Second, digital methods will be used in order to analyse the topic on the data level. For instance the researcher will perform a hyperlink network analysis which can help to determine who are the powerful actors in networks and the role they play in the formation of cultural capital (Beer, 2011: 4.14). They will also conduct a sentiment analysis of different kinds of online posts which can be mapped in order to determine positive, neutral or negative sentiment. Such analysis can help to ascertain broad sentiment towards, and connection between, particular topics.

However, it is imagined that the student will contribute to the final and more detailed research methodology for the project and take a decisive part in further developing the proposal.

Please contact Dr Natalia Gerodetti for further details: [mailto:n.gerodetti@leedsbeckett.ac.uk] 1.

Shocking news was revealed about Hello Kitty on her 40th birthday in summer 2014: ‘Hello kitty is not a cat – she’s a British girl’ named Kitty White and lives with her sister and parents in suburban London. But this has hardly affected the global popularity of this character created by the Japanese company Sanrio in the 1970s. Her fandom has a large following around the world. She can be seen in Tokyo, New York, or Rio de Janeiro. 25,000 fans flocked to her convention in Los Angeles last year. The world’s first Hello Kitty theme park opened in China.

Illuminating on the intersection of popular culture and international relations (IR), the Hello Kitty and International Relations workshop aims to explore deeper, more nuanced understandings of IR through an interdisciplinary dialogue on the Hello Kitty phenomenon. International relations is not defined here as a narrow subfield in politics, but an interconnecting constellation with cultural, social, economic, and linguistic implications. It is the production of ‘relations international’ (Christine Sylvester) that incorporates questions of gender, relations among ethnic/racial groups and bridges between local and regional communities.

In the spirit of the aesthetic turn in IR (Roland Bleiker), this workshop recognises Hello Kitty's potential to invite us to challenge granted dogmas in everyday life, interrogate in new ways global issues that affect our life-worlds, and reinvigorate silenced or marginalised debates. Above all, despite her commodification, she is an artistic expression that reifies and epitomises hope in and for the everyday. As the Japanese-American conductor Kent Nagano claims, the main purpose of art is to plant the seed of hope, through impassioning our innermost feelings.

This ubiquity of Hello Kitty is a result of her ‘emptiness’, or what Roland Barthes calls ‘the empty sign’ that embodies ‘an empty point-of-affluence of all its occupations and its pleasure’. Christine Yano’s recent monograph on Hello Kitty concurs: Hello Kitty ‘inhabits the “thingness” of the “thing” in the physical properties of cuteness she brings to meaning making’. Hello Kitty is then a ‘liminal space’ to posit academic conjectures on the everyday and the international.

This workshop welcomes contributions from a variety of approaches that discover Hello Kitty’s relevance in the contemporary world, especially in consideration to the three following sub-themes:

- Resurgence of the global (political) subjects
- Performing IR in everyday life
- Speaking in silence: reconstructing marginalised voices in IR

**Registration:** Please contact Misato Matsuoka (m.matsuoka@warwick.ac.uk) by **5th June**; limited spaces are available.

______________

**Online Misogyny and Sexual Harassment Event (2015-05-27 08:56)**

**Online Misogyny and Sexual Harassment**

**Gender & Sexualities Research Forum (GSRF) at City University London**

Wednesday 17 June 5-7pm

Rooms A107 and A108, [1] College Building

St John Street
London
EC1V 4PB

Online spaces such as blogs, forums and Twitter are invaluable resources for feminist communities. However, due to its nature, the Internet also expands the space available for misogynistic discourses to spread and be heard and - as the cases of Caroline Criado-Perez and Mary Beard demonstrate - provides an outlet for ‘trolls’ to enact vitriolic attacks on women who publicly voice their opinions. Whilst encouraging progress has been made in increasing public and corporate awareness, we still have much to learn about this problem and about how we can start to tackle it. This seminar will discuss new research into the online harassment of women and explore how academic work can start to answer some of these questions. Topics up for discussion include: what methods can we use to track harassment on large social media platforms? What is the role of the law in addressing cyber-hate against women? What would a more ethical Internet look like and how might this be achieved?

**Speakers:**
Marianne Franklin (Goldsmiths, University of London): Title TBC

Marianne Franklin is Professor of Global Media and Politics at Goldsmiths, University of London, where she is a member of the Centre for Feminist Research. Active in research and advocacy on human rights issues and the internet, she has served as co-Chair of the Internet Rights and Principles Coalition at the UN Internet Governance Forum and is currently chair of the Global Internet Governance Academic Network ([2]GigaNet). Her latest book is Digital Dilemmas; Power, Resistance and the Internet (Oxford University Press, 2013).

Olga Jurasz (Open University): “Online Misogyny and Social Media: A Challenge for (Legal) Regulation”

Olga Jurasz is a lecturer in law at the Open University Law School. Her main research interests are public international law, human rights and legal regulation of gender-based violence. She has been recently working on a collaborative project addressing gender, cyberviolence and law.

Carl Miller (Centre for the Analysis of Social Media, Demos): “Researching Misogyny on Twitter”

Carl Miller is the Research Director of the Centre for the Analysis of Social Media at Demos. It is the first British think tank unit dedicated to researching and understanding the digital world. He develops new ways of understanding social media as a new part of social and political life. He wrote a weekly column on digital politics for The Sunday Times and is a social media commentator for Sky. He is a Visiting Research Fellow at King’s College, London.

Chair: Laura Thompson

** Talks and discussion followed by refreshments at 7pm **

Youth, Multiculturalism and Community Cohesion by Paul Thomas (Palgrave Macmillan, 2011) (Palgrave Politics of Identity & Citizenship Series)
Thomas’ book is an engaging and well-written account of the dilemmas of contemporary society in dealing with youth identity and multiculturalism, particularly since 2001 when new ways of approaching multicultural youth work came to the forefront because of government concerns about the failure of multiculturalism. Riots in 2001 in Oldham, Burnley and Bradford, and the events of 9/11 and 7/7 led to the introduction of new models of dealing with the youth of ethnically diverse towns and cities based upon ideas about community cohesion. The principal strategy discussed in this book is employment of community cohesion policies and practices: Thomas highlights what these policies on community cohesion, that have been increasingly been recommended by government, mean on the ground for those working with young people in diverse ethnic communities like Oldham and Rochdale, and he attempts to take a positive approach to the current debates on the implications of community cohesion policies.

“All public bodies in Britain now have a duty to promote community cohesion...” (p1).

What is community cohesion? Community cohesion refers to an emphasis on commonalities rather than differences. Thomas’ perspective on community cohesion is that it is a “re-balancing of multiculturalism towards a more overt and proactive commitment to liberal citizenship for all citizens, of whatever ethnic background” (p189). Rather than simply dismissing community cohesion as an assimilationist project or as the death of multiculturalism, Thomas uses empirical evidence to argue that these aforementioned ways of understanding community cohesion are inadequate for in his view “community cohesion represents a helpful and necessary reorientation of multiculturalism’s priorities and approaches in order to positively engage with modern complexity, and that it is certainly not a retreat to assimilationism” (p4).
The empirical data is drawn from “the most marginalised” (p6) young people and their youth workers in Greater Manchester - Oldham and Rochdale - where the communities experience high levels of economic and social deprivation. Thomas highlights how “issues of ethnicity and youth are highly relevant to wider discussions of poverty, inequality and life chances in areas like Oldham and Rochdale” (p6), and there is a chapter discussing gender dynamics as well as the territorialisation elements to belonging to the locale, but in general the book does not sufficiently cover the significance of structural inequalities in the lives of young people inhabiting multicultural urban spaces in Britain. I would have liked to have learned more about material disadvantages faced by these ethnically diverse youth that might contribute to tensions and troubles in their everyday lives in multicultural communities.

The main arguments employed by Thomas are that community cohesion policies (though critiqued by some academics) are utilised successfully by youth workers in their work with young people – where safe spaces are created to encourage direct contact between otherwise segregated youth:

“...cohesion in practice is working with and respecting existing ethnic and other identities, augmenting them, rather than replacing in an assimilationist sense, with an overarching focus on common identities and experiences” (p10).

The strengths of this book are that Thomas rightly emphasises the significance of exploring the lives of young people in marginalised and deprived areas of the UK, for as he points out these youth are central to the future of multi-ethnic Britain. Moreover, he argues that there is a lack of empirical evidence in academic writings on community cohesion, and thus he has significantly addressed this current failing by including the ideas and identities of young people and their lived experiences of the impact of community cohesion policies on their local areas. Thomas has aimed to relay to the reader the practice of community cohesion policies – how local and national government officials have implemented notions regarding cohesion in diverse communities like Oldham and Rochdale.

The empirical research in the book gives the reader a sense of optimism about how governmental policies can be engaged with in meaningful ways on the ground (even if, like me, you might be sceptical about the government’s focus on cohesion rather than inequality and austerity). One of the most impactful chapters focuses importantly on Muslim youth and their relationship to national identity and belonging to Britain, challenging the negative scaremongering that is prevalent in mainstream media. We learn that, contrary to media and political rhetoric, young Muslims are able to express a strong faith identity alongside their British identity. In a different chapter, we are also guided through a critique of the much maligned Preventing Violent Extremism (PVE) policies and programmes, and shown how examples of local organisations using PVE resources resiliently to do good work with young people. Another well-written and significant chapter discusses white working-class youth identity and the importance of bringing social class to the debates on belonging, identity and multiculturalism, whilst remaining sensitive to the anti-racist project.

At the time of publication, perhaps there was not more known about the failure of Prevent, as though it has been mentioned, I would have liked to have seen more critique about how Prevent was implemented in local communities by key local players. One very off-putting point that arises again and again in the book is reference to Trevor Phillips who is quoted regarding his skewed views on multiculturalism. Yet Trevor Phillips is not well respected by many academics writing about multicultural belonging to Britain, and thus citing his views takes away something from this otherwise admirable book. This book’s focus is northwest England, particularly Oldham and Rochdale, but it would be interesting to learn more about community cohesion polices in practice in other parts of Britain.

The Offending Article on www.bustle.com:

Kendall Jenner is known for showing off her toned model bod and long legs, but she kept the paparazzi on their toes with her latest bold style trend. According to Refinery29, Kendall Jenner wore a dress over pants (OK, fine, it was technically a tunic, but still) while wandering the streets of LA, adding yet another trend to her resumé of style pioneering. The all-white wonder was a nice change from her normal crop top and mini-skirt ensembles, but she still managed to look as effortlessly chic as always.

The outraged POC Responses on Facebook:

Are you a dandelion or a mammal? (2015-05-27 21:13)

This is a question [1]Cory Doctorow introduces in his book Information Doesn’t Want To Be Free:

When my daughter was born, I became keenly aware of how much stock we mammals put into the copies we make of ourselves (yes, a child isn’t a "copy" exactly, but go with it for a moment). Mammalian reproduction is a major event, especially for us primates, and we want to be sure that every "copy" we make grows up healthy, strong and successful.

But here are other life forms for whom copying is a lot more casual. Dandelions produce two thousand seeds every spring, and when a good, stiff breeze comes around, those seeds are blown into the air, going every which way. The dandelion’s strategy is to maximise the number of blind chances
it has for continuing its genetic line - not to carefully plot every germination. It works: every summer, every crack in every side walk has a dandelion growing out of it.

Next question: are you a [2]hedgehog or a fox?

Social Media and Ambient Intimacy (2015-05-27 21:41)

There’s an extremely important idea expressed in this video if you can get past the irritating presenter:

IFRAME: [1]https://www.youtube.com/embed/IgsHuaS8G84

I’ve written more about this idea [2]here. It needs to be treated carefully but this formulation shouldn’t be dismissed.

1. https://www.youtube.com/embed/IgsHuaS8G84
Last month I made the mistake of putting my mobile phone in the washing machine. Despite being quickly retrieved, the phone died. I left it to dry out for a few days, but nothing. There was an encouraging flashing light, but this was a false dawn. Breaking your phone is probably a fairly common experience and shouldn’t be too much of a problem, but what I was surprised about was the feeling that it created. There was something disconcerting about not having my phone with me. This moment of stupidity was a moment of rupture for my normal routines. It provided me with some insight into just how much we rely on our mobile devices. This reliance is not just based on the fact that these phones allow us to keep in touch, to stay networked and to participate in the incessant din of social media. The response I had was not just about the missing functions of the phone and my sudden inability to stay networked. Rather this was about the comforting presence that these objects have in our lives.

We might go as far as to say that we develop something of an emotional attachment with our smart phones, particularly as they become embedded in our bodily routines. They provide a comforting weight in our hands, pockets and bags. We slide them out, check them, hold them, place them back. When we think about the impact of phones, we usually just think about what it is that they can do. But they also have a material presence in our lives. Our relationship with them is tactile and physical. They are not just devices or portals onto an informational world, they are also objects.

Sherry Turkle has used the phrase ‘evocative objects’ to think about the types of connections that we have with the things that we surround ourselves with. Turkle’s point is that what seem like quite mundane objects can have profound personal meanings for us – triggering memories and emotional responses. For Turkle, we should think of these types of evocative objects ‘as companions to our emotional lives or as provocations of thought’. We connect to these objects and use them to negotiate and stimulate emotional responses or to trigger thoughts and
feelings. We share experiences, moments and sentiments with these objects – which, in Turkle’s edited volume, can range from a camera, to a suitcase, to a rolling pin, to a yellow raincoat. This is what the anthropologist Daniel Miller has called the ‘[4]comfort of things’. His study of a street of 30 households revealed a deep connection that the residents had to the stuff that filled their homes, these objects were seen to have a comforting presence in their lives. We probably all have objects around with which we have a strong emotional attachment, and which are both evocative and comforting. I’m sitting writing this next to a miner’s lamp which I keep on my desk, it means nothing to anyone except me. Yet, for me, it brings both strong memories and a sense of familiarity and reassurance.

In the 1930s, [5]Walter Benjamin wrote some brief reflections on what it was like to be reunited with his book collection – it had been in transit when he had been forced to move across Europe. Benjamin uses that experience of prizing open the packing cases to reflect on the attachment that he had with his books. His essay explores the importance of the materiality of the book collection. Benjamin’s book collector sees through the objects into their past. Part of our attachment with these objects, Benjamin’s piece suggests, comes from the shared biographies of the book and its owner – the yellowed paper, the coffee stains, the dog eared pages, the dusty cover. He suggests that what is written in the book is not necessarily the only thing that is of importance to the collector, rather it is the presence of that book in the glass case or on the shelf that matters – the cloth, cardboard, paper and binding that can be held in the hand or put on display. Benjamin’s attachment to his books is material. It is not about the function of the media, but their presence in the collector’s life.

As [6]we live with them, we develop a kind of personal attachment with our phones. This is so familiar to us now that we might only notice it in moments of rupture – when a phone is lost. We might even go as far as to say that they are ‘evocative objects’ with which we have a visceral bodily connection. Although we move onto the next phone when the time comes for an upgrade, transferring this temporary attachment to the next phone – perhaps experiencing a brief moment of uncertainty and discomfort in these moments of change and before our new object becomes familiar. We are attached to what it is that these devices can do, facilitating our [7]creeping connectivity, but they are also objects that are [8]comforting and reassuring.

I’ve argued [9]elsewhere that smart devices have a kind of comforting effect that can be linked to the broader neoliberal political agenda, making us work smarter and not harder. Again though, that piece was concerned with what these devices are seen to be capable of. The notion of smartness there was a concept that performed a particular role, both comforting us and provoking action. My experience with my broken phone suggests that they are not only reassuring us in this way, but that they are also comforting in their material presence as objects in our lives and in our hands. It is perhaps hard to separate these mobile media devices themselves from their functionality, but it does help us to notice how attached we have become to their presence. Smartphones, it seems, are comforting both in the functional role that they perform and as potentially evocative objects that are, as Turkle put it, companions to our emotional lives.

David Beer is Senior Lecturer in Sociology at the University of York. His most recent book is Punk Sociology.

Challenging ‘Lad Culture’ in Higher Education and Through Education

Thursday, 4th June, 12.30-4.30, in the Social Sciences Building, level 12, room 12.25

We warmly invite you to this half-day event hosted by Sharon Elley, FLaG and Sally Hines, CIGS in the School of Sociology and Social Policy. The event brings together leading academics, researchers and practitioners working to challenge laddism, violence, gender and class inequalities in higher education and via education. Attendance is free and refreshments will be provided. Places are limited so please register your attendance ASAP by email to: [1]s.t.elley@leeds.ac.uk.

The Issues:

12.30-12.50: Register
12.50-1.00: Welcome: Dr Sharon Elley
1.00-1.30: ‘Lad cultures’ and sexual violence in UK higher education - where do we go from here? Dr Alison Phipps, University of Sussex
1.30-2.00: ‘Is 'lad culture' a problem in HE? Exploring the perspectives of staff working in UK HEIs', Dr Vanita Sundaram, University of York
2.00-2.30: Q & A
2.30-3.00: Refreshments

Tackling issues:

3.00-3.30: ‘Escaping the ‘Man-box’ – Coaching Healthy and Respectful Masculinity in Schools: An Approach to Prevention’ Michael Conroy, A Call to Men, UK
3.30-4.00: ‘White, Male and Privileged’: Experiences of Lad Culture in the US Context, Jon Mermelstein, Exchange Student, University of Leeds
4.00-4.25: Q & A
4.25-4.30: Closing: Dr Sharon Elley

1. mailto:s.t.elley@leeds.ac.uk
The Research Companion (2015-05-28 08:12)

by Petra Boynton

10 years ago I published a book called 'The Research Companion'. It was based on talks and teaching I'd been doing with social scientists and healthcare staff that were supposed to be about the 'how to's' of research (questionnaires, focus groups, ethics approval, publishing etc), but inevitably turned into the practical bits of research you don't necessarily get taught in standard methods courses. Things like how to stay safe when doing research, managing bullying at work, publishing and presenting for the shy, how to read a paper, addressing inequalities in academia, or getting people to actually take part in your research.

Within the book was a link to a forum, which was excitingly cutting edge at the time. Like most people, the times when I'd struggled with research, writing, analysis and so on wasn't necessarily when I was at work, but was in the early hours of the morning or over the weekend when I had nobody about to ask for help. A forum provided a round the clock place for people anywhere in the world to ask for help about their research, or share their experience, or link to tools and resources they were finding helpful.

As with so many things social media moved on, the book grew out of date and the forum closed. But the need for research help didn’t go away and increasingly as I began working with people in development, activism and those outside academia I wanted to create somewhere that people could use to talk about research as and when they wanted to that could, perhaps, avoid some of the hierarchies built in to standard university teaching or continued professional development.

Facebook seemed an obvious place to try, with the opportunity of having a closed group where researchers from any country, at any level, working anywhere across the social/health sciences or development could link up. I post resources, job adverts, calls for conferences and fun stuff on a daily basis while other group members ask for advice or share their learning as necessary.

The group is diverse and I hope will stay that way. It’s got people within it from all over the world and I’m especially keen to welcome those who ordinarily aren’t having dedicated academic support where they are based. Group members include students, professors, journalists, retired research enthusiasts, activists, and community workers. Not everyone has, or is working towards, a higher degree. Not everyone is employed or working in/for a university. Many
members are carers, parents or have other jobs alongside their research work. We connect via phone or computer with some in the field (including field hospitals) and some, like me, at the kitchen table fitting in posts around the housework and sorting the kids’ packed lunches.

As I’m revising the Research Companion book for a second edition I sometimes ask within the group for people’s thoughts about something I’m working on. Alongside the Facebook group is a blog where I share wider, open resources on research methods and things that will be referred to in the updated text but won’t be explored in depth there. I also archive what’s been shared in the Facebook group on a monthly basis and put that on the blog so anyone who’s not on Facebook (including in countries where access is limited) can still find and use resources that might help in their work.

All of this is still a work in progress and is very much being led by the communities of diverse people who either call themselves researchers or call what they are doing research. I’m interested to see what works best, with the overall aim of making research methods interesting, accessible, effective and ethical. Noting that research can be exciting and enjoyable, a total nightmare, or just a job to get on with.

There’s more information about the Facebook group and what people can get from it here

A conversation with Lisa Mckenzie about sociology, activism and sociological activism (2015-05-29 12:24)

I recorded this interview with [1]Lisa Mckenzie last month, a few weeks before the general election in which she was standing as a challenger to Iain Duncan Smith in Chingford. We cover a lot of ground in the discussion but underlying it all is a clear commitment to the public role of sociology. Rather than sociology and activism being in tension, Lisa makes a convincing case that one can inevitably lead to the other.

