst.it/1ismv (2019-03-17 21:59:34)
Excellent post. I used to be checking continuously this blog and I am impressed! Very helpful info specially the closing section :) I take care of such info much. I was looking for this certain information for a long time. Thanks and good luck.

What is a research technologist? (2017-05-13 08:00)
I described myself as an ‘academic technologist’ for a number of years. During my part-time PhD, I’d drifted into a number of roles which felt connected but which were difficult to summarise: training people to use NVIVO, writing digital scholarship resources, advising on CAQDAS strategy for research projects, running workshops about social media and maintaining social media feeds. Since then I’ve ceased to use the description, in part because I got sufficiently sick of talking about NVIVO that I resolved never to approach the topic again, but also because the term didn’t really seem to have much purchase. I rarely felt people understood what I meant by it. But unlike ‘digital sociologist’, their lack of understanding wasn’t coupled with some degree of interest in finding out.

Perhaps research technologist would have been a better term. This is what Andy Tattersall uses in a [1]thought-provoking essay at the LSE Impact Blog. He identifies a strange lacunae which has also long-fascinated me: a proliferation of digital tools emerging from outside the academy, increasing numbers of technology startups focused on the academy, strategic investment in tools and platforms by institutions but specific features of academic labour which are hindering uptake:
Whilst this work is a great help to those aware of it, the reality is a majority of academics are either unaware of or unwilling to engage with the myriad tools and technologies at their disposal (beyond social networking sites such as Twitter, Facebook, ResearchGate, etc.). There are several reasons for this: workload and deadline pressures; fear of technology; ethical implications around their use and their application, especially when it comes to third party software; or too much choice.

I'd add to this that their engagement with social networking sites is inevitably shaped by the [3]conditions of academic labour in ways which can prove detrimental. The research technologist, on Tattersall’s account, emerges to mediate between different stakeholders in these transformations and to help academics negotiate these changes in an effective way:

But with so many tools available, how do academics navigate their way through them? How do they make the connection between technology and useful application? And who helps them charter these scary, unpredictable waters?

The parallel he draws is with the learning technologist: “this group of centralised, university-educated professionals help drive teaching innovations that are underpinned by technology”. As he describes the practical activity performed in such a role:

It would support research and its dissemination in the use of video, animation, infographics, social media, online discussion, mobile device use, and social networks, to name just a few technologies. The learning technologist applies pedagogical reasoning for their technology choices, and the research equivalent would need to assess the same considerations. Not only that but good communication skills, information literacy, and an understanding of data protection, ethics, and what constitutes a good technology – and how it can be applied to a specific research setting in a sustainable and timely manner – are all essential. For example, the use of video to disseminate research around speech therapy would potentially be more useful than an infographic. In the same way, an infographic published in a blog post might be a better way of conveying the results of a public health project.

On this understanding, I could easily be described as a research technologist who specialised in disseminating sociology. I have a broad acquaintance with the discipline, understand its different intellectual currents and am very familiar with the sociological sensibility that unites much of them. Someone operating in this role might step in to do the dissemination work on behalf of an individual or a project. But the intellectual familiarity also facilitates their entering into the project, in a relatively narrow capacity, in order to support and guide this activity. The point is
not only to undertake the activity, it’s the capacity to work with researchers as they do this and to understand the practical challenges they face over and above the technology itself:

The reason why in-house support could benefit the practice and dissemination of research is that researchers are very pressured for time, and often don’t know what they need regarding research technologies and especially dissemination. Secondly, when they do know what they want, they often need it "as soon as possible". These two problems are more solvable within the department, especially as researchers often don’t know where to go for specific help. The research technologist would be a designated, focused role, embedded within the department. They’d be a signpost to new ways of working, problem solving and, most importantly, be able to consider all issues of ethics and/or compliance when passing on advice.

This involves a familiarity with the issues encountered in technology use, rather than simply the tool or platform itself. Andy’s example of guiding researchers through the experience of dealing with hostility and abuse on Twitter is an excellent example. I really like his vision of "a kind of 'Swiss Army knife' professional, who can exploit the burgeoning number of opportunities afforded by the many new technologies out there" but I suspect I’ll still continue to call myself a digital sociologist for the time being.

Here’s a really interesting presentation by Matthew Dovey about the emergence of this role and the purpose it serves:

The Politics of Race in Contemporary Film and Digital Practice (2017-05-14 08:00)

Thursday 18 May to Friday 19 May 2017

Goldsmiths, University of London (Day One)
Institute of Contemporary Arts (Day Two)
The Sociological Review is pleased to announce that it is supporting the Black Frim British Cinema Conference 2017: The Politics of Race in Contemporary Film and Digital Practice.

KEYNOTE SPEAKERS

Professor Sarita Malik, Brunel University

Dr Kara Keeling, University of Southern California

THEMES

Whether we consider the rise of the concept of diversity, the on-screen representation of identities, the off-screen workforce, the production trends of film institutions, new forms of independent production opened up by new media, or film education and talent development, questions of race and ethnicity remain central to contemporary British film.

This conference will mark nearly 30 years since the original Black Film, British Cinema conference at the ICA and its subsequent publication, which has been a huge influence on scholars exploring race, culture and the politics of representation. Some of its core thinking by Kobena Mercer, Stuart Hall, Paul Gilroy and others remains an excellent point to consider what has, and has not, become of black and Asian film and TV production in the UK.

The aim of this two-day conference is to consider the politics of race in contemporary British cinema and visual practice and reflect on almost 30 years of black film production vis-a-vis the institutional, technological, textual, cultural and political shifts that have occurred during this period. The conference will welcome scholars, early career researchers, postgraduate students and practitioners working at the intersection of film, TV, Moving Image, Media and Communication studies, Sociology, Politics and Cultural Studies.

**Call for Papers: Imagining the Future: Financial Capitalism & the Social Imagination**

Call for Papers: Imagining the Future: Financial Capitalism & the Social Imagination

**UCL Institute of Advanced Studies // 11 July 2017**

**Keynote speakers:**

- Professor Ruth Levitas (Bristol)
- Professor Jens Beckert (Cologne)
We invite abstract submissions (up to 300 words) which explore the various ‘intersections’ between political, economic and social imaginaries of financial capitalism. We are especially interested in theoretically-driven approaches studying the role of different types of imagination in materially mediating currently experienced crises (economic, social, border, migration etc.), through producing and legitimating dominant visions and narratives of the future.

Please email your abstract (up to 300 words) and a short bio to

2. [mailto:reclaimingutopia@gmail.com](mailto:reclaimingutopia@gmail.com)

by Patrick Alexander

What do you want to be when you finally grow up? In 2014, on a humid September morning, I boarded a crowded subway train to arrive at the New York City public high school where I would spend a whole year exploring this question. I wanted to find out how high school kids make sense of their futures, and to better understand how schooling socialises us to imagine the future in particular ways. I also wanted to know more about the barriers that get in the way of achieving these futures, and how young people manage to overcome these challenges (if they do). I didn’t know then that masculinity would also become one of the more important and evocative themes in the ethnography. Understanding experiences and articulations of masculinity became a way for me to consider how neoliberal framings of aspiration are used to make sense of the future for young people in school.

On that first day of the ethnography, and empty of students before the beginning of term, the school felt like an immense ship being prepared for a familiar but long and arduous journey. Custodial staff sweated around the school, towels tucked in T-shirt necks, and shouted an echoing commentary to one another down shiny corridors as they hammered, painted, and jerry-rigged the school back into shape. Teachers weaved in and out of classrooms and offices, plain-clothed, switching quickly between smiling conversations about summer vacations, tans, or new haircuts, and more serious hushed huddles about school gossip, office supplies, bureaucracy, and the coming storm of teenagers. The ebullient figure of the Principal loomed large in this scene, smiling and stating with happy sincerity that, ‘every day at (this school) is a good day!’ He gathered the teachers together to go through past progress statistics and talk about the year to come – a year that would be bigger and better not only for the students on the sometimes treacherous path towards graduation, but also for the school as an entity with its own collective aspirations and hopes for the future. To me, this moment of caesura – this hurried but confident fixing of costumes before curtains-up – is a fascinating example of how futurity is constructed and reproduced through the mundane processes of schooling. I think that it’s indicative of the ways in which schools help in both subtle and explicit ways to socialise us not only into imagining a horizon upon which we can fix our gaze, but also into constructing a sense of social identity that’s only sensible when framed in this particular future-gazing way.

Throughout the year of research, Bronx High showed itself to be a profoundly future-oriented institution in which students reconcile the privileging of imagined neoliberal futures with the often starkly different realities of their own experiences outside of school. The processes through which constructions of masculinity are fused into constructions of aspiration in the context of schooling emerge in numerous vignettes from the ethnography – for example, in how dominant forms of neoliberal masculinity are reproduced in school discourse at the institutional level, and in the persona of the school’s principal. Drawing on examples from the classroom, I also show in my research how male students negotiate between “tough” performances and narratives of masculinity framed in relation to educational failure, and articulations of masculinity that fit with notions of academic, athletic, and/or economic success. Through these examples I consider how multiple, entangled, concurrent, and often uncertain imaginings of gendered future aspirations are collapsed, made invisible, or rendered tractable under the weight of
a single dominant, taken-for-granted neoliberal reckoning of what the future will look like for young men coming of age through the recession.

Andre, a successful senior student, was a good example of this experience. While he was very strategic in his planning for the future, and had a clear path laid out, he also told me: ‘You know, life is straight improv: you just make it up as you go along. You never know what’s going to happen or what kind of man you’re gonna be. And I wouldn’t want a roadmap for what my life is going to be like – that would be boring. Even when you do have a plan, you never know how you’re going to like it until you’re in it. Life is straight improv!’ Andre may think that "life is straight improv," but he knows not to show this in how he articulates his imagining of the future to teachers, college administrators, and the keepers of scholarship money. As a noticeboard at Bronx High reminds us: “The American Dream Can Be Achieved Through Education! (Pass With Hard Work).”

One useful way to make sense of this complex reckoning of aspiration and masculinity, I argue, is through a quantum metaphor of personhood. I use a metaphor of quantum personhood to suggest that multiple and seemingly mutually exclusive discourses of aspiration and masculinity may in fact intertwine in the everyday lives of young men at Bronx High. This precarious balancing act speaks to the notion that the recent financial crisis represents a potential ideological as well as structural crisis for neoliberalism – in this case, by subtly challenging the extent to which neoliberal framings of aspiration can or should be accepted by young men as the "natural" foundations for particular imaginings of the future framed in relation to masculinity.

The great meritocracy

When she became British prime Minister in July 2016, the core narrative of Teresa May's premiership was [1]quick to emerge: "I want Britain to be the world's great meritocracy - a country where everyone has a fair chance to go as far as their talent and their hard work will allow." According to this notion of meritocracy, a just and fair society is one in which people's outcomes are governed by two things: their skills, and the effort they are willing to exert.

'Rearing aspirations'

Young people's aspirations (their desires for the future) play a key role in this view of society: if meritocracy requires people to work hard and use their talents, then it also requires that they are motivated to do so. Without 'high aspirations' there is no motivation to strive. For this reason, successive governments in the UK have focused on [2]'raising' young people's aspirations, and this approach is key to oiling the wheels of the great meritocracy.

Neoliberal foundations

The policy focus on 'raising aspirations', and the underlying meritocratic ideal that outcomes are governed by hard work and ability, both have their roots in neoliberal thinking. As an ideology, neoliberalism demands that young people take responsibility for their life outcomes, they exercise free choice in governing those outcomes, and are willing to move freely in order to find the best use for their talents. However, despite their ideological unity there are fundamental tensions between each of these tenets of neoliberal meritocracy and the 'raising aspirations' agenda it has given rise to. These tensions are thrown into stark relief when we consider the experiences of white working class boys – a group [3]singled out by Prime Minister May as demanding particular policy attention. My [4]fieldwork with a group of white working class boys in an outer-urban estate in Manchester aimed to directly explore these tensions.

Mobility vs. identity

Firstly, the imperative to 'raise aspirations' often involves overriding young people's place-based identities. For most young people, attending university and engaging with high-status professional, managerial and technical occupations requires some form of movement away from spatial, social, and cultural familiarities such as family, friends and neighbourhood. However, white working class boys often voice a strong attachment to their locality. Despite this, the neoliberal imperative to be 'footloose' is strongest for those in the most deprived contexts: young people attending school in areas with few highly skilled jobs and no nearby university face the greatest pressure to transcend their place-based identities in order to "get out" and "get on".

'High aspirations' vs. individual choice

Secondly, a narrow definition of 'high aspirations' undermines the sanctity of individual choice. The neoliberal meritocracy holds that young people should be free to decide where they want their talents and hard work to take them. However, in reality the aspiration-raising agenda is highly prescriptive, with "high" aspirations defined narrowly in terms of pursuing higher education or high status professional occupations. This delegitimises aspirations that young people might have for local work, or to enter employment as soon as possible after completing compulsory education – a common thread linking the white working class boys that participated in my research.

'Success for all' vs. opportunities for the few

Thirdly, the neoliberal notion of meritocracy puts forward a vision of "success for all" with unlimited space at the top for people to fill, as long as they have sufficiently high aspirations, hold the requisite talents and are willing to work hard enough. However, this underplays the reality that there are finite positions at the top of the educational...
and occupational hierarchy and that ruthless sorting will necessarily take place. This sorting process favours those from middle class backgrounds, who have access to particular forms of social and cultural capital such as unpaid internship experience.

**A harmless discourse with harmful consequences**

The neoliberal meritocracy is based on principles that are, at face value, laudable and uncontroversial: the importance of seeking opportunities wherever they might lie, the sanctity of young people’s individual choices and the belief that all young people can achieve success. However, the ‘aspiration raising’ agenda which lies at the heart of this neoliberal view of meritocracy sits in stark tension with these underlying principles. It also exposes how an outwardly innocuous discourse can impose particularly negative side effects on the most disadvantaged young people. The aspiration-raising agenda opposes key elements of individual identity, discredits aspirations for material security and family life, and paints a mirage of “success for all” even though educational and labour market outcomes continue to be largely dictated by socioeconomic background. These effects are arguably felt most starkly by white working class boys. They are the group who will benefit least, not most, from the neoliberal notion of meritocracy and its aspiration raising agenda.

Will social media lead to the return of the general intellectual? (2017-05-16 08:00)

In his detailed study of Sartre's rise to prominence as an authoritative public intellectual, Patrick Baert argues that the general intellectualism embodied by Sartre depended upon social conditions which no longer obtain. Such intellectuals “address a wide range of subjects without being experts as such” and speak “at, rather than with, their audience” (pg. 185). In doing so, they depend upon a broad support for intellectual life within society alongside a concentration of cultural and intellectual capital within a small elite. Without the hierarchy this gives rise to, one in which enough of the subordinate are invested, it cannot be tenable to pronounce with such perceived authority across such a broad range of subjects. This hierarchy is manifested both in educational institutions but also in the disciplines from which such general intellectuals emerge. However general intellectuals are not dependent upon these institutions, instead being able to leverage their authority into income from the media (non-fiction, print journalism, broadcast media) and often being able to rely on family wealth. The authority invested in their discipline, alongside “the confidence of the right habitus and an elite education” mean “they can speak to a wide range of social and political issues without being criticised for dilettantism” (pg. 185).

What led to their decline? Baert identifies numerous intellectual factors, including the emergence of theoretical movements which “questioned, if not undermined, the erstwhile superiority of philosophy over other vocabularies” (pg. 185). The professionalisation of the social sciences facilitated the challenge of claims by philosophers about the social world which were effectively just bad sociology. Their expansion meant that there were now subject experts in areas upon which philosophers used to make pronouncements, implicitly or explicitly casting such outpourings of opinion as inadequate. Much as the authority of philosophy was undermined from within, so too was educational authority eroded from without as mass higher education contributed to a softening of the disjunction between educational elite and the population at large. As Baert puts it, “with higher education also comes a growing scepticism towards epistemic and moral authority, an increasing recognition of the fallibility of knowledge and of the existence of alternative perspectives” (pg. 186). The declining acceptability of speaking at such public audiences was compounded by the erosion of the deferential attitudes which had previously characterised the media. Indeed, over time the media came to include subject experts who felt competent challenging the lauded experts.

Baert suggests that social media further intensifies this trend. He recognises that gatekeepers still exist online and that most bloggers have little audience. But nonetheless he argues that “the technology has made a difference, once which surely has further lessened the likelihood of authoritative public intellectuals” (pg. 186-187). In the place of such generalists, we see expert public intellectuals who resemble what Foucault described as the specific intellectual. Such figures “draw on their professional knowledge, whether derived from their research in the social and natural sciences, to engage with wider societal or political issues that go beyond their narrow expertise” (pg. 187). Their capacity to exert an influence rests on “intellect and acquired knowledge, and mastery of the inductive technology (observational skill, statistical methods, lab machinery etc.) to acquire or verify that knowledge” (pg 187-188). Dialogical public intellectuals often draw on the affordances of new technology to “get their message across” and position themselves against those who rely on traditional media, “emphasising how the new technologies permit frequent and intense interaction” (pg. 189). In doing so, they embody a prior trend towards more iterative and dialogical forms of engagement, constructing themselves as learning from their public while the public learn from them.

It’s striking how much less detailed Baert’s description of the latter category is compared to the preceding
two. Indeed the only figure named is Michael Burawoy, in relation to his plea for public sociology rather than his performance of it. This intellectual self-presentation is something which investigation might reveal to be a self-marketing strategy for intellectuals seeking to stake out ground within an increasingly competitive marketplace of ideas, within which social media has removed barriers to entry while also generating a whole new arena of interaction through which to cultivate a relationship with one’s hoped for audience. To be fair to him, Baert perhaps recognises this, stressing that “the situation is often more complex than the bloggers themselves tend to acknowledge” and point out they will often continue to write for newspapers and magazines etc (pg. 189). But how seriously this claim to dialogical interaction should be taken is an empirical question. How much does this interaction shape their views? How much of this interaction do they respond substantively to? How long do they spend each week engaging in such interaction? Without substantive interaction, this dialogical relation is in part imagined, a constructed audience reproduced in the mind and reality through limited interaction with a small subset of it.

My suggestion is that social media is far more hospitable to the conditions of the general intellectual than Baert suggests. The intellectual self-presentation of the dialogical scholar, orientated towards extending their network and cultivating their online audience, represents a strategy conducive to success in the attention economy if they can balance this time-demanding pursuit with the exigencies of their day job. The increasing reliance of journalists, particularly freelancers, on social media for networking and research mean such figures will inevitably be invited to contribute to features and discussions beyond their area of expertise. Even if the dialogic public intellectual has a self-understanding grounded in circumscribed expertise, their digital footprint will inevitably push beyond this and lead others to tempt them still further.

In a way, this post is the latest part of an extended conversation with myself about whether to say ‘yes’ when I get asked to contribute to features on subjects I have opinions about but no expertise. To name some recent examples: selfie culture, conspiracy theories, algorithmic culture, hipsters, the meaning of tolerance. With one exception, I’ve always said ‘no’, largely out of caution. It’s possible there has been a misunderstanding, such that someone infers the existence of a trajectory of research from one blog post on a topic whereas actually that single blog post represents the sum total of my engagement. It’s also possible they’re made in relation to a university affiliation, something which I’m certain is the case with those last minute e-mails explaining the journalist has an imminent deadline and needs an expert quote taking an agreed stance to complete a nearly finished article.

But I suspect something more is going on, in which the price of admission to public platforms has changed from expertise to a capacity for cogency, a quickness in response and the willingness to comment. The invitations are there for generalists emerging from the academy, liable only to grow if they pursue even the most basic strategies of visibility and connection through social media. The rewards are there, in so far as such activity can be plausibly glossed as public engagement potentially generative of impact. The costs potentially faced by generalists are weak from within the academy, liable to be restricted to those who have an extremely high profile and thus counteract the anonymity of abundance or those who inadvertently provoke a controversy with ill-thought out statements on controversial topics that lead them to be held to account. Under such conditions, the reflexivity of the individual intellectual becomes key, something unlikely to change when the academy remains as fragmented as is currently the case.

What it means to be an intellectual is changing in an age of social media and we’ve yet to really get to grips with what this means.

The transformation of academic writing and the challenge of ephemera (2017-05-17 08:00)

What does social media mean for academic writing? Most answers to this question focus on how such platforms might constrain or enable the expression of complex ideas. For instance, we might encounter scepticism that one could express conceptual nuance in 140 characters or an enthusiasm for blogging as offering new ways to explore theoretical questions beyond the confines of the journal article. However these discussions only rarely turn to writing in a more biographical sense, as a recurrent activity which is both personally meaningful and professionally necessary.

Social media is certainly offering us more occasions for writing. The most obvious form this takes is the personal blog, providing one with a platform for exploration whenever we are taken by the feel of an idea worth exploring. However I suspect that many academics who sustain a personal blog do so because it serves a purpose prior to writing, serving as a common-place book or ideas garden. In such cases, the time spent blogging serves as a preparation for writing, even if it is sometimes an oblique one. There is no necessary tension here between blogging and writing, even if sometimes the former can hinder the latter, for instance when the familiarity of the blog draws us away from more formal writing that might not be going well.

What about online writing that doesn’t serve this preparatory function? In the last few weeks, I’ve found myself thinking about the challenge of ephemera increasingly confronting academics. I mean ephemera in the literal sense of “things that exist or are used or enjoyed for only a short time”. Long-established examples include book reviews, newsletter articles and short pieces in magazines. With the growth of social media, we are seeing a rapid expansion in opportunities to produce such ephemera. Multi-author blogs and online magazines will often be sources of invitations to write, as well as offering opportunities for this to qualified parties who are seeking them out. Such writing rarely constitutes much of a commitment in its own terms. One of many reasons I enjoy writing of this sort is that the usual temporal horizon rarely exceeds a few hours work. For instance, it might take a while to read a book for review but not to write the review itself.

To call ephemera a ‘challenge’ may be misleading. In many ways, I remain convinced this is an opportunity, for the enjoyment of intellectual richness and diversity at the level of both individual scholars and scholarly communities. But unlike blogging in the preparatory sense discussed above, it can often take away from time and energy available for ‘real’ writing. The number of opportunities can itself prove problematic, as invitations and inclinations lead to over-commitment in the face of this abundance. For instance, in the next couple of weeks, I’m supposed to write an article for a magazine, a book review for a blog symposium, a blog post for a newspaper and a piece of sociological fiction for a zine. If I’m being realistic, it seems unlikely I’ll complete them all and thus the writing that was chosen rather than invited is likely to fall by the wayside. Though I think it’s a shame that I experience this as in some sense a distraction, despite my enthusiasm for the planned pieces. Much of this is related to journal articles, as things I should be writing but feel little inclination to, leaving it hard not to see a distance from academia as involving a gain rather than a loss of intellectual freedom.

A subsequent conversation made me think back to Richard Rorty’s remark about universities enabling one to “read books and report what one thinks about them”. Is the promise of ephemera a matter of keeping in touch with this aspiration within a university system which militates against its realisation?
Where now for the random probability survey? (2017-05-18 08:00)

Face to face survey fieldwork is widely perceived to be in crisis. Do ever-dwindling response rates signal the end for traditional probability methods, and if so can alternatives such as quota sampling or probability panels take their place? This event explores the options available to research commissioners seeking rigorous findings, and identifies the trade-offs in terms of cost, bias, and timeliness.

Several experts will be sharing their insights:

1. The facts about declining response with Patten Smith, Head of Research Methods Centre at Ipsos MORI and SRA Chair, and colleagues
2. The case for quota sampling with Roger Mortimore, Director of Political Analysis, Ipsos MORI
3. Random probability adaptations with Kirby Swales, Director of the Survey Research Centre at NatCen; Alice Fitzpatrick, Research Director and Joel Williams, Head of Survey Methods, both at Kantar Public
4. The scientific assessment with Patrick Sturgis, Director of the National Centre for Research Methods
5. The clients' perspective with Siobhan Campbell, Head of Central Research Team and Deputy Chief Scientific Advisor at the Department for Transport

The chair will be Ed Dunn, Deputy Director of ONS and Head of Social Survey Division.

Following the event you’re invited to a drinks reception and delegates will also have the option to view the Wellcome Collection galleries which are free of charge and open until 10pm.

[3]mailto:admin@the-sra.org.uk
In December 2016, China published a gender specific textbook for boys, aiming to help male pupils understand their gender roles in society. It emphasizes the issue of masculinity and addresses the question of effeminate boys and the feminization of schooling. The text for boys is a product of an ongoing debate on boys' schooling and a crisis of masculinity for boys in China with which that our chapter on 'Re)masculinizing “Suzhi Jiaoyu” (Education for Quality): Aspirational Values of Modernity in Neoliberal China' critically engages. We argue that the media-generated discourse of failing boys' and the suggested accompanying feminization of schooling as a threat to the nation can be read as a strategic move to (re)masculinize suzhi education to prepare boys (and girls) for a future neoliberal-based economy and nation. This contemporary move draws upon a historical understanding of gender by attempting to promote and modernize, through notions of aspiration and competition, the wu (military and physical) aspect of Chinese masculinity (Louie 2002), alongside a wider Confucian traditional patriarchal order, in the contemporary educational system.

With the globalization of education, policy borrowing is a common social practice. For example, Madsen (2006) found that the education ministries of Eritrea, Nepal, and Denmark were embracing a northern hemisphere notion of cultivating academic skills to ensure economic and social development. Blackmore (2000) identifies that this policy borrowing has a major impact on the development of gender equality, as one of the features of neoliberalism is that it is an individualizing process. This neoliberal individualizing process, which draws upon a narrow definition of aspiration (Stahl 2012), also erases social and cultural explanations that address the impact of material, symbolic, and psychic dimensions of wider historical, socio-economic, and institutional forces. Within a Western context, this is often particularly significant in relation to working-class and minority ethnic communities, while in a Chinese context, questions of differential access to schooling, cultural capital, student performativity, inequality, and social justice are particularly significant in relation to students from rural communities, working-class students in the context of an emerging new urban middle class, and the children of internal migrants. Meanwhile, public discourse has created a major anxiety focusing on a boy crisis:

"The fall behind and failure of boy's education will have a major impact on the individual and the society....The quality of boys' health has not only created a shadow in the future for themselves, but also planted a risk for the quality of future citizens and directly affect the nation's security and competitiveness." ("Boy Crisis" 2012)

Examples such as the above narratives illustrate that suzhi education is imagined as a key (re)masculinizing process, in which embodied gendered (boy) subjects must be disciplined in developing their current and future entrepreneurial selves, while girls' and young women's selves are erased. The disconnection of the media-led "boy discourse" from wider gender relations serves to mask this erasure. An important critique of these media scripts is that implicitly they are involved in making a series of reductive moves, including: writing out Chinese historical understandings of masculinity; erasing current Chinese educational research on the intersections of multiple social inequalities; underplaying complex subject positions inhabited by young people as students; and disconnecting the concept of masculinity from gender relations. Perhaps one of the most pernicious effects of these moves is the media's allocation of a minor role to female students, who are dismissed on the basis of an ascribed over-aspirational schooling performance in competitive examinations (too much masculinity), within a major media narrative that focuses on underperforming male students (too little masculinity). We have found that it is necessary to open up space for discussions on educating boys and girls within a context of nuanced understandings of reconfiguring gender relations, as they are played out between the local and global tensions of future shifting geo-political domains. Of particular significance for future research in Chinese schools will be a critical
examination of how the curriculum, pedagogy, and assessment can be understood as institutional structures that enable spaces for the formation of masculine and feminine subjectivities, placing students at the center of education.

“I Want To Be a Soccer Player or a Mathematician”: Fifth-Grade Black Boys’ Aspirations at a “Neoliberal” Single-Sex School (2017-05-18 20:05)

By Joseph Derrick Nelson

For over a decade, amid widespread neoliberal education reform in the United States, single-sex schools for boys of color have increased in popularity among urban school districts. The growing interest in this school model is generally due to its ability, as perceived by school professionals and policy makers, to ameliorate challenges associated with the socio-emotional development and school success of Black and Latino boys, particularly boys living neighborhoods with concentrated poverty. Rooted in the social and material conditions of urban environments in the U.S., these single-sex learning contexts are more specifically a response to a set of adverse social and academic outcomes associated with boys and men of color (e.g., homicide and incarceration rates, and high school and college retention). In this chapter, I argue that these challenges and outcomes contributed to the onset of a neoliberal education agenda in the United States.

The threat of high social costs tied to urban poverty, specifically for Black and Latino males, has in fact compelled private foundations, community organizations, and school professionals in the U.S. to demand that federal efforts be made to address their distressing school and life outcomes. Fergus, Noguera, and Martin (2014) contend that two neoliberal education policies at the federal level have greatly influenced the expansion of single-sex education for boys of color. First, in 2002, specific amendments to Title IX (i.e., No Child Left Behind Act) were enacted, which explicitly permitted the establishment of single-sex learning contexts (e.g., schools, classrooms, and programs). The second policy, in 2001, was the reauthorization of the Elementary and Secondary Education Act, which introduced a new academic performance measure entitled Adequately Yearly Progress. This measure, in part, called for public records to document academic performance among distinct subgroups of students (e.g., economically and racially marginalized, students with special needs, and by sex and gender). Together, the data
reports associated with these policy changes revealed the high frequency at which boys of color experience academic failure, and struggle socially and emotionally in school.

A seminal longitudinal study of single-sex schools for boys of color in the U.S. (Fergus, et al., 2014) noted that the expressed mission of these institutions was to enhance the educational opportunities for Black and Latino boys, with direct implications for their school performance and life chances. At the root of their mission lies a belief in supporting boys' understandings of "who they are" or "what they believe" is possible in their lives in contrast to their social and academic outcomes, and oftentimes these particular single-sex schools act on this belief through exploring boys' school and life aspirations. This chapter therefore examines the aspirations of low-income fifth-grade Black boys at a single-sex middle school for boys of color in New York City—one of the grade levels at which Black boys in the U.S. tend to make personal decisions related to their long-term school engagement. Many Black boys, for example, eventually succumb to the rigid stereotypes of Black males in the U.S. (i.e., hyper-aggression, anti-intellectualism, and hyper-sexuality) that restricts their academic identities, aspirations, and overall worldview.

In doing so, Black boys' perceptions of their single-sex education and life aspirations were drawn from 45-60 minute interviews with 20, fifth-grade Black boys at the single-sex middle school (4th-8th grade) for Black and Latino boys in New York City. These in-depth interviews were gleaned from a three-year (2013-2016) ethnography of the school site, which is an independent (private) school for academically talented boys of color from lower socioeconomic backgrounds. Iterative analysis of boys' responses unearthed four distinct categories, ordered by salience: (1) "way of being" or "qualities to possess:" (2) profession or career; (3) desired experiences in life; and (4) high school and university of choice. In the chapter, each category will relay the aspirations mentioned, and make explicit connections to Black boys' identities and child development. The goal of this chapter is to showcase boys' school and life aspirations, and explicate how the U.S. neoliberal education agenda influenced boys' aspirations within a distinct single-sex environment in a large urban city. More importantly, the chapter intends to contribute to a "reimagining of Black boyhood" (Dumas & Nelson, 2016) that provides a counter-narrative rooted in asking boys, "who they are, what they think, and what they desire in their lives" (27), and in order to foremost inform "pedagogical and policy interventions that create spaces for Black boys to construct and experience robust childhoods" (27), as well as challenge disparaging discourse associated with Black boys (and men) in the United States. Adapted from: Alexander, P., (2017) "I Want To Be a Soccer Player or a Mathematician": Fifth-Grade Black Boys' Aspirations at a "Neoliberal" Single-Sex School'[1] In Stahl, G., Nelson, D., & Wallace, D. **Public Engagement and Social Media (2017-05-19 08:00)**

There’s a really important piece in the [1]LSE Impact Blog by Philip Moriarty describing his experiences using social media for public engagement. In many ways he has been the embodiment of the engaged academic, driven by a sense of responsibility to communicate scientific knowledge and an enthusiasm for engaging with the public about that knowledge. Not only has he been a prolific blogger and video blogger, he has spent countless hours engaging with these visitors and viewers, producing what he estimates as half a million words of comments and responses in the process. He believed passionately in they importance of this activity, the necessity of academics being willing to directly engage with the public and take advantage of the opportunities for this which social media have opened up.
His reflections on these experiences are essential reading for anyone interested in the future of social media for academics. In retrospect, he believes his efforts achieved virtually nothing. Though there have always been productive exchanges which he cited in the face of scepticism by friends and colleagues about the value of what he was doing, Philip argues that the obstacles to the engagement he pursued have their origin in the platforms themselves. The incentive to build a subscriber base, something which can be enormously profitable on YouTube, incentivises behaviour which has created an environment toxic to the reasoned discussion which public engagement presupposes. To approach it in the open-minded way he did, with a commitment to open debate and a refusal to block or ban, has created all manner of difficulties and his article is an important warning about the difficulties that social media can leave academics exposed to.

While it’s essential that we recognise these dangers, the risk is that it generates a backlash against public engagement through social media. Yet as Philip says, “Productive engagement online is possible”. What's urgently needed is a more nuanced discussion about social media platforms, the opportunities and challenges attached to each, before we advocate public engagement be pursued through them. My recent preoccupation has been on how the way in which we talk about social media, as powerful new ways to get our ideas ‘out there’, can preclude such nuance. If we see social media as helping us scale the walls of the ivory tower, allowing us to form connections with a public that has been kept out by our impenetrable language and paywalled journals, we might get an unpleasant surprise when we encounter disinterest, antipathy or outright hostility in response to our efforts.

This shouldn’t lead us to rethink public engagement, it should lead us to question the assumption that ‘the public’ is present on these platforms waiting for us to engage with them. We need to understand how platforms influence who sees our activity, how they interpret it and how they respond to it. We need to be clear about the particular groups we are trying to engage with, how to develop connections with them and why they will be interested in connecting with us. We need to understand how things can go wrong and we need to develop support mechanisms for those who find themselves in such positions. We need to do this urgently, in order to ensure that the increasing visibility of academic life through social media isn't seized upon to fuel the developing backlash against expertise and experts. This new interface between the university and wider society needs to be carefully managed. There are exciting opportunities here but also profound risks if we fail to meet this challenge.

As one who blogs, tweets and uses FB, this is a very pertinent issue. ‘Public Engagement’ is a laudable aim of course and you are right to raise the assumption that the ‘public’ is present and wants to be engaged. From experience, I can vouch for the ‘echo chamber’ effect and the power of algorithms. I do however have a very small number of people who post on my FB timeline views which are, well, ‘different’. I've recently read about the ‘backfire effect’: "given evidence against their beliefs, people can reject the evidence and believe even more strongly" (Brendan Nyhan and Jason Reifler), and if Jonathan Haidt is correct about moral intuitions and George Lakoff is on 'framing', then we need to learn a set of skills that goes beyond transmitting ‘facts’ through reason and data, beyond explaining/discussing the science or theory. Actually, getting to the ‘discussion’ phase would be great! To what degree are ‘academics' prepared for communicating in this way? I find reflexivity useful, and trying to understand why the other person takes their view...how does my message (which might be fact based) come across? What works in seminars, lectures, tutorials with students who least want to be engaged (in theory at least!) as you know will not wash with for example a white supremacist when discussing gun laws or health inequalities. I know that is an extreme example of an exchange on SM, but it is born of experience.
I wonder if that points to scholarly communication necessarily becoming professionalised e.g. as people get training to learn to deal with backfire effects and to think about framing effects?

Help us forge UK applied sociology (2017-05-19 19:58)

by Nick Fox and Marguerite Regan

For the past 18 months, the British Sociological Association (BSA) group Sociologists outside Academia (SOA) has been focusing on the potential for careers working as applied or practical sociologists, beyond the traditional remits of academia. Sociology is essential not only for understanding the big problems that face society, but also the daily issues that need addressing at work, at home or in the community. We believe sociologists have the concepts, the theories and detailed knowledge of organisations and human interactions that can address such everyday situations.

In the US and elsewhere, sociology has already established a profile for solving these kinds of problems, but much less so in the UK. That’s not to say there aren’t UK sociologists already using their skills and knowledge in applied settings. Some call themselves ‘consulting sociologists’, others run businesses that provide sociological expertise to industry, local government and voluntary organisations. There are also many sociologists working in areas where they bring to bear their knowledge and expertise, even if they don’t have the job title ‘sociologist’. But there is a lack of visibility around this application of sociology outside academia.

Last year an SOA workshop kick-started work on developing a field of applied and practical sociology here in the UK. We considered the kinds of knowledge, skills and models needed to solve the problems that organisations, businesses and the public-sector face, and started to map out how careers as an applied sociologist could pan out. Doing this kind of applied sociological work required specific skills to explore how social and cultural factors link individual experience to everyday events. Generic skills were also needed, including reasoning, communication and collaborative working.

SOA now wants to evolve this work further, by developing a curriculum in applied sociology for final year undergraduate students. This curriculum can not only be offered to universities as an option they might develop for their students, but will also be a way to really clarify the knowledge, concepts, and subject-specific and generic skills that an applied sociologist will need to work effectively in non-academic organisations and settings.

We invite applications from sociologists who would like to join an SOA task and finish group to work on this development of an applied sociology curriculum. We conceptualise a six-month programme, in which the group will meet virtually. At the end, we will seek funding for a public launch of our curriculum for applied sociology.

If you are a sociologist who works predominantly in a non-academic setting, but use your sociological skills and knowledge to inform your work, we would like to hear from you. We would also welcome one or two current
undergraduate or master’s students to join the team, to provide input in terms of what is needed educationally in an undergraduate applied sociology curriculum.

Unfortunately, we cannot pay any fees for this work, and we do not have a budget for face-to-face meeting expenses. This will be a labour of love, for those wanting to flex their sociological imaginations, and due credit will be given to all those involved.

Please contact Nick Fox, SOA co-convenor (n.j.fox@sheffield.ac.uk) for more information about the project and details of how to apply. Applications will close on 19 June 2017 and successful applicants will be notified shortly thereafter.

The Politics of Agency (2017-05-20 08:00)

Ever since I was a philosophy student, I’ve been interested in how we conceptualise individuals and groups. The two are connected in my mind because, if groups are composed of individuals, our concept of *individuals* is going to condition our concept of *groups* and vice versa. However discussion at this level of abstraction can seem remote from the real world. In fact this is what led me away from philosophy and into sociology when I encountered it as a masters student. But this wasn’t my rejecting a focus on *concepts* as much as a desire to see how those concepts operate in the world.

I was thinking of these issues again when reading Jana Bacevic’s [*From Class To Identity*, a study of education reforms in former Yugoslavia. How we conceptualise agency is a key concern of the book from the outset at the level of its *object* (claims about groups are a crucial factor in educational reform) and its *explanatory framework* (claims about groups are crucial to explaining the link between education and conflict). For instance "linear, one dimensional or causal explanations" such as "educational discourses -> exclusionary identities -> war" make (inadequate) assumptions about agency while being "hardly helpful in the understanding of the dynamics between education and conflict" (pg 7). Agency is often left unexamined in such processes, particularly when researchers are examining trends at the macro-social level. From pg 9:

Consider, for instance, practices of military recruitment: going into the army (in countries without mandatory conscription) is frequently the choice of people who come from poor, discriminated or otherwise marginalized backgrounds. Knowing the ubiquitous (and at least partially causal) connection between education, income and social status, it is both reasonable and empirically sustainable to assume that these people also happen to have lower educational levels. But do they go to war *because* they are not educated? Or do they go to war *because* they are poor and marginalized, so enlisting may give them an opportunity to earn (legally or illegally) wealth, security, and status they could otherwise not hope to attain?
If we fail to recognize the role of agency in such dynamics, we render the political opaque. From pg 17-18:

In other words, instead of the teleological understanding of the political dynamics of the Western Balkans as progress towards European integration and away from the communist past, this book will aim to bring the political back into the analysis of policymaking. In this context, the notion of “political” is closest to the meaning in which theorists such as Chantal Mouffe (2005, 1993), Ernesto Laclau (1994), and Jacques Ranciere (e.g. 2010) utilize it (cf. Ruitenberg 2011, 98). This means understanding politics as a place of, and for, the challenging, contestation, transformation and deliberation of different ideologies related to what constitutes a good society, who should rule it, and how its benefits should be distributed.

Treating agency in the abstract is not a retreat from the political but rather a precondition for its adequate exploration. Claims about individuals and groups are fundamentally contestable, if not necessarily contested, constituting vectors through which political struggle is pursued. The success of such strategies leads their advocates to leave the stage, with the results of their scheming appearing to be self-evident and incontestable. But these deploy particular understandings of individuals and groups which exercise a causal influence through their embedding in policy agendas and organisational processes. From pg 19:

Rather than a self understood and "natural" part either of dealing with the communist legacy, or of European integration of the region, then, policy agendas and particular decisions are seen as fundamentally political, in the sense in which they actively engage in creating, constructing, defining, organizing, using and mobilizing, or, alternatively, suppressing, containing, manipulating and controlling particular political and group identities.

We face a challenge in distinguishing between these various claims about agency, the social processes through which they are rendered natural and the real properties and powers of agents in virtue of which they are able to pursue or contest such claims. Abstraction is crucial to meeting this challenge because it allows us to distinguish between individual/groups and the claims made about them. In part this is a matter of theoretical literacy, ensuring we have the vocabulary we need in order to draw these distinctions, preventing us from getting tied up in the discursive contest and letting the world which is being contested slip away from us. But it’s also concerned with the reality of the agents themselves, their characteristics and capacities, the contexts that have shaped them and how they’ve shaped those contexts.

The Liberated Mathematician Stands Up to Gender and Race Inequality in Academia (2017-05-21 08:00)

This week, Dr. Piper Harron, mathematics professor based at the University of Hawaii, and a vocal feminist and supporter of under-represented groups in the academic mathematics community, published a provocative [1]blogpost on the website of the AMS (American Mathematical Society), in which she points out some of the glaring gender and
race inequalities in academia. What do you think happens, when a Black female professor at a 21st century university mentions some of her criticisms of gender inequality? You guessed it. Over the last days, her article has stirred a hurricane of angry backlash - not only from mathematicians but also from wider sources. Piper Harron continues to receive a lot of harassment from alt-right media and trolls.

"Remember that you live in a world where people don’t succeed in a vacuum; most success happens on the backs of others who did not consent. You have no idea how successful you would have been if you were still you, but with an additional marginalization (not white, or not male, or not cis gender, or with a disability, etc).

...

"What can we do? When every role model, when every concept you have, is steeped in sexism, what can you do?"

(read the full blogpost [2]here)

Fight back and support others who do! Sociologists: support mathematicians in their struggle for equality in science!

Grant (2017-05-31 18:25:30)
While I admit there are issues with the demographics in mathematics the reason for the backlash was because of the ‘solution’ she presents. Her solution is white cis gendered males giving up their positions and offers no actual solution to what they should do after the fact. Also she completely throws out the concept of meritocracy and is a racist, and sexist herself. Stating that even if the white candidate was more qualified they should still hire the other person because they’re black and not male.

How can Arendt and Heidegger help us think about distraction? (2017-05-22 08:00)

In his *Debating Humanity*, Daniel Chernilo compares the approaches taken by Martin Heidegger and Hannah Arendt to the question of thinking. Both began with the philosophical tradition’s opposition between thinking and action: in
this sense it implies withdrawal in some sense, relative to a world of activity. However Heidegger saw this thinking as an activity for the chosen few. From pg 80:

For Heidegger, on the contrary, it is defined in terms of the fundamental realisation that thinking is exclusively to do with thinking itself. Thinking is the professional craft of the philosopher; the slow, painful and authoritative listening to the great minds of the past in a process that leads to understand the one idea that a genuine thinker may be able to develop over the course of a lifetime.

This is a radically slow conception of thinking. So slow as to preclude the vast majority of humanity from truly engaging in it. The human disappears in Heidegger’s conception of thought, as the irrelevant site through which thought occurs. His approach to thinking entailed that we leave out the thinker, as thought itself proceeds on a level which is entirely independent of the one who thinks. In contrast, Arendt casts thinking in a thoroughly quotidian frame as “the internal dialogue of a thinking ego that is directed to objects in the world”, ascribing to this “general anthropological capacity of stop and think” the ability of humans “not only to regain some control over their lives but to creatively envisage something that is new” (pg. 80). It is, as Chernilo puts it, "precisely the human quality of thinking that makes thinking worthy of attention" for Ardent (pg. 81).

What caught my imagination about Chernilo’s account is his contrast between the worldliness of Arendt’s conception of thought in contrast to the worldlessness of Heidegger’s. This distinction is one we could usefully apply to contemporary debates on distraction, distinguishing between what I think are two clear tendencies:

- Constructing ‘distraction’ in terms of a lost past, contrasting the attentional commitment presumed to have once been possible with the fragmentation assumed to define the life of the contemporary mind. What was once slow has become fast, what was once quiet has become loud and human beings (or in some cases only ‘millennials’) are seen to have undergone a process of loss.

- Constructing ‘distraction’ as a practical impediment to the capacity to withdraw from the world so as to reflect on it. Distraction is cashed out in terms of specific impediments to thought, inviting us to consider what withdrawal actually means and the socio-temporal conditions which can facilitate it.

If we reject the former in favour of the latter, it no longer seems plausible to frame ‘distraction’ in epochal terms. Perhaps more importantly, we can begin to explore the socio-temporal and socio-technical conditions within which we ‘stop and think’, as well as how we can individually and collectively exercise an influence over them. We must insist on worldliness in how we characterise the life of the mind. Or at the very least I should finally get round to reading [1] this book I’ve intended to for years.

Critical Perspectives in the Age of Big Data (2017-05-22 20:29)

Call for Papers ECREA Symposium Digital Democracy: Critical Perspectives in the Age of Big Data
The coordinates of democracy, civic engagement and political participation are being fundamentally reconfigured in the context of digital media, Big Data and algorithmic culture, and so too are the media industries. This joint conference of the ECREA Communication and Democracy and Media Industries and Cultural Production Sections provides the opportunity to analyse and assess these changes.

The constant need to measure and capture our behavior and attitudes has consequences for our political agency and subjectivities. What do big data and algorithmic culture mean in the context of democratic participation and engagement? What are the consequences of ubiquitous surveillance, preemptive policing and social bots for our understanding of democracy and exercise of civic rights? How do current discussions of political agency in the digital age compare to previous moments of disruption in terms of the introduction of media technologies?

Big data and issues related to algorithmic governance have become a major topic of enquiry in the context of media industries as well. ‘Legacy media’ are trying to respond by integrating new digital services with their existing ones and new data-driven journalistic and media production practices emerge. This presents policy challenges, as, for example, public service media need to adapt to a situation in which data is increasingly commercialized. There are implications too for media workers in this new moment. In this context, we wish to explore issues related to the integration of Big Data and the media industries as well as online production, creativity and digital labour.

During this section conference, we aim to engage with questions concerning datafication, media industries and (digital) democracy through addressing topics such as (but not limited to):

- Political subjectivities and political agency in the age of Big Data
- Political consequences of storing, processing and organizing of data
- Civic engagement and political participation in times of Big Data
- Surveillance and preemptive policing
- Materiality and environmental issues of Big Data and algorithmic culture
- New actors and discourses in the context of datafication
- Democratic potential of Big Data and algorithmic culture
• Algorithmic taste management in the media industries
• Archives and archiving of cultural production and civic engagement
• Media work and labour in datafied media industries
• Data Journalism

A YECREA workshop on "Digital methods for studying algorithms: complicating the socio-technical relation" facilitated by Annette Markham will be arranged for doctoral students, post-docs and early career scholars. The workshop will take place in the afternoon of the 9th November. For more details please check [1]www.sh.se/bigdata

Submission details

Please submit a 300-word abstract for individual proposals

Panel proposals should include a 300-word panel rationale plus individual 200 word abstracts from a minimum of four speakers.

All abstracts for individual as well as panel proposals should be submitted through: [2]https://easychair.org/conferences/?conf=ecreadigdem2017

Deadline for submission is 1 June 2017. Notifications of acceptance will be issued by 15 August 2017.

Registration and Fees

Early bird registration €50 (until 1 September 2017)

Early bird reduced student fee €30 (until 1 September)

Full fees €75

Reduced student fee €40

Organising Committee:

Göran Bolin, Hanne Bruun, David Hesmondhalgh, Anne Kaun, Maria Michalis, Maria Kyriakidou, Fredrik Stiernstedt, Julie Uldam, Julia Velkova

2. [https://easychair.org/conferences/?conf=ecreadigdem2017](https://easychair.org/conferences/?conf=ecreadigdem2017)

Undisciplined Methods at the University of Brighton (2017-05-22 20:30)

Come and join us down by the seaside for two days of methodical undisciplining.
31st May – 1st June at the University of Brighton. We will be investigating alternative ways of creating and understanding with words, images and bodies through workshops and other interventions in the company of artists, performers and academics. There will also be ample time for participants to share and contribute, including a scratch night on the evening of the 31st of May followed by live performances. We have some wonderful contributors, for more information and programme, please visit: [1]http://bit.ly/undisciplinedevent The event is FREE to attend and lunch and refreshments will be provided on both days, but places are limited, please register to secure your place: [2]http://shop.brighton.ac.uk/conferences-and-events/life-health-physical-sciences/events/undisciplined-methods-31-may-to-1-june-2017

We are really pleased to have the following contributors confirmed.

Prof Harriet Hawkins (professor in Geohumanities at Royal Holloway)

Sarah Eliza Kelly (poet, paper artist and PhD student at the Royal College of Art)

Sarah Grange (multi-disciplinary artist)

Miriam Lorenzo (practitioner in performing arts and PhD student at Universidad Rey Juan Carlos)

Dr Helen Johnson (poet and Senior Lecturer at the University of Brighton)

Dr Philippa Lyon (convenor of the Drawing Research Interest Group at the University of Brighton)

Dr Matt Rudkin (University of Brighton)

Organised with support from TECHNE and the University of Brighton Centre for Research in Spatial, Environmental and Cultural Politics.

Do you want your research to produce more impact? (2017-05-22 20:58)
Do you want your research to produce more impact? Many researchers are excited about the potential social media offers for generating impact but with 500 million tweets per day, 3 million blog posts per day and over a billion websites they face an obvious challenge: how do you ensure you are heard above the din? How can you use social media effectively without spending all your time online? How can you use social media as part of a multi-faceted and cost-effective impact strategy?

This workshop offers a practical introduction to these challenges, exploring how to use social media to engage with groups beyond the academy and ensure the impact of research. The session will include an overview of key considerations and group discussion of practical problems. The focus throughout will be on practical and sustainable techniques to build ongoing relations with publics outside the academy.

At the end of the day, participants will have learnt about the opportunities and challenges posed by social media for researcher impact, as well as having designed a bespoke impact strategy relevant to their own projects. Participants also have the option of purchasing five hours of coaching via Skype to support the implementation of this strategy. This includes a free copy of [1]Social Media for Academics.

What will Macron be like in government? (2017-05-23 08:00)

I happened to be reading this page of Yanis Varoufakis' political memoir a few moments before Macron’s near certain victory was announced. From loc 3398:

Emmanuel Macron listened actively and engaged directly, his eyes radiant and ready to display his approval or disagreement. The fact that he had good English and a grasp of macroeconomics as well meant we were soon on the same page regarding Europe’s need for a genuine investment programme that would put its trillions of idle savings to work for the collective good. From my first meeting with him, I regretted dearly that it was Sapin who represented France in the Eurogroup and not Macron. Had they swapped roles, things might have ended up differently.

From loc 4308:

only one Frenchman was lending moral support, Emmanuel Macron, the French economy minister. Having no seat in the Eurogroup himself, he had called to wish me well just as I was stepping into the meeting. During the negotiations over the communiqué he sent me regular requests for updates. What was my feeling? How was the meeting going? I replied that I was prepared to bend over backwards to make a decent communiqué possible. 'The first draft was appalling, let’s hope that they will not prove ridiculously stubborn,’ I texted him. At 10.43 Emmanuel responded, advising me to keep cool and seek a compromise but only if they moved in our direction. At 11.02 I texted back, 'They are pushing us out of the door ... They wanted to roll me into a communiqué that not even Samaras would have signed.'

Elections cannot be allowed to change economic policy (2017-05-24 08:00)

What does it mean for policy to be insulated from politics? That’s the question we ultimately confront when investigating the putative depoliticisation of the economy. Matters which should be publicly resolved, through organised processes of contestation, instead get decided privately. We can cite examples of such transitions, consider whether they embody a broader tendency and offer explanations which account for this direction of travel.

However I’ve often wondered about the micro-social aspects of such a transition, specifically how policy makers make sense of this depoliticisation. Is it a naked power grab? Is it a response to the vagaries of the electorate? Is it an attempt to address issues of socio-economic change which are seen as being impossible to raise with the public? Yanis Varoufakis offers a partial answer to these questions in his gripping accounts of Eurogroup negotiations in his political memoir Adults In The Rooms. From loc 4202
As he spoke, Schäuble directed a piercing look at Sapin. ‘Elections cannot be allowed to change economic policy,’ he began. Greece had obligations that could not be reconsidered until the Greek programme had been completed, as per the agreements between my predecessors and the troika. The fact that the Greek programme could not be completed was apparently of no concern to him. What startled me more than Wolfgang Schäuble’s belief that elections are irrelevant was his total lack of compunction in admitting to this view. His reasoning was simple: if every time one of the nineteen member states changed government the Eurogroup was forced to go back to the drawing board, then its overall economic policies would be derailed. Of course he had a point: democracy had indeed died the moment the Eurogroup acquired the authority to dictate economic policy to member states without anything resembling federal democratic sovereignty.

A conversation with Dave Elder-Vass about the Digital Economy (2017-05-25 08:00)

In this podcast I talk to Dave Elder-Vass about his new book, Profit and Gift in the Digital Economy. Find out more about his research [1]here.

Special Issue on Computational Propaganda and Political Big Data (2017-05-26 08:00)

Call for Papers: Special Issue on Computational Propaganda and Political Big Data

We welcome manuscripts from scholars across the social and computer sciences, and are particularly interested in research from teams of authors from both domains of inquiry. Please submit your papers online to our web-based manuscript submission and peer-review at [1]www.liebertpub.com/manuscript/big[2]http://www.liebertpub.com/manuscript/big.

Computational propaganda—the use of information technologies for political purposes—is on the rise. Many different kinds of political actors use a wide range of computational systems, social media platforms, and big data
analytics to understand and manipulate public opinion. The political use of algorithms over platforms like Twitter and Facebook has received much journalistic attention, but it can be difficult to relate the dissemination of content over social networks to changes in public opinion or voter preference. The firms behind these platforms, however, increasingly acknowledge that politically motivated algorithms and automation can have deleterious outcomes for public life. How does big data get used for political purposes? Can the behavioural impact of politically-motivated big data manipulation be measured? How does the structure, function or affordances of computational propaganda vary across platforms, issue areas, or country cases?

This Big Data special issue on Computational Propaganda and Political Big Data, scheduled for publication in December 2017, aims to advance our understanding of how the Internet can be used to spread propaganda, engage with citizens, and influence political outcomes. We welcome submissions that utilize big data or engage with methodological, theoretical, practical, and ethical issues associated with politicized use of big data. The special issue seeks to describe and discuss:

- the effects of computational propaganda, automated social actors and bots on Internet platforms, Internet users and political processes.
- measurement of the distribution and impact of fake news;
- linking, sharing, and citation structures across large numbers of voters or supporters;
- the political economy of big data mining;
- the political inferences that can be made by reverse engineering de-personalized data, analysing relational data, or assembling shadow profiles on people not represented in political data;
- the path from exposure to computational propaganda to behavioural change;
- the use of the drones, smart city sensor networks, the Internet of Things or proprietary device networks for gathering politically valuable big data.

The editors also seek research on the computationally creative ways of mitigating the impact of computational propaganda: alert systems for identifying algorithmically-based political manipulation or high levels of automation over device networks and social media platforms; big data driven systems for source verification or fact checking that might raise trust in computing; ways of detecting the origins of manipulative content on massive social network platforms.

The deadline for manuscript submission is June 1, 2017. We welcome manuscripts from scholars across the social and computer sciences, and are particularly interested in research from teams of authors from both domains of inquiry. Please submit your papers online to our web-based manuscript submission and peer-review at [4]www.liebertpub.com/manuscript/big<; [5]http://www.liebertpub.com/manuscript/big>.

5. [http://www.liebertpub.com/manuscript/big](http://www.liebertpub.com/manuscript/big)
I serve on the editorial board of several journals. In one such journal, the custom is to circulate all the articles that passed the external review process so that the board can officially give its approval for publication. We get to see the final version, the reviewers’ reports and whatever additional statement the author provided in explaining whatever revisions were made. Usually this is little more than a ritual that marks the board’s taking collective ownership for what is published in the journal.

In one recent case, I remarked of an accepted piece that it could have been written thirty years ago – not because of the references (which were up to date) or the argument (which was at the relevant level of technicality and did not miss out any recent relevant data) – but simply because I seemed to recall that the article’s argument was being made thirty years ago, albeit with different references. Sure enough, one of the my fellow board members whipped out an article written thirty years ago, and even published in the same journal, that fit the bill!

Nevertheless, it looks like we will publish the newer piece because it has successfully passed through the peer review process, and those ‘peers’ are supposedly closer to the article’s topic than we sitting on the editorial board.

So what is going on here?

At one level it looks like a failure to take the full measure of past knowledge prior to embarking on new inquiries. [1]This is how I have written about the phenomenon in defence of more epistemically scrupulous literature reviews. But on further reflection, this apparent collective amnesia on the part of academic knowledge producers, whereby we continue to reinvent the wheel, may be based on an empirically false assumption, namely, that academic knowledge production is cumulative and progressive. On the other hand, if we shifted to a more ‘steady state’ model of knowledge production, then the phenomenon becomes one of a (intergenerational) transfer of ownership over a domain of inquiry from one network of people to another network of people, as reflected in the replacement of key authors and an associated shift in their citation patterns. The knowledge domain itself is settled, but it requires the regular reproduction of the settlement, which is to say, a reproduction of the relevant positons and oppositions as well as standard resolutions.

In the more theoretical reaches of the humanities and social sciences, this may even be the standard mode of academic knowledge production, a mark of ‘scholasticism’. To be sure, one can imagine some intellectually interesting variants. In particular, the transfer of intellectual ownership may occur not through an act of conscious succession (e.g. by students replacing teachers) but through one research network seizing ownership of a field that had been previously defined by another research network. (Continental philosophers often complain about analytic philosophers in this manner.)

I’m still against the phenomenon I’m describing, but at least I think I now understand it better.

The causal powers of media (2017-05-27 08:00)

In The Mediated Construction of Social Reality, Nick Couldry and Andreas Hepp take issue with the primacy of face-to-face interaction that has so often been assumed within social thought. Our embodied interaction is taken to be primary, often assumed to be unmediated, with the mediation of interaction through technology seen as additional to it. From loc 697:

Berger and Luckmann, as was common in sociology for a long time, wrote as if there is first face-to-face 'everyday life' and then there is a supplement: what we do, technologically, to mediate that everyday life. This was hardly true through most of human history, at least since the discovery of writing, but today it would simply be bizarre to ignore how the reality of everyday life is inseparably linked with media, when supermarket checkouts read our credit cards with our personal data, when our everyday communication happens to a high degree via mobile devices, platforms and interactive systems, and when children learn to play through the means of internet-connected tablets. Under these circumstances it makes no sense at all to think of everyday reality as a 'pure experience' that can be contrasted with a (somehow secondary) 'mediated experience'. Everyday reality, from the beginning, is in many respects mediated, which means that the complex social world of interconnections constructed from everyday life's foundations is media-tized.

Much rests on how we conceptualise face-to-face interaction. If we demarcate it as a sphere of interaction which is in some sense given, it obscures the role of media in shaping such interactions and how these interactions in turn contribute to the shaping of media. As they write on loc 632:

We cannot analyse the social world via a simple division between 'pure' face-to-face communication and a separate presentation of the world to us 'through' media. Many of the communicative practices by which we construct our social world are media-related ones. Our daily communication comprises much more than direct face-to-face communication: mediated communication –by television, phones, platforms, apps, etc. –is interwoven with our face-to-face communication in manifold ways. Our face-to-face interaction is continuously interwoven with media-related practices: while we talk to someone, we might check something on our mobile phones, get text messages, refer to various media contents.

The challenge lies in conceptualising such interweaving. If we see interaction as constituted through its mediation, it becomes difficult to unpick how particular interactions might be shaped in particular ways by particular media. This is why I think a causal powers approach to media could be so valuable, even if it's currently rather underdeveloped. This is what I think Couldry and Hepp do, albeit using a different terminology, in their analysis of longer term processes of mediatization. Each of these four changes, discussed on loc 918, make specific claims about how the causal powers of media facilitate the emergence of new dynamics in face-to-face interaction:

But, unimaginably for Schutz or anyone writing up to the 1980s, even our mediated communication can have enhancements which make them closer in specific responses to the face-to-face communication; for instance, video calls with simultaneous text messaging and email stream, enabling two parties to share simultaneous focused attention on the same external communicative stream, that is, an email attachment
or website (contrast the simple phone call). A second deepening is the embedding not just of particular communicative streams into everyday life, but of the inputs from past communications (continuous streams of information from both Mitwelt and Umwelt): think of the feedback loop that operates when, while communicating with somebody else face to face, we are also checking information on earlier interactions on our smartphone, involving other communication partners. We are involved in a ‘multi-level’ construction of the social world, acting on various ‘levels’ of communication at the same time. Third, and also unimaginable to Schutz, is the already discussed continuous availability of media as a current resource in face-to-face communication, from showing pictures on one’s digital device to the use of video even in the most intimate of settings. And fourth, we are living through an integration of all these three shifts into the habits and norms of all communicative behaviour, both face to face and mediated. Increasingly we expect that our comments and gestures can be mediated for future commentary, circulation, etc., unless, that is, we insist they should not be re-circulated (Tomlinson, 2007, pp. 94–123).

Making an Impact with Social Media (2017-05-28 08:00)

Many researchers are excited about the potential social media offers for making an impact with their work. However 500 million tweets per day, 3 million blog posts per day and over a billion websites poses an obvious...
challenge: how can you ensure you are heard above the din? How can social media be used by busy researchers in an effective and efficient way?

This workshop offers a practical introduction to these challenges, exploring how to use social media to engage with groups beyond the academy and ensure the impact of research. The session will include an overview of key considerations and group discussion of practical problems. The focus throughout will be on practical and sustainable techniques to build ongoing relations with publics outside the academy.

At the end of the day, participants will have learnt about the opportunities and challenges posed by social media for researcher impact, as well as having designed a bespoke impact strategy relevant to their own projects. Participants also have the option of purchasing five hours of coaching via Skype to support the implementation of this strategy. This includes a free copy of [1]Social Media for Academics.

Mark Carrigan is a Digital Sociologist and Social Media Consultant. He is Digital Fellow at The Sociological Review and recently completed three years as Research Fellow in the Centre for Social Ontology at the University of Warwick. He is the author of Social Media for Academics, published by Sage in early 2016. This is the first book length guide to the use of social media within higher education and has been widely praised across a diverse range of reviews.

A conversation with Daniel Chernilo about Philosophical Sociology (2017-05-29 08:00)

In this podcast I talk to Daniel Chernilo about philosophical sociology. This is a subject that has long fascinated me as someone who moved from philosophy to sociology as a postgraduate. Find out more in his [1]new book.

Social media offers exciting opportunities for generating impact and communicating research beyond the academy. However, 500 million tweets and 3 million blog posts that are generated in a single day, as well as over a billion websites, pose an obvious challenge: how do you ensure you are heard above the din? How can you help researchers use social media effectively? How can you use social media as part of a multi-faceted and cost-effective impact strategy?

Aimed at research managers, university leaders, and project administrators, this workshop offers a practical introduction to using social media to engage with groups beyond the academy in a way that generates lasting impact. The session includes an overview of key considerations and group discussion of practical problems. The focus throughout will be on practical and sustainable techniques to build ongoing relations with publics outside the academy.

Each participant will have the opportunity to learn about the potential of social media in the current research funding environment, as well as draft an impact strategy relevant to their own projects. In addition to this, participants also have the option to purchase five hours of additional coaching via Skype to support the implementation of this strategy. This includes a free copy of [1]Social Media for Academics.

CfP: Online Othering: Exploring the Dark Side of the Web (2017-05-29 15:07)

Call for Papers – Edited Collection

**Online Othering: Exploring the Dark Side of the Web**

Editors:

Dr Karen Lumsden (Loughborough University) and Dr Emily Harmer (University of Liverpool)

The Internet plays a vital role in many aspects of our social, political and cultural lives and in the early days of its expansion there was much enthusiasm for its potentially transformative role in providing a space for individuals to construct their identities, communicate with others and share ideas and concerns. A perhaps unanticipated consequence of these developments has been the extent to which some individuals and groups have used this freedom to engage in hateful or discriminatory communicative practices online in these loosely regulated spaces, often hiding behind the cloak of anonymity. For instance, women on Twitter and in the public eye have found themselves subject to online harassment, sexism and trolling, while the aftermath of the Brexit vote saw in a rise in reports of hate speech including racism, Islamophobia, and anti-Semitism, in both online and offline contexts.

This edited collection explores the othering and discrimination propagated and encountered by individuals online and in social media contexts and cultures. It problematizes and analyses the dichotomy presented between real and virtual worlds (and spaces) by exploring the motivations behind certain offending and othering behaviours, and the impact this has on the targets of online abuse and hate speech. This includes the extent to which online othering constitutes a new phenomenon and how the motivations for committing forms of cyber-abuse, cyber-hate, and othering relate to the expression of these attitudes and behaviours in the offline context.

It explores the extent to which forms of information and communication technologies facilitate, exacerbate, and/or promote, the enactment of traditional offline offences (such as domestic abuse and stalking). Finally, the collection addresses the role of the police and other agencies in terms of their interventions, and the regulation and governance of virtual space(s).

The edited collection is an output from a one-day conference on **Online Othering** hosted at Loughborough University. We are seeking additional contributions to the volume from scholars and researchers working in disciplines such as sociology, communication and media studies, criminology, political studies and/or gender studies.

Contributions should address the ways in which various groups and identities are subjected to othering in online environments. This can include news websites, social media platforms (i.e. Twitter, Facebook, Instagram, YouTube, etc.), blogs, and forums. We are also interested in contributions which explore othering across multiple contexts.
Potential topics can include, but are not limited to:

- Trolling and gendered online abuse/harassment;
- Cyber-bullying or cyber-stalking;
- Hate crime/speech online;
- Homophobia and/or transphobia;
- Online representations of disability;
- Class bigotry;
- Racism, Islamophobia, or anti-Semitism;
- Sexting and/or revenge pornography;
- Brexit, Trumpism and the rise of the ‘alt-right’.

The edited collection proposal is to be submitted to Palgrave as part of their Cyber-Crime series by Autumn 2017. For accepted submissions, the finalised chapters will need to be received by the end of September 2018.

Submissions:

Interested contributors should email a title, abstract (250 words) and biography (100 words) to both Karen Lumsden [1] K.Lumsden@lboro.ac.uk and Emily Harmer [2] E.Harmer@liverpool.ac.uk by 31 August 2017. Authors will be informed of decisions by 30 September 2017.

First Cambridge summer school in social theory
University of Cambridge, Department of Sociology, 4-6 September 2017
Conveners: Jana Bacevic (University of Cambridge) and Mark Carrigan (The Sociological Review)

Passionate about social theory?

Want to learn more about how it is created?

Interested in seeing theory being made, rather than just read or applied?

Apply to the first Cambridge Summer School in Social Theory, “The Practice of Theory”. Hosted by the Department of Sociology, University of Cambridge, the school aims to bring together researchers interested in the practice of social theory and its relationship with reading, writing, and teaching in the social sciences.

We invite applications from early career researchers (PhD students or postgraduates) involved in theoretical work within or independently of their theses.

This summer school involves graduate students and early-career researchers in a series of thematic sessions that address different aspects of social theory (writing, teaching, translating, presenting, engaging), and gives them an opportunity to develop outputs and interactive tools that can be applied to a variety of contexts – from theses and articles, to teaching and public engagement. Besides an enhanced understanding of social theory, the school aims to equip participants with ideas, as well as practical skills, for applying this knowledge in communication with both academic and non-academic audiences.

The participation fee for the school is 75 GBP (this covers teaching materials, coffee and tea breaks, and lunch on 4 and 5 September). Please note that, in order to secure their place, selected participants will be asked to register and pay the participation fee in full via online transfer by 15 July 2017. We regret that we are not able to offer reimbursements (except in outstanding circumstances) nor guarantee your place if you do not register by this date.
Please contact jb906@cam.ac.uk and mark@markcarrigan.net if you have any questions. We'll be releasing the full programme in the near future and we'll be in a position to advise successful applicants on affordable accommodation in the area.

Please complete your application by June 20th 2017. We'll confirm the success of your application by July 1st.

Apply here: [1]https://goo.gl/forms/CBh5RFTCGEi8rf2L2

What's the difference between academia and politics? (2017-05-30 08:00)

In his wonderful memoir, *Adults In The Room*, Yanis Varoufakis reflects on the frustrations of politics and how they compare to academia. From loc 5504:

Possibly because of my academic background, this was the Brussels experience I least expected and found most frustrating. In academia one gets used to having one's thesis torn apart, sometimes with little decorum; what one never experiences is dead silence, a refusal to engage, a pretence that no thesis has been put forward at all. At a party when you find yourself stuck with a self-centred bore who says what they want to say irrespective of your contribution to the conversation, you can take your glass and disappear to some distant corner of the room. But when your country's recovery depends on the ongoing conversation, when there is no other corner of the room to retreat to, irritation can turn into despair –or fury if you grasp what is really going on: a tactic whose purpose is to nullify anything that is inimical to the troika's power.

I found it fascinating to read this. Since encountering [1]this paper by Richard French a few years ago, I've been interested in the implicit conceptions of politics which animate the publicly-orientated activity of academics. How do they think power works? How do they think problems are solved? How do they think challenges are negotiated? It seems as if Varoufakis's intellectual interests (particularly game theory and political economy) left him well attuned to the dynamics of power but his nostalgia for academia certainly resonates with what French argues here:

Many academics misunderstand public life and the conditions under which policy is made. This article examines misconceptions in three major academic traditions—policy as science (e.g., 'evidence-based policy'), normative political theory, and the mini-public school of deliberative democracy—and argues that the practical implications of each of these traditions are limited by their partial, shallow and etiolated vision of politics. Three constitutive features of public life, competition, publicity and uncertainty, compromise the potential of these traditions to affect in any fundamental way the practice of politics. Dissatisfaction with real existing democracy is not the consequence of some intellectual or moral failure uniquely characteristic of the persona publica, and attempts to reform it are misdirected to the extent that they imagine a better public life modeled on academic ideals.

A BSA Sociology of Education Study Group One-Day Conference in association with the Faculty of Education, Canterbury Christ Church University.

5 July 2017

At
Canterbury Christ Church University, UK

[1]PROGRAMME

This one-day conference, supported by the BSA’s Education Study Group, focuses on current research in the area of white working-class youth’s social mobility, aspirations and education. The conference will explore – and welcomes paper submissions related to - a range of questions, including:

- What are the aspirations of white working-class youth?
- How do educational institutions and practices define, understand and support these?
- What are the perceptions and lived experiences of white working-class youth within education, and how are these shaped by notions of place within and across urban, rural and coastal contexts?
Keynote speakers:

- Dr Nicola Ingram (Lancaster University); and
- Dr Garth Stahl (University of South Australia)

The conference will explore – and welcomes paper submissions related to - a range of questions, including: What are the aspirations of white working-class youth? How do educational institutions and practices define, understand and support these? What are the perceptions and lived experiences of white working-class youth within education, and how are these shaped by notions of place within and across urban, rural and coastal contexts?

We welcome papers from researchers from across the career stage and located in a diverse range of fields. To present, please send an abstract (up to 250 words with your email and institutional affiliation) in Word format to Andrew.Peterson@canterbury.ac.uk. There will be a small registration fee of £55 for attendance (reduced rate of £40 for BSA members). This conference accepts papers in English only.

“Gotta get that laziness out of me”: Negotiating masculine aspirational subjectivities in the transition from school to university in Australia (2017-05-30 14:15)

by Sue Nichols and Garth Stahl

Aspiration is centrally concerned with becoming, and inherently frames the present in terms of the future desired self. The moment at which a young person graduates from school is a nexus point for aspirational narratives. Graduation brings to fruition a goal that was aspired to – the attainment of a secondary school qualification – and at the same time makes not only possible, but necessary, new aspirations. The focus of our study is on the experiences in the post-school year of a cohort of 16 young men living in Australia. The post-school year is the very process of disentangling the self from one of society’s strongest institutions (the school), as well as the learner identities associated with it, which is of interest to us and contributes to our understanding of the post-school year as a space in which different aspirations become possible.

Aspirations, self-making and higher education in the context of neoliberalism

In current neoliberal times, aspirations are constituted according to an ‘ideology of performocracy’ whereby performativity is grounded in a market ideology ‘where it is a winning performance that counts’ and where the daily goal is to “achieve a competitive advantage, whether for individuals in the competition for credentials, jobs, or income” (Brown, 2013, p. 687). Individualism is expressed in terms of a ‘moral system’ (Ball and Olmedo, 2012, p. 5096)
where a lack of success in exploiting such opportunities is constituted as a personal failure rather than a failing of the state (Francis, 2006, p. 191).

**The Life After School Project**

What makes the study of gendered aspirations difficult in the current context is the alignment between the neoliberal discourse of aspiration, and a modernist discourse of gender equity. The former emphasizes individual achievement rather than group membership, and the latter represents the current times as the culmination of progress towards a state of equality between women and men. Both are progress narratives. Gender is implicitly woven into the official discourse of university aspiration through its targeting of specific groups who are seen as representing untapped potential in the population. Amongst this group of 'potential aspirees', young men from working-class backgrounds figure largely.

The *Life After School Project*, funded by the Hawke Research Institute, was a longitudinal multiple-case design study, which followed 16 young men across their first post-school year. Participants were recruited from three high schools (two co-ed and one single-sex) and, while the majority was enrolled at the University of South Australia, there were representatives of all three of the major local universities in the cohort. The cohort included young men from a range of cultural backgrounds including Anglo-European, Asian and Middle-Eastern. Amongst the group were those whose parents had attended university as well as some who were the first in their family to attend higher education.

A salient theme in our research on localized Australian masculinities in relation to aspirations was the notion of egalitarianism. Egalitarianism is defined through a disposition toward 'fitting in' and the Australian national meritocratic rhetoric of a 'fair go' where no one is better than anyone else. This is represented in an easy-going nature of going with the flow, being open, waiting to see what happens, not stressing about it, comparing self with others who take things more seriously. As our participants navigate the shift from high school to university, we consider how adhering to an egalitarian disposition is interwoven with the process of renovating their identities.

In understanding Australian masculinities and relation to aspirations we critically consider how presenting an egalitarian – or 'easy-going' subjectivity – plays role in negotiating aspiration, especially aspirations that are neoliberal. As our participants navigate the shift from high school to university, adhering to and disengaging from an egalitarian disposition is interwoven with the process of renovating their identities. In the *Life After School Project* we see a learner identity responding to pressures and undergoing renovation through a process of transition. Our participants are required to manage a situation in which aspects of the 'easy-going' high school identity may not translate easily into a university context which emphasizes individual responsibility. It would appear full abandonment of the 'easy-going' identity would have negative consequences not only for their learner identities, but also their masculine identity formation.

Blog adapted from:

**Sue Nichols** is an Associate Professor in Education at University of South Australia. Twitter: ([2]@suemarynichols). **Garth Stahl** is a Senior Lecturer in Education at University of South Australia. Twitter: ([3]@GarthStahl).
These are particular versions of 'aspiration' that are tailored and performed (cf. Nichols and Stahl, 2017; Goffman, 1956), reducing the messiness of the future into sound-bytes that are often singular, [...]
their social position within gendered, classed, and racialized structures. Therefore, we propose two moves in order to think and rethink masculinities in neoliberal times:

- Embracing intersectional approaches to researching boys’ engagement with education: This means paying attention to how the interplay between social class, gender and ethnicity shape boys’ identities as well as their actual opportunities. We argue that in order to grasp young people’s identity making fully we tease out how neoliberal policies shape and reconfigure constellations of gender, social class, and ethnicity.

- Sensitivity towards everyday cultural practices in reference to how aspirations are shaped, negotiated, and resisted. This means building on existing research which examines the ways in which boys understand and react to the neo-liberal demand to pursue individualized notions of ‘success’. Such an approach would examine how boys navigate potential tensions between their preferences and dominant discourses in imagining their future lives and their actions in everyday educational situations.

Such theorizations allow us to turn our attention to agency, contestation, and resistance, and, perhaps more importantly, unearth a wider field of potentialities in thinking about young people’s future lives. This appears not only important in relation to researching young men’s aspirations in neo-liberal times, but also for developing pedagogical approaches that support young people in developing their future imaginaries.

By Derron O. Wallace
In post-Brexit Britain, who considers the impact of the aspiration agenda on ethnic minority young people – particularly Black boys? What is the role of Black boys in building the ‘aspiration nation’? Better still, what is the role of the ‘aspiration nation’ in building them? In my book chapter, ‘Aspiration Anxieties: Developing Middle Class Masculinities among Black African Boys in London’, I explore these and related questions, noting the complex influences of migration and motherhood on the formation of Black African boys aspirations. The findings suggest that the transmission of neoliberal logics of aspirations across multiple social institutions can inspire “aspiration anxieties” – what I characterize as an unyielding tension between desire for educational advancement and structural disadvantage, between optimism about occupational development and limited work opportunities, between long-held dreams of social mobility and stalled upward mobility.

It is crucial that we consider future of Black African boys in British society. The most recent British census confirms that for the first time in recent British history, Black Africans outnumber their Black Caribbean counterparts. While immigration from the Caribbean has slowed to a trickle, the movement of economic migrants and refugees from sub-Saharan Africa to Europe has increased considerably. But Black African migration is not only having an impact on wider British society; it is informing British school as well. Whereas Black Africans accounted for 1.7 % of the primary and secondary school populations (ages 5-16) in 2003, they were noted as 3.3 % of the school population in 2013. With the demographic shift in Britain’s Black population comes the increasing cultural influence of Black Africans—in schools, in neighbourhoods, in civil society institutions and the wider society. Yet, studies of Black Africans immigrants in Britain—and Black African boys in particular—remain sparse. The chapter I provide in the anthology, Masculinity and Aspiration in the Era of Neoliberal Education: International Perspectives, adds to the literature and spotlights the complex formulations of aspiration.

Through the ongoing influence of their immigrant mothers, the participants highlighted in the chapter draw on their aspirations as strained resources for the transformations of three sites—the self, the nation and the homeland. Firstly, they sought to develop themselves as middle class men, earning admission to Russell Group universities, securing leadership positions in corporate and civil society, and privileging the institution of marriage as a marker of status and stability. Secondly, they wished to contribute to the economic and moral character of the nation as ‘worthy migrants’—avoiding ‘the dole’ and becoming men of industry to justify their presence in the nation as a credit to the nation, not a liability. Lastly, despite hardships endured during the ‘Great Recession’ and Britain’s prolonged austerity measures, they desired to aid in the transformation of their homelands by providing strong financial support to families overseas.

These aspirations come at a cost. Participants encounter significant psycho-social burdens, or what I refer to as aspiration anxieties, when they realize that the opportunity structures of British society do not privilege their aspirations as necessary for the future of the nation. They wrestle with their limited capacity to pursue their dreams and their mothers’, and internalize such shortcomings, as a personal problem, not a public issue. When participants realize how institutional racism influences university enrolment at places like Oxford and Cambridge, they grapple with abandoning or amending their aspirations. However, the pressure of their mothers’ aspirations pushes them to declare unrealistic aspirations even if they induce considerable stress.

It would be foolhardy to suggest that Black African boys are the only ones who encounter aspiration anxieties. Multiple young people, from a variety of racial and ethnic backgrounds, struggle with aspiration anxieties. Yet, there is very little attention devoted to understanding the challenges that prohibit young people from living out their aspirations and proving themselves as productive citizens. Politician, pundits and parents stand to benefit from listening more attentively to young people, including Black African boys, about how aspirations can function as an ideological whip that constrains their futures.

Wallace, D., (2017) ‘Aspiration Anxieties: Developing Middle-Class Masculinities among Black African boys in...
Universities, neoliberalisation, and the (im)possibility of critique (2017-05-31 08:00)

By Jana Bacevic

Last Friday in April, I was at a conference entitled [1]Universities, neoliberalisation and (in)equality at Goldsmiths, University of London. It was an one-day event featuring presentations and interventions from academics who work on understanding, and criticising, the transformation of working conditions in neoliberal academia. Besides sharing these concerns, attending such events is part of my research: I, in fact, study the critique of neoliberalism in UK higher education.

Why study critique, you may ask? At the present moment, it may appear all the more urgent to study the processes of transformation themselves, especially so that we can figure out what can be done about them. This, however, is precisely the reason: critique is essential to how we understand social processes, in part because it entails a social diagnostic – it tells us what is wrong – and, in part, because it allows us to conceptualise our own agency – what is to be done – about this. However, the link between the two is not necessarily straightforward: first you read some Marx, and then you go and start a revolution. Some would argue that the reading of Marx (what we usually think of as consciousness-raising) is essential part of the process, but there are many variables that intervene between awareness of the unfairness of certain conditions – say, knowing that part-time, low paid teaching work is exploitative – and actually doing something about those conditions, such as organising an occupation. In addition, as virtually everyone from the Frankfurt School onwards had noted, linking these two aspects is complicated by the context of mass consumerism, mass media, and – I would add – mass education. Still, the assumption of an almost direct (what Archer dubbed an ‘[2]hydraulic’) link between knowledge and action still haunts the concept of critique, both as theory and as practice.

In the opening remarks to the conference, Vik Loveday actually zeroed in on this, asking: why is it that there seems to be a burgeoning of critique, but very little resistance? For it is a burgeoning indeed: despite it being my job, even I have issues keeping up to speed with the veritable explosion of the writing that seeks to analyse,
explain, or simply mourn the seemingly inevitable capitulation of universities in the face of neoliberalism. By way of illustration, the Palgrave series in "[3]Critical University Studies" boasts eleven new titles, all published in 2016-7; and this is but one publisher, in English language only.

What can explain the relationship between the relative proliferation of critique, and relative paucity of resistance? This question forms the crux of [4]my thesis: less, however, as an invocation for the need to resist, and more as the querying of the relationship between knowledge – especially as forms of critique, including academic critique – and political agency (I do see political agency on a broader spectrum than the seemingly inexhaustible dichotomy between 'compliance' and 'resistance', but that is another story).

So here's a preliminary hypothesis (H, if you wish): the link between critique and resistance is mediated by the existence of and position in of academic hierarchy. Two presentations I had the opportunity to hear at the conference were very informative in this regard: the first is Loveday's analysis of academics' experience of anxiety, the other was Neyland and Milyaeva's research on the [5]experiences of REF panelists. While there is a shared concern among academics about the neoliberalisation of higher education, what struck me was the pronounced difference in the degree to which two groups express doubts about their own worth as academics, future, and relevance (in colloquial parlance, 'impostor syndrome'). While junior* and relatively precarious academics seem to experience high levels of anxiety in relation to their value as academics, senior* academics who sit on REF panels experience it far less. The difference? Level of seniority and position in decision-making.

Well, you may say, this is obvious – the more established academics are, the more confident they are going to be. However, what varies with levels of seniority is not just confidence and trust in one’s own judgements: it’s the sense of entitlement, the degree to which you feel you deserve to be there (Loveday writes about the classed aspects of the sense of entitlement [6]here). I once overheard someone call it the Business Class Test: the moment you start justifying to yourself flying business class on work trips (unless you’re very old, ill, or incapacitated), is the moment when you will have convinced yourself you deserve this. The issue, however, is not how this impacts travel practices: it’s the effect that the differential sense of entitlement has on the relationship between critique and resistance.

So here's another hypothesis (h1, if you wish). The more precarious your position, the more likely you are to perceive the working conditions as unfair – and, thus, to be critical of the structure of academic hierarchy that enables it. Yet, at the same time, the more junior you are, the more risk voicing that critique – that is, translating it into action – entails. Junior academics often point out that they have to shut up and go on ‘playing the game’: churning out publications (because REF), applying for external funding (because grant capture), and teaching ever-growing numbers of students (because students generate income for the institution). Thus, junior academics may well know everything that is wrong with the academia, but will go on conforming to it in ways that reproduce exactly the conditions they are critical of.

What happens once one ascends to the coveted castle of permanent employment/tenure and membership in research evaluation panels and appointment committees? Well, I’ve only ever been tenure track for a relatively short period of time (having left the job before I found myself justifying flying business class) but here’s an assumption based on anecdotal evidence and other people’s data (h2): you still grin and bear it. You do not, under any circumstances, stop participating in the academic ‘game’ – with the added catch that now you actually believe you deserved your position in it. I’m not saying senior academics are blind to the biases and social inequalities reflected in the academic hierarchy: what I am saying is that it is difficult, if not altogether impossible, to simultaneously be aware of it and continue participating in it (there’s a nod to Sartre’s notion of ‘bad faith’ here, but I unfortunately do not have the time to get into that now). Ever encounter a professor stand up at a public lecture or committee meeting and say "I recognize that I owe my being here to the combined fortunes of inherited social capital, [white] male privilege, and the fact English is my native language"? I didn’t either. If anything, there are disavowals of social privilege (“I come from a working class background”), which, admirable as they may be, unfortunately only serve to justify the hierarchical nature of academia and its selection procedures (“I definitely deserve to be here, because
look at all the odds I had to beat in order to get here in the first place”).

In practice, this leads to the following. Senior academics stay inside the system, and, if they are critical, believe to work **against the system** – for instance, by fighting for their discipline, or protecting junior colleagues, or aiming to make academia that little bit more diverse. In the longer run, however, their participation keeps the system going – the equivalent of carbon offsetting your business class flight; sure, it may help plant trees in Guinea Bissau, but it does not obfuscate the fact you are **flying** in the first place. Junior academics, on the other hand, **contribute through their competition for positions inside the system** – believing that if only they teach enough (perform low-paid work), publish enough (contribute to abundance), or are visible enough (perform unpaid labour of networking on social media, through conferences etc.) – they will get away from precarity, and **then** they can **really** be critical (there’s a nod to Berlant’s *cruel optimism* here that I also unfortunately cannot expand on). Except that, of course, they end up in the position of senior academics, with an added layer of entitlement (because they fought so hard) and an added layer of fear (because no job is really safe in neoliberalism). Thus, **while everyone knows everything is wrong, everyone still plays along**. This [*gamification*] of research, which seems to be the new **mot du jour** in the academia, becomes a stand-in term for the moral economy of justifying one’s own position while participating in the reproduction of the conditions that contribute to its instability.

**Cui bono critique**, in this regard? It depends. If critique is divorced from its capacity to incite political action, there is no reason why it cannot be appropriated – and, correspondingly, commodified – in the broader framework of neoliberal capitalism. It’s already been pointed out that [8] critique sells – and, perhaps less obviously, the critique of neoliberal academia does too. Even if the ever-expanding number of publications on the crisis of the university do not ‘sell’ in the narrow sense of the term, they still contribute to the symbolic economy via accruing prestige (and citation counts!) for their authors. In other words: the critique of neoliberalism in the academia can become part and parcel of the very processes it sets out to criticise. **There is nothing, absolutely nothing, in the content, act, or performance of critique itself that renders it automatically subversive or dangerous to ‘the system’.** Sorry. (If you want to blame me for being a killjoy, note that Boltanski and Chiapello have noted a long time ago in "[9]The New Spirit of Capitalism" that contemporary capitalism grew through the appropriation of the 1968 artistic critique).

Does this mean critique has, as Latour famously suggested, '[10]run out of steam'? If we take the steam engine as a metaphor for the industrial revolution, then the answer may well be yes, and good riddance. Along with other Messianic visions, this may speed up the departure of the Enlightenment’s legacy of pastoral power, reflected – imperfectly, yet unmistakably – in the figure of (organic or avant-garde) ‘public’ intellectual, destined, as he is (for it is always a he) to lead the ‘masses’ to their ultimate salvation. What we may want to do instead is to examine **what promise critique (with a small c) holds** – especially in the age of post-truth, post-facts, Donald Trump, and so on. In this, I am fully in agreement with Latour that it is important to keep tabs on the **difference between matters of fact, and matters of concern**; and, perhaps most disturbingly, think about whether we want to stake out the claim for defining the latter on the monopoly on producing the former.

For getting rid of the veneer of entitlement to critique does not in any way mean abandoning the project of critical examination altogether – but it does, very much so, mean reexamining the positions and perspectives from which it is made. This is the reason why I believe it is so important to **focus on the foundations of epistemic authority**, including that predicated on the assumption of difference between ‘lay’ and academic forms of reflexivity (I’m writing up a paper on this – meanwhile, my presentation on the topic from this year’s BSA conference is [11]here). In other words, in addition to the analysis of threats to critical scholarship that are unequivocally positioned as coming from ‘the outside’, we need to examine what it is about ‘the inside’ – and, particularly, about the boundaries between ‘out’ and ‘in’ – that helps perpetuate the **status quo**. Often, this is the most difficult task of all.
Here’s a comic for the end. In case you don’t know it already, it’s Pearls Before Swine, by the brilliant Stephan Pastis. This should at least brighten your day.

P.S. People often ask me what my recommendations would be. I’m reluctant to give any – the academia is broken, and I am not sure whether fixing it in this form makes any sense. But here’s a few preliminary thoughts:

(a) Stop fetishising the difference between ‘inside’ and ‘outside’. ‘Leaving’ the academia is still framed like some epic sort of failure, which amplifies both the readiness of precarious workforce to sustain truly abominable working conditions just in order to stay “in”, and the anxiety and other mental health issues arising from the possibility of falling “out”. Most people with higher education should be able to do well and thrive in all sorts of jobs; if we didn’t frame tenure as a life-or-death achievement, perhaps fewer would agree to suffer for years in hope of its attainment.

(b) Fight for decent working conditions for contingent faculty. Not everyone needs to have tenure if working part-time (or going in and out) are acceptable career choices that offer a liveable income and a level of social support. This would also help those who want to have children or, god forbid, engage in activities other than the rat race for academic positions.

(c) This doesn’t get emphasised enough, but one of the reasons why people vie for positions in the academia is because at least it offers a degree of intellectual satisfaction, in opposition to what Graeber has termed the ever-growing number of ‘bullshit jobs’. So, one of the ways of making working conditions in the academia more decent is by making working conditions outside of academia more decent – and, perhaps, by decentralising a bit the monopoly on knowledge work that the academia holds. Not, however, in the neoliberal outsourcing/‘creative hubs’ model, which unfortunately mostly serves to generate value for existing centres while further depleting the peripheries.

By "junior" and “senior” I obviously do not mean biological age, but rather status – I am intentionally avoiding denominators such as ‘ECRs’ etc. since I think someone can be in a precarious position whilst not being exactly at the start of their career, and, conversely, someone can be a very early career researcher but have a type of social capital, security, and recognition that are normally associated with ‘later’ career stages.

Happy birthday to us (2017-06-01 08:00)

We’re seven years old today

The Future of Esports: Challenging Work and Gender Issues in the UK’s Professional Computer Gaming Industry (2017-06-02 08:00)

Part of the Sociological Review Research Seminar Series

Funded by The Sociological Review Foundation

Wednesday, 16th August 2017
5106
‘Esports’ or electronic sports is the umbrella term for organised, competitive computer gaming usually played by paid professionals. It is an emerging entertainment market worth an estimated $1.5 billion and is comparable in size to many traditional sports, with audiences of tens, even hundreds, of millions of people worldwide. This one-day symposia seeks to build expertise between early career researchers, professional players, and industry experts who are interested in problematising the social, cultural, and economic dimensions of Esports. Sociological research on Esports has begun to highlight the precarious working conditions, such as temporary contracts and exploitative pay practices that characterise professional computer gaming. Similarly, early research into women and Esports suggests that these competitive gaming environments tend to reproduce ‘hegemonic masculinities’ which can leave women isolated and a structural disadvantage in terms of employment opportunities. At this moment, there is the need to launch fruitful and long-term collaborative research agendas to understand the nature of these issues, and establish the networks needed to bring about practical and sustainable social change. Papers and talks will be presented by academics, organisers, and campaigners, addressing a range of issues from exploitative labour practices, gender representation, social inclusion, as well as the challenges of studying player careers, and the complexities of different Esports ecologies.

Registration is free of charge.

Complimentary lunch and refreshments will be provided. Tickets are limited.

What is it like when interviews go well? (2017-06-03 08:00)

I thought this was a lovely description on pg 8 of [1]Sherry Turkle’s *Reclaiming the Conversation*:

> When things go right, the social scientist’s interview becomes an open, easy exchange. This often happens after trust has been established, when the researcher’s notebook has been closed, when people who only a few minutes earlier had been "participants" in "your study" realize that there is something in this for them. Your question becomes their question as well. A conversation begins.

How would you describe the feeling when interviews go well? Tell us in the comments box and we’ll compile them into another post.

---

Alexandra Ridgway (2017-06-03 10:47:08)
When the conversation hits a rhythm and the words just flow like poetry rather than the response to an interrogation. When I don’t need to ask the questions because they understand my topic so well that they answer everything naturally and somehow through their telling they cover everything comprehensively. When I create a space for them to be the true storytellers and where they can take control of the research and really delve into the layers of their own knowledge. As researchers, one of the best things we can do is to let go and see where the interview takes us, rather than trying to control the process.

Mary (2017-06-03 19:29:21)
Well, having just completed the lonely task of transcribing some interviews, can we really say that they ever go well? The feeling of accomplishment first of all is one great thing about interviews. But then there is also that feeling that you encounter half way through transcription, when you realise “Oh No! This is so not going well”; that point where your interviewee rephrases your entire research question and you wonder whether your previous interviews went well at all. The question that I think we should ask is, what happens when the interview that you thought went well actually didn’t go well. What do you do? Do you painfully extract the answer that you are looking for in that interview (if it’s your only one) or do you carry on searching with modifications here and there in the next interviews. In all honesty however, when an interview goes well, I relax and tentatively look forward to the transcription phase, as I am personally only ever present in the interview at that stage.

Fatema (2017-06-03 23:09:25)
I’m a sociology major, and one of my required courses was Research Methods in Sociology. For an assignment, I had to go out and find someone to interview as part of a fake research study, in order to practice interviewing and data coding skills. So I’m talking to this girl - let’s call her Andrea - and initially it was all awkward introductions and stumbling follow-up questions to her abrupt responses (a mistake on my part because I was asking the wrong sort of questions). And then we found that magical question - you know, the kind that makes people pause; maybe wonder precisely what that question means to THEM, not just what it means. The kind of question that, when they find their answer, they get so excited about it they start going off on tangents. And THAT’S when you discover the true depth and meaning of the lived human experience, which was very much an embodied experience in this particular instance because my questions were about nutrition and maintaining a healthy lifestyle. Mine and Andrea’s Q &A gradually took on the attributes of a typical conversation between friends. She chattered animatedly at times, while at others she would stop, think a little, talk again but slower. And our silences weren’t at all awkward. They were comfortable silences, where neither of us felt any need to fill it with incessant chatter, but really used it to momentarily retreat within our own thoughts, thinking more deeply, more critically about our own lives. I started sharing my own experiences with food and eating healthy, and she’d comment on something I said, or vice versa. Or I’d say something and she’d go, “Oh my god yes! That’s so true...” and off she went to explain in more detail. I forgot I was supposed to be one critically analyzing her responses as a student researcher. My phone was recording her words (with permission), so I felt no need to take notes. I also put away my interview guide after some time because I no longer needed it. That was euphoric. I felt accomplished, like I’d done something right as a human being, to have been able to connected with this complete stranger on such a personal level that she and I were conversing passionately on the topic of scrutiny, without any probing or prompting on my part. Even when she went off on tangents, or I went off on tangents because I’d quickly adopted her style of speech, they were still somehow related. This I only realized retrospectively, since at the time I wasn’t paying any more attention to the assignment, but rather to the highly intriguing conversation. Alas, she had to soon return to her work, and I too, had to leave. I thanked her and left. Suffice to say I received full points on that assignment. But I learned so much about myself that day. Not as a researcher; rather, as just one human being connecting to another. Simply because we’re human, and due to that commonality I was able to develop such a conversational and open relationship in such a short amount of time.
What is a wonk? (2017-06-04 08:00)

What is a wonk? It’s a deceptively simple question which it’s worth us attending to. This is the answer given in an [1]excellent Baffler essay by Emmett Rensin:

What, after all, is a wonk? It is not the same thing as an expert, although those are tedious as well. In a 2011 interview with Newsweek, Ezra Klein explained that he gave Wonkblog its name (and accepted the moniker himself) in an “effort to denote that we’re doing something a lot different by covering Washington through a policy lens.” This fits well with what Baltimore Sun reporter Jon Morgan meant when he [2]introduced the term into American political vernacular back in 1992 by applying it to then-candidates Bill Clinton and Al Gore: they were politicians, to be sure, but ones with a “preference for arcane policy details over back-slapping and baby-kissing.” Jacobin editor-in-chief Bhaskar Sunkara, in a 2013 essay for In These Times, [3]gave the term a less charitable reading, but the essence is the same. The wonk, he wrote, is a “technocrat, obsessed with policy details, bereft of politics, earnestly searching for solutions to the world’s problems through the dialectic of an Excel spreadsheet.”

The wonk is defined “by his devotion to the churning irrelevant details of a game that ordinary people watch to see who actually wins and loses”. Rensin makes a powerful case that the wonk is an over-privileged super fan who wishes nothing ever change lest they have to learn the rules of their favourite game all over again:

It was better before they tried to make it so accessible to newbies, they were better before they went mainstream, the real game got lost when they made all those stupid changes to the rules. The wonk’s essential function in technocracy is to explain (they are always, always explaining): why History is Over, why justice is not possible, why evil can’t win and you can’t win either, how a little fix here and there is all we can really hope for. The futility of all of this does not discourage the wonk. The point is that they’re interested, that they’re searching. They’re more interested and more searching and more obsessed than you’ll ever be, poser.

What defines the wonk is not their concern but their concern for what is. Where are they situated though? My first reaction when reading this essay was to wonder about differentiation, with the wonk living and breathing the reality of the field within which they work. But there have always been people defined by their occupations.

What’s different about the wonk? Does it reflect an increasing degree of cultural autonomy, such that one can have an identity and lifestyle built solely in terms of the field they work within? Or a newfound inclination to so exhaustively construct a sense of identity around work? Or is it something about the intersection between fields, with wonks existing at the interface between politics, media, think tanks and academia? Is wonkish-ness a form of subcultural capital (to use Sarah Thornton’s concept) operating at this intersection? Who values wonkishness other than the wonks themselves? Finally, what are we to make of the rise of the higher education wonk? What does that say about the university system?

Call for papers: Social Media for Learning in HE Conference 2017 (2017-06-05 08:00)

#SocMedHE17: Making an impact  
Tuesday 19th December 2017  
at Sheffield Hallam University

The third social media for learning in HE conference: #SocMedHE17: Making an impact, considers the role that social media - when used in formal and informal learning contexts - can play in addressing the major challenges currently being faced by Higher Education. This conference is accepting submissions from students, academics and managers from national and international HEIs.

The pressures on universities are hard to ignore. In the UK, the introduction of the Teaching Excellence Framework ([1]TEF) and its core metrics – employability, teaching quality and retention – directly influence the direction of university strategies; while the National Student Survey ([2]NSS) reveals specific contextual challenges that demand attention. Internationally, the titles may be different, but the pressures will be similar.  

#SocMedHE17 encourages submissions (research, practice or discussion papers) that provide evidence of educators and students using social media to make a positive impact on these challenges in formal and informal learning environments. Indicative themes include:

- engaging, stimulating and challenging learners
- reaching and engaging different groups of learners
- innovative ways of meeting learning outcomes and enabling learning gain
- enhancing employability outcomes
- building staff and student digital capability and confidence
- scaling up excellence for broader impact

Please visit the conference site: [4]http://go.shu.ac.uk/socmedhe for the full call, booking and planning information, and outputs from the previous SocMedHE conferences.

Follow us on Twitter @SocMedHE for regular updates  
Use #SocMedHE16 to discuss the event.

**Intellectual diversity, disciplines and public engagement (2017-06-06 08:00)**

Why do psychologists and economists enjoy more prominence in the public sphere than sociologists? I’ve been thinking a lot in the last couple of days about what seems to me to be a failure of sociology to value or encourage media engagement by sociologists. It should go without saying that these aren’t the only reasons for the difference in visibility. It’s easier for psychologists and economists to talk confidently in terms of an accumulating body of knowledge because of the relative lack of dissensus within these disciplines. This shouldn’t lead us to minimise the methodological and theoretical disputes which occur within them, as much as to ask why these lead to growth outwards rather than fragmentation inwards? As this thoughtful review of Doug Porpora’s [1]Reconstructing Sociology: The Critical Realist Approach by Priscilla Alderson put it,

> One defence of our discipline’s diversity is that its adaptable rich variety can embrace numerous theories, methods and topics. However, variety does not preclude coherence, and coherence does not demand narrow uniformity – like the neoclassical mantras that now monopolise economics. Medicine is a hugely varied discipline yet, fortunately for society’s healthcare, it is unified by powerful common values and theories about causal realities. By contrast, and unfortunately for society’s wellbeing, sociology is split not only by disagreements but, more seriously, by basic contradictions: positivism accepts pristine independent social facts and aims to discover general laws, whereas interpretivism sees only local contingent variety; statistics and experiments are set against ethnography; sociology is variously taken to be value-free, relativist or a moral endeavour.

In this review, Alderson looks to social theory as something that could bring order to this mess. Not in the sense of imposing unity upon diversity but rather bringing divergent perspectives into the same intellectual space. In this sense, I share her aspiration to “position its many valuable insights and methods in relation to one another, showing how they connect and interact within larger relations, to be more like a coherent jigsaw puzzle in progress, rather than a heap of pieces”. But how else could we pursue this other than through social theory? I wonder if the internal diversity of disciplines and how they conduct external engagement are intrinsically linked?

I’d suggest that *communicating sociological knowledge* – as well as public engagement more broadly, though in a somewhat different way –should not be seen as something extrinsic to sociological inquiry. Instead, it can potentially bring order to the discipline, through forcing its practitioners to develop their capacity to contextualise, translate and apply knowledge outside of the academy. Particularly when the practitioner in question is working beyond their area of immediate expertise and talking in terms of the discipline as a whole. This could then be something that feeds back into the core of the discipline, both directly (research and teaching) and indirectly (their broader influence).
The challenge is how to ensure that we **recognise, value and encourage these capacities**. My hunch is that few of these conditions obtain at present. There's certainly a widespread openness to public sociology but a disconnection between the rhetoric and the reality. Furthermore, working with the media and pursuing visibility seems by many to be seen as vaguely suspicious (or worse). What I'd like to understand is how these practical challenges which can easily be construed as being *outside* the discipline, in fact reproduce core intellectual features which many would see as problematic.

The Personal Morphogenesis of Francis Begbie (2017-06-07 08:00)

Which character from the Irvine Welsh novels has the most depth? While Francis Begbie might have counted as the most vivid, particularly as he was brought to life in Robert Carlyle’s unforgettable performance, I’d be surprised if anyone thought of him as the deepest. Yet that’s the impression one is left with after reading Irvine Welsh’s latest novel *The Blade Artist*. I don’t mean depth in terms of the psychological coherence of the characterisation, as much as that Welsh has clearly spent a great deal of time reflecting on Begbie and what makes him who he is.

*The Blade Artist* begins in California. We meet Jim Begbie, successful artist and devoted husband and father, facing down two men on the beach who threaten his wife and daughters. We soon see the remarkable, most of all happy, life he has built for himself across the Atlantic. A balance which is shattered by the news that his son Sean has...
been murdered, prompting Begbie to fly back to Edinburgh in order to attend the funeral.

His transition is explored through his return to Leith and reacquaintance with the familiar figures from his older life. He finds himself sympathising with the police’s lack of interest in his son Sean’s murder, wondering to himself “Why indulge people like that when they would simply take each other out if you left them to their own devices?”. He’s baffled in the face of old rivals, astonished “now to think that he cared enough about this guy to consider doing that”. In the face of the leering optimism of Sean’s mother that they might reconcile, he can only find her grotesque and idiotic.

Finding his way to an old boxing gym when he returns, he suddenly relates to past acquaintances in a new way. Those who had “been keeping him at arm’s length for years” were now suddenly “welcoming him into the ‘he used to be a bam but he’s alright now’ club”. They had joined this club a long time ago but in finding membership in it, he realises there’s still a place for himself in the city and once more feels at home there.

There were two figures integral to his transformation. The first, John Dick, “believed in him, despite Franco being determined to present all the evidence to the contrary” and ran the prison scheme which “brought in the writers, poets and artists, to see if anything would gel” and “Saw a spark ignite in a few, Frank Begbie being the most unlikely. Amongst these was Melanie, the art therapist, now his wife:

But who was she? She was good and strong and I was bad and weak. That’s what hit me most of all from being around her. That I was weak. The notion was ridiculous; it went against everything I’d come to believe about my persona and image, against the way I’d consciously forged myself over the years. Yet who else but a weak man would spend half his life letting others lock him up like an animal?

I was one of the weakest people on the planet. I had zero control over my darker impulses. Therefore I was constant jail fodder. Some mouthy cunt got wide; they had to be decimated on the spot, and I was back in prison. Thus such nonentities were in total command of my destiny. That was my first major epiphany: I was weak because I wasn’t in control of myself. Melanie was in control of herself. In order to be with somebody like her, to live a free life, not in a tenement or scheme on the breadline, or even a suburb and crippled with a lifetime of debt, I needed a free mind. I had to get control of myself.

His work began to receive recognition when he was granted day release to take part in an exhibition in Edinburgh. It soon won celebrity sponsorship, with prominent figures fixating on his portrayal of the life he had denied the man he killed, as well as his wider tendency to mutilate representations of celebrities in the name of art. Social recognition comes to provide a momentum of its own, sweeping him along in changes that are already underway, not least of all through his relationship with Melanie.

Much of all his change involves a changed relation to himself. Throughout the story, we see Begbie respond to situations through self-restraint, in full awareness of his inclination to lash out. This illustrates the continuity of his character, as the old impulses are marginalised rather than annihilated. What has changed is how he relates to himself and the world, with new concerns leading to an eerie distance from the social world which formed him.

To the outside world, such a change is baffling. It comes from nowhere and invites accusations of insubstantiality. An accusation that has a kernel of truth given that he is still the same person, he simply orientates himself to the world in a different way. But there were moments in his past in which he sought change:

Ah’m just no feelin it, he says, recalling slivers of alcohol-fuelled violence, bonhomie and shagging. Then the long periods in between, of being stuck in a cell. Coming out. A fresh start. A new bird. Big plans.
Resolutions made.

Then another wide cunt. Another incident.

Rather than a life time of stasis being followed by a sudden change, we can instead see his life as involving a whole sequence of impeded attempts to change. Frustrated attempts to become something other than he was, lacking both external guidance and the conditions within which he might enjoy success. For all its flaws as a novel, *The Blade Artist* captures the dynamism inherent in becoming who we are, the constant activity at work even when people fail to outwardly change and the possibility of significant transformation which always remains latent within them. In the end do we really change? *The Blade Artist* would suggest not but does so in a way that reminds us of the limitations of treating fictional portrayals as akin to qualitative data.

Snapping out of Brexit: An invitation to Sociological Citizenship (2017-06-07 08:59)

As the June 8 snap election approaches and variations on the theme of Brexit creep into competing party pledges, a breath-catching pause that allows us to figure out what Brexit really is, how we have reacted to it so far, and how we might think about and act differently towards it this time may prove to be a fruitful endeavour, especially when so much is currently at stake; from the state of the economy, and everything that hinges on it, to the UK’s direction of travel not just politically, but culturally and socially too. This article will offer some critical reflections on all the above, while also arguing that the forthcoming general election offers an opportunity to (re)democratise ourselves, by breaking the mould of the thinking habits and voting behaviours that bring about or fail to stop phenomena like Brexit. Unsurprisingly, the role of sociology as a valuable resource with which to think about and act towards politics will be celebrated and “exported” as a “technology” for thinking about and (re)acting towards the social world around us.

What Brexit really is

While interpretations of Brexit abound, depending on how we think, who we are, and where we situate ourselves on the social ladder and the ideological map, it is important to offer some definitions so that our discussions of Brexit don’t undermine themselves by a lack of clarity. Brexit is hereby understood as the outcome of last year’s referendum which was held by obscuring its actual advisory (consultative) nature and proclaiming it instead to be binding (legislative). This goes against the relevant legislation, democratic processes, and rules which require parliamentary approval before an advisory/consultative referendum can be implemented. The EU Referendum Act is no exception, which leaves little room for doubt about the government’s intention to wilfully deceive voters by making them believe that their decision amounted to an accomplished fact rather than something to be discussed within parliament as is the case in liberal representative democracies like ours. The electorate, in turn, reacted by making a choice expecting its voice to be heard without any interference from the institutional guardians of parliamentary democracy, be it the Parliament itself or the high court.

Brexit and the rise of post-democratic non-citizenship

5114
Seen in this light, Brexit could be likened to a political autoimmune which undermined democratic citizenship by allowing the government and the electorate alike to use the tools, forums, and institutions of democracy (publicity campaigns, voting) against its principles and content (referendum legislation, rational argument), to deliver “the will of the people” at the expense of critical citizenship and formal democratic procedure. In doing so, the government’s authoritarian tendencies and the electorate’s majoritarian impulses were allowed free reign without paying heed to the need for constitutional checks and balances, or sufficient reflective, critical thought. To make matters worse, it could be even argued that we have entered a political phase of “post-democratic non-citizenship”; where referendums can be won by peddling lies, obscuring the facts, disrespecting citizens, insulting our intelligence, undermining our critical faculties, and appealing to our desires and prejudice instead of addressing our reason.

Post-democratic citizenship therefore is “post-democratic” because the software of democracy seems to hold scant appeal for us other than as a tool for getting what we want; thereby transforming democracy into a spectacle where voting becomes a superficial, fast-twitch response to real, deep grievances by allowing ourselves to be misled instead of leading ourselves to the wisdom of our own mind. And it is a form of “non-citizenship” because it reveals an estranged, distanced, push-button mentality that only cares for individual preferences rather than the public good. In the Classical Athenian lexicon, we would simply be dismissed as idiōtes who are private, circumspect, and withdrawn when we should be alert, critical, and publicly involved demokrātes. Liberal democracies may indeed be reduced to illiberal bureaucracies when they resemble awkward, dispiriting, and distant institutions that rule from afar but, equally, democracies are not worth being referred to as such if its citizens do not deliberate, participate, or uphold the principles and values of the political arrangements they lead their lives by.

How to fight Brexit with Sociology

Brexit may seem like a foregone conclusion by now, especially as the two main contending parties insist on treating it this way, despite the fact that there is still nothing legally binding about it. [1] Article 50 can be revoked, making it obvious that political cost currently overrides political will. It therefore seems preferable to pretend that the referendum result seals the deal than to admit that the electorate was lied to, that the referendum was never supposed to be binding, and that it might be sensible to ask people to vote again; provided that this time they are given all the information necessary for making an informed decision, and that enough of us vote for the result to matter as the decision of an actual supermajority, [2] as referendum legislation dictates, instead of “the will” of just a fraction of the voting public.

Since there is little indication that the government, the opposition, and the electorate have any appetite for such legalistic pedantry however, it seems like the only way to mitigate the cyclonic consequences of Brexit is to act against it with our vote by withdrawing our support for any party that colluded with and cowed submissively to the government’s dishonest politics of fudge and dodge. This would require us not just to peruse party manifestos but to judge them against the parties’ performance during and after Brexit. If they only bowed to their audience and self-interest then, what makes them reliable now? Voting decisions matter enormously, but what matters most is how we arrive at them. Are we simply toeing the party line as an oath of allegiance or are we sensible enough to vote against our preferences by acting towards the common good?

While it is always admirable to vote for who we believe in, it is infinitely more important to vote for what we truly believe in. This, however, requires us to look beyond the end of our nose when making decisions whose gravity urges
us to sacrifice ideological purity for social justice, by subjecting our will to critical judgement in order to ensure that we defend broader principles and values instead of merely serving parties or nourishing pet dogmas. Sociologists are no strangers to such (self-) reflective, critical thinking harsh though it may seem. In fact, that’s what we (proclaim to) do in our scholarly and public lives. The importance of such an irreverent attitude towards (even) our very own thinking, however, goes beyond mere voting decisions and spells an altogether different way in which we can "do" citizenship, especially in times of Brexit as we shall see in turn.

What has sociology got to do with it all?

Thinking sociologically about Brexit involves understanding Brexit as something more than Brexit, but as the flare-up that resulted from multiple igniting sparks that were overlooked until everything went up in flames. Apart from the result of a referendum, or a barometer of social attitudes towards immigration, the professionalisation of politics, the perceived lack of sovereignty, and the intensifying pressures of social inequality, Brexit can also be seen as a case study in how we think about and how we act towards politics more broadly; signifying, as is argued here, a change in and an affront to citizenship for reasons that have been outlined in previous sections of this article. If this diagnosis is correct, it seems like the best way to fight Brexit is not by fighting Brexit per se but by re-democratising ourselves first. This, however, involves treating democracy not as a conduit of public emotion, but as a form of government by and through discussion, participation, and voting only after due deliberation with our fellow-citizens.

To think with sociology about politics therefore, offers an opportunity to drag ourselves out of the slipstream of populist politics by becoming thoughtful, curious, critical, reflective, and engaged citizens instead of passive consumers of catchy slogans and ideological artefacts. Yet "sociological citizenship" involves even more than that. It invites us not just to think critically but self-subversively too, so that we can be(come) sympathetic citizens of the world who resist their immediate self-interest or punitive passions in favour of the general public good; relying on ‘vigour of thought' and ‘thoughtful deed' as W.E.B Du Bois put it. Sociology, after all, is not merely the study of 'how society is possible’ but of how it can become possible as a great deliberative assembly through the medium of active citizenship. Thinking and acting like sociologists can therefore help us vote in a way that will not just stop Brexit but also challenge the (populist) logic that brought it about with the government and the electorate's blessing.

Above all, thinking, acting and voting sociologically against Brexit teaches us how to listen and debate, thereby reintroducing politics as a quest for finding common ground through conflict but without violence while committing to 'let the ears of a guilty people tingle with truth [...] in this dreary day when human brotherhood is mockery and a snare', as Du Bois urged us to do with characteristic conviction, determination, and grace too. As a sociologist-criminologist and a citizen these are the words I live and work by, leaving me no other choice but to share them with you as a prime example of the gift that sociological citizenship can be, only if we let it ‘spring’ to ‘reap the harvest wonderful'.

The fortress city scenario (2017-06-08 08:00)

A disturbing scenario from John Urry’s [1]What is the Future? From loc 2996-3045:

The final scenario involves the development of the Fortress City. Rich societies break away from the poorer into fortified enclaves. Those able to live in gated and armed encampments would do so, with much privatizing of what were, in many societies, public or collective functions (Davis 2000; Graham 2011; Leichenko, Thomas, Baines 2010: 142). Outside the enclaves would be ‘wild zones’ which the powerful would pass through as fast as possible. Systems of long-range mobility would only be available for the super-rich. Bauman maintains that one key technique of power is: ‘escape, slippage, elision and avoidance, the effective rejection of any territorial confinement’ – to have the power to avoid being trapped by
others, to escape into 'sheer inaccessibility' (2000: 11). There are many examples of such elites exiting from where obligations would be extracted. The elite, we can suggest, are increasingly 'absentee landlords' with potential for exit mobility, if and when the 'going gets tough' (Bauman 2000: 13; Urry 2014a).

This future involves 'fortressed' walled cities and an extensive 'security-ization' of populations, similar in some ways to cities in the medieval period which provided protection against raiders, invaders and diseases. Those outside the enclaves would be unable or unwilling to travel far. Long-distance travel would be risky and probably only undertaken if people or machines were armed. The rich would mainly travel in the air in armed helicopters or light aircraft, a pattern already prefigured in contemporary Sao Paulo, as noted above (Budd 2013; Cwerner 2009). Futurists Gallopin, Hammond, Raskin and Swart thus argued: 'the elite retreat to protected enclaves, mostly in historically rich nations, but in favoured enclaves in poor nations, as well ... Pollution is also exported outside the enclaves, contributing to the extreme environmental deterioration induced by the unsustainable practices of the desperately poor and by the extraction of resources for the wealthy' (1997: 34).

Such an energy-and knowledge-starved city would entail falling standards of living, a greater focus upon the 'products' of the increasingly privatized security industry, probable re-localization of mobility patterns, towns and cities built for visitors deteriorating into ghost towns, and an increasing frequency of resource-related 'new wars' (Kaldor, Karl, Said 2007). These would involve private mercenaries as well as statis military forces; de-professionalized armies (sometimes made up of 'boys'); the use of cheap weapons bought through the market/ internet; an asymmetry of military force with no fixed 'fronts' or treaties and peace processes; the military targeting of civilians through, inter alia, suicide bombing and drone attacks; the role of warlords combining entrepreneurial and military skills; and the tendency for such wars to last interminable periods of time. Lives in the Fortress City would be conducted with the continuous spectre of warfare, the militarization of young men and the raping of women and girls as constant threats to a decent life.

This is a 'neo-Mediaevalist' vision of cities of the future. As in the Middle Ages, there would be little democracy, limited state power to govern legitimately, many non-state bodies with a mix of military and ideological powers, much illegal movement of peoples across borders, various empires, many new wars and intense conflict over scarce resources. City lives would be as in Hobbes’ Leviathan: ‘solitary, poor, nasty, brutish, and short’. Lovelock points to the 'peaking' of oil, gas and water, as well as 'western life' more generally. Shortages will make economic production and social lives more local than appeared likely during the increasingly mobile twentieth century (see Chapter 3 above).
This chapter analyses how a neoliberal masculine logic permeates discussion of Australia's "education industry" and associated skilled migration program. Indian students play a key role in this. It is generally agreed that the initial phenomenal growth in terms of their enrolment numbers (2002-2009) was fueled by the opportunity to apply for permanent residency after completion of studies. After a series of violent and racist attacks on Indian students in 2009 and the closing of a significant number of substandard colleges which primarily catered to Indian students, enrolments declined rapidly.

In particular the attacks led to a fierce discussion in Australian media whether or not they were in fact racist in nature and whether or not Australia was a racist nation. Within this discussion, the validity of Indian students' claims of racism was gradually mitigated; the attacks were construed as opportunistic as Indian students were considered "soft targets" or "weak prey" whose own behavior (traveling home late at night from poorly paying part-time jobs, drawing attention to themselves by talking loudly on their phones, living in far-off and low-rent neighborhoods) contributed to their vulnerability to violent crime. It was further highlighted that the majority of Indian students were enrolled in so-called "dodgy" colleges that primarily to the desire for PR.

In mainstream media these developments were framed in a particular language that linked the predicaments of (male) Indian students with "industry"-related concerns that spoke to even larger, nation-spanning ones. "Them" being male played a significant factor in this as it allowed their intentions to be contrasted with the inherently neoliberal and deeply masculine logic (and intentions) of the skilled migration program and education industry. The neoliberal logic that underpins this process of othering is fueled by conflicting notions of masculinity that reference and rest on assumptions about the self and the other.

The self here needs to be thought of as a shorthand for the interplay between the Australian economy, its cities and "local" job markets, as well as its skilled migration program (SMP) and "education industry." Australia's SMP is the product of concerns over an ageing population, competitiveness within the (Asia-Pacific) region, and skill shortages locally. The country's SMP directly sources a significant portion of its "new" migrants from the large number of international students who study in Australia. With their ever-growing numbers Indian students then form a highly visible presence in Australian cities, putting pressure on local infrastructure and posing challenges to the multicultural makeup. Meanwhile Australian universities have become highly dependent on the fees brought in by international students and the "education industry" itself has become vitally important source of jobs and revenue for local economies.

The other here is the quintessential international/Indian student who comes to Australia on a temporary basis but might stay on permanently. While the Australian self here references systems or programs that are by and large guided by neoliberal market principles, controlled/adjusted by policy and speak to national interests and concerns, the other is an unpredictable individual (an Indian student migrant) whose intentions might not always run in tandem with what the system or a particular program is supposed to "produce."

Although Indian students were initially welcomed as international students and potential migrants they were gradually reduced to an essentialized unwanted other. "Them" being male played a significant factor in this as it allowed their intentions to be contrasted with the inherently neoliberal and deeply masculine logic (and intentions) of the skilled migration program and education industry. As such Indian students came to stand for the failure of the skilled migration program and education industry to generate the right kind of student migrant and, eventually,
permanent resident or even citizen.

Making an Impact with Social Media, July 5th in Manchester (2017-06-09 00:29)
Social media offers for exciting opportunities for generating impact and communicating research beyond the academy. However, 500 million tweets and 3 million blog posts that are generated in a single day, as well as over a billion websites, pose an obvious challenge: how do you ensure you are heard above the din? How can you help researchers use social media effectively? How can you use social media as part of a multi-faceted and cost-effective impact strategy?

Aimed at academic researchers, research managers, university leaders, and project administrators, this workshop offers a practical introduction to using social media to engage with groups beyond the academy in a way that generates lasting impact. The session includes an overview of key considerations and group discussion of practical problems. The focus throughout will be on practical and sustainable techniques to build ongoing relations with publics outside the academy.

Each participant will have the opportunity to learn about the potential of social media in the current research funding environment, as well as draft an impact strategy relevant to their own projects. In addition to this, participants also have the option to purchase five hours of additional coaching via Skype to support the implementation of this strategy. This includes a free copy of [1]Social Media for Academics.

Mark Carrigan is a Digital Sociologist and Social Media Consultant. He is Digital Fellow at The Sociological Review and recently completed three years as Research Fellow in the Centre for Social Ontology at the University of Warwick. He is the author of Social Media for Academics, published by Sage in early 2016. This is the first book length guide to the use of social media within higher education and has been widely praised across a diverse range of reviews.

Call for Participants: The Practice of Social Theory

The Practice of Social Theory

University of Cambridge, Department of Sociology
4-6 September 2017

Conveners: Jana Bacevic (University of Cambridge) and Mark Carrigan (The Sociological Review)
Passionate about social theory? Want to learn more about how it is created? Interested in seeing theory being made, rather than just read or applied?

Apply to the first Cambridge Summer School in Social Theory, "The Practice of Theory". Hosted by the Department of Sociology, University of Cambridge, the school aims to bring together researchers interested in the practice of social theory and its relationship with reading, writing, and teaching in the social sciences.

We invite applications from early career researchers (PhD students or postgraduates) involved in theoretical work within or independently of their theses.

This summer school involves graduate students and early-career researchers in a series of thematic sessions that address different aspects of social theory (writing, teaching, translating, presenting, engaging), and gives them an opportunity to develop outputs and interactive tools that can be applied to a variety of contexts – from theses and articles, to teaching and public engagement. Besides an enhanced understanding of social theory, the school aims to equip participants with ideas, as well as practical skills, for applying this knowledge in communication with both academic and non-academic audiences.

*Speakers include Nicholas Gane (Warwick), Linsey McGoey (Essex), and Simon Susen (City).*

The participation fee for the school is 75 GBP (this covers teaching materials, coffee and tea breaks, and lunch on 4 and 5 September). Please note that, in order to secure their place, selected participants will be asked to register and pay the participation fee in full via online transfer by 15 July 2017. We regret that we are not able to offer reimbursements (except in outstanding circumstances) nor guarantee your place if you do not register by this date.

Please contact [1]jb906@cam.ac.uk and [2]mark@markcarrigan.net if you have any questions. We'll be releasing the full programme in the near future and we'll be in a position to advise successful applicants on affordable accommodation in the area.

Please complete your application by June 20th 2017. We'll confirm the success of your application by July 1st.

*Apply here:* [3]https://goo.gl/forms/CBh5RFTCGEi8r f2L2
The Political Economy of Student Housing (2017-06-09 08:00)

In the last few years, I’ve been intrigued by how changes in student housing track a broader transformation of higher education. The obvious change in the UK has been in student numbers, with major implications for the demographics of cities with major universities:

Between 1994 and 2012 the number of undergraduates in Britain grew by 45%, to 1.8m. Until recently, the housing stock changed little to accommodate them. Students clustered in neighbourhoods near universities, typically filling up old terraced houses. In Leeds, they spent much of the 2000s gradually spreading from old back-to-back houses in Hyde Park, which is near the two main universities’ campuses, into Headingley, a more middle-class district farther from the centre.

However since 2007, the number of students living in private halls of residence has more than doubled to 102,000. It has been a sustained area of growth for investors since the financial crisis, at a time when comparable investment categories have decelerated, with private sector investment estimated to have grown from £350m in 2009 to £2.1 billion in 2013. The growth since then has been even more substantial:

The UK purpose-built student accommodation market is estimated by Knight Frank to be worth £46bn and new developments completed this year are expected to total a record £4.7bn.

Last year, £3.1bn worth of student halls were sold – more than double the amount traded in 2013 and 2014. All five of the biggest deals – worth a combined £1.5bn – were sold to overseas investors. The largest transaction was the purchase by the property arm of Temasek, the Singapore state investment fund, of a portfolio of 25 student buildings in several cities including London and Manchester.

There are many factors which seem to be at work here:

- opening up a new category of luxury accommodation for students whose ‘needs’ were unmet by previous housing regimes
- depending on specific factors of the student experience (possible atomisation, relative privilege, informational disadvantage etc) to extract higher rents than would be possible through the wider lettings market
• student numbers increasing faster than universities can invest in infrastructure to house them
• the ‘unbundling’ of the university and the opportunities created for private providers when they lessen their commitment to student services
• the opportunity hoarding of the middle class under conditions of austerity & the transfer of parental resources into ensuring an effective student experience
• the appeal of a relatively buoyant asset class in a wider context of declining returns

However the one which interests me most is what this suggests about the future of higher education. It is being evaluated as one of the most reliable institutional areas in which to invest, in the sense that student numbers are expected to grow. But what are the aggregate consequences of these changes likely to be for higher education? Could this emerging political economy of student housing generate unintended consequences which act back on the sector itself?

Gender, sexuality and digital culture: A half day symposium at City, University of London, 20 June 2017 (2017-06-10 08:00)

GENDER, SEXUALITY AND DIGITAL CULTURE

A half day symposium at City, University of London, University Building B200, Northampton Square, EC1V 0HB

June 20th 2.00-7.30pm /// Wine reception @7.30PM

Keynotes: Winnie M Li and Rowan Ellis

New and established scholars and activists reflect on old questions and new challenges. Please join us for an afternoon of talks and discussion at City, in central London, to be followed by drinks and refreshments.

Sue Jackson (VUW, New Zealand) talks about her work with girls on feminism

Roisin Ryan Flood (Essex) reports on her interviews about internet dating

Josie Reade (RMIT, Australia) opens up new ways of thinking about ‘fitspo’

Maree Martinussen (Auckland, New Zealand) explores practices of intimacy in female friendships.
Anastasia Powell (RMIT, Australia) talks about her new book Sexual Violence in a Digital Age

Laura Thompson (City, London) explores sexual harassment on mobile dating apps

Celiya Koster (activist/student, London) discusses co-founding a new intersectional feminist magazine, Typical Girls

We are delighted that the symposium will be followed by two very special keynote presentations by Winnie M Li and Rowan Ellis (6-7.30PM)

Winnie M Li, author, activist, researcher (LSE) will talk about her extraordinary new novel Dark Chapter, discussing ‘Narrating Lived Experiences of Sexual Violence through Crime Fiction’
@Winniemli

Rowan Ellis (‘queer feminist geek’) will discuss her phenomenal campaign to get YouTube to lift their LGBTQ+ restrictions
@HeyRowanEllis

Followed by a wine reception at 7.30PM

Free and open to all but booking essential. Book here:

What would a materialist phenomenology of ‘post-truth’ look like? (2017-06-11 08:00)

That’s the question I’ve been asking myself when reading through two books by NickCouldry in which he develops a materialist phenomenological approach to understanding social reality. The first is The Mediated Construction of Social Reality (with Andreas Hepp) and the second is Media, Society, World. It’s in the latter book that he considers the representational power of media. From loc 683:

Media institutions, indeed all media producers, make representations: they re-present worlds (possible, imaginary, desirable, actual). Media make truth claims, explicit or implicit: the gaps and repetitions in media representations, if systematic enough, can distort people’s sense of what there is to see in the social and political domains.

There is a political economy underpinning this, in terms of the capacity to make such representations and the gains accruing from this capacity. The common reference points which accumulate as a consequence serve a broader economic purpose. From loc 701:
However, if basic consumer demand—for fashion, music, sport—is to be sustained at all, it requires ‘the media’ to provide common reference points towards which we turn to see what’s going on, what’s cool.

The interests and influence in play here have been crucial to the unfolding of late modernity. Media has been a site through which power has consolidated. What we are seeing with ‘post-truth’ is a deconsolidatiob of this apparatus, taking place at a number of different levels. From loc 886:

Representations matter. Representations are a material site for the exercise of, and struggle over, power. Put most simply, our sense of ‘what there is’ is always the result of social and political struggle, always a site where power has been at work. 150 But fully grasping this in relation to media is difficult: because the role of media institutions is to tell us ‘what there is’—or at least what there is that is ‘new’—media’s work involves covering over its daily entanglement in that site of power. Media aim to focus populations’ attention in a particular direction, on common sites of social and political knowledge. Media institutions’ embedding as the central focus of modern societies is the result of a history of institutional struggle that is becoming more, not less, intense in the digital media era. It is essential to deconstruct the apparently natural media ‘order’ of contemporary societies.

Call for Participants: The Practice of Social Theory (2017-06-12 08:00)

First Cambridge summer school in social theory
University of Cambridge, Department of Sociology, 4-6 September 2017
Conveners: Jana Bacevic (University of Cambridge) and Mark Carrigan (The Sociological Review)

Passionate about social theory?

Want to learn more about how it is created?

How Democracy Can Generate Progressive Collective Intelligence in Two Steps (2017-06-12 11:23)

First, citizens don’t vote for a representative simply based on who they judge as best matching their interests, but rather on who they judge as best matching their interests given the candidate’s chances of winning in the election.

Second, the successful candidate – the people’s elected representative – doesn’t simply vote for the policy that best matches his/her constituency’s interests, but rather for the policy that best matches the constituency’s interests given the chances of the policy winning in a legislative vote.

If both the people and their elected representatives followed the above strategy, social progress would be made, albeit not at the pace that anyone would find especially desirable yet that all could tolerate. To my mind, that is an optimal outcome for a democracy that respects the judgemental capacity of its individual members.

Note that in both steps, we’re talking about the voter or the representative functioning as a reflexive agent in his/her judgement. You might think of this as a ‘populist’ version of Fabian socialism – given that the original Fabians were technocrats – which works in a society that is at once smart and patient, two qualities normally seen as opposed to each other.
Call for Chapters: Bourdieu, curriculum studies, education policy and reform (2017-06-12 16:32)

Co-editors James Albright (The University of Newcastle, Australia) and Shaun Rawolle (Deakin University)

Revisiting the *Principes pour une réflexion sur les contenus d'enseignement* (Bourdieu, 1989)

Call for chapters

This proposed book aims to bring together scholars that take as their starting point Bourdieu's (1984) theoretical and empirical contributions to curriculum studies and his pragmatic recommendations for education policy and reform.