Remembering Operation Spanner: Culture, Law, History and Crime

10th & 11th September 2015

Two interdisciplinary workshops at the University of Essex & Royal Holloway, University of London
Keynote Speakers:

Professor Ken Plummer (University of Essex)

Professor Carl Stychin (City University)

February 2017 will mark the 20th anniversary of the 1997 European Court of Human Rights’ judgment in the case of Colin Laskey, Roland Jaggard and Tony Brown v United Kingdom, ending the legal appeals for the defendants in R v Brown [1994]. A group of men were convicted of assault occasioning actual bodily harm for engaging in ‘extreme’ sadomasochistic sex acts. None of the ‘victims’ of the ‘assaults’ were themselves the complainants, and in fact gave evidence of their consent to the acts. Moreover, the activities were undertaken in private without causing any lasting injury. An undercover Manchester Metropolitan police investigation of 1987 called Operation Spanner uncovered video evidence of the incident and the CPS made the decision to prosecute the assailants. While legal scholars have interrogated the judgment by focussing on the deployment of consent, recklessness and the legality of sexual pleasure, a major interdisciplinary project that examines the wider and longstanding impacts of Spanner and the judgments has not yet been undertaken. The ruling was affected by and had wide-ranging impacts on culture more broadly, and its shockwaves continue to be felt today. Two single-day seminars at Essex and Royal Holloway will be held on the 10th and 11th September 2015 respectively. The convenors intend that these intensive one-day workshops will facilitate discussion to determine the direction of a series of fundable research projects and outputs, and bring together an interdisciplinary cohort working on these topics in order to lead to published and other material outcomes. We solicit papers and proposals for 20 minute papers which examine Spanner and its legacies from the time of the arrests to the present day in broader social, cultural and historical contexts, including but not limited to: · criminological and criminal justice contexts · performance art · body modification, both professional and private · Socio-legal and cultural regulation of bodies · the “Video Nasties” panic of the mid-80s, cultural rhetoric of danger and contagion · sexual subcultures, sexual rights and activism in the late 1980s and early 1990s · pornography, particularly that classed “extreme” by recent laws · political discourses on homosexuality, and sexual behaviour more generally · Biomedical issues including HIV transmission, public health We welcome proposals from the humanities and social sciences, including but not limited to sociology, law, history, criminology, art history, cultural studies, media studies, film studies, anthropology and geography. Please send abstracts of 300 words (max) to [1]mlodder@essex.ac.uk and [2]alex.dymock@rhul.ac.uk by Friday 17th July 2015. Funding for travel and speaker accommodation is available. Speakers are very welcome to attend both workshops.

For those who think Islamophobia is not an issue... (2015-05-29 20:03)

Please read [1]this report by the anti-racism educational organisation Show Racism the Red Card.
“To what extent do young people share potentially damaging attitudes with far right groups and where do these ideas come from? What are the opportunities and risks that this presents?”

[2]Dr Paul Jackson from the University of Northampton, who worked on the research project with SRTRC, said: “There is clearly a gap between the reality and perception on issues like the number of immigrants or the size of the UK’s Muslim community among some young people. The subsequent levels of hostility towards these groups is very worrying and is something that we, as a society, need to take seriously.”

How else to know people? (2015-05-30 07:59)

This is an extract from [1]The Happiness Industry by [2]William Davies. If you find it interesting then you’ll like [3]this podcast.

Psychology and social science are perfectly possible, under the sorts of conditions described by Wittgenstein, indeed they are much more straightforward. Systematic efforts to understand other people, through their behaviour and speech, are entirely worthwhile. But they are not so different from the forms of understanding that we all make of one another in everyday life. As the social psychologist Rom Harre argues, we all face the occasional problem of not being sure what other people mean or intend, but have ways of overcoming this. "The only possible solution", he argues, "is to use our understanding of ourselves as the basis for the understanding of others, and our understanding of others of our species to further our understanding of ourselves".[i]

One implication of this, when it comes to acquiring psychological knowledge, is that we have to take what people say far more seriously. Not only that, but we have to assume that for the most part, they meant what they said, unless we can identify some reason why they didn’t. Where behaviorism always attempts to get around people’s ‘reports’ of what they’re feeling, an interpretative social psychology insists that feeling and speaking cannot be ultimately disentangled from each other. Part of what it means to understand the feelings of another is to hear and understand what they mean, when they use the word ‘feeling’.

Techniques such as surveys may have a valuable role to play, in fostering mutual understanding across large and diverse societies. But again, there is too much misunderstanding as to what is going on when a survey takes place. Surveys can never be instruments which represent some set of quasi-natural, objective facts; rather they are useful and interesting ways of engaging with people, probing them for answers. As the critical psychologist John Cromby has argued with respect to happiness surveys:
Happiness does not exert a determinate force that always makes all human participants tick the boxes on a... scale in a particular way. There is not the law-like relation between happiness and questionnaire response that exists between, say, the volume of a quantity of mercury and its temperature.[ii]

This doesn't mean that a happiness survey doesn't communicate anything. But what it conveys cannot be disentangled from the social interaction between the surveyor and the surveyed. The ideal of discovering something more objective than this, through stripping out the self-awareness of the respondent (for instance, analysing twitter sentiment instead) is a chimera. It also involves forms of trickery and manipulation, which open up a breach between the researcher and everybody else.

Another way of understanding this argument is that psychology, clearly understood, is a door through which we pass on the way to political dialogue. This is in contrast to the Benthamite and behaviorist traditions explored in this book, which view psychology as a step towards physiology and/or economics, precisely so as to shut the door on politics. Unless something goes wrong, the core questions of psychology are relatively simple. 'What is that person doing?'. 'What is that person feeling right now?'. For the most part, the answers to these questions are relatively unproblematic, and the first and most important 'methodology' for answering them is one that we all use every day: just ask them.

That this methodology is not taken more seriously by managerial elites is scarcely surprising. It requires processes of deliberation. It credits people with their own legitimate interpretations and critiques of their own circumstances. It also requires skills to listen, which become submerged in societies that have privileged the power to observe and visualise. Management and government are more secure with the notion of brains 'lighting up' or thinking being 'no less observable than baseball', than they are with the prospect of people intentionally expressing their emotions and judgements. For various reasons, making our minds visible seems safer than making them audible. Entire organisational structures would need to change, if the behaviorist vision of an automated, silent mind were abandoned, in favour of an intelligent, speaking one.

In a society organised around objective psychological measurement, the power to listen is a potentially iconoclastic one. There is something radical about privileging the sensory power of the ear, in a political system designed around that of the eye. The clinical psychologist, Richard Bentall, argues that even quite severe forms of 'mental illness', which are routinely treated with drugs in the West today, can be alleviated through a patient, careful form of engagement with the sufferer and their life history. He suggests that:

If psychiatric services are to become more genuinely therapeutic, and if they are to help people rather than merely 'manage' their difficulties, it will be necessary to rediscover the art of relating to patients with warmth, kindness and empathy.[iii]

Listening and talking will not 'cure' them, because they are not 'treatments' in the first place. But behind the symptoms of psychosis and schizophrenia there are stories and emotional injuries, which only a good listener will discover.

The rediscovery of listening is a priority that permeates other fields of social science. The sociologist, Les Back, argues that "listening to the world is not an automatic faculty but a skill that needs to be trained", noting that it is this which gets lost in a society of 'abstracted and intrusive empiricism' of endless data, exposes, facts and figures.[iv] To know others is to engage with their stories and how they tell them. In the past, critiques of 'ideology' have proposed that most people labour under a 'false consciousness', not knowing what their real interests are. There is a certain irony, in the age of 'nudges' and clandestine facebook experiments, that it may now be more radical to highlight precisely the ways in which ordinary people do know what they're doing, can make sense of their lives,
are clear about their interests. For this, researchers need to learn some humility.

Amongst all of this, one of the most important human capacities which is rediscovered by the sociological psychologist is that to offer a critical judgement. To describe a critique or a complaint as a form of ‘unhappiness’ or ‘displeasure’ is to bluntly misunderstand what those terms mean, or what it means to experience and exercise them. ‘Critique’ will not show up in the brain, which is not to say that nothing happens at a neurological level when we exercise critical judgement. The attempt to drag all forms of negativity under a single neural or mental definition of unhappiness (often classed as ‘depression’) is perhaps the most pernicious of the political consequences of Benthamism generally.

If we understand concepts such as ‘critique’ and ‘complaint’ properly, we will recognise that they involve a particular form of negative orientation towards the world, that both the critic herself and her audience are aware of. As Harre puts it, "to complain verbally is a part of being discontented, because part of what is ascribed to a person who is described as 'discontented' is a tendency to complain".[v] Notions such as ‘critique’ and ‘complaint’ mean nothing, without also appreciating that people have the unique power to interpret and narrate their own lives. Where the 'sentiment analyst', mining reams of twitter data, is looking for evidence of psychological emotion which people have emitted by accident, to listen to someone explain the rights and wrongs of their own lives is to grant them the human dignity of both understanding and articulation.

Recognising that people get angry, critical, resistant and frustrated is to understand that they have reasons to feel or act in these ways. People express themselves in different ways, and with different levels of confidence, but there are good reasons to accept the narratives that people offer about their own lives. If someone is invited to express their feeling (rather than instructed to correctly name or quantify it), they make it into a social phenomenon. Once people are critical or angry, they can also be critical or angry about something, which is external to themselves. Whether or not they are considered an articulate or expert person is scarcely relevant. This is already a less lonely, less depressive, less narcissistic state of affairs, than one in which people wonder how their mind or brain is behaving, and what they should do to improve it.

[v] Harré & Secord (1972) p. 107

2. http://www.gold.ac.uk/politics/staff/davies/

Thanks for this. I found it useful, but a bit patronising towards the end.
Atmospheres play a significant role in, and add an important quality to, our intimate, domestic and public lives, yet are often overlooked in social research, not least because of the methodological challenges involved in ‘capturing’ them.

In this major conference celebrating the 10th anniversary of the Morgan Centre, we will be using the theme of ‘atmospheres’ as our starting point for interdisciplinary dialogue.

Keynote Speakers
• Simon Armitage
• Jennifer Mason
• Sheila Rowbotham

For details of the full programme, please visit [1]http://www.socialsciences.manchester.ac.uk/morgancentre/events/atmospheres/programme/ Early Bird Registration closes 31 May 2015 £160 - Full conference attendance (2 days) £80 - Full conference attendance (2 days), concession* £120 - One day attendance £60 - One day attendance, concession* * The concessionary rate is available to full-time students and unwaged (retired, unemployed)
For more details, and to register please visit [2]http://www.socialsciences.manchester.ac.uk/morgancentre/events/atmospheres/registration/

E-mail apnoea (2015-05-30 20:03)

Even though the postural mechanism invoked here makes sense, it’s hard not to wonder about the psychosocial costs of our communications systems when [1]reading about things like this:

While we have a greater tendency toward email apnea or screen apnea, while doing email and texting on laptops and smartphones, we are at risk for breath holding or shallow breathing in front of any screen, any time. Not only does this increase stress levels, it impacts our attitude, our sense of emotional well-being, and our ability to work effectively.

In 2007, I noticed this in myself, and then placed heart rate variability ear clips (HRV is often used to measure stress) on visiting friends while I observed them doing email and texting. I observed and interviewed people in cafes, offices, and on the street. At the same time, I contacted and interviewed physicians, psychologists, cardiologists, neuroscientists, and others, to learn about the implications of breath holding and shallow breathing, especially when it’s chronic and cumulative – day after day, hour after hour.

Recently, researchers, Gloria Mark, Stephen Voida, and Anthony Cardello, have made headway into [2]formally validating the impact of email, using HRV.

Why are we doing this? Our posture is often compromised, especially when we use laptops and smartphones. Arms forward, shoulders forward, we sit in a position where it’s impossible to get a healthy and full inhale and exhale. Further, anticipation is generally accompanied by an inhale – and email, texting, and viewing television shows generally includes a significant dose of anticipation. Meanwhile, the full exhale rarely follows. The stress-related physiology of email apnea or screen apnea is described in some detail in my 2008 post, linked to above.

This [1]superb post by Tressie McMillan Cottom considers the algorithmic shaping of life chances under digital capitalism:

Whether or not I know these ads are scams is entirely up to my individual cultural capital. Basically, do I know better? And if I do know better, how do I come to know it?

I happen to know better because I have an advanced education, peers with advanced educations and I read broadly. All of those are also a function of wealth and status. I won’t draw out the causal diagram I’ve got brewing in my mind but basically it would say something like, “you need wealth and status to get advantageous services offered you on the social media that overlays our social world and you need proximity wealth and status to know when those services are advantageous or not”.

It is in interesting twist on how credit scoring shapes life chances. And it runs right through social media and how a “personalized” platform can never be democratizing when the platform operates in a society defined by inequalities.

Introducing Feminist Dissent: a new journal from Warwick University (2015-05-31 07:44)

Feminist Dissent is a new academic journal. It brings together activists, academics and writers to interrogate the multiple connections between religious fundamentalism and gender. It will open up new ways of thinking about secularism, religious freedom, civil liberties and human rights, nationalism and identity politics, anti-racism and multiculturalism, neo-liberalism, feminist theory and feminist resistance.

At this event, members of the editorial collective will present the thinking behind the new journal.

- Why feminist dissent? (Rashmi Varma)

- Why universal human rights? (Alison Assiter)

- Why fundamentalism? (Gita Sahgal)

Presentations will be followed by questions, comments and discussion.

DETAILS:
Date: Monday 15th June 2015

Time: 12.30pm - 3pm (lunch and refreshments will be provided)

Venue: IALS seminar room (F204), Milburn House, University of Warwick

Rashmi Varma teaches in the Department of English and Comparative Literary Studies at the University of Warwick.

Alison Assiter is Professor of Feminist Theory at UWE, Bristol, the author of a number of books and articles and also feminist and anti fundamentalist activist.

Gita Sahgal is a founder of the Centre for Secular Space, which opposes fundamentalism, amplifies secular voices and promotes universality in human rights.

Places for the event are limited, so please do use the eventbrite page to register.

The unfolding events of TeachHigher (2015-05-31 07:50)

For the last few months I’ve been regularly coming into my department to work on Sundays. It’s quite a conducive environment for working on my soon to be completed book, as well as for catching up on ad hoc tasks. My desktop at home has been broken for a while and I sometimes find it helpful to switch from my laptop to my office PC. This is all in contrast to my continued inability to ever get any serious work done on the campus during the week. It’s usually devoid of people on a Sunday and yet it’s nonetheless often very noisy. I’m writing this post as the noise of the endless building work reverberates around my office in a way that leaves me relying on the radio in the background to block it out. On those rare occasions when the creative destruction of the [1]accelerated academy has temporarily ceased, I’m always surprised by quite how much traffic there is in the background on this leafy campus on the outskirts of a medium sized city. During the week there’s noise everywhere. It’s a state of affairs I’ve got used to and I only notice it on a Sunday because its relative absence carries within it the unrealised promise of potential tranquillity.

I’m struck by the thought that this noise could be understood as an important marker of institutional acceleration. The ‘slow academy’ which we inevitably imagine when we consider the ‘accelerated academy’ is inevitably richly symbolic, mediated through nostalgic narratives of what we have lost and a pained awareness of what we cannot or will not adapt to about present circumstances. With that caveat out of the way, I think it’s interesting to consider how I imagine the ‘slow academy’ as very quiet. I’m sure I’m not alone in this but I may be wrong. Here’s the image of slow academia which I’ve recently been preoccupied by:

When questioned by a friend in 1980 as to whether he was happy at Princeton, the philosopher Richard Rorty replied that he was “delighted that I lucked into a university which pays me to make up stories and tell them”. He went on to suggest that “Universities permit one to read books and report what one thinks about them, and get paid for it” and that this is why he saw himself first and foremost as a writer, in spite of his already entrenched antipathy towards the philosophical profession which would grow with time. It’s a lovely idea, isn’t it?

The image Rorty presents us with of scholarship is idealistic. It reflects his own privilege. It’s an artefact of a higher education system that in the 1980s Ivy League was substantially different to what we see in 2015 in the UK. Most strikingly of all: the image is of a slow life. It suggests Rorty dreamily ambling through his days, going for long morning walks through the Gothic splendour of Princeton’s campus and spending long afternoons reading books in front of a fireplace, occasionally putting pen to paper to record what thoughts they have provoked within him.

Now I realise that there are universities which are quiet. The time I spent in Trinity Cambridge (staying with my ex-partner rather than in any academic capacity) left me captivated by how quiet it could (sometimes) be, as much as I felt profoundly uncomfortable there on an interpersonal level. On my one experience of visiting Princeton it seemed remarkably quiet and the IAS there seemed designed to amplify this character of the campus: though the fact it was a freezing Sunday afternoon and evening probably contributed as well.

In contrast my present university has a blaring big screen in the piazza. Don’t get me wrong, I see nothing intrinsically problematic about this. But I remember a weird evening, soon before handing in my thesis, when I walked through the piazza at 3am in the morning on my way home after an evening spent drowning my pre-completion sorrows with friends. An old Arnold Schwarzenegger was playing on ITV with full volume as I stood there, alone, in the court yard in the middle of the night. At the time this seemed simultaneously absurd, disturbing and hilarious to me and I find it hard not to think back to it when considering how loud the accelerated academy is.

Considering this in a less impressionistic way, I think a plausible case can be made about noise as a marker of...
institutional acceleration: for instance the endless extensions of campus and new buildings, the increasing circulation of people as a function of desynchronised schedules and the crude but I think not inaccurate generalisation that people in a rush tend to make more noise while going about their day. Don’t even get me started on open plan office which is something I’d be utterly unable to cope with. I struggle to work on the occasions my various shared office have in fact been shared, instead talking endlessly to whoever else is physically present as a way of displacing my inability to concentrate without solitude.

Were universities ever quiet? I suspect the reality is more uneven than a simplified juxtaposition between the ‘slow academy’ and the ‘accelerated academy’ would allow for. But I think a sensory perspective on these questions is a really interesting facet to my ongoing work which until a couple of hours ago had never occurred to me. I’ve had a project in mind for a while about recording ‘soundscapes’ to capture the texture of different university campuses and I’m now extremely keen to actually do this.

The challenge of open plan offices and the importance of quiet | Progressive Geographies (2015-05-31 13:38:48) [...] of open-plan offices at her personal blog Refracted Input; and then Mark Carrigan asking ‘were universities ever quiet?’ at The Sociological [...]  

Don't like unions? Fine. Tomorrow go to work for 16 hours. Do it for 6 days, 52 wks/year. Congrats, you're now living like workers did before unions came along.

Towards a Digital Social Ontology: Free Day Symposium in London on July 8th (2015-05-31 14:02)

The Social Ontology of Digital Data & Digital Technology
Wednesday, July 8, 2015 from 10:00 AM to 5:00 PM

This innovative symposium brings together leading figures from a variety of fields which address issues of digital technology and digital data. We’ve invited speakers with a range of intellectual perspectives and disciplinary backgrounds who engage with questions relating to digital data and digital technology in their work. Our suggestion is that social ontology, however this might be construed, represents a potential common ground that could cut across this still rather siloed domain of inquiry into the social dimensions of digital technology.

The symposium aims to explore this possibility by assembling a diverse range of perspectives and drawing them into a dialogue about a common question, without assuming a shared understanding of the topic at hand. Our aim is to extend this digitally via twitter, podcast and blog beyond the event itself, in order to facilitate an extended conversation that will draw more people into its remit as it circulates after the symposium itself.

To this end, we invite each speaker to address this theme (the social ontology of digital data & digital technology) in whatever way they choose. Each speaker will have 30 mins to talk and 15 mins for questions. We’ll have an accomplished audio editor on hand to record each talk as a podcast. These will be released on [1]www.socialontology.org and will be circulated on social media in order to try and stimulate a continuing debate around the issues raised at the symposium. The hashtag for the day will be #socialontology.
This event is funded by the Independent Social Research Foundation

Confirmed Speakers:

Chair: Celia Lury (Warwick)

Noortje Marres (Goldsmiths) - Does Digital Sociology have a Problem?
Jochen Runde (Cambridge) - Non-materiality and the Ontology of Digital Objects
Alistair Mutch (NTU) - Organizational Implications of Digital Data
Susan Halford (Southampton) - title TBC
Nick Couldry (LSE) - title TBC
Emma Uprichard (Warwick) - title TBC

Are you a PhD student or early career researcher interested in social ontology? (2015-05-31 14:09)

Centre for Social Ontology PhD/ECR Conference
June 23rd, University of Warwick, 10am – 4pm

Social ontology is integral to the study of society. It is impossible to inquire into the social world without some understanding, at least tacitly, concerning the entities which make up that world and their properties and powers. However social ontology remains an often confused and contentious matter within the social sciences.

The first Centre for Social Ontology PhD and ECR conference seeks to address this matter through papers exploring the role of social ontology within sociology.

The conference is open to all PhD students and Early Career Researchers with an interest in social ontology.

Schedule

9:30 to 10:00 — Welcome and coffee

10:00 to 11:30 — 3 papers

• Jonathan Beacham: Mixed Method Ontologies and Dialectical Futures
• Adam Wood: Why Architecture Needs a Social Ontology
• Giulia Lasagni: Mutual Recognition and Social Commitment

11:30 to 11:45 - Coffee

11:45 to 12:45 - 2 papers

• Janet Lord: What does it mean to be a teacher? A critical realist approach.
• Kalok Yip: IHL and IHRL – Convergence of Laws, Conflation of Ontologies

12:45 to 13:30 - LUNCH

13:30 to 15:00 — 3 papers

• Gry Cecilie Høiland: Using a critical realist approach for studying the implementation of a work inclusion policy measure at the front lines of the Norwegian Labour and Welfare Agency - methodological implications
• Michael Bauwens: What is social ontology (not)?
• Michael Edward Walsh: title TBC
15:00 to 15:30 - Coffee

15:30 to 16:30 - 2 papers

- Maryam Al Mohammad: Towards building a researcher methodological habitus
- Sara Melo: Exploring the ontology of patient safety

This event is funded by the Independent Social Research Foundation

6.6 June

The Logic of Freedom in Digital Capitalism (2015-06-01 08:39)

I’m sitting in Edinburgh airport having a coffee and catching up on some e-mail before I start my day. This required internet access and I was pleased to find free WiFi here. What irritated and amused me in equal measure though was the discovery that you can’t register for free WiFi without confirming that "I would like to receive news and exclusive offers from Edinburgh Airport":

I would like to receive news and exclusive offers from Edinburgh Airport.