In 1984, responding to Mitterrand's (the first socialist president of France's Fifth Republic) commissioned reports on the future of education, Bourdieu led colleagues (comprised of leading College de France professors) to author a set of guiding principles for educational change. First published as *Proposition pour l'enseignement de l'avenir* (College de France, 1985) and later as the *Principes pour une réflexion sur les contenus d'enseignement* (Bourdieu, 1989), the principles set out a rational basis to restructure the curricular division of knowledge; provide a new definition of the transmission of knowledge; eliminate outdated or outmoded notions; and introduce 'new knowledge that stems from research as well as economic, technical and social changes' (Bourdieu, 1989: 309).

At the core of these recommendations was the call for a curriculum that focused on the 'genealogy of concepts, ways of thinking, mental structures...to give everyone the means to re-appropriate the structures of their own thinking' (Grenfell and James, 2004: 75). Although *Principes pour une réflexion sur les contenus d'enseignement* (Bourdieu, 1989) may have had little lasting effect on the course of French educational policy, many aspects of Bourdieu's principles for reflecting on the curriculum resonate with contemporary theoretical and pragmatic issues in the fields of curriculum studies and development.

This collection reflects on the relevance of Bourdieu and colleagues' call for a revisioning of the curriculum, amid growing concern around the direction that education reform has subsequently taken. It invites a reconsideration of paths not taken and to draw on a broadened sociological imagination in order to challenge misrecognition of the violence and challenges education faces as a field, nationally, transnationally and globally.

We provisionally envision the collection have 7 chapters and seek potential contributors for each of the following. We are not limited to these and invite additional and alternatively frames submissions.

Chapter 1: Understanding the historical importance of the *Proposition pour l'enseignement de l'avenir* (College de France, 1985) and later the *Principes pour une réflexion sur les contenus d'enseignement* (Bourdieu, 1989);

Chapter 2: Reassessing their core recommendations in light of current theoretical and pragmatic issues in curriculum studies and development;

Chapter 3: Analysing why the *Principes pour une réflexion sur les contenus d'enseignement* (Bourdieu, 1989) had little lasting effect on the course of French educational policy and, more broadly, why the academic field has had limited influence in reforming educational policy, generally;

Chapter 4: Analysing how the *Principes pour une réflexion sur les contenus d'enseignement* (Bourdieu, 1989) fits within Bourdieu's empirical studies in education, culture, and economics;
Chapter 5: Debating Bourdieu's contention that across the breadth of the school curriculum, 'techniques or cognitive tools, which are totally indispensible in promoting rigorous and reflective reasoning' (Bourdieu, 1989: 312) should be the focus of curricular theorising and planning;

Chapter 6: Evaluating those aspects of Bourdieu's principles that resonate with the theoretical and practical desires for interdisciplinarity or transdisciplinary education. Bourdieu characterises school subjects as 'interpretations' of disciplines. As such, researchers and teachers must be mindful of the 'logic and traditions of certain specialisms...where they are located in the curriculum' and how each 'contribute[s] to different thought processes' (Bourdieu, 1989: 312). Arguing that the curriculum of the day seldom did this and, when it did, only tacitly, Bourdieu argues that transdisciplinary inquiry where teachers from various subject areas are brought together to collaborate in curriculum design may remedy this absence; and

Chapter 7: Bourdieu's principles reflect the continental tradition of educational didactics. Didactics is broadly theorized as 'not a normative theory...nor is it descriptive but reflective...an explication of how instructional processes in the institutionalized school may be experienced...useful as a thought model and a research model (Uljen, 1997: v). It may be interesting to English-speaking curriculum theorists to note that didactics is often broadly posited by European researchers as a science that focuses on the institutionally bounded 'diffusion' of knowledge (Chevallard, 1991).

For almost four decades American and, to some extent, curriculum theorising in the Anglosphere, with the exception of Bernstein (1999), has been dominated by a reconceptualist theoretical break with institutional focus on schooling and empiricism. Reconceptualism in Anglo–American curriculum has adopted broad perspectives from a wide range of philosophical, psychoanalytical, aesthetical and ethical standpoints, which runs counter to the didactics 'down-to-earth, realistic point of departure' (Bjerg et al. 1995: 33). Criticism has ranged from its need for greater verticality and disciplinarity (Pinar, 2007) to its loss of scientific authority and marginalization in the field of education (Ladwig, 1996). This issue invites historical, theory, and research papers that address this nexus of Anglo and Continental curriculum theorising.

Important dates and submission process

- Deadline for proposal submission: 1 December 2017 (250-500 words)
- Notification of proposal acceptance: 1 February 2018
- Deadline for full manuscript submissions: 1 September 2018
- Manuscripts returned to authors for revision: 1 November 2018
- Final manuscripts due: 1 March 2019 (6,000-8,000 words)
- Publication: 2019

A free one-day event co-funded by Keele University and Cultural Politics.

Tuesday 27th June, Keele University. Register [1]here.

Schedule

10am – 10.30am: Coffee

10.30am – 11.00am: Mark Featherstone (Keele University, Sociology) – Introduction: ‘The New (Ab)Normal: Sociology in Extremis’

11.00am – 11.30am: Ronnie Lippens (Keele University, Criminology) – ‘Rothko’s Chapel in Houston, Texas (1970): Luciferian Notes on the Age of Light’

11.30am – 12.00pm: Eva Giraud (Keele University, Media) and Sarah-Nicole Aghassi-Isfahani (Keele University, Sociology) – ‘Has Critique run out of Memes? Interrogating the ‘Post-Truth’ Media Landscape’

12.00pm – 1.00pm: Deborah Frizzell (Art, William Patterson University, USA) – ‘Trajectories of Aesthetics and Ethics in the Chthulucene: A Case Study of “Outcast” Women Artists’

1.00pm – 2.00pm: Lunch

2.00pm – 2.30pm: Kirsten Forkert (Media, Birmingham City University) – ‘Austerity, Right Populism and the Public Mood’

2.30pm -3.00pm: Seb Franklin (Kings College, London) and Penny Newell (Kings College, London) – ‘The Economics of Abnormality’

3.00pm – 4.00pm: Steve Hall (Criminology, Teeside University) – ‘System Reboot: Steve Bannon’s Dream as the Restoration of the Pseudo-Pacification Process’

4.00pm – 4.30pm: Coffee

4.30pm – 5.45pm: Doug Kellner (Education, UCLA, USA) – ‘Donald Trump, Media Spectacle, and Authoritarian Populism’
Background: Following the financial crash of 2008 and the subsequent tightening of economic conditions resulting from massive bank bail outs many of the major western liberal democracies lurched towards the right politically. The crash created a hole in public finances that increased economic and consequently social and cultural stresses with the result that rightist politics based upon law, order, discipline, hard work, and the policing of borders became more popular. In the immediate aftermath of the catastrophe this hardening of attitudes towards others remained inside the political mainstream and essentially took the form of a militarised version of (neo)liberalism intolerant of weakness and vulnerability.

It is possible to argue that the political objective of this new militarised approach to policy was two-fold. In the European context, where the economic consensus suggested that it was necessary to balance the books, the aim was to claw back the money spent saving the financial system from public services deemed unproductive and too expensive. In order to defend this turn to austerity, the second policy aim of the hardening of the liberal agenda was to justify the move to an austere society and an austere cultural attitude through the denigration of others (the poor, ethnic minorities, immigrants, the disabled) who it was claimed were a drain on squeezed, scarce, resources. While the rich, and particularly the super-rich, remain necessary in this story, because they are seen to grow the economy and effectively keep people in work, various others are represented as redundant, unproductive, useless, and exorbitant. They cost too much and can no longer be afforded. They are the waste product of the stressed, austere, society and in this cultural politics they are effectively dehumanised.

However, the problem with this social and cultural approach, which was designed to maintain the integrity of (neo)liberal consensus that has ruled since the end of the Cold War at the expense of the weakest and most vulnerable, is that it appears to have unleashed social and cultural forces that the mainstream seems no longer able to control. These social and cultural forces, which seem to be based upon the resentment of the old working classes towards a model of globalised society they feel abandoned them long ago and the fear of the middle classes who want to protect what they have managed to build in the good years, are transgressive of the (neo)liberal mainstream because they are organised around ideological coordinates that run counter to those that support the hegemonic global social, economic, political, and cultural order. While the hard language that speaks to those threatened by the effects of increasing economic stress emerged from the mainstream, it appears that it has now been taken over by populist leaders (Farage, Trump, Le Pen) who have advanced the original austerity narrative of the insiders in such a way that the (liberal) ‘system’ is now somehow supportive of the other who threatens normal, ‘hard working’, people and therefore must be replaced by a new social, economic, political, and cultural system based upon meeting the needs of the silent majority.

But is this new narrative, which we are provocatively calling the new (ab)normal, truly revolutionary in its attempt to over-turn the (neo)liberal hegemon which has organised American-led processes of globalisation since the 1980s? If this is, indeed, the case, and we have entered a new cultural sphere of radical (ab)normality, then we wonder what the future holds. In many respects it seems that the new turn to the right is wholly negative, simply because its key figures have no positive programme for change. Instead the turn to a politics of anti-liberal (ab)normality, which have ironically come to the fore in the home countries of neo-liberal globalisation (Britain and America), appear to be based in little more than a violent rejection of otherness in all forms and a valorisation of borders, boundaries, and defensive formations. In this way the new(ab)normal, which we have seen emerge from the rhetoric of Farage, Trump, and Le Pen, seems to be founded upon an ideology of intolerance that recalls the Italian fascism and German national socialism of the 1920s and 1930s. Or perhaps this is hyperbole and there is actually very little that is new about the new situation. Perhaps the idea of anti-liberal (ab)normality is simply about the retrenchment of white, male, power which has effectively dominated the west from the very beginning?

Given the possibility of the rise of these new cultural politics, which appear to legitimate racism and sexism in
the name of a kind of anti-intellectual populism, should we now speak of anew authoritarianism that has been more or less entirely normalised? In the face of the potential rise of this new discourse, which we want to think about in terms of the new(ab)normality, the objectives of this workshop are to (1) try to make sense of the emergence of what appears to be a new form of intolerance, which seems to have very quickly moved from the margins into the mainstream and managed to construct itself in terms of an apparently radical, but also entirely reasonable and pragmatic response to the critical state of the old (neo)liberal hegemon; (2) think about whether academics need to develop new ways to respond to this potentially new cultural politics of violence through the use of knowledge, evidence, theory, and pedagogy in the name of creating a space for a more constructive, positive, inclusive cultural politics able to shape the future for everybody; and finally (3) to develop a proposal for a special issue of Cultural Politics, concerned with these issues, questions, and debates.

**CfP: Japan in the Digital Age (2017-06-13 08:00)**

Japan in the Digital Age
Call for Papers for a one-day Symposium
Saturday 28th October, 2017
The Shed, Manchester Metropolitan University, Manchester

Keynote Speakers

Prof. Ian Condry, Professor of Japanese Cultural Studies, Massachusetts Institute of Technology

Mr. Kazuhito Gen-I (? ?), award-winning media practitioner, working on 2.5 Dimension project (theatre adaptation of anime, manga and videogame)

Japan has been a place of fascination throughout the years, particularly to those interested in media and popular culture, business, science and technology, and other related areas such as transport and tourism. Yet surprisingly, there is little sustained discussion on how contemporary Japan is situated within the rapidly changing landscape of digital technologies in the New Millennium. How has digitisation changed Japanese aesthetics and values? Have mobile phone technologies altered the way Japanese business language is used? How does 'tradition' shape Japanese digital cultures? Such questions need urgent attention as currently, there are a number of significant and innovative digital initiatives in Japan which have impacted on Japanese culture and arts, technology, business and society, but are little known outside of Japan.

We invite academics, PG students, industry researchers and practitioners for contributions which examine the transformation of Japan in the Digital Age, and the transformation of the Digital Age through Japanese culture, practice, politics, technologies, industries and beyond. The overall aim of the Symposium is to provide a supportive and inspiring environment to encourage cross-disciplinary and cross-sector dialogues, to learn about innovative digital projects in Japan, and to build a network of those engaged with Japan through their work and lives.

Suggested topics include:
Digital technologies and Japanese popular culture (e.g. anime/manga, games, fashion)

Japanese digital identity, politics and society

Digital communications, Japanese language and business

Innovative Japanese digital design and technologies

Please submit a 250-word abstract to [1]e.miyake@mmu.ac.uk by 4th August 2017, using the following format: title + abstract; name of author(s); affiliation; email; key words. For any enquiries, please get in touch with Dr. Esperanza Miyake ([2]e.miyake@mmu.ac.uk)?

Political speeches, relational authoriality and fetishising ‘strong leadership’ (2017-06-14 08:00)

The notion of relational authoriality, which consistency demands I acknowledge emerged in conversations with [1]Jana Bacevic, conveys a relational realist perspective on the question of authorship. It rejects the notion of the liberal individual as the origin of a text while continuing to insist that there is a definite causal story to be told about the emergence of any text, encompassing individuals and the relations between them. Relational authoriality stresses how creative production happens through interaction, direct or mediated, between individuals who care about what they discuss. People debate, discuss and digress about things that matter to them. It’s this concern to enter into dialogue, sometimes with the parties involved changing as a result of the process, which provides the relational underpinning to creative production. It might be that a particular individual takes forward this raw material, running with it and placing their mark on it in a way which leads to it being recognised as theirs. But this simple wouldn’t be possible without these prior networks, acting as the creative ecology within which individual authorship becomes feasible. Every completed act of authorship has its own history of emergence and accurate accounts of it will lead back to individuals, interactions and relations.

I was led to think back to this line of thought when reading Shattered: Inside Hilary Clinton’s Doomed Campaign. As is often the case, speeches and speech writing figure prominently in the book. I’ve read a lot of campaign books over the years and I’ve always been gripped by these details. In part this is because political speeches are such a crucial part of the politician’s craft, with their (perceived) success or failure being integral to the fluctuating fortunes of political careers. This isn’t simply an American phenomenon. Consider the acclaim which greeted David Cameron’s 2005 conference speech, delivered without a lectern or notes, widely seen to have tipped the leadership contest in his favour. We can see a parallel in Ed Milliband’s first conference speech as Labour leader. Much of the increasing ‘plausibility’ of Corbyn as a political leader, at least amongst the commentariat, rests on the increasingly polished way in which he delivers speeches.

Why does this matter so much? There are many reasons why accomplished delivery are valued in an age of media-saturated politics. But I wonder if a fetish of delivery reflects a denial of relational authoriality. In reality, all who have considered it must surely recognise that politicians do not straight-forwardly write their own speeches, allowing them to meaningfully claim ownership of them in an individualistic sense. These are team efforts, at best produced through careful collaboration between committed partners and at worst produced mechanically through
committees. We can see the character of politicians, as well as the nature of the organisations they inhabit, reflected in how they approach these challenges. Contrast the dialogical collaboration between Obama and trusted aides with the byzantine, sometimes conflicting, structures which Clinton often established for speech writing. But these are subtle judgements, pointing to relational authoriality rather than individual authorship, which sit uneasily within the individualistic frame of ‘political leadership’. We fetishise delivery of speeches, as well as the perceived strength of the individuals who deliver them, as the spiralling complex of governance ever more outstrips the capacities of the ‘strong leaders’ we praise.

How do we explain the election of Donald Trump? (2017-06-15 08:00)

How do we explain the election of Donald Trump? Far too much of the media's response to this question has been to take Trump's account of his own powers at face value. This scion of the elite, who never felt at home amongst the elite into which he was born, imagines himself as able to work with kings yet not lose the common touch. His [1]use of Twitter is integral to this fantasy, resting on the [2]illusion of unmediated interaction with everyday Americans. But the biographies I've read of Trump in recent months make me wonder if it goes further than this, reflecting an identification he has cultivated since his early years as a young man who felt out of place, with endless meetings with ‘ordinary people’ facilitated by his work with his father. Either way, as Jan-Werner Müller cautions in this [3]excellent essay, we need to avoid taking the account of figures like Trump at face value:

> While disputing virtually every claim made by populists – especially their supposedly simplistic policy solutions – they buy without question the story that populists sell about their own successes. When Arron Banks proclaims that 'Facts don’t work ... You've got to connect with people emotionally,' they just nod. But it isn't true that ‘the masses’ are emotional basket-cases ready to be seduced by a charismatic demagogue. For a start, the neat distinction between reason and emotion is misleading. People are angry for a reason, and usually they can articulate that reason, as part of a larger story about what went wrong in their lives. Trump gained some trust as an outsider and, even more, as a credible exemplar of what it means to be unprofessional in politics.

There are many features of our political context which remain obscure if we uncritically accept Trump's narrative of his own success. This [4]crucial essay by Mike Davis captures many of them: the results of Republican gerrymandering, voter suppression, flight of funders away from the Presidential race towards House and Senate, investment in state-focused political think tanks, the electoral peculiarity of the American system and the psephological particularity of the result.

However the most important feature is perhaps the weakness of the Clinton campaign. As Jonathan Allen and Amie Parnes report in their *Shattered*, the Clinton campaign deliberately sought to avoid substantive engagement with the working-class electorate, so long dormant within American politics, which Trump's campaign successfully mobilised. From pg 193:
One of the lessons Mook and his allies took from Michigan was that Hillary was better off not getting into an all-out war with her opponent in states where non-college-educated whites could be the decisive demographic. In Michigan, they believed, Hillary’s hard campaigning had called attention to an election that many would-be voters weren’t paying attention to, and given Bernie a chance to show that his economic message was more in line with their views. So Mook’s clique looked at the elevation of the Michigan primary—poking the sleeping bear of the white working class—as a mistake that shouldn’t be repeated. “That was a takeaway that we tried to use in the general,” said one high-ranking campaign official.

Their analytics driven campaign was orientated towards tactical advantage in each state during the primaries, leaving them to ignore the large swaths of rural and/or working class voters whose disengagement rarely registered empirically in political models. From pg 130-131:

Bill’s time on the ground only encouraged his skepticism of Mook’s reluctance to send him outside population centers. Having grown up in Arkansas, Bill understood that a major political player—a senator, a governor, or a former president—could bridge ideological divides by just showing up in small towns that never got much attention from elected leaders. He liked to go to small towns in northern New Hampshire, Appalachia, and rural Florida because he believed, from experience, that going to them and acknowledging he knew how they lived their lives, and the way they made decisions, put points on the board. Mook wanted Bill in places where the most Hillary-inclined voters would see him. That meant talking to white liberals and minorities in cities and their close-in suburbs. That was one fault line of a massive generational divide between Bill and Mook that separated old-time political hustling from modern data-driven vote collecting. Bill was like the old manager putting in a pinch hitter he believed would come through in the clutch while the eggheaded general manager in the owner’s box furiously dialed the dugout phone to let him know there was an 82 percent chance that the batter would make an out this time. It’s not that Bill resisted data—he loved poring over political numbers—but he thought of it as both necessary and insufficient for understanding electoral politics.

What engagement took place was largely tone-deaf, reflecting the limitations of public opinion research, the insulated world of political operatives and the limitations of campaign structures which reinforced orthodoxy. Any account of the virtues of Trump’s campaign needs to be supplemented by an account of the weakness of Hilary Clinton’s.

When Tweets Turn Sour: Avoiding Legal Pitfalls on Social Media (2017-06-16 08:00)

When Tweets Turn Sour: Avoiding Legal Pitfalls on Social Media
2 hour masterclass, £12-13 per person
When:6-8pm, Wednesday 28th June 2017
5136
Where: NUJ, Headland House, 72 Acton Street, London, WC1X 9NB
Who for: Anyone using Twitter for PR, media/journalism or any kind of professional work

Book your place via Eventbrite: [1]https://www.eventbrite.co.uk/e/when-tweets-turn-sour-tickets-34619598150?aff=erepanelorg
Pressure on journalists to use social media grows daily, but fast-changing criminal and civil case law makes this perilous terrain – as Katie Hopkins, Sally Bercow and George Monbiot have found. Designed for professional communicators, this masterclass covers up-to-date case studies of privacy, libel, contempt, as well as copyright and emerging issues such as information security, and reputation management. Holly Powell-Jones is a journalist, media tutor and researcher who lectures on Media Law and Ethics for Goldsmiths University, London College of Communication and City, University of London. She also trains journalists, businesses, charities and schools on managing the risks of new media and runs a police-funded project in secondary schools on social media law and ethics. She is completing a PhD on youth cyber offending.

Help us forge UK applied sociology (2017-06-16 08:15)

Help us forge UK applied sociology

by Nick Fox and Marguerite Regan

For the past 18 months, the British Sociological Association (BSA) group Sociologists outside Academia (SOA) has been focusing on the potential for careers working as applied or practical sociologists, beyond the traditional remits of academia. Sociology is essential not only for understanding the big problems that face society, but also the daily issues that need addressing at work, at home or in the community. We believe sociologists have the concepts, the theories and detailed knowledge of organisations and human interactions that can address such everyday situations.
In the US and elsewhere, sociology has already established a profile for solving these kinds of problems, but much less so in the UK. That's not to say there aren't UK sociologists already using their skills and knowledge in applied settings. Some call themselves ‘consulting sociologists’, others run businesses that provide sociological expertise to industry, local government and voluntary organisations. There are also many sociologists working in areas where they bring to bear their knowledge and expertise, even if they don't have the job title 'sociologist'. But there is a lack of visibility around this application of sociology outside academia.

Last year an SOA workshop kick-started work on developing a field of applied and practical sociology here in the UK. We considered the kinds of knowledge, skills and models needed to solve the problems that organisations, businesses and the public-sector face, and started to map out how careers as an applied sociologist could pan out. Doing this kind of applied sociological work required specific skills to explore how social and cultural factors link individual experience to everyday events. Generic skills were also needed, including reasoning, communication and collaborative working.

SOA now wants to evolve this work further, by developing a curriculum in applied sociology for final year undergraduate students. This curriculum can not only be offered to universities as an option they might develop for their students, but will also be a way to really clarify the knowledge, concepts, and subject-specific and generic skills that an applied sociologist will need to work effectively in non-academic organisations and settings.

We invite applications from sociologists who would like to join an SOA task and finish group to work on this development of an applied sociology curriculum. We conceptualise a six-month programme, in which the group will meet virtually. At the end, we will seek funding for a public launch of our curriculum for applied sociology.

If you are a sociologist who works predominantly in a non-academic setting, but use your sociological skills and knowledge to inform your work, we would like to hear from you. We would also welcome one or two current undergraduate or master's students to join the team, to provide input in terms of what is needed educationally in an undergraduate applied sociology curriculum.

Unfortunately, we cannot pay any fees for this work, and we do not have a budget for face-to-face meeting expenses. This will be a labour of love, for those wanting to flex their sociological imaginations, and due credit will be given to all those involved.

Please contact Nick Fox, SOA co-convenor ([1] n.j.fox@sheffield.ac.uk) for more information about the project and details of how to apply. Applications will close on 19 June 2017 and successful applicants will be notified shortly thereafter.
How Corbyn hacked the media (2017-06-17 08:00)

It’s conventional wisdom that Corbyn’s leadership campaign was the target of brutal coverage by the media. I was interested to learn in The Candidate, by Alex Nunns, that this wasn’t quite how the campaign itself saw the situation. Understanding why can help elucidate the surprise that was #Election2017. From loc 4591-4556:

Ask some of Corbyn’s allies about the press coverage they received during the leadership contest and a surprising response comes back. “There are very few campaigns on the left that I’ve been involved in where we’ve had good press,” says Jon Lansman, “but this is one of them.” His definition of “good press” is unconventional, a variation on ‘all publicity is good publicity.’ Of course there was hostility, but the campaign managed to connect with its intended Labour audience in spite of it. “We always made the agenda. The others didn’t get a look in. We were the story throughout.” It was all about Corbyn. Because of the scale of interest, the campaign’s press officers found that along with the dross came greater opportunities to place their stories in the media than would normally be afforded to a left candidate. “The majority of things we tried to land landed, and in the ways we wanted them to land,” says James Mills, who was seconded to the press team from CWU. Whatever was being thrown at them, Team Corbyn pushed on with scheduled policy announcements, getting out a positive message that Mills believes cut through.

This dynamic within the print media played out in turn within the broadcast media. Not only were the campaign setting the agenda, with journalists responding in ever greater numbers to the issues they were raising, it led to increasing television coverage which highlighted the mismatch between the construction of Corbyn as a dangerous radical and the nice bearded chap who no one could really take much of a personal dislike to. From loc 4530:

Broadcast media followed a journalistic agenda that was still largely set by newspapers, despite the precipitous decline in their circulation. But broadcast had an inbuilt corrective missing from print—viewers and listeners could see and hear Corbyn for themselves. “They threw everything at Jeremy and it was so over the top that when he came on TV you expected him to be a combination of all sorts of villains,” says McDonnell. “When he came across as just a nice bloke answering questions honestly, that was it.”

This is something which the media themselves could be drawn into. As Phil BC insightfully pointed out some time ago, professional commentators are prone to confuse an absence of the presentational skills common amongst the political elite with a profound naïveté, as if Corbyn and McDonnell hadn’t spent their entire lives negotiating the political machine with some success from a position of marginality. As he [1] asked in response to media astonishment at McDonnell’s apparent competence in his first speech at a Labour conference as Shadow Chancellor, “Were they really expecting him to commit Labour to a programme legislating for full communism?”

An escalating media campaign against Corbyn brought him endless ‘earned’ media, while offering an opportunity for the public to make up their own mind about the hyperbolic cliches in terms of which such media warfare was inevitably fought. If he got dragged into this, perhaps punching back against the onslaught, he likely would have been torn apart as self-defence would be cast as ‘gaffes’ and replayed endlessly. But by choosing to ignore media
condemnation, in a way analogous to but different from Trump, it could be exploited for the benefit of the campaign. A similar effect was at work with denunciations from within the party. After Blair’s famous speech in which he attacked members drawn towards Corbyn as needing a heart transplant, the campaign saw an immediate influx of donations and volunteers.

I’d like to understand the mechanisms at work here: when do media attacks have their desired effect and when do they simply drive welcome coverage of a candidate? How does social media work to undermine the former and bring about a latter? One clear effect is that fighting back against this media onslaught can provide a way for followers to participate. There are legitimate issues which can be raised around ‘digital activism’ but I find it plausible that this social media activity helped the campaign consolidate, amplified its message and drew people into ‘offline’ participation. Though how, if at all, these effects worked to blunt media attacks is a more complex question. From loc 4530-4545:

Perhaps the most important factor explaining why the press onslaught backfired was the existence of social media. The old press no longer enjoyed a monopoly on having a voice. Through Facebook and Twitter ordinary people could critique and rebut journalists’ output directly. “Every time the mainstream media attacked Jeremy the social media shield would go up around him, bat it off, and get to the truth of the matter,” says Marshajane Thompson. Research carried out by YouGov in August 2015 found that 57 per cent of Corbyn supporters cited social media as “a main source of news,” compared to around 40 per cent for backers of the other candidates. 78 “Part of the reason why they were spending so much time on social media was because they didn’t trust the traditional media any more,” believes Ben Sellers. One of the main functions of the Corbyn For Leader social media operation run by Sellers and Thompson was to circumvent the press, both by publicising the explosion of activity happening all around the country, and by curating the mainstream media to pick out the half-decent reports (“sometimes that was a struggle,” Sellers quips).

There was an [2]interesting finding before the election that there were more Labour tweeters who also tended to tweet more. There is a wide network, retweeting Labour candidates, with a larger and sustained focus on Corbyn than was the case with the Conservatives. Identifying what role this played in the general election will be central to understanding [3]the rise of Corbyn. My suggestion is that the use of social media in the earlier leadership election would be a useful place to begin this inquiry.

Much of the reaction to Labour’s election success last week has been framed in terms of their ‘rewriting the rules’. One particularly explicit example of this can be seen in an article by Jonathan Freedland, an enthusiastic critic of Corbyn, pontificating that Corbyn took “the traditional political rulebook” and “put it through the shedder”. What are these rules that had formerly seemed so influential?

1. Young people don’t vote. Any enthusiasm you create with them will come to nothing because they won’t turn out on election day.

2. UKIP voters are Tories. If UKIP ceases to be viable then most would switch to the Conservatives.

3. Divided parties never win elections. Unless a party can pull together at the local and national level, it can’t achieve success.

4. Economic credibility is crucial. If a party is not perceived as being economically competent then there is no chance voters will trust it.

There are certainly more rules like this. The conventional rulebook wouldn’t have proved so influential if it only had four points in it. But where do these rules come from? How is this conventional wisdom formed? How does it become so influential that the metaphor of the ‘rulebook’, adhered to by all ‘serious’ commentators and operators, can be taken seriously?

Part of the answer lies in the fixation on the ‘political centre ground’ which is embedded in the dominant wisdom of Labour modernisers. The first cohort fought and won against the Labour left in the 1980s. The second cohort grew up in the Labour establishment moulded by these predecessors. The internal struggles of the 1980s cast a long shadow over them all, a fight to drag the party to a political location and then keep it there. As Alex Nunns describes it on loc 4468 of The Candidate:

> The political centre ground, in this view, appears as a clearing in a forest—a fixed location—and politics is a simple orienteering exercise where the parties are given a map and a compass and told to go and find it. Occasionally they inexplicably wander off into the woods and have to be scolded by journalists until they take their navigation task seriously again. The great, unpredictable social and economic forces that constantly sculpt new historical terrain are, in this Duke of Edinburgh Award Scheme version of politics, merely gusts of wind that must not blow the parties off course. Nothing changes.

Despite this professed concerned for ‘what works’, adherents of the political rulebook often display a remarkable lack of empirical interest in the political world. This can produce odd juxtapositions, such as the Blairite candidate Liz Kendall being backed by supporters who saw "understanding what it takes to win an election" as the most important characteristic of being a leader while all the available data suggested her chosen tactics for winning the leadership election were heralding no success whatsoever. The invocation of ‘what works’, the celebration of oneself as pragmatist foregoing childish moral indulgence in pursuit of success, licenses a weird disregard for how the world works. This is I think because it’s not pragmatism in any meaningful sense but ideology. The political centre ground is a theory of politics. Furthermore, it’s a painfully simplistic theory of politics unable to adapt to changing circumstances. As Nunns goes on to write on loc 4484,
The trouble with such a static, ahistorical view is that it is unable to account for new phenomena, much less understand people’s motivations for acting in unexpected ways. So when hundreds of thousands of people simultaneously decided they had other priorities than hopelessly trudging around looking for a centre ground that, mysteriously, kept moving further away, these professional political pundits could only dismiss them as either insane or self-indulgent.

Such a theory of politics resists falsification. It in its original context, it reflected a degree of engagement with the world around its progenitors. In a important sense, New Labour started as a psephological analysis of a changing electorate and a tactical case about engagement with the media. Over time, it became folk wisdom, espoused by all ‘serious’ people as a way to demonstrate their seriousness, increasingly cutting it off from any meaningful analysis of the circumstances in which their serious business was being conducted. It might resist falsification but its advocates greedily seized upon confirmation. As Nunns points out, Labour’s continued rightward shift yielded little success at two elections, but the eventual victory of 1997 was taken as a sign that the moderniser’s case was correct all along. They had vanquished their foes on the left and, what is more, no ‘serious’ person could doubt they were right to do so. Perhaps there’s a risk that this hubris be repeated by the Labour left today. Everything I say below stands in my mind as a caution about what is to come, as well as an account of what has passed.

This analysis had become a folk theory, so obviously correct that repudiations of it could no longer be taken seriously. The culmination of this process was the ascendency of Cameron, the heir to Blair, who made the same case in relation to his own party, albeit primarily with regards to social issues rather than economic ones. Much like the Labour modernisers, what become an article of faith originally began as a psephological analysis, developed through the polling of Lord Ashcroft, appointed Deputy Chairman of the Conservatives under David Cameron. The intellectual case these originators assented to became a point of division and contention within the party, as people flocked to join their cause or lashed out against it. What interests me are the subtle changes that occur as groups are led to defend or attack reflective arguments and how this changes how people relate to such arguments. My contention is that a theory of politics that was already relatively immune to falsification becomes a guarded axiom unable to be seriously considered or any longer reflected upon.

This was the process by which a reflective analysis of political change transmuted into a folk theory and ossified even further into the political rule book. How was this reinforced by media commentators? After all, it’s their discursive power which is so crucial to accepted/acceptable accounts of ‘how things are’ in politics. At one level, it can be explained in terms of the patronage networks that exist between senior politicians and senior journalists. As Nunns writes of Andrew Rawnsley’s contempt for Corbny on loc 4406, “Suddenly, the centre of gravity was moving away from the Labour elite to which he had unparalleled access, and from which he had mined the raw materials needed to fashion—with considerable skill—the books and journalism that had won him acclaim”. But there’s a broader process at work, insightfully captured by Phil BC in this post. I’ve quoted the relevant section at length here but please do read the [1]whole thing in full:

Firstly, consider what mainstream commentators observe. They watch the comings and goings, the toings and doings of senior politicians. They see how MPs club together in the Commons, formulate policy, take legislation through the House and involve themselves in massive rows with one another. This, more or less, forms the basis of copy that comes to thousands of hours of broadcasting and millions of words year in, year out. And this is politics. What happens in the chamber matters simply because that’s what appears to matter – it’s where policy is brought forward and enacted into law. What goes on in politics outside, like local council and devolved administration stuff simply isn’t on the radar, because they don’t see it. Likewise, movements that occupy the streets or, indeed, [2]transforming a political party are curiosities but unworthy of real analysis and understanding. It’s all such a sideshow to Parliament’s main event.
A similar sort of process is at work with our professional Westminster watchers, but is ramped up to a higher degree. Firstly, consider what mainstream commentators observe. They watch the comings and goings, the toings and doings of senior politicians. They see how MPs club together in the Commons, formulate policy, take legislation through the House and involve themselves in massive rows with one another. This, more or less, forms the basis of copy that comes to thousands of hours of broadcasting and millions of words year in, year out. And this is politics. What happens in the chamber matters simply because that’s what appears to matter – it’s where policy is brought forward and enacted into law. What goes on in politics outside, like local council and devolved administration stuff simply isn’t on the radar, because they don’t see it. Likewise, movements that occupy the streets or, indeed, [3] transforming a political party are curiosities but unworthy of real analysis and understanding. It’s all such a sideshow to Parliament’s main event.

This focus is also bounded by the media the commentators produce. Famously, the BBC take its lead for what the hot politics stories are from the front pages of the broadsheets. Likewise, hacks in other operations parasite off the BBC and each other to fill the schedules, put stuff out, and meet the insatiable appetite for hot takes. The result is little time for thinking, a scramble for a story or an original angle, and a tendency toward herding thanks to the recursive universe generated from the quantum foam of chatter. It produces a mode of thought that is based entirely on appearance without trying to understand what may lie behind what immediately presents itself. For instance, the Tories are the new party of the working class because minimum wage rises. Labour’s members have foisted the disaster onto the party because atomised members of the public tell focus groups. There is no sense of movement, little idea that parties as expressions of interest evolve and move, nor that the people who support them, actively or passively, have connections with multitudes of normal people that can pull, persuade, cajole masses of them and transform them into a collective that starts making its own history. As none of them regularly go on the doors outside of the capital, they have to rely on what the pollsters tell them and, as we saw last night, only two of the established firms come out of the election with any sort of credit.

Thus we have the ‘political rulebook’, the framework within which political reality is interpreted, adhered to by all serious political figures and commentators. It’s empiricism of a particularly stupid sort, oblivious to its own theoretical underpinnings and all the more dangerous for it. It maps the most superficial contours of political life in order to better navigate one’s way towards the mythical centre ground and for no other purpose. In the next post of this series, I’m going to consider what it is about opinion polling that lends itself to such uses, what the consequences are for political leadership and how economic depoliticisation plays a role in propping the whole thing up.

The Practice of Social Theory

The first Cambridge summer school in social theory

First Cambridge summer school in social theory

University of Cambridge, Department of Sociology, 4-6 September 2017

Conveners: Jana Bacevic (University of Cambridge) and Mark Carrigan (The Sociological Review)

Passionate about social theory?
Want to learn more about how it is created?

Interested in seeing theory being made, rather than just read or applied?

Apply to the first Cambridge Summer School in Social Theory, “The Practice of Theory”. Hosted by the Department of Sociology, University of Cambridge, the school aims to bring together researchers interested in the practice of social theory and its relationship with reading, writing, and teaching in the social sciences.

We invite applications from early career researchers (PhD students or postgraduates) involved in theoretical work within or independently of their theses.

This summer school involves graduate students and early-career researchers in a series of thematic sessions that address different aspects of social theory (writing, teaching, translating, presenting, engaging), and gives them an opportunity to develop outputs and interactive tools that can be applied to a variety of contexts – from theses and articles, to teaching and public engagement. Besides an enhanced understanding of social theory, the school aims to equip participants with ideas, as well as practical skills, for applying this knowledge in communication with both academic and non-academic audiences.

The participation fee for the school is 75 GBP (this covers teaching materials, coffee and tea breaks, and lunch on 4 and 5 September). Please note that, in order to secure their place, selected participants will be asked to register and pay the participation fee in full via online transfer by 15 July 2017. We regret that we are not able to offer reimbursements (except in outstanding circumstances) nor guarantee your place if you do not register by this date.

Please contact jb906@cam.ac.uk and mark@markcarrigan.net if you have any questions. We’ll be releasing the full programme in the near future and we’ll be in a position to advise successful applicants on affordable accommodation in the area.

Please complete your application by June 20th 2017. We’ll confirm the success of your application by July 1st.

---

**Trolling, public engagement and the sociology of knowledge (2017-06-20 08:00)**

In recent months, I’ve become preoccupied by how we make sense of the experiences of academics being harassed or trolled when using social media. My initial interest in this was in my capacity as a trainer and consultant. One of my roles is to encourage, train and support academics in their use of social media. The apparent rise of this experience necessitates a response. We need to know how to prepare academics for this experience, as well as be able to advise on potential responses and their likely efficacy.

However as a sociologist I’m dissatisfied with the idea that we leave trolling framed solely as a risk encountered in public engagement through social media. There is something more complex happening here, as a new
media infrastructure changes the real and imagined relationship of academics to the wider public. It would be a mistake to frame this in terms of disintermediation: social media changes the role of previous gatekeepers to publics (e.g. journalists, broadcast researchers, think tank staff) while opening up opportunities to work with them in new ways. Their gatekeeping function becomes less straight forward. But it also empowers platforms themselves as gatekeepers, with mediation now being in large part enacted through the architecture of each social media platform.

This can produce what feel like unmediated meetings with the general public. It is imperative that we realise this is not the case and ensure a wide understanding of how platforms mediate interaction, as well as how we can collectively work to exercise an influence over these processes in order to ensure public engagement has a chance of succeeding. But it also invites us to call into question some of the assumptions about publics and our relation to them which were allowed to develop under the conditions provided by the older media infrastructure. I really like the account Jana Bacevic offers of these assumptions in [1]this recent essay:

In assuming a relatively benevolent reception of scientific knowledge, then, appeals such as Chis and Cruickshank’s to engage with different publics—whether as academics, intellectuals, workers, or activists—remain faithful to Popper’s normative ideal concerning the relationship between reasoning and decision-making: ‘the people’ would see the truth, if only we were allowed to explain it a bit better. Obviously, in arguing for dialogical, co-produced modes of knowledge, we are disavowing the assumption of a privileged position from which to do so; but, all too often, we let in through the back door the implicit assumption of the normative force of our arguments. It rarely, if ever, occurs to us that those we wish to persuade may have nothing to say to us, may be immune or impervious to our logic, or, worse, that we might not want to argue with them.

What fascinates me about these encounters is how unprepared we seem to be for the possibility that ‘the public’ could be disinterested or even actively hostile to what we are doing. I don’t think online harassment can be reduced to such hostility, far from it, but I do think it’s often an important component of it. This is even more the case with trolling, though drawing a principled distinction between the two is a (challenging) topic to another post.

We urgently need to prepare for these encounters, including avoiding the dispiriting trap of drawing too sharp a contrast between old and new. We have not left behind an old world of mediated engagement where we can imagine pliant publics to enter a new world of unmediated engagement where we directly encounter hostile publics. There is still mediation and we still imagine our publics. But we now have the possibility of somewhat random, largely unpredictable interactions which I want to argue have important implications for the sociology of knowledge.

The meaning of @realdonaldtrump (2017-06-21 08:00)

How significant can a tweet can be? We can point to isolated cases of individual tweets going viral, creating controversy and producing material outcomes in the world. But isolated tweets rarely have such significance. Instead, we need to look at a Twitter feed as a unit of analysis, taking someone’s entire output on the platform as a sustained
trajectory of action. This is precisely what Peter Oborne and Tom Roberts do in *How Trump Thinks: His Tweets And the Birth of a New Political Language*. It’s not a systematic analysis and there are clear limits to it e.g. the failure to state any principles upon which selections have been made from Trump’s output. But I found it a thought-provoking book, both in terms of understanding Trump’s self-formation as a political figure and how we might approach Twitter methodologically.

There are trivial though interesting biographical details which can be ascertained about Trump through the examination of the feed. For instance the consistency with which he tweets extremely early in the morning and very late at nights lends credence to his claim about sleeping little. Looking at how these tweets are sequenced raises fascinating questions about how Trump spends his time and the psychological state in which he takes to social media. From loc 4084:

In this extraordinary sequence of Tweets, despatched in less than two hours before dawn on 4 March, Donald Trump accused his predecessor of illegally tapping his phone and of being malevolent or mentally ill; attempted to conflate Obama’s routine meetings with the Russian Ambassador at the White House with Trump’s Attorney General Jeff Sessions’s undeclared discussions during the election with the representative of a foreign power; and poured scorn on Arnold Schwarzenegger for his failure to sustain Trump’s TV franchise.

As they say, “Twitter is the medium which allows Trump to expose these thoughts to the world in real time”. Uses of Twitter which seems ill-judged can reveal much more about the user than their learned capacity to deploy it for personal gain. But the more important features, to which Osborne devotes much of his attention, concern his evolving strategy and relationship to the platform. He offers a plausible narrative of Trump coming to find his voice on Twitter, a process tied up with his developing preoccupation with the power of the platform and the reach it affords him:

My twitter account is now reaching more people than the New York Times-not bad. And we’re only going to get better! 11:14 AM –4 Apr 2012

With almost 1.3 million followers and rising really fast, everyone is asking me to critique things(and people). Finally, I will be a critic. 11:41 AM –11 Jun 2012

Today we just passed 1.4 million twitter followers.. 11:09 AM –23 Aug 2012

Happy to have just passed 1.3M Twitter followers. Love communicating with everyone daily. 3:51 PM –2 Jul 2012

Today we just passed 1.4 million twitter followers.. 11:09 AM –23 Aug 2012

Happy to have just passed 1.5M followers on twitter. We picked up over 14,000 yesterday alone. It’s great to speak to everyone daily. 10:31 AM –4 Oct

My twitter followers will soon be over 2 million- & all the “biggies.” It’s like having your own newspaper. 10:07 AM –17 Oct 2012

Wow, I have just exceeded 2 million followers-and in such a short time! 10:38 AM –14 Jan 2013
Obviously in no sense does he ‘reach’ this headline figure. There is a revealing naïveté about how he treats this follower count, something it is hard to ascribe to a strategy of simply trumpeting his own demonstrable advance in social media status. We can't know that he cares about this stuff. But the evidence suggests that he does. His preoccupation with the size of his following is allied with an irritation that not all the reaction he generates is positive:

It’s okay but why do the haters (& losers) want to follow me on twitter?? Get a life! 1:39 PM –12 Feb 2013

My Twitter has been seriously hacked-and we are looking for the perpetrators. 12:00 PM –21 Feb 2013

Twitter will soon be irrelevant if lowlifes are so easily able to hack into accounts. 1:57 PM –21 Feb 2013

I have many great people but also an amazing number of haters and losers responding to my tweets-why do these lowlifes follow nothing to do! 3:34 AM –24 Apr 2013

Wow, I’m at 2,200,000 followers but I’d love to get rid of the haters & losers—they’re such a waste of time! 11:50 AM –25 Apr 2013

But it ultimately seems to be worth it. On numerous occasions he draws the analogy between his personal platform on social media and owning a newspaper. When he enters the presidential race, he styles social media as facilitating his one-man fight back against a crooked established which is stacked against him. Driven by the value he finds in the platform, he continues to celebrate numerical milestones as his Twitter career continues:

"@Heaveenly: @realDonaldTrump how does it feel to have 2.1 million followers” Great like owning The New York Times without the lo $ $es! . 8:04 PM –7 May 2013

Just hit a million on Facebook-http://t.co/FDv4aLoomz

Wow, honored to just pass 2.5M followers on @twitter. Thanks to all my followers. We are going to have a great year together.

Congrats everyone-we topped 4 million today on Twitter-and heading up fast! 1:41 PM –1 Sep 2015

He writes about his tweeting in terms of a relationship with his followers and a personal capacity he excels it. As he put it in a Tweet from July 2014, ”Many people have said I’m the world’s greatest writer of 140 character sentences”. His professed skill at tweeting is what underwrites his imagined relationship with his followers. Through his skill, he builds a relationship with his followers and through the ever-expanding platform that ensues, he accumulates power. As he declares on 17 Oct 2012, ”My twitter has become so powerful that I can actually make my enemies tell the truth.”

He regularly reflects on the specific practices which lead him to accumulate followers:
Everybody's talking about my doing twitter during the likely very boring debate tonight. @realDonaldTrump #DemDebate 10:09 AM – 13 Oct 2015

#DemDebate was really boring but had a lot of fun live tweeting and picked up by far the most followers. 9:57 AM – 14 Oct 2015

Brian–Thanks dummy–I picked up 70,000 twitter followers yesterday alone. Cable News just passed you in the ratings. 12:14PM -7 Nov 2012

This includes retweeting his followers, selectively landing a platform to those without visibility, resonant of his election rhetoric about the forgotten, at least when they talk in a way congruent with his own ego:

"@redneckgp: All you haters out there, STOP trashing the only candidate @realDonaldTrump that will put ALL OF YOU & AMERICA FIRST #trump" 9:32 PM –8 Apr 2016

Dennis Bryant (Twitter handle “RedneckGP”) at this point had seventy-five Twitter followers. He suddenly found himself retweeted to Trump’s then 8 million followers. Trump loved to lift his supporters from obscurity. This was one way he established an emotional bond with his supporters.

"@phickeyma: When I come home from work my Twitter page is filled with Donald Trump tweets...Love reading them...So Bold & Truthful." 5:36 PM –18 Oct 2013

Trump loved to retweet messages from his followers, thus forging a personal bond with voters. In the election year of 2016 Retweets would come to form approximately half of his Twitter output.

What interests me is his developing relationship with the metrics. As he sustains his engagement on the platform, he reports upon his own ‘progress’ in ever more granular ways. He’s concerned with what ‘works’ and what doesn’t. He has data about his ‘growth’ ready-to-hand. There is a relational biography here concerning himself and the platform, as well as the real and imagined relationship it facilitates to his followers. I’m interested in what this case illustrates about imagination and social media, how numbers become means through which dreams come to seem realisable. I’ll come back to this in a later post but I couldn’t resist ending on this tweet:

With almost 1.3 million followers and rising really fast, everyone is asking me to critique things(and people). Finally, I will be a critic. 1141 AM – 11 Jun 2012
There's an intriguing argument in *The Mediated Construction of Social Reality*, by Nick Couldry and Andreas Hepp, concerning our dependence upon digital media and how we respond to its failure. From loc 5527:

We feel the costs viscerally: when ‘our’ media break down –we lose internet connection, our password stops working, we are unable to download the latest version of software required by the device or function we want to use –it is as if the social infrastructure were itself, in some respect, breaking down: recursivity has been interrupted, ontological security becomes threatened.

I take their point to be that our reliance upon digital media isn't simply about specific purposes. For digital media to fail does not frustrate us because it impedes a particular purpose. In an important sense, our purposiveness as such, has come to rely upon digital media. For this reason, there is a latent trauma inherent in its breakdown. We experience its failure in terms of a impeded capacity to act within the world, as opposed to simply frustrating specific actions.

The argument is underdeveloped, as can be seen by the “in some respect” clause within it. It’s nonetheless an important and provocative one. It left me wondering if anyone has done qualitative research about experiences of wifi breaking down in terms of the affective fallout from such a failure? My experience of this has tended to be one of whole categories of action being foreclosed when this happens, as in a real sense I lose the ability to proceed with my work, rather than it simply being a contingent impediment to particular tasks. I imagine there’s a great deal of variability in how people respond to such a situation but I nonetheless think Couldry and Hepp are pointing towards something very interesting.

---

I've always been a big supporter of bursaries to 'English' (understood as a transitive verb) the dissertations of students for whom English is a second language. These students often have interesting things to say and deserve to have their ideas taken seriously. So, the cost of grammatical editing is worth the benefit of the ideas that can be thereby expressed. But why limit this policy to language differences? After all, academics even speaking their native languages may need some help to make what they are trying to say worth saying.

The next step is to develop machines/programmes that can deliver papers more effectively than their human authors, especially when the authors also tend to restrict the scope of the Q &A to just what was explicitly said in the paper – and not because of a lack of fluency in the language of presentation. Why should academic conferences routinely tolerate human authors who lip sync their papers and respond to questions in the form or repetition or mild elaboration of what they had just said? A computer should be able to do that sort of thing – including Powerpoints – more efficiently without the need for a flesh-and-blood human presence. As long as the human gets credit for what the machine says, there is hardly cause for objection. Moreover, it would diminish the academic’s carbon footprint! To make the conference experience more visually exciting, a hologram of the author could be projected at the moment of presentation. Imagine a large international conference of academics that hosts concurrent sessions of speakers in the style of a Cineplex!
But you might ask at this point who will physically attend such conferences in which most of the speakers are represented by holograms....

But if we’re willing to go this far, then we should take seriously what I call the Google Test – by analogy with the Turing Test. Can an academic audience distinguish between a human presenter and a holographically enhanced machine presenter that is programmed to access a search engine capable of anticipating and responding engagingly to a wide range of questions related to an academic paper? To be sure, the devil is in the details of what ‘engagingly’ means. But someone who developed a form of AI that passes the Google Test for a swathe of academic researchers would effectively issue a wake-up call to academics to redefine their sense of a vocation in a world where every other form of labour is gradually – sometimes not so gradually – being replaced by intelligent machines.

“Help! Help! Here comes everybody!”: Social Media and Corbynism (2017-06-23 08:00)

How has social media contributed to the growing success of Corbynism? In asking this question, we risk falling into the trap of determinism by constructing ‘social media’ as an independent force bringing about effects in an otherwise unchanged world. This often goes hand-in-hand with what Nick Couldry calls ‘the myth of us’, framing social media in terms of the spontaneous sociality it allegedly liberates as previously isolated people are able to come together through the affordances of these platforms. It’s easy to see how one could slip into seeing digital Corbynism in these terms: the power of social media allowed ordinary labour members to come together and take their party back from the Blairite bureaucrats. Such a view would be profoundly misleading. But social media has been crucial to events of the last few years in the Labour party. The challenge is how we can analyse this influence without allowing ‘social media’ to take centre stage.

It’s useful to see these issue in terms of institutional changes within the Labour party. Membership had declined from 405,000 in 1997 to 156,000 in 2009. The election of Ed Miliband in 2010, with his union-backing and soft-left presentation, led to a surge of 46,000 new members. This stabilised throughout the parliament, with continued new members replacing those who left or lapsed, before another small surge took membership past 200,000 in the run up to the 2015 election ([1]loc 377). The fact this influx of new members took place while social media was on the ascendancy in the UK implies no relationship between the two trends. But it’s interesting to note that substantial numbers of new (or returning) members were coming into the party at precisely the moment when new tools and techniques for interacting with each other and with the party itself were coming to be available.

It is convenient for some to blame social media for how events unfolded. We see this view reflected in the complaints of some on the Labour right that the nomination for Corbyn in the first place represented MPs crumbled under an orchestrated social media onslaught. However as Nunns ably documents, we can see a clear political calculus at work in many cases, with many feeling the need to keep the left onside, within their constituencies and beyond. In some cases, he speculates, such pressure provided an excuse to act on pre-existing concerns. There can be a cynical aspect to attributing causal power to social media, deflecting the assertion of incoming members and refusing to engage with developing trends that might threaten one’s political self-interest.

However what fascinates me is those for whom these events were inexplicable. In a way, it is a flip side of attributing power to social media, even if there might also be a cynical aspect to such a judgement. We account for events we don’t understanding by blaming a mysterious new element (‘social media’) which interrupted something
that was previously harmonious. If these events are seen as inexplicable, what does it say about the person making the judgement? As Nunns observes, it was the subterranean nature of Corbyn’s early campaign which allowed later mass rallies and mass actions to appear as if they were the work of some malign outside agency. The processes through which he gathered support were largely invisible to party insiders and this rendered the eventual outcomes close to inexplicable.

Hence the preponderance of bewildered lashing out, vacuous psychologising and conspiratorial theorising about a planned influx of far-left activists. These tendencies are more pronounced when the activity in question is disorganised. As Corbyn’s press spokesperson described the leadership campaign, this central organisation which sought to direct national activity was often “at the reins of a runaway horse”. To a certain extent these incoming groups were disorganised, sometimes acting in ways which reflected that, striking fear in the heart of some MPs familiar with limited contact with ‘the public’ under strictly defined conditions. These ‘normal people’ might prove baffling to career politicians:

We can see a positive myth of us and a negative myth of us, defined by a shared belief that social media has facilitated a transformation of the Labour party. Where they differ is in whether that involves authentic members taking their party back or outside agitators invading the party with malign intent. If we want to understand the role of social media in bringing about Corbyn’s ascent, we need to reject both and look more deeply into how the new tools and techniques they offered were just one amongst many factors in bringing about a profound transformation in British politics.

The precursors to curation (2017-06-24 08:00)

While many see the term ‘curation’ as modish and vague, I see it as an important concept to make sense of how we can orientate ourselves within a changing cultural landscape. However I can sympathise with the thrust of these objections, in so far as they take issue with a sense of curation tied in with the worship of the new. Such a use of the term is possibly dominant, framing the curatorial imperative (selecting from available variety through filtering, commentary and evaluation) as a specialisation which emerges to cope with the late modern world. If we frame curation in this way, we miss out on the opportunity to explore how it has changed over time. See for example Nick Couldry’s *Media, Self, World* loc 1732:

Some literary cultures have been distinguished by the richness of their practices of commentary: the Jewish tradition of cabbala is frequently cited, but the ancient world’s general scarcity of textual objects meant that written manuscripts often reached people with the commentary of previous readers’ (so-called ‘scholiasts’) embedded within them, a tradition which reaches us now via the comments written in medieval versions of Greek texts.

Now we are entering an age of commentary for the opposite reason: because of the almost infinite proliferation of things to read and look at, we need to send signals to help each other select from the flux. At the same time, and for related reasons, our ability to send comments and signals has been massively extended by digital media: we take it for granted that by emailing or uploading a link we can point at something interesting we have just read and so alert someone on the other side of the world. The scope of commentary as a practice has been massively enlarged.

It is important that we can address problems and opportunities created by specific technologies without circumscribing our accounts in a way that limits them to these technologies. If we do so, we fail to recognise the continuities and we are inevitably left with anaemic conceptions of the human and the social which tend to be exhausted by the social-technical. From loc 1534 of Couldry’s book:

From searching, other practices quickly develop: practices of exchanging information by forwarding web-links to family, friends or work colleagues, warehousing sites that collect recommendations from users so other users can narrow down their search practice (Digg, etc.), and tools for pre-ordered searches (RSS feeds and other alerts). These various search-enabling practices are increasingly prominent in everyday life as people seek to optimize their access to the vastly expanded flow of potentially relevant information. Their dispersed agency (anyone can forward a link or signal that they ‘like’ a post) contrasts with earlier centuries’ ways of disseminating interesting material: for example, the ancient and medieval world’s florilegia produced by groups of scholars, often in monasteries, who collected interesting quotes from otherwise obscure books into new volumes. Now not only do individuals (from their computers or phones, wherever they are) make the recommendations, but system interfaces, such as Digg and reddit, enable them to recommend cumulatively. Some commentators hope that ‘collaborative filtering’ and other collective forms of information sorting can challenge the dominance of Google and even create new forms of social bond.

How do we ensure we recognise these contrasts? How can we explore them in a way which allows us to productively theorise continuities and differences? There’s a fascinating meta-theoretical challenge here which I’d like to engage
with seriously in future.

Ten Theses on Liberalism (2017-06-24 16:29)

When I was first exposed to liberalism as a political philosophy, I was told that its founders were Spinoza and Locke, two thinkers who have always struck me as having rather little in common, except some common foes – especially a repressive state, be it based on religious or secular grounds.

Liberalism is less an ideology than a meta-ideology, namely, that the good society allows people as much as possible to decide matters for themselves.

Liberals thus place greater value on independence of mind than the particular positions to which it leads people.

A society of liberals may recognize each other as fellow liberals while disagreeing on most substantive matters.

The proper opposite of 'liberal' is not 'conservative' but 'authoritarian'.

The history of liberalism lacks a substantive focus that is conveyed across time, as each generation faces its own obstacles to the exercise of liberty.

It would be difficult to track liberalism in societies that lack a strong sense of self individuation and ownership because one would not be able to identify the relevant sense of 'independence' that the liberal values in persons.

Tolerance for a liberal is not an end in itself but rather a background virtue against which agreement and disagreement can be openly expressed.

Liberalism's main political challenge is to expand the sphere of tolerable diversity, understood in terms of participants, positions and outcomes.

The sociology of liberalism begins by assuming that individuals spontaneously differ and so various changes of mind are always required to generate any stable social consensus, which is itself always presumed to be temporary.

Modernity places a positive value on liberalism, though history suggests that it is by no means clear that liberalism can be fostered and maintained by purely liberal means.

Dedicated to Carl Gombrich, who queried the nature of liberalism on Twitter.
Lance Goodman (2017-06-24 17:03:08)
...and on the face of it who would quibble with such values and positions? The knowing sociologist would contextualise these and suggest that they are exercised often within a power/knowledge context. Poverty and social exclusion can make positions such as tolerance irrelevant to the everyday misery many endure in liberal societies. That is not argue that we do away with some of those theses but to admit that from certain subject positions they look like comfortable bourgeois theses argued from the safety of the coffee house from which many sprung. A nice summation and useful starting point for discussion,

Steve Fuller (2017-06-25 08:51:28)
Yes, but think of it this way: Critical theorists would be out of a job if liberals weren’t such hypocrites! All of critical theory’s positive normative ideals – such as they are – are parasitic on liberalism, but unfortunately liberals don’t live up to their own hype.

Public intellectuals as guides to the political flux, Or, “who can tell us what the fuck is going on?” (2017-06-25 08:00)

In the last couple of days, I’ve been reading The Candidate by [1]Alex Nunns. It’s a detailed and insightful account of Corbyn’s ascent to the leadership of the Labour party and the conditions which made this possible. After the election, it can also be read as as an analysis of broader conditions which might facilitate Corbyn’s ascendency to government. What both events share is their unsettling of political assumptions, as nascent transformations in political life made themselves felt for the first time in outcomes which professional observers of politics dismissed as impossibilities.

There’s an insightful discussion in The Candidate of this infamous dismissal of Labour members as ‘morons’ by Blairite apparatchik John McTernan. It took place in the run up to the leadership election when the first authoritative poll gave Corbyn a huge advantage over his rivals:

![John McTernan](https://example.com/mcternan.png)
What fascinates Nunns about this is how the bewilderment of the presenters led them to so openly reveal their biases. The underlying assumptions which bind together establishment worlds of politics and the media stand repudiated by these events and the presenters “struggle to keep their journalistic footing for five minutes of balanced analysis, even as the political terrain falls away beneath them” (loc 4070). As he goes on to observe on loc 4086:

In such moments of political flux, when a sudden development cannot be made to fit into the standard patterns of reporting used to depict the world, underlying biases are revealed. The genuine shock evinced in the Newsnight studio was reflected across the media; the shared assumptions and sympathies echoed in the vast bulk of the reporting and commentary that followed.

We have seen a lot of political flux in recent years. It would be absurdly inaccurate to see this uncertainty as something unique to the 21st century. There have been many other periods of world history characterised by a similar degree of uncertainty, as well as the the obvious point that ‘our’ certainty has often been ‘their’ uncertainty e.g. military adventurism during a relatively stable period of British politics. So by ‘political flux’, I mean events which can’t be incorporated into the intellectual frameworks dominant within the media and politics, usually taking place within national politics but sometimes aggregating together like an outflowing of nested bubbles across the globe.

But I believe media saturation represents a turning point because it leaves events unfolding more quickly, due to the affordances of digital communications, as well as folding back bewildered commentary into those events themselves. The political terrain can fall apart much more quickly and we can many more conversations in the period of time in which it is falling apart. There has been a qualitative and quantitative change in how such moments of uncertainty are constituted, as well as how they can generate new events.

Under these circumstances, I’m increasingly convinced there are new openings for public intellectuals. Probably not for hedgehogs but rather for foxes: discursive power falters in these moments of uncertainty and there’s new opportunities for influence available to those who can quickly and plausibly offer sophisticated explanations of events & maps of ways forward while the existing arbiters of political reality are quite openly wondering what the fuck is going on. There is a place opening up for a new kind of intellectual here. Can the established conditions of critical social thought give rise to it?

2. https://www.youtube.com/embed/r9hNQSghYKs?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent

John McCreery (2017-06-26 01:06:48)
Interesting point. How do we teach new generations of public intellectual wannabes how to be more foxy? Especially when academic disciplines reward specialization?
In political and social theory, the notion of constitution remains a central topic inasmuch as the term articulates a modern predicament with deep historical roots. For constitutions are not merely juridical objects of a superior rank that ground rights, institute law-making capacities, and secure state legitimacy. They attest to the self-constituting capacities of society to produce normative structures and shape life in common. This power of a community (or some of its members) to make and re-make its political form of coexistence manifests itself in the sedimentation of social practices, concepts, institutions, and knowledge. In this sense, a constitution does not represent a static unity of purpose, but rather an open arena of conflicting forces, processes, and strategies. The question of constitution is of special relevance and urgency today, both in the local context of the conference (as Chile has recently embarked on a process of establishing a new constitution) and in the international arena (given the constitutional crisis of the EU, the populist assault on constitutional democracy, and the failure of a number of constitutional projects in post-conflict societies). The conference invites proposals for presentations in English or Spanish that explore the question of constitution and the power to shape forms of life from different disciplines (philosophy, politics, sociology, history, law, anthropology) and approaches (critical theory, deconstruction, feminism, postcolonialism, conceptual and intellectual history, etc.). Possible topics include: – The concept of constitution and constitutional concepts – Constituent and destituent powers – Constituent moments and constitution-making – Constitutional crises and constitutional revolutions – Constitutional learning, progress, and regression – Democratic sovereignty and postdemocratic forms of life – Constitution of political subjects, subjectivities, and subjectivations – Normative struggles and critiques of constitutional norms – Constitutional politics, affects, and imagination – Transnational constitutions – Constitutions beyond constitutionalism We welcome submissions of extended abstracts of around 500 words, or else of complete papers. They should be prepared for blind review and sent to [1]coloquio_constitucion@mail.udp.cl. The deadline for submissions is July 16. Notices of acceptance will be sent by July 30. The conference is hosted by the Instituto de Humanidades and the Núcleo de Teoría Social (Facultad de Ciencias Sociales e Historia) of the Universidad Diego Portales. For additional information, please contact the organizers, Rodrigo Cordero and Wolfhart Totschnig, at the email address above.

1. mailto:coloquio_constitucion@mail.udp.cl
clearly communicating our findings and why they matter; and demonstrating how high standards in design, conduct
and analysis are built in to our research.

At this stage we are looking for up to 500 words to describe and explain what you’d like to present – with a
focus on one or more of these topic areas:

- Getting the message across
- The value of narratives
- Policy evaluation
- Embedding quality assurance
- The value of quality in evidence
- Qualitative innovation
- Quantitative innovation
- Involving research participants
- Dealing with the unexpected

The deadline for submissions is **Monday 7 August**. The SRA Events Group will assess all entries and aim to let you
know the outcome in September/October.

Presentations will be in parallel workshop sessions of 20 minutes (followed by a 10 minute Q &A). One pre-
senter per submission will pay a reduced delegate rate of £55.

Abstracts and other details must be submitted using the **template Word doc** that can be downloaded on our
website here: [1]www.the-sra.org.uk/events

We hope you will consider making a submission for the conference. And of course please feel free to share
this call with colleagues and networks.

**On the Spiralists (2017-06-28 08:00)**

In a recent editorial in Current Sociology, Michael Burawoy warns about what he describes as the [1] ascent of the
spiralists. He finds these figures throughout the UC Berkeley administration, accusing them of being "people who
spiral in from outside, develop signature projects and then hope to spiral upward and onward, leaving the university
behind to spiral down". There are naive spiralists and experienced spiralists but between them they are transforming
the university system:

---

5158
Spiralists enter the university from the outside with little knowledge of its inner workings. They don’t trust the local administration and instead cultivate, promote and protect each other through mutual recruitment, at the same time boosting their corporate-level incomes and contributing to administrative bloat. At UC Berkeley, senior managers have increased five-fold over the last 20 years, rising to 1,256 in 2014, almost equal to the number of faculty, which has barely increased over the same period (from 1,257 to 1,300). While the number of faculty has remained stagnant, student enrollment has increased by 20 percent.

Coming from the outside and concerned more about their future, spiralists are in the business of promoting their image — Dirks employed a firm to do just that at a cost of $200,000 to campus. Branding takes priority over ethics. This last year we have witnessed the cover up of sexual harassment by prominent faculty and administrators and the exoneration of punitive football coaching that led to the death of a football player and a $4.75 million civil suit — all designed to protect the Berkeley brand.

His analysis of the spiralists is heavily focused upon higher education:

Spiralism is not a function of pathological individuals but of an executive class who conceive of themselves as visionary innovators with new financial models, traversing the globe in search of private investors while complaining about recalcitrant legislatures and conservative faculty. They blame everyone but themselves for the plight of the university.

However I think the concept has a broader purchase than this. Reading the recent account of Hilary Clinton’s failed campaign, *Shattered*, I was struck by how many of the key figures could be seen as spiralists in this sense. In their concern for their own advancement, seeing the campaign in terms of opportunities to position themselves for their next job, the possibility for collective purpose amongst the top operatives was fatally undermined.