To use the free service, Skyscanner would like to send you great travel deals, tips and inspiration direct to your inbox.

* Compulsory fields

By using this service you agree to Arqiva WiFi Ltd Terms & Conditions and Privacy Policy.

Register & get online

There are obviously many digital services we use for which making our selves and our data available function in lieu of monetary payment. But I don’t recall ever seeing this logic stated in such a charmingly artless way before. I’m newly hopeful that the many pages of terms & conditions for each iTunes update will be replaced by a compulsory checkbox saying "I would like Apple to elaborate opaque terms governing use of their services and impose them on
Muslim youth live in very diverse contexts from Muslim majority societies of the Middle East like Iran and Egypt through religiously and ethnically divergent societies like Malaysia and India to Western societies like France and the UK. Constituting nearly one fourth of the world youth population, Muslim youth are experiencing a crucial era with multiple political, socio-cultural as well as economic challenges in contemporary world at all levels. Muslim communities usually have a very high proportion of youth population and the phenomenon of youth bulge is of considerable implications. Young people are at the forefront of dramatic political developments such as the so-called Arab Spring while being the vanguard of cultural and social change in their respective societies. Muslim youth in Western societies have also come to the attention of politicians, policy makers and most notably the international media given the security threats that have occurred in the past decade. Therefore, this session is aimed to address the main current challenges that are experienced by Muslim youth and future prospects for them and thus welcomes papers dealing inter alia with the followings:

1. Diversity in everyday life challenges of Muslim youth
2. Culture and subcultures of Muslim youth and their identity
3. Muslim youth as actors of social and political change
4. Portray and representation of Muslim youth in western media
5. Muslim Youth and their integration in non-Muslim societies
6. Youth policies in Muslim societies or policies affecting Muslim youth in other societies

Why is social science communication so underdeveloped compared to natural science communication?

The evidence included below is rather crude but it lends support to my impression that social science communication lags far behind natural science communication. The former isn't taken seriously as a specialist role (frustrating for someone like me who increasingly thinks of myself as a communicator of sociology as much as a sociologist) whereas the latter is a well established occupational role with its own conferences, support structure and occupational culture.
This relates to the ideas Steve Fuller and I offered a few months ago about the need for a public understanding of sociology chair and how this might work: [1]here, [2]here and [3]here. More self-interestedly, it also relates to my awareness that despite effectively working as a consultant social science communicator, my sense is that I would just confuse people if I described myself that way when looking for work.

Dave Ashelman (2016-07-21 13:12:00)

This may be a legitimation problem. Is it the public's fault for not understanding, is it the social scientist's fault for not communicating, or is it something deeper within social science discipline? I'm going with #3. Before I got into Sociology, I was in natural sciences (physics/chemistry). I was surprised at how few Sociologists (and social scientists in general) think like scientists. In the natural sciences, we are not afraid of the unknown. The words "I don't know" is almost sacrilege to utter in the social sciences. In the natural sciences, if a theory doesn't support the observable facts, then the theory is tossed out. In the social sciences, it's the opposite; if observable facts don't fit the theory then it's not the theory that's bad, it's that the data wasn't manipulated enough, we observed the wrong thing, or (worst case) observations just don't matter. If Social Science wants to be a "science," then perhaps it's time that Social Scientists start to think like "Scientists." Once that happens, then transmitting knowledge to the public will not only become easier, but will become legitimate in the public view.

The E-mail Charter (2015-06-03 09:03)

I came across [1]this great initiative via Blair Matthews - it started with a blog post by Chris Anderson and Jane Wulf from TED that has since been added to by a wide range of contributors:
10 Rules to Reverse the Email Spiral

1. Respect Recipients' Time
This is the fundamental rule. As the message sender, the onus is on YOU to minimize the time your email will take to process. Even if it means taking more time at your end before sending.

2. Short or Slow is not Rude
Let’s mutually agree to cut each other some slack. Given the email load we’re all facing, it’s OK if replies take a while coming and if they don’t give detailed responses to all your questions. No one wants to come over as brusque, so please don’t take it personally. We just want our lives back!

3. Celebrate Clarity
Start with a subject line that clearly labels the topic, and maybe includes a status category [Info], [Action], [Time Sens] [Low Priority]. Use crisp, muddle-free sentences. If the email has to be longer than five sentences, make sure the first provides the basic reason for writing. Avoid strange fonts and colors.

4. Quash Open-Ended Questions
It is asking a lot to send someone an email with four long paragraphs of turgid text followed by "Thoughts?". Even well-intended-but-open questions like "How can I help?" may not be that helpful. Email generosity requires simplifying, easy-to-answer questions. "Can I help best by a) calling b) visiting or c) staying right out of it?"

5. Slash Surplus cc's
cc's are like mating bunnies. For every recipient you add, you are dramatically multiplying total response time. Not to be done lightly! When there are multiple recipients, please don’t default to 'Reply All'. Maybe you only need to cc a couple of people on the original thread. Or none.

6. Tighten the Thread
Some emails depend for their meaning on context. Which means it’s usually right to include the thread being responded to. But it’s rare that a thread should extend to more than 3 emails. Before sending, cut what’s not relevant. Or consider making a phone call instead.

7. Attack Attachments
Don’t use graphics files as logos or signatures that appear as attachments. Time is wasted trying to see if there’s something to open. Even worse is sending text as an attachment when it could have been included in the body of the email.
8. Give these Gifts: EOM NNTR
If your email message can be expressed in half a dozen words, just put it in the subject line, followed by EOM (= End of Message). This saves the recipient having to actually open the message. Ending a note with "No need to respond" or NNTR, is a wonderful act of generosity. Many acronyms confuse as much as help, but these two are golden and deserve wide adoption.

9. Cut Contentless Responses
You don't need to reply to every email, especially not those that are themselves clear responses. An email saying "Thanks for your note. I’m in." does not need you to reply "Great." That just cost someone another 30 seconds.

10. Disconnect!
If we all agreed to spend less time doing email, we’d all get less email! Consider calendaring half-days at work where you can’t go online. Or a commitment to email-free weekends. Or an 'auto-response' that references this charter. And don't forget to smell the roses.

Podcasts from the @IJSRM (2015-06-03 09:08)
The International Journal for Social Research Methodology has a new podcast page:

The hollowing out of local government in the UK (2015-06-03 09:13)
This agenda has gone [1]very far in an extremely short space of time:
Councils of all stripes have been outsourcing for decades, which is why your local traffic warden is usually tramping the streets on behalf of a private firm. But that isn't enough for Tory-run Barnet – it is on a mission to make itself disappear. It has begun a programme to farm out so many of its services that the local trade union calculates staff will [2] shrink from 3,200 in September 2012 to just 332.

Everything from registering births to mowing the local cemeteries has either already been outsourced or is about to about be. And most of the key tasks have been given to the FTSE giant [3] Capita. Not just for a few months or a couple of years, mind you: Capita will run these services for at least 10 years.

So an arm of Britain’s local government has in effect agreed to a friendly takeover by a £7bn multinational. Whoever Barnet residents vote for in local elections, they will always get Capita. Whenever they phone or email or visit, they will speak to a [4] Capita employee. The FTSE giant will face no competition for the next decade; nor will it endure the same scrutiny as democratic government, as previously public information is veiled under “commercial sensitivity”.

This scale of outsourcing is new to Barnet, but has already given rise to some monstrous cock-ups. I’ve mentioned one here before: the loss of legal expertise meant that Barnet councillors were given the wrong reports to vote on last summer, prompting an independent inquiry that concluded: “[5] There is no one who understands local government law in depth at Barnet.” And while the council claims the point of outsourcing is to save money, evidence of that is thin. One local blogger, who writes under the pen name [6] Mr Reasonable, makes it his habit to go through the accounts and can’t identify any of the much-touted savings. He has offered to donate £250 to charity if the council can prove its claims, but so far there’s been no reply. I asked the local authority the same question this afternoon, but staff couldn’t come back to me in time. Meanwhile, the cost of interim and agency staff is ballooning from £12.5m two years ago to £15.5m.

Fitcoin, exercise and the logic of capital (2015-06-03 09:23)

Would you exercise for money?
A new online currency system has been developed to reward people for their exercise activity. [1] Fitcoin is a "cryptocurrency" like [2] Bitcoin (currently it actually uses Bitcoin but there are plans to develop their own) which has been produced by the company [4] Chaotic Moon. It runs through an iOS app when connected to an activity tracker like [5] Fitbit, the phone is used to "mine" new Bitcoins and effectively converts the user’s exercise activity into virtual currency. The [6] company website describes the system like this:

"FitCoin is a connected app ecosystem leveraging the power of your fitness tracker to generate cryptocurrency. After your workout, your wearable sends the data to the Fitcoin app that is analyzed to find out how hard you were pushing yourself. It also detects your exact activity so weight lifters won't get snubbed.

FitCoin uses a calibrated algorithm so your effort matches your payout. Your average heart rate, distance, and pace are counted and turned into a FitCoin value. Your FitCoin value totals the amount of bitcoin you’ve earned—from your workout to your (BitCoin) wallet."

The system is currently in a testing phase and is technically still a proof of concept although it has generated significant interest not least from Adidas and Nike (who might consider it a more advanced replacement for their [8] NikeFuel system). If one of these big corporations do get hold of Fitcoin it is likely that it will be presented in a friendlier way but the commercial, neo-liberal, entrepreneurial spirit is currently clear in the slogans found on Chaotic Moon’s website (even if it is semi-satirical):

"Sweat for coin. Get rich. Die Young. Submit to the gods of image and wealth."

[9] A demonstration at SXSW festival showed a designer run on a treadmill for 40 seconds and generate five cents. While this is unlikely to be a route to riches the company are suggesting reductions in health insurance premiums or free merchandise as potential applications.

It is possible that such a system will be effective as a motivational tool (if ethically questionable) but what is more interesting to me is the cultural impact it might have on the meaning of exercise. Will exercise come to be seen more like work ([10] an idea I have already developed elsewhere)? Especially when language such as “mining” is used.

Fitcoin seems to perform all of the necessary functions to transform an activity into labour which generates value. Heterogeneous exercise activities are transformed into a standardised form (a digital trace) which can be combined and compared with others and can take on an exchange-value from which profit can be extracted.

When considered in this way Fitcoin seems to be turning exercise into a form of "[11] digital labour" so perhaps it is positive for people to be paid for the value they are generating for corporations. There have been (partly satirical) [12] calls for Facebook to pay users for the value they produce through "liking" on their site for some time. However, there might be more problematic impacts on how we conceptualise exercise.
A divide may already be emerging between those exercise activities which are tracked and those which are not with the more enthusiastic trackers seeing little point in untracked activity. Perhaps this will also happen with monetised and non-monetised exercise. Anyone who has ever trained for any kind of long running race has probably been asked "who" or "what" they are running for. The implication being that it is something of a waste to dedicate time to running without generating money for charity. This logic could easily be transferred to a more individualistic narrative. What is the point in exercise unless you are earning?

“What kind of a cultural space is the nation with its transgressive boundaries and its ‘interruptive’ interiority?” (p5)

Bhabha’s edited book contains chapters by prominent thinkers on the “ideological ambivalence” of nation, and the performative nature of language employed when narrating nation (p4). The book’s aim is to provide a space for writers to articulate the in-between spaces and international aspects of nation where the “origins of national traditions turn out to be as much acts of affiliation and establishment as they are moments of disavowal, displacement, exclusion and cultural contestation” (p5). The book reminds us of the complexities of modern national belonging:

“America leads to Africa; the nations of Europe and Asia meet in Australia; the margins of the nation displace the centre; the peoples of the periphery return to rewrite the history and fiction of the metropolis. The island story is told from the eye of the aeroplane which becomes that ‘ornament’ that holds the public and the private in suspense. The bastion of Englishness crumbles at the sight of immigrants and factory workers.” (p6)

Bhabha acknowledges the fact there are people in this world yet to find a sense of belonging to nation, who are seeking nationhood – he refers to the Palestinians, for example as one such people. Today, we might also think about the Rohingya people. Bhabha rightly laments that “it is our loss in making this book we were unable to add their voices to ours” (p7). Thus, any contemporary research on nation must account for ways to represent the voices
of such marginalised peoples on identity and belonging. Also Bhabha highlights that through the cases of these nationless peoples we must make efforts to understand our positioning and our relationships with others.

**Renan on “What is a Nation?”**

Nation is a relatively new concept which "antiquity was unfamiliar with" (p9). Renan explains that although some political theorists attempt to define a nation as dynastic, a nation is not a dynasty. There have been claims that a nation is based upon the exclusivity of race or of language, yet these are proven to be misguided assertions as there is no purity of a nation due to race or language, instead the opposite is the case and nations are racially and linguistically heterogeneous.

Importantly Renan has emphasised the problematic nature of claiming an exclusive nation by proclaiming racial or linguistic superiority:

"Such exaggerations enclose one within a specific culture, considered as national; one limits oneself, one hems oneself in. One leaves the heady air that one breathes in the vast field of humanity in order to enclose oneself in a conventicle with one's compatriots. Nothing could be worse for the mind; nothing could be more disturbing for civilization." (p17)

Moreover, Renan reminds us that we should not neglect an exploration of “the secret of the genuine education of the human spirit”, after all universal human values matter:

"Let us not abandon the fundamental principle that man is a reasonable and moral being, before he is cooped up in such and such a language, before he is a member of such and such a race, before he belongs to such and such a culture. Before French, German or Italian culture there is human culture".(p17)

In any teaching and learning of issues of nation and national identity there would be a need for teachers to bear these aforementioned points in mind. The book delves deeper into the meanings of nation by referring to literary genres including Australian, English and American. For Brennan, there may be multiple mythical elements to nation and narration – where nation can be seen as a distortion, or a mythical tradition, or as literary representation. Whilst for Sommer, Latin American literature reveals romantic notions of nation and identity. The chapter by Gunew refers to Australian literature and its relationship with multicultural belongings and ways of being, as she recommends ways of re-reading texts bearing in mind cultural nationalisms and multicultural concerns. Bennington highlights the distinct approaches towards studying nation – do we examine the centre? Or do we start from the edges and margins? He provides a new way of considering post-structuralist thinking in relation to narrating the nation.

This is an open event: we welcome anyone interested in critically reshaping the future of wearables and their impact on society. Here’s the [1]registration form for the event. There's more information below.

Why?

There is an urgent need to open up critical thinking and doing around wearable technologies. The headlong rush to market and the huge potential for applications like personal health monitoring occlude both the potential dark side and the possibility for wearables to be part of alternative social formations.

In the post-Snowden era we cannot ignore the consequences for privacy, ethics and governance of wearing networked devices. Nor can we ignore the way a narrow focus on individual applications overlooks the potential role of wearables in collective and community-driven activities. By questioning the dominant narratives around wearables and facing up to the dark sides of surveillance and unsustainability, the research lab will help to clear the way for fresh and more unexpected questions about their transformative potentials.

This research lab will be an intensive one-day event that brings together researchers and practitioners to raise questions and generate new ideas, collaborations and methodologies. It will link directly to a second event which will take the form of a hackathon, prototyping practical devices that draw on questions raised by the research lab.

How?

The lab itself will be based on ‘material thinking’ - making speculative devices that combine real wearables with junk material which is used to materialise research questions. This hands-on method can make visible the overlooked aspects of existing assemblages and can encourage new questions about what kind of futures are likely or possible.

During the day this will be combined with demonstrations of real devices, firestarter presentations, group work and discussions. In the morning we will address head-on the the dystopian aspects of wearables, and in the afternoon we will raise interesting research questions about alternative possible futures. The overall format will be in the unconference or barcamp style.
Participants will include researchers from a wide range of fields & disciplines, from fashion to machine learning and from computing to cultural studies. It will appeal to practitioners who are seeking the space to reflect on the meanings being materialised by their current work, and who are looking for new ways to frame future activities.

Impact in Sexualities and Queer Research: One day event in Leeds (2015-06-04 08:23)

IMPACT IN SEXUALITIES AND QUEER RESEARCH
Sponsored by the Space, Sexualities and Queer Research Group of the Royal Geographical Society with the Citizenship & Belonging Research Cluster, University of Leeds

Date and time: 8 September 2015, 10 AM – 3:30 PM
Location: University of Leeds, UK
Organising Committee: Robert Vanderbeck (University of Leeds), Martin Zebracki (University of Leeds), and Alexandra Fanghanel (University of Bedfordshire)

Confirmed keynote panellists:
Dr David Bell, University of Leeds
Dr Gavin Brown, University of Leicester
Prof Ruth Holliday, University of Leeds
Dr Jacqui Gabb, Open University
Prof Paul Johnson, University of York
Prof Nina Laurie, University of Newcastle
Dr Joanna Sadgrove, Research and Learning Advisor, the United Society

Overview
The notion of 'impact' has become increasingly central to the practice of research in the U.K. Research councils now expect research to have clearly defined 'pathways to impact', while the Research Excellence Framework (REF) has made the evaluation of impact central to its assessment of the research activity of universities. Questions about the ability of researchers to generate demonstrable research impact have now become a commonplace feature of the appointment process for academic positions, with implications both for aspiring academics and those already in academic posts. In some academic departments, it is a mark of prestige to have one's work be the focus of an 'impact case study' for the REF, with internal competition between colleagues taking place over whose research will be seen as the most 'impactful' for the REF.

While many critical geographers and other social scientists have long stressed the importance of conducting research that has relevance outside the academy, the current drive for impact has triggered a range of critical discussions regarding the definition of impact, the implications of the 'impact agenda' for curiosity-driven research, the effect of the 'impact agenda' on how researchers work with external partners and organisations, and a range of related issues (see, for example, Pain et al. 2011; Phillips 2010; Rogers et al. 2014; Slater 2012).
This one-day event provides a forum for discussion of the theme of research impact as it relates to sexualities and queer research (broadly defined) in human geography and the social sciences. Issues for discussion include:

- the prospects for, and challenges of, working with non-academic partners and research users to generate impact
- ethical issues and dilemmas related to generating research impact
- interacting with the press and other news media
- using blogs and other media as tools for research dissemination and public engagement
- the career implications of the impact agenda for sexualities and/or queer scholars
- the influence of the ‘impact agenda’ on the future trajectories of sexualities and queer research in the U.K. and beyond
- strategies for challenging the instrumentalisation of impact within the academy

The event will combine two keynote panels with smaller, interactive discussions where participants will reflect upon issues related to impact as they relate to their own research endeavours. Early career researchers and postgraduates are especially welcome to attend. Some funds for travel bursaries are available for postgraduate students and unwaged individuals to contribute towards travel expenses (see below).

**Registration**

The cost of registration is £15 (£5 for students and unwaged). This includes a light lunch and refreshments. Students and unwaged individuals can apply for bursaries (below). The registration cost can be waived for research user organisations with limited resources (please contact Robert Vanderbeck: [r.vanderbeck@leeds.ac.uk](mailto:r.vanderbeck@leeds.ac.uk)). Please visit the following site to register: [http://store.leeds.ac.uk/browse/extra_info.asp?compid=1&modid=2&deptid=9&catid=47&prodid=551](http://store.leeds.ac.uk/browse/extra_info.asp?compid=1&modid=2&deptid=9&catid=47&prodid=551) Bursaries Bursary applications are available on the SSQRG website. Students and unwaged individuals are welcome to apply for bursaries.

**Young Voices: The Active Engagement of Young People, Methods Workshop** (2015-06-04 08:24)

**Young Voices: The Active Engagement of Young People, Methods Workshop**

The Manchester Centre for Youth Studies invites you to a FREE methods-based workshop, 10am-3.30pm Thursday 25th June. This event is open to academics, practitioners, and local youth organisations. You’re also welcome to invite any of the young people you work with to join us. For more info, follow the link below.

There will be five interactive sessions, each led by a different presenter, including:

- Andrew Clark (University of Salford, Visual Methodologies)
- Natalie Walton (Freelance Arts Consultant, Art and Creative Methods)
- Joanne Tippett (Ketso, Hands-on kits for Creative Engagement)
The day will conclude with a short Q &A session, based on the day’s activities. We hope you’ll join us to share experiences and ideas.

Please register everyone in your party for catering purposes: [1]https://mcysyoungvoices.eventbrite.co.uk

1. [https://mcysyoungvoices.eventbrite.co.uk/](https://mcysyoungvoices.eventbrite.co.uk/)

**CfP: Ethical Practice and the Study of Girlhood** *(2015-06-04 08:26)*

Special Issue of
Girlhood Studies
An Interdisciplinary Journal

**CALL FOR PAPERS:**
Ethical Practice
and the Study of Girlhood

For this themed issue of Girlhood Studies: An Interdisciplinary Journal, "Ethical Practice and the Study of Girlhood," we invite submissions from transnational and transdisciplinary perspectives that investigate how the constructs of girlhood and ethics might inform each other. We are interested in work that explores, disrupts, or otherwise complicates the notion of girlhood studies as an ethical space. As of yet, the relationship between girlhood studies and the field of ethics remains under-articulated and under-researched. While there is a range of research that takes up questions of feminist ethics, childhood ethics, and to a lesser extent feminist girl-centred interventions, ethics in girlhood studies is a new nexus of inquiry. Persistent forms of marginalization and ongoing concerns about the physical and mental wellbeing of girls around the world necessitate the development of girl-responsive ethical frameworks. Ethical considerations may also allow probing into the taken-for-granted aspects of what it means to be a girl. The aim of this themed issue is to produce new imaginings and understandings of ethical being, rights, otherness, power, agency, and responsibility in relation to the study of girlhoods.