It’s a descriptively rich concept but it’s also an explanatory one. How does the concentration of spiralists shape organisational outcomes? Under what conditions will spiralists be attracted to organisations? Can certain sorts of organisations ever redeem and transform spiralists? The editorial Burawoy offers doesn’t delve into these questions but the concept he offers is a potentially powerful one.

It could be read superficially as an implied contrast between instrumental rationality and value rationality. But I think it’s more subtle than that. It points to particular intended and actual trajectories through organisations, opening up the relations between spiralists and their unintended consequences for the spiralists themselves and the organisations they work within.

1. [http://burawoy.berkeley.edu/Universities/Ascendancy%20of%20Spiralists.pdf](http://burawoy.berkeley.edu/Universities/Ascendancy%20of%20Spiralists.pdf)
‘multi-vocality’ as an example). If, however, real power is vested in a committee, or easily influenced leader, for example, it’s variable expectations may allow various interpretations of roles and outcomes, thereby permitting an outsider to take control of assets and roles for their individual gain. Leadership has a responsibility for the exercise of power particularly as cooperation versus domination, in order that organisations remain logical, and effective.

Making an Impact with Social Media, July 5th in Manchester (2017-06-29 08:00)

Social media offers for exciting opportunities for generating impact and communicating research beyond the academy. However, 500 million tweets and 3 million blog posts that are generated in a single day, as well as over a billion websites, pose an obvious challenge: how do you ensure you are heard above the din? How can you help researchers use social media effectively? How can you use social media as part of a multi-faceted and cost-effective impact strategy?

Aimed at academic researchers, research managers, university leaders, and project administrators, this workshop offers a practical introduction to using social media to engage with groups beyond the academy in a way that generates lasting impact. The session includes an overview of key considerations and group discussion of practical problems. The focus throughout will be on practical and sustainable techniques to build ongoing relations with publics outside the academy.

Each participant will have the opportunity to learn about the potential of social media in the current research funding environment, as well as draft an impact strategy relevant to their own projects. In addition to this, participants also have the option to purchase five hours of additional coaching via Skype to support the implementation of this strategy. This includes a free copy of [1]Social Media for Academics.

Mark Carrigan is a Digital Sociologist and Social Media Consultant. He is Digital Fellow at The Sociological Review and recently completed three years as Research Fellow in the Centre for Social Ontology at the University of Leeds.
of Warwick. He is the author of Social Media for Academics, published by Sage in early 2016. This is the first book length guide to the use of social media within higher education and has been widely praised across a diverse range of reviews.

Theory as practice: for a politics of social theory, or how to get out of the theory zoo (2017-06-30 08:00)

By Jana Bacevic

[These are my thoughts/notes for the "[1]Practice of Social Theory", which Mark Carrigan and I are running at the Department of Sociology of the University of Cambridge from 4 to 6 September, 2017].

Revival of theory?

It seems we are witnessing something akin to a revival of theory, or at least of an interest in it. In 2016, the British Journal of Sociology published Swedberg’s “[2]Before theory comes theorizing, or how to make social sciences more interesting”, a longer version of its [3]2015 Annual public lecture, followed by responses from – among others – Krause, Schneiderhan, Tavory, and Karleheden. A string of recent books – including Matt Dawson’s [4]Social Theory for Alternative Societies, Alex Law’s [5]Social Theory for Today, and Craig Browne’s [6]Critical Social Theory, to name but a few – set out to consider the relevance or contribution of social theory to understanding contemporary social problems. This is in addition to the renewal of interest in biography or contemporary relevance of social-philosophical schools such as Existentialism ([7]1, [8]2) and the Frankfurt School ([9]1, [10]2).

To a degree, this revival happens on the back of the [11]challenges posed to the status of theory by the rise of data science, leading [12]Lizardo and [13]Hay to engage in defense of the value and contributions of theory to sociology and international relations, respectively. In broader terms, however, it addresses the question of the status of social sciences – and, by extension, academic knowledge – more generally; and, as such, it brings us back to the [14]justification of expertise, a question of particular relevance in the current political context.

The meaning of theory

Surely enough, theory has many meanings ([15]Abend, 2008), and consequently many forms in which it is practiced. However, one of the characteristics that seem to be shared across the board is that it is part of (under)graduate training, after which it gets bracketed off in the form of “the theory chapter” of dissertations/theses. In this sense, theory is framed as foundational in terms of socialization into a particular discipline, but, at the same time, rarely revisited – at least not explicitly – after the initial demonstration of aptitude. In other words, rather than doing, theory becomes something that is ‘done with’. The exception, of course, are those who decide to make theory the centre of their intellectual pursuits; however, “doing theory” in this sense all too often becomes limited to the exegesis of existing texts (what [16]Krause refers to as ‘theory a’ and Abend as ‘theory 4’) that leads to the
competition among theorists for the best interpretation of “what theorist x really wanted to say”, or, alternatively, the application of existing concepts to new observations or ‘problems’ (‘theory b and c’, in Krause’s terms). Either way, the field of social theory resembles less the groves of Plato’s Academy, and more a zoo in which different species (‘Marxists’, ‘critical realists’, ‘Bourdieusians’, ‘rational-choice theorists’) delve in their respective enclosures or [17]fight with members of the same species for dominance of a circumscribed domain.

Competitive behaviour among social theorists
This [18]summer school started from the ambition to change that: to go beyond rivalries or allegiances to specific schools of thought, and think about what doing theory really means. I often told people that wanting to do social theory was a major reason why I decided to do a second PhD; but what was doing theory about? I did not say ‘learn more’ about social theory (my previous education provided a good foundation), ‘teach’ social theory (though supervising students at Cambridge is really good practice for this), read, or even write social theory (though, obviously, this was going to be a major component). While all of these are essential elements of becoming a theorist, the practice of social theory certainly isn’t reducible to them. Here are some of the other aspects I think we need to bear in mind when we discuss the return, importance, or practice of theory.

Theory is performance

This may appear self-evident once the focus shifts to ‘doing’, but we rarely talk about what practicing theory is meant to convey – that is, about theorising as a performative act. Some elements of this are not difficult to
establish: doing theory usually means identification with a specific group, or form of professional or disciplinary association. Most professional societies have committees, groups, and specific conference sessions devoted to theory - but that does not mean theory is exclusively practiced within them. In addition to belonging, theory also signifies status. In many disciplines, theoretical work has for years been held in high esteem; the flipside, of course, is that ‘theoretical’ is often taken to mean too abstract or divorced from everyday life, something that became a more pressing problem with the decline of funding for social sciences and the concomitant expectation to make them socially relevant. While the status of theory is a longer (and separate) topic, one that has been discussed at length in the history of sociology and other social sciences, it bears repeating that asserting one’s work as theoretical is always a form of [19]positioning: it serves to define the standing of both the speaker, and (sometimes implicitly) others contributors. This brings to mind that...

Theory is power

Not everyone gets to be a theorist: it is also a question of recognition, and thus, a question of political (and other) forms of power. ‘Theoretical’ discussions are usually held between men (mostly, though not exclusively, white men); interventions from women and persons from outside epistemic centres are often interpreted as empirical illustrations, or, at best, contributions to ‘feminist’ or ‘race’ theory*. Raewyn Connell wrote about this in [20]Southern Theory, and initiatives such as [21]Why is my curriculum white? and [22]Decolonizing curriculum in theory and practice have brought it to the forefront of university struggles, but it speaks to the larger point: that the ‘subaltern’ exists only to provide empirical or ethnographic illustrations for the theories developed in the metropolis.

The problem here is not only (or primarily) that of representation, in the sense in which theory thus generated fails to accurately depict the full scope of social reality, or experiences and ideas of different people who participate in it. The problem is in a fundamentally extractive approach to people: when their problems are turned into theoretical, they exist primarily, if not exclusively, in order to be explained. This leads me to the next point, which is that...

Theory is predictive

A good illustration for this is offered by pundits and political commentators’ surprise at events in the last year: the outcome of the Brexit referendum (Leave!), US elections (Donald Trump!), and last but not least, the UK General Election (surge in votes for Corbyn!). Despite differences in how these events are interpreted, they in most cases convey that, as one pundit recently confessed, nobody has a clue about what is going on. Does this mean the rule of experts really is over, and, with it, the need for general theories that explain human behaviour? Two things are worth taking into account.

To begin with, social-scientific theories enter the public sphere in a form that’s not only simplified, but also distilled into ‘soundbites’ or clickbait adapted to the presumed needs and preferences of the audience, usually omitting all the methodological or technical caveats that they normally come with. For instance, the results of opinion polls or surveys are taken to presented clear predictions, rather than reflections of general statistical tendencies; [23]reliability is rarely discussed. Nor are social scientists always innocent victims of this media spin: some actively work on increase their visibility or impact, and thus – perhaps unwittingly – contribute to the sensationalisation of social-scientific discourse. Second, and this can’t be put delicately, some of these theories are just not very good. ‘Nudgery’ and ‘wonkery’ often rest on not particularly sophisticated models of human behaviour; which is not saying that they do not work – they can – but rather that theoretical assumptions underlying these models are rarely accessible to scrutiny.

Of course, it doesn’t take a lot of imagination to figure out why this is the case: it’s easier to believe that selling vegetables in attractive packaging can solve the problem of obesity than to invest in long-term policy planning
and research on decision-making that has consequences for public health. It is also easier to believe that removing
caps to tuition fees is likely to result in individual universities charging fees distributed normally from lowest to
highest, than to bother reading theories of organizational behaviour in different economic and political environments
and try to understand how this maps onto the social structure and demographics of a rapidly changing society. In
other words: theories are often used to inform or predict human behaviour, but often in ways that reinforce
existing divisions of power. So, just in case you didn’t see this coming...

Theory is political

All social theories are about constraints, including those that are self-imposed. From Marx to Freud and
from Durkheim to Weber (and many non-white, non-male theorists who never made it into the canon), theories are
about what humans can and cannot do; they are about how relatively durable relations (structures) limit and enable
how they act (agency). Politics is, fundamentally, about the same thing: things we can and things we cannot change.
We may denounce Bismark’s definition of politics as the art of the possible as insufficiently progressive, but – at the
risk of sounding obvious – understanding how (and why) things stay the same is fundamental to understanding how
to go about changing them. The history of social theory, among other things, can be read as a story about shifting
the boundaries of what was considered fixed and immutable, on the one hand, and constructed – and thus subject
to change – on the other.

In this sense, all social theory is fundamentally political. This isn’t to license bickering over different historical
materialisms, or to stimulate fantasies – so dear to intellectuals – of ‘speaking truth to power’. Nor should theories
be understood as weapons in the ‘war of time’, despite Débord’s poetic formulation: this is but the flipside of intel-
lectuals’ dream of domination, in which their thoughts (i.e. themselves) inspire masses to revolt, usually culminating
in their own ascendance to a position of power (thus conveniently cutting out the middleman in ‘speaking truth to
power’, as they become the prime bearers of both).

Theory is political in a much simpler sense, in which it is about society and elements that constitute it. As
such, it has to be about understanding what is it that those we think of as society think, want, and do, even – and
possibly, especially – when we do not agree with them. Rather than aiming to ‘explain away’ people, or fit their
behaviour into pre-defined social models, social theory needs to learn to listen to – to borrow a term from politics
its constituents. This isn’t to argue for a (not particularly innovative) return to grounded theory, or ethnography
(despite the fact both are relevant and useful). At the risk of sounding pathetic, perhaps the next step in the
development of social theory is to really make it a form of social practice – that is, make it be with the people, rather
than about the people. I am not sure what this would entail, or what it would look like; but I am pretty certain it
would be a welcome element of building a progressive politics. In this sense, doing social theory could become less
of the practice of endlessly revising a blueprint for a social theory zoo, and more of a project of getting out from
behind its bars.

The tendency to interpret women’s interventions as if they are inevitably about ‘feminist theory’ (or, more frequently,
as if they always refer to empirical examples) is a trend I have been increasingly noticing since moving into sociology,
and definitely want to spend more time studying. This is obviously not to say there aren’t any women in the field of
social theory, but rather that gender (and race, ethnicity, and age) influence the level of generality at which one’s
claims are read, thus reflecting the broader tendency to see universality and Truth as coextensive with the figure of
the male and white academic.

In the contemporary world social theory plays the part that philosophy and religion once did. Theories make things happen; they make connections that were not there; they are becomings. We should acknowledge that theory has a life of its own, it has agency, independent of humans. That idea may be scary but it also allows us to step back and ask ‘what can a theory do?’

8.7 July

The dark future of mediatization (2017-07-01 08:00)

In the last year, Facebook Live has been plagued by occasional headlines reporting on shocking instances of violence being streamed through the platform. The sporadic quality of these reports easily creates an impression that this is exception. There have always been violent crimes, right? Therefore it stands to reason that the spread of the platform would inevitably create occasional incidences in which it featured in such crimes. However as this BuzzFeed analysis makes clear, such incidences have been a regular occurrence on the platform since its inception:

Facebook Live has a violence problem, one far more troubling than national headlines make clear. [1]At least 45 instances of violence — shootings, rapes, murders, child abuse, torture, suicides, and attempted suicides — have been broadcast via Live since its debut in December 2015, a new BuzzFeed News analysis found. That’s an average rate of about two instances per month.

When it launched, Facebook CEO Mark Zuckerberg touted Live as “a great medium for sharing raw and visceral content.” But from its inception and over the many months that followed that became darkly true — to terrible effect. Videos of shootings, murders, suicides, and rapes began to show up on Facebook with alarming regularity.

What should we make of this? There are important issues raised about the accountability of platforms, as Facebook have refused to comment on this trend and instead simply pointed to past statements by Mark Zuckerberg and their committed to hiring new moderators. But there is enough evidence of a relationship between Facebook Live and violence that we should take seriously the possibility that in some cases the platform might be contributing to crime generation rather than merely reflecting it.

The disturbing possibility invoked in the article is that there is a mimetic dynamic at work, as the possibility for immediate notoriety and a growing list of exemplars incline people towards horrific acts which might have remained embryonic without these two conditions:

Some criminologists worry that broadcasts of violent crimes to Facebook Live might lead perpetrators of violent crime to view the platform as a means of gaining infamy, bypassing the traditional filter of the
media. “The most likely impact is that it’s going to be a model of how to distribute and immortalize your act,” Ray Surette, a criminal justice professor at the University of Central Florida, told BuzzFeed News.

Jacqueline Helfgott, chair of the Criminal Justice Department at Seattle University, agreed. "It's making it easier for people to gain notoriety instantly without gatekeepers," she told BuzzFeed News. "I definitely think there’s a mimetic effect."

The mainstream media have previously been gatekeepers to such notoriety. But now it’s possible to achieve it through virality, assuming moderators prove unable to near immediately remove such videos. There’s an incredibly bleak book by Franco Berardi, Heroes: Mass Murder and Suicide, which offers useful resources for making sense of this possibility. He argues that mass murderers are “the extreme manifestation of one of the main trends of our age” involving “people who are suffering themselves, and who become criminals because this is their way both to express their psychopathic need for publicity and also to find a suicidal exit from their present hell” (pg 3).

In such crimes we see a “violent acting out, as disconnected from a conscious elaboration: just do it” (pg. 56) but one licensed by a desire for infamy. It is this fame which motivates the act, offering the possibility of transcending one’s own subordination by living on forever, showing them forever:

Like the large majority of the generation that has grown up in the Neoliberal decades, the young Eric Harris is totally persuaded that the strong have the right to win and predate. It is the natural philosophy that he has absorbed in the social environment in which he was educated, and it also the underlying rationale of the video games that he loved to play. But the young man knew very well that he was not going to be a winner in the social game. Instead, he decides that he will be a winner for a moment; I’ll kill and I’ll win; then I’ll die. The murderous action is conceived as revenge for the humiliation that he has suffered in the daily game of competition. (Pg 50)

The infamy is what ensures that victory will live on. It cannot be reversed. Through their actions they achieve the status they were constantly seeking yet could never receive within life. As with much work of this type, it’s speculative social science of a sort that can be critiqued on empirical grounds. But the underlying thesis is one we should take seriously: the promise of infamy coupled with the release of violently acting out is a socially produced temptation in a profoundly unequal society which valorises ‘winners’ while attacking ‘losers’. These exceptional acts need to be understood as extreme responses to social conditions which are pervasive.

If there is any accuracy to these claims, we ought to be extremely concerned about Facebook Live. The barriers to entry for Berardi’s ‘heroes’ are lowering radically: the pathway to infamy can be found in the everyday object of the smartphone, rather than being reliant on recognition from the mass media. What might seem like exceptional cases, inexplicable in terms of wider social forces, could in fact herald the dark future of mediatization.

From a politics of speed to a political sociology of speed (2017-07-02 08:00)

In the last few years, I've become a little obsessed with speed. It seems this often leaves me coming across like an accelerationist. I occasionally flirt with the idea that I'm a slightly peculiar form of left-accelerationist, but it's more for rhetorical amusement than genuine conviction. In fact I find much of what's written about the politics of speed inadequate, with my interest instead being in a political sociology of speed. By the former, I mean a valorisation or condemnation of speed, exploring the emancipatory potential in speed or seeking salvation through slowdown. By the latter, I mean an analysis of how speed is a vector through which power operates in social life. The concerns of the former often obstruct the analytical imperatives of the latter, though of course accelerationists inevitably address these questions as well.

What made me reflect on this was an interesting example I stumbled across in The Divide: American Injustice in the Age of the Wealth Gap by Matt Taibbi. On pg 127-128 he describes the enforced slowness which results from data-driven policing inspired by a ‘broken windows’ philosophy of crime:

If you’re charged with a crime, and you get notice of a court appearance, you have to show up to a packed room at an appointed time that in reality is only an approximate time. If it says 10:30 a.m. on the notice, you may end up waiting three, four hours for your case to come before the judge. During that time you are permitted to do exactly one thing: sit in court and watch the action. There is no talking, sleeping, eating, or reading in any of the courtrooms like the one on Schermerhorn Street. You must pay attention to the judge at all times. Some of the judges are insanely touchy about these rules, too. Judge Charles Troia, a glowering dark-haired man who runs a courtroom on the eighth floor, has a particular mania for talkers and readers. He has his court officer bark out instructions on the matter repeatedly throughout the morning. “In case you missed the sign,” the officer yells out, “there’s no reading, eating, or sleeping. Listen up! It’s going to be a long night.” The ban on reading is particularly odd, given that some of the judges have literary ambitions. Judge John Wilson, who by the time this book is published will have moved from the Brooklyn courts to the Bronx, is notorious in this courtroom for having authored a children’s book called Hot House Flowers.

This looks like hyperactive activity when considered at the level of the police, with 22,000 people arrested for loitering in a typical year in New York City. But from the perspective of those regularly subject to such nuisance arrests, it’s profoundly decelerative, with one interviewee describing how “you come to court and you’ll sit there all day waiting for your name to be called” and how he had “probably sat ten hours in the three times” he had come to court (pg 125). This is an example of the chronopolitics of speed, something which manifests itself relationally within an institutional context. It’s hard to theorise if we remain on the level of treating speed as what Filip Vostal calls a ‘mega force’. For this reason our starting point needs to be the political sociology of speed rather than the politics of speed.

Practitioners of social philosophy regard what they do as valuable, imbuing it with a sense of importance which is reflected in the often scholastic way in which readers cite and engage with such work. How seriously should we take this judgement? Does social philosophy have intrinsic worth? Or could it be considered a peculiar form of speculative journalism?

Reading a recent book by Matt Taibbi led me to reflect on this question for the first time in a while. After enjoying his account of the Trump election campaign, I’ve been working my way through his previous books. In *The Divide* he explores how rampant income inequality in America has reshaped the criminal justice system, creating a two-tier system which complicates traditional notions of equality before the rule of law. From pg 207:

In other words, there’s a new class of people whose goal is to become above citizenship. Live in America, conduct your trades in the weaker regulatory arena in London, pay your taxes in Antigua or the Isle of Man. Keep the rights but offshore the responsibilities. The flip side is that there is a growing subset of people, like undocumented immigrants, who live below the level of full citizenship. If the first group is stateless by choice, these people are involuntarily stateless and have virtually no rights at all.

What struck me about this argument was how easily I could imagine it being advanced by someone like Zygmunt Bauman. The terminology would be different, the tone would be different and the context would be different. But the argument Taibbi develops in this book is one which converges with the thesis Bauman developed in books like *Globalisation* and *Wasted Lives*. In fact I’m pretty sure I could restate the core argument of Taibbi’s book in persuasively Bauman-esque language.

This is a period of Bauman’s work I really like, something I observe to make clear that this isn’t just another dismissal of the Liquid Modernity cottage industry. But reading Taibbi’s entertaining and informative book, I was left reflecting on whether social philosophy of this sort has intrinsic value over-and-above journalism of the kind Taibbi engages in. What does the abstraction actually contribute? We can easily delude ourselves into thinking that abstraction inevitably brings us closer to the truth beyond appearances, the way things really are. But it can also simply obfuscate, rendering partial judgements with an unclear empirical basis as authoritative statements about epochal change.

This isn’t an argument against social philosophy. It’s an attack on the implicit hierarchies expressed in how we compare it to other ways of telling about society. There’s much we can learn from exploratory investigative journalism that leads to social critique. But doing this requires we have the confidence to laugh in the face of those who might accuse of us of seeking to become “a mere journalist”:

In many academic circles today anyone who tries to write in a widely intelligible way is liable to be condemned as a ‘mere literary man’ or, worse still, ‘a mere journalist.’ Perhaps you have already learned that these phrases, as commonly used, only indicate the spurious inference: superficial because readable. The academic man in America is trying to carry on a serious intellectual life in a context that often seems quite set against it. His prestige must make up for many of the dominant values he has sacrificed by choosing an academic career. His claims for prestige readily become tied to his self-image as a ‘scientist’. To be called a ‘mere journalist’ makes him feel undignified and shallow. It is this situation, I think, that is often at the bottom of the elaborate vocabulary and involved manner of speaking and writing. It is less difficult to learn this manner than not. It has become a convention – those who do not use it are subject to moral disapproval. It may be that it is the result of an academic closing of ranks on the part of the mediocre, who understandably wish to exclude those who win the attention of intelligent
Earlier this month I co-organised an event exploring how graphic novels can be used to communicate research. My interest in research communication and love of the medium had long left me fascinated by this possibility, something which I began to explore more seriously when I attended a weekend masterclass by Tony Lee. This comprehensive introduction to the writing and production process left me newly aware of the difficulty of the medium but even more excited about the possibilities which graphic novels offered for communicating social research.

Therefore I was delighted when The Sociological Review agreed to support a one day workshop, organised with Jenny Thatcher, introducing the medium to social scientists. In the morning, Helen Kara introduced graphic social science and placed it in the context of creative methods, before Katy Vigurs talked about the process of putting together her research-informed comic Higher Fees, Higher Debts: Greater Expectations of Graduate Futures. The bulk of the day was then convened by Tony Lee, introducing the medium and walking us in detail through the process of writing comics, before we discussed potential ways forward for graphic social science in a final session. You can see a compilation of tweets from the day here.

What is Graphic Social Science? (2017-07-04 08:00)
This paper by Ernesto Priego, in which he [9]interviews Katy Vigurs about Higher Fees, Higher Debts, provides a useful overview of how non-fiction comics have been taken up across a range of fields, as well as the reasons for this:

Researchers have turned to comics as valid outputs for displaying research findings in print and online publications that can lead to the wider adoption of such research and can influence public policy. By arguing that comics creation is a 'way of thinking', comics have also become academic outputs in their own right ([22]Sousanis 2015a, [23]2015b; [24]Labarre 2015). According to Erin Polgreen, 'comic book narratives can work across platforms, engage younger, more visually oriented readers, and transcend cultural borders,' ([25]2014: 12). Polgreen cites cognitive scientist Neil Cohn: 'the evidence is fairly clear that sequential images (usually plus text) are an effective teaching tool' ([26]2014: 13). Indeed, it is today almost common-place to state that comics and cartoons are valuable means of teaching multimodal literacy skills ([27]El Refaie and Hörschelmann 2010). As Cohn notes, 'growing research suggests that sequential images combined with text are an effective tool of communication and education (e.g., [28]Nakazawa, 2005; [29]Nalu and Bliss, 2011; [30]Short et al., 2013), beyond just being entertainment' ([31]Cohn 2014).

There are some really exciting possibilities here. While much of the day was a hugely informative introduction to the creative and logistical challenges to putting together a research-informed comic, the final session turned to ideas about how we could support Graphic Social Science as an exercise that sought to produce outputs such as this. Here are some of the ideas we had about features for a web based resource supporting graphical social science:

- Comprehensive bibliography
- Database of research-informed comics
- Listings of conferences and events
- Links to other resources
- A skills bank collecting 'how-to' guides in various formats
- Write-ups of experiences of collaborations
- Reflections on the methodology of graphic social science
- Listings of funders open to graphic social science
- Listings of publishers open to graphic social science

[33]Graphic Medicine was discussed as an example of how such an online resource could function. We discussed other ideas for how the development of Graphic Social Science could be supported:

- Producing a code of ethics
- Producing a web comic to disseminate short-form Graphic Social Science
- Developing an anthology (or series thereof) to disseminate Graphic Social Science
- Hosting further events, hopefully involving a wider non-academic community

In an extensive discussion of the challenges facing Graphic Social Science, I felt six main themes emerged:

- Establishing the academic legitimacy of Graphic Social Science
- Finding places to publish the outputs of Graphic Social Science
- Establishing how peer review can function properly for Graphic Social Science
- Establishing good practice for collaborations
- Clarifying where Graphic Social Science sits within the research process e.g. is it ‘just’dissemination?
- Exploring the potential audiences for Graphic Social Science: are we seeking to communicate ‘internally’, ‘externally’ or both?

Hopefully we can take this forward from here! Join the [34]Facebook Group or get in touch via [35]Twitter if you'd like to be involved.

Terry Smyth (2017-07-04 09:44:46)
If anyone needs to be convinced of how graphic novel techniques can illuminate complex sociological, psychological and historical topics, I’d urge them to read Art Spiegelman's Maus. It changed my mind totally about the power of text and image combined.

This Week in GraphicMedicine (7/7/17) – The Graphic Librarian (2017-07-07 16:38:54)
[...] What is Graphic Social Science? [...] 

The revenge practices of plutocrats (2017-07-05 08:00)

What do we think of when we imagine elites exercising their power? There are many ways we can approach such a question, with varying degrees of abstraction. But reading The Divide: American Injustice In The Age Of The Wealth Gap, by Matt Taibbi, has left me preoccupied by how they practice revenge. It's easy to imagine our contemporary plutocrats having an impulse towards revenge, as we trundle ever more inexorably towards what appears to be a dark neo-feudal future. The structural constraints upon vengeance are weakening, reflecting the declining accountability of plutocrats, accompanied by a diminishing sense that such figures are part of the social order and bound by the same rules as those within it:
Such considerations can easily fuel a dystopian imagination, powerfully expressed in Peter Frase’s idea of exterminism. His concern is with the growing tendency of the rich to regard themselves as persecuted and seek to withdraw
themselves from wider society. As he writes on loc 1471 of Four Futures:

But the construction of enclaves is not limited to the poorest places. Across the world, the rich are demonstrating their desire to escape from the rest of us. A 2013 article in Forbes magazine reports on the mania, among the rich, for evermore-elaborate home security. 11 An executive for one security company boasts that his Los Angeles house has security “similar to that of the White House.” Others market infrared sensors, facial recognition technologies, and defensive systems that spray noxious smoke or pepper spray. All this for people who, although rich, are largely anonymous and hardly prominent targets for would-be attackers.

Paranoid though they may seem, large numbers of the economic elite appear to regard themselves as a set-upon minority, at war with the rest of society. Silicon Valley is a hotbed of such sentiments, plutocrats talking openly about “secession.” In one widely disseminated speech, Balaji Srinivasan, the cofounder of a San Francisco genetics company, told an audience of start-up entrepreneurs that “we need to build opt-in society, outside the US, run by technology.” 12 For now, that reflects hubris and ignorance of the myriad ways someone like him is supported by the workers who make his life possible. But it demonstrates the impulse to wall off the rich from what are deemed to be surplus populations.

His suggestion is that such defensiveness might over time become offence. Not in the generic sense in which the accumulated privilege of the plutocrats necessarily entails a relationship of offence to wider society. But in the much darker sense of deliberately seeking to eliminate surplus populations. In a speculative but thought-provoking account, he draws together a diverse range of trends which collectively point towards the increasing willingness of elites to sanction intensifying violence against ever greater portions of their populations.

How seriously should we take this? I’m not sure. But I realise my interest in the revenge practices of elites is motivated by a concern to elucidate where our present conjuncture could one day lead. There’s a disturbing story in The Divide which the author summarises on pg 248:

The Fairfax fiasco is a tale of harassment on a grand scale, in which the cream of America’s corporate culture followed executives, burgled information from private bank accounts, researched the Canadians’ sexual preferences for blackmail purposes, broke into hotel rooms and left threatening messages, prank-called a cancer-stricken woman in the middle of the night, and even harassed the pastor of the staid Anglican church where the Canadian CEO worshipped on Sundays. They worked tirelessly to instigate phony criminal investigations in multiple countries, tried relentlessly to scare away investors and convince ratings agencies to denounce the firm, and in general spread so many lies and false rumors to so many people using so many different false names that they needed a spreadsheet to keep track of their aliases.

What’s so grim about this tale is the personal animus which seems to be at work here. As well as their initial financial motivations, they really want to destroy the life of the Fairfax chief for rather indiscernible reasons. The reporting isn’t complete by any means but it’s a fascinating and disturbing account of one of the most extreme examples of revenge by defensive elitists I’ve come across. I’d like to find and study more examples of this to better understand that characteristic defensiveness which I’m beginning to try and theorise, as well as where it might lead us in future.

Think of a big country like Brazil and you'll see the terms with which these revenge practices of the elites have worked their way after the latest coup d'État around here. With no otherwise valid excuse to implement "protection against political corruption", the elites now in power have made cuts in public health care and education that had been a touchstone of 13-year left-wing Workers' Party governments (Lula's and Dilma's) that notably aided the poorer segments of society and kept the economy going alright. The Brazilian elites and the media ousted Dilma and put a supid puppet in her place.

CFP: Global Digital Media Cultures and "Extreme Speech" (2017-07-06 08:00)

CFP WORKSHOP
Global Digital Media Cultures and "Extreme Speech"
23-24 February 2018

Ludwig Maximilian University, Munich
Abstracts due: 31 August 2017

Convenors:
Sahana Udupa (LMU Munich)
Matti Pohjonen (Africa's Voices Foundation)

Recent political upheavals in Europe and the US have once again highlighted the paradoxical nature of contemporary digital communication. The celebratory discourse of digital technologies' potential for openness and democracy is now eclipsed by the "dark side" of new media as a platform for promoting hate speech, fake news, terrorism, misogyny and intergroup conflict. Researchers are confronted with a new lexicon of communicative tactics: ecosystems of fake news; disinformation campaigns; coordinated troll attacks; and targeted hacks aimed at influencing elections. Calls to monitor, legislate and remove hateful and violent online speech have also reinvigorated older legal, political and philosophical debates on the boundaries of accepted civility and legitimate forms of political communication. The negative forms of online speech, it is widely argued, threaten the taken-for-granted freedoms commonly associated with digital media cultures across the world and bringing about what some critics have called a "post-truth" society.

Despite this heightened sense of urgency, these concerns are, however, by no means new or limited to the Western world. A cursory glance of many examples from the "global South" reveals a long-standing anxiety about the dangers of unbridled speech in situations where it can provoke ethnic and
religious conflict, mass violence and social unrest. In Ethiopia, for example, following a series of violent protests and killings, the government has declared a state of emergency and made political commenting on Facebook illegal under the pretext of preserving peace. In India, social media is replete with acrimonious abusive exchange in political debates. Legal stipulations to prevent hate speech on grounds of religious harmony and national security are routinely invoked to regulate online media in India, Pakistan, Malaysia and Sri Lanka. In Myanmar, social media has been used widely by Buddhist groups to ignite violence against its Muslim minority. In all the cases, digital media have also evolved into vibrant forums for political participation and counter-speech.

The aim of the Global Digital Media Cultures and Extreme Speech workshop is to examine these paradoxes of contemporary digital communication from a critical-comparative perspective rooted in ethnography. By defining online vitriol as "extreme speech", we depart from the dominant legal definitions of "hate speech" and narrowly constructed terrorism talk. As a form of digital culture, "extreme speech" pushes the boundaries of legitimate speech along the twin axes of truth-falsity and civility-incivility, raising critical questions about some of the taken-for-granted assumptions of communication and political participation. "Extreme speech" serves to reinforce differences and hatred between groups on grounds of religion, race, political ideology and gender, often with the overt intent to intimidate and agitate target groups and individuals. Yet, its ambivalent nature in certain contexts could also provoke challenges to established hegemony. "Extreme speech" thus foregrounds an approach to digital cultures as forms of situated practice (i.e. what people do that is related to media within specific cultural contexts) in order to avoid predetermining the effects of online volatile speech as vilifying, polarizing or lethal (Pohjonen and Udupa 2017).

To advance these aims, the workshop invites a selected number of scholars from across the world to discuss the latest empirical findings, methodologies and theoretical frameworks to understand "extreme speech" in Africa, Asia, Europe and North America. We invite scholars engaged in ethnographic research on the topic using the perspectives of anthropology, critical discourse analysis, history or communication studies. Over two days of presentations and discussions, the participants will explore the different mediatized contexts of digital use and circulation and cultures of digital exchange and securitization, to examine what this dramatic rise of volatile speech means for democratic dialogue and participation across the world.

Topics include but are not limited to:

- Ethnographies of production and circulation of online extreme speech
- Ethnographic analysis of ‘hate speech’ discourse as regulatory/state agenda
- Cultural translation of hateful content
- Audience ethnographies and the consumption of extreme speech
- Ethnographically driven mixed method approaches to study online extreme speech (virtual ethnography, data-driven digital ethnography, offline-online multi-sited ethnography, network ethnography)
- Trolling and online aggression
- Extreme speech and gender
- Extreme speech and ethnic conflict
- Political cultures of disinformation and fake news
- Forms of resistance to extreme speech
- Extreme speech and its challenges to communication theory
- Technologies and cultures of extreme speech monitoring

Attendance to this closed workshop is fully funded. Organizers will cover the costs of travel, accommodation and food. Workshop papers will contribute to the proposed edited collections (a special journal issue and an edited volume). The workshop will be held at Frauenchiemsee, a picturesque island about an hour away from Munich.

Please send your extended abstracts (1200 words) with the subject line "Abstract for the Global Workshop on Extreme Speech" to [1]ONLINERPOL@ethnologie.lmu.de before 31 August 2017. We will send notifications of acceptance by 30 September 2017. Abstracts should contain a clear outline of the argument, theoretical framework, methodology and ethnographic material (and findings if applicable), as well as a brief elaboration on how the research links to the overall theme of the workshop. Please also include 3-5 keywords that describe your work, and a Bio note (up to 100 words, stating affiliation).

The workshop is part of Project ONLINERPOL ([2]www.fordigitaldignity.com) funded by the European Research Council Starting Grant and hosted at LMU Munich, Germany.

Social morphogenesis: five years of inquiring into social change (2017-07-07 08:00)

Postmodernity. Second modernity. Network Society. Late modernity. Liquid modernity. Such concepts have dominated social thought in recent decades, with a bewildering array of claims about social change and its implications. But what do we mean by ‘social change’? How do we establish that such change is taking place? What does it mean to say that it is intensifying? These are some of the questions which the Social Morphogenesis project has sought to answer in the last five years, through an inquiry orientated around the speculative notion of ‘morphogenic society’.

In our book launch on May 30th 2017 at the British Library, contributors to the project gathered in order to reflect on their contributions and the project as a whole. Here are podcasts from the talks on the day:
You can see live tweets from the event [6]here.

Outflanking Platitudes: We should be excited but cautious about Platform Cooperativism (2017-07-08 08:00)

In the first episode of Outflanking Platitudes, Mark Carrigan argues we should be excited but cautious about the promise of Platform Cooperativism. This 2 minute 8 second provocation was recorded at the Centre for Social Ontology Book Launch event on May 30th, 2017.

The University Without Academics, by @johnbrissenden (2017-07-09 08:00)

by John Brissenden

In September 2027, England's first super-universities opened their doors to students. Of course, these doors were as much virtual as physical, since the majority of students studied entirely remotely, from around the world. But the defining feature of the four institutions, all privately owned and operated, was less to do with students, but the almost complete absence of academic staff.

The super-U's (unrelated to the French supermarket chain of the same name) were announced by the government shortly after the Conservatives were re-elected in 2022. Construction of the massive, brand new campuses, in London, Bristol, Liverpool and Leeds, began in 2023 following a closed auction of bids from Pearson and Kaplan.

The function of the campus, like so much else in the super-U, was fundamentally different from that in the old, public sector institutions. It was still the centre of the university, but it was now wholly devoted to the objectives of branding, reputation, employer and brand partner access, and student experience. The new centres dwarfed the priapic rush of university construction projects that followed the 2012 tuition fee increase, and resembled a Dubai shopping mall more than a university.

The super-universities' boundaries were porous, by design. Teaching delivery would now be much more flexible, thanks to the absence of awkward, unhealthy, grumpy academics. Classes were not only delivered remotely, but campus "events" were scheduled year round, at evenings and weekends. Employers and brand partners enjoyed extensive access to the campus, to the students, and to promotional opportunities. Buildings, programmes and students themselves had become the object of sponsorship on a grand scale. Branded satellite experiences had popped up in cities, and at festivals, around the world, months before the first admissions in 2027.

Most teachers were "employed" on Uber-type terms, while a few Premier League superstar teachers commanded massive remuneration as they toured these liberated institutions. Tuition fees were slightly lower than 5182
those charged in the old public sector universities, but not much, so as to sustain brand equity and shareholder value.

Students were issued a smartwatch and other high end hardware so as to enable the harvesting of data and the optimisation of satisfaction and achievement. The data was sold to interested third parties: loan providers, potential employers, brand partners. (The market in student data derivatives was still some years away.)

The universities claimed that they would be exponentially more responsive to students, since their satisfaction was now monitored in real time. However this responsiveness was in the aggregate. As before, the "student" in the "student experience" was imagined and based on data proxies. Actual, individual students had no greater status than Facebook users.

The arrival of the super university was the outcome of several disparate factors. There had been general agreement, following the United Kingdom's messy and inconclusive withdrawal from the European Union in late 2018, and the subsequent vote for Scottish independence, that the higher education industry in England faced an existential crisis. Most administrative, and many junior academic, roles had become obsolete thanks to automation, artificial intelligence and regulatory reforms. Finally, the collapse of national collective bargaining, and the subsequent splintering of the academic staff union, while long predicted, had finally happened at just the right time for the government, university managers and private providers to drive through the mass redundancies on which the super universities' business model would be predicated.

John Brissenden is Senior Lecturer in Public Relations at Bournemouth University

Emotion and affect in datafied worlds - workshop in Helsinki, 1st of Nov (2017-07-10 08:00)

1st of November 2017, University of Helsinki, Finland

Feeling data: emotion and affect in datafied worlds - workshop

Scholars working in the interdisciplinary field of ‘critical data studies’ have begun to address the effects of ‘datafication’ - understood as the conversion of qualitative aspects of life into quantified data – on the economy, public life, and self-understanding. The workshop focuses on the emotional properties and affective forces of datafication with the intent of exploring how these perspectives could operate as a fruitful starting point for thinking about future societal trajectories in terms of datafied power, domination, and agency. The goal is to bring together scholars working with questions of the emotional and the affective with the intent of demonstrating how the two research streams could strengthen each other. With a focus on emotional dimensions of datafication, addressing emotional engineering, emotion tracking, and everyday engagements with data, the goal is to explore the communication of the emotional, but also the various kinds of agencies, both human and non-human, that the focus on the emotional can uncover. The exploration of the affective exposes atmospheres, temporalities, energies and rhythms involved in datafication and living with data. Together these research streams point towards the central role that forces such as the non-human, non-quantified, non-linear and non-cognitive play in datafication, raising questions about inequality, discrimination and data in/justice and how to overcome them.

Confirmed speakers: Helen Kennedy (University of Sheffield) and Deborah Lupton (University of Canberra)
The workshop addresses topics such as:
- emotional effects and consequences of data/fication
- affective dimensions of data/fication
- emotional responses to data/data visualisations/data materialisations
- affective atmospheres of data gathering devices, and services
- emotional topics and patterns uncovered in small/big data
- emotional engineering and emotion tracking
- sensory dimensions of data and data materialisations
- relationship between emotions, trust and truth in data/fication

If you want to participate in the workshop, please submit a 300-word abstract and a short bio to [1]minna.ruckenstein@helsinki.fi.

Deadline for submissions is 8 of September 2017.

The workshop is arranged by the Data, Self & Society group at the Consumer Society Research Centre, University of Helsinki and the Self-tracking and automatised bodies -network, funded by Riksbankens Jubileumsfond/The Swedish Foundation for Humanities and Social Sciences.

Two modes for becoming who we are (2017-07-11 08:00)

The self as painting: we become who we are through repetition and representation. Encumbered only by our imagination and the culture in which we find ourselves, we craft ourselves through iterated projects of self-representation. We might find the materials available to us limiting, in which case we might seek out a more diverse palette of cultural ideas through which to express that which we are and wish to be. We might also seek to refine our technique, extending the range of our potential selves by expanding our capacities to represent them. But the process is fundamentally repetitive. We begin within constraints but once we start painting, it’s up to us what we do. The freedom exercised through this is one of redescription, in Richard Rorty’s sense, something which Roy Bhaskar once critiqued as relying on a ‘free-wheeling’ conception of freedom: it doesn’t hook on to the world, to the definitive ways in which things are at any given point in time, with all the constraints and limitations which this entails. Its appeal rests on the prospect of everlasting freedom. We can dispense with any one painting once we grow dissatisfied, throwing it away to restart in pursuit of ever richer and more vivid representations of our self. But there is an element of fantasy in this, refining our representation of self potentially at the cost of losing touch with the reality of who we are and where we are at any given moment. To craft the self as painting represents a private project of self-creation. It approaches the challenges of existence in an aesthetic register, one which cuts us off from our selves and from others in an ever-so subtle way, while holding out the (always re-treating) promise of endless freedom in inner life, whatever the world out there holds for us and what we care about.

The self as sculpting: through a sustained engagement with the material we find in our selves and our lives, we gradually produce the person we aim to be through our crafting of self. The process is subtractive, rather than additive. We select, refine and remove in a way that is path-dependent, often finding unexpected limitations which
follow from the whole sequence of past choices we have made. The further we go in this process, the less room for manoeuvre we have because our form becomes progressively more concrete with time. To become who we are depends on what was latent with us, but how this comes to take the form it does depends on the world we have found ourselves in and how we have chose to make our way through it.

We shape the clay but we do not choose it and our understanding of the range of possibilities latent within it will always be constrained by circumstance and experience. When the promise of the protean self is ubiquitous, tempting us with the idea that the only limit on who we can be is our imagination, the limitations of the clay can seem suffocating. But there is a freedom within these constraints. A profound, challenging and subtle freedom which refuses the reduction of existence to aesthetics.

The Personal Stories of a Methodology Study Group: An independent learning and support mechanism for postgrads (2017-07-12 08:00)

by Karen Cooper, Louise Oliver, Mananya Podee & Joanna Thurston

(Faculty of Health and Social Sciences, Bournemouth University, UK)

Figure 1 (l. to r.) Louise Oliver, Jo Thurston, Karen Cooper & Mandy Podee

Supervisor’s Notes:
Three postgrad students whom I supervise had varying degrees of difficulties with their Transfer Vivas, and particularly with defending their choice of method, and explaining how they went about choosing it.

Frequently, a research method is chosen for a study (often too early), but when it comes to defending that choice and describing how the method itself has developed over time, responses are found lacking in the students' responses to questioning. I felt that working together to strengthen their methodological expertise might be helpful. For this reason, I suggested that they form a short-term methodological study group.

Here, in a nutshell, are the potential research methods that each of the initial group have under consideration (taken from their Method Chapters work). As you can see, there is much that the initial three have in common in terms of the methodological approaches under consideration:

- Karen Cooper: Qualitative > Case study > focus group > Interviews
- Louise Oliver: Case Study > Biographic Narrative Interpretative Method > Interviews > Reflective Teams
- Mandy Podee: Interpretative Sociology > Qualitative > In-depth interviews and/or focus groups > Narrative Inquiry Approaches

Just before the group formed, I examined a PhD Transfer Viva for Jo Thurston. It was agreed during and then following the Viva that she would explore more fully auto-ethnographic and auto-biographic approaches in her research. Jo agreed, therefore, to join the group.

Below are their responses to questions that I submitted to them after about two months of meeting as a group.

- How did the idea for the Methodology Study come about? Had you been involved in any projects like this previously?
Mandy: My supervisor, Kip Jones, kindly introduced me to the group of postgraduate students who do similar projects in terms of methodology. I attended several workshops regarding methodology in my first year, but those workshops provided only basic knowledge, and I didn’t have much chance to discuss with other students like I do in this Methodology Study group. In this group, we also share reading materials. We learned to think about other members when we find articles that could be useful for their projects.

Karen: Suggested by my supervisor in terms of identifying a few people who were using similar methods but different approaches. Have not been previously involved in any projects specifically focused on one methodology.

Louise: Dr Kip Jones brought the group together; this was a very different group to anything I have been a part of before.

Jo: I was introduced to the idea of the study group by one of my examiners (Jones) for my transfer document. I have never been involved in anything like this and was nervous to be in a situation where I would be ‘comparing’ my methodological knowledge to others! It is always nice to hide behind the written word but to have to talk to others about methods is more exposing, but great practice for the final viva!

- Are there elements of method that you share in common? How does this help the group to move forward?

Mandy: We all do narrative research so it is common for us to share textbooks. We can also share our work with each other and receive advice from each other since we are working in similar fields.

Karen: Yes, in terms of historical background and development of the methodological approach. It has helped us all in terms of sharing not just the stages of our study, but we have also got so much from sharing different literature and resources between us. We have now reached the stage where we are so aware of each other’s work that we recognise sources that may not be specific to our individual research, but know whom in the group it might be helpful for! We have become more open and developed critiquing ability with constructive feedback.

Louise: The elements of the method we share together is the use of narrative and, to some extent, biography within our research methods. Therefore, we are able to talk about the history of narrative research, debate the methodology as well as support one another with the best approach to writing about our methodology and method. It is this commonality which was the initial push forwards in keeping the group together.

Jo: It was so interesting to see how, despite the fact we are all using slightly different approaches, the commonality of our collecting people’s stories united us in our conversations. We agreed early on to all look at the history of biographical methods and the commonalities and divergences that we had found were really interesting points on which to build conversations. We each agreed to read each other’s draft Chapter Three’s and then present our methodologies to each other to practice articulating our approaches and question each other. We all have a common goal of passing our PhDs so we wanted to provide a platform to enable each other to talk through challenges and practice the skills required to defend our work.
• One particularly interesting aspect of the project is the relationship between each other, each other's work and your own thesis. Have links developed?

Mandy: We often discuss about our writing feedback from supervisors, then we come up with some ideas to help others. I personally think that this is one of the best parts, because as I discuss my work with others, it helps me to understand and be more confident about my topic.

Karen: Due to the small number within the group we have developed a true bond with each other in terms of support—both personally and a greater awareness the stages of everyone’s research and understanding. It has helped me is in terms of developing my own knowledge of the methodology and the underpinning philosophies and epistemologies within the approaches used by others within the group. This again, then strengthens the ability the reason and defend our individual approaches, the similarities and differences.

Louise: This to me is not just a methodology group, it is a methodology support group where we help each other out theoretically as well support each other emotionally; this has brought the group to form quickly, and a close relationship between us all has developed. Adding to this, we all know of different academics outside of our group, and have encouraged links that way as well.

Jo: I feel we have really bonded over this experience and keep others in mind when we come across research etc that might be relevant to their study. My personal research has developed because of ideas and questions posed by others in the group. We have also adopted a slightly pastoral role for each other...possibly because we are all women and have naturally nurturing instincts/professional roles. I have only known these women a few months but we are literally rooting for each other to finish our studies and watch each other walk across the stage at graduation. I think it is particularly important for international students to be within a study group such as this to truly integrate them into their study experience and provide another level of support in addition to official university mechanisms.

• What advice would you give to social scientists interested in using a similar study group? How can these help postgrad students particularly to develop methodology?

Mandy: If you aren’t fearful in bringing up your problems with others who do similar things, it will definitely help you in your work. By exchanging study materials and presenting your work, it will lead you to be more efficient in your research and build up self-confidence.

Karen: To start with small numbers - as what was helpful was that has been no sense of competition but more an awareness of what stage everyone is at, individual challenges, and being open and honest about any difficulties and pressures at any given time. This also has been made easier with short focused weekly sessions in the first 2 months. The smaller groups have meant that these sessions have enabled everyone to have enough individual time for expression and their voice being heard. It was helpful to have an initial starting session that was facilitated...
in terms of introduction and potential possibilities of the group formation. It helps in several ways, for example, defending explaining their own research and methodology for their work with a developed understanding.

Louise: I think that the group being quite small has helped. Also, I am aware of the professional backgrounds of the majority of the group, who are in caring professions – which I think may bring in a different dynamic to the group, in the way that we support one another, have a shared ethos in practice and how we approach research. This group has been extremely helpful and I would not have developed my understanding of the methodology as quickly if it were not for the group and how we organised ourselves and set tasks for each week. So, each week we would each present or discuss something new.

Jo: Chapter Three has a fairly mechanistic structure and as such, no matter what the methodology, if you are in a methodology study ('support') group (!) you can support each other through the Chapter development and talk through ideas, etc. We set weekly goals to keep our focus and momentum (You don't just want to waste an hour chatting about how hard everything is!) and this was really important. To be able to research and then talk through your writing on history, for example, helps the student work through their methodological understanding and rehearse the articulation of justification etc.

- **How has working in a study group made it easier to return to working alone and in isolation? Or have you found an answer to this in the group process itself?**

Mandy: Working with the group helps me in terms of having clearer picture for my own work, therefore I find it easier to work on my own project afterward. Also, when I have problems, I know that I can always ask others either by email or at our group meeting.

Karen: I feel that the answer has been in the group process itself. The nature of the small group itself has been informative, motivational and developmental, which is self-evident in the progress and understanding we have all made during this process. After two months, the group has become a key factor in my personal learning and development. We appear to have no desire for the group working process to have an end point and have developed a joint affinity in the journey. We changed the name from Methodology Study Group to Methodology Support Group!

Louise: We have decided not to work alone and in isolation again. When I have been working on my Methodology Chapter, I have kept the others in the group in mind, and sent them research which I felt was relevant to their own individual studies, and they have done the same for me. It has taken the isolation out of what I do and we have decided to continue our group beyond writing our methodology chapters. This is to provide support throughout our research. Not only to support each other emotionally and take away the isolation but to continue the critical debates about research which, I can say, I have found extremely helpful.

Jo: The study group has been such a positive experience for each of us we have arranged to continue to meet to talk through progress and challenges, albeit slightly less frequently than once a week. To meet as a group makes us accountable for progression as you don't want to let down the others and not produce the work that we have all agreed to look at! The setting of small goals for each week enabled a more focused approach and that has continued for me in working on my own. however It is seeing the next group meeting in the diary, however, that helps me maintain momentum and keep progressing to Chapter completion!
**Biographies**

Karen Cooper qualified as a Registered General Nurse in 1978 and worked in clinical practice for 30 years within medicine and care of the older person. Since 2005, she has been involved in nurse education and is currently a lecturer in adult nursing. Her current research interests include practice assessment and mentorship in relation to practitioners personal and professional development, humanised care, qualitative research, group narratives and case study methodology.

Louise Oliver's research is about Child-To-Parent Violence and Abuse. This research was inspired by her experiences of working with families experiencing this form of family violence. In addition to this research, she is also a Social Worker.

Mananya Podee (Mandy) is an international PhD student from Thailand. The aim of her research is to critically evaluate the needs people with dementia toward holiday experiences in order to develop dementia-friendly holiday accommodation.

Joanna Thurston is the Programme Leader for the BSc (Hons) Sports Therapy programme at Bournemouth University and a part-time PhD researcher. Her research uses autobiographical methodology to explore her experience of living with osteoporosis as a young active female.

Mich Page (2017-07-13 07:39:45)

What a lovely idea to create a group that not only support each other academically, but it would seem to be the case that they now feel empowered to progress independently, knowing that they have colleagues who will understand their struggles and dilemmas, emotionally as well as practically. This has also created a fabulous opportunity for group writing or performance, the experience (arduous though it may be) of actually doing research, pushing the boundaries of knowledge and having the courage to step out into the unknown, is in itself an under-researched area, and I’m sure would be of great interest to other students.

ADRC's PhD Student Mananya Podee contributes towards an article | BU Research (2017-11-09 16:10:11)

[...] Mananya Podee & Joanna Thurston), Faculty of Health and Social Sciences, have just published an article in the Sociological Imagination blog. All at similar stages in the PhD [...] 

**The data warriors and the electoral wars they wage** (2017-07-13 08:00)

One of the most interesting issues raised by the rise of data science in party politics is how to untangle corporate rhetoric from social reality. I have much time for the argument that we risk taking the claims of a company like Cambridge Analytica too seriously, accepting at face value what are simply marketing exercises. But the parallel risk is that we fail to take them seriously enough, dismissing important changes in how elections are fought as marketing hype propounded by digital charlatans.

Perhaps we need to focus more on the data scientists themselves. As much as there is something of the
Bond villain about Alexander Nix, CEO of Cambridge Analytica, it’s important that we don’t become preoccupied with corporate leaders. Who are the rank-and-file data scientists working on campaigns? What motivates them? How do they conceive of the work they do? There were interesting hints about this in the recent book *Shattered*, looking at Hilary Clinton’s failed election campaign. Much as was the case with Jeb Bush’s near entirely stalled campaign, there had been much investment in data analytics, with buy-in right from the top of the campaign. From pg 228-229:

These young data warriors, most of whom had grown up in politics during the Obama era, behaved as though the Democratic Party had come up with an inviolable formula for winning presidential elections. It started with the “blue wall”—eighteen states, plus the District of Columbia, that had voted for the Democratic presidential nominee in every election since 1992. They accounted for 242 of the 270 electoral votes needed to win the presidency. From there, you expanded the playing field of battleground states to provide as many “paths” as possible to get the remaining 28 electoral votes. Adding to their perceived advantage, Democrats believed they’d demonstrated in Obama’s two elections that they were much more sophisticated in bringing data to bear to get their voters to the polls. For all the talk of models and algorithms, the basic thrust of campaign analytics was pretty straightforward when it came to figuring out how to move voters to the polls. The data team would collect as much information as possible about potential voters, including age, race, ethnicity, voting history, and magazine subscriptions, among other things. Each person was given a score, ranging from zero to one hundred, in each of three categories: probability of voting, probability of voting for Hillary, and probability, if they were undecided, that they could be persuaded to vote for her. These scores determined which voters got contacted by the campaign and in which manner—a television spot, an ad on their favorite website, a knock on their door, or a piece of direct mail. "It's a grayscale," said a campaign aide familiar with the operation. "You start with the people who are the best targets and go down until you run out of resources."

Understanding these ‘data warriors’ and the data practices they engage in is crucial to understanding how data science is changing party politics. Perhaps it’s even more important than understanding high profile consultancies and the presentations of their corporate leaders.

CfP: "Truth, facts, and fake: The shifting epistemologies of news in a digital age" (2017-07-14 08:00)

Special issue of New Media & Society and related online workshop

Truth, facts, and fake: The shifting epistemologies of news in a digital age

Co-editors:
Mats Ekström, University of Gothenburg
Seth C. Lewis, University of Oregon
Oscar Westlund, University of Gothenburg

Tentative timeline:
Abstract submission deadline: Monday, October 2, 2017
Notification on submitted abstracts: Friday, October 20, 2017
Online workshop focusing on the special issue theme: in early February 2018
Article submission deadline: Thursday, March 1, 2018
Verified, fact-based information is presumed to be an important feature in society, for citizens individually and for democratic governance as a whole. During much the 20th century, legacy news media enjoyed a prominent position in attempting to fulfill that role, reporting on happenings near and far. Journalists professionalized over time, developing standards, norms, methods, and networks of sources that enabled them to make knowledge claims. Such epistemological practices—presumed to provide factual and reliable public information—have made journalism one of the most influential knowledge-producing institutions in society.

However, both slow and sudden changes are challenging the role of journalism in society. There is an ongoing but gradual shift from legacy media to digital media. On the one hand, this shift has opened new pathways for news access and distribution across an array of platforms—social, mobile, apps, and the like. On the other hand, this shift has generally undercut the business models of legacy news media organizations, resulting in the weakening and downsizing of newsrooms and the fragmenting of collective audiences for news—altogether raising questions about the continued viability of journalism to produce reliable information. Meanwhile, the more sudden change in the information landscape is the rapid expansion of actors that, in some cases, are intent on providing “alternative facts” or otherwise questioning the accounts of news media. This comes at a moment when many people, particularly in developed countries, appear to have little confidence in the press. While some of these sources seek to verify facts in a journalistic fashion, others pursue a deliberate strategy of disinformation for political or financial purposes. The success of such “fake news” has led to widespread debate about what some are calling a “post-truth” era.

Altogether, these developments point to many opportunities for research and theory. A general question concerns how the epistemologies of journalism—knowledge claims, norms, and practices—are shaped by the changes and challenges in digital news production. How do journalists know what they know, and how are their knowledge claims articulated and justified? To understand the destabilization of the epistemic status of journalism articulated in current debates, what is needed are empirical studies, historical explanations, and theoretical developments. Moreover, it is essential to better understand how news consumers perceive news, “fake” or otherwise; e.g., how do they evaluate and act upon such claims? Citizens also need media literacy skills to assess the quality of information; what constitutes such literacy, and how does it respond to the knowledge conditions of the contemporary digital environment? As a response to the rise of fake news, several groups have mobilized to investigate information. The functioning and implications of such mobilizations (such as fact-checking movements), as well as digital media tools that aid citizens and professionals in verifying information, are important to analyze to develop our understanding of the production and consumption of more or less verified and non-verified information in a changing news media landscape.

For this special issue, the guest editors welcome two kinds of article submissions: theoretically informed and empirically rigorous articles (using quantitative, qualitative, computational, and/or mixed methods), as well as conceptualizations involving systematic and relevant literature reviews. Contributors may address issues including, but not limited to, the following:

The epistemology of different forms of journalism—such as data journalism, which conveys news through the analysis and visualization of numerical data, and participatory journalism, which involves audiences and communities in news construction;

Knowledge-oriented norms, values, and practices applied when publishing and distributing news, accordingly to varying socio-cultural, political, organizational, and technological contexts;

The shifting networks of sources on which journalists and other information professionals rely;

The discursive construction of “truth” and “facts” in the context of news production, distribution, and consumption;
Notions of “fake news,” “post-truth,” and related controversies brought to light by the 2016 U.S. presidential election, and which are applicable also in many other countries and contexts;

The knowledge-oriented practices of news consumers as they encounter purportedly “fake news” and propaganda online (and, by extension, questions of and conceptualizations for media literacy);

Verification on/for social media as well as related forms of technologically driven means of information assessment;

Perceptions and practices of professional footage vis-à-vis amateur footage, including issues of authenticity and authority;

The formation, vision, and practices of initiatives, groups or organizations working toward identifying “fake news,” on behalf of professionals, the public or both;

Comparative perspectives on news consumers and their relative trust in different forms of media processes and products;

The development, appropriation, and use of technological systems and tools for verification.

Information about submission:

Proposals should include the following: an abstract of 500-750 words (not including references) as well as background information on the author(s), including an abbreviated bio that describes previous and current research that relates to the special issue theme. Please submit your proposal as a PDF to the e-mail address [1]ekstrom.lewis.westlund@gmail.com[mailto:ekstrom.lewis.westlund@gmail.com] no later than Monday, October 2, 2017. Later that month, by October 20, authors will be notified whether their abstract has been selected, and consequently if they will be encouraged to develop and submit an article for peer review. Please note: Authors whose abstracts are shortlisted for full-paper submission to the special issue also will be committing to take part in an online workshop, hosted by the University of Gothenburg, to be held in early February 2018. This experimental approach will allow for the sharing and commenting on drafts as well as the discussion of more general theoretical issues, future research opportunities, and networking among scholars. Live sessions will be held for portions of two days, in addition to a week period for open commenting and discussion. Further details will be conveyed to shortlisted authors. Finally, full articles will be due Thursday, March 1, 2018, for full blind review, in accordance with the journal’s peer-review procedure.

CFP: 'What' and 'How' of Critique: Styles, Issues and Confrontations in Critical Social Theory and Research
(2017-07-15 08:00)

Wednesday, 20th September 2017, Duurham University Keynotes: Professor Peter Fleming (City University London), Dr Ana Cecilia Dinerstein (University of Bath) The way power operates in contemporary societies is changing and critical reflection and action is as relevant now as ever. There exist numerous styles of critique in contemporary social theory and research (Marxism, Frankfurt School, post-structuralism, feminism, post-colonialism, constructivism, ANT, etc.).
which often encompass different epistemological, normative, and political commitments and their understanding of critique differs accordingly. Moreover, some scholars argue for a move towards a “post-critical” approach to social research. However, answers to questions of what is critique, how should it be conducted, and how can it contribute to social change often remain implicit and underexplored. This postgraduate symposium will contribute to open and explicit discussion of what it means to be critical in social research practice, what different styles of critique researchers follow and highlight important differences between them. The symposium seeks to encourage students to reflect on what ‘being critical’ means in their academic and research practice. In addition, it offers a forum for discussion of what questions and challenges postgraduate students working in critical tradition face. We invite both theoretical reflections and examinations of these issues in relation to problems addressed in students’ research. We particularly encourage papers that: 1) Reflect on meanings of critique in relation to students’ own research 2) Discuss and compare different styles of critique focusing on their differences, advantages, and disadvantages. Please email abstracts of no more 250 words or questions regarding the symposium to [1]critique.pgbsa@durham.ac.uk. Bookings are now [2]OPEN. Registration Rates: BSA Member £10 Non Member £25 Key dates:

- Abstracts due: 1st August 2017
- Decisions announced: 8th August 2017
- Date of the symposium: 20th September 2017

Amado (2018-05-10 05:45:38)

wonderful points altogether, you just gained a new reader. What would you suggest about your publish that you simply made some days in the past? Any positive?

betberry login alternatif (2018-10-12 02:04:44)

I do accept as true with all of the ideas you’ve presented for your post. They are very convincing and will definitely work. Nonetheless, the posts are too quick for newbies. May just you please extend them a bit from next time? Thank you for the post.

greece ferry (2019-02-25 10:28:31)

Everything composed was actually very logical. But, what about this? what if you typed a catchier post title? I mean, I don't want to tell you how to run your blog, however what if you added a title that makes people want more? I mean » CFP: 'What' and 'How' of Critique: Styles, Issues and Confrontations in Critical Social Theory and Research The Sociological Imagination is kinda boring. You should pek at Yahoo's front page and watch how they create article titles to grab viewers tto click. You might add a related video or a pic or two to get people excited about everything’ve written. In my opinion, it could make your blog a littke livelier.

Politico-environmental crisis (2017-07-16 08:00)

In Naomi Klein’s new book No Is Not Enough, there’s a lucid overview of the intersection between political and environmental crisis. The role of drought in fermenting the conditions for the Syrian civil war was something which [1]Marc Hudson first explained to me last year. From pg 182-183:
The irony is particularly acute because many of the conflicts driving migration today have already been exacerbated by climate change. For instance, before civil war broke out in Syria, the country faced its deepest drought on record—roughly 1.5 million people were internally displaced as a result. A great many displaced farmers moved to the border city of Daraa, which happens to be where the Syrian uprising broke out in 2011. Drought was not the only factor in bringing tensions to a head, but many analysts, including former secretary of state John Kerry, are convinced it was a key contributor.

In fact, if we chart the locations of the most intense conflict spots in the world right now—from the bloodiest battlefields in Afghanistan and Pakistan, to Libya, Yemen, Somalia, and Iraq—what becomes clear is that these also happen to be some of the hottest and driest places on earth. The Israeli architect Eyal Weizman has mapped the targets of Western drone strikes and found an “astounding coincidence.” The strikes are intensely concentrated in regions with an average of just 200 millimeters (7.8 inches) of rainfall per year—so little that even slight climate disruption can push them into drought.

In other words, we are bombing the driest places on the planet, which also happen to be the most destabilized. A frank explanation for this was provided in a US military report published by the Center for Naval Analyses a decade ago: “The Middle East has always been associated with two natural resources, oil (because of its abundance) and water (because of its scarcity).” When it comes to oil, water, and war in the Middle East, certain patterns have become clear over time. First, Western fighter jets follow that abundance of oil in the region, setting off spirals of violence and destabilization. Next come the Western drones, closely tracking water scarcity as drought and conflict mix together. And just as bombs follow oil, and drones follow drought—so, now, boats follow both. Boats filled with refugees fleeing homes ravaged by war and drought in the driest parts of the planet.

Surely these intersections should be at the forefront of how we imagine social processes? I realise there are many reasons why this isn’t the case but the one I’ve been pondering is the sustained hold of the nature/society distinction. If we see nature and society as distinct domains, we’re liable to be blind towards the environmental factors at work in social catastrophe. Only an idiot would deny the relationship in principle but the effects are projected into the future, as an expected horizon in which the natural will impact upon the social. But in doing so, their present entanglement with all the consequences flowing from this, comes to be lost in the analysis of events which are interpreted as narrowly political.