We ask: What does an ethics of girlhood studies look like? Are there unique features of a girlhood studies ethics? Feminist, postcolonial, and childhood studies have troubled adult-centric views on girls' and young peoples' visibility, citizenship, and capabilities. How might ethics in girlhood studies be connected to such examinations of girlhood? How may new understandings of the relationship between ethics and girlhood complicate these existing fields of scholarship? Research with girls, for girls, and by girls aims to draw attention to the absence of girls’ voices in initiatives that affect their lives. Given that this is the starting point of Girlhood Studies, what would that mean for an ethics of research in such studies? Research with girls necessarily invokes a range of legal and moral obligations. How might the changing socio-political forms of girls’ lived experiences and the representation of these inform the meaning of constructs such as "in the best interest of the (girl)-child" and “doing the most good and least harm”? This questioning extends to research into practice, policy, and theory.

Articles may approach ethics and girlhood studies from a number of perspectives that reflect shifting understandings. We position ethics as a multifaceted entity that encompasses systems of socialization, morality, norms,
prescriptive rules of conduct, and personal transformative practices and discourses. We seek submissions that draw on the perspectives of girls themselves and subjective, embodied experiences of girlhood. A range of research approaches is encouraged including memory work, ethnographic, artistic, poetic, narrative and other forms of qualitative or quantitative inquiry.

Contributions to this themed issue may address the following topics:

- The ethics of research into health as it relates to girls, and issues of participation in medical research, treatment, and care
- The ethics of research into girls' work and labour
- The ethics of research into girls' experiences with and use of social media, online communications, and digital networking platforms
- The ethics of doing visual work with girls
- Girls' agency in the context of research into family dynamics and parental rights, as in cases of abuse, incest, or exploitation
- Building global ethical practices and transnational solidarity in international research with girls
- Discourses of institutional ethics and the construction of girls in relation to concepts such as vulnerability, informed consent, assent, and beneficence
- Ethical responses to gender-based violence and institutional violence against girls
- The ethics of work on LGBTTQQIA girlhoods and normative belonging, identity, categorizations of difference, and the meaning and boundaries of the body
- The ethics of research into indigenous girlhoods, self-governance, and responses to colonial gendered-based violence including the connections between colonial gender constructs and violence against indigenous girls and the land
- The ethics of girlhood studies in the context of histories, colonialism, and the neoliberal moment
- The ethics of research into girl-led movements, activism, and creative practices of resistance (for example, instances of girls as producers of their own culture and girl-implemented social change)

Suggested Bibliography
Mupotsa, Danai. 2010. “If I Could Write This in Fire/African Feminist Ethics for Research in Africa.” Agenda Africa 6, no. 1: n.p..

GUEST EDITOR
April R. Mandrona is currently a SSHRC Postdoctoral Fellow in the Department of Integrated Studies of Education at McGill University. Her doctoral research involved the creation of art groups with young people in rural South Africa and focused on the development of ethical practices as a researcher, teacher, and artist. Dr Mandrona’s current research explores the building of intergenerational digital networks to help youth art communities grow and develop.

ARTICLE SUBMISSION
Manuscripts may be no longer than 6,500 words including abstract (150 words), keywords (6 to 8), article, bio (100 words), references, and notes, captions, tables, and acknowledgments (if any). Girlhood Studies, following Berghahn’s preferred house style, uses a modified Chicago Style. Please refer to the Style Guide on the website. If images are used, authors are expected to secure the copyright themselves.
Inquiries and submissions may be sent to: April R. Mandrona ([1]aprilmandrona@gmail.com)
Should we include audio extracts in publications? (2015-06-05 12:45)

I’m listening to a really interesting talk by Paul Hopkins at the University of Hull about the use of multimedia as part of the PhD thesis. Surprisingly it seems this isn’t disallowed at many institutions even though it’s far from encouraged. Have you used multimedia as part of your thesis?

The broader question this talk has left me with is whether extracts of audio files could be included in publications more generally? As Paul points out, listening to an extract from an audio file is not equivalent to reading a transcription of that extract. There are many reasons why this might not be a good idea but I’m fascinated by the potential implications of this in an intellectual context where writing about qualitative research is dominated by what Nick Hopwood calls quotitis:

> Look at your findings / discussion section. How much is indented as quotes from raw data? How much is “quoting the delicious phrases of your participants” within a sentence? It would be daft of me to give a fixed proportion to limit this, so I’m not going to. Do you give multiple exemplars to illustrate the same theme? Look at the text around the quotes. Have you given yourself (word) space to introduce quotes appropriately, and to comment on them in detail?

[1]https://nickhop.wordpress.com/2014/02/02/do-you-have-quotitis-how-to-diagnose-treat-and-prevent/

What do you think? I can’t work out if I actually think this is a good idea but it’s certainly a provocative one. In spite of the potential problems, the idea of drawing on research data to produce multi-modal publications in the spirit of a curatorial sociology rather appeals to me. I returned to my audio files in the later stages of writing up my thesis, long after I’d initially transcribed them, finding myself surprised by how effective this proved in changing how I was orientated towards my research data. What effects would it have on journal readers if we replaced the block indented quotations that characterise quotitis with snippets of the original interview?

[1]https://nickhop.wordpress.com/2014/02/02/do-you-have-quotitis-how-to-diagnose-treat-and-prevent/
Another useful point from this great presentation by Paul Hopkins at the University of Hull. I’d like to try using Textwall myself in the near future:

**what is a textwall?**

A textwall is a web page that learners or delegates can send text messages to. The messages can then be shown on a large screen or interactive whiteboard as part of a lesson or event for everyone to see.

You are not charged for messages you receive. It costs the learner their standard sms charge to send text messages to the textwall. Depending on their phone contracts, this could be free.

**sending SMS messages**

A textwall can be used to compose and send bulk text messages to learners or delegates for informative, administrative or pastoral purposes.

**choose your own textcode**

You will be asked to choose a textcode when opening your textwall account which must be between 3 and 5 characters in length.
"No one would be interested in what I have to say" (2015-06-05 17:00)

How widespread is this sentiment? It's been discussed a few times during the social media day I'm attending and it's made me realise that I don't really address this fear properly in my upcoming social media book. In part this is because my faith in narrowcasting had led me to assume that there would be an audience for any topic, no matter how niche. This is how Marshall Poe describes *narrowcasting*:

> The Internet, however, can make these connections because it permits economical, finely calibrated "narrowcasting," that is, the transmission of specific information to specific interest groups. Of course print and – to a much lesser extent – radio and television also allowed some narrowcasting. Academic journals and industry newsletters are perhaps the best examples. But the scale of narrowcasting on the Internet is orders of magnitude greater than anything known before. Take the blogosphere for example. Here tens of thousands of interest-specific public intellectuals talk to tens of thousands of interest-specific publics concerning every imaginable interest. If you want to know about it — beer brewing, Italian shoes, organic chemistry — you can probably find someone with considerable expertise blogging about it. That’s truly remarkable.

But is there much to this story? What do people think? Is it possible that there is no one out there who will care about your research? I’d like to think that this isn’t the case but the conversations earlier have left me aware that this is an assumption I’m making.

---

Tony Soprano and reflexive socialisation in late modernity (2015-06-06 15:01)

Watching the Sopranos, I was struck by what a good example this was of what Margaret Archer argues are the consequences of the intensification of social change for intergenerational socialisation: the decreasing likelihood that children will encounter occupational roles familiar to their parents will tend to increase the degree of reflexivity with which the parents orientate themselves to the lives of their children. If they don’t feel they understand the occupation world their children are entering than what might have otherwise be a transmission of normative guidance is more likely to become a generalised expression of support as they make their own choices.
Richard Wilsnack, Department of Psychiatry and Behavioral Science, University of North Dakota School of Medicine and Health Sciences (2015-06-06 19:26:17)

Mark, what you describe is from another perspective a chronic problem of aging amid social and technological change, at least in the USA. People approaching and passing retirement age are not adequately prepared for the extent to which the generations after them (such as their children) will experience what their elders know (and tell them) as obsolete, irrelevant, and intrusive. We geezers often suffer from a painful awakening to how useless we are to people younger than us.

Sociological Imagination (2015-06-07 10:07:07)

I’d not thought of it in those terms. That’s very interesting. My point is that this experience of being ‘useless’ will likely have important consequences for how parents relate to their children. If you feel your understanding has no use to them then your parenting style will likely become much more non-directive (“I’ll support them in whatever they decide”) which has important developmental consequences for the children’s transition into adulthood.

What can economists learn from science fiction? (2015-06-07 10:11)

This intriguing talk by Ha-Joon Chang, author of 23 Things They Don’t Tell You About Capitalism, was given at the launch event for the Political Economy Research Centre at Goldsmiths. Listen to the podcast here: [1]http://www.perc.org.uk/project _posts/podcast-of-ha-joon-chang-lecture-what-can-economics-learn-from-science-fiction/
What Can Economics Learn From Science Fiction?

Economics and science fiction have many relationships that are rarely noticed. A lot of economics is science fiction, in that economists believe in the fiction that they are practicing a 'science', and that progress in this 'science' can potentially solve all economic problems. Equally, science fiction can be a helpful way of imagining alternative realities, making us re-think assumptions about economy and society that we otherwise take for granted. In this public lecture and launch event for PERC, Professor Ha-Joon Chang argues that science fiction teaches us important lessons about the economy, in particular that it can be changed, that it has been changed, and, most importantly, that it has been changed in the way it has only because some people dared to imagine a different world and fought for it.

Sociologist Considers Own Behavior Indicative Of Larger Trends (2015-06-07 10:19)

Funny but potentially painful reading at the Onion. Read it in full [here]:

According to the findings of a paper published Monday in The American Journal Of Sociology, the behaviors and experiences of Boston sociologist Dr. Stephen Piers are indicative of a host of wider societal trends.

"My observations indicate that the typical married American man has had increasing difficulty relating to his spouse over the last two and a half years, ever since she started taking those yoga classes," wrote Piers, 56, in his Interpersonal Connections Within The Marriage Paradigm: A Study In Causality.

In the paper, Piers asserted that the most pressing issue for American men is maintaining healthy sexual relations with their wives.
"Back in 1999, American men's frustration derived mostly from the infrequency of sex," the paper read. "Recently, however, that trend has shifted as husbands report a decreasing interest in intimacy, particularly if there is a Celtics game or a new NYPD Blue on TV. While many men cite increased job responsibilities and stress as possible catalysts, many more blame the affair their wives had a year ago with some textile salesman during a training conference in Seattle."

What is Extreme Early Retirement? (2015-06-07 10:23)

By Karl Thompson

What is Extreme Early Retirement?

Extreme Early Retirement (EER) is a strategic approach to the life-course through which the individual aims to
achieve financial independence within five to twenty years by saving half or more of their income. Rather than focussing on generating extreme levels of wealth in order to retire to a life of leisure and luxury, the philosophy of EER is to reject the ordinary debt-driven, high-consumption, convenience based lifestyle of the typical consumer and instead practice ‘optimism rather than convenience’ and to develop a range of ‘resilience skills’ in order to live well on a relatively low income. EER also involves taking an interest in and learning something about the economics surrounding investing and personal finance.

Extreme Early Retirement finds most of its followers in America, where the two most popular foundation blogs are based - [1]Mr Money Moustache, and Jacob Lund Fisker’s [2]Early Retirement Extreme, both of which are written by individuals who achieved early retirement in their 30s.

Mr Money Moustache is closer to a more conventional early-retirement model: he and his wife were high-income earners ( $130 000 per annum between them) and simply saved two thirds of their income to accumulate a total net worth (TNW) of £600 000 and now live on an annual income of around $25 000. Fisker is a little more opaque about the precise details of this own capital situation but given that he lives on $7000/ year, my own estimate is that he retired with a TNW of around $150 000.

Both blogs are keen to emphasise that EER is achievable by even average income earners because the basic principle is that whatever your income, the higher your savings to expenditure ratio, then the earlier you can retire. Mr Money Moustache illustrates this by pointing out that if you can save half of your income then it will take you seventeen years until retirement, but at 75 % it will take you only seven years.

While no precise figures exist on the number of people pursing extreme early retirement, overall numbers are small. The [3]Mr Money Moustach Forum has 20 000 members, but it is likely that only a tiny percentage of these are people who are seriously practicing the early retirement philosophy: a brief analysis of the blog-role reveals a mere 60 people actively documenting their missions towards early retirement. Fisker’s more radical [4]Early Retirement Extreme Forum is even less popular with only 3500 members.

In the United Kingdom, there are a mere handful of individuals actively pursuing and publishing their efforts to achieve financial independence and early retirement. The site which is the most dedicated in terms of regular posts and explicit details pertaining to finance is [5]The Firestarter (Financial Independence, Retire Early) which is run by a 32 year old ‘normalish bloke’ who is aiming to retire within five years, having started with a TNW of practically zero.

Extreme Early Retirement as a form of Social or High Reflexivity

Those practicing extreme early retirement certainly seem to be engaged in what Giddens (1991) would refer to as 'social' or 'high' reflexivity as EERs clearly maintain a high degree of separation between their daily lives and their virtual reflections on early-retirement. EER blogs are not focussed on 'what I like doing' they are focussed on 'here are the reasons I am doing this given the goal I am trying to achieve'. The EER community is also highly calculative - It is common to post considerable details of monthly finances; there is constant assessment of the transformative potential of lifestyle choices to bring forward or retard the date of early retirement; and a high degree of willingness to engage with a variety of new information in order to develop resilience skills to reduce dependence on money.

Our ideas about retirement are normally embedded within a broad set of existing cultural norms surrounding work, consumption and the life-course more generally, and these ideas are largely taken for granted and not reflected on, but the reflexivity of EERs clearly transgresses such normative boundaries forcing the individual the rethink their entire life-course.

Fisker’s Early Retirement Extreme especially offers a critical intellectual framework for rethinking about work-
consumption-retirement, criticising what he casts as the 'wage-credit-spend-consume-retire on a million-cycle'. It also offers us an overview of an alternative way of thinking about this nexus which ultimately means working and consuming less, retiring a lot earlier than normal, and rethinking what retirement actually means (which is not merely conceived as a life of never ending leisure in EER circles).

**Extreme Early Retirement as a Critique of The Society of Consumers**

One of the predominant themes in the work of Zygmunt Bauman is that in post/late modern consumer society the rapid consumption of goods and services has become the primary mechanism of social integration, and the primary means whereby individuals seek to find biographical solutions to systemic problems: buying things plays a fundamental role in maintaining personal relationships; and shopping has become an end in itself through which we escape the harsh realities and instabilities of working-life.

Bauman also argues that seeking to construct an identity through consumption means that we suffer from 'subjectivity fetishism' – constructing an identity may involve freely choosing between objects, but we forget that we are, in fact, dependent on those objects, and thus not truly free. Moreover, we are not truly free of the economic system which requires us to rapidly become dissatisfied with today's products so that we will buy new ones tomorrow, a system that depends on consumers buying and throwing away goods at an ever faster rate, which in turn requires credit.

Ultimately, if we buy into a life course mediated by consumption, we buy into a life of having to make progressively more choices pertaining to consumption as we age. The end result is that our subjectivity narrows and we end up suffering from the tyranny of choice and a curiously hurried life as we unconsciously react to markets in overdrive.

The Extreme Early Retirement community presents a sustained critique of what Bauman calls the 'consumerist syndrome', and, very much in the spirit of C. Wright Mills' sociological Imagination - they make familiar consumption habits seem unusual, even pathological.

'Convenience consumption' is subjected to the highest degree of criticism – the poster child of which is the $4 daily Latte, and extending to a whole range of labour-saving goods and services.

There is also considerable criticism of wasteful consumption, which mainly focuses on buying products which we hardly ever use which includes everything from the obvious kitchen and gardening gadgets which are stored in the cupboard for most of the year to the less obvious - buying a house with a spare bedroom is widely regarded as superfluous expenditure for example.

Finally, EER blogs rail against what Mr Money Moustache calls 'Tiny details exaggeration syndrome' or the practice of paying hundreds of dollars more for a car with a bespoke paint job or thousands of dollars of more for a house with a better view. Where the later is concerned, wanting to live in a 'good neighbourhood' may well be the thing which prevents you from living close to work and locks you into needing a car rather than being able to walk to work, then you pay for a gym membership to keep fit.

However, it is not just high levels of the wrong type of consumption which EER critiques, it also emphasises deferred over immediate gratification, and the fact that its adherents have extremely long term plans regarding their finances EER can also be seen as an alternative to living a hurried, fragmented, Pointillist existence.

**The Limitations of the Critical Potential of Extreme Early Retirement**

Despite its critique of consumer culture it would be inaccurate to describe the Early Retirement Extreme community as a movement because it operates firmly within the Capitalist system, given that each individual's ultimate aim is to generate sufficient capital to provide a return sufficient to meet their needs.
The EER community also appears to be little more than a lose network of isolated individuals seeking privatised, individualised strategies towards early retirement, individuals whose most committed relationship is ultimately between their individual selves and international financial markets. There appears to be no affective commitment or collective-investment that binds the community together in any significant way, with connections limited to that of knowledge exchange. It cannot be said to offer anything like a viable systemic solution to problems such as job insecurity and work based alienation, rather it offers a means of escape for the relatively well off.

Having said this, there is some overlap with the more radical elements of the EER community and movements for social change - Fisker’s approach involves a much higher level of frugality, and stems from a unique criticism of the inefficiencies of the present economic system and at times chimes with the ideals of self-reliance found within anarchism, although Fisker himself is definitely not anti-capitalist.

A further problem of Extreme Early Retirement is that it is clearly not open to everyone. Its two leading proponents both had solid professional careers – in Engineering and Astrophysics and earnt significantly above the average salary, which meant they were able to save considerable sums in a short time-frame and retire very early.

Where the UK is concerned I have [6]elsewhere calculated that the median income earner in the could retire at the age of 52 if they started on an early retirement strategy at the age of 35, this assumes, however, an extremely frugal existence and no significant life events that would detract from savings, and on the median salary the kind of sums being put away every month would hardly be motivational to keep one going for such a long period.

Obviously Extreme Early Retirement is not an option to anyone living in at least the bottom quintile of income earners, given that such a low income would require 100 % of expenditure for meeting basic needs within nothing left to save.

**Conclusion - The Social Significance of Extreme Early Retirement**

Given its reflexive and highly individualised nature, the EER community is very much a product of late modernity, and its social utility lies in the fact that it encourages us to think critically about the sub-optimal nature of the consumerist mode of existence, and for those with the means it offers the potential to gain a high degree of financial freedom very early in life. However, precisely because of its highly individualised nature and strategic dependence on personal wealth generation, extreme early retirement in its present form can only ever be achieved by a tiny minority of people, thus while it remains of sociological interest, it is of limited use in helping us to translate personal troubles into broader public issues.

**Sociological and Other Works drawn on**

Giddens, A (1991) The Consequences of Modernity: Self and Society in the Late Modern Age

**About The Author**

I’m Head of Sociology in the best marketed sixth form college in the country. I’m now in my 14th year of teaching, having originally intended to do the job for a year and then get back to my PhD research into radical eco-communities in 3670
the UK. I guess I stayed because all things considered it’s quite a nice job - you get to make interesting ideas accessible to people, it’s stable and permanent, well paid and now I’m established I get a genuine 13 weeks of holiday every year. Sad to say but had I carried on with the PhD I doubt if I’d be able to tick any of those boxes by now.

I blog at 'RealSociology’ – mainly focusing on various aspects of Sociology to do with the A level syllabus (most of it’s pretty interesting), Buddhism, and Extreme Early Retirement.

When I retire (in six years aged 47) I intend to establish an edible forest garden, graze and meditate for a few years and then figure out what do with the rest of my life. [/nbox]

Charles Knight (@Charlesknight) (2015-06-07 20:04:29)
Interesting blog post - I take it EER overlap with people who aim for a similar date but don’t plan to retire? On my current projections, I’ll be about to pack in at 52 - but I wouldn’t because - what would I do all day? It’s an interesting worldview because it dictates all sorts of life choices that are not apparent to others - I work at a post-92 university and have turned down offers to work at RG universities - my academic friends are astonished - "but it’s big london university X!" However although I like academia - it’s a way of earning a living not a lifestyle for me. Yes I would get a short-term ego-boost from moving to an more impressive university but I’d take a massive cost of living hit. Moreover once you live that way - all sorts of other 'behaviours’ that academics take for granted and the academy tries to ‘breed’ into you no longer make sense - pay your own money to attend a conference? 0 _0

thefirestartercouk (2015-06-11 10:14:54)
Great summary of ERE Karl... and a thoughtful post to read on a sunny Thursday morning :) You bring up some of the drawbacks and criticism which is interesting as it’s not written about so much in "our" sphere, or if it is I often don’t find that the answers given are really that satisfying. MMO in particular makes a lot of sweeping statements and is far too over optimistic about what if everyone lived this way. I mean it would be good for getting more/all people to live the good life that is described, but IMHO individually we’d all end up working more again as returns on investment would be much lower. Saying that I would happily trade that for a better functioning, more efficient, more equal and happy world. To Charles - The "what would I do all day” is a common reply to retiring early and you are lucky that you have found a job you enjoy and has purpose (sorry I am assuming there but that is what it sounds like you meant by your comment). ERE people are either usually in a job they don’t particularly find fulfilling or just have far too many other interests to have to concentrate on one area 40 hours per week. I am a little of column A and a lot of column B. Most of us will never(!?) be short of something to do in early retirement, I have so many things I want to see, do and learn it will easily last me out a 50 year retirement span (if I last that long, fingers crossed!) Thanks!
The really hard problem facing behavioural science (2015-06-07 10:51)

In recent years behavioural science has made great advances in the reliability of facial recognition techniques. Current evidence suggests algorithmic facial identification systems are now more reliable than human attempts to recognise faces. This leads some to have confidence in the capacity of computational systems to read human emotions in a way that will be more reliable than interpersonal interpretation. To those optimists, I present the really hard problem facing data driven behavioural science (HT [1]Shit Academics Say):

![Star Wars Emotions](image)

For a more serious attempt to make the same point, see [2]this post from a few weeks ago.

Marx and Philosophy Society Conference: Marx and Utopia (2015-06-08 08:24)

Marx and Philosophy Society
Annual Conference 2015
'Marx and Utopia'

Saturday 13th June 2015, 9.45am - 6.00pm
Room 828, UCL Institute of Education 20 Bedford Way, London WC1H 0AL

9.45 Registration

10.00 Lea Ypi (LSE) Revolutionary Partisanship

11.15 Break

1.45 Parallel graduate panels:

(1) Paul Raekstad (Cambridge) Marx's realism, utopianism, and the role of vision Owen Holland (Cambridge) Utopia and the suspension of the political Sina Talachian (Amsterdam) Between universalism and particularism: the later Marx's conception of reformism

(2) Emily Cousens (Oxford Brookes) Marx's contribution to feminist thought Dimitri Kladiskakis (Sussex) Marx and Heidegger: social ontology and the object Chris Ferguson (Sussex) Alienation as social-institutional heteronomy

1.30 Lunch

2.30 David Leopold (Oxford) Marx's Critique of Utopia

4.00 Break

4.30 Gregory Claeys (Royal Holloway) Marx, Marxism and Utopia

Admission free
Please reserve a place in advance by emailing Meade McCloughan at [1]meade.mccloughan@gmail.com Further details: [3]http://www.marxandphilosophy.org.uk We gratefully acknowledge the support of the Mind Association

Thanks to [1]Jacqueline Bartram who drew these great cartoons as I was talking at a Hull event last week about academic blogging. Why should academics blog about their research?

It provides a home for things you reluctantly cut from your publications:

It allows you to get early feedback on ideas and try them out for the first time in public:
It allows you to exchange early thoughts with others working on the issues that concern you:
It allows you to share your struggles with others who are going through the same thing:
1. http://www.twitter.com/jaxbartram/

Why should academics blog about their research? An answer in pictures | Progressive Geographies (2015-06-13 10:09:30) [...] should academics blog about their research? An answer in pictures at The Sociological Imagination. Four reasons in the full [...]

Like many other graduate students, I need scraps of teaching to survive. Today's session is one of several teaching commitments. My thesis is nearing completion but my funding has evaporated, so I am fortunate to have found some work in a nearby university. However, as the bus meanders along and I overhear students disparaging their assignments and lecturers with increasingly colourful language, I cannot help wondering whether my efforts will be worth it.

At the university, there is no office space for temporary staff, so I head to the campus cafe. Like much of the UK, it is privatised. I cannot justify buying an expensive coffee just to sit comfortably, so I turn away from the soft seats, which are reserved for customers, and find a wooden bench in the corner. Slowly, the space fills with students as lecture time nears. Looking around, I become aware of other older faces: people perched on the peripheral benches buried in piles of marking, or reading the only open books in the room. These are academic staff, people priced to the edges of their own workplace as the gentrification of higher education continues apace.

I purloin a cup of water and review my lecture resources. In this department, most course “content” is slathered on to PowerPoint. The students expect it; presumably it reminds them of school. I quickly discover their aversion to lectures that revolve around listening and discussion, their resistance to independent thinking, and their lack of interest in sustained engagement with textual sources. Later I am told, perhaps apocryphally, that one can finish an undergraduate degree here without ever reading
a whole book.

The reality of digital capitalism (2015-06-09 08:38)
CfP: Journal of Peer Production: Work and peer production (2015-06-09 08:44)

CFP Journal of Peer Production: Work and peer production
Editors: Phoebe Moore (Middlesex University London), Mathieu O’Neil (University of Canberra), Stefano Zacchiroli (University Paris Diderot)

The rise in the usage and delivery capacity of the Internet in the 1990s has led to the development of massively distributed online projects where self-governing volunteers collaboratively produce public goods. Notable examples include Free and Open Source Software (FOSS) projects such as Debian and GNOME, as well as the Wikipedia encyclopedia. These distributed practices have been characterised as peer production, crowdsourcing, mass customization, social production, co-configurative work, playbour, user-generated content, wikinomics, open innovation, participatory culture, produsage, and the wisdom of the crowd, amongst other terms. In peer production, labour is communal and outputs are orientated towards the further expansion of the commons, an ecology of production that aims to defy and resist the hierarchies and rules of ownership that drive productive models within capitalism (Moore, 2011); while the commons, recursively, are the chief resource in this mode of production (Söderberg & O’Neil, 2014).

Peer projects are "ethical" as participation is primarily motivated by self-fulfillment and validated by a community of peers, rather than by earning wages. Their governance is "modular," understood in a design sense (decomposable blocks sharing a common interface), but also in political-economy terms: participants oppose restricted ownership and control by individually socializing their works into commons. Conflicting interpretations of their societal impact have been articulated (O’Neil, 2015). Skeptics view the abjuration of exclusive property rights over the goods they produce as irrelevant, and ethical-modular projects as increasing worker exploitation: participants’ passionate labour occurs at the expense of less fortunate others, who do not have the disposable income, cultural capital, or family support to engage in unpaid labour (Moore & Taylor, 2009; Huws, 2013). In contrast, reformists, often hailing from a management perspective, suggest that the co-optation of communal labour by firms will improve business practices and society (Arvidsson, 2008; Demil et al., 2015). Finally activists celebrate the abjuration of exclusive property rights, and present ethical-modular projects as key actors in a historical process leading to the supersession of capitalism and hierarchy (Kostakis & Bauwens, 2014).

This last perspective raises a central challenge, which is the avoidance of purely utopian thinking. In other words, how can commons-based peer production reach deeply into daily life? How can already existing non-capitalist economic processes be strengthened, new non-capitalist enterprises be built, and communal subjects be established (Gibson-Graham, 2003: 157)? An increasingly large free public goods and services sector could well cohabit in a plural economy with employment in cooperatives, paid independent work, and the wage-earning of the commercial sector. However analysis of peer production typically eschews mundane considerations such as living wages, benefits, job security, working conditions, work-induced medical conditions, and debates on labour organization. How can peer production operate as a sustainable practice enabling people to live, if labour and work issues are not formally addressed?

To advance this agenda, the tenth issue of the Journal of Peer Production, titled Peer Production and Work, calls for papers in two linked areas:

Peer production in a paid work society*

Nowadays firms attempt to monetize crowdsourced labour. The paradigmatic example is Amazon’s Mechanical Turk labourers (popularly known as "Turker=s", "cloud workers" or "click workers") who accomplish micro-tasks such as tagging and labeling images, transcribing audio or video recordings, and categorizing products. This extreme modularization of work results in their status being that of independent contractors rather than employees with rights, necessitating novel means of protection and redress (Irani & = Silberman, 2013). The so-called ‘sharing economy’ also uses peer production methods, such as the self-selection of modular and granular tasks, to extract ever-more value from the labour of volunteer =prosumers=" (Frayss=E9 & 3680
Capitalist firms are also increasingly engaging with ethical-modular organizations, in some cases paying wages to participants. Such labour is thus both alienated, or sold, and communal, as workers freely cooperate to produce commons. Do traditional categories such as exploitation and alienation still apply?

Topics may include, but are not limited to:
- Peer production and the global political economy
- Peer production and the rise of precarious work
- Peer workers and possibilities for worker organisation
- Does the autonomy of peer workers cause conflict in firms, and how is it resolved?
- What strategies do firms adopt to co-opt peer production (e.g., hackathons)?
- Do tensions around property rights emerge?
- Subjectivity in peer production
- Peer production and intellectual property, coded work

Paid work in peer production projects

How does paid labour affect ethical P2P projects? Mansell and Berdou (2010) argue that firms supporting the work of programmers who contribute to volunteer projects, to the commons, will not affect the cooperative spirit of projects; nor can this support prevent the results of labour from being socialized into commons. Is this always the case?

Topics may include, but are not limited to:
- How do peer projects deal with the presence of paid or waged labour?
- Is this topic discussed within peer production projects? In what way?
- What benefits do paid or waged workers enjoy in peer projects?
- How does paid labour affect peer production projects?

Timeline

300-500 word-abstract due: 30 July 2015
Notification to authors: 30 August 2015
Submission of full paper: 31 December 2015
Reviews to authors: 15 February 2016
Revised papers: 30 April 2016
Signals due: 30 May 2016
Issue release: June/July 2016

Submission guidelines

Submission abstracts of 300-500 words are due by July 30, 2015 and should be sent to work@peerproduction.net. All peer reviewed papers will be reviewed according to Journal of Peer Production guidelines. See http://peerproduction.net/peer-review/process/ for review. Peer reviewed papers should be around 8,000 words; personal testimonies or tales of toil in the Processed World tradition should be up to 4,000 words.

Towards a Digital Social Ontology: Free Day Symposium in London on July 8th (2015-06-09 15:32)

The Social Ontology of Digital Data & Digital Technology
Wednesday, July 8, 2015 from 10:00 AM to 5:00 PM

3682
This innovative symposium brings together leading figures from a variety of fields which address issues of digital technology and digital data. We’ve invited speakers with a range of intellectual perspectives and disciplinary backgrounds who engage with questions relating to digital data and digital technology in their work. Our suggestion is that social ontology, however this might be construed, represents a potential common ground that could cut across this still rather siloed domain of inquiry into the social dimensions of digital technology.

The symposium aims to explore this possibility by assembling a diverse range of perspectives and drawing them into a dialogue about a common question, without assuming a shared understanding of the topic at hand. Our aim is to extend this digitally via twitter, podcast and blog beyond the event itself, in order to facilitate an extended conversation that will draw more people into its remit as it circulates after the symposium itself.

To this end, we invite each speaker to address this theme (the social ontology of digital data & digital technology) in whatever way they choose. Each speaker will have 30 mins to talk and 15 mins for questions. We’ll have an accomplished audio editor on hand to record each talk as a podcast. These will be released on [1]www.socialontology.org and will be circulated on social media in order to try and stimulate a continuing debate around the issues raised at the symposium. The hashtag for the day will be #socialontology.

[2]//eventbrite.com/tickets-external?eid=16315265398 &ref=etckt

[3]Powered by Eventbrite

This event is funded by the [4]Independent Social Research Foundation
Confirmed Speakers:

Chair: Celia Lury (Warwick)

Noortje Marres (Goldsmiths) - Does Digital Sociology have a Problem?
Jochen Runde (Cambridge) - Non-materiality and the Ontology of Digital Objects
Alistair Mutch (NTU) - Organizational Implications of Digital Data
Susan Halford (Southampton) - title TBC
Nick Couldry (LSE) - title TBC
Emma Uprichard (Warwick) - title TBC

Are you a PhD student or early career researcher interested in social ontology? (2015-06-09 15:32)

Centre for Social Ontology PhD/ECR Conference
June 23rd, University of Warwick, 10am – 4pm

Social ontology is integral to the study of society. It is impossible to inquire into the social world without some understanding, at least tacitly, concerning the entities which make up that world and their properties and powers. However social ontology remains an often confused and contentious matter within the social sciences.

The first Centre for Social Ontology PhD and ECR conference seeks to address this matter through papers exploring the role of social ontology within sociology.

The conference is open to all PhD students and Early Career Researchers with an interest in social ontology.
Schedule

9:30 to 10:00 — Welcome and coffee

10:00 to 11:30 — 3 papers

- Jonathan Beacham: Mixed Method Ontologies and Dialectical Futures
- Adam Wood: Why Architecture Needs a Social Ontology
- Giulia Lasagni: Mutual Recognition and Social Commitment

11:30 to 11:45 - Coffee

11:45 to 12:45 - 2 papers

- Janet Lord: What does it mean to be a teacher? A critical realist approach.
- Kalok Yip: IHL and IHRL – Convergence of Laws, Conflation of Ontologies

12:45 to 13:30 - LUNCH

13:30 to 15:00 — 3 papers

- Gry Cecilie Høiland: Using a critical realist approach for studying the implementation of a work inclusion policy measure at the front lines of the Norwegian Labour and Welfare Agency - methodological implications
- Michael Bauwens: What is social ontology (not)?
- Michael Edward Walsh: title TBC

15:00 to 15:30 - Coffee

15:30 to 16:30 - 2 papers

- Maryam Al Mohammad: Towards building a researcher methodological habitus
- Sara Melo: Exploring the ontology of patient safety

This event is funded by the Independent Social Research Foundation

Questionable university advertising #1 (2015-06-09 15:41)

In this new feature we’re collecting examples of questionable university advertising. Get in touch (mark@markcarrigan.net) if you’d like to share some advertising you’ve seen.
I saw this at Sheffield train station in June 2015. I found the premise of the advert fascinatingly weird:
"We Can More Or Less Know What You’re Thinking About" (2015-06-09 15:49)

Gayatri Spivak on Still Pushing for the Humanities (2015-06-11 08:03)

LSE Gender Institute: Professor Gayatri Spivak speaking on June 29th.

Still Pushing for the Humanities
In this lecture, Professor Gayatri Chakravorty Spivak will explore the importance of teaching the humanities at both ends of the spectrum: post-tertiary at Columbia and elementary on the Birbhum-Jharkhand border. She examines how being taught the humanities can provide a critical route to social justice for today’s youth within globalization.

Date: Monday 29 June 2015
Time: 6.30-8pm
Lectureships in The Theory and Methods of Social Futures (2015-06-11 08:07)

Lectureship (x2) in The Theory and Methods of Social Futures
50th Anniversary Lectureships
Starting Salary between £33,242 - £39,685 *
Closing Date: Tuesday 30 June 2015
Interview Date: To be confirmed

Lancaster University is seeking exceptional people to help set up and develop a major new Institute for Social 3688
Futures, co-directed by Professors John Urry and Linda Woodhead. This interdisciplinary Institute is concerned with examining the nature of multiple, complex and interdependent social futures.

In the first 2 years you will concentrate upon research while in subsequent years you will develop UG and PG teaching and administration in a relevant Lancaster University department(s). A strong interest in social futures is expected, as well as a PhD and excellent research outputs and grant promise. Grounding in social science is expected, but we are mainly looking for innovative researchers working across disciplines, and with interests in interdisciplinary research.

Appointments will normally be made with starting salaries in the range £33,242 - £39,685 but appointments may be made at a more senior level including Senior Lecturer/Reader

Great to see all the sessions from [1]this immensely oversubscribed event at LSE now available as videocasts:

Ayn Rand on Love and Happiness (2015-06-11 14:34)

As much as I dislike the ideas of Ayn Rand, I think this animation is marvellous. I'd love to see something along these lines exploring the ideas of C. Wright Mills:

[IFRAME: 1]https://www.youtube.com/embed/mQVrMzWtqgU
Recently I have been catching up on publications about diversity, ethnicity and multiculturalism. The following books, written or edited by academics from a range of backgrounds including the Social Sciences, Geography, Population Studies have provided a broad and engaging insight into contemporary academic debates and discussions in the UK and abroad. The books are accessible to all interested in modern multicultural in society, and in particular useful for those interested in gaining an in-depth understanding of the evidence about race and migration, in order to learn about how to effectively challenge the pernicious myths that perpetuate racial inequalities and racism in local, national and international landscapes.

'Sleepwalking to segregation'? Challenge myths about race and migration
- Nissa Finney and Ludi Simpson (Policy Press, 2009)

Finney and Simpson, of University of Manchester, discuss contemporary UK media and political debates about migration and race showing us that many of the prevailing ideas that are perpetuated particularly by right-wing factions of polity and media are actually dangerous myths and generalisations. Statistics about immigration, race relations and integration are being utilised to scare-monger, rather than being used fairly and openly, as the authors advocate. Evidence is frequently ignored by those pursuing a pessimistic agenda. Evidence is "selectively presented, at times ignored and at times creatively invented", resulting in myths and distortions when it comes to issues of race and migration. Myths about segregation, ghettos, immigrants and Muslim terrorists are seeping into the public imagination. Worrying still is that academic research slips into a discourse – which is subject to "exaggeration and untested assumptions" about 'problem' immigrant areas. The authors are concerned by how spokespeople from the media and institutions such as polity, as well as MigrationWatchUK, are prone to "repeating claims without concern for their truth".

The authors focus on presenting the evidence we should know about multicultural Britain. Finney and Simpson argue that the current pessimism about Britain as a failing, ailing segregated and ghettoised society is "unnecessary and unwarranted". They want us to think about alternative ways of discussing race and migration in modern Britain. They support equality of treatment as the basis for respect, as well as action against racism, and
ensuring promoting of the rights of refugees. The authors discuss how ethnicity/race is defined/measured in this inaccurate storytelling about the state of modern multicultural Britain. Selective reporting represents communities and schools that are segregated, yet Finney and Simpson show that these communities and schools could equally be described as mixed, if certain evidence was used fairly and openly, instead of through selective ignorance and abuse of statistics. "Overstatement and oversimplification" are two ways that lead to abuse of statistical evidence on race and migration. If the growth of segregation is a myth, as shown by the authors, then they argue that multiculturalism is a "legitimate option in social policy".

The book is very useful for those reading up on and researching multicultural Britain, as it provides you with the myth-breaking that is urgent and necessary in challenging the current climate where moral panics and hysteria are provoked by some media and political players. The authors also provide the readers with a summary of much needed arguments and evidence at the end of the book to be used as a reliable reference source. Although the book principally concentrates on Britain, there is information provided about France and North America in relation to how data on race and ethnicity are utilised, thus giving the reader some comparative perspectives.

Lived Diversities: Space, Place and Identities in the Multi-Ethnic Society – Charles Husband, Yunis Alam, Jorg Huttermann, Joanna Fomina (Policy Press, 2014)

"What do we expect of people who share life in specific neighbourhoods?" (p5)
The book successfully explores the concept of co-existence within a contemporary multi-ethnic urban specific space, bearing in mind that the global and the local are not mutually exclusive but often interdependent concepts in the study of modern societies. Co-existence and ethnically diverse cities are not new phenomena (for example, convivencia was commonplace in Muslim Spain), and the authors aim to contribute to current literature on belonging to a multi-ethnic locality through their detailed focus on Manningham, which is an area (in the city of Bradford) often viewed negatively in public discourses by those external to the area, but desirable to those inhabiting this place. The key strength of this collaborative text is that the multiple authors contest deficit discourses (on the part of the government and the media) regarding diversity in Britain by showing us how the locals make meaning from multi-ethnic belongings; moreover, the diverse demographics of Manningham can be used to critique the "essentialising language of government" (p10). Manningham "has its own distinctive history, which includes a long history of different flows of migration" (p34), and thus the authors are able to show us that census data alone cannot provide an accurate picture of the daily diversities of the people in this locale.

Ethnicity has come to be understood as more than a "mere convenient marker of interesting difference between citizens", for it is a "powerful means of coding a complex web of conceptions of superiority/inferiority, entitlement/disenfranchisement and closeness/distance" (p3). Unfortunately for contemporary British society, political and policy rhetoric have "racialised the experience, and conception, of coexistence in multi-ethnic urban settings"(p3). Bradford – and Manningham – have been racialised too as "Pakistani" places, yet the authors present a place that has a great Polish presence too. The authors also report interview findings that show the nuances of how both majority and minority ethnic Manningham residents perceive their everyday lives and identities: as a safe and familiar space of settlement for some Muslim South Asians, as a cosmopolitan place according to some local White people, or some White people who feel they are a "self-conscious minority" (p81).

Language employed nowadays in relation to ethnic diversity – pejorative words like "conflict" and "challenge" create an image of "disaffected and inadequately assimilated minority groups destabilising urban life...inherent pathologies in their way of life that have rendered them a dysfunctional and threatening presence in our urban landscape" (p4). The authors bring to the forefront the lived realities of the residents of Manningham by providing a detailed description of the streetscape, as well as the historical and physical factors that impact upon the everyday interactions of the local people, in order to challenge negative stereotypes about the area.