What does public sociology have to say about sociologists who are ‘merchants of doubt’? (2017-07-17 08:00)

What does public sociology have to say about sociologists who are ‘merchants of doubt’? This is the question I’m slightly obsessing over after discovering that Peter Berger, famous for his work on social construction and the sociology of religion, [1] worked as a consultant [2] for the tobacco industry. As Source Watch [3] details, he was tasked with establishing that “anti-smoking activists have a special agenda which serves their own purposes, but not necessarily the majority of nonsmokers”:

He served as a Tobacco Institute consultant. While at Boston College, Berger, (as quoted in tobacco industry newsletter “The Tobacco Observer,”) described tobacco control proponents as “fanatical.”[6][1]
Berger attended Philip Morris executive meetings and participated in the multinational tobacco industry’s Social Costs/Social Values Project, created to refute the social costs theory of smoking and to help reverse declining social acceptability of smoking. He was a contributing author to the industry-financed book Smoking and Society, edited by another tobacco industry consultant, Robert Tollison.

This is critical sociology deployed on behalf of the powerful: pulling back the veil on a group pursuing an ideational agenda and claiming they act out of sectional interests. What other examples are there of prominent sociologists acting in this capacity? How should these cases inform our conception of public sociology?

1. http://montclairsoci.blogspot.co.uk/2017/06/peter-berger.html

Wander Nunes Frota (2017-07-17 14:41:22)
Here in Brazil, our former president, Fernando Henrique Cardoso, who used to be a leading leftist sociologist responsible for explaining what the so-called “Dependence Theory” meant for Brazilians, i.e. he somehow had helped develop this theory while he was in exile in Chile (at CEPAL) in the mid-1960s, even though he was the son of an old Army General, he turned out to be something of a fraud when he became Brazil’s president in the 1990s; for one thing, he was crazy enough to ask Brazilians to “forget what he had written as a sociologist”... So sincere on his part, isn’t it?

Purple Peppercorn (2017-07-18 02:14:12)
Chilling indeed. Thomas McLaughlin wrote "Street Smarts and Critical Theory" and looked at how it is taken up by right wing activists.

Public Intellectuals and the Shock Doctrine (2017-07-18 08:00)

In the last year, I’ve been preoccupied by the relationship between periods of political flux and public intellectualism. These aren’t longer term processes, in which the coordinates of an established consensus begin to disintegrate, but rather short term periods of intense public confusion e.g. the immediate aftermath of the Brexit vote or the shock Labour result in the last election. What happens when the established commentators don’t know what’s going on? What happens when large swathes of the population peer beyond the veneer of governance and realise no one
is really in charge of the system?

It is inevitably the case that order is soon resumed and an account of these events is established. However those interstitial moments where a dominant frame has broken down, without any successfully coming to take its place, represent a failure of interpretation with potential influence to be accrued by public intellectuals who can step into the picture and provide a clear and plausible explanation of what is happening i.e. why is this situation so rather than otherwise? This contrasts with the descriptions which the emerging model of intellectualism-as-punditry offers, as political scientists compete to see who can offer the most compelling hot take on the issue foremost on the media agenda.

It occurs to me when reading Naomi Klein’s new book, No Is Not Enough, what I’ve been calling ‘political flux’ relates to what she characterises as ‘shock’. These failures of interpretation can be brought about deliberately, creating moments in which resistance is untenable because things are moving too fast. But political flux can also emerge as unintended consequences from deliberate shocks, with the shock-architects themselves being taken aback by the consequences of their actions. On pg 6 she describes some of the shocks we are likely to see in the near future, as the Trump administration pursues its agenda:

it’s also a vision that can be counted on to generate wave after wave of crises and shocks. Economic shocks, as market bubbles—infated thanks to deregulation—burst; security shocks, as blowback from anti-Islamic policies and foreign aggression comes home; weather shocks, as our climate is further destabilized; and industrial shocks, as oil pipelines spill and rigs collapse, which they tend to do when the safety and environmental regulations that prevent chaos are slashed. All this is dangerous. Even more so is the way the Trump administration can be relied upon to exploit these shocks to push through the more radical planks of its agenda. A large-scale crisis—whether a terrorist attack or a financial crash—would likely provide the pretext to declare some sort of state of exception or emergency, where the usual rules no longer apply.

What role do public intellectuals have here? In alleviating the disorientation shock gives rise to by interpreting the political flux, it’s possible to stake out a new role for public intellectuals which takes advantages of the affordances of social media*. But this also requires linking these moments of flux together, drawing out the connections between the different shocks and articulating a story about how this all fits together. From pg 8:

we have to tell a different story from the one the shock doctors are peddling, a vision of the world compelling enough to compete head-to-head with theirs. This values-based vision must offer a different path, away from serial shocks—one based on coming together across racial, ethnic, religious, and gender divides, rather than being wrenched further apart, and one based on healing the planet rather than unleashing further destabilizing wars and pollution. Most of all, that vision needs to offer those who are hurting—for lack of jobs, lack of health care, lack of peace, lack of hope—a tangibly better life.

Yes, I realise it’s not as simple as simply getting ideas ‘out there’, but that’s a topic for another post.

Ways of Being in a Digital Age - A Review Conference (2017-07-19 08:00)

Ways of Being in a Digital Age - A Review Conference*

Dates: 10th and 11th of October 2017

Location: University of Liverpool, UK

Key Dates: 300 word abstracts: 21^st July 2017; Acceptance by 25th August 2017;

This conference will close the UK Economic and Social Research Council (ESRC) review of "Ways of being in a digital age". The project was commissioned by the ESRC to help identify and prioritise future areas and methods for research on the social, economic, political, psychological and cultural impacts of digital media and technologies. The final report will be published over the summer of 2017.

Click here for details of the project: [1]https://waysofbeingdigital.com/
Click here for details of the conference: [3]https://waysofbeingdigital.com/conference/
Click here for the submission site: [5]https://waysofbeingdigital.com/conference/ Led by the University of Liverpool, the project team consists of academics from eight UK universities and a broader international steering group that represents 18 universities and organisations from across the UK, France, the USA and Singapore. Click here for more information on the people involved in this research: [6]https://waysofbeingdigital.com/people/

To close the project, we are holding an academic conference to present, extend and deepen the work of the project team. We are calling for review papers on topics that address any aspect of the seven project domains: 1. Citizenship and politics 2. Communities and identities 3. Communication and relationships 4. Health and wellbeing 5. Economy and sustainability 6. Data and representation 7. Governance and security We are looking papers that offer systematic, thematic or methodological reviews of existing research on any aspect of the seven project domains. We are particularly interested in papers that build on reviews to offer analysis of research gaps and challenges for social research in the digital age. We intend to include the conference papers in an edited collection developed from the project. Abstract submissions are sought by 21^st July 2017 to: [8]https://easychair.org/conferences/?conf=wbda2017 For information on the conference or the project contact: [9]simeon.yates@liverpool.ac.uk

Brand Corbyn and Brand Trump (2017-07-20 08:00)

What do Jeremy Corbyn and Donald Trump have in common? On the face of it, two people could not be more
dissimilar but I'm curious about what might be their analogous position in relation to mainstream political culture.
After all, in a sense Corbyn came from outside party politics, albeit not in the way Trump did, being a life-long back
bencher and consummate constituency MP who never sought power in any sense. Both reject the common sense of
party politics and have in different ways [1]benefitted from a media which is superficially hostile to them.

Perhaps we can make sense of their commonality in terms of their political brands, both of which have formed
quickly in a way that floats free of the manifold pressures which shape self-presentation by those who spent years
seeking power through steady ascent of within a political party. Neither learned to walk the walk and talk the talk
in the way needed to gain respect and cultivate influence amongst their peers, perhaps avoiding the [2]deformation
professionelle to which these colleagues are subject to as a result. They don’t assume that political correspondents
are all powerful because they haven’t spent their professional lives seeking coverage from them, as well as being
judged by their peers on their success or otherwise in doing so.

This is what Naomi Klein says of Trump's political brand on pg 33 of her new book No Is Not Enough:

> It's also why no labor scandal is ever going to stick to him. In the world he has created, he's just acting like
> a "winner"; if someone gets stepped on, they are obviously a loser. And this doesn't only apply to labor
> scandals—virtually every traditional political scandal bounces off Trump. That's because Trump didn't just
> enter politics as a so-called outsider, somebody who doesn't play by the rules. He entered politics playing
> by a completely different set of rules—the rules of branding. According to those rules, you don't need
> to be objectively good or decent; you only need to be true and consistent to the brand you have created.
> That's why brand managers are so obsessed with discipline and repetition: once you have identified what
> your core brand is, your only job is to embody that brand, project that brand, and repeat its message. If
> you stay focused, very little can touch you.

This opens up the possibility that what is seen as electability, strong leadership and plausibility might actually be little
more than weakness in the face of the media. If you've built your political brand on performing in a way that wins
the media's favour, you are inevitably subject to their whims. You are constitutively tied to the cluster of journalists,
much as they are in turn tied to you through their need for access, leaving politics as a deformed game of intellectual
twister taking place on the parliamentary estate. But to be a new brand, emerging quickly in a way external to these
dynamics, involves near complete freedom from such influences if you can only 'stay focused'. Brand Corbyn and
Brand Trump couldn't be more different but there are deep similarities in how and why the media struggle to touch
them.

A playbook for merchandising doubt (2017-07-21 08:00)

I’m currently reading [1]Merchants of Doubt, a fascinating study of the tobacco industry’s deployment of academic experts to cast doubt on the harm caused by cigarettes. Being in the mood to read the book in an ultra-cynical way, here’s my playbook for merchandising doubt, derived from reading these cases through the lens of critical realism:

1. Exploit multiple causation to maximum effect: it might be that X reliably brings about harmful outcomes for society but so do A, B and C. Focusing on these alternate pathways to personal and social pathologies helps relativise the harm caused by X, as well as highlighting the uncertain relationship between it and those outcomes which everyone agrees are undesirable.

2. Attack inferences from populations to individuals: exploit the difficulty of apply population level generalisations to individual cases. Highlight these cases, promote them and promulgate them as emphatically as possible. These cases are your friend! The public don’t think in terms of statistical knowledge, but rather in terms of individuals. The more you can focus on individuals, the easier it will be to discredit statistical claims. Exploiting folk theories of causation and correlation will be key to using this tactic effectively.

3. You need facts to counter facts: it won’t work to simply dismiss research that harms your interests. It’s necessary to find ‘alternative facts’: claims about reality with enough evidence to make them hard to dismiss, but which encourage alternative framings of an issue that might otherwise be a matter of scientific consensus. Even if experts might question the salience of these facts, journalists will feel the need to report ‘both sides’ in interests of fairness or even highlight the novelty of the new framings your alternative facts open up. Plus the more facts the better, at least in so far as you’re trying to encourage the public to withdraw from intellectual engagement with these debates.

4. Create a debate and then swamp your enemy: such alternative facts and their playing out in the media can be a powerful way to create a debate out of something which is actually a matter of scientific consensus. Once this happens, it’s important that you outspend your opponents to the greatest possible extent. Scientists are rarely versed in public engagement, lacking both the disposition and expertise. Find experts at communicating your message and provide them with all the resources they need. Activist groups are slightly better equipped for this communication, but you’ll always be able to out spend them. It’s even better if you can create your own activist groups!

5. Always stress the vested interests of your enemies: behind their protestations of disinterested rationality, scientists are people with careers, employers and aspirations. By definition, their interests are served when they do their job in the way they are expected e.g. by producing knowledge. If you stress the way this work serves their interests, it obscures their cognitive commitment to the production of knowledge. This is even easier with activist groups who are vocal about their ideological commitments: in their case, their failure to perform the disinterestedness of scientists can be used to dismiss them as zealots!

6. Hack science through manipulating the burden of proof: most people don’t understand the way science progresses and uncertainty about peripheral issues can be exploited to cast doubt on what is largely settled. The complications which arise through new studies are your friend! Such a tactic will work even more effectively if you can find scientists prone to scientism, an obsessive commitment to countering claims that are seen to involve ‘over-reaching’; whose zealotry coupled with authority can help make your case.
7. If all else fails, attack the proposals: once the battle is lost, don’t waste time continuing to defend your case. Move on to the consequences of what your enemy advocates: what is the evidence for their proposals? Question the evidence, smear it as non-scientific, fund your own counter studies to discredit it. If their evidence is unimpeachable, invoke the slippery slope and attack the possible consequences of what they are advocating. Invoke democracy: who are they to say what we can or cannot do? Who gave them the right to shape policy? Who is controlling their agenda?

One of the more irritating framings of Donald Trump's rise to power has been to stress his 'disruptive' credentials. Such accounts often focus on the role of Jared Kushner, who has been granted a dizzying array of responsibilities in the Trump Whitehouse, prompting Gary Sernovitz to observe the overlap with recent events in Saudi Arabia:

When Donald Trump travels to Saudi Arabia later this month, the first country he will visit as President, the attention will be on geopolitics and the complicated friendship between Saudi Arabia and the United States. But the trip also highlights, just off center stage, an unremarked-upon similarity between the current Saudi government and the American White House: in both places, unelected men in their thirties have swiftly amassed power.

In Saudi Arabia, the thirty-one-year-old Prince Mohammed bin Salman, the deputy Crown Prince and son of King Salman, is now in charge of the oil industry, the economy, defense policy, a war in Yemen, and various domestic initiatives. In the United States, the national responsibilities of Jared Kushner, the President’s thirty-six-year-old son-in-law, include, according to the Times, “Middle East peace, the opioid epidemic, relations with China and Mexico, and reorganizing the federal government from top to bottom.” Kushner is technically the President’s senior adviser, but you might also call him America’s crown prince.

Both men are presented as "bringing modern and advanced ideas into stodgy government terrain", empowered by ageing rulers in virtue of their “being in touch with the latest in finance and technology”. There is little to justify this veneer of being tech-savvy, but it certainly covers up the role of “family ties and court intrigues” in their respective advancement. In the case of Kushner, such a framing can give a superficial plausibility to his leadership of the Office of American Innovation, arguably entrenching, extending and radicalising Obama’s mission to ‘reboot how government works’.

However I want to argue that Trump is a disrupter. But not in the sense in which the many tech-bros who cautiously applaud his assent are liable to understand the term. As Naomi Klein writes in her new book *No Is Not*
As this has been unfolding, it struck me that what’s happening in Washington is not the usual passing of the baton between parties. It’s a naked corporate takeover, one many decades in the making. It seems that the economic interests that have long since paid off both major parties to do their bidding have decided they’re tired of playing the game. Apparently, all that wining and dining of elected officials, all that cajoling and legalized bribery, insulted their sense of divine entitlement. So now they’re cutting out the middlemen—those needy politicians who are supposed to protect the public interest—and doing what all top dogs do when they want something done right: they are doing it themselves.

In this sense, we can see Trump as disintermediating politics. America has long faced a quasi-oligopolistic situation in which elites rules through strategic influence, near to unopposed in a situation which the political sociologist Colin Crouch characterises as post-democracy. The disruption of the Trump presidency involves the removal of that mediation, directly empowering the most activist and reactionary tier of this plutocratic elite. As she goes on to write, from pg 3-4:

But the Trumps seem unconcerned. A near-impenetrable sense of impunity—of being above the usual rules and laws—is a defining feature of this administration. Anyone who presents a threat to that impunity is summarily fired—just ask former FBI director James Comey. Up to now in US politics there’s been a mask on the corporate state’s White House proxies: the smiling actor’s face of Ronald Reagan or the faux cowboy persona of George W. Bush (with Dick Cheney/Halliburton scowling in the background). Now the mask is gone. And no one is even bothering to pretend otherwise.

The idea of post-democracy conveys a ‘hollowing out’, rather than a negation. What’s so disturbing about recent events in America is that we may be seeing the early stages of a transition from post-democracy to non-democracy.

Incidentally, this always reminds me of an Economist interview in which a reluctant conservative supporter of Trump explained how if you have an infestation of vermin, you call in the exterminator but that doesn’t mean you want the exterminator to run your house after the vermin have gone (or words to that effect). The point being that ‘disruption’ of politics is a culturally specific expression of a broader political sentiment.

CfP: Social Research in a Sceptical Age (2017-07-23 08:00)

Conference title: ‘Social Research in a Sceptical Age’

Conference date: 6 December 2017

Venue: British Library in London

Call deadline: Monday 7 August

The workshop sessions at the conference are a great opportunity to share and discuss your work with practicing social researchers and research users. Last year’s conference attracted over 200 people – from research institutes, commercial agencies, central and local government, the voluntary and independent sectors, academia, and more.

You'll have 20 minutes to present plus 10 more for Q &A, in parallel workshop sessions. What you present may or may not relate to this 'sceptical age', but that's fine – we are looking for examples of innovation, applications of methods, and experiences (rather than simple findings) that this audience will find interesting and useful.

At this stage we’re looking for an abstract of up to 500 words to describe and explain what you’d like to present – with a focus on one or more of these areas:

- Getting the message across
- The value of narratives
- Policy evaluation
- Embedding quality assurance
- The value of quality in evidence
- Qualitative innovation
- Quantitative innovation
- Involving research participants
- Dealing with the unexpected

One presenter per successful entry will pay a reduced delegate rate of £55. The volunteer SRA Events Group will assess all entries and aim to let you know the outcome in September/October.

Please use the template Word doc for your entry, downloadable on our website here: [1]www.the-sra.org.uk/events. You can also see there a detailed flyer about the conference, and the keynote and plenary speakers.
The legacy of Zygmunt Bauman (2017-07-24 08:00)

I've been looking forward to this book for months. The author wrote a fantastic review essay in The Sociological Review. This is the author’s account of his book from the BSA Theory mailing list:

Members of the group may be interested in my new book, the first single-authored critical appraisal of Bauman’s prodigious output. Other single-authored books have been merely exegetical, and given how prolific Bauman was in his later years, are seriously out of date.

As you will see partly from the little blurb that you will find via this link, I critically evaluate, especially, his Holocaust thesis, his conception of 'Liquid Modernity', his simplistic views on consumerism, his Eurocentrism and his debilitating lack of interest in issues of gender and race (apart from ant-Semitism) and his negative perspective on the new social movements: feminism, protests by black youth which he dismissed (as did Thatcher, Cameron and The Daily Mail) as simple acts of criminality (he called them 'flawed consumers' rather than young people protesting against racial discrimination by police and, and so forth. He also regarded the Internet as generally part of the growing lack of civility in social life, thus under-estimating its critical potential, etc, etc.

I also discuss his pessimism and ask whether, politically, that is not a constructive position to adopt in our current fraught times.

This, I hope, gives you enough of a flavour of my interpretation, which is somewhat at odds with the many who—not surprisingly, given his two-books-a-year output—simply gave up reading him after his Holocaust book, but looked upon him favourably for his undoubted championing of the down-trodden more generally.

BTW, I also explore critically his Levinas-based views on ethics, his generalisations on globalisation, identity, his analysis of the state (he over-exaggerated the impotence of the state in the face of globalisation), and much much more—he wrote about many, many social phenomena, and I have put all of them under a critical spotlight.

The Sociological Review will be publishing a review symposium on the book; reviews are planned by Theory, Culture and Society, and the US journal Cultural Politics (co-edited by Douglas Kellner), amongst others.

A book launch will take place in October at City, University of London; the book is available from 1 August 2017.

An interesting extract from Swedish documentary The Swedish Theory of Love.

CFP: (Re)producing Insecurities, Uni of Sheffield, 29 September 2017 (2017-07-26 08:00)

Call for Papers: (Re)producing insecurities

The recent EU referendum campaign and resultant vote for the UK to leave the EU is creating new insecurities for EU citizens within and prospective migrants to the UK. At the same time, the European refugee ‘crisis’ was mobilised as a source of fear, insecurity and threat to the UK electorate by the Leave side in the referendum campaign. A collision of fears around intra EU mobility and refugee crisis was manufactured as a central feature of the Brexit vote. Central to such mobilisations are of course the reproduction of older legacies of inequality, precarity as well as white privilege, racism and colonial constructions of self and other. This workshop aims to address this duality within the new politics of insecurity in Europe: the (re)production of new forms of insecurity for migrants and their families, and the mobilisation of migration as an insecurity for resident populations. Here (re)production draws attention to the intimate connectivities of multiple ‘crises’ and the material, intimate, embodied sites and processes through which ‘new’ insecurities are (re)produced.

We particularly invite papers which connect fear of migrants with migrants’ fears. We also encourage consideration of the multiple scales and temporalities through which insecurity is felt, understood, managed, manipulated and ultimately (re)produced: through intimate relationships, within and outside ‘family’ groupings, across and within forms of affiliation, wider social institutions and trans/national polities. Papers are welcomed addressing (but not limited to) the following questions:

- How are connections between the consequences of the Brexit vote and the migrant ‘crisis' reproducing (in)securities?
• How are migration insecurities mobilised politically across Europe?
• What evidence, if any, exists that migration contributes to rising economic and social insecurities of citizens in receiving societies in terms of e.g. labour markets, housing and welfare?
• How might experiences of precarity across groups posited as 'us' or 'them' be connected?
• How are insecurities processed, mediated or challenged through intimate relations?
• How do precarious migrants and their families plan future lives amid 'crisis'?
• What practices of in/visibility are employed in the micro-politics of everyday encounters by EU nationals in response to fears?
• What research methods and approaches capture crisis, emotion, intention and temporality of (re)producing insecurities?
• How do we move forward as a society from these insecurities?

We invite paper proposals (abstracts of 200 words) addressing these and related questions from a theoretical, empirical, and/or normative perspective. PhD students and early career scholars are encouraged to apply.

The workshop is particularly interested in papers that examine the social, political and ethical dynamics of (re)producing insecurities for (and about) mobile subjects within the contemporary 'crisis'.

The workshop keynote lecture will be given by Professor Nicholas De Genova.

Please send abstracts to Hannah Lewis ([1]h.j.lewis@sheffield.ac.uk) by 1 August 2017.

1. mailto:h.j.lewis@sheffield.ac.uk

Zygmunt Bauman: 'No one is in control. That is the major source of contemporary fear' (2017-07-27 08:00)
https://www.youtube.com/watch?v=73Nmv-4jvSc

______________________________

John McCreeru (2017-07-28 03:31:20)
Politics=the ability to decide what must be done Power=the ability to get things done The contemporary world=separation of politics and power leaving no-one in control, the source of our current nightmares. An elegant and thought-provoking formula.
Denaturalising digital capitalism (2017-07-28 08:00)

One of the most pressing issues we confront when analysing the digital economy is a pronounced tendency towards oligopoly which makes a lie of an earlier generation's utopian embrace of the Internet as a sphere of free competition and a driver of disintermediation. There are important lessons we can learn from platform studies about the reasons for this, concerning the architecture of platforms and the logic of their growth. But it’s important we don’t lose sight of how these dynamics are reliant upon existing legal and economic processes which predate the ‘digital revolution’. As Jonathan Taplin points out in Move Fast and Break Things, their competitive advantage was reliant upon a specific regulatory environment that was far from inevitable. From pg 79:

The economist Dean Baker has estimated that Amazon’s tax-free status amounted to a $20 billion tax savings to Bezos’s business. Baker notes, “In a state like New York, where combined state and local sales taxes average over 8.0 percent, Amazon could charge a price that was 1.0 percent below its brick and mortar competition, and still have an additional profit of 7 percent on everything it sold. That is a huge deal in an industry where profits are often just 2–3 percent of revenue.” Bezos, eager to preserve this subsidy, went to work in Washington, DC, and got Republican congressman Christopher Cox and Democratic senator Ron Wyden to author the Internet Tax Freedom Act. The bill passed and was signed by President Bill Clinton on October 21, 1998. Although not barring states from imposing sales taxes on ecommerce, it does prevent any government body from imposing Internet-specific taxes.

This is only one example. An adequate understanding of the digital economy requires that we identify the regulatory environments within which each category of tech firm operates and how this has contributed to their thriving or struggling. When we combine this institutional analysis with platform dynamics, we can begin to account for the level of market concentration which Taplin summarises on pg 119-120:

In antitrust law, an HHI score —according to the Herfindahl-Hirschman Index, a commonly accepted measure of market concentration —is calculated by squaring the market share of each firm competing in a given market and then adding the resulting numbers. The antitrust agencies generally consider markets in which the HHI is between 1,500 and 2,500 to be moderately concentrated; markets in which the HHI is in excess of 2,500 are highly concentrated. The HHI in the Internet search market is 7,402. Off the charts.

He goes on to argue on pg 121-122 that this situation helps generate a cash glut with serious systemic consequences:

The problem is that the enormous productivity of these companies, coupled with their oligopolistic pricing, generates a huge and growing surplus of cash that goes beyond the capacity of the economy to absorb through the normal channels of consumption and investment. This is why Apple has $150 billion in cash on its balance sheet and Google has $75 billion. These enterprises cannot find sufficient opportunities to reinvest their cash because there is already overcapacity in many areas and because they are so productive that they are not creating new jobs and finding new consumers who might buy their products. As former treasury secretary Lawrence Summers has put it, “Lack of demand creates lack of supply.” Instead of making investments that could create new jobs, firms are now using their cash to buy back stock, which only increases economic inequality.

In other words: the inequality which digital capitalism generates is only contingently a function of technology.
When wasn’t it so? Take the popular music industry as an example. From the very inception of its recordings, which began having a price as they were planned for sale, i.e. for consumption.

“So you thought about it one day and started the next morning?”

This is a question which Zeynep Tufekci recalls in her Twitter and Tear Gas: The Power and Fragility of Networked Protest, posed to a group of young Turkish activists about 140journos, a crowdsourced citizen journalism project which they started. As she writes on pg 37:

In Turkey, like much of the Mediterranean, there is a tradition of slow, conversational drinking that is the opposite of a loud, hurried bar scene. Such conversational drinking often leads to discussions of politics. The stereotype of these all-night drinking locales in Turkey is that everyone has a plan to “save the nation” after the first glass of raki, a strong aniseed-based drink that is considered the national liquor (it is nearly identical to ouzo, the Greek national drink). In a previous era, an all-night drinking and talking session on the sorry state of news and the extent of censorship might have ended merely in a hangover the next day. Even if it might have gone further—for example, the people might have decided to try to start a journal or a newspaper—a lot of work, resources, and luck would have been required. However, unlike citizens in a previous era for whom frustration with mass-media bias had engendered little more than sour feelings the next day or an uncertain, lengthy, journey, these young men—only four of them—immediately conceived 140journos, a crowdsourced, citizen journalism network on Twitter.

The low costs involved facilitate a particular culture of project work, comfortable with sometimes vague aspirations and working out the details on the fly. But while Tufekci’s interest in this concerns activism, I wonder about the effects in other spheres. What about higher education for instance? What Dave Beer describes as ‘punk sociology’ shares much of the mentality which Tufekci describes.

Agnosticism, Science and Public Engagement

One of the clear themes which emerged for me when reading Merchants of Doubt, a detailed exploration of corporate propaganda by historians of science Naomi Oreskes and Erik M. Conway, concerns the politics of public engagement. What might in other circumstances seem like anodyne issues confined to the university, who talks about science in public and the status attached to this activity, become urgent questions of societal importance when seen in terms of the history of doubt merchandising. As they write on pg 263: 5208
The scientific societies have tried to address this by developing formal statements on climate change that reflect the collective wisdom of their members, but these statements tend to be dry at best, and often nearly impossible for a normal person to decipher. Who among us has read the IPCC Summary for Policymakers, much less the thousands of pages of actual reports? Indeed, who on the planet has read all this stuff? What average citizen knows that the American Meteorological Society even exists, much less knows to visit its home page to look for its climate-change statement? Clearly, it’s ridiculous to imagine that anyone would, so someone has to summarize and communicate it. Then another difficulty arises. Scientists are finely honed specialists trained to create new knowledge, but they have little training in how to communicate to broad audiences, even less in how to defend scientific work against determined and well-financed contrarians. They often have little talent or taste for it, either. Until recently, most scientists have not been particularly anxious to take the time to communicate broadly. They consider their "real" work to be the production of knowledge, not its dissemination, and they often view these two activities as mutually exclusive. Some even sneer at colleagues who communicate to broader audiences, dismissing them as "popularizers."

If we talk of 'embedding a culture of public engagement', it can easily feel like a trojan horse for the reconfiguration of academic labour: the centrality of scholarship giving way to viral self-marketing, as universities move ever further away from their traditional mission. I have a lot of time for this critique but I think it misses something important, mistaking contingent features of ‘public engagement’ as it has emerged within a particular context for intrinsic features of any call for more activity like this.

For many years, I've been driven by a sense of an explicitly political public engagement, though it’s hard to articulate this amidst the conceptual detritus of the impact agenda and the sterile conceptual frameworks of so much of the orthodox literature on public engagement. There is a transformation in academic labour underway which we need to resist but this shouldn’t preclude a turning outwards because the capacity of the natural and social sciences to influence post-democratic social life is declining by the day. To the extent we can recognise their current organisation as hindering our attempts to reverse this trend, we confront an exciting challenge to articulate a vision of a ‘culture of engagement’ which is driven by ‘bottom-up’ social concern rather than ‘top-down’ imperatives of university management.

The Data Economy workshop: how online data change economy and business (2017-07-31 08:00)

The organisers of the Data Economy workshop (to be held at the Internet Science Conference 2017) kindly invite you to submit research full papers (10-20 pages) presenting new results and short papers (6-9 pages) with disruptive ideas and work-in-progress, shedding light on how online data change economy and business. Accepted papers will appear in a post-conference proceedings volume to be published by LNCS Springer. Submitted papers should follow the INSCI Paper Submission Guidelines.

Important Dates
Deadline of paper submission: 20/8/2017, 15:00 CET
Notification of Acceptance: 20/9/2017
Description
Big data, data analytics, personal data, open data, linked data, metadata, data journalism, data science, data infrastructures….and still you can add a new “data” phrase!
Data has become a buzzword used in a number of disciplines, by technical and business communities. At the same time, the growing interaction among corporate, governmental and personal information spaces introduces a novel set of opportunities and challenges for the economy.
The DATA ECONOMY workshop will try to engage scholars and professionals from multiple disciplines including economics, management, open governance, data science, computer science and software engineering in discussions related to how digital data, scattered in decentralised information systems and applications and being accessible via the Web, change the economy and the ways we are doing business.
Possible topics for discussion (but not limited to):

● Economic theory and practice related to online data and the Web
● Data infrastructures (and open standards) for the economy (e.g. open banking standard)
● Data and information strategies and policies
● Open data as a tool in economic policy
● Open data for business and economic development
● Financial data transparency (e.g. open ownership, open budgets)
● Business practices and the economic impact of GAFA
● Business intelligence and data analytics
● Business models and value creation in data-oriented environments
● Data and content based e-commerce
● The role of data in the Digital Single Market in Europe
● Open Scientific Data and the European Open Science Cloud
● Computational economy and big data in finance
● Big data in operational research, business intelligence and economic analysis
● Personal data and Personal Information Management systems (PIMS): markets, business models and consumer behaviour
● Economic implications of data transparency and algorithmic (or AI) accountability
● Social media analytics: business models and economic impact
● Measuring the data economy (e.g. open data indices, societal impact etc.)
● Legal issues in the data economy
● Security issues for data economy stakeholders (e.g. in security for data centres, cloud infrastructure, user authentication etc.)
● Privacy as a commodity and privacy-related aspects of monetising user data

Keynote speakers
Daniele Rizzi, EC DG Connect
Nikos Loutas, PwC
The question of the human in philosophy of technology (2017-08-01 08:00)

Over the next few years, I’ll be working on a collaborative project on trans- and post-humanism, building on the Centre for Social Ontology’s previous Social Morphogenesis series. My main contribution to this will be co-editing a volume, Strangers in a Familiar Land, with Doug Porpora and Colin Wight as well as exploring digital technology and what it means for human agency.

This project is giving me a reason to read more widely than I have in a while, with a particular focus likely to be Andy Clark’s work in the philosophy of mind, speculative realism and continental philosophy of technology. There’s a lot of value to be found in the latter but one persistent point which frustrates me is what appears, to me at least, to be a fundamental confusion about the category of the human. This issue became clear to me when reading a [1]thought provoking blog on Social Ecologies:

Why must everything revolve back to a human relation – for-us? This human exceptionalism resides throughout the gamut of philosophical reflection from Plato to Derrida. One will ask as Bradley does: Why, in other words, can something that believes itself to be a critique of anthropologism still be seen as essentially anthropocentric? Can we step outside this temple of man and create a non-anthropocentric discourse that doesn’t find itself reduced to this human relation by some backdoor slippage of conceptuality? Are we condemned to remain human? What or who is this creature that for so long has created a utopian world against its inhuman core? If we were to be released from this prison of the human who or what would emerge? How alien and alienated am I to what I am? How monstrous am I?

[2]https://socialecologies.wordpress.com/2017/07/17/we-were-never-human/
Unless I’ve entirely misunderstood a literature I’m still relatively new to, ‘technicity’ is an abstraction from material culture. It’s an abstraction which serves a purpose, allowing us to isolate the technical so as to inquire into its character, but the empirical referents of the term are technological artefacts i.e. a domain of material culture. In which case, it should not surprise us that the human constantly resurfaces, nor should we impure this tendency to a mysterious stickiness which ‘humanism’ as a doctrine possesses.

Material culture will always imply questions of the human because we are talking about artefacts built by, for, with and against human beings in social contexts which are similarly human saturated. The value in considering ‘technicity’ lies in opening out a space in which we can inquire into the emergent characteristics of the technical as a domain of material culture, considering the logic that guides it and how it can act back upon creators and the social contexts in which they create. But explaining material culture necessarily entails human-centred accounts, even if these have tended to problematically exclude or marginalise non-human elements.

To suggest otherwise strikes me as straight-forward mystification, circumscribing large domains of social life as outside analysis, rather than offering a meaningful competing ‘inhuman’ explanation. It seems like a clear example of what Andrew Sayer calls a ‘PoMo flip’: responding to a problematic dichotomy by inverting it, rather than seeking to transcend the conceptual structure that creates the problem. In this case responding to an exclusion of non-human elements by seeking to exclude the human elements instead.

2. https://socialecologies.wordpress.com/2017/07/17/we-were-never-human/

Steven Hickman (2017-08-01 17:57:35)
Thanks for the thoughts... Technicity names something which can no longer be seen as just a series of prostheses or technical artefacts—which would be merely “supplemental” (or supernumerary) to our nature—but the basic and enabling condition of our life-world. From the watch we wear to the server we log into, we exist prosynthetically, that is to say, by putting ourselves outside ourselves. If the classical opposition and hierarchy between thought and technology can no longer be sustained from this perspective—such that what Plato calls anamnēsis may be nothing other than a complex repertoire of motor functions, cybernetic loops and self-replicating hypomnesic systems—then it is clear that this insight poses a new and urgent task for any philosophy of technology. In other words, the question arises as to whether it is possible to think something that is nothing less than the basic condition of thought itself. As Bradley suggests what impact does this state of technicity have upon our concepts of what it is to be human (rational animal, homo faber, homo sapiens, Dasein, even the so-called “posthuman” cyborg)? What—if anything—constitutes the “essence” of human being today? How might we begin to construct a thought that could do justice to that being? And if the task of “thinking technicity” is less a matter of anamnestically recollecting some immortal past than of entering a radically indeterminate hypomnesic future, then who or what—to go back to where we started—would be the agent—the “ego cogito”—of that thought?1

The Digital Sociology podcast series (2017-08-02 08:00)

An interesting new project by occasional SI contributor Chris Till, following from his Digital Health series:

5212
The fortress city and what it may portend (2017-08-03 08:00)

A couple of months ago, I shared a disturbing extract from John Urry’s final book about what he termed the ‘fortress city scenario’. There’s a powerful section in Naomi Klein’s recent book, No Is Not Enough, which illustrates the basis of this scenario in actually existing conditions & the manner in which contemporary warfare can act as a laboratory for dystopian futures. From pg 130-132:

I watched another such dystopian window open in 2003 in Baghdad, shortly after the invasion. At that time, the US occupation had carved the city in two. At its heart, behind enormous concrete walls and bomb detectors, there was the Green Zone—a little chunk of the United States rebuilt in Iraq, with bars serving hard liquor, fast-food joints, gyms, and a pool where there seemed to be a party 24/7. And then—beyond those walls—there was a city bombed to rubble, where there was often no electricity for hospitals, and where violence, between Iraqi factions and US occupation forces, was spiraling out of control. That was the Red Zone. The Green Zone at the time was the fiefdom of Paul Bremer, former assistant to Henry Kissinger and director of Kissinger’s consulting firm, whom George W. Bush had named as the chief US envoy to Iraq. Since there was no functioning national government, that essentially made him Iraq’s supreme leader. Bremer’s was an entirely privatized empire. Dressed in combat boots and a sharp business suit, Bremer was always protected by a phalanx of black-clad mercenaries working for the now-defunct company Blackwater, and the Green Zone itself was run by Halliburton—one of the largest oil field companies in the world, previously headed by then vice president Dick Cheney—along with a network of other private contractors. When US officials made forays outside the Green Zone (or the “emerald city,” as some journalists called it), they did so in heavily armored convoys, with soldiers and mercenaries pointing machine guns outward in all directions, guided by an ethic of “shoot first, ask questions later.” Regular Iraqis supposedly being liberated by all this weaponry had no protection, except for the kind provided by religious militias in exchange for loyalty. The message broadcast by the convoys was loud and clear: some lives count a hell of a lot more than others. From deep inside his Green Zone fortress, Bremer issued decree after decree about how Iraq should be remade into a model free-market economy. Come to think of it, it was a lot like Donald Trump’s White House. And the edicts were pretty similar too. Bremer ordered, for instance, that Iraq should have a 15 percent flat tax (quite similar to what Trump has proposed), that its state-owned assets should be rapidly auctioned off (under consideration by Trump), and that government should be

Call for Papers: Eastern Sociological Society 2018

2018 ANNUAL MEETING
CALL FOR PAPERS

The Eastern Sociological Society welcomes submission, drawing on every methodology, addressing any and all issues of interest to sociologists. The 2018 meeting will have a special focus on “As Time Goes By: Social and Institutional Change.”

Since its founding in 1909, sociology has addressed issues having to do with the causes and consequences of societal change. At the center of sociology’s agenda is a multi-faceted interest in mechanisms of social and institutional change. What drives the diffusion of rational myths, institutionalized practices and cultural beliefs of advanced industrial economies in an emergent world society? What are the consequences of diffusion of rational capitalism and organizational forms in non-Western countries? Why is human migration an endemic feature of the global economic order and what are the consequences of a world on the move? What accounts for ‘blending’ and ‘negotiating’ social dynamics in heterogeneous populations? How and why do race and gender matter in understanding social inequalities? What mechanisms drive collective action aimed at addressing social problems and inequalities? Where does trust and cooperation come from? What explains counter-narratives aimed at pushing back societal change? What is the role of political actors and the state in social and institutional change?

On a policy panel are Douglas Massey and William Julius Wilson, “As Time Goes By: Immigration and Race in American Society.”

Speakers for presidential panels include Richard Alba, Jeffrey Alexander, Tinaspeed, Nancy Brannen, Dalton Conley, Raul H. Puigcerver, Paul DiMaggio, Martha Derick, Matthew Hughey, Mikael Tamanan, Omar Lizardo, Harvey Mansfield, Alexandra Potter, Lisaian Kenan, Mario Luisi, and Bruce Western, Fred Macrae and Verona Dzulwa.

We look forward to submissions that will fill the meeting Idaho. Although the ESS especially encourages submission related to this year’s theme, we welcome submission on all sociological topics. Potential methods and terms include: individual papers, wholly constituted sessions (with names and affiliations of all presenters); thematic conferences (panels of two or more scholars engaged in debate or exchange); workshops on specific topics and theories; special sessions organized around prominent scholars and their work.

Paper submissions and session proposals are due by October 15, 2017.

Questions should be sent to eastern2018@gmail.com

Victor Tsoi, ESS President; F instituted, Program Chair

AS TIME GOES BY:
SOCIAL AND INSTITUTIONAL CHANGE

February 22-25, 2018 Baltimore, MD
In only a matter of years, blogging has become a mainstream part of academic practice. Research projects, networks and centres regularly maintain blogs, with the intention of promoting their work and building their connections. However it can be difficult to ensure this activity is worthwhile, rather than an additional burden in already busy working lives.

This afternoon workshop will help you ensure that blogging contributes to your research project, research network or research centre. It is led by one of the most experienced academic bloggers in the UK: a personal blogger for almost fifteen years, founding editor of The Sociological Imagination, digital fellow at The Sociological Review, former editor of the LSE’s British Politics & Policy Blog and founding member of the editorial board at Discover Society.

This three hour session will address the full range of issues faced by those maintaining blogs for research projects, research networks or research centres:

- How do I find the time for blogging?
- What should I post on our blog?
- How do I increase the audience for our blog?
• How do I assess the success of our blog?
• How can I make our blog more visually appealing?
• How can I integrate our blogging with other social media?
• How can we collaborate effectively on our blog?
• How do we use the blog to promote our publications and events?

There will be plenty of time for general questions, as well as opportunities to network with other academic bloggers. In addition to this, participants also have the option to purchase five hours of additional coaching via Skype to offer ongoing support. This includes a free copy of [1]Social Media for Academics.

The rhetoric and reality of user generated content (2017-08-05 08:00)

On pg 102 of Jonathan Taplin’s Move Fast and Break Things, he highlights email exchanges between YouTube’s founders, released in a court case, which suggest the invocation of ‘user generated content’ might be a matter of branding rather than a meaningful growth strategy for social media platforms:

In another email exchange from 2005, when full-length movies were being posted on YouTube, Steve Chen, a cofounder of the company, wrote to his colleagues Hurley and Jawed Karim, “Steal it!,” and Chad Hurley responded: “Hmm, steal the movies?” Steve Chen replied: “We have to keep in mind that we need to attract traffic. How much traffic will we get from personal videos? Remember, the only reason why our traffic surged was due to a video of this type…. viral videos will tend to be THOSE type of videos."

Much critical literature has focused on how social media platforms ossify existing hierarchies and establish new ones. It is too easy to see this as an unexpected consequence of a new social infrastructure, as opposed to an outcome which was knowingly designed in from the start.
Towards a sociological curatorial journalism (2017-08-06 08:00)

In *Twitter and Tear Gas: The Power and Fragility of Networked Protest*, Zeynep Tufekci discusses the emergence of curatorial journalism and contrasts its function with that of traditional journalism. From pg 41:

Traditional journalism tries to solve a problem of scarcity: lack of cameras at an event. Social media curatorial journalism tries to solve a problem of abundance: telling false or fake reports from real ones and composing a narrative from a seemingly chaotic splash-drip-splash supply of news.

This is something which has often been undertaken by citizens, rather than professional journalists, lacking a commitment to established ways of performing journalism which emerged within a different information environment. Could this also be a model for public engagement by sociologists? We can already see many sociologists performing this function, maintaining Twitter feeds and blogs which select from media sources and filter them through the prism of a research agenda and expertise which has been accumulated over many years.

It occurs to me that "composing a narrative" out of the informational disarray which predominates on social media is a task which sociologists could be well suited for, particularly in terms of complex and peripheral issues which are framed in isolation within the media. It would be interesting to know how sociologists who already perform this role online understand their own activity. Are there differences in how this is theorised by practitioners? Does this have implications for practice? Is this a new frontier of public sociology or merely a digital reiteration of the older traditional public intellectual?

Madelon van Oostrom (2017-08-06 12:03:40)

Interesting topic and very fruitful for active learning, communicative and open minds. I wonder though to what extent this practice is feasible in publish-or-perish academic world. I would love to spend more time on blogging or writing but a day lasts 24 hours and one has to prioritize. For me, curating contents adding the sociological lens, a critical question or issue that’s the content lacks, is a better option. As one of sociology’ key tasks is problematizing taken-for-granted matters, this is a very stimulating challenge.

Mark Carrigan (2017-08-06 22:04:13)

I think that’s very much a reality for most & definitely a constraint on this.

CFP: All Things in Moderation: The People, Practices and Politics of Online Content Review – Human and Machine Dec 6-7 2017, UCLA (2017-08-07 08:00)

It’s my great pleasure to announce the following event and related CFP. On December 6-7 2017, UCLA’s Department of Information Studies, part of the UCLA Graduate School of Education and Information Studies, welcomes participants to a two-day conference on commercial content moderation (CCM) of user-generated social media material.

At All Things in Moderation: The People, Practices and Politics of Online Content Review – Human and Machine we will offer a new forum bringing together those interested in the multiple challenges related to CCM, and to content moderation of all kinds. The goal of this foundational event is to map the current landscape from a
number of perspectives. During these two days, scholars, students, journalists, policy makers and CCM workers will share their insights in order to generate a discussion about the challenges, methodologies and frameworks that are necessary to integrate a comprehensive, academic study of commercial content moderation, other kinds of online moderation, and its outcomes and implications into existing paradigms in labor studies, information studies, computing and internet history, public policy, internet governance and media studies, to name but a few.

Beyond analyzing the contemporary case of CCM across the social media and other digital industries, we anticipate that All Things in Moderation will require a look to the past and to other media sectors, as well as a gaze into the future, to anticipate the problems related to CCM and to our social media-reliant world, and to collectively think about solutions. We anticipate a fruitful gathering.

Please join us on the beautiful UCLA campus this December. The conference is _free _ for participants, but space is limited. Please register early ([1]https://atm-ucla2017.net/registration/) and visit the call for participation ([2]https://atm-ucla2017.net/about/) to submit your proposals for papers, sessions and other interventions. We look forward to hosting you at UCLA! Sarah T. Roberts, Ph.D., Conference Convener Patricia Ciccone, Conference Coordinator

The Digital University in a Neoliberal Age (2017-08-08 08:00)

The Digital University in a Neoliberal Age

Speakers: Jana Bacevic, Mark Carrigan, Gary Hall, and Liz Morrish

Wednesday 8th November 2017,
1-6 PM

Register (for free) [1]here

1 – 1.30 reception and buffet lunch

1.30 – 2.30 Gary Hall - ‘Data Commonism versus ÜberCapitalism ‘

2.30 – 3.30 Liz Morrish - ‘The accident of accessibility: How the data of the TEF creates neoliberal subjects'
Abstract

Neoliberalism has disrupted higher education by redefining it as a market trading in commodities. In theory, price signals are meant to reflect the worth of a product in a market but neoliberals tend to see the economic success of corporations as the gauge of market success, despite their ability to ‘distort’ market signals. In the UK, higher education uses audit culture in place of an open market of differing price signals. This allows the state, which engineers how the ‘free market’ works, to set the terms of competitive reference. The REF, the NSS, various league tables and ‘rankings’ based on these assessments combined with other data such as data on employment, and now the TEF, provide ways for university brands to compete for students redefined as ‘customers’ purchasing human capital. Information and communication technology (ICT) allows for the intensification of audit culture and marketization. The ‘performance’ of staff can be assessed continuously, often using a traffic light system of staff grading, with management using ICT to check on the ‘impact’ of ‘research outputs’ and customer ‘feedback’ for instance. In place of professional autonomy there is to be ‘transparency’, with academic work continuously monitored for performance in relation to the objectives of brand managers. The purpose of this symposium is to both diagnose the range of problems presented by the neoliberal use of digital technology in higher education and to explore what potentials there are to overcome such problems.

The content density of a cultural producer (2017-08-09 08:00)

An interesting snippet on pg 164 of Jonathan Taplin’s Move Fast and Break Things suggests a metric of content density which could be extremely interesting to explore:

Digiday looked at the race for what some are calling peak content. What it found was that in 2010 the New York Times, with 1,100 people employed in the newsroom, created 350 pieces of original content per day and attracted 17.4 million page views per day. By contrast, the Huffington Post, with 532 people employed, posted 1,200 pieces of content per day (most of it created by third-party sites) and 400 blog entries (mostly unpaid), receiving 43.4 million page views per day. One can understand why the future of original journalism is threatened.

This quantitative metric raises questions which invite qualitative analysis e.g. to what extent does an increase in content density (less staff producing more content) correlate with content being shorter, derivative and shallow? Are there cultural producers where this isn’t the case? What are the conditions which counteract this seemingly inevitable consequence of asking people to produce more with less?

Benny Goodman (2017-08-09 10:16:51)
These figures are very interesting. As with music, poetry and fiction, content has never been easier to publish widely at such low cost. The obvious inference here is that from the consumer/reader/listener/researcher/student position.....the content is overwhelming and the human capacity for time consuming quiet, critical and thoughtful reflection on material has not, will not, keep pace. I am mindful for example just how long it can take to really get one’s mind around the classic writers....take the work of C Wright Mills just as an example. Will the current contemporary content flooding by digital content crowd out a careful slow reading of the ‘good stuff’ and how will we know what the current good stuff is (a potential tall poppy) if it has to compete with a other poppies, not just in a small field in which it can easily be seen, but in a prairie of poppies in which it is easily overlooked? There are gatekeepers still directing one’s attention, but are we still faced with too much stuff?

CFP: The Will to App: Digitising Public Health (2017-08-10 08:00)

Call For Papers
Media International Australia no. 171 (May 2019)
The Will to App: Digitising Public Health
Theme Editors: Kath Albury, Paul Byron and Frances Shaw
Overview

This themed issue of MIA proposes to engage with the digitisation and mediatisation of health promotion and health communication, particularly the development and delivery of mobile apps, websites and associated platforms by government and non-government health organisations. We offer the term ‘the will to app’ as a play on Foucault’s (1978: 140-144) concept of ‘bio-power’, that is, the process through which external regimes of power and discipline are internalised and normalised, both collectively and individually.

This collection will focus on work that engages with critical data studies and critical media studies literature to examine the dynamics at play in digital health policy and practice. Consequently, we seek contributions that examine apps (and associated platforms) as media objects, whose modes of production, circulation and consumption are open to analysis as forms of situated knowledge. We are particularly interested in the ways that apps can be seen to mediate relationships, including between users and institutions, and between institutions and funding bodies.

Topics that might be considered include:

The datafication and appification of health promotion and health communication services:
How does digitisation assist (or undermine) health service organisations and consumer advocacy groups that seek to promote cultures of community care, engagement and participation? Why might an organisation (or funding body) prioritise stand-alone apps over engagement with health consumers via social media platforms? What counts as meaningful engagement, and how might it be measured?

Data ethics:
How are health organisations engaging with the ethical issues raised by data collection and data retention? The use of mobile sensor data can undermine confidentiality, raising potentials for user-identification and locational awareness. How are practices such as ‘informed consent’ translated in this space? How are health organisations and app developers engaging with data management, and the decision whether or not to act on information provided by app users? Where apps are intended to help users contact healthcare providers, how are responses resourced?

User-centred accounts of health apps, platforms and services:
How are app designers and developers engaging with government, non-government and grassroots health organisations? How are health consumers, public health workers and healthcare providers using apps? How does might this usage differ from official discourses regarding the apps’ stated purpose? What workarounds (or vernacular health data cultures) are emerging in this space?
We also welcome submissions that engage with health data imaginaries, that is, critical reflections and speculations as to what health data, algorithmic calculations and data analytics can or should do in the fields of health communication and health promotion.

Please submit full articles (5,000-8,000 inclusive of notes and references) by 28 February 2018 via the MIA website submission system:

The 'marketplace of ideas' and the future of academic social media (2017-08-11 08:00)
A really interesting Google Hangout discussion. I’ll be taking part in a follow up later this month:
https://www.youtube.com/watch?v=v0bWSkknrac

Boundaries and barbarians: ontological (in)security and the [cyber?] war on universities (2017-08-12 08:00)

By Jana Bacevic

Prologue

One Saturday in late January, I go to the PhD office at the Department of Sociology at the University of Cambridge’s New Museums site (yes, PhD students shouldn’t work on Saturdays, and yes, we do). I swipe my card at the main gate of the building. Nothing happens.

I try again, and again, and still nothing. The sensor stays red. An interaction with a security guard who seems to appear from nowhere conveys there is nothing wrong with my card; apparently, there has been a power outage and the whole system has been reset. A rather distraught-looking man from the Department History and Philosophy of Science appears around the corner, insisting to be let back inside the building, where he had left a computer on with, he claims, sensitive data. The very amicable security guard apologises. There’s nothing he can do to let us in. His card doesn’t work, either, and the system has to be manually reset from within the computers inside each departmental building.

You mean the building noone can currently access, I ask.
I walk away (after being assured the issue would be resolved on Monday) plotting sci-fi campus novels in which Skynet is not part of a Ministry of Defense, but of a university; rogue algorithms claim GCSE test results; and classes are rescheduled in a way that sends engineering undergrads to colloquia in feminist theory, and vice versa (the distances one’s mind will go to avoid thinking about impending deadlines)*. Regrettfully pushing prospective pitches to fiction publishers aside (temporarily)**, I find the incident particularly interesting for the perspective it offers on how we think about the university as an institution: its spatiality, its materiality, its boundaries, and the way its existence relates to these categories – in other words, its social ontology.

War on universities?

Critiques of the current transformation of higher education and research in the UK often frame it as an [1]attack, or [2]war, on universities (this is where the first part of the [3]title of my thesis comes from). Exaggeration for rhetorical purposes notwithstanding, being ‘under attack’ suggests is that it is possible to distinguish the University (and the intellectual world more broadly) from its environment, in this case at least in part populated by forces that threaten its very existence. Notably, this distinction remains almost untouched even in policy narratives (including those that seek to promote public engagement and/or impact) that stress the need for universities to engage with the (‘surrounding’) society, which tend to frame this imperative as ‘going beyond the walls of the Ivory Tower’.

The distinction between universities and the society has a long history in the UK: the university’s built environment (buildings, campuses, gates) and rituals (dress, residence requirements/’keeping term’, conventions of language) were developed to reflect the separateness of education from ordinary experience, enshrined in the dichotomies of intellectual vs. manual labour, active life vs. ‘life of the mind’ and, not least, Town vs. Gown. Of course, with the rise of ‘redbrick’, and, later, ‘plateglass’ universities, this distinction became somewhat less pronounced. Rather than in terms of blurring, however, I would like to suggest we need to think of this as a shift in scale: the relationship between ‘Town’ and ‘Gown’, after all, is embedded in the broader framework of distinctions between urban and suburban, urban and rural, regional and national, national and global, and the myriad possible forms of hybridisation between these (recent work by [4]Addie, Keil and Olds, as well as [5]Robertson et al., offers very good insights into issues related to theorising scale in the context of higher education).

Policing the boundaries: relational ontology and ontological (in)security

What I find most interesting, in this setting, is the way in which boundaries between these categories are maintained and negotiated. In sociology, the negotiation of boundaries in the academy has been studied in detail by, among others, Michelle Lamont (in [6]How Professors Think, as well as in an overview by [7]Lamont and Molnár), Thomas Gieryn (both in [8]Cultural Boundaries of Science and few other texts), Andrew Abbott in [9]The Chaos of Disciplines (and, of course, in sociologically-inclined philosophy of science, including Feyerabend’s Against Method, Lakatos’ work on research programmes, and Kuhn’s on scientific revolutions, before that). Social anthropology has an even longer-standing obsession with boundaries, symbolic as well as material – [10]Mary Douglas’ work, in particular, as well as Augé’s [11]Non-Places offer a good entry point, converging with sociology on the ground of neo-Durkheimian reading of the distinction between the sacred and profane.

My interest in the cultural framing of boundaries goes back to my first PhD, which explored the construal of the category of (romantic) relationship through the delineation of its difference from other types of interpersonal relations. The concept resurfaced in research on public engagement in UK higher education: here, the negotiation of boundaries between ‘inside’ (academics) and ‘outside’ (different audiences), as well as between different groups within the university (e.g. administrators vs. academics) becomes evident through [12]practices of engaging in the dissemination and, sometimes, coproduction of knowledge, (some of this is in my contribution to [13]this volume). The thread that runs through these cases is the importance of positioning in relation to a (relatively) specified
Other; in other words, a relational ontology.

It is not difficult to see the role of negotiating boundaries between 'inside' and 'outside' in the concept of ontological security (e.g. [14]Giddens, 1991). Recent work in IR (e.g. [15]Ej dus, 2017) has shifted the focus from Giddens’ emphasis on social relations to the importance of stability of material forms, including buildings. I think we can extend this to universities: in this case, however, it is not (only) the building itself that is ‘at risk’ (this can be observed in intensified securitisation of campuses, both through material structure such as gates and cards-only entrances, and modes of surveillance such as Prevent – see e.g. [16]Gearon, 2017), but also the materiality of the institution itself. While the MOOC hype may have (thankfully) [17]subsided (though not [18]dissappeared) there is the ubiquitous [19]social media, which, as quite a few people have argued, tests the salience of the distinction between ‘inside’ and ‘outside’ (I’ve written a bit about digital technologies as mediating the boundary between universities and the ‘outside world’ [20]here as well in an upcoming article in Globalisation, Education, Societies special issue that deals with reassembling knowledge production with/out the university).

Barbarians at the gates

In this context, it should not be surprising that many academics fear digital technologies: anything that tests the material/symbolic boundaries of our own existence is bound to be seen as troubling/dirty/dangerous. This brings to mind Kavafy’s poem (and J.M. Coetzee’s novel) [21]Waiting for the Barbarians, in which an outpost of the Empire prepares for the attack of ‘the barbarians’ – that, in fact, never arrives. The trope of the university as a bulwark against and/or at danger of descending into barbarism has been explored by a number of writers, including [22]Thorstein Veblen and, more recently, [23]Roy Coleman. Regardless of the accuracy or historical stretchability of the trope, what I am most interested in is its use as a simultaneously diagnostic and normative narrative that frames and situates the current transformation of higher education and research.

As the last line of Kavafy’s poem suggests, barbarians represent ‘a kind of solution’: a solution for the otherwise unanswered question of the role and purpose of universities in the 21st century, which began to be asked ever more urgently with the post-war expansion of higher education, only to be shut down by the integration/normalization of the soixante-huitards in what [24]Boltanski and Chiapello have recognised as contemporary capitalism’s almost infinite capacity to appropriate critique. Disentangling this dynamic is key to understanding contemporary clashes and conflicts over the nature of knowledge production. Rather than locating dangers to the university firmly beyond the gates, then, perhaps we could use the current crisis to think about how we perceive, negotiate, and preserve the boundaries between ‘in’ and ‘out’. Until we have a space to do that, I believe we will continue building walls only to realise we have been left on the wrong side. (*) I have a strong interest in campus novels, both for PhD-related and unrelated reasons, as well as a long-standing interest in Sci-Fi, but with the exception of DeLillo’s White Noise can think of very few works that straddle both genres; would very much appreciate suggestions in this domain! (**) I have been thinking for a while about a book that would be a spin-off from my current PhD that would combine social theory, literature, and critical cultural political economy, drawing on similarities and differences between critical and magical realism to look at universities. This can be taken as a sketch for one of the chapters, so all thoughts and comments are welcome.

Julia Hobsbawm (2017-08-12 08:10:26)
What a great post. Lovely breadth and depth. For a good novel - not a campus novel - but one on space and time and being both "inside" and "outside" self and community I recommend the just-published Forest Desk by Nicole Krauss. On the whole over reliance on technology thing, I propose your first piece, I look at this quite a lot in my current book Fully Connected: Surviving and Thriving in an Age of Overload. Anyway thanks, good post to read this rainy morning.

Jana Bacevic (2017-08-14 13:14:26)
Thank you, Julia - and particularly for reading recommendations! Look forward to both. Jana

The Problem of Order on Planes (2017-08-13 08:00)

From pg 24 of Zeynep Tufekci's [1] Twitter and Teargas:

You could not, for example, squeeze more than a hundred chimpanzees into a thin metal tube, sitting knee-to-knee and shoulder-to-shoulder in cramped quarters, close the door, hurl the tube across the sky at great speed, and always expect those disembarking at the other end to have all their body parts intact. But we can travel in airplanes because our social norms and nature are to comply, cooperate, accommodate, and sometimes even be kind to one another.
Call for Participation: Sociology and Social Media, Problems and Prospects (2017-08-13 18:50)

A Sociological Review Foundation Workshop
Goldsmiths, University of London
Saturday 2nd December 2017
09.30-18.00, followed by wine reception

The Sociological Review is delighted to announce the opportunity to take part in a one-day workshop on Sociology and social media. This workshop will be taking place exactly a year after the [1] Value & Values event. It will allow issues to be raised by the sociological community and provide a forum in which they can be discussed, instigating a public debate about the implications of social media for sociology.

Social media has rapidly become a central part of British Sociology, with most academic departments, research centers and journals now maintaining an online presence. Social media has also increasingly been taken up by sociologists as individuals, though perhaps in part as a response to the pressures of an institutional culture demanding ‘impact’. Some sociologists relish intervention in public debates, while others see it as a burden. Some claim that social media offers exciting new forums for scholarly debate, while others see it as a turn away from serious scholarship, driven by the impact agenda and an uncritical embrace of platform capitalism.

We believe that social media offers profound opportunities for the discipline at a time when its institutional presence is imperilled. However, realising these opportunities necessitates that we think systematically about how the discipline and its practitioners embrace social media, working to develop shared standards about online behaviour and shared aspirations about how sociologists can use this space productively. If social media is here to stay, we urgently need to address what this means for the discipline in a way that extends beyond the individualised responses which have heretofore been dominant.

Call for Participation

Sociology and Social Media: Problems and Prospects is an attempt to initiate what we hope will be a much broader conversation. We invite contributions in two forms:

Issues: five-minute talks framing a practical issue social media raises for the discipline. There will be four discussion sessions on the day: trolling and harassment, professional standards, career development, public sociology and miscellaneous. Each issue should be pitched to one of these categories. We hope to record each five-minute question and publish it on our blog for further discussion, including blog posts from those not present at the event.

Proposals: ten-minute talks identifying potential solutions to problems which social media raises, offering proposals about courses of action which individual practitioners or the discipline as a whole should pursue. These talks will also be recorded and published on the blog to facilitate further discussion.
The deadline for call for applications of participation is September 18th 2017, 17.00 BST. We cannot accept any late applications. Decisions will be communicated on 16th October 2017

[2]Applications for Participation

Registration Only

Registration is free, but it is essential that you register.

Please note, places are strictly limited. In the event that you are no longer able to attend this workshop, please email Jenny Thatcher: [3]events@thesociologicalreview.com. Failure to give notice of cancellation or ‘no shows’ may result in rejection of applications to attend future TSRF events.

[4]Registration Only

Travel Bursaries

There are a limited number of travel bursaries available for ECRs and PGRs who have their call for participation accepted. Applications for bursaries should be made during the submission of participation. Bursaries will be capped at £150.00 for UK based applicants and £250.00 for non-UK based applicants.

For academic inquiries about this event please contact Mark Carrigan: mark@markcarrigan.net

All other inquiries about this event including applications, bursaries etc, should be directed to Jenny Thatcher: events@thesociologicalreview.com

1. http://thesociologicalreview.us9.list-manage.com/track/click?u=13f3ba09fc9454bf79b17ad38&id=abdc7f96c3&e=789a4573bc

Call for chapter proposals - Different Bodies: Disability and the Media (2017-08-14 08:00)

Book edited by Jacob Johanssen and Diana Garrisi (Communication and Media Research Institute, University of Westminster)

Following on from the conference 'Different Bodies: (Self-) Representation, Disability and the Media' which was held at the University of Westminster in June, we are preparing a book proposal based on some of the themes arising from the conference. The book proposal will be submitted to Peter
Lang, who have already expressed a strong interest in the project.

The collection is intended to offer a comprehensive view of the relationship between disability and the media from a global and multidisciplinary perspective. Building upon existing studies, the book aims to explore if and how the rapidly changing technological means of communication are affecting how the body as strange, shameful, wrong, impaired, wounded, scarred, disabled, lacking, different or ‘other’ is constructed in the media. In particular the book aims to discuss whether the Internet has made it possible to develop new, alternative or more inclusive narratives that challenge long-established mainstream coverage of disability. Some of the questions we would like to address are, for example, whether self-representations of disability on the Internet are contesting or aligning with representations on mainstream media outlets. We would also like to look at issues such as the rise of disability hate crimes online, the relationship between journalism and disability awareness campaigns, online dating and disability, the media coverage of disability rights and employment. One of our aims is to establish the extent to which the media contribute to shape our relation with diversity in the digital era and, ultimately, our relationship with ourselves.

Possible themes include but are not limited to:
- Affective labour of bodies
- Auto-ethnographic accounts of the body in / through digital media
- Celebrity bodies and the spectacles of transformation
- Cinema and disability

We invite submissions of 200-250 words chapter proposals. Deadline: 30 September 2017.
Submissions should also include:
The poverty of student experience (2017-08-15 08:00)

By Jana Bacevic

One of my favourite texts back from the time when I was writing my Master’s thesis is the Situationist International’s [1]On The Poverty of Student Life ([2]De la misère au milieu étudiant). Written in 1966 and distributed in 10,000 copies at the official ceremony marking the start of the new academic year at the University of Strasbourg, it provoked an outcry and a swift reaction by the university authorities, who closed down UNEF, the student union that printed it. Today, it is recognized as one of the texts that both diagnosed and helped polarize conditions that eventually led to the famous 1968 student rebellions in France. This is how it begins:

“We might very well say, and no one would disagree with us, that the student is the most universally despised creature in France, apart from the priest and the policeman. The licensed and impotent opponents of capitalism repress the obvious—that what is wrong with the students is also what is wrong with them. They convert their unconscious contempt into a blind enthusiasm. The radical intelligentsia prostrates itself before the so-called 'rise of the student' and the declining bureaucracies of the Left bid noisily for his moral and material support.

There are reasons for this sudden enthusiasm, but they are all provided by the present form of capitalism, in its overdeveloped state. We shall use this pamphlet for denunciation. We shall expose these reasons one by one, on the principle that the end of alienation is only reached by the straight and narrow path of alienation itself.

Up to now, studies of student life have ignored the essential issue. The surveys and analyses have all been psychological or sociological or economic: in other words, academic exercises, content with the false categories of one specialization or another. None of them can achieve what is most needed—a view of modern society as a whole.”
This diagnosis is pretty much relevant today: most discussions of tuition fees avoid tackling the bigger question, which is the purpose of education and its role in society, beyond the invocation of the standard slogans related to either economic development or social justice and fairness. However, neither clarity of its analysis nor its resonance with contemporary issues are the main reason why I believe the Situationist pamphlet is worth reading. Instead, I would like to draw attention to the underpinnings of one of its underlying assumptions, reflected in the broader cultural imaginary of the ‘misery’ of student existence, life and social position, and then contrast it with current trends in the provision of student ‘experience’. Last, I want to bring this conversation to the question of tuition fees, which recently re-gained prominence in England, but has been at the back of higher education policy discussions – both in the UK and globally – for at least the last 30 years, and then use it to reflect on the changing role of higher education more generally.

The misery of student life?

There existed a time when being a student was really an exercise in misery. Stories of dank rooms, odd jobs, scraping by on half a baguette and half a pack of cigarettes used to be the staple of ‘the student experience’. Nor were such stories limited to France; I often hear colleagues in the UK complain about not being able to stand cider as they drank way too much of the cheap stuff as undergrads. All of this, as the adage went, was in preparation for a better life to come: stories of nights spent drinking cheap cider only make sense if they are told from a position in which one can afford if not exactly Dom Perignon, then at least decent craft beer.

In fact, these stories are most often told in senior common rooms, at alumni gala dinners, or cheerful reunions of former uni classmates, appropriately decked out in suits. In them, poverty is framed as a rite of passage, serving to justify one’s privileged social and professional position: instituting a myth of meritocracy (look how much I suffered in order to get to where I am now!) as well as the myth of disinterestedness in the material, creature-comforts side of life (I cared about perfecting my intellect so much I was prepared to lead a life of [relative] material deprivation!).

These stories do more than establish the privilege and shared social identity of those who tell them, however. They also support the figure of ‘the student’ as healthy, able-bodied, and – most of all – with little to focus on besides learning. After all, in order to endure between three and eight years on packets of noodle soup, cheap booze, and no sleep, you need to be young, relatively fit, and without caring duties: staying up all night drinking Strongbow and discussing Schopenhauer is kind-of-less-likely if you’ve got to take kids to school or go to work in the morning. This automatically excludes most mature and part-time students; not even to mention that negotiating campus sociality is still more difficult if (for cultural, religious, health or other reasons) you do not drink or do drugs. But, most importantly, it reinforces the idea that scarcity is a choice; the ‘student experience’, in this myth, is a form of poverty tourism or bootcamp from which you emerge strengthened and ready to assume your (obviously advantageous) position in life. This, clearly, excludes everyone without a guaranteed position in the social and economic elite. Poverty is not a rite de passage for those who stay poor throughout their life, and there is no glory in recalling the days of drinking cheap cider if, ten years down the line, you doubt you’ll be able to afford much better. Increasingly, however, that is all of us.

Situationists recognized the connection between the ‘poverty of student life’ and generalised poverty back in 1966:

“At least in consciousness, the student can exist apart from the official truths of ‘economic life’. But for very simple reasons: looked at economically, student life is a hard one. In our ‘society of abundance’, he is still a pauper. 80 % of students come from income groups well above the working class, yet 90 % have less money than the meanest laborer. Student poverty is an anachronism, a throw-back from an earlier age of capitalism; it does not share in the new poverties of the spectacular societies; it has yet to attain
the new poverty of the new proletariat.”

This brings us to the misery of student experience here and now. For the romanticisation of the poverty of student life makes sense only if that poverty is chosen, and temporary. Just like the graduate premium, it is predicated on the idea that you are ‘suffering’ now, in order to benefit later. And, of course, in the era of precarity, unemployment, and what David Graeber famously dubbed ‘bullshit jobs’, it no longer holds.

The gilded cage of student experience

Of course, university degree, in principle, still means your chances on the job market are better than those of someone who hasn’t got a degree. But this data skews the bigger picture, which is that the proportion of bullshit jobs is increasing: it’s not that a university degree guarantees fantastic employment opportunities, it’s that not having one means falling out of the competition for anything but the bottom of the job ladder. Most importantly, talk of graduate premium often omits to take into account the degree to which higher education is still a proxy for something else entirely: class. The effect of a university degree on employment and quality of life is thus a compound of education, social background, cultural capital, and race, gender, age etc., rather than an automatic effect of enduring three to eight years of exam taking, excessive drinking, and excruciating anxiety.

Perhaps surprisingly, one of the most visible reflections of the changing socio-economic structure of student existence is the growth of high-end or luxury student housing, and the associated focus on ‘student experience’. Of course, in most cases universities and property developers do this in order to cater to foreign, ‘overseas’ fee-paying students, who are often quite openly framed as the institution’s main source of income (it is particularly interesting to observe otherwise staunch critics of ‘marketization’ and defenders of the ‘public’ status of the university unashamedly treat such students or their parents as cash cows, or at the very least, consumers). But, to a not much lesser degree, it is also a reflection of (if still implicit) recognition that studying no longer guarantees a good and well-paid job. In other words, if you’re not necessarily going to have a better life after university, you may as well live in decent conditions while you’re in it.

The replacement of dank bedsits and instant noodles with ensuite rooms and gluten-free granola, then, is not ‘selling out’ the ideals of education in order to pander to the ‘Snowflake’ generation, as some conservative authors have argued. It is a reflection of a broader socio-economic shift related to the quality of life and life chances, as well as the breaking of the assumption of a direct (if not necessarily causal) link between education, employment, and status. In this sense, Labour’s plan to abolish tuition fees is a good start, but it does not solve the greater question of poverty and precarity, both of which will increasingly impact even those who have previously been relatively shielded from the effects of the crumbling economy – graduates.

Beyond fees

Even with no tuition, graduates will either need loans to cover living costs, or – unless they rely on their parents (and here we are stuck in the vicious cycle of class reproduction) – engage in bullshit work (at least until there is an actual effort to integrate part-time study with decent jobs, something that the Open University used to do well). In the same vein, Graduate Tax only makes sense if the highly educated on the whole actually earn much more than the rest of the population (see an interesting discussion here) – which, if current trends continue, is hardly going to be the case. In the meantime, the graduate premium reflects less the actual ‘earning power’ a degree brings and more the further slide into poverty for those without degrees, coupled with the increasing wealth of those in top-tier jobs, hardly representative of graduates as a whole (in fact, they usually come from a small number of institutions, and, again, from relatively privileged social backgrounds).

Addressing tuition fees in isolation, then, does little to counter the compound effects of deindustrialization,
financialization, and growing public debt. This is not to say that it isn’t a solution – it’s certainly preferable to accruing a lifetime of debt – but it speaks to the need to integrate education policy into broader questions of economic and social justice, rather than treat it as temporary solution for rapid social, technological and demographic change. Meanwhile, we could do something really radical, like, I dunno, tax the rich? Just a thought.

Computational social science and the promise of a reflexive, empirically robust activist-sociology (2017-08-16 08:00)

By John-Paul Smiley

The failure of the majority of researchers in the discipline to predict and understand both Brexit and the election of Donald Trump to the US Presidency indicates the need to rethink the approach taken, in order to contribute more usefully to public political discourses. What I want to suggest here is that a more openly activist approach to sociology is now required, in order to achieve the sort of impact its practitioners desire. But this is to be a more holistic sociology, one which makes much greater use of computational data science in order to provide robust empirical groundings, but that does so in conjunction with more reflexive and conscientious engagements with ethics, history, and philosophy.

It is to be openly activist because social research in general nearly always already is, though it is rarely acknowledged or labelled as such, and recognition of this allows researchers to more honestly, reflexively, and transparently engage with and present their work. For example, a sociologist’s work very often suggests change, of cultural and/or institutional forms, in the service of advancing some implicitly or explicitly desired vision of the ‘good life’. This is an inherently political act. Similarly, suggestions for the need for policy interventions, whether in matters of domestic social policy (for example, welfare cuts) or debates concerning intervention in international matters (for example, military, humanitarian and/or peacekeeping interventions) all aim towards particular normative ends ([3] see Bartram: 2010), and rest on implicit visions of ourselves and others, as humans, and of the duties, freedoms, obligations and rights we believe accompany these conceptions ([4] Chernilo: 2014 [5] ; 2016).

Even in cases where research suggests stasis, this too is a political act as it denotes an articulation of resistance to change and an argument for the status quo to prevail – all based on often tacit philosophical assumptions. Research acts are thus always political acts, regardless of whether the researcher themselves is aware of this. And these political acts are informed by ethical-normative assumptions which are inexorably tied to historically specific visions of ourselves and others. The vision of sociology as a detached, objective discipline is an illusion. It is not how we practise, it is not how we, as humans, live, and so continuing to suggest it as an ideal for the discipline going forward is unhelpful. Far better to be honest and explicit regarding our varying assumptions and biases in order to facilitate quality, genuine, and sincere dialogues ([6] see Smiley: 2016).

In pursuing whatever particular vision of the ‘good life’ a researcher does, however, this is where the activist-sociologist must also become a historian. There must be recognition that such assumptions, beliefs and visions are culturally and historically specific, that they have emerged at a particular point in time, in response to perceived needs that have been negotiated by various social actors, and which are open to constant contestation and revision. There must also be recognition of the history of peoples which are the object of any study ([7] see Fatsis: 2016), especially if the researcher has any explicit intention to inform political decision-making. ‘Peoples’, to the extent that they are meaningful as a category, are historically emergent and specific. And by virtue of this specificity, there will be a tendency for the individual social actors within them to possess prevailing configurations and versions of ‘cultural software’ (Balkin: 1995), which shapes and constrains their social attitudes and behaviours, leading to predominant configurations of ontological security, what Croft (2012) has defined as, ‘...the need to construct biographical continuity, to construct a web of trust relations...’ ([8] Croft: 2012: p.219).

This is what Balkin (1995) meant when he stated that,
‘To exist in history means to be the bearer of a particular type of cultural software...historical existence is not merely existence in time, but existence at a time when one is constituted by a particular form of cultural software’ ([9] Balkin: 1995: p.1229).

It is thus only through the recovery and understanding of any social actors' historical embeddedness, that robust knowledge of them is truly possible, and without such, the capacity for political discussion and persuasion on any topic in the present is reduced, as one lacks a genuine understanding of the social 'others' one is engaging with. In order to think usefully about the future, then, a sociologist must have a rich and nuanced conception of the present, and forming such requires one to look back to the past.

To facilitate such rich, nuanced historical understandings, this activist-sociology should have more robust empirical groundings in computational data science. The promise of such lies in its potential to allow researchers to identify what Bauman (1990) has referred to as the '....social in the individual, the general in the particular...' ([10] Bauman: 1990: p.10).

It will increasingly offer sophisticated background and contextual data to the fundamental foci of sociological inquiry: social constructions, social inequalities, social orders, and social patterns, and will allow researchers to see the numerous figurations and patterns which make up social life in ways previously impossible, and with that, provide new opportunities for re-understanding practices. This is not to suggest that computational social science become the only tool utilised by researchers – there is, and should remain, a place for a variety of research methods. What is does suggest, however, is that these other methods, including those common to qualitative small-n studies such as interviews, be complemented with such data in order to at least provide greater background and context to their studies – this is to be quantitative data utilised with qualitative sensibilities. So, for example, if a researcher intends to carry out ethnographic work with working-class social actors, a richer story will be provided by empirically understanding the historical emergence of the category in the territory under consideration, through which the actors self-identify. A study of such, even with a small sample size, would have increased value by providing a more robust empirical foundation through which to interpret any observational and/or interview data gathered, allowing any results and conclusions to be interpreted in a more holistic context. But it must be recognised that such data will always require interpretation by researchers, both concerning what it supposedly represents in itself, and also with regards its supposed potential to inform any particular political decisions. This critical point is especially important to recognise because, as, Lukács (1923) stated, 'A situation in which the “facts” speak out unmistakably for or against a definite course of action has never existed, and neither can nor will exist' ([11] Lukács: 1971: p.23).

Finally, what does all of this mean for the training provisions for sociology students going forward into the future? The training of doctoral students in sociology should necessarily include greater training in quantitative methods, particularly computational data science. But this must be complemented with training in ethics, history and philosophy. Students should be taught to recognise their own assumptions and biases and to use that knowledge to assist them in producing more robust logical arguments. To this end, mandatory introductory training modules in computational data science, ethics, and political philosophy should be completed (these could be web-based modules, for convenience). Researchers should also have to complete a brief essay by the end of their first year of doctoral study on the historical emergence of their objects of study in comparative perspective (approximately 5000 words should
suffice). Such training would enhance the future relevance of sociological research not only by providing more robust empirical groundings, but by ensuring all researchers could clearly articulate their philosophical presuppositions and are able to locate their research, and present their arguments, in historical perspective. This would represent a significant step towards ensuring quality sociological contributions to more informed contemporary and future public discourses, allowing sociologists to participate more productively in political life going forward in the decades to come.

John McCreery (2017-08-17 11:41:50)

This is an eloquent and powerful statement with which I largely agree. One flaw is the cliché that "Research acts are thus always political acts, regardless of whether the researcher themselves is aware of this." The argument that all research is political in the sense that the decision to do apolitical research is itself inherently political is one of those steps too far that obscures an important dimension of difference, i.e., between research like my own current project which combines social network analysis on a large dataset with historical and ethnographic research to better understand the world of award-winning advertising creatives in the period 1981 to 2006 but advocates no policy position whatsoever and, for example, that conducted on behalf of microtargeting voters during political campaigns. Aiming for absolute universality the argument becomes vacuous. P.S. If citations are included in a blog post, said post should be accompanies by a list of references. Otherwise, great job. I have taken the liberty of posting the links in several anthropology-related groups on Facebook.

John-Paul Smiley (2017-08-17 16:50:15)

Thank you, I'm glad you found it of some interest. My aim was simply to highlight the promise of new computational social science methods and to point out that every aspect of the research process rests on certain assumptions which ought to be recovered and made explicit by researchers, as much for their own understanding as for others. If we can begin to marry the advanced computational techniques on the horizon with a greater degree of researcher reflexivity, there is potential going forward for genuine understanding of social phenomena. The reason there is no reference list at the end of this piece is simply a matter of convention for this particular blog site. I have previously published here with a reference list, but have been informed that the preference now is for hyperlinks embedded in the text, rather than a list at the end. Hopefully they're easy enough to follow, should anyone be inclined to do so. And thanks for sharing the piece. I hope your colleagues and/or
students find it useful as well.

Ontology Etc (2017-08-17 08:00)

https://www.youtube.com/watch?v=HDItGMd2bTY &utm_content=buffer12913 &utm_medium=social &utm_source=twitter.com &utm_campaign=buffer

Philosophy often operates at such a high level of abstraction it is difficult to see how it can be useful to practicing social scientists. The work of Roy Bhaskar is no different. Renowned for its difficulty, its technicality, and its obscurity, while Bhaskar claims to underlabor for social science, his work remains a work for philosophers rather than researchers. Based off a forthcoming book in the Routledge Critical Realism series in this webinar Dr. Timothy Rutzou (Yale University) will discuss Bhaskar’s work focusing upon ontology, epistemology, and methodology, and looking to answer the question, how on earth does one use the work of philosopher Roy Bhaskar to do empirical social science?

Wander Nunes Frota (2017-08-17 12:13:04)
Pierre Bourdieu used it!

Stephen Norrie (2017-08-26 20:36:12)
Did he? Where?

Adrian Brewster (2017-08-18 09:13:02)
Hey Mark, Thanks for the brilliant blog and just to reassure you that real people do read it should point out that mysteriously the webinar video link “has been removed by the user. Sorry about that.” Having seen it before it vanished you aren’t missing much although the book sounds like it could be good. So far the best answer I have found to, "...how on earth does one use the work of philosopher Roy Bhaskar to do empirical social science?" has been Paul K. Edwards et al's book discussed here http://criticalrealismnetwork.org/2016/01/11/putting-critical-realism-into-practice/ and of course the man himself in Enlightened Common Sense (2016) but always on the look out for other suggestions of accessible ways into metareality for the un-academic.

Mark Carrigan (2017-08-20 16:40:28)
Thanks Adrian, I’ve asked Tim what happened to the video but he hasn’t got back to me yet.

Academic Autism: Its Institutional Presence and Treatment (2017-08-19 17:51)

Over the weekend, Steve Fuller published this blog post which has understandably been the object of many complaints. Steve is one of a number of people who have accounts which enable them to post directly on the site, without the intervention of an editor. For the six years he has been posting on the site, this has been unproblematic until now. But I’m in complete agreement with the criticisms made of this post, through e-mail and Twitter, regretting the fact that it was ever posted. I’ve decided we should continue to host the piece but also carry responses to it, as well as linking to this note. If you’d like to write one, please e-mail me at mark@markcarrigan.net to discuss ideas or with your completed response.

Thorstein Veblen notoriously wrote of the ‘trained incapacity’ of academics, by which he meant the inability of scholars to apply their vast learning to public problems by virtue of the narrowness of their training. In effect, academia had caused them to lose both their grasp on empirical reality and their power of imagination. I believe that Veblen was correct, but the pathology also has an inward expression. It appears as a kind of autism that renders academics incapable of engaging with each other’s arguments if they make claims that transgress one’s own disciplinary norms, ranging from the assertion to facts to the deployment of concepts.

The physicist Alan Sokal triggered a celebration of such ‘academic autism’ in 1996 with his notorious ‘hoax’ article in the pages of the cultural studies journal, Social Text. The article was a pitch-perfect politically correct piece of postmodern theorizing that interlaced references to noted theorists and fake physics. The failure of the editors to spot the fake physics by itself was widely taken to have demonstrated their lack of intellectual integrity. That the article may have contained some interesting claims and arguments – notwithstanding the fake physics that Sokal planted and in spite of what he himself may have intended – was never taken seriously.

Because I draw on many fields in my work, sometimes casually, I am susceptible to autistic treatment by fellow academics. It is epitomized in the following question: ‘How do you expect to be taken seriously if you make these egregious errors in presenting material from my field?’ One might have thought that the simple answer is that one reads to the end and then judge the extent to which the ‘errors’ matter to the argument. (Indeed, there may be some other concept, fact or figure from the interlocutor’s field that actually helps the argument.) But all too often the interlocutor responds that the errors blind her from determining what the argument is. At that point, one might question the interlocutor’s ability to handle semantic ambiguity more generally.

Of course, academia provides an institutionalised way of getting around its self-induced autism. It involves the cultivation of a fan base, aka ‘school’, the job of which is to immunize the chosen transgressive academic from autistic assault. Remember when Rudolf Carnap excoriated Martin Heidegger’s misapplication of the logic of negation? When Lawrence Stone took on Michel Foucault’s sloppy scholarship? When John Searle diagnosed
all of Jacques Derrida's philosophy in terms of a failure to appreciate the difference between cause and effect? When Denis Dutton invented a 'bad writing' prize just to award it to Judith Butler? When Alan Sokal and Jean Bricmont charged Bruno Latour with systematically confusing relativity and relativism? Perhaps not – and that’s the point.

The fans come to the rescue, interpreting the offending the texts in a more charitable light or, if that proves to be too great a labour of love, making explicit what the offending author should have said in order not to have cause such great offence. Much of this work, which may constitute the bulk of scholarship in the 'human sciences', is probably best seen as a species of historical fiction. But over time it does the job of keeping the accusers at bay, basically by turning the 'errors' of the accused into 'aporiae' whose depths can be plumbed in perpetuity – or at least over several academic career cycles.

Jacques Derrida understood this point especially well, as he both wrote about and exemplified this process. It enabled him to face the very many detractors in his lifetime with complete equanimity. As someone who came of intellectual age as Derrida was reaching his peak reception in the Anglophone world, his example left a lasting impression on me, which I encapsulated in my first book *Social Epistemology* in the phrase, 'Hobbesian hermeneutician'. Textual interpretation is a war of all against all in semantic space: Your words can mean whatever your readers let you get away with.

Professor Celia Kitzinger (2017-08-21 09:21:47)
As a psychologist and senior academic who values the (cross-disciplinary) research, teaching, and collegiality of academics with autistic diagnoses, I am dismayed to find "autism" used as a slur in this way. It’s insensitive, unkind and untrue to label particular kinds of academic critique “autistic assault”. It is unnecessary - and distracting from your argument - to casually derogate a whole category of people in the course of advancing your claims. Your metaphor reinforces prejudice and discrimination against autistic academics (see #autisticsinacademia). I hope you might want to rework this piece to remove the hurtful language.

Steve Fuller (2017-08-21 11:21:39)
Thank you for your comment. I clearly come to this matter with a different set of lenses from you. First of all, words like 'autism', 'paranoia', 'schizophrenia', 'obsession', 'compulsion', 'sadism', 'masochism', etc. have had relatively fluid transit between ordinary and scientific usage, and it's an open question whether scientific usage should be considered dominant. My article is actually against disciplinary ownership of concepts, which implies a tolerance for the fluidity of concept use. In this particular case, I worry that the scientific colonization of these concepts heightens the difficulty of discussing the normative character of these personality traits without automatically 'pathologising' them in some medical sense. We should be able to say that certain traits are desirable or not under certain circumstances without recourse to 'illness' talk. Placing taboos on the use of the word 'autism' doesn't help matters in this respect. It’s true that ‘autism’ tends to be used pejoratively in public discourse, and my intent was indeed to use the word pejoratively, but not out of disrespect for the people that you’re concerned about. However, it’s worth noting that Thomas Kuhn described the psychological role of paradigms in forming the scientific mind in terms of a great narrowing of vision which at the same time provides insight that could not be got without such a sharp focus. He actually saw this in very positive terms. When people speak of the positive features of ‘autistic’ people, such matters come to the fore. However, I think they can be overvalued – and perhaps they’re overvalued in the academy, where specialisation is still very highly respected and used as a general competence filter. My more general view about ‘autism’ and other such psychiatric terms is that rather than trying to regulate the speech surrounding them, regardless of the context, they should be positively re-appropriated in public discourse, in the manner of ‘queer’. That doesn’t solve all the problems, for sure, but that would make more sense to me.
I would invite you to look at the #autisticsinacademia hashtag on Twitter - firstly, to observe the hurt that your article has caused, and secondly, to engage with the socio-political issues and cultural world of an identity group that you have appropriated and so publicly denigrated here.

The idea that autism is 'over-valued in the academy' is laughable for autistic academics. We are extremely marginalised. Furthermore, there is only one stereotype of autism that you are referring to here. We are nothing like this stereotype.

"It's true that 'autism' tends to be used pejoratively in public discourse, and my intent was indeed to use the word pejoratively, but not out of disrespect for the people that you're concerned about." Okay, well, it is we the actually autistic who actually suffer marginalization and ostracism when people like you help popularize use of the term to denote a set of undesireable character traits rather than the results of a neurodevelopmental condition that affects language, movement, and sensory processing. I DO think we should positively re-appropriate the term....to refer to what it actually means....but you're not doing that here. By your own admission, you are using it as a pejorative.

"My more general view about 'autism' and other such psychiatric terms is that rather than trying to regulate the speech surrounding them, regardless of the context, they should be positively re-appropriated in public discourse, in the manner of 'queer'. That doesn't solve all the problems, for sure, but that would make more sense to me." Yes, OK, but I should imagine (someone correct me if I'm wrong) that the re-appropriation of 'queer' was initiated and led by those belonging to the queer community, not by smarty-pants provocateurs gleefully using the term as a 'pejorative metaphor'.

Oh my God, how did I miss that he'd written that? See, this is what happens when he just can't say something along the lines of "I see now I was wrong, I apologize, and I will do better." Or, failing that, just ignoring this comment section altogether would have been better than what I've read from the follow-ups! Not "I'm sorry for offense caused" or "I'm sorry if anyone was offended." If he's not sorry, he doesn't have to be! But don't give a BS pseudo-apology, then claim you've given an apology, therefore making any more anger about the issue unwarranted. Not only what you said is correct, Jason, that the queer community led the move to claim back the word "queer," and that's how it should be. Along the same lines, many black people have tried to claim the n-word in the same way. That charge is certainly not led by anyone outside the black community, and it’s "definitely" not being led by someone out of it who admits he's using the word in a pejorative manner that relies on stereotypes that would be erased with a decent 15-minute Google search. Here's another thing, not quite related to what you said, Jason, but I hope people read this, including the original author (though he seems to be ignoring my question about what aspects of my being I'm currently ignoring by embracing my autistic identity). What is going on here isn't language policing. No one is going to jail. No one is going to court. What is going on here is that language is being challenged, and it's being challenged vigorously. If someone wants to put on an academic cap and put this crap out, then that person's going to get challenged, and "Whaaa, whaaa, whaaa, my language is being policed" is the cry of a bully. The author had a chance to respond to these very vigorous, tough challenges. The author, if his ideas are valuable, interesting, worthy of consideration, had a chance to respond to these challenges. Now I know he think he has. But when your defense then includes both ideas of "You all embrace this autistic stuff too much" and "Hey, I'm a champion for autistic rights by re-claiming the word," I realize I'm dealing with an intellectual fool. Here's the deal. My diagnosis came in my thirties. I wasn't looking for it. I was looking for help. When I received my diagnosis, I didn’t quite reject it, but I didn't accept it either. But it was a kind of skeleton key–it would unlock all the doors in my mind that had been previously closed. I suddenly had an explanation for why I did things and why I’d done things all my life. I had better control over my life, my mind, my actions. I found a community of people who'd experienced things that I thought were my failures, my quirks, my burden to bear. They thought like I did, feared things I did, and so on and so forth. Some became my dear friends. I joined their communities, and we talk every day. This idea of “maybe ya’ll hold on too much to your autistic identity” is the same NT nit-wittery as
when I heard someone ask me, "So what do you and your autistic friends talk about all the time? Just being autistic?" On the contrary, we talk about movies, literature, politics, science, relationships, and everything else under the sun. And yes, we also talk about our life experiences as autistic people and take solace, get advice, and learn from each other. I lived until my thirties without knowing I was autistic, and after so, so, so many struggles, I have a number of accomplishments and so many "aspects of my being"—that I wear. Realizing I was autistic was like applying some kind of cleaning product to my mind...everything became clearer, and I became more confident for it. I went public with it a few months ago, and people (well, most people) have been nothing but supportive precisely because they don't see me as someone who limits "aspects of my being." This is just one more window by which they can look in on me and understand me. For me, it's a huge, huge, huge part of my identity for reasons I've described and more. What gets me about all of this isn't really the original post. I mean, academics are pretty notorious for taking ideas that I could explain to a five-year-old and making them largely inaccessible with constant jargon and a belabored metaphor. The fact that it's an offensive metaphor doesn't really shock me, especially given the attitude of so many academics. I wasn't even going to say anything until I started reading the author's follow-up comments because in THOSE lies the really horrid insults, in my opinion. At this rate, I hope I've made some sense to anyone reading this. If you're a fan of putting out daring, controversial ideas, don't you dare say or imply your language is being policed when you get push-back, when you get challenged. But really, I'm refusing to engage this professor to any extent until he answers my original question to him, which I will now repeat to him. What, pray tell, "aspects of my being" do you think I'm ignoring by embracing my autistic identity?

Richard Woods (2017-08-22 16:20:12)
A most informative post. Do you think Steve Fuller can answer your question? "What, pray tell, "aspects of my being" do you think I'm ignoring by embracing my autistic identity?" Maybe that is the point of your question is that Steve Fuller can not answer it? He does not know you, so he can not give an informed reply. Therefore Steve Fuller has no right to say what he has said, he even acknowledged it is none of his business.

Brad McKenzie (2017-12-09 03:51:22)
I question your 'heroic crusade' to change current social norms to fit your ego based on historical references. Have you ever been in a minority group? Have you ever suffered the pains of persecution? Have you ever empathised genuinely with others who are sensitive to the structures of present day society? I ask that you stop being so pompous and grandiose and start moving with society instead of trying to speak your way back to the era from whence you came. Trying to reclaim language that as you rightly point out is "fluid" is only contradictory to your argument. Doing so, willingly and knowingly hurting a great many in society, to satiate your own ego, testifies only to your psychopathology as evidenced by your blatant disregard for others. If you would like I would be happy to put that in layman's terms to express it how the majority would, however I have respect for other's as a social value!!

» A note on this weekend's post The Sociological Imagination (2017-08-21 11:30:03)
[...] the weekend, Steve Fuller published a blog post which has understandably been the object of many complaints. Steve is one of a number of people who [...]
in place by disciplinary structures, funding systems and especially audit systems. I think the strength of sociology at its best is that it enables us to see how these systems and structures work, and there is a proper question about the psycho-social consequences of academic disciplinarity. But of course, sometimes if one works across many fields, as I do myself, one may indeed make errors, egregious or otherwise.

Damian Milton (2017-08-21 14:19:30)
The article uses autism as a stereotypical slur and is harmful, stigmatising and ableist.

Damian Milton (2017-08-21 14:22:10)
Perhaps readers would like to know about how autistic academics have been trying to break down the disciplinary silo mentality? Such as the open access journal: Autonomy: The Journal of Critical Interdisciplinary Autism Studies, or the Participatory Autism Research Collective?

Steve Fuller (2017-08-21 14:58:57)
First, I want to thank Damian Milton for the reference to the journal, which looks very interesting. However, contra Gail Loomes, I don’t believe that using a word, especially as a metaphor, is necessarily to appropriate a group’s identity, let alone in some injurious fashion. In fact, my article is not about autistic people in the sense that concerns you. However, I would say that over-identifying oneself with a word such as ‘autistic’ to capture the essence of one’s being is a potential problem, perhaps a pitfall of identity politics, especially in the case of ‘autistic’, whose medical meaning has considerably broadened out in recent years. Nevertheless, I had no intention to cause offence to you or your community. As for Ruth Levitas, I’m happy to see that she’s found a forum to voice some long-standing grievance of which I had not been aware. I’m not sure I quite said what she attributes to me, but I acknowledge that I may have said something that could have been taken that way. However, I must disagree with her substantive point – or at least find it too glib. The fact that disciplinary boundaries have been institutionalised a long time doesn’t mean that they can’t be overturned in shorter time through some determined effort, but that does have a psychological component. Yes, it’s hard and there are many obstacles, but she knows as well as I do that sociologists tend to be in their comfort zones when they diagnose all the ‘structural difficulties’ that prevent things from changing rather than trying to change things themselves. In any case, my apologies to Ruth for any offence I have caused her in the past.

Cos Michael (2017-08-21 15:07:57)
Firstly, the concept of autism used here is wrong: there are many autistic people, academic or otherwise, who are very well able to embrace and debate new ideas. You have misunderstood or misinterpreted what is known about autism, which negates your entire piece. Then you use it in a deliberately perjorative way, which is insulting and discriminatory to autistic people and to right minded non-autistic people, most of whom object to discrimination. Finally, you try to justify your argument: so who is it who is “incapable of engaging with each other’s arguments if they make claims that transgress one’s own disciplinary norms, ranging from the assertion to facts to the deployment of concepts”? What any reasonable person would do, faced with the realisation that they had been offensive, is apologise unreservedly, in the same publication that published their work. Otherwise, I cannot see how the editorial team from that publication could risk accepting material from that individual again, as in law, the publisher is liable for what they publish.

Kate Fox (2017-08-21 15:24:22)
Luckily as Professor Fuller is so deeply committed to a de-siloing of academic disciplines, concepts and language, I am fully hopeful that he will now be acquainting himself with the multiple ways the descriptor “autistic” is now used inside and outside the academy. He will thus find that his use of the word Autism to denote rigidity of thought and isolationism is wrong and outdated. I hold out no hope that he will concede that his usage of it is stigmatising and offensive to autistic people (though many have told him that it is). But surely, surely if he cares about accurate scholarship and precise use of words, then he will search his brain, the thesaurus or the words offered to him on Twitter, for a clearer, sharper way to describe a certain sort of sort of monopomism. (Ooh-there’s another good word).
Steve Fuller (2017-08-21 15:24:57)
To Michael Cos, I have already apologised for having caused any offence. I was indeed using ‘autism’ in a stereotypical way that does not cover the full range of behaviours, etc. now covered by the ‘autistic spectrum’. But in that case, is it even useful to retain the term ‘autism' for scientific purposes given its increasingly wide-ranging character? Moreover, don’t you worry that by identifying so strongly with autism, people are limiting other aspects of their being?

Lauren Hall (2017-08-21 15:30:28)
The way autism is perceived by a very large proportion of the autistic community is that it is inseparable from their being - as our minds are autistic, and this being autistic informs how we understand and perceive the world around us (not just intellectually, but relating, say to sensory perception as well), it informs all aspects of our being and sense of self.

Damian Milton (2017-08-21 15:31:07)
In reply to that comment, not at all. I also consider myself a sociologist, would you have the same concerns there? You may find this debate of interest as it specifically addresses this point https://blogs.exeter.ac.uk/exploringdiagnosis/debates/debate-1/

Cos Michael (2017-08-21 15:52:50)
What sort of academic is proud of using stereotypes? Particularly an outdated one which is debunked by the actual presence of autistic academics, scientists and creatives? At this point, clinging so desperately to your argument speaks more of insularity than an ability to accept that other people may know what they are talking about. For example: I sign myself Cos Michael whereas you mis-assign maleness to me. I know my name. Your response to my first comments is deeply patronising: I am autistic and no - it has never limited any aspect of my being - it is part of my being.

Ann Memmott (2017-08-21 16:08:09)
Autism is not a set of behaviours. It is a neurodiversity. In recent years, the definition of autism has for the most part changed to include fewer characteristics, not more. Intellectual disability has been removed from DSM V. Likewise speech/language conditions. Autism is a brain difference from before birth, staying with us for life. All of us have brains that use different social communication protocols to non-autistic brains. All of us have a need for predictability and logic, in routines and in communication. All of us have passionate interests, some of which may lead to extraordinary specialisation and expertise. And most of us have sensory processing differences that can be either blessing or problem, depending on the environment. It’s really not a huge range of different things. Autism has never limited me, any more than any other aspect of my being. Society’s general attitudes and refusal to build a world that allows us to thrive are what limits. We need fewer articles that are written in a pejorative way, and more engagement with us as fantastic and much loved people.

Doug Waddell (2017-08-21 17:08:19)
I identify very strongly with being autistic. What other aspects of my being do you imagine I'm limiting? When "I'm sorry; I will do better" just won’t cut it, double down, I guess?

Richard Woods (2017-08-21 16:27:14)
It would your last sentence is uncannily prescient: "Textual interpretation is a war of all against all in semantic space: Your words can mean whatever your readers let you get away with." As an autistic academic, the irony is not lost on me. However this question must be asked; are you deliberately trying to bait us?

Catriona Stewart (2017-08-21 16:49:09)
Steve - there is an extraordinary amount of cognitive dissonance going on here. You claim to believe that the term ‘autism’ is effectively defunct, it being too broadly applied to be useful and yet you use it to describe a narrow, cliched - and increasingly and effectively challenged - set of characteristics assumed by the ill-informed to apply to those who are defined as ‘autistic’. You complain about the explicit medicalisation of those to whom the term is applied by academics and scientists and yet see no issue with placing the term 'autism' within a group of terms that includes others such as 'sadism', 'paranoia' and 'obsession'. You tell autistic people they shouldn't define themselves by this medicalised, obsolete, narrow definition while
defending your use of the term as a ‘symbolic’ description of parallel medicalised, narrow, cliched characteristics you claim to identify among academics. You say you don’t intend to offend anyone and yet refuse to listen to the #actuallyautistic people who are telling you your words have offended them - what makes it worse is you really think it’s ok to tell them/us that perhaps they/we have it wrong and shouldn’t identify as autistic, on the basis, it seems, that you feel you have a better handle on what the term means than anyone else. To quote a great line from a great film by Rob Reiner (1987): "You keep using that word. I do not think it means what you think it means." Maybe you could just accept that you’ve got it wrong, that your blog-piece was poorly conceived and offensive, apologise profusely and learn something. Or are you deliberately trying to upset people?

Steve Fuller (2017-08-21 17:50:29)
First of all, to be honest, it never crossed my mind that my post would be baiting autistic people because I hadn’t realized that autistic people claim such a sense of self-ownership over the word ‘autism’. That does reflect ignorance on my part. It’s another matter whether it’s wise for people to identify so strongly with a word like ‘autism’ that they make their identities hang on the latest medical deliverance while meanwhile they police ordinary discourse. You can see that I have my doubts, but in the end it’s none of my business. As for my use of stereotypes, I am not doing it ‘proudly’, I’m simply doing it, and they do illuminate to a certain extent – as stereotypes are designed to do, as Walter Lippmann pointed out many years ago. It’s in the nature of stereotypes that they can be spun both positively and negatively, since they bring out saliences. ‘Autism’ is no different in this respect. And I said early in the Twitter responses, yes, the responses do exemplify part of what my article was about – but that was not my intent! However, I have found some of the links interesting, especially Damian Milton’s debate on whether autism has an essential nature.

Cos Michael (2017-08-21 18:47:04)
Steve, You have just shown the world how personal conceit can lay waste to academic discourse. You may be right or wrong, but it is not a conversation if one side repeatedly insists that they are correct and denigrates anyone who disagrees. I find it incomprehensible that you are so closed to other opinions, when overwhelmingly, responses to your article have found it wanting in factual basis and offensive in its depiction of autism. Not one response has defended your opinion - do you honestly believe that this makes you the only enlightened academic, beset by a multitude of inferior minds? Or might you have simply made a mistake, but are too arrogant to admit it? This is not your finest hour.

Steve Fuller (2017-08-21 19:05:17)
You must not be reading what I’m writing. I’ve conceded lots of points here and apologised at offence caused. The fact that others have not ventured to defend my position may be down to editorial discouragement (I do know of one case) or people just not wishing to get into more trouble than it’s worth. It may also be so far there has been little interest in discussing the substance of the article. The article is not about autism. It uses autism as a metaphor. That choice of metaphor may be wise or unwise, and clearly people here think it’s unwise. And they may be right. But from my standpoint, I need to disentangle identity politics side of this from the semantic side of my argument. I have found what most people have said here helpful and interesting, but I’m not sure what more you’re looking for.

Kate Fox (2017-08-21 20:30:49)
Not sure what more commenters are looking for? I’d suggested considering these comments as-not peer review but review from outside-the-silos and substituting another word for autism. Show-in some way -that you’re listening. This is not only an “identity politics” issue but an accuracy issue. You make a valid point about academic silos-is that not more important than sticking with your use of the wrong word? Does your argument rest on this word? No.

Catriona Stewart (2017-08-21 19:11:48)
Thank you for that - yes, to suggest that autistic people should consider ‘reclaiming’ the word does indeed show how little you are aware of the great amount of work carried out by many autistic people, academics and non-academics, over decades of reclaiming, redefining, and ‘self-owning’. It’s interesting (to me, anyway) that one of the ways in which autistic people are ‘othered’ is through a claim we are incapable of self-awareness and self-insight (apparently one of the defining qualities of a human, and which differentiates us from other mammals) and yet, as you have found, this claim is egregious (in the modern
sense), demeaning, othering. I haven’t seen the Twitter responses so I can’t comment on how the responses fitted into your expectations but you must be aware that the limitations of Twitter include both restrictions on terms of communication (word count) and tendency to elicit ‘knee-jerk’ reactions. Damian - yes, highly respected by us other autistic academics (my own PhD focused on Asperger’s girls and anxiety). Incidentally, my younger daughter, who has just graduated from Cambridge with a degree in Psychology, might well agree with you regarding the academic silo problem, I don’t think she’d agree with you in most other respects, not least your use of the term ‘autistic’. She loved her degree, she loved doing her research (gender id and autism) but she also learnt a great deal about ‘academia’ she wasn’t so enthusiastic about. I would love to see her pursuing research as I think she has so much to contribute but I also understand why she might decide not to. It is an ongoing issue for those who are both intellectually able and ethically driven. ‘Ordinary discourse’. In my mother’s middle-class day, ‘ordinary discourse’ included terms such as ‘nigger’, used often in a casually dismissive, demeaning, othering context, thoughtlessly used, and often indignantly defended in the context of someone who thought of themselves as well-educated, well-meaning, charitable, on the ‘side of right’. Did that make it ok? No of course not. Terms such as ‘spastic’ and ‘retard’ are also of dubious provenance but have also been part of ‘ordinary discourse’. When ‘ordinary discourse’ takes a whole population of people and defines them - as you rightly identified - solely on their differences in a pejorative sense then it is discriminatory and ultimately inhuman.

Mark Corbett Wilson (2017-08-21 19:29:19)
I find it fascinating that a blog post about what "renders academics incapable of engaging with each other’s arguments if they make claims that transgress one’s own disciplinary norms, ranging from the assertion to facts to the deployment of concepts" gathers so many replies that fail to engage with the author’s argument. "‘How do you expect to be taken seriously if you make these egregious errors in presenting material from my field?’ One might have thought that the simple answer is that one reads to the end and then judge the extent to which the ‘errors’ matter to the argument. (Indeed, there may be some other concept, fact or figure from the interlocutor’s field that actually helps the argument.) But all too often the interlocutor responds that the errors blind her from determining what the argument is. At that point, one might question the interlocutor’s ability to handle semantic ambiguity more generally." Apparently Dr. Fuller’s repeated apologies are not enough to prevent this blog from being abandoned. I have learned so much from "The Sociological Imagination" as an undergraduate adult learner, please don't double down on PC censorship and remove this informative (and at times controversial) source of Sociological learning. From the comments I have learned more about the "autistic community" and will also be more circumspect in my use of stereotypes. Including SJW’s. ;-)
definite point in the future with a new purpose & new team behind it”. Editorial oversight does not amount to ‘PC Censorship’.

Damian Milton (2017-08-21 20:35:58)
P.s. We have engaged with the argument both here (see references I posted) and elsewhere on social media. Perhaps you could learn from Prof. Fuller's example here and engage with some of this work?

Damian Milton (2017-08-21 20:36:51)
I don't think Mark was blaming our responses for that.

Olbvn (2017-08-22 03:23:03)
"However, I would say that over-identifying oneself with a word such as ‘autistic’ to capture the essence of one’s being is a potential problem, perhaps a pitfall of identity politics, especially in the case of ‘autistic’, whose medical meaning has considerably broadened out in recent years. Nevertheless, I had no intention to cause offence to you or your community." You have to be joking, Steve Fuller. Are you ignorant, or just a a woeful pedant? Autism is an actual neurotype that affects 1 out of 66 of your fellow humans, regardless of your application of the term, It is indeed harmful and ignorant to use "autism" and its variants in the pejorative, and the fact you would say it’s due to “a pitfall of identity politics” shows how little you understand about what the diagnosis of autism is, or why throwing an entire minority of people under a pejorative bus to prove some poltroonish calumny against fellow academics should be perceived as the cognitive and morally bereft bungle it is. There are other terms you could have used; I suggest a meander through a thesaurus is in order; there are plenty available online.

Sue Fletcher-Watson (2017-08-22 09:28:21)
Steve, I'd like to thank you for providing such an excellent opportunity for some of the sharpest autistic minds working as academics and activists today to showcase their brilliance. The comments thread on the piece profoundly undermines the negative stereotypes you so thoughtlessly peddle. I will be sharing this with my colleagues as a virtuoso example of the arguments around autistic identity. I hope that you may be inching towards a realisation that you do not get to justify your outrageous and offensive statements by claiming an alternative "lens". What a feeble excuse. It is not for you to decide what should or should not be found offensive by a community to which you do not belong. Your writing does you no credit.

Michael Rowlands (2017-08-22 14:54:55)
Why would I even bother reading an article that uses "autistic" as a pejorative? I don't care who you are, if you use terms that further the marginalization of an already marginalized group then you can fuck right off. I expected better from an "academic".

Richard Woods (2017-08-22 16:00:02)
Micheal Rowlands please could you apologise to Steve Fuller for your comments towards him? While I agree Steve Fuller should never have used autism in the way he did, no-one person deserves to be spoken to so disrespectfully. Especially when most of the autistic person's points is that Steve Fuller has been willfully ignorant and done us a great disservice as human beings. It is that thing people are told in school: "treat wish people how you wish to be treated". You are not doing yourself any favours treating Steve Fuller this way. By association you are not doing us any favours by using such language towards Steve Fuller. Maybe in the future you should try to calm down before replying to such charged topics? For Steve Fuller if you want an better understanding of autism, I would recommend the book "Autism and Asperger Syndrome in Adults" by the autistic academic Dr Luke Beardon: https://www.amazon.co.uk/Autism-Asperger-Syndrome-Adults-Beardon/dp/1847094457/ref=sr_1_1?ie=UTF8&qid=1503413619&sr=8-1&keywords=luke+beardon Luke Beardon does a great job at dispelling most of the present autism myths. Your blog post does highlight why the book's opening sentence is "Never believe anything you read about autism."

Doug Waddell (2017-08-22 20:54:28)
100 % disagree. No one deserves to be talked to so disrespectfully? I can think of a whole host of people who deserve zero respect. While the professor's not quite in that category, if he's going to challenge the positivity of autistic pride, then getting an "eff off" in return should be expected and, I would argue, is warranted given his comments here. If the concern is that
disrespect will make him ignore our push-back, then that’s even more revealing of the professor and isn’t Michael’s problem.

Please justify your comment on you “100 % disagree”? That is not my concern at all. Pay attention to the comments; we (autistic people) are being judged too, that is my concern. While I agree we (autistic persons) should not always be expected to follow social conventions, however sometimes it is beneficial for us to follow them if we can. Such as most replies by individuals like Catriona Stewart, Damian Milton and Gill Loomes have all been respectfully critically engaging with this thread for a reason, because such tactful replies are the social etiquette. There are also more useful conventions to when you disagree with an academic, such as writing journal articles highlighting the perceived errors in the academics work. Taking issue with any academic’s work by writing journal articles is more important to the offending academic, than any blog post you might produce critiquing their work. Which is why I have been writing journal articles recently when I read things that I find antagonistic. This is only my understanding of it. Please enlighten me if you think I am mistaken?

Jojo Bemis (2017-08-22 21:29:29)
I find it disturbing that you are more concerned with a swear word than Mr. Fuller’s smearing a whole disability community to brow beat his colleagues then claims we are too invested in our autistic identity to literally add insult to injury. I say this because given choice of who to side with, you allied with Mr. Fuller over a (rather much deserved) four letter word. Congrats.

Richard Woods (2017-08-22 23:10:11)
I have been clear that agree with the critique applied to Steve Fuller. I am disagreeing with how it has been done in some cases. My point is that we should treat Steve Fuller with dignity and respect while we critique him. He is a human being, just as much as autistic persons are. I disagree with the myth of how we lack empathy and have a theory of mind deficits. If we can not treat Steve Fuller with “empathy”, then it just reinforces negative stereotypes about us. Which is the entire point of the community’s response to Steve Fuller is that he has been propagating negative stereotypes of autism. Maybe I am trying too hard to convey my point?

Doug Waddell (2017-08-23 00:01:35)
Richard, two broad points here. As far as justifying my comment as to why I 100 % disagree, I was responding to the claim that no one deserves to be talked to with such disrespect. Well, let’s do a thought experiment here. Think of the most evil person you can imagine–either historical or perhaps imaginary. (Define “evil” as you like–replace “evil” with objectionable if that helps.) I’m thinking extremes–Nazis, the KKK, etc. Now when a person goes that far, I owe them no respect. In fact, I would disrespect the concept of respect itself in doing so. (At least that’s what I think.) Now the professor here does not fall into one of those extremes. However, what the thought experiment reveals–at least for me–is that some people certainly do not deserve our respect. Therefore, I have to reject the very broad claim that no one deserves to be treated with disrespect. When I reject that claim, then I come to this alternative conclusion–some people can do things to make it so that they do not deserve respect. I’ve chosen to walk that line a bit in this comment section, but I cannot blame anyone who decides that the professor has lost claims to respect, “especially” given the aftermath here in the comment section. That’s the first point. If you disagree, I don’t think I can convince you otherwise. But that brings me to the second broad point. You suggested that traditional academic discourse is the way to combat antagonist ideas like this, not battling it out over a blog post. Here’s the trouble–I’m responding in the format in which I was presented the ideas, and the author of those ideas is also responding in this format. So as far as recommending that I take to scholarly journals is all fine and well–and may be something autistic academics should do–but they should do it in addition to what’s happening here. If someone writes an inflammatory blog post, and then continues to inflame in the comments section of that blog post, and then I respond in said comments section, it’s a bit disingenuous to tell me that I’m showing bad form by not participating in traditional academic discourse with this matter. As far as a larger point goes, you’ve highlighted a HUGE problem with academia–if the ideas mean anything, then they should affect the world outside of academia. Sure, the ideas will get “boiled down” to a general audience, and this may take some time, but if ideas have any merit at all, surely they should have merit for more than a coterie of scholars. I actually “do” admire the efforts on this blog and similar blogs from scholars to present ideas to the public rather than present them exclusively to those with access to a university library. “That’s” a great direction for academia, but it comes with a reality–the
nature of the discourse will change. It will not go through a rigorous peer review process, but that's the nature of discussion outside of academic journals. I'm not saying there's not a place for scholarly work meant for other scholars, of course not, but when it cannot come out of its ivory tower, then it's probably not worth very much at all. The argument that we need to adhere to rigid academic conventions goes against the professor’s own argument, from what I can tell. As for outsiders reading this, if they need 18th-century-salon-type etiquette to go away feeling like ignorance and stereotyping are bad things, then that’s revealing larger issues they probably need to address with themselves and their colleagues.

Richard Woods (2017-08-23 00:59:39)
It is not that I fundamentally disagree with you. There are people I do not give the time of day too because I disagree with them and their actions. It is more I think it is a part of everyone’s human rights to be respected and treated with dignity. I would always prefer to be nice to someone than deny someone their rights of being treated in a polite manner. Maybe I am too idealistic on that one? I suspect it is part of my strong sense of right and wrong. There are open access journals like Autonomy which can be accessed by the general public. Some journals have free online access for some sections, such as Disability and Society. Generally I do accept your points. I think the situation is more nuanced than you say. Sometimes the best response is the academic literature, Especially when critical blogs are ignored and with some literature the peer reviewers are being too lenient. The peer review process has its flaws and is far from perfect. An issue of peer review is that often the reviewers will know of the author and can deduce the author’s identity. Subsequently the paper is "waved" through. I have read some papers of shoddy authorship, where some claims are made without providing references. I think an example I can give is how some of the recent autism articles discussing the neurodiversity movement by non-autistic scholars, often ignores autistic scholarship when discussing the neurodiversity movement leading to some dubious observations. Just as much as I had have a paper rejected by both reviewers and successfully challenged it with the editor, because it looks like the reviewers rejected the paper for political reasons. You are right we should challenge things in blogs and in the literature. I do agree with you knowledge should most definitely be shared with the public in an accessible way. It does not help that some academics produce work that is written in a very unaccessible way. I think if all academic articles were open access it would help a lot more. I do standby my point on treating Steve Fuller with respect and dignity in this thread. We should aim to be the better person in this situation.

Michael Rowlands (2017-08-22 15:00:40)
My apologies. I thought this was the original blog post, as it is not I would change my first sentence to "Why would I even bother reading a blog post that uses "autistic" as a pejorative?" I actually just made a video about this very topic yesterday and then this came to my attention today. https://www.youtube.com/watch?v=EUzILYZJss &lc=z23zepscuevg14it04t1ao9g425g0vcjwif-r10ukk3rk0h00410

Chris Connor (2017-08-22 19:11:43)
The inherent problem of using negative stereotypical autism metaphors, is that it runs the risk of alienating autistics from the core augment. This neuronormative barrier makes it problematic to engage with the core augment of silo mentality in academia. The metaphor serves little propose to the core augment, allistics (non-autistics) don’t have to go thought the trouble of filtering out the metaphor in order to have discourse about the silo mind state in this instance.

chavisory (2017-08-23 00:45:07)
"The inherent problem of using negative stereotypical autism metaphors, is that it runs the risk of alienating autistics from the core augment." I mean, that's certainly one inherent problem, but I'd argue the biggest one is that it runs not the risk but the near certainty of helping perpetuate false and damaging prejudices about autistic people, including that we are inherently self-absorbed or that we lack empathy or the ability to take the perspective of others. These lead directly to our being discriminated against for jobs, being considered a danger to others (especially children), mistreated in relationships and by health care and education professionals, and to being regarded as something less than entirely human.

Shona (2017-08-24 09:43:33)
Steve Fuller, You have provided a good example of the 'double empathy problem' as you fail to see how the language you use has
real life impact on a marginalised group. We all make mistakes but you are choosing not to take on board what autistic people are telling you. The reason it took 37 years for any one (including myself) to notice I was autistic was because of the stereotypes you are reinforcing. This has had a dramatic effect on my life. This is not an academic argument. Real people get hurt by false stereotypes. I have got some reading for you: Beardon, L. (2008). 'Is Autism really a disorder part two - theory of mind? Rethink how we think'. Journal of Inclusive Practice in Further and higher Education, 1: 19 - 21 Milton, D. (2012). On the ontological status of autism: The "double empathy problem". Disability & Society, 27(6), 883-887. doi:10.1080/09687599.2012.710008

"Conservatism is the new Punk Rock". Discuss. – A Guest Post by Philip Moriarty | In the Dark (2017-08-25 14:18:08) [...] caught a lot of flak at this point for his lack of judgement in posting this a couple of days ago: "Academic Autism: Its Institutional presence and Treatment". The use of “autistic” as a perjorative is exceptionally common among those edgy [...] John Spencer might not be my real name (2017-11-12 16:17:11) This thread shows how silly academia is... and it is not Steve's fault. I am just surprised how much rhetoric is nowadays in the sociological discourse. No wonder nobody takes this discipline seriously... So much bias on both sides, but neither of the camps would admit that they are merely perpetuating their own silly discourse. I am just surprised how many people here are experts in autism, all of a sudden. Feeling offended is not sociology, my friends! Using the word "problematic" is not an argument in itself.

Engines of Knowledge in the First Information Age: The Library and the Text (2017-08-20 08:00)

By Hamish Robertson

Introduction

This is the final piece in this series for [1] The Sociological Imagination and it comes full circle by focusing on one of the most obvious, even foundational, 'factories' of knowledge - the library. More specifically, the public library and its associated texts, documents, processes and numerous innovations during the 19th century. This is a very large topic in its own right and one which cannot be addressed in its entirety here. So consider this is a selective exploration of some of the key knowledge formation and 'production' elements of the library as we understand it from the Victorian period.

The library is an ancient institution, and while far from unique to the 19th century, this proved a boom time for libraries, librarians and the emergence of library science – the first information science as we now understand it. The term 'library science' was coined in the by Bavarian librarian [2] Martin Schrettinger.

In the United Kingdom, the Public Libraries Act of 1850 (following the Museums Act of 1845) set the scene for free, public libraries at the municipal level. Many new private, public, subscription and academic libraries emerged as well as a variety of affiliated educational organisations, such as the Mechanics Institutes, reading rooms and a swathe of new universities and schools, promoting reading as never before. Much of this change was reformist in nature and some was associated with the Victorian idea of social uplift through the virtues of 'high' cultural exposure. It was during the 19th century...
th century that the foundations of what we now consider near universal literacy as a pervasive social norm and tangible reality emerged. So too did the various media produced and consumed under that paradigm, which joined up and developed enormous, even industrial, momentum.

**The Rise of the Modern Reader**

For libraries to be patronised by readers, as with writing and publishing, there was a need for a growing literate population with the time and opportunity to read. Just when this process took off in the United Kingdom is still a subject of debate, as are the interconnections between books being available, the rise of educational access, industrialisation and a variety of other factors. In the UK religion is still seen as a factor in the mix driving towards an overarching growth in literacy levels – including not only early developments in general literacy in Scotland, which reformed its university system along the Dutch lines in the 18th century – but also the growth in ‘non-conformist’ schools and academies south of the border and the enormous influence of Quakers and others in the British industrial revolution, its social effects and various charitable responses. The politics of formal education seen in the Victorian era endure to the present day.

Some of the literacy debate seeks a singular ‘generative’ factor, or tipping point, essential in producing a more rather than less literate population. But perhaps this is unrealistic in the Victorian context when so many new and expanding factors need to be considered in explaining a shift from one ‘side’ of the literacy equation to the other. For many people schooling was still minimal and may jobs did not yet require adult literacy as an essential skill, perhaps we need to consider a broader cultural dimension in which many factors actively and passively supported a growing ‘culture’ of literacy. In effect, these component’s added to the whole that made general literacy the norm and the library the engine of knowledge it soon became.

**Text and Image**

It seems perhaps obvious to suggest that there could be no great demand for the printed word without an expanding audience of readers, and this has certainly been the case. Many Gutenberg-centric histories of the rise of literacy, often minimising the Chinese and Japanese contributions to the whole process, supported by paper and paper products, focus on the text and the mechanics of printing, often at the expense of the image. This creates a false dichotomy in that images were meant to be ‘read’ and readers often supported a large audience of listeners, with writing and representative images used in combination. Dickens’ serialised novels in newspapers were still meant to be both read and heard.

Literacy did not mean an automatic turn to silent reading, in the same way that public speaking did not fall away as a skill as literacy and silent reading expanded. And earlier visual methods, such as the plan, map or atlas, became
so important, and even artistic, that map folios were produced for all manner of audiences from early modern times onwards. Some, such as the [8] *Klencke Atlas* now in the British Library, were even produced in 'book' formats that were physically so large they took several people to handle. In the 19th century ['9]infographics’, designed to summarise growing factual and conceptual complexity, were everywhere and have remained with us ever since, gaining a renewed utility in the digital era.

This singular emphasis on the text needs to be reconsidered because both prior to the 19th century and deep at its heart was the idea of the image supplementing and supporting the text. This process expanded during the Victorian period to include the rapid growth of [10] graphical statistics with which we are familiar from William Playfair and Florence Nightingale's efforts. Illustrations supported and enhanced the written word in many domains. But also, the idea of complex information being summarised in visual form was a major feature of this period and utilised for all manner of books, journals, pamphlets and associated products.

It is no surprise that visual advertising, and [11] advertising agencies, gained enormous momentum in this period as general literacy, the media and public education grew rapidly. At the same time, earlier forms of retail such as the department store began to diversify, expand and accelerate in many countries including the UK, the US and Europe. The development of postal services obviously supported these processes which included not only the more commercial formats but the writing of the informal, the intimate thought or feeling and the interior experience that could not always be [12] spoken aloud. We need, therefore, to also consider the psychological element of the visual, the written word, the tactility of paper itself and its dynamic cultural position.

**Technologies of Reading and Vision**

While paper-making is a centuries old craft and commonly attributed to Chinese ingenuity, including a [13] map from the first millennium BC, the manufacture of *continuous* paper proved extremely challenging and was only fully resolved in the 19th century. French technical innovations were covertly transferred to England during the revolutionary period and a successful machine was funded by the [14] Fourdrinier brothers, eventually bankrupting them due to its phenomenal development costs. Yet another talented engineer, Bryan Donkin, then produced a working machine that was replicable, and continuous paper production began to gain momentum. Books, newspapers, periodicals and, of course, book publishers grew rapidly in both number and variety, producing a print culture. Paper itself precedes all this technology and exceeds them still in that it is itself an enormously flexible medium. The sheer diversity if its uses position it differently to the technologies by which it is manufactured, which has been remarked on at least since [15] Innis and even more recently by [16] Gitelman.
As remains the case today, for reading to be learned, accessible and usable in daily life most of us require light, either natural or artificial. Natural light in buildings, including schools and libraries, was facilitated by rapid growth and innovation in glass manufacturing, including Pilkington’s window glass production in the United Kingdom, Corning in the United States as well as many other general and specialist producers across Europe. Indeed, glass increasingly became associated with modernity itself, not only for its qualities of light but in the technical innovation its mastery as a material illustrated. The Great Exhibition of 1851 combined the Victorian technological triumphs of iron and glass in the Crystal Palace (preceded by the Great Conservatory at Syon Park), a ‘temple’ to industrial achievement and a form widely copied in other industries locally, including the railways, and internationally. In the following century glass-fronted skyscrapers would become so commonplace as to barely warrant mention but these too let in the light, while often reducing the available light at street level in a curious equation of internal light versus external shadow.

The 19th century was also the period in which public and then domestic lighting by gas and electricity (and often dangerous combinations of the two) emerged as an increasingly accessible technology. This made reading an increasingly mass activity. The newspapers, journals and periodicals that emerged in the 19th century began to escalate dramatically in the 19th century. This included creating a habit of reading through publishing instalments of longer articles and novels in newspapers and magazines. Publishers were hungry for content and opportunities for writers grew accordingly.

We also need to consider the social order and ordering that (artificial) light made possible. To be able to light a building, town or city at night makes it more policeable. And some early incarnations of street lighting were actually paid for from police budgets. Indeed, many light ‘technologies’ supported social regulation in ways we would recognise today, including not only street lights but photography (commonly used in criminology and eugenics), spot lighting, flood lighting and, towards the end of the 19th century, the electric torch or flashlight. Even the Post Office made surveillance possible in ways that were easier and faster than ever before.

**Beyond the Text**

Over time many libraries have lent not only books but a variety of other cultural artefacts as well. Indeed, linked to the more progressive side of 19th century reformism, many libraries founded in this period were seen as community resources in a much broader sense than simply being a place where one could borrow a book for free or on subscription. Andrew Carnegie founded more
than 2,500 libraries between 1883 and 1929 in more than a dozen countries. Some 1600 were in the United States which by 1919 constituted almost half of all public libraries in the country. Many were framed around the idea of being a central community resource, so, for example, his first American public library was established in Braddock, Pennsylvania in 1889 and operated until 1973. This library was essentially a community centre, as we would now think of it, and included a bathhouse and billiard tables with further extensions adding a swimming pool and bowling alley. The management of these [20] libraries saw a variety of social, technical and governance changes over the period including the increasing feminisation of the role of the librarian.

The other side of the library equation is its more conventional role as a social institution with ordering tendencies. [21] Black's work, for example, has explored the mix of progressive and authoritarian tendencies visible in the development of the public library during the long 19th century. More interesting still, he has remarked on the library as a clinic, after Foucault, aimed at ‘treating’ a variety of social ills arising from massive social, industrial and urban change – including deviance, disorder, drunkenness, political radicalism and the like. The library can be seen then as a site of quite particular forms of knowledge production and a locus for promoting behaviours acceptable to dominant social elites. What perhaps resonates down to the present is, in extending Black’s notion, of engines of knowledge as sites of social ‘treatment’ for the prevailing issues of the time. What happens as these cultural institutions, as they have become, are consolidated, defunded, privatised or closed?

Conclusion

We can see that the library became a locus for social, technological and informational change as well as to maintain order in the context of massive social and technological change. The library is still an engine of knowledge but, as with the topics of most of these pieces, it is also a highly-connected engine, one functioning by connection to and in association with a variety of other engines and processes, including socio-political changes, technological innovations and the emergence of new professions. The library was, in all its complexity, not simply a site for the Victorian social virtue of ‘self-betterment’ or education as a personal virtue but a complex and negotiated space in the growth and development of the engines of knowledge explored in this series. That place of early information science continues to be negotiated in our contemporary digital era.

[22]Hamish Robertson is a geographer at the University of New South Wales with experience in healthcare including a decade in ageing research. He has worked in the private, public and not-for-profit sectors and he has presented and published on a variety of topics ranging from ageing, diversity, health informatics, Aboriginal health, patient safety and spatial science to cultural heritage research. Hamish is currently completing his PhD on the geography of Alzheimer’s disease and recently finished editing a book on museums and older people.

The Surplus of Objects (2017-08-20 08:00)

In *Immaterialism*, Graham Harman offers a provocative critique of Latour’s social theory, praising Actor-Network Theory as “the most important philosophical method to emerge since phenomenology in 1900” (pg. 1) while also regarding its account of *objects* as philosophically deficient. While he accepts the ANT thesis that objects mediate human relations, something which chips away at the pervasive anthropocentrism of social theory, it nonetheless reinforces a human-centric world view in a subtle and interesting way. From pg 6:

>To say that objects mediate relations is to make the crucial point that unlike herds of animals, human society is massively stabilized by such nonhuman objects as brick walls, barbed wire, wedding rings, ranks, titles, coins, clothing, tattoos, medallions, and diplomas (Latour 1996). What this still misses is that the vast majority of relations in the universe do not involve human beings, those obscure inhabitants of an average-sized planet near a middling sun, one of 100 billion stars near the fringe of an undistinguished galaxy among at least 100 billion others.

The commitment of ANT to defining actors through actions, itself understood in terms of effects on other actors, “allows objects no surplus of reality beyond whatever they modify, transform, perturb, or create” (pg. 10). Without this surplus, Harman questions how it can be possible for them to change. It is only when we recognise “an object is more than its components” and “less than its current actions” that its capacity to *do otherwise* becomes conceivable (pg. 11). Exactly what the surplus is, as well as how it underwrites this potentiality, might vary. As Harman notes of himself on pg 11:

>The author Harman who currently types these words in the University of Florida Library while wearing a black sweater is far too specific to be the Harman who will leave Florida next Sunday and can remove the sweater whenever he pleases.
These features of the object which aren’t exhausted in its present actions are what account for its future capacities. If my specificity is exhausted in my writing of this blog post, it becomes mysterious how I cooked dinner or planned a trip earlier. There are the facts of these other actions but myself, as a unifying nexus in which these properties and powers converge, becomes emptied out into a frantic existence of constant process.

I couldn’t agree more with Harman’s claim that every object should be considered “as a surplus exceeding its relations, qualities, and actions” (pg. 3-4). Where I part company is with his epistemic pessimism. From pg 17-18:

And whereas naive realism thinks that reality exists outside the mind and we can know it, object-orientated realism holds that reality exists outside the mind and we cannot know it. Therefore, we gain access to it only by indirect, allusive, or vicarious means. Nor does reality exist only “outside the mind,” as if humans were the only entities with an outside. Instead, reality exists as a surplus even beyond the causal interactions of dust and raindrops, never fully expressed in the world of inanimate relations any more than in the human sphere.

This leaves me preoccupied by variance. My issue is not with the claim itself, as much as with it being framed in a way which makes it hard to unpack how this might vary between objects and contexts. How much surplus remains when we consider a given action? It depends on the action, the actor and the context. I don’t for a second believe this can be reduced to calculus but I nonetheless maintain there are differences of degree. I’m not convinced that the surplus of objects is quite as epistemically intractable as Harman makes it sound.