A highly engaging chapter of the book introduces the interplay between masculinity, urban life, ethnicity and the automobile – what is the symbolic significance of the car in the lives of the Manningham residents, and how does this relate to issues of identity? This "vibrant and, at times, overpowering car presence" (p198) is explored to make sense of as the authors highlight how "part of the story rests in the rich texture of meanings that car ownership has for some of Bradford's Pakistanis" (p149):

"It is a physical presence that has the capacity to trigger acute moments of inter-ethnic sensibility that may be characterised by envy, suspicion, resentment and anger, each with the associated attribution of legitimating beliefs about the character and intentions of the car driver/owner" (p149).
Book Review: Muslims, Schooling & The Question of Self-Segregation

The Sociological Imagination (2016-01-16 20:18:18)

[...] and political rhetoric about segregated ghettos and cultural clashes lack empirical evidence; when statistics and claims, even those presented by academics and well-intentioned government organs... Similarly Muslims, Schooling & The Question of Self-Segregation by Shamim Miah deconstructs [...] 

Land of Strangers – Ash Amin (Polity Books, 2012)

Ash Amin’s book focuses on how we live as strangers in modern society: the stranger who resides in hybrid modern Western societies “with their heterogeneous populations and cultures, they exist as gatherings of strangers – home grown and migrant”. He is fascinated by the gaps between the singularity and plurality, how social beings are subject to processes and practices of inclusion or exclusion, how society can be regarded as hybrid or otherwise,
and how “the stranger is not afforded air to breathe”. Amin argues that we need to develop a discussion around the existence of the society of strangers to understand the nature of modern multicultural society, as well as its potential.

Amin aims to expand a discussion on this very fascinating type of belonging to a society of strangers, as well as the fate of the stranger in modern Western cosmopolitan society, for he believes that studying the land of strangers would help us to understand modern multicultural globalised society, instead of narrowly focusing on the discourses about social integration and social cohesion. Amin concentrates upon the different ways that the stranger is defined and labelled as an outsider, as not belonging, and as the racialised Other by referring to “an intricate and often interwoven set of biopolitical, behavioural and affective forces that are simultaneously ingrained and unstable”.

Negative commentary on multicultural society places strangers and minorities in precarious positions, and calls for assimilation and promotes exclusion. The book highlights how calls for reviving nationalism is “regressive for its veiled xenophobia and exclusionary nostalgia, and unrealistic for its denial of the plural constituency of modern being and belonging”. In Europe, we observe the rise of “aggressive political demagoguery, targeting minorities, immigrants and democracy itself” which is worryingly no longer the sole domain of far right extremists but it is witnessed in “mainstream political forces trying to appease national majorities that have been destabilized by growing economic and welfare insecurity, cultural and ethnic mixity, and future uncertainty”.

The book also explores the meeting of strangers in workplaces, the concepts of social ties and situated practice in the work place, where learning and creativity can be priorities. Trust, loyalty and mutuality in workplace settings point towards virtues of social encounters and community. Furthermore, we learn about “urban technologies, infrastructures and aesthetics” relate to how strangers belong to modern society”. A “flourishing and dissenting public sphere” is argued to be a legitimate place to encourage shared encounters, participation and engagement.

The imaginary notion that British society exists as a homeland “with its own people, known and loyal to itself (and distinct from strangers from another land) remains vice-like”. And thus Amin questions this vice-like grip of imaginary territorial belonging by exploring whether modern multicultural societies are actually cohesive because of “plural publics and as the result of active work by collective institutions, integrating technologies, and constructed narratives and feelings of togetherness, rather than around givens of historic community?” We cannot simply rely on these notions of historical territorial belonging when we consider how there are a vast range of belongings: local, national, virtual, postcolonial and transnational.

Stop the Arms Fair: Conference at the Gates A Workshop on Militarism, Resistance and Academic Praxis
(2015-06-12 08:52)

Call for Papers

Stop the Arms Fair: Conference at the Gates
A Workshop on Militarism, Resistance and Academic Praxis

Where: ExCeL Centre, East London, E16 1XL
When: Thursday 10th September 2015
This September arms dealers from around the world will congregate in London's ExCeL Centre for the DSEi arms fair. As one of the world's largest arms fairs, DSEi brings together over 1,500 arms companies and military delegations from over 100 countries. On display will be everything from crowd control equipment to machine guns, tanks, drones and even battleships. It is a crucial event in the business of the international arms trade, and the deals done here play a major role in reinforcing Western militarism, fuelling conflict, repressing dissent and strengthening authoritarian regimes across the world.

The Stop the Arms Fair coalition have called a week of action at the venue to disrupt the setup of the arms fair. On Thursday 10th September, the protests will focus on the relationship between militarism and education. As part of this day, there will be an open air academic workshop at the gates of the ExCeL Centre. The aim is to build networks of solidarity in opposition to the arms trade, to explore forms of academic practice that don't stop at the university walls, and to directly disrupt the setup of the arms fair. Blurring lines between theory and practice, academics from a range of disciplines will gather at this event to explore issues and ideas relating to contemporary militarism and global politics.

Papers, presentations and performances are welcome on any theme. However, we particularly encourage contributions that focus on aspects of conflict, security, militarism and warfare, and those which engage the politics of protest and resistance. Possible topics include:

- The political economy of the arms trade
- The militarisation of police and security forces
- Contemporary imperialism and colonialism
- The gendered politics of conflict and militarism
- The neoliberalisation of war
- Militarism in everyday life
- Prospects for resistance during the second Tory government
- The Egyptian Revolution: five years on
- Resisting new strategies of repression
- Peace movements and anti-militarism

Presentations should be between 10 and 15 minutes. Please send a title and a short bio to chris_ross-dale@hotmail.com by the 10th July 2015. Alternatively, let us know if you would like to attend/be kept informed of further developments, but don't wish to give a presentation.

Further details will be announced nearer to the time.

---

**Food, poverty and policy: evidence base and knowledge gaps (2015-06-12 08:53)**

**BSA Food Study Group ￿ SPERI event**

Tuesday 30th June 2015, 09:00-17:00

Interdisciplinary Centre of Social Sciences, University of Sheffield, S1 4DP

3696
Plenary session with: Geoff Tansey, Chair of the Fabian Commission on Food and Poverty; Niall Cooper, Director of Church Action on Poverty; and Elizabeth Dowler, Professor of Food and Social Policy, University of Warwick

Book Now - booking deadline 20th June 2015

In the current era of austerity, with high costs of living, stagnating incomes, and rising levels of inequality the question of how well all people are able to eat is increasingly urgent. In this context a growing body of UK research addresses the extent and experience of household food insecurity. Yet despite this evolving evidence base there has as yet been little discussion between academic researchers themselves, or between academics, policy makers and practitioners, about what this wealth of research adds to knowledge and how it may be able to play a stronger role in influencing effective policy interventions.

This day-long workshop will bring together leading sociological and other researchers, policy makers and practitioners to showcase cutting-edge findings, take stock of the research available and reflect on the implications of what we know. The day will also highlight key gaps in our evidence base that need filling and explore the cross-overs between different disciplinary and sub-disciplinary approaches and between non-academic researchers, practitioners and the academy.

In the closing session Liz Dowler, Geoff Tansey and Niall Cooper will reflect and elaborate, in discussion with the audience, on the history of food insecurity in UK public policy, the relationship between evidence and policy in this field and the increasingly important role of civil society organisations in influencing the agenda.

Booking closes on Friday 20th June. Click here for practical information.

More questionable university advertising (2015-06-12 18:38)

This one from Cem Selvi. There are no English subtitles but, as he points out, "You do not really need to understand though :-()". I agree.

More questionable university advertising please! Send your examples to mark AT markcarrigan.net or on twitter @mark_carrigan

Masculinity, Labour and Neoliberalism: Working-Class Men in Global Perspective
Editor: Charlie Walker, University of Southampton, UK

The social position of working-class men across the Western world has been transformed in recent decades. In material terms, the replacement of industrial sector jobs by unemployment and hyphenated forms of service work has all but removed old pathways into a respectable working-class masculinity for young men, while even those retaining a position in skilled manual labour find themselves worse off than their fathers had been relative to the rest of the workforce. Furthermore, both young and older working-class men are not only the losers of neo-liberal transformation, but are commonly depicted as its enemies, apparently unable and unwilling to heed the prevailing rhetoric of responsibility, flexibility, and self-improvement that has come to dominate life domains from employment and education to health, consumption and leisure. Having once been valorized for their authenticity and resistance, working-class men are often pathologized as part of the newly abject, left behind in the last modernity and without a legitimate place in the present.

While such notions have been a mainstay of popular and policy discourses, the academic literature exploring the making of masculinity amongst working-class men has presented a range of portraits illustrating not their inflexibility, but the structural and institutional barriers to the forms of self-invention now expected of them. This book intends to build on this literature, exploring the active ways working-class men construct and perform masculinities in the context of wider shifts towards individualization and self-making associated with processes of neoliberalization. Crucially, since such processes are not confined to the core countries of Western modernity, the book adopts a global perspective, inviting contributions addressing the lives of working-class men in countries across the world. Following attempts to understand how re-constructions of hegemonic masculinity have both reflected and been central to the cultural and economic projects of neoliberal globalization (Connell and Wood 2005), the book seeks to explore the ways in which working-class masculinities across a range of countries have been re-positioned by these same global processes, and the ways men have negotiated this through forms of adaptation, resistance and rejection. While the impact of transformations in employment is a central concern of the book, it seeks contributions that understand constructions and performances of masculinity as multi-sited, being enacted not only within and through formal spheres such as employment, training and education, but also in informal work, family life and leisure.

Abstracts of around 500 words should be sent to Charlie.Walker@soton.ac.uk by Friday 3 July 2015.

Talking ourselves through the working day (2015-06-13 11:58)

After seven years of studying the internal conversation, it still surprises me how sceptical many sociologists are of its existence and/or significance. This scene from the Sopranos is a great illustration of how quotidian the internal conversation often is: [1]Vito’s work. Unfortunately embedding is disabled by request on the YouTube video.

Perhaps Sociologists can learn from the wisdom of Tom Waits (2015-06-13 11:59)

"They say that I have no hits and I’m difficult to work with. They say that like it’s a bad thing" - Tom Waits

A world without foundations: Politics, society and history in post-foundationalist thought (2015-06-14 09:13)

A world without foundations:
Politics, society and history in post-foundationalist thought
September 23 & 24, 2015 / Universidad Diego Portales, Santiago de Chile
Keynote speakers:
Oliver Marchart (Academy of Arts Düsseldorf, Germany)
Martín Plot (CONICET/IDAES-UNSAM, Argentina)

* The abstract submission deadline has been extended until June 21, 2015 **

In political as well as scientific debate, not having "foundations" for the things one says or does is often considered as indicating a failure to comply with certain moral or epistemic standards, as it suggests the absence of grounds upon which one’s words and actions may be interpreted, evaluated and justified. In view of this fact, it may seem surprising that "post-" or "antifoundationalism" has become established as a label and general description for a particular strand of contemporary philosophical, political and social thought. The term designates a kind of thinking that conceives the human being, society, history, or the cosmos at large as lacking any fixed ground or telos (revealed divine precepts, universal moral and political principles dictated by reason, immutable laws of nature, etc.), a thinking that insists on the contingency, fragility, and plurality of our modes of living. Thinkers as diverse as Arendt and Foucault, Laclau and Deleuze, Agamben and Badiou—to name but a few of the most prominent—have been associated with this description.

This conference is intended to explore the very idea of anti- or post-foundational thought from an interdisciplinary perspective (including philosophy, sociology, politics, history, among others). More specifically, it seeks to discuss the various challenges that this way of thinking confronts. How can one think without solid foundations? Can such an approach be consistently carried out, i.e., can it avoid the risk of self-contradiction? Does it lead to the sterile conclusion that "anything is possible" or "anything goes"? Are the thinkers who commonly receive the label adequately understood in this way?

The conference invites proposals for presentations in English or Spanish. We welcome submissions of extended abstracts of around 500 words, or else of complete papers. They should be prepared for blind review and sent to coloquio_sin_fundamentos@mail.udp.cl. The deadline for submissions is June 21. Notices of acceptance will be sent by July 6.

The conference is hosted by the Instituto de Humanidades and the Facultad de Ciencias Sociales e Historia of the Universidad Diego Portales. For additional information, please contact the organizers, Rodrigo Cordero and Wolfhart Totschnig, at the email address above.
How many twitter followers does it take to run for President? This interesting feature on [1]the National Journal shows how the once marginal role of social media in election campaigns has become hugely prominent:

Democrats

[2]Hillary Clinton: 883,292 Facebook likes, 3.6 million Twitter followers, 119,000 Instagram followers, and 25,273 YouTube subscribers

[3]Bernie Sanders: 545,897 Facebook likes, 60,700 Twitter followers, 9,634 Instagram followers, and 1,669 YouTube subscribers

[4]Martin O’Malley: 70,822 Facebook likes, 74,500 Twitter followers, 1,517 Instagram followers, 539 Youtube subscribers, and Snapchat

Lincoln Chafee: 7,216 Facebook likes, 16,600 Twitter followers, 93 Instagram followers, and 63 YouTube subscribers

Republicans

[5]Rand Paul: 2 million Facebook likes, 628,000 Twitter followers, 27,200 Instagram followers, 6,352 YouTube subscribers, 1,664 Vine followers, 133,559 Google+ views (account does not give followers), and Snapchat
Ted Cruz: 1.2 million Facebook likes, 415,000 Twitter followers, 7,133 Instagram followers, 5,364 Vine followers, and 22,489 YouTube subscribers

Marco Rubio: 877,283 Facebook likes, 745,000 Twitter followers, 13,000 Instagram followers, 3,726 YouTube subscribers, 212 Pinterest followers, Snapchat, and a Tumblr.

Ben Carson: 1.5 million Facebook likes, 354,703 Twitter followers, 15,700 Instagram followers, 1,371 Vine followers, and 10,693 YouTube subscribers

Carly Fiorina: 3,946 Facebook likes, 670 Twitter followers on her campaign account and 370,000 followers on her personal account, 176 Instagram followers, and 319 YouTube subscribers

Mike Huckabee: 1.7 million Facebook likes, 369,000 Twitter followers, 4,106 Instagram followers, 298 YouTube subscribers, and 76 Google+ followers

Rick Santorum: 261,297 Facebook likes, 232,000 Twitter followers, 2,217 Instagram followers, and 2,992 YouTube subscribers

Lindsey Graham: 113,826 Facebook likes, 18,200 Twitter followers, 638 Instagram followers, 84 Google+ followers

Rick Perry: 1.1 million Facebook likes, 292,000 Twitter followers, 2,458 Instagram followers, 1,029 YouTube subscribers, and Snapchat

George Pataki: 15,585 Facebook likes, 41,900 Twitter followers, 44 Instagram followers, and 103 YouTube subscribers

In a fascinating paper from 2008, Michael Burawoy wrote an Open Letter to C. Wright Mills. You can read it online [1]here but I wanted to share this insightful passage which stood out to me:

But recognizing the link between social milieu and social structure does not mean crossing the line, turning personal troubles into public issues. Knowing that my unease or malaise is due to anomie in society, or knowing that I’m without a job because I live in a world of unregulated capitalism does not necessarily lead me to turn my personal trouble into a public issue. In fact, knowing the power of social structures is just as likely to paralyze as to mobilize. Indeed, sociological insight may even be universal but that would not guarantee bringing personal troubles into the public sphere. This is your first scholastic fallacy—that knowledge is liberating. Today, following Michel Foucault, we are more likely to follow the bleak hypothesis that sociological knowledge is disabling, incapacitating, a form of control. I know you saw that sociology could be used to serve power, as in your article "A Marx for managers", but you thought that if sociologists were independent then their sociological imagination was liberating. Not necessarily so.
I've written about this as the 'fallacy of amelioration': the notion that all it takes to solve social problems is the improved circulation of expert knowledge concerning their resolution. It's a surprisingly common assumption and I'm surprised to find myself agreeing with Burawoy that Mills ascribed to a version of it. This surprises me because this concept is one I came to from reading the latter's work about professional socialisation. I see the fallacy of amelioration as one that goes hand-in-hand with the tendency to slip so readily into unintelligibility so pithily identified by Mills. It's a professional conceit, emerging through years of training that don't quite ensure a secure social status, allowing the sociologist to ignore the messy and ambivalent business of politics by arming them with the confidence that these problems would be solved *if only people would listen to us.*

I shall read this article with great interest! Thanks.

Sociological Imagination (2015-06-16 08:18:07)
it's good!

Dr. Muhammed Asadi (2016-04-12 05:39:34)
The author of the letter misunderstands the entire concept behind personal troubles and public issues as for the powerlessness due to structural forces, Mills wrote, "The powers of ordinary people are circumscribed by the everyday worlds in which they live, yet even in these rounds of job, family, and neighborhood they often seem driven by forces they can neither understand nor govern." and "The more we understand what is happening in the world, the more frustrated we often become, for our knowledge leads to feelings of powerlessness. We feel that we are living in a world in which the citizen has become a mere spectator or a forced actor, and that our personal experience is politically useless and our political will a minor illusion." To translate personal troubles into "public" issues means being aware of social structure and the structural underpinnings of your troubles instead of self blame, to translate public issues into personal troubles means being aware of your biography as societally enacted. There is no fallacy on the part of c.w.mills, just ignorance on the part of his detractor.
I must say, I agree. At the early stage in the book where Mills makes these claims, he also claims that sociology realizing its concept or 'fulfilling its promise' requires that it first sweep the decks of poor theory. But it is not true that Mills is claiming this would be sufficient - just that it would be necessary for social change. Arguably this claim is correct - certainly it appeared to be Marx's and, among many others, my belief.

Marcin Grodzki (2016-07-20 17:42:22)
Just read Burawoy's letter. Must say that it is typical for leftist sociologists in their study of Mills' work to skip Character and Social Structure, which no doubt stands as the theoretical primer for much of his post 1956 work, and without which the theoretical basis for those other works remains hidden (one would think that especially in a class on theory one would begin with the most theoretical work of his corpus but no!). Ideological analyses of the ideological project of "public sociology" aside, which Mills understood as the practice of "political philosophy" (old discipline which in vain tries to combine the role of sociologist as theoretician of certain cultural systems with the role of moral philosopher and the role of ideologue), it seems to me that any criticism of Mills' work must meet on the ground of the critique of the theoretical scaffolding contained in the Character and Social Structure and worked out in other books, otherwise it's just a newer generation of scientific ideologues talking to their past heroes of how to do political philosophy without the benefit of them answering back, but there is little theoretical and methodological advancement beyond their heroes...

Dr. Muhammad Asadi (2016-07-25 20:43:31)
Not true. Biography and Structure relationship which is what the Sociological Imagination is all about and is well known and discussed, is what Character and Social Structure is about. Because political philosophers like Nietzsche lacked an understanding of Social Structure, Mills found their work defective, something he also stated for Dewey. Character and Social Structure is primarily more about Mead, Marx and Weber and not Mills' theoretical underpinnings which were vaster, as in the pieces he reproduced in "Images of Man."

Marcin Grodzki (2019-01-23 22:06:00)
Character and Social Structure is a synthetic theoretical work in what Gerth and Mills called "the psychology of social institutions." What Mills called biography and history corresponds to the study of biographies as "character structures" and the study of history as structured by the institutional social structures discussed in part 3 of the Ch & S.S.; the last part of the work deals with "dynamics" and "trends." Mills' other sociological works are monographic studies of particular strata of the U.S. institutional social structure. They can be read as application of the theory to particular segments of the U.S. society. Agents who are part of these strata are studied based on the role theory presented in Ch & S.S...

Traditional public sociology vs organic public sociology (2015-06-15 08:03)
Another interesting passage from the [1]Open Letter to C. Wright Mills by Michael Burawoy:

But how should we talk to publics? Your modus operandi, I have to tell you this, is to talk down to publics. You place yourself above publics. In fact you don't believe there really are any publics except the New York intellectuals that surround you. For the rest you have mass society, atomized, deceived, and manipulated individuals. It's as if making direct contact with people would contaminate you or your thoughts. There is a deep elitism in your detachment. You represent what I would call traditional public sociology — books written for but not with publics.
There is another type of public sociology, what I call organic public sociology, in which the sociologist steps out of the protected environment of the academy and reaches into the pockets of civil society. The organic public sociologist enters into an unmediated dialogue with neighborhood associations, with communities of faith, with labor movements, with prisoners. If, for traditional public sociology, publics, say the readership of The New York Times, are national, thin (people hardly aware of one another), passive, and mainstream, the organic publics are likely to be local, thick, active and often counter-public.

Benjamin Geer (2015-06-16 09:02:39)
As much as I approve of Burawoy’s call for unmediated dialogue with counter-publics, I’m a bit uneasy with the idea of criticising academics for ‘talking down’ to laypeople. When medical researchers tell people to quit smoking, is that ‘talking down’?

Sociological Imagination (2015-06-20 15:09:58)
Point well made

**Government Interference in Academia (2015-06-15 16:36)**

Last week there was a conference that took place at the University of Bath: *Understanding Conflict: Research, ideas and responses to security threats*.

[1]The programme included:

- The Historiography of Terrorism by Marc Sageman, former CIA Operations Officer
- Killer Drones as a Weapon of Empire Terrorism by Scott Poynting, University of Auckland
- Problems and Pitfalls of ‘Preventing Extremism’in Britain’s Education System by Katy Sian, University of Manchester
- Extraordinary Extradition: Exploring Race and Citizenship in the Context of the War on Terror by Nisha Kapoor, University of York
- Pushed Out: A Practitioners Assessment of the Role the State Plays in the Process of Disenfranchisement by Asim Qureshi, CAGE

[2]and many other presentations on counter-terror, conflict and Islamophobia.
Professor David Miller and Narzanin Massoumi have written about the problems of government agencies interference in university research, published in today's Guardian:

“We have experienced pressures about who should speak at the event and who should be allowed to attend, for example the police asked for the list of all delegates (which we did not supply). We had a number of speakers from civil society and Muslim groups, often attacked by the conservative press, government ministers and the Twittersphere. These included Moazzam Begg from Cage, the civil rights organisation which works with terrorism suspects, and a representative of Tell Mama, which monitors anti-Muslim hate crime. But we also had the prominent former CIA official Marc Sageman and counter-terrorism officials from the government’s Prevent strategy (pdf). Also in attendance were two officials from the MoD and even two from the Israeli embassy in London, who reportedly recorded sessions and photographed presentation slides.”

For more on the conference proceedings, check out #iprunderstandingconflict on Twitter.

The Present Situation for LGBTI People in Uganda (2015-06-16 08:24)

The Present Situation for LGBTI People in Uganda - Dr. Frank Mugisha (Executive Director, Sexual Minorities Uganda) Tuesday 16 June, 5.00pm - 7.00pm Yudowitz seminar room, Wolfson Medical Building, University of Glasgow.

On 17 June Dr Frank Mugisha, Executive Director of Sexual Minorities Uganda and Robert F. Kennedy Human Rights Award Laureate (2011), will be awarded the Honorary Degree of Doctor of the University (DUniv) at the University of Glasgow, on Commemoration Day. This award follows Dr. Mugisha’s address as Keynote Speaker at the LGBTI Human Rights in the Commonwealth conference held at the University on Nelson Mandela Day 18 July 2014, as a partnership between Glasgow Human Rights Network, Equality Network, Kaleidoscope Trust and Pride Glasgow.

On 16 June the Glasgow Human Rights Network, in partnership with the Gender and Sexualities Forum, is hosting a special event for Dr. Mugisha to speak on ‘The Present Situation for LGBTI People in Uganda’, regarding, lesbian, gay, bisexual, transgender and intersex people’s experiences. The event will be chaired by Dr. Matthew
'Unnatural offences' concerning 'carnal intercourse against the order of nature' have been prohibited by legal statutes in Uganda since their creation by the British Empire in 1902. In 2009 the 'Anti-Homosexuality Bill' was introduced into the Uganda parliament, initially proposing the death penalty for 'aggravated homosexuality' and known as the 'Kill the Gays' bill. A later revised version removed the death penalty. On 24 February 2014, after the bill's passage through parliament, President Museveni signed the Anti-Homosexuality Act into law. However on 1 August 2014 the Constitutional Court in Uganda ruled the Act invalid due to parliament not being quorate when passed. A further bill called The Prohibition of Promotion of Unnatural Sexual Practices Bill was drafted in 2014.

The event will take place in three parts. First, Dr. Mugisha will make a presentation on the present situation in Uganda and international responses. Second, Dr. Mugisha will engage in conversation with Dr. Waites on several questions, particularly on how the LGBTI movement struggles in Uganda relate to UK and transnational politics and LGBTI activism. Thirdly there will be substantial time for questions and open discussion involving everyone attending; it is intended that this final section will be informal and an open forum, including for activists/NGOs to discuss current developments and collaborative strategies and support.

The event will conclude with a wine reception. If you would like to attend, please register on the Eventbrite site, and bring your ticket.

Event website - to register: http://www.gla.ac.uk/research/az/glasgowhumanrightsnetwork/events/headline_400528_en.html

Facebook site:
https://www.facebook.com/events/406031949580168/

Please share information about this event widely to all relevant networks for human rights, LGBTI and social justice issues.

The venue is accessible. Anyone attending with particular access or other requirements or questions, please contact Matthew.Waites AT glasgow.ac.uk

(HT Pat Lockley)

Call for papers: Open issue

Ada: A Journal of Gender, New Media, and Technology | adanewmedia.org
Issue 9, April 2016

Editors: Radhika Gajjala (Bowling Green State University) and Nina Huntemann (Suffolk University)

We invite contributions to a peer-reviewed open call issue featuring research on gender, new media and technology. We are particularly interested in contributions that exemplify Ada’s commitments to politically engaged,
intersectional approaches to scholarship on gender, new media and technology

Contributions in formats other than the traditional essay are encouraged; please contact the editors to discuss specifications and/or multimodal contributions.

All submissions should be sent by **AUGUST 10, 2015** to editor@adanemedia.org. Your contribution should be attached as a word document. Please use "Ada Open Call Contribution" for your subject line and include the following in the body of your message:

- A 50 word abstract
- Your name
- A mailing address
- Preferred email address.

**Important dates:**

- Deadline for full essays: August 10, 2015
- Open peer review begins: January 15, 2016
- Expected publication date: May 1, 2016

**About Ada:**

Ada is an online, open access, open source, peer-reviewed journal run by feminist media scholars. The journal’s first issue was published online in November 2012. Since that launch, Ada has received more than 200,000 page views. Ada operates a review process that combines feminist mentoring with the rigor of peer review.

*We do not — and will never — charge fees for publishing your materials, and we will share those materials using a Creative Commons License.*

**Information about the editors:**

**Radhika Gajjala** is professor of media studies and American culture studies at Bowling Green State University, Ohio, where she teaches courses in global media, international communication, media and cultural studies and feminist research methods. She is the author of *Cyberselves: Feminist Ethnographies of South Asian Women* and of *Cyberculture and the Subaltern: Weavings of the Virtual and Real*. She has also co-edited *South Asian Technospaces* and *Cyberfeminism 2.0*. She is co-editor of *Ada: A Journal of Gender, New Media, and Technology*.

**Nina Huntemann** is associate professor of media studies at Suffolk University and and co-director of Women in Games Boston. Her research focuses on the intersections of gender, culture and technology, applying feminist theory and cultural production perspectives to the industrial and social practices of digital gaming. She is co-editor of *Gaming Globally: Production, Play and Place* and *Joystick Soldiers: The Politics of Play in Military Video Games*. She is also the associate producer of the film *Joystick Warriors: Video Game Violence and the Culture of Militarism* and produced and directed *Game Over: Gender, Race and Violence in Video Games*, both distributed by the Media
Education Foundation. She is co-editor of *Ada: A Journal of Gender, New Media, and Technology*.

Elites and Urban dynamics: New Perspectives (2015-06-16 08:29)

Wednesday 22nd July

LSE International Inequalities Institute One-day Seminar
*Elites and Urban Dynamics: new perspectives*

10.00-12.00 Session 1: The resurgence of elite sociology

13.00-14.30 Session 2: Urbanism and wealth

15.00-16.30 Session 3: New agendas and Future Research

Location: Room 1.04, 32 Lincoln’s Inn Fields

Booking is essential. To request a place please email Clara Lyons: [c.lyons AT lse.ac.uk](mailto:c.lyons AT lse.ac.uk)

More information: [http://www.lse.ac.uk/socialPolicy/departmentDiary/home.aspx](http://www.lse.ac.uk/socialPolicy/departmentDiary/home.aspx)

The Sociological Review’s Early Career Researchers Event: Working Outside of Academia
Organised by The Sociological Review Early Career Researcher team

For those with a background in social science, career paths do not always followed a straight forward traditional academic trajectory. With the current shortage of entry-level academic jobs and the opportunities in academia being short term or exploitative for recent graduates, many may seek employment outside of the academy.

Social scientists have a lot to offer other employment sectors. Whether you are activity pursuing employment outside of academia or thinking of taking a new direction in your career, this event will provide an insight into the world of social scientists engaged in practice outside the university.

Please join The Sociological Review’s Early Careers Researchers’ event for what is going to be informative and stimulating event.

[1] REGISTER HERE
Speakers include:

Carole McNaughton Nichols (Director at Truth)
Simon Roberts (Stripe Partners)
Kandy Woodfield (Higher Education Academy)
George Julian (Indie researcher)

When: Friday, October 30, 2015 from 1:30 PM to 5:00 PM (GMT)
Where: Friend’s Meeting House, Euston Road, London

Illustrated metaphors for the Postgraduate Research Experience (2015-06-17 10:32)

A lovely feature on the #HullEdD blog: [1]read it in full here.

"I'm not racist, but..." (2015-06-18 07:20)

A few days ago, [1]Sadia Habib posted this excellent cartoon on our Twitter feed:

This [6]sadly defunct website explores the same theme. Many extremely offensive though often strangely interesting examples of "I'm not racist, but..." to [7]read through here:
Joel Tieg (2016-06-13 05:53:36)

Why do people get mixed up between race and ethnicity? Arabs and Persians are both white.

Author Meets Readers: Wendy Brown's Undoing the Demos

Date: Tuesday 30 June 2015
Time: 4-6pm
Venue: Vera Anstey Room, LSE Old Building, Houghton Street.
Author: Wendy Brown (Political Science, UC Berkeley)
Readers: Anne Barron (LSE Law), Nick Couldry (LSE Media and Communications), David Graeber (LSE Anthropology), Anne Phillips (LSE Government).
Chair: Ayça Çubukçu (LSE Sociology)

The argument of Wendy Brown's powerful new book is that neoliberalism is in the process of draining liberal democratic ideals – liberty, equality, legality, popular self-rule – of their distinctively political meanings. Worse, it is filling these terms with new meanings that represent the political as subsumable, like everything else, within a totally 'economised' world, a world ordered entirely by the imperative to maximise capital in all its forms – including
that which is supposedly embedded in human capacities and potentials.

Drawing on, but also departing from, Foucault’s writings on neoliberal governmentality, Professor Brown characterises neoliberalism as a form of calculative reason that is colonising every domain of life in Euro-American societies today: from states and workplaces to educational institutions and households. Warning that both liberal democratic practices and radical democratic aspirations are threatened with extinction by these changes, Undoing the Demos (Zone Books, 2015) focuses particularly on three manifestations of what its author calls 'neoliberalism's stealth revolution': the continued rise of governance as a characteristic modality of rule in the post-democratic state, an ongoing judicial trend towards extending 'human' rights to corporate persons, and tendencies in the organisation and culture of universities that are reducing higher education to little more than a site of human capital formation, justifiable only insofar as it delivers a competitive rate of return on students’ investments in themselves.

On Tuesday, June 30, Wendy Brown meets a panel of readers – Anne Barron, Nick Couldry, David Graeber and Anne Phillips – who will have approached her book from disparate perspectives informed respectively by legal theory, media theory, anthropology and political theory. This event is free and open to all with no ticket or pre-registration required. Entry is on a first come, first served basis. For any queries, email a.barron@lse.ac.uk.

Wendy Brown is Class of 1936 First Professor of Political Science at the University of California, Berkeley, USA, and a Shimizu Visiting Professor in the Law Department at LSE, 2015.
Anne Barron is an Associate Professor in the Law Department at LSE
Nick Couldry is Professor of Media, Communications and Social Theory in the Department of Media and Communications at LSE
David Graeber is Professor of Anthropology in the Anthropology Department at LSE
Anne Phillips is the Graham Wallis Professor of Political Science in the Department of Government at LSE
Ayça Çubukçu is an Assistant Professor in the Sociology Department and in the Centre for the Study of Human Rights at LSE

People Against Neoliberalism: Why We Are Not Okay With This System (2017-08-17 11:28:38)

Dare to Do it Differently: Creative Methods In Gender and Sexuality Research & Public Engagement

Transforming Sexuality and Gender Research cluster event on: Friday 3rd July from 12.00-4.30 p.m, Falmer Campus, University of Brighton

Want to explore beyond well-used methods that reproduce well-established stories about sex, gender, sexuality and relating?

Fancy yourself doing modelling, bad sex writing or as a deep thinker, visual artist or ‘craftivist’? Read on!

Creative research methods can yield narratives different from and phenomenologically richer than interviews, focus groups and surveys. When doing public engagement and dissemination, creative methods can help people think differently about sex, gender, sexuality and relations/relating to challenge popular/media representations.

Having been successfully hosted by the Open University, University of Manchester and Coventry University this half-day FREE event is hosted by the University of Brighton. It will encourage sharing of knowledge and experiences and will explore among a host of other issues:
• creative writing around intimacy, desire, and sex;
• arts-based and performance practices;
• craft, activism and creative play to present narratives;
• tools for collaborative production.

This event would appeal specifically to; PhD Students; Researchers in the Field; Community Partners

(Please circulate as appropriate)

The event is free, but to book a place please visit the UoB online store by clicking on the link below

For further information please feel free to contact us at [2]SexGenCluster AT brighton.ac.uk

2. mailto:SexGenCluster@brighton.ac.uk

We need also a workshop in Austria :)

Porn Studies
Special Issue: Inside Gonzo Porn

This special issue of Porn Studies focuses on contemporary gonzo pornography. Emerging in the United States in the late 1980s and pioneered by directors such as John Stagliano, Seymore Butts, Ben Dover, and Rodney Moore, gonzo constituted both a low budget response and an “aesthetic” alternative to the glossy, plot-oriented feature films produced by companies such as VCA or Adam & Eve. Gonzo established a new “mode” of pornographic expression, taking fiction out of hard-core videos and heading straight for the sex, employing a documentary style – hand-held camera, camera-looks, live recording etc. – in order to enhance the authenticity and the realness of sexual representation (Hardy 2008; 2009; Biasin, Zecca 2009; Fuchs 2011; Tibbals 2014). In doing so, gonzo exacerbated the constant dialectic between the immediate, indexical depiction of the “mechanical truth of the bodily pleasure” (Williams 1989), and its symbolical reconstruction and “falsification” through specific representative and stylistic conventions (Dyer 1985; 1994). At the same time, gonzo pushed hard-core videos increasingly to the “extreme,” bringing sex performances and body practices to become more and more “hyperbolic” (Stüttgen 2009; Biasin, Zecca 2009; Paasonen 2011; Maddison 2012) – and almost completely detached from any sexological “idealism”.

3719
Discursive tensions circulate gonzo – where different and often contrasting perspectives (theoretical and political) on porn representation and sexual agency meet and collide with each other. Some identify gonzo as a violent vehicle for the humiliation of women (Dines 2006; Purcell 2012) and “grotesque degradation” (Langman 2004), a chauvinist and hyper-masculinized “fantasy” of retaliation to women’s social assertiveness. Yet other academics and activists promote a queer, (trans)feminist and subcultural re-appropriation of gonzo as a way to explore new “contra-sexual” body practices (Preciado 2000; Stüttgen 2009), and to displace the heteronormative order (Borghi 2014); for them, gonzo constitutes a film form that can be productively re-employed to express new post-pornographic fantasies and desires, and to open alternative markets of porn consumption (Maina 2014). However, despite its centrality in debates about pornography, gonzo has hardly been examined in depth. This special issue of Porn Studies welcomes essays, interviews, and personal accounts from academics, artists, activists, and adult industry practitioners. Proposals are invited to address (but are not limited to) the following questions:

**Genders/Bodies:** What gender configurations does gonzo perform and (re)produce? What constitution types does it dictate and (re)shape? How are bodies depicted and “treated” in gonzo?

**Actors/Stars:** What performative abilities and what acting techniques does gonzo require? What actor’s personae does gonzo construct? How is a gonzo celebrity built? And what is its social “aura”?

**Styles/Texts:** What are the representative conventions of gonzo? What is its iconography? What are the stylistic features of gonzo “aesthetics”? Is there a gonzo textual “canon”?

**Contexts/Positions:** What are the ways in which gonzo is consumed? And in which contexts? What consumption positions does gonzo activate? And what cultural repertoires does it entail?

**Markets/Business:** How is gonzo positioned within the porn market? How is gonzo produced? What are its business models, its working routines, and its commercial strategies?

**Communities/Fans:** What reception and interpretive communities does gonzo produce? And what are their dynamics? Is it possible to speak about a gonzo participatory fan culture? Is there a gonzo “cult”?

**Tastes/Affects:** Does gonzo produce a distinctive sex taste culture? What fantasies and pleasures does it entail? What affects does gonzo generate? What is its carnal appeal? How could gonzo be embodied by the viewers?

**Global/Local:** How has US gonzo been re-adapted in different national contexts? What are the globalisation/glocalization processes that underlie the international dissemination of gonzo style?

**Submission Details**

Articles for peer-review should be between 5000-6000 words. Shorter thought pieces of approximately 1500-2000 words may also be submitted, and the editors will make a selection for the Forum section.

**Journal Deadline**

The deadline for submission of proposals is September 1, 2015. Please send abstracts of 400 words and a short biographical note to federico.zecca AT uniud.it and e.biasinAT libero.it. Authors will be notified by September 7, 2015 if their proposals have been accepted.

The deadline for submission of full articles is January 18, 2016.

The special issue will be published in December 2016.

**How to Submit**

All the manuscripts must be submitted online. Please consult the Authors and Submissions tab in the journal website for more information, and the Submit Online link is there as well: http://www.tandfonline.com/loi/rprn20#VOomnFPF-#.VOomnFPF-.

**Editorial information**

Guest editor: Dr Enrico Biasin (e.biasin AT libero.it)

Guest editor: Dr Federico Zecca (federico.zecca AT uniud.it)

If it wasn’t for the fact we’ve been going for over 5 years, I’d be tempted to move SI over to [1]Medium. It’s immensely appealing in a range of ways and it becomes more exciting with each passing month. As this talk by the editor-in-chief of one of the most prominent magazines on Medium makes clear, it’s redefining what digital publishing means in an era of social media:

IFRAME: [2]https://www.youtube.com/embed/AyxIQnPEeoc

An interesting post on Deborah Lupton’s blog considering [1]digital data as something we consume. I’m not persuaded by the bulk of the argument, even though it’s thought provoking:

Mol points out that once a foodstuff has been swallowed, the human subject loses control over what happens to the content of the food in her body as the processes of digestion take place. As she notes, the body is busily responding to the food, but the individual herself has no control over this: ‘Her actorship is distributed and her boundaries are neither firm nor fixed’ (Mol, 2008: 40). The eating subject is able to choose what food she decides to eat, but after this point, her body decides how to deal with the components of the food, selecting certain elements and discarding others.

This raises questions about human agency and subjectivity. In the statement ‘I eat an apple’ is the agency in the ‘I’ or in the apple? Humans may grow, harvest and eat apples, but without foodstuffs such as apples, humans would not exist. Furthermore, once the apple is chewed and swallowed, it then becomes part of and absorbed into the eater’s body. It is impossible to determine what is human and what is apple (Mol, 2008: 30) The eating subject, therefore, is semi-permeable, neither completely closed off nor completely open to the world.

Mol then goes on to query at what stage the apple becomes part of her, and whether the category of the human subject might recognise the apple as ‘yet another me, a subject in its own right’ (Mol, 2008: 40). Apples themselves have been shaped by years of cultivation by humans into the forms in which they now exist. In fact they may be viewed as a form of Haraway’s companion species. How then do we draw boundaries around the body/self and the apple? How is the human subject to be defined?
It strikes me that this only works if you hold a ‘subject’ to be something with fixed boundaries and absolute mastery over its inner space. Does anyone actually hold this view? I don’t think even rational choice theorists, surely the strongest advocates of contemporary individualism, would accept such a view. The risk here is of what Andrew Sayer calls a PoMo flip: responding to a problematic position (that may or may not be held by anyone) by flipping to the other extreme while retaining the problematic conceptual structure. This isn’t an obscure matter of ontology because how we conceive of the subject has important consequences for how we make sense of Deborah’s final question:

How are the flavours and tastes of digital data experienced, and what differentiates these flavours and tastes?

This is a fascinating question which I’ve tended to think of as ‘data sensibilities’: how do we develop tastes for different kinds of data? The recent work of Will Davies could be read as, in part, an account of how these tastes changed. We’ve developed a taste for quantitative data about our behaviour that increasingly replaces a taste for qualitative data about our action. Making sense of such changes, let alone the political economy underlying them, necessitates that we identify the variable capacities of the subject to ‘consume’ data, to put it to work in some way, as well as how these tendencies can be influenced by broader social and cultural structures.

Mol’s account is a form of what Margaret Archer calls central conflation: responding to the challenge of analytically unpacking the interface between objectivity and subjectivity by blurring the boundaries between them. Whereas I think Deborah’s question, which seems enormously important to me, necessitates an account of the sequencing of objectivity and subjectivity over time: how we ‘consume’ certain kinds of data, the work to which these are put in our lives and how we change in the process, with effects upon our future data tastes. Here are the questions which such a view would lead to:

- What types of individual data tastes can we identify?
- How did these types of individual data tastes come about?
- What work do these types of individual data tastes do in personal life?
- How do these types of individual data tastes shape the biographical trajectories of individuals?
- What are the aggregate effects of these outcomes for social life as a whole?
- What are the collective effects of these types of individual data tastes i.e. how do they condition social participation and collective action?

Any thoughts much appreciated!