The populist right are demotic, rather than democratic (2017-08-21 08:00)

In an [1]important essay earlier this year, Jan-Werner Müller identifies a dangerous tendency for leftist critics to take the claims of right-populist demagogues at face value. Suddenly vindicated in their struggle with the ‘third way’ that has dominated the centre-left, the claims of nascent populists to speak for a ‘left behind’ majority, created by the neoliberalism which has consumed mainstream social democratic parties, has imbued many leftists with a newfound self-confidence.

This risks simplifying events with a complex array of causes, like the vote for Brexit and Trump’s election, imputing them to the quasi-magical capacity of populists to speak directly to the people. In doing so, it hinders the detailed analysis of these events which we so urgently need: see for instance this [2]important essay by Mike Davis which discusses the American conservative movement’s massive investment in political infrastructure across every state in the country.

However it also lends credence to the populist right, supporting claims of speaking for those left behind which belie the naked class hatred which some of these figures exhibited in the recent past. This is what Angela Nagle argues in her important book Kill All Normies. From pg 101:
Ann Coulter had long drawn upon the elite fear of the hysterical and easily led crowd. In her book Demonic: How the Liberal Mob is Endangering America explaining how ‘the liberal mob is destroying America’ she drew upon Gustave LeBon, the misanthropists’ favorite theorist of the masses. Her writing on overbreeding, overcrowding swarms of immigrants is a direct continuation of this theme, which has been consistent in elite circles since the beginning of industrialized urbanized mass society, first applied to their multiplying native proletariat and later to new waves of immigrants. Before the ‘ordinary people’ narrative became suddenly ubiquitous on the new online right after the election results, Milo could be seen in photo shoots wearing a ‘Stop Being Poor’ T-shirt, a quote from the heiress Paris Hilton, one of his idols. After the election results he was giving talks about the white working class. The hard alt-right had also rejected the idea that the masses were their naturally traditionalist allies any longer, as the conservative establishment had typically believed. Instead, they had argued that the great mass of society had been tainted and indoctrinated by liberal feminist multiculturalism, and were close to beyond redemption. It was no longer ‘five minutes to midnight’ as the anti-immigration right had long claimed but well past midnight. While the Trumpians are busy quickly rewriting history, it is important to remember that behind the ‘populist’ president, the rhetoric of his young online far-right vanguard had long been characterized by an extreme subcultural snobbishness toward the masses and mass culture.

I wonder if Graham Turner’s distinction between the demotic and the democratic, made in the context of reality television, might be useful here. One could be said to involve foregrounding ‘the people’ as an imagined construct, the other involves empowering people as a social reality. The populist right is demotic, not democratic. This is what the leftist critique of mainstream social democracy, which I’m otherwise entirely in agreement with, risks obscuring.

A note on this weekend’s post and the future of this blog (2017-08-21 11:29)

Over the weekend, Steve Fuller [1]published a blog post which has understandably been the object of many complaints. Steve is one of a number of people who have accounts which enable them to post directly on the site, without the intervention of an editor. For the six years he has been posting on the site, this has been unproblematic until now. But I’m in complete agreement with the criticisms made of this post, through e-mail and Twitter, regretting the fact that it was ever posted. I’ve decided we should continue to host the piece but also carry responses to it, as well as linking to this note. If you’d like to write one, please e-mail me at mark@markcarrigan.net to discuss ideas or with your completed response.

If we had a mandatory review process, requiring any post to be at least looked over by another person, it obviously wouldn’t have happened. But it also reflects my own lack of attentiveness to Sociological Imagination over a number of years now. What was once an enormously fulfilling hobby has long since become a slightly unwelcome commitment which I aim to dispense with as quickly as possible each month. This has felt frustrating to me for a long time but until this morning, it simply hadn’t occurred to me how problematic this could prove in practice. I now realise how irresponsible it is to leave a platform like this effectively running unattended. This seems like a good reason to finally put the site on indefinite hiatus, with the intention of hopefully relaunching it at some indefinite
point in the future with a new purpose & new team behind it.

Sine Anahita (2017-08-21 19:52:03)
I am sorry to see Sociological Imagination go into hiatus, but I support your decision. Thanks for all you have done.

Julianne Higgins (2017-08-23 00:39:53)
I'll keep a look out for the time, if/when you start up again. As an autistic I applaud your sense of responsibility and appreciate the need to put Sociological Imagination on hold. I've only just discovered this site and will read earlier articles.

Pierluigi Richini (2017-08-27 22:41:05)
I just discovered this blog today and browsing it I was excited about the richness of the contents. However I read this post discovering that Sociology Imagination will be suspended... I'm very unlucky! I hope you will find the best solution for the blog's future.

Announcing a community noticeboard for Sociology (2017-10-29 14:57)

A couple of months ago, I decided to put Sociological Imagination on hiatus after a contributing author posted something which [1]left me unwilling to run a group blog without a proper editorial process. Since then I've been wondering what, if any, purpose this site could serve.

Unfortunately, none of us have the time nor energy to implement a proper editorial process. I'm open to suggestions from potential editing teams who have ideas about how to take this forward: e-mail using [2]this form with your proposal to discuss.

In the meantime, it seems a waste to leave the site completely derelict. We still get 400-600 hits per day and have 29,000 followers on Twitter. Therefore, for the time being, we're open to using this as a community noticeboard. If you have calls for papers, event announcements or calls for contributors to disseminate then [3]send them in plain text using this form and I'll publish them unless they seem obviously irrelevant to our audience.

In a few months, I'll review the engagement to see if this function proves useful. At that point, we might actually call it a day on the site. There has been some great writing posted here over the years, so I would like to put together a book of highlights if we do take the site offline.

2. https://markcarrigan.net/get-in-touch/
3. https://markcarrigan.net/get-in-touch/
Karen Price (2017-10-29 21:07:32)

I can't quite remember the details of the deal breaker. However I wonder at the response. Most of us would recognise the risks inherent in open access academic social media. So I would not think your very excellent brand or reputation has been broken. If the offending item was removed with explanation and follow up, is that not sufficient? We now see the hidden voices some of which need voice with respect to intersectionality. However others are more questionable. Social media and digital publishing has provided a space for all. Apologies if my assumptions about the issue are not accurate but it would seem a pity given the level of engagement to let your knowledge dissemination go. To quieten your own voice would be a loss. Hope you are okay. Sincerely. Dr Karen Price. MBBS, Fracgp PhD candidate Monash University GPDU forum Admin.

Mark Carrigan (2017-10-30 12:51:32)

Thanks, there's definitely an element of that in my reaction. But it's mostly about being realistic about how much time & energy I have. I hope we can find a good purpose for what we've built but I'm increasingly aware I can't offer enough any more in terms of taking it forward.

SOCIOMETRY GROUP (2017-11-28 08:18:23)

First Global Biophilia Summit (2017-10-30 10:23)

http://biophiliasummit.com

First Global Biophilia Summit

In partnership with www.pandisciplinary.net

Call for Presentations

Dates: May 21, 22 and 23, 2018
Location: Mount Mellary Monastery, County Waterford, Ireland

Conference Fee: From €380 (Includes accommodation, all meals, tea/coffee breaks, and return transport from Dublin to the monastery)

The theory of biophilia proposes that in the earth’s biosphere, all living things – both non-human and human – are inextricably linked and innately motivated to interact with other species. When our motivations demonstrate the characteristics of awe, reverence, respect, and empathy, these inter-species interests and interactions can be mutually beneficial psychologically, biologically, emotionally, and spiritually in ways that encourage the species’ survival, evolution, development, and ability to flourish. We can live in harmony with nature. Conversely, when these inter-species interests and interaction are plagued by egocentrism, self-serving biases, devaluation, and domination of one species by another, the outcomes can be catastrophic across the entire biosphere, resulting in the decimation, destruction, and/or extinction of both known and yet-to-be discovered species.

The biophilia perspective provides a fertile ground (pun intended) for the intersection of theory and praxis. This exciting international Summit will allow access opportunities to a diverse group of individuals who originate from a variety of disciplines and careers yet who share a common interest in, and love for, Nature. Since the survival and well-being of the species who share our biosphere is approaching crisis point, this Summit is designed to facilitate a free exchange of ideas as well as to encourage communication and collaboration among the participants before, during and after the proceedings.

Among the delegates who we would encourage to attend are: conservationists, zoologists, philosophers, botanists, psychologists, climate scientists, NGOs, creative artists, biologists, educators, sociologists, therapists, cultural theorists, counsellors, teachers, musicians, medical professionals, writers, pharmacologists, clergy, neuroscientists, theologians, parents, political scientists, hospitality industry or tourism professionals, public relations and advertising professionals, economists, journalists, researchers, and anyone else who has a contribution to make regarding the biophilia perspective.

As we explore the manifold aspects of the concept of biophilia, we encourage participants to think outside the limits of their own discipline, and to explore the implications for practice of biophilia and the related theories and perspectives that they espouse. In better understanding biophilia, we can establish a more personal one-to-one relationship with Nature, and have a role in raising the awareness of the communities of which we are a part. As Albert Einstein said:

"Look into Nature and you will understand everything else better."
"Not make use of the world, but to understand it ..."

We welcome traditional papers, panels and workshop proposals, as well as other forms of presentation platforms (art, poetry, posters, video submissions, and so on), given the interdisciplinary nature of the Summit, and recognising that different groups express themselves in various formats and mediums.

We would like participants – both from within and from outside academia – to explore the concept of biophilia in ways that include, but are not limited to:

**Expressions or Contexts For Biophilia**

- Visual Arts across various media (drawing, painting in watercolors, acrylics, oils, and so forth)
- Music spanning a variety of styles (classical, folk, blues, and so on)
• Literature (narratives, ancestry, lore, poetry, essay, book review, etc.)

• Film (fiction and non-fiction) with examples, such as *Medicine Man* with Sean Connery or *Avatar* with Sigourney Weaver

• Theatre (mainstream and otherwise)

• Television (series, mini-series, science channel, history channel, and so forth)

• Print (books, magazines, book chapters, and so on)

• Health (physiological, psychological and psychical benefits)

• Philanthropy (individuals and organizations that benefit human and non-human species)

• Volunteering (internal and external motives that motivate volunteering as well as organizations, circumstances, and situations that provide such opportunities)

• Culture (correlations and examples of the relationship between culture and biophilia)

• Spirituality (non-religious and religious examples of the relationship between spirituality and biophilia, such as Buddhism, Druidism, and so forth)

• Sacred Spaces and Sit Spots (the creation and existence of sacred spaces and sit spots in Nature)

• Social Media (blogs, discussions, web pages, and so forth that address biophilia)

• Internet (national and international dissemination of information, news, education, and so on pertaining to biophilia)

**Definitions of Biophilia**

• What does *Biophila* mean to you? How would you define it? How does your definition compare and contrast with that of others?

• Theoretical Perspectives (biological, zoological, botanical, philosophical, theological, anthropological, sociological, psychological, physiological, spiritual, etc.) What theoretical perspective or combination of theoretical perspectives do you favour when addressing biophilia? Why?

• Peak Experiences: awe, reverence, euphoria, epiphanies, the sublime etc. How can Nature elicit such peak experiences? Have you personally experienced one of more of them or some other type of peak experience? How did it manifest itself to you (visually, auditorily or some other way)?

**Wider Implications of Biophilia**

• Historical Implications – How have our perspectives changed over time with regard to biophilia? Are these perspectives generationally oriented?

• Law and Public Policy – How does this relation to natural justice? Legal justice? Differential justice?

• Structural Inequalities (taxonomy, species orientation, human/non-human dichotomy, “civilized things vs. natural things,” and so forth)
• Power Asymmetry (Social Dominance Orientation/SDO, mutualism vs. Amensalism, human domination over all non-human species rather than collaboration between human and non-human species [companion and mutual benefactor approach], and so on)

• Organizations and Associations (Association of Nature and Forest Therapy, Green Peace, Pets for Vets, NGOs, 4H Clubs, Scouts, and so forth)

• Generational Influences (Baby-Boomers, Generation X, Millennials, etc.)

• Morality and Ethics (responsibilities in research, the expansion of the Belmont Report, and so forth)

• Anthropogenic Causes (of pressing problems such as climate change, global warming, sea level rise, species extinction, and so on)

• World Views (economic, political, social psychological, evolutionary, etc)

Barriers to Biophilia

• Resources Perspective (consumerism, mass production, cloning, commodities, and so forth)

• Population growth (industrialized nations, developing nations, and so on)

• Advanced technology (genetic splicing/engineering, etc)

• Industry (agriculture, logging, residential development, real estate, and so forth)

• Education (development of age-appropriate academic courses, adult education courses, CEUs, and so on)

• Personal engagement (strategies to create an immersion in Nature and to establish a one-to-one personal relationship with Nature, and so forth)

• Public awareness (strategies and methods to raise public awareness and its personal investment in Nature, etc.)

What to Submit:

300 word abstracts should be submitted by January 5, 2018. All submissions are minimally double blind peer reviewed. If an abstract is accepted for the conference, a full draft paper should be sent by February 28, 2018. Abstracts should be emailed simultaneously to the Organising Chairs; abstracts should be submitted in a Word format with the following information and in this order:

1. a) author(s), b) affiliation, c) email address, d) title of abstract, e) body of abstract f) up to 10 key words

E-mails should be entitled: Biophilia Summit 1. Abstract Submission.

Please use plain text (Times New Roman 12) and abstain from using footnotes and any special formatting, characters or emphasis (such as bold, italics or underline). We acknowledge receipt and answer all paper proposals submitted. If you do not receive a reply from us in a week you should assume we did not receive your proposal; it might be lost in cyberspace! We suggest, then, to resend it.
Organising Chairs

Mary Ann O’Grady: biophiliasummit1@gmail.com
Lonny Meinecke: biophiliasummit2@gmail.com
Sean Moran: sp.moran@hotmail.com
Michelle Ryan: michelleryan22@gmail.com

This event is an inclusive interdisciplinary research project. It aims to bring together people from different areas and interests to share ideas and explore various innovative and exciting discussions.

All papers accepted for the conference must be in English, and last no more than twenty minutes to present.

We believe that it is a mark of personal courtesy and professional respect to your colleagues that all delegates should attend for the full duration of the conference. If you are unable to make this commitment, please do not submit an abstract for presentation.

Please note: we are not in a position to be able to assist with conference travel or subsistence, but we will provide free return transport from Dublin to the conference venue.

Venue

Our conference will be in a historic monastery, set in the beautiful Irish countryside. It will be an opportunity to escape from the world for a short while, and enjoy some friendly and stimulating discussions in a serene environment. Our goal is to conduct as much of the Summit as possible outdoors and in conjunction with Nature. The monastery website can be found at www.mountmellarayabbey.org

Conference Website

Book Launch: Care and Policy Practices (2017-10-30 12:50)

Care and Policy Practices
The Sociological Review Monograph Launch & Wine Reception

Friday 10th November 2017, 17.45-19.30, followed by wine reception

5262
The Sociological Review is thrilled to be launching the latest of their 2017 monographs, [1] Care and Policy Practices. For over fifty years, our monograph series has showcased the best and most innovative sociologically informed work, producing intellectually stimulating volumes that promote emerging and established academics. Care and Policy Practices continues this trend, exploring a seemingly currently widespread crisis in care and the relation between policy and care which is under intense scrutiny and contestation.

Care, including an alleged loss of care in public services, has become a focus of increased public concern, political debate and academic research. At the same time, numerous policies have been exposed as ineffective, harmful or deliberately weak. There is a concern that ‘policies’ are not care-full enough and may even promote relations of neglect and suffering. This monograph draws from this context, offering a collection of case studies of locations, relations and heterogeneous entities that make up policy practices in various sites. The contributions explore how policy and care are not separate matters, but are entangled in diverse ways.

The event will include discussion with the guest editors: [2] Vicky Singleton (Lancaster University), [3] Claire Waterton (Lancaster University) and discussant [4] Richard Freeman

(University of Edinburgh).

This event is free, but registration is required. Register here: [6] https://www.eventbrite.co.uk/e/care-and-policy-practices-the-sociological-review-monograph-launch-tickets-36830146961

Identity, belonging and activism in the 21st Century (2017-11-01 23:40)

CALL FOR PAPERS
February 24, 2018
Venue: University of Nottingham
Abstract Deadline: December 8, 2017

How do the pressures of austerity, migration and populism impact on identity and belonging in the 21st century?

What is the emotional cost of maintaining the ‘self’ in circumstances of marginalisation and feelings of ‘unbelonging’?

How are identities challenged by multiple sites of oppression and new threats to community and solidarity?

How does individual and collective action influence policy and bring about social change in this context?

Identity and belonging are dynamic sociological concepts illuminating the ways in which individuals navigate the effects of local and global inequalities. The lived experiences of individuals offer important insights into effects of ‘(un)belonging’ and the maintenance of the ‘self’. Perspectives from social class analysis, identity politics and intersectionality challenge populist notions of division and individualism.

We invite doctoral and early career researchers to present on these and related questions at the 10th Anniversary Enquire Conference. We welcome abstracts on empirical and theoretical research which could be based on, but not limited to, the following areas:

• 'Race' & ethnicity • Disability • Gender • Social class
• Migration • Sexuality • Technology • Place & space
• Political activism • Age • The body • Globalisation
• Social citizenship • Social Policy • Education • Intersectionality

This is a one-day event, costing £10, to be held on Saturday 24th February 2018, with keynote speakers including Professor Anne-Marie Fortier (Lancaster) and Dr Elisabetta Zontini (Nottingham). We welcome abstracts of 250-350 words in length for presentations of 15 minutes, to be submitted to [1]enquire@nottingham.ac.uk by 8th December 2017. We look forward to hearing from you.

1. mailto:enquire@nottingham.ac.uk

The social life of time: power, discrimination and transformation
The 1st Temporal Belongings International Conference
5264
Since 2011 the Temporal Belongings network has brought together scholars from across the arts, humanities and social sciences to investigate the role that time plays in communities. Our first meeting in Manchester set our initial agenda and since then we have explored a range of issues including community futures, the role of power and agency, time in community development and methods for studying social time. We’ve expanded understandings of community to explore time in more-than-human worlds and have also rethought the material infrastructures communities use to keep time in our Temporal Design events. Throughout we have argued for deeper understandings of the ‘social life’ of time (Appadurai 1988, Law 2009, Law & Ruppert 2013) and asked questions not only about the rhythm, pace and directionality of time, but also how particular constructions of time challenge or enact particular forms of relationality. Who belongs in particular accounts of time, and who is excluded? What are the effects and affects of various social understandings of temporality? What are the politics of time? How are power and legitimacy operationalised through temporal frameworks? What might it mean to transform dominant conceptions of time?

Research on the role of time in social life has rejected the notion of time as an inert container in favour of a more complex and contested field of interactive relations (e.g. Sharma 2017, Birth 2014, Huebener 2016). Here time arises from relationships between actors, both human and non-human. Indeed some theorists such as Bruno Latour go as far as to claim that “time is not in itself a primary phenomenon. Time passes or not depending on the alignment of other entities” (2005, 178). The Temporal Belongings network has sought to build on this framework by paying attention to how time is made through relations, but also, and most importantly, to the ways that relations themselves happen through the organisation, conceptualisation and experience of time.

We are now keen to gather up the work we have done so far and launch a larger, international platform for exploring these issues. Thus, in collaboration with the Waiting Times project, led by Lisa Baraitser and Laura Salisbury and funded by the Wellcome Trust, which is investigating the relationship between time and healthcare, we are pleased to announce this call for papers for our first international conference.

The aim of this conference is to share current research on the social nature of time and to collaboratively reflect on key issues, problems and methodological approaches. In keeping with previous Temporal Belongings events, we will include a mixture of presentation styles, and plenty of time for discussion. We are particularly interested in playing with the traditional time of the academic conference and will include collaborative, participant-driven sessions where themes emerging from the presentations can be synthesised and explored in greater depth. Proposals are sought for lightning talks (5 mins), traditional papers (15 mins), collective sessions such as roundtables and world cafe approaches (1.5 hours), or alternative presentation/participatory formats (1.5 hours). Proposals for single panels or streams of multiple panels focusing on a relevant theme or approach are also welcome.

Confirmed keynote speakers for the conference include:

- [3]Charles W. Mills (Philosophy - CUNY)
- [4]Jackie Sumell (Artist and activist)
- [5]Sarah Sharma (Communication - Toronto)
- [6]Paul Huebener (English - Athabasca)

Contributions might address topics such as:
• Time, power and resistance
• Time and care
• Embodied social times
• Representing time, including temporal narratives, stories, visualisations
• Temporal affects
• Methods for studying the social nature of time
• Environments and materials of time
• Organising time
• Critical temporalities, counter-stories and alternatives
• Time and agency
• Cultural concepts and experiences of time

Details on abstract and bio length for individual papers, panels etc can be found by following the submission link.

We will aim to notify of decisions by February 2018. Please send any queries to [8]temporalbelongings@gmail.com

Call for papers: Applying the Capabilities Approach to Media and Communications (2017-11-01 23:41)

CALL FOR PAPERS
INTERNATIONAL COMMUNICATION ASSOCIATION CONFERENCE
2018 PRECONFERENCE

Applying the Capabilities Approach to Media and Communications

May 24, 2018
5266
Recent years have seen a growing interest in the concept of justice in media and communication studies. In the more general literature on social justice, an important contribution has come from the capabilities approach developed by Indian economist Amartya Sen and US philosopher Martha Nussbaum. The theory challenges utilitarian narratives and liberal notions of redistributive justice and has become the cornerstone of the United Nations’ Human Development Index. Despite its potentially great relevance for media industries and production studies, information and communication for development, telecommunications and media policy, and digital media research, there has been limited use of the capabilities approach across the media, communication and cultural studies field.

By bringing together for the first time scholars engaged in applying the capabilities approach to media and communications, this ICA preconference advances an agenda to create a new interdisciplinary focus in the field. It aims to build conceptual bridges across emerging frameworks for studying communicative capabilities, media practice, and digital literacies and to engage with normative debates about media justice, creative justice, and data justice. The preconference directly engages with the central theme of the ICA Annual Conference on "Voices" by inviting reflection on the ways we can address inequalities and enhance communicative opportunities for media workers and users in a global context.

The preconference will open with a keynote address by Nick Couldry (London School of Economics) and feature panels from invited speakers applying the capabilities approach to policy debates, development interventions, and normative media theories. We also invite paper submissions from scholars interested in this topic and we will accept a small number of papers from this open call.

CONFIRMED PARTICIPANTS:

Nick Couldry (LSE)
Heather Ford (University of Leeds)
David Hesmondhalgh (University of Leeds)
Tom Jacobson (Temple University)
Krishna Jayakar (Penn State)
Kari Karppinen (University of Helsinki)
Dorothea Klein (Sheffield University)
Robin Mansell (LSE)
Giles Moss (University of Leeds)
Jonathan Corpus Ong (University of Massachusetts Amherst)
Amit Schejter (Ben-Gurion University of the Negev / Penn State)
Noam Tirosh (Ben-Gurion University of the Negev)
Thomas Tufte (University of Leicester)

Abstract of up to 500 words and a short bio of the author(s) should be sent to Prof Amit Schejter ([1]pennstateii@psu.edu<mailto:pennstateii@psu.edu>) by December 15, 2017. Please write IIPCAP: YOURNAME in the subject line of the email. Abstracts and bios should be sent as Word attachments, each in a separate document, one saved as YOURNAME:Abstract and the other as YOURNAME:Bio. Abstracts not sent according to the above instructions and not accompanied by a short bio will not be reviewed. Authors will be notified of their acceptance before January 12, 2018. A small number of abstracts will be accepted to the workshop and full papers are expected by May 1, 2018. Authors presenting at the pre-conference will be invited to submit their completed papers for review in a special issue of the Journal of Information Policy ([3]www.jip-online.org<http://www.jip-online.org/>) to be published in 2018. The preconference will take place at the ICA venue on Thursday, May 24, 9AM-5PM. With financial support from the Institute for Information Policy at Penn State, cost per participant

5267
CFP: Death Online Research Symposium (2017-11-03 16:05)

The 4th Symposium of the International Death Online Research Network will take place at The University of Hull, UK, August 15 – 17, 2018.

The symposium will consolidate the links between existing and new members of the network and provide opportunities for the discussion of ongoing and new orientations in the interdisciplinary field of death online. The meeting will explore the ways in which online connectivity is changing how, when and where we engage with death and dying and how we invest death-related practices with meaning in the online environment. We warmly welcome new members to the network as well as old friends.

Opening Keynote Address: Professor Charles Ess, University of Oslo, Norway.

Themes and perspectives of the symposium:
For this 4th Death Online Research Symposium we invite abstracts for oral presentations of new, recently completed, or ongoing research (including ideas for future academic research) on all kinds of death-related online practices. We welcome qualitative and quantitative work which expands our understanding of the current and future trends in death online research from a variety of disciplines, addressing any of the following themes:

Digitally mediated dying and narrative
Digitally mediated grieving and memorialising
Death online and embodied experience
Digital afterlife, post-mortem identity and digital legacy
Technological developments in the death care industry
Digital immortality
Online vs offline experiences
Theorising online life and death
Ethical challenges for studying death online.

The symposium will host a special workshop for participating Post Graduate students and early career researchers. We particularly welcome submissions from these groups. All submissions will be peer-reviewed, and we envisage publication of selected full papers in a special issue of an academic journal in the field as well as a collection of writing from the symposium in an open-access online platform.

Important information ell
Submission format: 300 word abstract

Call for Participation

The Digital Dissertation: History, Theory, Practice

A Database and eBook Project

Virginia Kuhn, Kathie Gossett (eds.)

Abstract submission: 12 January 2018

Humanities scholars recognize the growing importance of digital media in knowledge production and distribution. However, recognition does not imply acceptance. How does one negotiate digital scholarship in an academy that remains largely print based in its outputs? The most valued scholarship is still the book, monograph, or journal article, and this not only limits the audience for humanities research to university scholars, but also limits its forms of argumentation to a primarily Western, linearly structured way of thinking. That is, relying on one mode of communication limits what can be said and to whom it can be said, making the humanities insular rather than allowing it to take advantage of opportunities to communicate with the broader public. In their study, The Responsive PhD, The Woodrow Wilson National Fellowship Foundation, argues that "scholarship is the heart of the doctorate" and that programs need to ask "What encourages adventurous scholarship? What retards and discourages it?" Adventurous scholarship requires "new paradigms," which demand an examination of the often unarticulated philosophies that govern what qualifies as legitimate scholarship.

How do these "new paradigms" play out in the context of the dissertation? While digital dissertations have been around for twenty years or more, the precise processes by which they are defined, created and defended remain something of a mystery. Is an interactive pdf significantly different than its paper-based counterpart? What specific possibilities can a digitally networked environment offer that are impossible without its affordances? How are dissertation committees able to gauge the quality of natively digital work? What support systems and processes do students need to complete these types of projects? How do precedents prove helpful in defending one’s choice to create a digital dissertation? How do digital projects change the ways faculty members advise dissertations?
This project, The Digital Dissertation: History, Theory, Practice, will consist of a definitive database of digital dissertation projects as well as an ebook whose chapters explore the larger implications of digital scholarship across institutional, geographic and disciplinary divides.

There are two ways to participate:

1. Complete this brief survey about the work <[1]https://docs.google.com/forms/d/1PQkSmceYNV8JDoaCH9db_Z2UXujGbaao1ddK8JgzzMM/edit> (which will form a database) by January 12, 2018.

2. Complete this brief survey about the work <[2]https://docs.google.com/forms/d/1PQkSmceYNV8JDoaCH9db_Z2UXujGbaao1ddK8JgzzMM/edit> (which will form a database for others) and submit a 300–500 word proposal by January 12, 2018 for a chapter in the e-book which responds to the most salient issue/s surrounding the digital dissertation and the ways that students and committee members managed the possibilities and obstacles inherent in this type of work. We imagine these chapters as being 3000 to 5000 words in length and due on May 11, 2018. Authors will be notified in early February.

Please send proposals and/or any questions about the project to Kathie Gossett ([3]kegossett@ucdavis.edu) and Virginia Kuhn ([5]vkuhn@cinema.usc.edu).
modernization and development projects, and business endeavours such as the Basque private sector powerhouse Mondragón. With such diversity of histories and practice, what actually links cooperatives to one another? Why have cooperatives, as an organizational form, persisted for such a long time?

There has been considerable and sustained interested in cooperatives across the humanities and social sciences. Yet these approaches, which centre upon their status as economic organizations, political projects, and sites of meaning and value-making, remain largely siloed within specific disciplines. In anthropology, political science, and sociology, much of the debate has centred on whether cooperatives constitute a launch-pad for radical departures from prevailing social and economic conditions, or whether they instead reinforce the status quo. Other work, particularly in economics and development studies, has focused on more explicitly descriptive and applied ends: analysing the structure, efficiency, and successes/failures of particular cooperative projects, often in order to contribute to the progressive development of cooperative entities overall. What can we gain from bringing these two strands of research together? Furthermore, is it possible for us to move discussions of cooperatives beyond a consideration of structural politics and applied approaches, and what are the implications of this? What other (shared) avenues of analysis are open to us as cooperative scholars? As its primary objective, this two-day workshop seeks a more sustained and coherent interdisciplinary theorizing of contemporary and historic cooperative practice.

In particular, the workshop will explore the following questions: why and how have cooperatives endured as a form of social organization? What forms of sociality, politics, morality, and material practice do cooperatives engender? What is the relationship between cooperative form and practice across time and space? What role do cooperatives play in contesting and/or reproducing status quo economics, politics, and associated social forms? How might attentiveness to recent theorising about economics – particularly notions of performativity and the commons – generate new ways of thinking about cooperatives? Finally, how might cooperatives shadow other kinds of communal and collaborative working groups, such as labour unions, collectives, and associations?

Call for Papers

We invite papers from across the social sciences and humanities (anthropology, history, geography, economics, political sciences, development studies) and from emerging and established scholars, to contribute to the workshop.

Participants are welcome to consider the following:

- Theoretical reconsiderations of the cooperative as social form and political potentiality
- History and historiography of cooperatives, the cooperative movement, and cooperative 'experiments'
- The practice of cooperatives as 'total social institutions' and sites of meaning and value-making
- Continuities and frictions between cooperatives, the state, development NGOs, and market actors
- Micro-politics: governance, collective labour, and membership
- Theoretical and analytical connections between cooperatives and other types of communal and collaborative working associations (labour unions, collectives, informal work groups, the sharing economy, mutual and co-owned business, and associations)

Please send a 300-word abstract and short CV to Corinna Howland, cfh39 [at] cam.ac.uk by December 20th, 2017.
Applicants will be notified if they have been accepted by January 5th, 2018.

Successful applicants will then be asked to submit a 3000-word paper by April 20th, 2018 for circulation among the workshop participants. This, together with a fifteen-minute presentation, will form the basis of the workshop discussions.

Accommodation, lunches, and a workshop dinner will be provided for speakers.

Andrea Grant (2017-11-06 11:49:46)
Oh dear, oh dear. I don’t feel comfortable here. When can we stop being observers and actually see ourselves as participants in this conversation! I can’t help feeling frustrated as a sociologist in thinking that I actually exist in this system. How can we shift our research practice from meaningful observation to meaningful participation? Collaboration in our own investigations. Why are we so ‘behind the eight ball’ with this? As an observer I find this remarkably uninspiring. The world is changing, along with our perceptions of it. How can we be involved as sociologists? I hope you don’t publish this, it is just a reaction. No more than a distraction.

CFP|Reimagining the Cooperative: An Interdisciplinary Conversation | SAA Network (2017-11-07 04:16:24)

CfP: Good Data book (2017-11-11 14:54)
Call for Proposals for an INC Theory on Demand edited book

Editors: Angela Daly (Queensland University of Technology), Kate Devitt (Queensland University of Technology) & Monique Mann (Queensland University of Technology).

In recent years, there has been an exponential increase in the collection, aggregation and automated analysis of information by government and private actors, and in response to this there has been a significant critique regarding what could be termed ‘bad’ data practices in the globalised digital economy. These include the mass gathering of data about individuals, in opaque, unethical and at times illegal ways, and the increased use of that data in unaccountable and potentially discriminatory forms of algorithmic decision-making by both state agencies and private companies. Issues of data ethics and data justice are only likely to increase in importance given the totalizing datafication of society and the introduction of new technologies such as artificial intelligence and automation.

In order to paint an alternative, more optimistic but still pragmatic picture of the datafied future, this open access edited collection will examine and propose what could be termed ‘good’ and ‘ethical’ data practices, underpinned by values and principles such as (but not limited
to:

· privacy/regulation/information security by design
· due process rights
· procedural legitimacy
· the protection of individual and collective autonomy
· digital sovereignty
· digital anti-discrimination
· data and intersectionality
· ethical labour practices
· environmental sustainability.

Chapters should be short contributions (2500-5000 words) which can take differing forms, for example:

· Manifestos for Good Data
· Position papers
· Traditional academic chapters

Chapters can be theoretical takes or provocations on what Good Data is or should be, or can be case studies of particular Good Data projects and initiatives e.g. Indigenous data sovereignty initiatives, data cooperatives etc. Chapters can also be critiques of initiatives/movements which claim to be ethical but in fact fall short. All chapters, including academic ones, should be written in an accessible way and avoid the excessive use of jargon, etc. Academic chapters will be peer-reviewed. Other contributions will be editor-reviewed.

We encourage contributions from throughout the world and from different disciplinary perspectives: philosophy, media and communications, cultural studies, STS, law, criminology, information systems, computer science etc.

Proposals for chapters (up to 250 words) should be sent to Kayleigh Hodgkinson Murphy ([1]kayleigh.murphy@qut.edu.au) by Friday 15 December 2017. Please include a brief biography (indicating whether you are an academic or practitioner, etc) and signal what kind of chapter you are proposing (manifesto/academic chapter, etc).

If you have an idea for a chapter and want to discuss it before submitting a proposal, please contact Angela Daly ([2]angela.daly@qut.edu.au) as soon as
possible. We may be able to pair, for example, practitioners with academic authors on request.

Decisions on proposals will be made by mid-January 2017, with a first full draft of chapters to be submitted by 31 March 2018. We anticipate the book will be finalized and launched in late 2018, as part of the Institute of Network Cultures’ Theory on Demand series

<http://networkcultures.org/publications/ #tods>

Call for papers: Intimacies online, online intimacies (2017-11-11 14:55)

Call for papers: Intimacies online, online intimacies

We are delighted to announce this international conference about intimacy online, digitally mediated intimacies and how intimacies influence (new) mediascapes.

Online media are increasingly intersecting and intertwined with our daily lives, bodily and intimate practices, and relationships. This conference highlights how different digital, social and online media enable and/or produce new intimacies, as well as how practices and understandings of intimacy are both embedded in digitally mediated communication and generate innovative uses or forms of new media.

We invite papers (or other forms of expression) that explore various media sites and forms, including (but not limited to) social media, digital media, online media and mobile devices. And we invite papers investigating various intimacies, including but not limited to intimate and/or affective encounters, relationalities, practices, belongings, desires, proximities, kinships, friendships, or communities, as well as online and /or digital affective intensities, viralities, and connectivities. Papers discussing both methodological and empirical aspects are welcome.

Papers analysing the bodily and intimate doing of technology, and papers questioning the boundaries between body, media, technology and affect are welcome. Also, papers discussing the commercialization and capitalization of intimacies online are of interest. In particular, we welcome papers analyzing the ways in which new mediated intimacies (re)produce, configure and/or challenge power relations and hierachical structures in relation to:

• Sexual cultures, dating and hook-up, sexualities, and sexual identities
• Kinship and new (queer) families and reproduction
• Bodies and bodily markers of difference
• Migration, nation, borders, and surveillance
• Activism, resistance, counter publics, and subcultures

5274
The confirmed keynotes include Prof. Jack Halberstam (University of Southern California and Columbia University, US), Dr. Debra Ferreday (Lancaster University), and Dr. Sharif Mowlabocus (University of Sussex).

The conference will take place at Roskilde University, Denmark, May 30th–June 1st, 2018. Please send your abstract to newmedianewintimacies@gmail.com. Abstracts should be maximum 200 words long and written in English. Please include your name, title, and affiliation. Deadline of submission of abstract: Jan. 15th, 2018.

CFP - 11th International Critical Theory Conference of Rome (2017-11-11 14:56)

CALL FOR PAPERS

11th INTERNATIONAL CRITICAL THEORY CONFERENCE OF ROME

May 10-12, 2018

John Felice Rome Center of Loyola University Chicago

The John Felice Rome Center of Loyola University Chicago is hosting the 11th international conference on Critical Theory of Rome, which will be held at its campus in Rome, Italy - Via Massimi 114/A.

The conference will examine the importance and the developments of the Frankfurt School by addressing both the philosophical tradition of the early stages of Critical Theory - and in particular the works of Walter Benjamin, Theodor W. Adorno, Max Horkheimer and Herbert Marcuse - as well as the application of their theories to our contemporary society. The conference will also address the second and third generation of critical theorists, welcoming, among others, papers on Habermas and Honneth.

In order to reflect the wide range of topics addressed by Critical Theory, the conference will cover different aspects of philosophical reflection on justice, politics, aesthetics, sociology, theology, technology, literature and any other field of study related to the Frankfurt School.

The conference will be held at the Rome Center of Loyola University Chicago on May 10-12, 2018. It will begin on Thursday morning and end by Saturday evening (with a welcoming reception on the evening of Wednesday, May 9). During the sessions, each speaker will have 30 minutes (20 minutes for the presentation and 10 for discussion). All presentations will be made in English. We expect to have about 120 speakers.

Coordinator: Stefano Giacchetti Ludovisi, Loyola University Chicago, JFRC

Keynote speakers:

Deborah Cook, University of Windsor
Idit Dobbs-Weinstein, Vanderbilt University

Andrew Feenberg, Simon Fraser University

Alessandro Ferrara, University of Rome, Tor Vergata

David Ingram, Loyola University Chicago

Douglas Kellner, University of California, Los Angeles

Stefano Petrucciani, University of Rome, La Sapienza

If you are interested in presenting a paper or organizing a panel (of up to 6 speakers), please submit a 1-2 page abstract by February 28, 2018 (including name, eventual institutional affiliation and mailing address). Abstracts should be submitted by email. Decisions regarding the program will be made by March 2018.

To submit an abstract, or for more information, contact:

Stefano Giacchetti Ludovisi, PhD - [1]sgiacch@luc.edu

Conference fees: Unwaged: 90 Euro; Waged: 130 Euro. (Fees include also the reception of May 9, and breakfasts, lunches and coffee breaks throughout the conference).

Call for Submissions: Politicians and Social Media in the Global South (2017-11-11 14:59)

*Call for Submissions*
Politicians and Social Media in the Global South*

A seminar/workshop at the University of Michigan, Ann Arbor
Date: April 14, 2018
2345 North Quad
105 S. State Street, Ann Arbor, MI 48109

In the last decade, politicians in various parts of the world have invested in social media campaigns, including in settings where a relatively small proportion of the voting public is actually online. Leaders may use social media for a range of reasons such as to actively court constituents, to present a narrative on their political program to the international community, or to use the affordances of social media to frame the agenda on a specific issue.
Social media can also present a means for politicians to bypass the free professional media corps to directly speak to the electorate, and exercise greater control over the story crafted about them. After an early phase of enthusiasm on the scope of social media to bring decentralized power to the people, we increasingly have a balanced view of the potential and risks of online behaviour for democratic societies. Today, we see a social media environment in which a vast majority of major national politicians in countries throughout the world build social media presences for a diverse mix of these reasons. What do these developments mean for the future of political campaigning? What tactics have worked? How is the online strategy impacted by ideology, national economic priorities, or political structure?

To get at these questions, the University of Michigan is organizing a one-day seminar workshop to examine contemporary scholarship on political social media in the Global South. The goals of the workshop are to

1. Track the major trends in the use and spread of social media in election campaigns and in Global South settings

2. Highlight the cases of specific politicians, parties, communities or political issues discussed on social media

3. Enable interdisciplinary conversations to appreciate and incorporate alternate approaches towards studying

The event will feature a mix of talks and small workgroup sessions to explore these topics, with specific attention to politicians and political collectives. We invite contributions that are based on original research on studies of politicians or parties on social media in Global South settings using qualitative or quantitative perspectives including but not limited to data sciences, discourse analysis, digital humanities, and ethnographies.

Topics may include:

- Social media strategies of political accounts
- Political Networks and Affiliation online
- Identity and Political Social Media
- Framing of political issues on social media
- Mainstream media engagement with political social media
- Social media use in e-Governance

We also invite talks on citizen behaviour and issue framing online, so long as the work highlights a connection to party systems or individual politicians
Limited funding support is available to presenting attendees who require funding. Please send abstracts of 1200 words (plus citations) of original work with the subject line "Michigan Politics in the Global South Workshop" on or before December 20, 2017, to joyojeet@umich.edu.

All submissions must include a 250-word bio of the corresponding author. If a specific dataset is being used for the abstract, authors are encouraged to also include a short description of the data.

Organizers:

Joyojeet Pal, University of Michigan School of Information
Ceren Budak, University of Michigan School of Information

Sponsored by:

The University of Michigan International Institute
The University of Michigan School of Information
The University of Michigan Department of Communications
The University of Michigan Center for South Asia Studies

1. mailto:joyojeet@umich.edu

Setting the Scene, Shifting the Lens: Reflections on my Students’ Reflective Narratives on Race and Racism (2017-11-12 18:20)

By Lambros Fatsis

Earlier this year, I taught a module on the sociology of “race” and “ethnicity” with my beloved colleagues Bindi Shah, Pathik Pathak, and Luiz Valério P. Trindade; which was partly assessed by a reflective narrative that my students had to write in response to a fieldtrip that I organised and accompanied them to. The fieldtrip was composed of a visit to two photography exhibitions at Tate 5278
Britain and Goldsmiths College, both of which captured some pivotal moments in the experience of racism as suffered by Black Britons in a place that they could only nominally call or make "a home". Our first stop was the \[5\] 'Stan Firm Inna Inglan': Black Diaspora in London, 1960-70s' exhibition at Tate Britain, before making our way to Vron Ware's \[6\] '13 Dead and Nothing Said' exhibition at Goldsmiths College which featured, previously unseen, archival material from the Black People's Day of Action (March 2, 1981) following the \[7\] 'New Crass Massahkah' earlier that year (January 18, 1981). The fieldtrip proved to be a glittering success, if I may say so, and the three best reflective narratives were selected for publication here; not only to demonstrate the quality of our students' work, but also to encourage us to design our teaching and learning activities in a way that entices and releases our students' imagination from simply scoring high marks and accumulating credits towards their degree.

The thinking behind and the purpose of this choice of assessment, therefore, was hardly instrumental but entirely substantive. In fact, the entire module was designed with the aim of jerking some vitality into the curriculum by engaging and alerting my students to the experiential dimension of racism, while also allowing them to 'come to voice' \[8\] hooks, 1994: 148 and speak their minds about what they saw and thought both as a result of the fieldtrip and in relation to the overall module content. Much of the module itself was in fact organised not just around dusty documents (academic texts), but also stories (personal/literary), records (music), and images (photography, art, video) which narrated racism as a \textit{lived} reality and a form of social exclusion, rather than an abstract (sociological) concept. Making that leap from concept to reality was essential to sensitise ourselves to the processes by which racism is, can be, and has been experienced not as an accident, but an essential ingredient of human societies, whose roots and reality is historically and socio-culturally embedded, (re)produced, and sanctioned despite desperate attempts to deny, whitewash, or wish its legacy away.

In reading my students' work, I can't help but feel not just a sense of foolish (?) pride, but also a deep sense of admiration for the way in which they have engaged with and responded to the module content and the exhibits too. Their acute observations, sensitive perception, robust thinking, and playful imaginations don't just move me to tears, but also remind me of the importance of building, what pioneering educationalist and novelist Beryl Gilroy called \[9\] 1976: 160. 'sensory thresholds' into our teaching in order to transform 'knowledge' into 'human understanding' as John Blacking \[10\] 1977: 5 put it so nicely. What follows is just a selection of the many great narratives I read and was keen to share, as an example of how we can make our teaching and our subject relevant to the human experience, while also working against worrying signs of 'students [who] often do not want to learn and teachers [who] do not want to teach' \[11\] hooks, 1994: 12 in an educational context that often discourages 'the education of desire' to teach and learn \textit{worthily} \[12\] Thompson, 1976: 791,721.

Nikki, Holly, and Ola's contributions hold great promise and call for a certain amount of optimism about the ways in which we can forge a strong relationship between our students and what they study, as well as create a proper, human bond between our students and ourselves. Without creating opportunities for such engagement to happen.
in and out of the lecture room, the way sociology is taught, understood, shared, and talked about will inevitably suffer; especially if and when it is pursued in the instrumental manner that our students and ourselves otherwise rail against. Sitting back and thinking just how much intensity, care, warmth, as well as insight and perspective informs those students' writing, I can't help but feel that these three intelligent young women, as well as their peers, have not simply acquired but also applied and contributed to sociological knowledge through the power of their observations and the immediacy of their writing.

Look how imaginatively Nikki compares and contrasts the racist ‘[13] Keep Britain White’ graffiti with Trump’s pledge to ‘[14] Make America Great Again’, ponder over Ola’s sensitive curiosity about the ‘community feeling’ she saw in Colin Jones’ photographs of [15] The Black House or how she reacts to the sight of the lone skinhead in Syd Shelton’s photo of the [16] Rock Against Racism Carnival in Southall, and see how thoughtfully Holly gives an account of her sociological education, and how skillfully she filters her thoughts on the fieldtrip through that sharp “sociological eye” that pervades her entire narrative. Having read, re-read, and thought about my students’ written work I am convinced that these are not just a few isolated, emotionally-charged moments to live for but the very principles and aims that our teaching practice should continually be infused by.

As the end of my undergraduate degree in sociology draws closer I am beginning to realise that although the teaching and endless hours in the library will stop, the outlook that all this has provided me certainly will not. The three-year investment has not only shaped my academic understanding of the society that operates around us, but has more broadly applied a permanent filter, which draws the sociological aspects out of what, at first glance, can seem distinctly ordinary. The exhibitions Stan Frim Inna Inglan': Black Diaspora in London, 1960s-70s and Vron Ware: 13 Dead and Nothing said further confirmed this notion to me as the photographs, whilst being artistically engaging, held strong sociological messages by reflecting upon the role of race and racism within the Black community in recent history. Both exhibitions captured the lived experience of second generation Black Britons living in London from the 60s to the 80s. This draws the two exhibitions together and after exploring both I feel it necessary to touch upon this relationship.

On entering the Tate Britain exhibition, it was evident that through the prism of race, a diverse collection of content was displayed. As a compilation of eight different photographers' work, these pieces could be admired both in relation to one another and alone adding a real sense of dimension. From what had initially seemed like a passing thought, moving around the room I soon realised that this diversity within the display was an apt and potentially purposeful reflection of the multiplicity and complexity of experience within the Black community in London. Looking at the whole collection in this way, taking in photographs of interracial couples, family life, fashions and entertainment alongside more overt depictions of racial exclusion, revealed the thread that I felt was intensely important – the essence of the everyday. The multitude of experiences depicted does not detract from the marginalisation of the Black community, that holds a deep seated historical connection to the group, but rather reminds us that racism is not an outside force but entrenched within the everyday. Racism is not fixed but fluid and does not prevent the living of life but becomes a characteristic of it. It is a restrictive pressure that amalgamates and has effects in sometimes
more subtle but complex ways than it is given credit for. The experience of exclusion was clear without overtly and exclusively depicting racism and I truly appreciated this. The depictions of the Black communities’ experience was not just associated with racism alone. I feel that a simplistic equation of Black culture with racism would have omitted and underappreciated the fact that identity in any community is multifaceted and essentially played out day to day. This multifarious coverage was therefore what took my interest and the breadth of content was insightful for revealing key undercurrents.

Extending upon this, the photographers all used people as the focal point of their photographs and I noticed that the collection represented both men and women at different ages and stages of their lives encapsulating an intersectional element. By placing the attention on the subjects in the frame, the photographs felt intensely personal but by displaying a wide range of demographics it was clear that the meaning was linked to Black identity as a whole not solely to its manifestations on an individualistic level. Nevertheless, at times I felt this intimacy to such an extent that I could imagine the photographs being more suited sitting on someone’s mantelpiece than on the walls of a world-renowned art venue. The work of Colin Jones resonated particularly with me for encapsulating this multiplicity of experiences as seen in his depictions of the lives of young people living in The Black House, a community project and hostel, between 1973-6.

These three powerful stills pictured above, summarise to me the very essence of the exhibition. The first two share a similar strong stance, holding direct eye contact with the camera and in doing so were particularly engaging. They give the fundamentally 'Otherised' group a specific human face and neither exude a sense of weakness. I thought this triggered a greater understanding to the collection’s title which references the poem *It Dread inna Inglan* by Linton Kwesi Johnson which expresses the resilience from the Black community surrounding the desire to stay in Britain despite adversity. I felt the female figure perfectly reflected the interplay between social and economic exclusion associated to the wider group as the gas in the backdrop is clearly lit for warmth and the location within the domestic sphere makes it feel exceptionally authentic. While this photograph alludes to a sense of femininity, the second photograph is distinctly masculine in feel. The oversized collar is an iconic 70s statement and the urban feel translated through the solid brick wall led me to think about how as diasporic citizens, the individuals are not acculturating but are accultured, trying to live in London as anyone else would. I felt the trio added real sentiment, portraying real qualitative depth by also showing the residents living together. This reflects the point that through the commonality of race this exclusion was experienced by many.

The second exhibition displayed at Goldsmiths University consolidated this notion of solidarity within the Black British community. This exhibition of Vron Ware’s previously unseen photographs from the Black People’s Day of Action concerns a pivotal point in Black British history where there was a large demonstration regarding the inadequate response to the New Cross Road fire in 1981, and the media coverage thereafter. I was particularly drawn to one photograph for its poignancy and succinct reflection of the political outcry challenging institutionalised racism.

The sign was used as a key source of political rhetoric within the march, referencing the Stardust fire that broke out at a nightclub in Ireland that resulted in fatalities the same year. Margaret Thatcher, the then prime minister, sent her personal condolences to families involved but ignored the thirteen affected who were a stone’s throw away within the capital, to much controversy. To me, this photograph pertinently raises the question of what it means to be British and what it has meant in the past on a political level. The image manages to simultaneously embody the structural racial divisions directed at the Black community as well as the growth and effect of collective social action. As I looked at the photographs I could hear quite coincidentally someone playing the piano in an adjacent room and

5282
I found this fitting in a sense. I felt the music helped to build upon the message found within the succession of the pictures that highlights the protest day as a moment born out of devastation but also one of great significance.

It was as I was coming away from the second exhibition that I began to reflect upon the issues that I felt linked the two displays. For me, this fundamentally came from the exploration of citizenship that I felt arose from the photographers' work. Both pieces innovatively raise questions about belonging and entitlement through their pictures by highlighting how racial exclusion infringes upon rights. I noticed ‘Stan Firm Inna Inglan’, depicts citizenship in an individualistic sense by appealing to its everyday incarnation whereas ‘Vron Ware: 13 Dead and Nothing Said’, showcases its operation in terms of collective action. Between the two displays I thought about how this is reflective of the social and political dimensions of citizenship within identities and this strengthened my own understanding about the Black experience by demonstrating the different levels of exclusion. I also felt drawing the two together was useful for providing insight into how the Black communities experience has changed over time. In doing so, it enabled me to identify a shift in the photographs setting from the private to the public sphere that perhaps mimics the progression of the Black movement within the UK.

The similarities between the exhibitions interests can be explained by their support from the archive Autograph ABP. The organisation aims to bring underrepresented groups to the fore within art and explore surrounding issues of cultural identity. Whilst I am certain that the two examples of their work that have been discussed succeed in achieving this, it prompted some further thought within myself regarding the wider art world. I have become far more aware of the fact that artistic depictions of BAME groups are underappreciated and in the minority. I noticed that even when reflecting upon the physical position of the displays demonstrates this fact. To view the exhibition at the Tate Britain you have to navigate through a maze of 15th century paintings and at Goldsmiths the pieces are displayed in a corridor of the University. This means both could quite literally be walked past. But the themes and questions around multiculturalism raised by the photographs are too important to be missed particularly within our current political climate. I feel exhibitions like these hold a vital role within the arts for visually expressing cultural identities in a way that text and other exhibitions have not and I hope to see a growth in work grounded in this.

Reflective Narrative Essay of Two Photos observed at Stan Firm Inna Inglan’: Black Diaspora in London, 1960-70s Tate Britain (2017-11-12 18:22)

By Nikki Achilleous
I have never sincerely felt a victim of racism; I have never fully been personally exposed to hatred. Whilst looking around the Black Diaspora in London exhibition in Tate Britain, I absorbed the trajectories of the intersecting generations of black immigrant lives. I attempted to mentally place myself amongst this community that was characterized by resistance yet filled with celebration and hope. I tried to imagine the kind of atmosphere and struggle that they would have been exposed to. In doing so, two photos grabbed my attention and, despite all I had learnt about black experience this semester, I could not help but to be shocked by them. These two photos caught my attention for polar opposite, yet also intertwined reasons. Both captured politicized acts of graffiti on the streets of London, the first was explicitly racist, the second explicitly opposed racism.

The initial photo (Kenlock, 1972), captured a smartly dressed black lady pointing to a vandalised door at the International Personnel training centre in Balham. The graffiti slogan “Keep Britain White,” was tarnished with black paint onto the contrasting white door. My own shock reaction to the photo reminded me of how unnatural it is to think that this kind of act would be acceptable today. Yet when reflecting on our own political situation, it occurred to me how the reality of the current far right-wing rhetoric is displaying this same kind of anti-racist message, however does not use such exploitation of public space, nor use such explicitly racist language. Donald Trump’s rhetoric of Make America Great Again, and UKIP’s Brexit argument of Make Britain “Great Again” somewhat characterize an extension to the “Keep Britain White” slogan, yet this time they use blurred and confusing, non-explicitly colour based concepts to spread their message. “Great Again” is not a tangible concept, unless there exists a category of people who are defined as “not Great” for the country, and who must be expelled. It revealed how wrenching it must be for either current political or economic migrants, or anyone depicted as ‘foreign’, such as Muslims, to be placed into the ‘Other’ category of those “not so Great for Britain.” Moreover, it exposed how unsettling it must be to hear the constant discourse on how unwelcome they are as a category, whether in the 1970’s or in 2017. The main difference is that today, society does not generally visualize this hatred through the same kind of freely expressed political acts carried out by local citizens in public spaces, as depicted at the time of the picture.

During the 1970’s and 1980’s immigration bans were being implemented for the first time thus, as it were more politically and socially acceptable, the discourse surrounding anti-immigration was overtly racist (Small and Solomos 2006). In this way, right-wing politicians capitalized on the notions of White preference and purity to gain votes, however gradually, as anti-racist movements gained leverage, explicitly racist language became less commonplace and started to be socially challenged. Immigration, citizenship access and national security were previously problematized and controlled through the notion of ‘biological race’, yet the new rhetoric shifted to a more colour-blind approach which problematized the notion of culture, however distinctively related culture back to a specific skin-colour (Fanon, 1967).

Kenlock’s (1972) photo also reminded me of how the notion of skin-colour, and consequently ‘white purity,’ have been central to the concept of British nationalism since colonial times, and how for some citizens, ‘Whiteness’, and White culture remains one of the key characteristics of their formation of “Britishness” and national identity (Garner, 2012). The slogan in the photo also demonstrates Miles’ (1993:78) extension on Anderson’s argument of the interrelationship between the ideologies of race and nation and how the idea of ‘race’ can be used to “sustain a positive evaluation of a ‘supraclass population’.” According to Miles (1993:79), “the parameters of an imagined community of ‘nation’ can be specified and legitimated by racism...[and] the boundary of the imagined ‘nation’ is equally a boundary of ‘race’.” Through such fascist ideology, members of the non-White race are therefore seen as an ‘eternal contamination’ to the ‘imagined community’, which is exactly the philosophy that this photo captures. Interestingly, the use of coloured graffiti is also central in relaying this message. The fact that black paint
As stated, these boundaries of nation and race that were so openly expressed during the 1970's, and the need to 'manage' immigration continue their presence today. A poll in the recent EU referendum revealed that one of overly exaggerated, yet widely believed issues highlighted by Brexit supports was the lack of national control on immigration (Arnorsson and Zoega, 2016). Their fears expressed that Britain had been 'invaded' by too many foreign workers, and the sentiment that essential 'British' culture and values had been lost due to the presence of foreign communities. When observing the 1970's "Keep Britain White" slogan, similar questions and thoughts came to mind to those that arose when hearing the "Make Britain Great Again" campaign. Below is a brief demonstration of the relationship between the questions and thoughts raised:

Through the photo:

- Since when has Britain been ‘White’?
- What does it mean, culturally speaking, to be a ‘White Britain’?
- It highlights how darker skin-colour is not associated with Britishness.

During the campaign:

- Since when is Britain ‘Great’?
- What does it mean to be ‘Great’? Is this reflected in the skin-tone of the nation?
- Immigrants (of colour or of cultural difference) are not associated with Britishness.

Thus, this comparison between 1972 and today demonstrates how the same type of political rhetoric has been re-moulded decade upon decade, and how the coloured migrant or ‘Other’ is consistently illustrated as incompatible with ‘Britishness’. Although the photo captures the explicitly racist nationalist rhetoric that was actively being expressed in the streets, it re-highlighted not only how this racial tension still exists today, but how it is being communicated specifically through more private spaces, and through other mediums such as the news and social media which are accessed and controlled from the comfort of one’s home.

The second photo (Shelton, 1977) taken a few years later, features a white bald man walking through Jubilee Street in London with his eyes focused on the direct path ahead of him. In the background, there is a black wall tarnished...
with the white slogan of "Smash Racism" which he unnoticingly seem to pass. It was interesting to observe the polarity between the two images and the contrastingly mirrored use of black and white paint. Additionally, it was important to reflect on the way in which the participants in both images interact with equally the camera and their surrounding environment.

The lady in the first photo is actively involved with the racist slogan she confronts; her facial expression can be interpreted as mocking the slogan and she outwardly points to it. She is also looking directly into the camera, and from this we can determine that the viewer is fed a political message. Regardless of the ethnic background of the viewer of the photo, she demands a reaction from the viewer (Kress and Leeuwen, 1996), addressing them to question the graffiti in the place of UK society in the same way that she does. Furthermore, there is a ‘close personal distance’ between both the viewer and the participant, and between the participant and slogan. This helps the viewer to establish a closer connection and awareness with the subject, and also emphasises how the black lady is closely affected by the slogan.

Yet contrastingly in Shelton’s (1977) photo, the participant neither engages with the viewer nor with the anti-racist slogan that is prominent on the wall next to him; instead he un-observingly passes it by on his everyday self-orientated, unaware travels. This represents a wider reflection on race “privilege.” His blind neglect of the slogan re-enforces that he, as a white man, has no strong connection to racism itself, for he cannot be directly affected by it. Both racism and anti-racism efforts then go unnoticed by “privileged” citizens and such citizens do not consciously make an effort to study their surrounding environment. Additionally, the shot is taken from afar, meaning that this ‘far social distance’ that is created does not directly call the viewer for action (Kress and Leeuwen, 1996). In this way, both the first and second images reflect the wider societal reproduction and response to coloured racism, emphasising the role of race privilege and how black communities are consciously and continuously adversely affected. It demonstrates the contrast between both the coloured experience of racism and the fight for anti-racism, which is not just something that the black community can blindly choose to ignore on the street, and the stereotypical white citizen carrying out their daily life without too much disturbance. As the white man in the second image is not consciously involved with anti-racism, it sheds light on the consequential mind-set that could potentially occur: if they do not personally fight for anti-racism, someone else who needs to will.

In short, by studying both photos, it allowed me to more deeply empathize with the black experience in the UK and reflect on the discourse and framing of coloured racism in contemporary society, especially within the context of Brexit. The two photos also shed light on the notions of white purity, privilege and the unheard efforts of anti-racist protests. Overall, the exhibition also highlighted the power of imagery and art as a form of recognition and remembrance of the black struggle and captured how different ethnicities can experience racist and anti-racist graffiti in dissimilar ways depending on their own contexts.

Reflective Narrative Essay of Two Photos observed at Stan Firm Inna Inglan’: Black Diaspora in Lon... [...]

5286

By Ola Dirisu

Tate Britain Millbank, London: Exhibition Title: "Stan Firm Inna Inglan’: Black Diaspora in London, 1960-70s & Goldsmiths, University of London: Exhibition Title: “Vron Ware: 13 Dead and Nothing Said"

Unsure of what to expect or how I would learn something new before going on the field trip to these exhibitions, I started the day feeling apprehensive, as race and ethnicity is something that affects my everyday life. However, after visiting both the Tate Britain and the Goldsmiths College exhibition, my perception changed. The pictures gave a creative look at Black British history, which is something that is often not spoken about, and definitely not taught in schools. It was therefore very interesting to actually see some of the racial history of this country, and not just revisit African American history. It was also important to see and reflect on what I didn’t know about black British history, such as the New Cross Fire, killing 13 black teenagers, but not spoken about in the media, reminding me of how victim sympathy, especially in the media, can be based on racial identity (Christie, 1986).

The exhibition at Goldsmiths in particular left me pondering on many questions, such as; whether or not this would this still have been the case if the victims were of another ‘race’ or background? Would the media still have reported (or not) the incident in the same way? I think it was important to draw on knowledge I already had based on how incidences are depicted in today’s media, it reminded me that although times may have changed, the feelings and institutional powers, still have a powerful effect on perception.

The exhibitions further reminded me that the social construction of race is not about the fact that there are no differences biological or otherwise (Andreasen, 2000: 5653), between different ‘races’, but everything to do with the ability to dominate control and power over other people (Olson, 2005: 118; Barth 1969: 15) which was shown in this photo where the black woman and white man in the are virtually identical looking expect skin colour, sitting with each other. Maybe separation and/or discrimination are not inherent feelings, but rather socialised into us? As if we were not taught to see difference, there would be less hate and exclusion, in 2013-2014 there were over 45,000 racially motivated attacks (IRR Website: 2017).

The saying ‘A picture speaks a thousand words’ was very much so the case when visiting the exhibitions, as many pictures grasped my attention, however, three very striking images really made me think and one in particular changed my outlook.

‘Keep Britain White.’ actually made me quite sad when thinking about it. Often we see, in this day and age, covert forms of racism, where it is not so often easily noticeable, however in the past, it seemed that people were more brazen with their dislike. It initially struck me how sad it is that hate can stem purely from reactions to skin colour and how much energy seemed to go into expressing it. However, what really made me take notice of this picture was that there was somewhat an air of defiance. In this picture she is standing next to the door and taking a photograph with it and although she may really have been terrified about what had actually transpired, the fact that she stays strong and doesn't allow that emotion to show, is somewhat inspiring.

Secondly, in the same Tate Britain exhibition as the previous picture, I was reminded about community. The picture displayed reminds me of Hackney where I grew up visiting family as a younger child. There used to be a square area in the middle of the houses, where everyone outside would often congregate and do many different things together, not because we were related, but because there was a common experience and environment shared amongst all of those that lived there, living in less privileged working class areas.

Similarly, in this picture, there is a feel of community, where they are sitting down together and talking. What were they talking about? The need for a community to discuss life and issues together could be a way that they
got through this time and survived. They could probably relate to each other because they were likely to be in similar wage brackets and situations, and going through similar experiences, living in the same area, just like in Hackney. This shows how poverty, class, race and ethnicity are intertwined, as primarily black working class families dominated Hackney, as is what can be assumed from this picture. Smith (1986: 192) stated that ethnicity was sharing common heritage, traditions and descent and seeing this picture, it made me wonder whether our identity/ethnicity is constructed around our race and/or our shared lived experiences, or actually, whether our shared experiences are only because of race, which has been used to shape and define who we are as people.

Finally, looking at this photograph, the white man is the focus, in and amidst a group of black people, who seem to be joyous and happy, dancing and possibly singing, as well as being quite smartly dressed – almost like at a church or a function. There is a noticeable difference between how they are acting or being perceived and how he is acting. Where they are smiling and happy, he has a straight face and no real emotion. Also, as can be seen, he has a shaved head, which stereotypically at that time, was associated with skinheads and racism (having been adopted by neo-Nazi groups, who, when the picture was taken in 1976 were at the height of their terror) and had very negative connotations. Looking from the outside in at this picture, he looks out of place, which suggests to me, that after this picture was taken, something violent could or might have occurred. Syd Shelton, the photographer, and at the time was taking pictures of the rise of the National Front (a fascist hate-speech organisation) and given the context, and this picture, it would appear that there would have been extreme racial tensions at this time, which is why it is very easy to anticipate violence.

Of everyone in this photograph, it is natural that we would automatically see him as a potential suspect, if anything did actually occur after this. The problem I saw with this, is that it is ‘human nature’ to look at the physical differences between people (Du Bois, 1970: 75) and then question their motives (often pointing them out and cause separation) (Barth 1969: 15). At this event shown in the picture, there is a high chance, that had they been searching people, he would probably have been one of the first to be searched.

Questions such as: Is he there to cause trouble or is he there because he wants to be in support of whatever is happening? Is it simply a case of ‘wrong time, wrong place’? Initially made me stop and think, and I realised that this is the daily reality of many from the black community, who may look ‘out of place’ or look suspicious, singled out and questioned, even though their actions and intentions may not be bad. As there is a hyper vigilance of black people in society (Cohen 2002), when thinking or reflecting on this picture, his demeanour might not actually have been that of violence, but rather out of awkwardness. We assume or create an idea of who we think the person may be and maintain it (Haney-Lopez, 2006:78). This, linked with the racial tensions at the time, his presence at this event and this picture is something that would have sparked controversy and stood out for me. I thought this could also somewhat link with the idea of the criminalisation of minority people. Due to the racial tensions that have been occurring throughout history, black people are stopped and searched five times more than the white counterpart (Data.Police: 2017), and this is mainly to do with how people perceive them. On closer reflection, I found that just as it was easy for me to believe or assume that he might have done, be doing or about to do something wrong, based on prejudicial thoughts and stereotypes (stereotyping the skinhead or the look), can be how black people are viewed by other races, especially those with power such as the police. The same way I believed they would check or search him at the door of the event is quite possibly the same way others may view the need to stop and search ‘out of place’ ethnic minorities.

Overall, as a black Briton, these pictures and this trip resonated with me because this is the history of the UK black diaspora. So often black British history is eradicated and brushed aside in schools so to see it highlighted and focused on, made me quite happy, as it shows a move towards inclusion of excluded groups such as black community.

---

**Write for @DiscoverSoc (2017-11-12 18:29)**

We welcome contributions that are research-based and meet our guidance for contributors. Potential contributions can be discussed in advance with the editors via a short ‘pitch’ sent to: [1]discoversociety@outlook.com. **Guidance for contributors:** The target audience is the informed, interested general reader, rather than a subject specialist – so avoid writing in the style of journals, and instead write as far as possible in an engaging, accessible way. The first two paragraphs are especially important for capturing the reader, and encouraging them to read on. The first paragraph needs a ‘hook’ that gets the reader’s interest, followed by the ‘angle’ in the second paragraph (approach, preliminary findings, challenge, etc) to show what makes the piece significant and what will be developed in the rest of the article. A brief statement about the study/authority for claims made can come in the second or third paragraphs, with more detail in a paragraph at the end of the article (after the author bio) giving further links to the project or publications. When submitting your piece, use single-spaced 12-point Calibri (without any special formatting) and list any references at the end (don’t use Endnote or other embedded reference systems) if using footnotes, do not embed them with superscript, but use a bracket marker in the text (1), (2), at end of sentence, with the notes at the end of the article. Keep references to a minimum. The preference is to have references with a link (other references / further reading can be put at the end of the article - keep these to a minimum) if putting in links to publications try to link to versions that are outside of paywall protection if you are able to do so. Use hyperlinks where possible for references. Insert them in the text (for example, using CTRL + K) and **bold the hyperlinked part of the text** The word limit is 1500 but we
realise that some research/issues are may be difficult to capture within these limits. We want the majority of pieces to conform so that readers are not daunted by the length of every piece. Most other blog posts are 700-1000 words, so 1500 words is already more than most people are used to reading online. Please provide an illustrative picture (in ‘landscape’ orientation, rather than ‘portrait’) that is copyright enabled, with details of attribution. Note, that google images is not fully reliable, even on advanced search. Use of your own photos is encouraged. You can also usually access free to use images from the following sites: [2]New York Public Library Please provide a brief author bio, together with a hyperlink to your webpage Dissemination – Twitter Each article will be disseminated to the 12K+ followers of Discover Society on a regular basis in the month of the issue your article is published, as well as subsequently. It is also tweeted & retweeted by the Social Policy Association and the British Sociological Association and countless others. We tweet the article’s title and then require a further 5-6 tweets from you which could be catchy quotes or questions from the article. It’s important to have a catchy title for your article of no more than 100 characters (the Tweet limit is 140 characters, including hashtag and space for the inclusion of a partial url in order to indicate the link). Provide your twitter name if you have one or an institutional twitter account (e.g. university department, organisation, etc) for inclusion in the tweets. If you have a twitter account, retweet your own and other DS tweets!

Call for speakers: Answering social science questions with social media data (2017-11-13 09:58)

Thursday 8th March 2018, The Wellcome Collection, London, NW1 2BE

After several successful events, we’re pleased to say that the NSMNSS network ([1]http://nsmnss.blogspot.co.uk/) and Social Research Association ([2]www.the-sra.org.uk) are again teaming up to deliver a one-day conference on ‘Answering social science questions with social media data’.

As social media research matures as a discipline, and methodological and ethical concerns are being addressed, focus is increasingly shifting on to the role that it can and should play in the social sciences - what are the questions it can help us to answer?

We are looking for speakers who have completed a piece of social research using social media data to present their findings and discuss how this has made a difference:

• How has it impacted policy, best practice, or understanding?

• How has it answered a question that would have been unfeasible using conventional research methods alone?

This research could be in any substantive area, from health or crime to politics or travel, as long as it is ‘social’ research. It can also include any type of analysis – quantitative or qualitative analysis, big data or small – as long as it involves some form of data collection via a social media platform. We want to encourage a range of different methods and topics to help demonstrate the diversity of the methodology and the role it can play.

Are you interested in presenting?
If you have completed a piece of research using social media research methods, or have any suggestions of who we should contact, then please complete the submissions template and send to nsmnss@natcen.ac.uk by Monday 27th November. Let us know the name and topic of the research study, which social media platform was used, a brief description of methodology, and the findings and impact of this study.

This event is being set up by the SRA and NSMNSS network. We want to keep the event accessible and ticket prices reasonable, but need to cover the costs of the venue hire/refreshments, so we cannot pay presenters – however there will be 1 free place per presentation, and we will be able to cover reasonable ‘within UK’ public transport travel expenses.

The NSMNSS & SRA teams

CfP 'Data Justice', Cardiff University, 21-22 May 2018 (2017-11-13 14:31)

Date: 21-22 May 2018
Location: Cardiff University, Cardiff, UK
Host: Data Justice Lab, Cardiff University, Cardiff, UK

Submission deadline: 27 November!

The collection and processing of massive amounts of data has become an increasingly contentious issue. Our financial transactions, communications, movements, relationships, all now generate data that are used to profile and sort groups and individuals. With the platformisation of digital media alongside governmental and corporate uses of citizen data, developments in AI, the Internet of Things, smart homes and smart cities, the systematic collection and analysis of massive data sets across our social life is being normalised and entrenched – what has been described as the ‘datafication’ of society.

With the emergence of this data paradigm comes a new set of power dynamics requiring investigation and critique. Whilst promises of value-neutral information and possibilities for prediction are said to advance better responses to a range of social problems, they may also have serious implications for social and economic inclusion, autonomy, basic freedoms, and established notions of ethics, trust, accountability, governance and citizenship.

What are the implications for social justice? How do we understand social justice in an age of datafication? In what way do initiatives around the globe address questions of data in relation to inequality, discrimination, power and control? What is the role of policy reform, technological design and activism? How do we understand and practice ‘data justice’? How does data justice relate to other justice concerns?
This conference will examine the intricate relationship between datafication and social justice by highlighting
the politics and impacts of data-driven processes and exploring different responses. Hosted by the Data Justice Lab
at Cardiff’s School of Journalism, Media and Cultural Studies (JOMEC), it will bring together international scholars,
practitioners, and activists to engage with data from a social justice perspective. Confirmed speakers include:

Anita Gurumurthy (IT for Change, India)
David Lyon (Queen’s University, Canada)
Evelyn Ruppert (Goldsmiths, UK)
Rob Kitchin (Maynooth University, Ireland)
Sasha Costanza-Chock (Civic Media at MIT, US)
Seeta Peña Gangadharan (London School of Economics, UK)
Solon Barocas (Cornell University, US and FAT/ML)

The conference will combine academic papers with hands-on workshops relating to methods of investigation,
policy and design. We welcome submissions of abstracts for both types of sessions.

Themes of the conference include (but are not limited to):

Social justice and data
Data governance
Data discrimination
Data colonialism
Data sovereignty
Digital labour
Prediction and Preemption
Data scores and dashboards
Data ethics
Data policy and reform
Social justice-informed design
Uses of data by social justice groups
Data activism and advocacy

Submissions:
Submit via EasyChair: [1]https://easychair.org/conferences/?conf=dj2018 All submissions must include a title, author
name(s), institutional affiliation(s) and full contact information (mailing address, email address). If you propose a
workshop or practical demonstration, please provide a clear statement of purpose and a detailed description of
activities, as well as any infrastructure requirements. Information: Cardiff is a 2-hour train journey west of London
and Heathrow airport. The closest airports are Cardiff and Bristol. 'Data Justice' will take place shortly before the
ICA 2018 conference in Prague, 24-28 May. Flights to Prague take 2 hours from Heathrow. Conference fee: Full fee:
£75 (early bird) / £100 Reduced student fee: £50 (early bird) / £75 Conference organizing committee: Lina Dencik,
Arne Hintz, Joanna Redden (Data Justice Lab, Cardiff University, UK) For information about the Data Justice Lab, see:

RMIT University, Australia

Larissa Hjorth
RMIT University, Australia

Abstract Submission Deadline: 15 November 2017
Deadline extended to 25 November 2017
Proposal Selection Notification: 10 December 2017
Initial Article Submission Deadline: 01 March 2018

Contact email: sharingandstoring@gmail.com

Technologies and technological infrastructures are often associated with social and economic change. Airplanes and the shipping containers (Levinson 2008) became mechanisms for the spread of globalisation, reshaping the production processes and the trade and consumption of goods from around the globe. Undersea cables and mobile phone towers are often associated with providing the infrastructure of the digital age, enabling the flow of information, communication, media, technology, commerce and other goods to move at a greater speed than experienced in previous eras. These possibilities continue to expand with the introduction of solid state drives, Bluetooth capabilities, smartphones, ‘the cloud’ and social media platforms that have fundamentally altered the practices of storing, sharing and circulating digital materials. Yet, the increasing capabilities for sharing and storing also have consequences for the ways in which we engage with and/or manage our digital data on a day-to-day basis. Research on digital materials in the home highlight how families and households now grapple with an increasing number of digital photographs, videos and other digital materials that are often stored on a range of outdated or defunct devices, formats and platforms. Memory size in domestic technologies has increased, but so have the number and size of files that host many of the mundane digital materials. These constraints prompt decisions about what digital material should remain, what can be deleted and where certain digital materials should be stored. Such decisions become even more difficult with the increasing infiltration of work into the domestic sphere, syncing and other forms of automation and the increasing number of channels through which digital materials can circulate. For many people the separation of digital materials that move between different domains has become more challenging - and messier - than ever. This special issue examines our everyday relationships with digital materials and the various platforms, devices, spaces and formats through which they are stored and shared. We ask contributors to this special issue to consider: How do people manage the proliferation of digital material in their everyday lives? What strategies and rituals
do they develop to organize, curate or delete digital materials? How are existing cultural practices of sharing and storing in other domains shaping these strategies? What are the broader infrastructures, platforms, programs and devices that are enabling, hindering or changing people’s ability to navigate the ways they store and share digital materials? Papers in this special issue will explore the everyday ways we manage living in a world of digital data and may include the following topics: • Data transfer practices (e.g. moving digital materials from old to new devices) • Manual vs automatic syncing of digital materials • Temporalities of digital materials (e.g. long-term storage vs. transient data storage, changes of storing and sharing practices in relation to life stage) • Routines and practices (e.g. organising, cleaning or curating digital materials) • Non-sharing • Emergent categories of and distinctions between digital materials • Historical comparisons of sharing and storing of non-digital and digital materials • Specific studies of sharing or storing on or across specific platforms (e.g. WhatsApp, Facebook, Instagram, YouTube, Dropbox, iCloud, c-Share, Google Drive, etc.) Please note that the guest editors’ welcome submissions on a wide variety of theoretical and/or empirical contributions to the study of digital material beyond the suggestions identified. Submissions: Proposals should include the author’s name and affiliation, title, an abstract of 250-300 words, and 3 to 5 keywords, and should be sent to the e-mail address no later than 15 November 2017 (Note: Deadline extended to 25 November 2017). Invited paper submissions will be due 1 March 2018 and will be submitted directly to the submission site for /New Media and Society/: [5]https://mc.manuscriptcentral.com/nms where they will undergo peer review following the usual procedures of New Media & Society. Approximately 10-12 papers will be sent out for full review. All other papers will be returned to their authors for submission elsewhere. Therefore, the invitation to submit a full article does not guarantee acceptance into the special issue. The special issue will be published in 2019. Helen Margetts: How social media (and other platforms) can promote equality in 2027 (2017-11-14 20:51)

Thu 16 November 2017, 18:30 - 20:00 GMT
Anglia Ruskin University, Cambridge

Professor Helen Margetts, director of the prestigious Oxford Internet Institute, presents her personal, positive vision - and then leads discussion - on how the UK’s social media can be a force for greater equality in the year 2027.

Register online here: [1]https://www.eventbrite.co.uk/e/helen-margetts-how-social-media-and-other-platforms-can-promote-equality-in-2027-tickets-34398362428

Undisciplining: Conversations at the Edges

The BALTIC, Gateshead, UK; 19-21st June 2018

Call for Participation

In 2018 [1]The Sociological Review will be hosting our largest conference to date! This is a long-overdue cele-
5296
bration of our renewed commitment to fostering collaborations and dialogues that shape the nature and scope of the sociological, to making the sociological matter. Undisciplining seeks to challenge the presumed mainstream of sociological thought, its geographical assumptions and disciplinary hierarchies. It builds on The Sociological Review's rich history and future ambitions to bring the conversations at the edges into the centre, to unsettle comfortable and convenient understandings of the social world, and to recognise that the potential of sociological thought and understanding exists through debates that extend beyond disciplines and the university.

Confirmed Speakers

Professor Amita Baviskar (Delhi University), Dr Michaela Benson (Goldsmiths, University of London), Professor Ben Carrington (University of Southern California), Dr Ayona Datta (Kings College London), Professor Rosalind Edwards (University of Southampton), Professor Val Gillies (University of Westminster), Dr Nicola Horsley (Royal Netherlands Academy of Arts and Sciences), Dr Meritxell Ramirez-i-Ollé (University of Keele), Dr Deana Jovanovic (Keele University), Professor Alice Larkin (Manchester University), Professor Joanna Latimer (University of York), Professor Jenna Loyd (University of Wisconsin-Milwaukee), Professor Anoop Nayak (Newcastle University), Professor Rachel Pain (Newcastle University), Professor Virgílio Borges Pereira (Faculdade de Letras da Universidade do Porto), Dr João Pedro Luís Queirós (Faculdade de Letras da Universidade do Porto), Dr Ruth Raynor (Newcastle University), Professor Jenny Reardon (University of California, Santa Cruz), Dr Anamik Saha (Goldsmiths University), Professor Bev Skeggs (LSE), Dr Tom Slater (University of Edinburgh), Professor Mark Tewdwr-Jones (Newcastle University), Professor Imogen Tyler (Lancaster University), Professor Satnam Virdee (University of Glasgow)

Sociological Walks

Professor Maggie O’Neill (University of York), Dr Stephen Crossley (Northumbria University), Professor Roger Burrows (Newcastle University), Professor Stephen Graham (Newcastle University).

Our keynotes will be given by
The conference will include our Annual Lecture 2018:

Professor Satnam Virdee (University of Glasgow)
Unthinking Sociology and Overcoming its History Deficit

We are working hard to develop a lively programme of events. Rather than a classic conference format, we want to encourage different ways of participating, of communicating ideas and research, and providing space for critical and engaged dialogue.

You can also listen to our Managing Editor, Michaela Benson, introducing our forthcoming conference and explaining the motivations behind the conference here.

If you would like to take part, read on!

Take part

We invite submissions from social scientists at all stages in their academic careers, as well as from sociologically-inclined publics. We encourage submissions across a range of formats including film, workshops, performances, and posters. And if you have an idea that does not seem to fit to any of these formats, get in touch (events@thesociologicalreview.com) to discuss it with a member of the organising committee. Please note that we will only be considering applications submitted through the designated online form. **Deadline: 27th November, 2017 at 17.00 GMT**

CFP: 8th Annual What is...? Conference (2017-11-19 16:05)

WHAT IS UNIVERSE? COMMUNICATION • COMPLEXITY • COHERENCE
April 19-21, 2018 * University of Oregon in Portland, USA

The _WHAT IS UNIVERSE?_ [1] (2018) conference-experience examines communication, complexity/simplicity, coherence/incoherence and, how they may or may not contribute to "a pluralistic universe." This conference marks the third collaboration among scholars from the natural and social sciences, communication, media, law, design, and art. We invite proposals for scholarly papers, panels, exhibits and installations on a wide variety of issues and topics. Please see [1]{WHATIS.UOREGON.EDU for more details [2].

Participants will explore universes–from reality bubbles, immersive virtual environments, and alternate histories, to agential realism, media genealogy and archaeology, to bio-inspired, urban and ecological design, to universal rights, disabilities studies, multicultural communities, networks, and cosmologies.

PROPOSALS MAY ADDRESS THE FOLLOWING QUESTIONS (AS WELL AS OTHERS):

What are communication, science, media, design, and philosophy universes today, and how are they syncretizing? How can universities and disciplines be understood as universes?

How are citizens increasingly being drawn into alternate, fictional, cinematic, and comic book universes, social networks, immersive worlds, and augmented realities?

In an age of increasing communicative complexities and oversimplifications, what is truth and what is reality? How do real/virtual and analogue/digital universes overlap/separate?

How is journalism overcoming vernaculars of real/fake news in a "post-truth" era, while still actively seeking solutions?

What constitute material universes in antiquity and contemporary culture?

How do technological and cosmological universes transform theory-practice?

In this context, what is posthumanism and how are speculative futures already integrating into (re)generative medicine, music, law, and other...
disciplines?

How are emerging systems, environments, architectures, the sciences and the arts converging/diverging into societies and universes? What are universes of values?

With the definitions of "universe" continuing to multiply, important questions abound as we address a sweeping range of issues next April in Portland, Oregon.

CONFERENCE ORGANIZERS:
Janet Wasko and Jeremy Swartz (University of Oregon)

Send 100-150 word abstracts or installations by DECEMBER 31, 2017 to:
Janet Wasko * [2]jwasko@uoregon.edu

School of Journalism and Communication * University of Oregon * Eugene, OR 97403-1275

2. mailto:jwasko@uoregon.edu

______________________________

The 10th conference DIAGRAMS will take place in Edinburgh on 18-22 June 2018.
It will include presentations of refereed Papers, Abstracts, and Posters, alongside tutorials, workshop sessions, and a graduate symposium.
It provides a united forum for all areas concerned with the study of diagrams.

We invite submissions for peer review that focus on any issue pertaining to diagrams.
In particular, we welcome papers on the visualization of information, internet and social media.

Submissions can be:
- Long Papers (16 pages max.)
- Short Papers (8 pages max.)
- Posters (4 pages, min. and max.)
- Abstracts (3 pages max.)
Long Papers and Short Papers categories should report on original research contributions.
Abstracts category should report on significant research contributions, which may have been published elsewhere (such submissions must clearly cite prior work) or are intended to be published elsewhere.
Poster submission category should be used for work-in-progress.

How to Submit*
For all categories, the new deadlines are:
- Pre-submission of a title and a short descriptive abstract (200 words) due by 30th November 2017.
- Submission of full versions due by 7th December 2017

1. https://easychair.org/conferences/?conf=diagrams2018

Book launch with Dr Sadia Habib and Dr Julia Hope (2017-11-22 23:17)

![Image of book covers](image)

You are invited to join us for the launch of our new books: "Learning and Teaching British Values" by Dr Sadia Habib and "Children's Literature about Refugees" by Dr Julia Hope.

Two Goldsmiths alumni are holding a joint book launch:

"Learning and Teaching British Values: Policies and Perspectives on British Identities" by Sadia Habib
This book engages with important debates about multicultural British identities at a time when schools are expected to promote Fundamental British Values. It provides valuable insight into the need to investigate fluid and evolving identities in the classroom. What are the implications of Britishness exploration on young people’s relationships with and within multicultural Britain? What are the complexities of teaching and learning Britishness?

"Children’s Literature about Refugees: A catalyst in the classroom" by Julia Hope

In this book, Julia Hope explores ways of engaging in class with children’s books about refugees. Using Beverley Naidoo’s novel 'The Other Side of Truth' along with a book aimed at younger children - Mary Hoffman’s 'The Colour of Home' - Hope offers concrete case studies on how children’s literature about refugees can be used productively in the classroom.

Date: Thursday 30 Nov 2017, 4:30pm - 6:30pm
Venue: Rooms 109 & 110, Ground Floor, Margaret McMillan Building, Goldsmiths, University of London

Four lessons offered by Ann Oakley in her [1]Father and Daughter: Patriarchy, Gender and Social Science. This is a wonderful, thought-provoking and deeply human series of essays on the unfolding of her life in relationship to her father Richard Titmuss, the social science he advocated and web of

5302
relations which connected them all:

The first is the lesson about how lateral thinking is much more productive than stubborn disciplinary allegiances. It matters not at all (or only in an ‘academic’ sense) whether what we’re doing counts as social policy or social administration or sociology, whether it belongs in the field of education or health or welfare or in the more amorphous land of public policy. The questions override territorial enclosures. Richard Titmuss specialised in seeing that. Secondly, I understood that what I would later encounter as ‘the crisis in epistemology’ of Western culture – the suspension of belief in any kind of stable objective reality – is simply a trick of the mind invented by theorists who’ve got nothing better to do. Reality does exist, and so does the real stress and pain that derive from a completely non-random (unfair) distribution of life-chances. Thirdly, I learnt that one way to make a difference is to argue on the basis of evidence rather than opinion about the need for change (which is not to say that evidence plus opinion, in the kind of clever networking Richard Titmuss and his disciples were so good at on ‘their Holborn stage’, 73 isn’t the most effective option of all). Lastly, you don’t need to hold all this in your head so long as you know where to find it. Back in the 1950s we really did have door-to-door salesmen who tried to offload copies of the 32-volume Encyclopaedia Britannica on us. I was a sucker for their sales technique, but my financially prudent social accounting father was not. He told me to get on a bus and go to the library. Richard Titmuss would have loved the democratic epistemology of the internet (although his wife would probably have needed to operate the computer for him).

**CfP: Accelerated Academy (2017-12-10 18:05)**

Accelerated Academy #4  
*Academic Timescapes: Perspectives, Reflections, Responsibilities*

May 24-25, Villa Lanna, Prague, Czech Academy of Sciences

After meetings in Prague, Warwick and Leiden, the fourth Accelerated Academy conference calls for a more nuanced perspective in order to advance our understanding of academic temporalities as experienced, understood, controlled, managed, imagined and contested across different institutional contexts. The question of temporality – the human perception and social organization of time – in and of the academy has been attracting considerable attention across the social sciences in recent decades. Notable accounts have demonstrated that time is an important research object potentially offering new insights into the complex and shifting nature of the contemporary academy and its future. Existing studies tend to stress how pressures intrinsic to the imperatives of the knowledge economy and academic/epistemic capitalism co-shape policies and subsequently impact how time is perceived and experienced on the level of individuals and institutions, leading to concerns over their temporal relation to wider society. Taking the cue from the long tradition of sociology of time the conference aims to tackle various pressing
question in the emerging field of the social studies of academic time. The conference will address the following themes but the organizers welcome other cognate problematics:

- Theorizations and different disciplinary takes on temporality in academia
- (Possible) methods of inquiring into academic temporalities
- Temporal design(s), temporal policies
- Temporal justice vs/and temporal autonomy
- The promises and limits of ‘the slow’ in academia
- Temporalities in/of teaching; temporalities in/of research – tensions, complementarities, (in)compatibilities
- Temporal interfaces with wider society and its implications for science communication
- Temporality of science communication via social media
- Digitalization, temporal intersections and emerging temporalities in academia
- Temporality, metrics, evaluations

Please submit short abstract (250 words) and bio to vostal@flu.cas.cz by 28 February 2018. We intend to generate an edited volume from the conference so please indicate whether you’d be interested in contributing to the volume.

Organized by Centre for Science, Technology, and Society Studies, Institute of Philosophy of the Czech Academy of Sciences & University of Minho, Research Centre on Communication Studies (CECS)

Funded by Czech Science Foundation, Czech Academy of Sciences (Strategie AV21) & Portuguese Science Foundation, CECS, University of Minho.

Call for blog posts: the value of graphic social science (2017-12-10 20:29)

The Graphic Social Science Network blog is calling for contributions. Each month, we would like to open the floor to discuss issues relating to producing social science research in comics form.

Comics offer scholars a unique opportunity to communicate their research in two distinct but interwoven levels — words and pictures. While anyone who is already enamoured with comics can readily see the genius of graphic scholarship (of course!), the value of producing research in a traditionally derided medium may not be so obvious to everyone else.
In the inaugural Graphic Social Science blog debate, we would like to know how you would make a case for the value of graphic social science to your colleagues, students and publishers. We would like to hear both sides of the argument. Blog posts, podcasts, vlogs, and of course webcomics are welcome.

The deadline is **January 31st 2018**. Please send your submissions to Can Yalcinkaya (can.yalcinkaya@mq.edu.au) and Mark Carrigan (mark@markcarrigan.net).

---

**CfP New Research Network: 'Alternatives to Capitalism' (2017-12-18 14:47)**

Dear colleagues,

Attached you find the call for papers for the annual conference of our newly established research network on 'Alternatives to Capitalism', which is part of the Society for the Advancement of Socio-Economics (SASE) and will run for five years (2018-2022).

Next year it will be held on June 23rd-25th at the University of Dashisa, Kyoto (Japan).

Alternatives to Capitalism Research Network I: [1]https://sase.org/about/networks/ Deadline for Abstract Submissions and Sessions Proposals (max 500 words): January 8, 2018 Please note that several Early Career scholar awards are available to cover the costs of traveling, accommodation, and fees. For information on how to apply, please visit the website at [2]https://sase.org/events/conference-submission-and-award-guidelines/ You are very welcome to contact the research network chairs to discuss paper and panel submissions or any questions you may have: Dr. Lara Monticelli ([3]mailto:lara.monticelli@sns.it); Dr. Torsten Geelan ([4]mailto:tkg22@cam.ac.uk); Prof. Katherine Chen ([5]mailto:kchen@ccny.cuny.edu). Feel free to circulate the CfP to your networks and to potentially interested researchers. We look forward to receiving your abstracts and session proposals! With our best wishes for 2018, The research network chairs, Lara, Torsten & Katherine – Dr Torsten Geelan Affiliated Researcher, Department of Sociology, University of Cambridge [6]https://research.sociology.cam.ac.uk/profile/dr-torsten-geelan

In a recent [1] article for the *British Journal of Sociology* I offered a critical, and for the most part sympathetic, engagement with Actor Network Theory (ANT) in which I focused particularly on Bruno Latour’s provocative critique of sociology. The thrust of Latour’s argument is that what he calls ‘the sociology of the social’ fallaciously ascribes agency to a non-existent entity called ‘society’ or to a non-existent substance: ‘the social’. But society, Latour convincingly argues in his occasionally insightful and occasionally irritating polemics, does not exist, and neither does ‘the social’ (Latour 2005). Sociologists, therefore, should abandon their antiquated conceptual vocabulary (society, power, classes, capitalism etc) and focus instead on researching complex, hybrid networks of humans, concepts, objects, machines and molluscs.

I won’t go into much further detail, but my argument in that article is that whilst Latour identifies a real weakness in much sociological theory, the analytical payoffs promised by Latourian metaphysics can best be found in a sociological realism rooted in the philosophy of critical realism.

One impressively lucid alternative has been offered by Dave Elder-Vass, who has himself engaged critically with Actor Network Theory (Elder-Vass 2008) and who kindly offered some feedback on a draft of my article. Elder-Vass rejects the reification of society and ‘the social’ for similar reasons to Latour, but argues nevertheless that the intellectual resources of sociology can be effectively utilised if we attribute *causal powers* not to society as such, but to a myriad of social institutions he calls norm circles (Elder-Vass 2010, 115-143). This, he argues, allows us to speak of a social structure above and beyond the beliefs and actions of individuals; something which sociologist have always done, but without sufficient precision or clarity.

In Elder-Vass’s theory, norm circles are understood as overlapping social collectives that encourage, endorse and enforce particular practices. In doing so, these ‘circles’ are more than the sum of their parts and give rise to a tendency for particular outcomes via each member’s understanding of their own normative environment. There are said to be different types of norm circles that relate to different types of norms, and understood within norm circle theory any identifiable social groups will likely be associated with numerous overlapping norm circles (described in terms of ‘clustered’ circles). There are, for example, epistemological and epistemic circles. Epistemological circles are collectives that validate beliefs as *knowledge* by upholding and enforcing particular epistemological standards, whilst epistemic circles are groups which uphold and enforce particular knowledge claims (Elder-Vass 2012).
What I think is particularly useful in the idea of norm circles – and the thing that makes it distinct from many other contemporary sociological models – is that it is fundamentally concerned with people and practices, rather than ideas or discourses. In this respect, a potentially interesting point of comparison is Bourdieu's concept of the social field, which is another significant attempt to conceive of an objective social structure above and beyond individual human agents – and one which is similarly more concerned with practices than ideas and discourses. In An Invitation to Reflexive Sociology, Bourdieu who was certainly gifted, but not with concision, defined a social field as a network, or a configuration, of objective relation between positions. These positions are objectively defined, in their existence and in the determinations they impose upon their occupants, agents or institutions, by their present and potential situation (situs) in the structure of the distribution of power (or capital) whose possession commands access to the specific profits that are at stake in the field, as well as by their objective relation to other positions (domination, subordination, homology, etc.). (Bourdieu 1993, 97)

Social fields, Bourdieu goes on to say, are a 'structured social space, a field of forces, a force field' (Ibid). Part of the difficulty here is that the concept of 'field' is tied up with Bourdieu's other sociological concepts. But in more conventional terms we can understand social fields as 'relatively autonomous social microcosms' that emerge historically and are characterised by unique forms of competitive and strategic relations between the agents and institutions that populate them. Bourdieu's fields are hierarchically structured, and their agents possess differential resources with which they pursue distinct strategies in 'struggle[s] for the transformation or preservation of the field' (Bourdieu 1998, 40). As Thomson emphasises (2008, 72), the concept of a social field, like all of Bourdieu's concepts, should be seen as 'an epistemological and methodological heuristic' to be put to use in empirical research. Doing so, according to Bourdieu, should involve (1) establishing where a field stands in relation to what he calls the 'field of power' (meaning the field of the ruling class, the elite, or the dominant classes in society) (Wacquant 1993); (2) mapping out the relations between the positions within the field occupied by agents and institutions; and (3) examining the internalised dispositions (habitus) of its agents. (Bourdieu and Wacquant 1992, 104-5) Bourdieu himself used the concept to research education, culture, academia, housing, television journalism and the state.

How might a Bourdieusian social fields relate to norm circles? Are they compatible epistemological and methodological heuristics? In broad terms, I think they are. Were we to overlay a social field with norm circles, I think we might consider it as comprising of overlapping 'circles' that together produce and reproduce its particular dynamics. In a given field there will likely be a set of norms that undergird the terms of competition within it (described by Bourdieu in terms of a field's illusio and doxa), as well as norm circles associated with particular locations within the field and the distinct norms that predominate there.

In the academic field, for example, there are more or less universal norms relating to certain pedagogical and scholastic practices (relating for example to lecturing, plagiarism and peer review) as well as distinct norms associated with particular disciplines and competing subfields, each with their own epistemologies, political commitments (tacit or explicit) and scholastic practices. In the case of sociology, for example, we could point to Burawoy's influential typology of professional, policy, critical and public approaches (Burawoy 2005), or Williams, Sloan and Brookfield's (2017) more recent description of analytical and critical approaches in UK sociology. In Bourdieu's somewhat
idiosyncratic schema, the sorts of strategies and dispositions associated with these different sociological practices would be regarded as forms of the position taking, *illusio* and *doxa* that characterise social fields, but they can at the same time be understood as practices undergirded by clusters of overlapping norm circles – clusters which together give rise to the social field’s relational dynamics and emergent properties.

**Tom Mills** is Lecturer in Sociology at Aston University. He is the author of ‘The BBC: The Myth of a Public Service’ (Verso, 2016) and the co-editor of ‘What is Islamophobia?’ (Pluto, 2017). His monograph, ‘The Politics of Terrorism Expertise’, co-authored with David Miller, will be published in 2018.

CfP: Articulating Voice (2018-01-03 11:56)
The Philosophy, Theory and Critique (PTC) Division of the International Communication Association

Event date: 24 May 2018, 9:00 AM to 5:00 PM, Prague, Czech Republic
Deadline for proposals: 10 January 2018 (300-500 words abstract)
Location: Main Conference Hotel
Organizers: Christian Pentzold (University of Bremen), Kenzie Burchell (University of Toronto), Olivier Driessens 5310
"Media matter most when they seem not to matter at all." (Wendy Chun) But how can we understand the practices through which innovations in media and digital data move from being unexpected, novel, and impactful to the negotiated, embedded, and habitual?

The pre-conference takes issue with the mundane yet pervasive nature of media habits, rituals, and customs. It assesses the purchase of practice-based approaches in order to see under what conditions and with what consequences they enter studies in communication and media. In particular, we invite participants to consider the expressive and performative dimension of what people actually do and say in relation to media and to the wider communication ecologies in which these articulations take place. We are especially interested in contributions that examine how voices are expressed, represented, or muted and that study the ways practices of voice combine, overlap, or collide with other mediated activities in contemporary societies. With this, we strive for an explanation and critical appreciation of media practices whose accomplishment is a perennial exercise in which we find ourselves immersed.

We welcome theoretical and/or empirical contributions on questions including:

How can we theorize and study the interplay between media-related practices and technologies, discourses, or institutions? How are these constellations created, maintained, and transformed? How do praxeological approaches correspond to other inquiries into speech acts, media rituals, or media habits?
What resources and skills are mobilized in order to perform voices? What is the meaning of the work that goes into activities of voicing? How do they contribute to or undermine the constitution of public spheres, privacy, and civic life in past and contemporary societies?
How do we grasp media practices empirically, and how do we analyze them across modes of expression, across cultures, different times, and ages? How can we challenge and advance the kinds of translation and transformation happening in-between the situated enactment of media practices and the descriptions and stories of scholarly accounts?
How can we understand the ways through which media practices are accomplished in social fields? How are they deployed in struggles for gaining voice and visibility as in political communication and journalism, participation and mobilization, health communication, or science communication? How have media practices changed over time and in relation to innovations in digitization and datafication?

Responses to the contributions will be given by Elisenda Ardèvol (Universitat Oberta de Catalunya); Maria Bakardjieva (University of Calgary), S. Elizabeth Bird (University of Southern Florida); Nick Couldry (London School of Economics and Political Science).

Please email a 300-500 words proposal to Christian Pentzold (christian.pentzold[at][1]uni-bremen.de) by January 10, 2018.

Authors will be notified of their acceptance before January 31, 2018.

Please direct any questions to: Alice Mattoni (alice.mattoni[at][2]sns.it) or Christian Pentzold (christian.pentzold[at][3]uni-bremen.de).

How do we imagine our collective future? A series of public events in the UK (2018-01-03 13:17)
Looks fascinating. Presumably, though a tad presumptuous (albeit implicitly) to suggest that there is still a unitary 'Britain' in 2027, rather than a rump UK whilst progressive radicals in Scotland have come to their senses and taken democratic control of their own future, and Ireland is at last undivided. ;-)

What an uplifting response it undoubtedly true though

Answering social science questions with social media data (2018-01-22 10:37)

What role can social media research play in the social sciences? What are the questions it can help us to answer? Speakers from a range of backgrounds will talk about their experiences of using social media in their research, providing real examples of use to those interested in seeing how the promises of social media research can be actualised.

Press the 'Register' button for more information and to book your place.

After last year’s successful 'Introduction to tools for social media research', the SRA and #NSMNSS are teaming up again to deliver a one-day conference on 'Answering social science questions with social media data'.

As social media research matures as a discipline, and methodological and ethical concerns are being addressed, focus is increasingly shifting on to the role that it can and should play in the social sciences.

The packed event will include keynote presentations from Steven McDermott and Suzy Moat, and examples from eight expert speakers of how social media research can provide insight into research questions in novel ways. It is aimed at social researchers who want to find out more about what this new methodology can offer, and see how the promises of social media research can be actualised.

Our speakers come from a range of backgrounds, including government and academia, presenting examples on topics such as politics and health, with data from Twitter, Facebook, blog sites and other platforms. Stuart B Hill (2018-01-26 04:42:04)
Some General Guidelines for Deep (vs. Shallow) Research – Prof Stuart B Hill - 2003 1. Don’t postpone (I repeat: DON’T POSTPONE!): live and conduct your research fully in the present (learn from the past and, with others, vision and work to bring
about improved futures). 2. First clarify (and continue to clarify) your passion(s) (along with your values and worldviews) to be able to: a) access your full potential; b) to be most contextually relevant; and c) be at your best for imagining, creating, planning and deciding (including choosing methodologies), and acting, i.e., methodologies must serve your passion and ‘higher’ values, and not vice versa (in everything be clear and take charge of ‘what’s in the service of what’). 3. Resist the distractions of: a) deceptive simplicity; b) ease (especially of securing funding, uncritical acceptance, retaining positional power, a job etc.); c) being stuck in describing, measuring, monitoring, accommodating and seeking only curative ‘solutions’ to problems; d) only efficiency and substitution strategies for problem solving (focus on design and redesign, i.e., ‘focus on ‘front-end’ [healthy system creation and maintenance: problem-proofing systems] over ‘back-end’ approaches to problems/issues); e) over-emphasis on short-term, direct, high-powered, purchased, expert-dependent, single-discipline, imposed, technology-intensive, ‘solutions’ to problems. 4. Seek understandings that are consistent with your highest values (e.g., re equity, respect of, and collaboration across, difference/diversity, mutualism and autonomy, meaning and service, sustainability and psychosocial co-evolution and developmental and ‘progressive’ change), and that are emergent from embodied experiences, relational, enabling and life-affirming. 5. Act from, and only work with (and therefore only validate, collaborate with and support), your and others’ ‘soulful person/essence/core being’ – and not your or their ‘adapted, patterned, distressed, fearful, unaware, disempowered, needy, ego-driven, disembodied, acting-out, withdrawn (etc.) selves’. In this connection, reflect on ways to act anonymously (helped by collaborating, over long timeframes, on projects that emphasise indirect and contextual approaches to change), and do it (i.e., don’t postpone)! 6. Be open to wild ideas, paradox, lateral thinking, contributions from the margins and borderlands, divergent and neglected areas, ‘other’ and unfamiliar disciplines, ways of knowing and languages, synchronicity, synergy and mutualism, obscure dreams, imaginings and interpretations; and risk working at your and others’ edges (where we are all most alive; and the locus of most meaningful innovations). 7. Include considerations of the personal (particularly the psychological), the socio-cultural (particularly institutional structures and processes), the ecological (and all of nature, from subatomic to cosmic expressions) and the ‘spiritual’ (the vast mysterious unknown – and resist letting your fears of this area result in imprisoning it in ‘domesticating’ structures and processes (as is common in most religions). 8. Map (and continue to re-map) and reflect on your processes, your learning and development (especially your evolving missions and agendas), ‘progress’, relationships, ‘gifts’ given and received (especially in relation to our psychosocial evolution as a species, to peace and social justice, to personal, community and ecosystem health/wellbeing and sustainability). 9. Develop and use your own personally- and contextually-relevant early ‘integrator indicators’, of the appropriateness of states, structures, processes, and ‘progressive’ and regressive/degenerative change. 10. Learn your way into the future by alternating between knowing/acting and unknowing/learning – don’t dwell for too long in either. January, 2003 (revised April, 2005) Emeritus Professor Stuart B. Hill, Foundation Chair of Social Ecology, School of Education Western Sydney University (Kingswood Campus), Locked Bag 1797, Penrith, NSW 2751, AUSTRALIA Location: Building K1, Room K-2-19A, WSU-Kingswood Campus, Penrith, NSW Tel: 61(0)2-4736-0799; Fax: -0400: Email: s.hill@westernsydney.edu.au; Web: www.stuartbhill.com

CfP: Marketization and the digital economy (2018-01-24 15:26)

Submissions are now open for SASE’s 30th annual conference, [1]Global Reordering: Prospects for Equality, Democracy and Justice, hosted by [2]Doshisha University from 23-25 June 2018. This is for a special section on digitalisation:

Global reordering in the economy is occurring at many levels – between geographical regions, within geographical regions, between economic sectors, between different players in the same sector, and between market and non-market models of economic provisioning. The digital economy is at the forefront of these processes of reordering.
For this miniconference we invite papers on all aspects of the socio-economic changes related to marketization and the contemporary digital economy, in all regions and sectors. Topics may include, for example:

**Collaborative forms of digital economy**

Digital technology has created new spaces for non-market and non-profit forms of economy, whether we call them collaborative, sharing, gift, or collective economies – from Wikipedia to Couchsurfing, from the open source software communities to Freecycle. How are these faring in their continuing competition with market forms? How do they combine or collide with more commercial forms? Are they able to deliver more equal and democratic forms of work and consumption?

**Marketization processes**

On the other hand, many practices previously considered as recreational or domestic are increasingly becoming marketized. Web platforms such as Airbnb.com, Craigslist.org, Etsy.com or Vizeat.com, encourage ordinary people to commodify their personal possessions as well as their common domestic or leisure practices. Human bodies and personal data are becoming commodified. Ordinary people are encouraged to turn themselves into entrepreneurs, changing forms of work-life articulation and generating altered social recognition. What are the causes and effects of these extensions of the market? How do market and domestic orders of worth combine? What are the consequences for the regulation of professions and the new challengers?

**The platform economy**

Platform sites like Amazon and Alibaba are well established, but the platform model is now breaking into vast new areas, most notoriously through taxi services like Uber and Didi. How do these new intermediaries benefit or harm competitors, states, workers and consumers? How can, and how should, they be regulated? Can those harmed by them find new ways to organize in response? Do the participants in the platform economy bring new values or moral economies to the markets that they impact? How do algorithm-based orderings, filterings and decisions fit with online platforms and their participants?

**Digital market processes**

The new economic sociology was largely defined by its account of embeddedness. Are digital commodity transactions and business models embedded in the social in different ways? How have the means of qualifying and valuing commodities changed, and who do these changes favour? Does digitalization favour specific forms of industrial organization? How does the massive collection of data on consumers affect the balance of power in and across markets and what risks does this generate? To what extent does digital automation (through algorithms, “artificial intelligence”) redistribute agencies and the balance of power within markets? What are the prospects for a digital transformation of the monetary form of commodity transactions?

**Systemic consequences**

What is the overall effect of these changes on macrosocial variables such as inequality, governance capacities,
systemic risk, environmental change, and political engagement with economic issues? Does digital technology offer a prospect of greater economic and financial inclusion or is it systematically stacked against the poorest and most marginalized?

Deadline extended to January 29th. Submit online here:

Answering social science questions with social media data, March 8th in London (2018-01-30 19:10)

After last year’s successful 'Introduction to tools for social media research', the SRA and [1] #NSMNSS network are teaming up again on 8 March to deliver a one-day conference in London on 'Answering social science questions with social media data'.

What role can social media research play in the social sciences? What are the questions it can help us to answer? Speakers from a range of backgrounds will talk about their experiences of using social media in their research, providing real examples of use to those interested in seeing how the promises of social media research can be actualised.

The packed event will include keynote presentations from Steven McDermott, Qualitative Analysis and Social Media Lead with HMRC and Suzy Moat, Associate Professor of Behavioural Science at Warwick Business School, and examples from eight expert speakers of how social media research can provide insight into research questions in novel ways. It is aimed at social researchers who want to find out more about what this new methodology can offer, and see how the promises of social media research can be actualised.

Our speakers come from a range of backgrounds, including government and academia, presenting examples on topics such as politics and health, with data from Twitter, Facebook, blog sites and other platforms.

To book and for the full programme, please see the [2] SRA website

Date & time: Thursday 8 March 2018, 9.40am to 5pm
Venue: Wellcome Collection, 183 Euston Road, London, NW1 2BE

Price: £115 (£95 for SRA members) includes lunch and refreshments

Delegate places: 100
9.2 February

Understanding the political economy of digital technology (2018-02-10 16:27)

A BSA Digital Sociology Study Group event hosted by the Web Science conference at Vrije Universiteit Amsterdam May 27th 2018

In more optimistic times we thought of ourselves as masters of digital technology: we told ourselves it was empowering, liberating, and democratising. Today, there is growing concern that we have ceded control of digital technology to digital capitalism's rapacious market monopolisers whose former insiders, in their epiphanies, tell us have '[1]ripped apart the fabric of society'. All corporate algorithms are [2]black-boxed – [3]protected by intellectual property law. Concepts that describe them such as AI and machine learning are problematically slippery and esoteric. So we are told algorithms that we can't see or understand are to blame for digital capitalism's social and political effects. This is a particular concern for sociologists because those who suffer material and social inequality are increasingly having their life chances defined by these algorithms (see for example [4]Eubanks (2018)). Perhaps the tech companies aren’t "anymore equipped to self-regulate any more than the fossil fuel industry" ([5]Umoja Noble, 2018): it would seem the best we can hope for is to judge them by their results, attempt to legislate, or petition technology’s plutocrats to stop ‘doing evil’.

All these issues, however, share an overarching theme: technologies are made and deployed within a political economy that incentivises, allows, enables or rewards actions that draw us away from visions of digital technology – particularly the Web – as a transporter for the Enlightenment’s values. Driven by the logic of extracting the maximum amount of the surplus value from our social and economic transactions and our (often very personal) data, these companies have ruthlessly and relentlessly pursued economies of scale to leverage their platform’s network effects: whatever the social cost. Interpreted through the political economy, problems with fake news, the attention economy, surveillance, the power of Silicon Valley etc. all demonstrate that politics, economics and digital technology are now indivisible. Addressing the political economy of digital technology more explicitly will help explain who are the ‘we’ in this instance, how have ‘we’ lost control and what do ‘we’ have to do to get it back?

This event will showcase some of the scholarship that is currently tackling these issues under the banner of Digital Sociology. As this event forms part of the 10th ACM Conference on Web Science speakers and delegates will have the opportunity to share insights with a broad community from a diverse range of academic and professional backgrounds. We also invite contributions from members of all disciplinary fields that provide insights into the relationship between digital technology and the political economy. How does the political economy affect your area of expertise? What needs to change and how can it be changed?

This is only a brief list of suggestions: we welcome contributions on any topic that addresses the day’s theme.

- Fake news, propaganda and public (dis)information
The digital public sphere: reconsidering democracy
Digital surveillance, high volume data and governance
Changing and emerging industries
Digital labour
Digital inequalities
Digital wellbeing
Education

Provisional schedule for the day:

Besides the traditional papers presentations, the event organisers will experiment with other formats, such as the fishbowl, that will allow speakers to engage their audiences in more active ways.

- 9.30 – 10.30 panel with crowdsourced questions from the Digital Sociology & Web Science communities (panellists TBC)
- 10.30 - 13.00 paper session 1
- 13.00 - 14.30 lunch (including networking events)
- 14.30 - 16.00 paper session 2
- 16.30 – 18.00 fish bowl – a moderated interactive session where attendees can have the floor to discuss the burning issues (including what a bigger Digital Sociology event should look like and how it could be organised).

To present your paper please submit an extended abstract (up to 750 words) to our easychair page [6]here by midnight GMT on Friday the 2nd of March 2018. This should include an indication of the substantive issues and how they relate to the day's central theme. Decisions on abstract submissions will be communicated by midnight GMT on the 23rd of March 2018.

Successful submissions will be put forward for journal special issue (details to follow shortly).

A breakdown for the registration fees for the day (and the full conference, which includes keynotes from Prof. José van Dijck, and Sir Tim Berners-Lee) can be found [7]here.

‘Social Listening’ Workshop: building qualitative skills in social media research (2018-02-15 09:53)

10am – 4pm, Saturday 24 February 2018

Palmer 101, Whiteknights Campus, University of Reading

‘Social Listening’ Workshop

Following the interdisciplinary showcase conference ‘“Social Listening’ in the past, present and future’ in November 2017, we are pleased to announce a British Academy funded follow-up workshop. Taking place at the University of Reading on 24 February 2018, this one-day event is targeted at postgraduates and early-career researchers designing or developing qualitative research projects in this new and exciting field.

Led by [1] Carl Miller from DEMOS and [2] Jai Seamen from SAGE Publishing, this skills-based workshop will provide a practical guide to: designing novel social-media-based research projects; collecting and classifying social media data; qualitative tools used to analyse and extract meaning from big data. Showcasing a innovative internal tool developed in collaboration between DEMOS and SAGE to optimise qualitative research methods, this workshop aims to bring to academia cutting-edge developments in this ground-breaking area in current and future scholarship.

Registration instructions:

The deadline for registration is [Monday 19 February]. Attendance to the workshop is free, and refreshments and lunch are included. We are also offering travel bursaries to postgraduate students, but these are limited and will be offered on a first-come, first served basis.

To register, email Dr Dina Rezk ( [d.rezk@reading.ac.uk] ).

Further information

More about the project can be found on our University of Reading [4] webpages, and on our pages on the University of Reading’s Department of History [5] blog.

Follow us on Twitter [6] @SocListening.
Catch up with videos from November’s ‘Social Listening’ conference, including the keynote by Carl Miller, over on the Department of History’s [7] YouTube channel.

thank you so much

6th Annual CPERI Workshop, 29-30 July 2018
Institute for Social Futures, Lancaster University, UK

We cordially invite submissions to the 6th workshop on the Changing Political Economy of Research & Innovation (CPERI), following previous events at Lancaster (2012), Toronto (2013), San Diego (2015), Liège (2016) and Boston (2017). CPERI is a unique global forum for the exploration of scholarship regarding the political economy of research & innovation (R &I), and hence at the intersection of STS, political economy and multiple other cognate disciplines, including geography, sociology, politics, law, education, medicine, engineering, computing & philosophy. The workshop series is dedicated to cultivating a growing community of committed and engaged international scholars of the political economy of R &I who will continue to build on their CPERI connections at subsequent workshops and conferences, and through collaboration on research. We aim to bring this crucial but neglected issue more centrally to major conferences in adjacent fields, where it remains overlooked. With these goals in mind, and to assist attendance from as diverse a group as possible, the workshop is also being held directly after the EASST Conference 2018, also in Lancaster. Attendance is free.

Our theme for 2018 is:

Making & Doing Technoscientific Futures Better

Keynote speakers:
Professor Susan Robertson (Cambridge) on “the University in an age of platform capitalism”
Dr Mark Carrigan (Cambridge) on “Securing public knowledge amidst the epistemic chaos of platform capitalism?”

Abstracts should be no more than 300 words, and should include the author’s name, institutional affiliation, and contact information. Questions and abstracts should be sent via email to CPERIWorkshop2018@gmail.com by 30 March.

Organizers:
After last year’s successful 'Introduction to tools for social media research', the SRA and #NSMNSS are teaming up again to deliver this one-day conference.

As social media research matures as a discipline, and methodological and ethical concerns are being addressed, focus is increasingly shifting on to the role that it can and should play in the social sciences.

The packed event will include keynote presentations from Steven McDermott and Suzy Moat, and examples from eight expert speakers of how social media research can provide insight into research questions in novel ways. It is aimed at social researchers who want to find out more about what this new methodology can offer, and see how the promises of social media research can be actualised.

Our speakers come from a range of backgrounds, including government and academia, presenting examples on topics such as politics and health, with data from Twitter, Facebook, blog sites and other platforms.

CfP: Using Creative & Visual Methods in Comparative Research (2018-02-20 07:54)

A one-day seminar funded by the International Journal for Social Research Methodology

Friday, 15th June, University of Surrey

CALL FOR PAPERS

Keynote speakers: Agata Lisiak (Bard College, Berlin) and Rita Chawla-Duggan (University of Bath)

Increasing use is made of both creative and visual methods in social research. Nevertheless, to date there has been very little discussion of the extent to which such methods can be used in comparative research. This seminar will explore some of the challenges of using these methods cross-nationally, examining the different cultural associations that may be brought to bear in different national contexts, and how these are accounted for in research design, data collection and analysis. It will also draw on the experiences of researchers working in this area, to explore how such challenges can most effectively be addressed. We welcome papers that address any aspect of using creative and/or visual methods in comparative research, or across spaces of difference more broadly defined (e.g. with groups from different ethnic or social class backgrounds).

Abstract Submission: Please send abstracts of up to 250 words by 14th April 2018 to Rachel Brooks at the University of Surrey: [1]r.brooks@surrey.ac.uk. (There will be no charge for attending the seminar as all costs are kindly being covered by the International Journal for Social Research Methodology.)

Seminar Organisers: The seminar is organised by the Eurostudents research team at the University of Surrey (Rachel Brooks, Jessie Abrahams, Predrag Lazetic and Anu Lainio). Further details about the Eurostudents project can be found at: [2]www.eurostudents.net.
Digital Cultures: Knowledge / Culture / Technology (2018-02-21 13:23)

International Conference / Leuphana University of Lüneburg

19–22 September 2018, Lüneburg, Germany

co-hosted by the Centre for Digital Cultures (CDC), Leuphana University of Lüneburg, and the Institute for Culture and Society (ICS), Western Sydney University, as part of the [1]Knowledge/Culture Series

(initiated by Armin Beverungen (CDC / University of Siegen) and Ned Rossiter (ICS))

Call for Papers
The advent and ubiquity of digital media technologies precipitate a profound transformation of the spheres of knowledge and circuits of culture. Simultaneously, the background operation of digital systems in routines of daily life increasingly obscures the materiality and meaning of technologically induced change. Computational architectures of algorithmic governance prevail across a vast and differentiated range of institutional settings and organizational practices. Car assembly plants, warehousing, shipping ports, sensor cities, agriculture, government agencies, university campuses. These are just some of the infrastructural sites overseen by software operations designed to extract value, coordinate practices and manage populations in real-time. While Silicon Valley ideology prevails over the design and production of the artefacts, practices and institutions that mark digital cultures, the architectures and infrastructures of its operations are continually rebuilt, hacked, broken and maintained within a proliferation of sites across the globe.

To analytically grasp the emerging transformations requires media and cultural studies to inquire into the epochal changes taking place with the proliferation of digital media technologies. While in many ways the digital turn has long been in process, its cultural features and effects are far from even or comprehensively known. Research needs to attend to the infrastructural and environmental registrations of the digital. Critical historiographies attend to the world-making capacities of digital cultures, situating the massive diversity of practices within specific technical systems, geocultural dynamics and geopolitical forces. At the same time the contemporaneity of digital cultures invites new methods that draw on digital media technologies as tools, and, more importantly, that engage the intersection between media technologies, cultural practices and institutional settings. New organizational forms in digital economies, new forms of association and sociality, and new subjectivizations generated from changing human-machine configurations are among the primary manifestations of the digital that challenge disciplinary capacities in terms of method. The empirics of the digital, in other words, signals a transversality at the level of disciplinarity, methods and knowledge production.

This conference brings together research concerned with studying digital cultures and the ways that digital media technologies transform contemporary culture, society and economy. The hosts specifically encourage approaches to digital cultures emerging from media and cultural theory, along with transnational currents of communications, science and technology studies. We also explicitly invite researchers from digital humanities, digital anthropology, digital sociology, gender studies, postcolonial studies, urban studies, architecture, organization studies, environmental studies, geography and computer science to engage in this endeavor to develop a critical humanities and cultural studies alert to the operations, materialities and politics of digital cultures.
Further information on themes, speakers, submissions and the preceding summer school on historiographies of digital cultures can be found at [2]digitalculturesconference.org.

CfP - Digital Economy: Ubercapitalism or Post-Capitalism? Conference, London, 11 May 2018
(2018-02-21 13:26)

The Digital Economy: Ubercapitalism or Post-Capitalism?
King’s College London, 11 May 2018

This international conference aims at exploring the digital economy, understood as the new forms of production, work, consumption, distribution, and finance ushered in by the diffusion of digital technology. From the way we work, to the way we consume and pay for products and services, to the rise of new platforms for consumption and collaboration, the economic field is being revolutionised by digital media. Yet, the jury is still out on whether these changes point to an even more exploitative or rather towards an alternative and fairer economic model.

The conference will explore these processes of transformation of the economy and their relationship with culture and society focusing on a number of specific phenomena that have been the object of intense debate in recent years and questioning the suitability of future trends and innovations: automation and its positive and negative repercussions on working conditions; crypto-currencies and whether they are freeing us from state control or reproducing neoliberal dynamics; universal basic income as a possible new form of welfare befitting the transformation of the economy in a digital era; the rise of digital giants such as Google, Apple, Facebook and Amazon and the consequences of their oligopolistic position in the market; the new models of value formation connected to data mining and analytics; and many more.

We invite participants from various disciplines and streams of research including media studies, sociology, economics, consumer research, management, information and computer science. Together, we will address a set of recurring questions. How, for example, is digital technology restructuring the economy? Are crypto-currencies really alternative to established financial regimes or are they rather at the very forefront of new forms of financial speculation? How do managerial practices evolve with the aid of digital resources? How do transformations in the mobile environment correlate to changes in the field of logistics? What are the features of the new forms of precarisation/casualisation of work that are described as “gig economy”? How does digital technology serve to enforce new forms of surveillance and measurement in the workplace? Can technological advancement promote alternative economic models as implied by references to terms such as “big data socialism” or “luxury communism”? Can digital media serve the construction of new forms of workers’ representation and trade-unionism?
The conference will comprise two plenary sessions and 4 breakout panels, and will host internationally acclaimed scholars as keynote speakers.

The conference will take place on Friday, 11 May 2018
Abstract of 250 words are due by 7 March 2018.
Submission lin: [1]https://easychair.org/conferences/?conf= digitalcapitalism201 Abstracts should be 250 words maximum, and include the author(s) name and position, and a short title. Acceptance notices will be given on 20 March 2018

9.3 March

FUTURESEX 2018: University of Surrey, 27th-28th June (2018-03-20 13:49)

We seek to interrogate the shifting norms of sex, gender and sexuality, while questioning how research methodologies can properly attend to these shifts. The conference's focus straddles historical, contemporary and future imaginations, and thus encourages interdisciplinary contributions. The conference will be an inclusive and welcoming event for those interested in sex, gender and sexuality. We welcome submissions from early career academics, students and academic-activists as well as those established in academic careers.

We are delighted to welcome 2 exciting keynote speakers: [1]Dr Kate Lister (Leeds Trinity University) and [2]Prof Katherine Johnson (Brighton University).

We invite proposals relating to any aspect of sex, gender and/or sexuality in the past/present and/or future, topics may include but are not limited to:

- Intersectionalities of sex, gender and sexuality
- Sex in art, history and literature
- Integrating and interrogating sex in psychology and the social sciences
- The politics of voice and silence in sexual stories
- The sexed and gendered past: real and imagined
- The sexual futures of humans and machines
- The (re)production of stereotypes
- Sexual communities beyond LGBT
- Past and future of queer theories
- Work, sex and diversity
- Archiving and preserving sexualities
- New approaches and methodologies
- Sex, gender and sexuality activism

Presentations will take the format of either:
- 15 minute presentation
- 5 minute lightning talks

Please submit abstracts of no more than 250 words [3]here by the 23rd March.
The event will include networking and development opportunities for PGRs and ECRs.

Cost: £60. This includes lunch and refreshments on both days. A very limited number of small travel bursaries and free spaces are available for unwaged/unaffiliated individuals. Please contact us for more information

Any queries, please email [4]futuresex2018@gmail.com

Crowd Sourcing the Advertising of the Accelerated Academy (2018-03-22 11:05)

I’m currently trying to collate a wide selection of examples of university advertising in the UK at the [1]Accelerated Academy Instagram feed. Would you like to take part? Just ping me an e-mail with a photo of advertising for UK universities (mark AT markcarrigan.net) and I’ll post it on the feed with details of your contribution.
Bourdieusian Field Analysis Training: Theoretical Basis and Empirical Applications (2018-03-26 16:10)

7th and 8th June 2018, Aston University, Birmingham, UK.

Bourdieusian field analysis continues to make a key contribution to both the theory and methodology of cultural sociology. The approach not only utilizes a relational sociological analysis of complex cultural patterns of cultural participation, it also enables researchers to develop national and cross-national analyses of power dynamics among different actors and institutions. Bourdieu defines fields as ‘structured spaces of positions’ and ‘the network of objective relations between positions’. Field analysis offers an alternative to ‘variable based’ approaches to social life and helps researchers to illustrate the links between actors’ volume and composition of capital and their interests, strategies and beliefs.

This course offers an introduction to Bourdieusian Field Analysis. Different from ‘hypothesis testing’ and regression modelling, field analysis uses multiple correspondence analysis (MCA), a geometric analysis to inspect and visualize the main cleavages, coalitions and clusters within the sample. This method allows researchers to observe horizontal and hierarchical patterns of oppositions within a field and to analyze topics such as culture and consumption, political and economic power, the academic field or dynamics of internationalization. The first day of the course will give you a general introduction to fields and multiple correspondence analysis, the second is dedicated to the practical application of the method to your own data (or data that will be made available to you) with the statistical software R.

This course is useful for:

- PhD students, post-doctoral researchers and academic staff in the social sciences,
- Those interested in learning about the methods used by Pierre Bourdieu for the analysis of cultural fields and social relations
- Those interested in elite networks, power in the political, economic or academic domain and dynamics of internationalization in these fields
- Market researchers, other commercial researchers, and public sector professionals wishing to learn MCA as a means of clustering complex data sets, and presenting attractive and intuitive visualisations.

Course Schedule

**Day 1: Introduction to Field Analysis and MCA**

The first day of the course will provide you with a theoretical and historical introduction of field analyses, illustrated by a series of examples from cultural sociology, sociology of professions, sociology of elites and the field of power. In the second part of the day, we will focus on multiple correspondence analysis (MCA) as a method, by showing its heuristic principles, its functionalities and requirements (in comparison with other statistical techniques such as
regression modelling) with exercises dedicated to practical application of the method.

**Day 2:** The second day of the course is dedicated to a more practical application of the method. The goal is to show you, on the basis of a simple data-set (or based on your own data), how MCA works and how it can be used practically in the framework of the R package soc.ca. All important steps of an MCA will be demonstrated and the main analytical decisions will be discussed.

**Location:**
Centre for Critical Inquiry into Society and Culture (CCISC), Aston University, Birmingham-UK.

**Teaching faculty:**
Dr. Felix.Bühlmann (University of Lausanne)

For further information please send an email to both emails:

Dr. Ebru Soytemel (CCISC-Sociology and Policy, Aston University- Birmingham)
e.soytemel@aston.ac.uk
John Pollard (Research Administrator, CCISC- Aston University- Birmingham)
j.pollard2@aston.ac.uk

**Course Fees:**
The course will run for two days. Participants can attend only Day 1 or alternatively Day 1 and Day 2.

Lunch and refreshments will be provided on both day.

1 day course
2 day course

Student
£100
£150
Academic
£125
£250

Platform Capitalism Reading Group at the University of Cambridge (2018-04-04 11:28)

In recent discussions of capitalist transformation, the notion of the ‘platform’ has come to play a prominent role.
role in conceptualising our present circumstances and imagining our potential futures. There are many criticisms which can be raised of the platform metaphor, however we believe it provides a useful hook through which to make sense of how social, economic, political, cultural and technological factors are collectively contributing to systemic transformation.

This intensive five week reading group explores platform capitalism, the growing focus on the platform and its implications for sociological and educational research. Each session will be an informal discussion of two papers, chapters, essays or talks:

- **May 9th, 4pm to 6pm** [3] *Engineering the Public: Big Data, Surveillance and Computational Politics* by Zeynep Tufekci [4] *The Anxieties of Big Data* by Kate Crawford
- **May 16th, 4pm to 6pm** [5] *Social Media Platforms and Education* by José Van Dijck and Thomas Poell [6] *Evaluative infrastructures: Accounting for Platform Organization* by Martin Kornberger, Dane Pflueger and Jan Mouritsens
- **May 23rd, 4pm to 6pm** [7] *Two Narratives of Platform Capitalism* by Frank Pasquale [8] *The Radicalization of Utopian Dreams* by danah boyd
- **May 30th, 4pm to 6pm** [9] *The Politics of Platforms* by Tarleton Gillespie [10] *Democracy is dead: long live democracy!* by Helen Margetts

The meetings will take place from 4pm to 6pm in DMB 2S5 in [11] The Donald McIntyre Building in the Faculty of Education at the University of Cambridge. This is a fifteen minutes walk from Cambridge train station and we welcome all attendees. We would appreciate if you could e-mail your intention to attend to mac228@cam.ac.uk so we can update you with further details.

about in WW Chinese or Vietnamese Prisoner camps - but in this case using the digital platform to disrupt services while in real life complement those with coercion & crime-terror junks. A very basic delegitimizing already. Second, is their rank criminal status as a state that is privatized by its various crime-terror groups that actually double up as it's political parties but without exception. With the digital platform already so severely compromised, one doubts their existence as purely service platforms or capacity to do so. While India is a medieval third world state that barely is away from the medieval peasantry in self-awareness or capacities - this fear only magnifies itself. Given its much touted self-status riding hard military power linked to its purchases of military hardware - it is a dangerous situation.

9.5 May

Undisciplining: Conversations from the Edges (2018-05-30 11:16)

The Sociological Review are organising a conference unlike any other next month in Gateshead, UK. There will be sociological walks, a film festival, art work, participatory workshops, a diverse array of plenary sessions and much more. It will be preceded by an ECR day organised by the journal’s early career editorial board. Thanks to the support of the foundation, the conference only costs £100 (standard) and £50 (concessionary).

Only a week left to get your tickets: [5]register here and don’t miss out!

1. https://undisciplining.org/sociological-walks/
Critique and Agency in the Accelerated Academy, June 8th @CPGJC

June 8th, 12pm to 2pm, [1]DMB 2S4
Faculty of Education, Hills Road, Cambridge

In the fifth event in the [2]Accelerated Academy series, the Cultural Politics and Global Justice cluster at the University of Cambridge’s Faculty of Education hosts an afternoon seminar on critique and agency in the accelerated academy. How is temporality changing within the academy? What does this mean for our capacity to individually and collectively shape our working lives? Is there still space for critique within an academy where time pressure has become the norm?

- **Time present and academic futures** - [3]Jana Bacevic (Faculty of Education, University of Cambridge)

Each speaker will talk for around 20 minutes, with time for questions. We will then open out for a broader discussion of the themes raised during the talks. For information about the Accelerated Academy project, see the [6]website or [7]special section of the LSE Impact Blog.