I'm currently reading an excellent book, [1]The Culture of Connectivity, by the media scholar José van Dijck. It has many virtues but her project as a whole really resonates with my interests. Though she doesn't use the term 'ontology', the intentions underlying the book are very much in keeping with those of the symposium on the [2]Social Ontology of Digital Data and Digital Technology (or Digital Social Ontology) which I’m running in London in July:

I propose to look at distinct platforms as if they were microsystems. All platforms combined constitute what I call the ecosystem of connective media—a system that nourishes and, in turn, is nourished by social and cultural norms that simultaneously evolve in our everyday world. Each microsystem is sensitive to changes in other parts of the ecosystem: if Facebook changes its interface settings, Google reacts by tweaking its artillery of platforms; if participation in Wikipedia should wane, Google's algorithmic remedies could work wonders. It is important to map convolutions in this first formative stage of connective media's growth because it may teach us about current and future distribution of powers. (loc 483)

Doing so necessitates that we address the underlying ontological questions in a systematic way: what are platforms? What are their characteristics? What are their causal powers? How are they shaped? How do they change? How do they interact? What are the properties and powers of the emergent wholes? These questions shouldn’t be detached from empirical studies but should rather be addressed in dialogue with them. Such issues are unavoidably addressed in social scientific work on social media but doing so in a systematic way, understanding this as Digital Social Ontology, would help draw partial answers into constructive dialogue and open up a conceptual space within which the "connective approach" advocated by José van Dijck would become easier to sustain, particularly across disciplinary boundaries within what is still a fragmented field of inquiry.

The Interdisciplinary Challenge of Social Media and the Need for Digital Social Ontology | The Sociological Imagination (2015-06-20 15:05:15)

[...] extract from the excellent The Culture of Connectivity which eloquently expresses why I think Digital Social Ontology is necessary, even if the author doesn't use such a term [...]

The Interdisciplinary Challenge of Social Media and the Need for Digital Social Ontology (2015-06-20 15:05)
Another extract from the excellent [1]The Culture of Connectivity which eloquently expresses why I think [2]Digital Social Ontology is necessary, even if the author doesn’t use such a term herself:

One obvious problem with studying the phenomenon of social media is that it involves a multitude of probing angles that each bring along a different academic expertise. If we take the above questions seriously, we need insights from at least six disciplinary perspectives—information technology, social science, humanities, economics, law, and political communication—to open up a panoramic view onto social media. This could well lead to each perspective highlighting one single aspect of the phenomenon. Information scientists are intent on exploring large data sets provided by, for instance, YouTube or Flickr, in order to analyze and design algorithms; social scientists study data to detect patterns of user behavior; academics from the humanities commonly set their minds to examining content and cultural form; economists and MBAs zoom in on business models; legal scholars focus on issues of privacy and intellectual property; and political scientists or sociologists are concerned with social media’s implications for the larger information order. Indeed, many of these disciplinary perspectives yield important research results and fascinating insights.20 The problem, however, is that each discipline moves around in its own orbit of mutually incompatible vocabularies and methodologies. (loc 906)

The Sadistic Irrational Bastards fallacy (SID) (2015-06-20 17:34)

On a couple of occasions I’ve heard Graham Scambler discuss what he calls the 'greedy bastards hypothesis' (GBH):

This asserted that health inequalities in Britain were first and foremost an unintended consequence of the 'strategic' behaviours at the core of the country’s capitalistic-executive and power elite. It is a hypothesis even more plausible in 2012 than it was in the late 1990s.

The term 'capitalist-executive', borrowed from Clement and Myles, contained what I subsequently called a core ‘cabal’ of financiers, CEOs and Directors of large and largely transnational companies, and rentiers. These individuals were perfectly capable of ‘conspiring’ but despite being involved in fierce competition rarely had a need to do so in the post-1970s neo-liberal era of financial capitalism. This cabal, I intimated, has come to exercise a dominating influence over the state’s political elite (that is, the upper echelons of government together with its multifold 'new middle class' tacticians). US historian David Landes’ once asserted that ‘men (sic) of wealth buy men of power’; and my contention was that they got more for their money post-1970s than in the postwar welfare-statist era. So the GBH charged leading capitalists and politicians with what the likes of Engels and Virschow in the nineteenth century called homicide. As Michael Marmot has more recently averred, policies can kill, and when these are reflexively enacted their architects shouldn’t be surprised to find themselves liable to prosecution in the
event of a regime change.

While I think he’s largely correct, I’d like to counterbalance GBH with my notion of the Sadistic Irrational Bastards (SID) fallacy. Put bluntly: we often tend to impute egregious dispositions to those people doing things which we find profoundly disagreeable on a moral level. We exaggerate their deficiencies of character (how else could they do these things if they weren’t evil sadistic bastards?) and correspondingly pay too little attention to how structural circumstances enable actions which have no explanation other than sadism when considered in individualistic terms. SID is morally reassuring. In its most extreme manifestations, it supports conspiratorial thinking where the complex problems of the world are reduced to the Machiavellian machinations of evil men plotting in a room in some secret location. But I think it’s more widespread than this. It underwrites a sense of one’s own righteousness and supports the kind of indignation which can drive valuable protest.

However my problem with it is that it leaves us ill-equipped to make sense of people doing sadistic things who do not in fact seem to be sadists. What’s more, they’re capable of giving reasons to justify their actions. We may dismiss their reasons instinctively or even through careful consideration of their moral and intellectual merits. But adherence to SID leaves a mismatch between our moral experience and our rational appraisal which can be strategically disorientating. It can leave us torn between indignant condemnation and rational acquiesce: allowing us to be content with expressing our contempt without this leading to sustained action. It tends to individualise problems which are not themselves individualistic and supports late capitalist cynicism of the sort described by Zizek: overestimation of subjective disavowal going hand-in-hand with objective complicity.

Benjamin Geer (2015-10-03 08:49:48)
The idea that social problems are caused by ‘bad people’ is a very common kind of folk sociology, and perhaps it’s the basis of all conspiracy theories. It’s dangerous, because it often leads to the demonisation of vulnerable groups, e.g. on the basis of religion, skin colour, nationality, etc. Shouldn’t one of the main tasks of sociology be to combat this folk sociology?
My new favourite way to write (2015-06-20 18:02)

Buy an Alphasmart Neo and do it like this all the time. NO distractions and batteries that last a year. It is so liberating.

Datafication, dataism and dataveillance (2015-06-21 06:43)

The Ace Scholarship #Asexuality (2015-06-21 07:21)

This is an interesting initiative I hadn’t encountered previously:

AceAdmiral (2016-05-05 03:06:20)
This comment is way late, but thank you so much for linking the scholarship solicitation. I really appreciate it!

you’re very welcome!
The conference stream on Radical Transfeminism, London Conference in Critical Thought takes place on Friday 26th/Saturday 27th June at the University College London anthropology department, 14 Taviton Street, London WC1H 0BW.

Against a backdrop of social gains made by mainstream LGBT movements, the reality of trans* lives (particularly for transpersons of colour) continues to be one of material and social struggle, against poverty, deprivation and violence.

While inclusion in existing structures, whether they be social initiatives or current feminisms, is often the focus of the discussion, this stream looks to radicalise the transperspective. This redistribution of emphasis from inclusion in existing centres to the possibility of elaboration from the limits outward, will give the will create the terrain for alliances, strategies, and politics. We propose to look at points of divergence instead of inclusion, both as means to build practices of solidarity, as well as highlight differences of perspective. By emphasising trans* as an open-ended category without a core, a potential radicalisation of perspective and action, as opposed to erasure, is actualised.
The stream aims to address the social, material and political necessity of transfeminism as a radical and potentially revolutionary sphere of thought and praxis. It will address the importance of a transfeminist critique of the limitations of liberal transgender politics that are being rapidly and unquestioningly taken up across the world. It specifically looks to extend transfeminisms beyond rights discourses, and formulate critiques as evolving practices and theories.

Friday 26 June 9:30-11:00 (room 2/TBC)
1. The End Times of a Failed Political Myth - openingspanel by Mijke van der Drift, Chryssy Hunter, Nat Raha.

Friday 26 June 13:45-15:15 (room 2/TBC)
2. Panel: Radical Transfeminist Activism
Mylo Lewis-Norman - Trans* generational sharing as a form of resistance to normalisation
Andy Misandry - I Have No Photo For You - liberal feminism, Germany's Next Topmodel and why it doesn't get better
Raju Rage - Reclaiming Radical Transfeminism: Time- Travelling Trans* Politics In Neoliberal Times
Respondent: Sasha Padziarei
Chair: Mijke van der Drift

Saturday 27 June 13:30 - 16:30 (Panels will happen with a small break in between) room 6/TBC
3. Roundtable: Radical Transfeminism in Communities
Ellis Suzanna Slack - Sexworker transfeminisms
Pum Kommattam - At the margins of margins - the necessity of actual intersectionality and solidarity in transfeminist queer communities
Audrey de Virion & Frankie Hall - The growth and formalisation of radical trans and queer support networks in Brighton, UK
Chair: Chryssy Hunter

4. Panel: Theories of Radical Transfeminism
Charlotte Gage - Reproducing ‘states of injury’ on trans* bodies: How does Wendy Brown's concept help to think through the idea of a ‘wounded attachment’ to the female body in feminism?
Barbara Neukirchinger - Critical Theory, Poststructuralism and the Intersection of Gender and Disability
Andi Sitwell - The politics of gender variance: a queer materialist critique of identity
Chair: Nat Raha

Other Europes: Migrations, Translations, Transformations
MLA International Symposia: Translating the Humanities
Düsseldorf, Germany, 23?25 June 2016

The Modern Language Association of America, the world? s largest professional organization for scholars of literature and language, announces its first conference outside the United States and Canada,
organized in collaboration with the Heinrich Heine University in Düsseldorf.

Europe remains a conspicuous part of the global public imagination and a haunting presence in literary and cultural studies across the globe, even as claims for its centrality continue to be challenged from a variety of political and theoretical perspectives. This conference brings together an international group of scholars and engages the paradigms in and through which they work. It seeks to develop ways of thinking that emerge from and address Europe’s evolving political, economic, historical, and philosophical role in a world of ever-shifting migrations, translations, and transformations.

We invite proposals across a broad range of historical periods and disciplines that engage with literary and cultural texts and practices as they interact with or resist political, economic, scientific, or philosophical models of thought.

Papers might be grouped under the following rubrics:

- Marking time: dynasties, empires, revolutions, republics, regimes; pasts, presents, futures, aftermaths; trauma and memory, ghosts and hauntings; generations; senses? of history; literary times and periods
- European maps: East, West, North, South; city, country, banlieue; center, margin, periphery; borders, boundaries, contact zones; the ?other? within and the ?other? without
- European economies and the economies of European cultures
- European subjects and identities: religions, genders, sexualities, ages, affects, bodies
- Community, nation, migration, mobility, roots
- Precarious lives: citizens, migrants, refugees
- Postcoloniality, decoloniality, subalternity, hegemony, sovereignty
- Languages of Europe; multilingualism; Latin, French, English as lingua francas
- European cultural politics and institutions: the economies of European cultures, book fairs, film festivals, prizes, universities, publication, national cultural organizations such as the Goethe-Institut, the Alliance Française, and the Instituto Cervantes
- Translation, resistance, transmission
- Theory transfers
- Media and genres, old and new
- Transatlantic Europe

The conference will feature several keynote talks and roundtables, as well as traditional sessions with three or four fifteen-minute papers, workshops with precirculated papers, and roundtable conversations based on five-minute presentations. We invite proposals for any of the above formats.
The conference languages will be English, German, French, and Spanish, but papers can be delivered in any language if speakers arrange for written or oral translation within the time frame of the session.

Paper proposals should include the paper title, a 300-word abstract, the speaker’s institutional affiliation (if any), and a 1-page biography or CV.

Proposals for panels, workshops, and roundtables should contain the above items for each speaker, a brief description of the format (including an estimate of how many speakers will participate), and a rationale for the session’s topic(s) and format.

Please send submissions to othereuropes2016@hhu.de. All submissions must be received by 15 August 2015, and participants will be notified of the outcome of the selection process by 15 October 2015.

25 Years of the Cambridge Realist Workshop (2015-06-23 08:26)

A reunion conference, generously sponsored by the Cambridge Journal of Economics, is to be held in Newnham College, Cambridge, 7-9 September 2015, marking 25 Years of the Cambridge Realist Workshop.

Conference Themes

The Conference Theme is 'Social Ontology and Modern Economics'.

There will be no parallel streams, just a series of single sessions. To allow maximum participation of everyone present the sessions will be mostly round tables on specific sub themes, with two or three individuals giving short introductions.

Those already agreeing to introduce various themes or otherwise participate include: Richard Arena, Bruce Caldwell, Steve Fleetwood, Tony Lawson, John Latsis, Paul Lewis, Nuno Martins, Dimitris Milonakis, Leon Montes, Jamie Morgan and Stephen Pratten.

Likely sub themes include (but are not exhausted by):

- Philosophical Ontology (emergence; causal reduction and downward causation; process and evolution; entities and stability; order and co-ordination; practice including language; comparing competing conceptions);
- Ontology and Heterodox Economics;
- Ontology in the History of Economic Thinking;
- Topics in Scientific Ontology (money, technology, gender, the corporation, social relations, institutions, communities, power, trust, rules, collective practices; method for scientific ontology);
- Ontology and Methodology (dialectics/contrast explanation; abstraction; methods of isolation; internal critique; transcendental reasoning);
- Ontology, Ethics, and Moral Conduct.

Conference structure

The conference will start late afternoon on Monday September 7 and most likely end around lunchtime on Wednesday September 9th. There will be conference dinners on both the Monday and the Tuesday evening, with a reception on the Monday. **Registration and other administrative stuff.** A conference fee of £24 (£20 +VAT) will be charged. However this is merely nominal. Participants will thereafter be invited to participate in both the conference dinners plus lunches, etc., without additional charge. Numbers though are limited to about 70 participants, and we do need you to register. In order to register please go to: [1]http://www.cpes.org.uk/events/25-crw/

**Accommodation** Basic (non en-suite) accommodation is available at Newnham College at very reasonable rates (about £48 per night inclusive of VAT). To book a Newnham College room please contact Marilyn Dowling, the Conference and Events Co-ordinator at Newnham College (Sidgwick Avenue, Cambridge CB3 9DF) by email: [2]marilyn@newn.cam.ac.uk (telephone : +44 (0) 1223 335803). Other Cambridge accommodation can be located here (though please check you are not further than you would like to be from Newnham College [CB3 9DF]): [3]http://www.visitcambridge.org/accommodation

Where you stay in College or elsewhere in Cambridge, do please register above first, and make sure you have a confirmation of registration. We are restricted to accepting only the first 70 so to register. **Hardship Fund** We do have a small amount of funding to help those whose situations make it difficult to raise the total costs themselves. Applicants for this should get in touch as soon as possible. Apply, sending details, to [4]CSOG@econ.cam.ac.uk with subject heading 'CSOG funding'.

**Where is the university? #CSOPhD (2015-06-23 11:00)**

A very interesting extract from Gilbert Ryle shared by Adam Wood (MMU) at the Centre for Social Ontology PhD Conference:

A foreigner visiting Oxford or Cambridge for the first time is shown a number of colleges, libraries, playing fields, museums, scientific departments, and administrative offices. He then adds "but where is the university? I have seen where the members of the colleges live, where the Registrar works, where the scientists experiment and the rest. But I have not yet seen the University in which reside and work the members of your university." It has then to be explained to him that the University is not another collateral institution, some ulterior counterpart to the colleges, laboratories, and offices which he has
seen. The University is just the way in which all that he has already seen is organized. When they are seen
and when their coordination is understood, the University has been seen. His mistake lay in his innocent
assumption that it was correct to speak of the Christ Church, the Bodleian Library, the Ashmolean
Museum, and the University, to speak, that is, as if "the University" stood for an extra member of the
class of which these other units are members. He was mistakenly allocating the University to the same
category as that to which the other institutions belong.

methods@manchester Summer School (2015-06-24 00:06)

Interesting in gathering and analysing twitter data?

The Manchester Methods summer school is fast approaching and runs from 6th-10th July 2015 at The University of Manchester.
Booking is essential to secure a place on the summer school courses.
The school will run for one week, and participants will select a single course for the duration of the school. Each course will deliver four days of content to a five-day timetable (Monday afternoon to Friday lunch-time), building on successful methods@manchester and CMIST short-courses given throughout the year. The courses include software training, qualitative and quantitative analysis, area studies, and research design.

We now have seven individual streams available on the methods@manchester Summer School, including courses on social network analysis, mplus, mixed methods research, content analysis, the Rasch Model and our newest addition ‘Researching public and voluntary sector organisations’.

Available Courses:
• Advanced methods for social network analysis (SNA)
• Structural Equation Modelling using Mplus
• Integrated Mixed-Methods Research
• Introduction to social network analysis (SNA) using UCINET and Netdraw
• Content Analysis for Online Data
• Constructing and Validating Measures using the Rasch Model
• Researching public and voluntary sector organisations

Full details of the Summer School, courses and booking requirements may be found at http://www.methods.manchester.ac.uk/events/summerschool
Call For Papers

Social media (from mainstream platforms such as Twitter to organization-specific tools) have become increasingly pervasive. This is exemplified by the diversity of uses ranging from Twitter and Facebook use during the Arab spring to the use of Snapchat by highly surveilled activist groups. Many social movements have increasingly seen social media as a means to collaboratively crowdsource, to network and communicate with diverse stakeholders. In large organizations, social media is often supported because the technology can help foster the sense of a “digital village”, where individuals are able to “see” the lives of others within their organization and feel closer to them.
However, the literature on social movements and social media has not fully grasped just how much social media has fundamentally changed the landscape of organizational communication, ranging from stakeholders being able to directly mobilize resources to making grassroots transnational social movements more organizationally feasible. Social Media, Activism, and Organisations (#SMAO15) seeks to better our understandings of how social media has shaped social movement organizations and the organization of social movements.

We invite you to submit short papers which explore the social media-influenced intersections of social movements and organisations. Full papers are not required for this conference, only short papers (2500 words, excluding references) related to the broad theme of “Social Media, Activism, and Organisations”.

Papers should be submitted by September 7, 2015 via [4]Easy Chair at [5]https://easychair.org/conferences/?conf=smao15 and there is no preset template for submission. If selected, the author(s) will be invited to give a 15-minute oral presentation followed by a 5 min Q &A period at the symposium.

Author(s) of accepted paper abstracts may also be invited to submit full papers to a special issue of The Sociological Review, published by Wiley.

#SMAO15 TOPICS OF INTEREST

- Organisational communication and social media
- Democratizing organisational structures via social media
- Gender, social media, activism, and organisations
- Activist knowledge aggregation techniques
- Enterprise applications and social activism
- Collaboration, social media, and activism
- Virtual teams, social media and activism
- Activist networks and organizational communication
- Social media and organizational leadership
- Communicating organizational messages via social media
• Social media and advocacy organizations

• Inter-movement organizational communication and social media

• Visual social media and organisations

• Implications of anonymous social media

We welcome both theoretical and empirical papers and the symposium seeks to showcase a variety of case studies to advance our understandings of how social media has shaped social movement organizations and the organization of social movements.

New website: Global Social Theory (2015-06-24 00:13)

From Gurminder K Bhambra:

This is just a quick email to let you know about a new website that has been set up on Global Social Theory. I have set this up together with Lucy Mayblin and Lisa Tilley and with expert web design by Pat Lockley.

The intention of the website - organised in terms of concepts, thinkers, and topics - is to provide resources for the teaching of theory from, and in, global perspective. The site is designed to be collaborative and resourced through contributions by students and colleagues. There are a few contributions already live, many promised, and more are needed to make this a fully functioning resource for the teaching (and learning) of global social theory.

If you would be interested in contributing an entry or two to the site, please get in touch with us at

contact@globalsocialtheory.org

If you would like to be more actively involved, then feel free to email me directly about this.
In the aftermath of the terrible events in Charleston, there were [1] politicians attempting to deny the racist nature of the terror that struck the Black people of Charleston, while [2] educators were working hard to challenge the spurious notions of a post-racial USA by directing us towards resources and readings crucial to understanding the persistently pernicious nature of racist inequalities.

[3] #CharlestonSyllabus is a necessary Twitter hashtag directing us to the much needed conversation on the subject of #BlackLivesMatter. Check out the # on Twitter for more useful links and ideas on how to teach slavery, civil rights, South Carolina history and many other related topics from a critical perspective.

The Groomers and the Question of Race (2015-06-24 15:08)

by Shamim Miah
The last decade has witnessed a number of prominent police-led operations relating to child sexual exploitation (CSE) in England. Whilst much of the public discourse related to Operation Yewtree, Operation Fernbridge, and others has focused on the criminal nature of CSE, race has been absent from that discourse; conversely, the public debates relating to grooming cases by men of Pakistani heritage have been marked by the presence of race. By critically evaluating the above cases this article aims to put forward three related arguments. First, it aims to highlight and explain contrasting ways in which CSE is debated vis-à-vis the category of racialised politics. Second, it demonstrates how racialised discourse of CSE, initially considered to be a feature of far-right rhetoric, has taken centre ground. Finally, drawing upon analysis of various reports it aims to question the links between race and CSE to show how racialised discourse of CSE helps undermine its victims.

Call for Abstracts: Unlocking the Black Box (2015-06-25 08:34)

Call for Abstracts: Unlocking the Black Box

Date:

Saturday, August 15, 2015 - 12:00pm

Location:

3742
The Yale Law School Information Society Project is seeking abstracts of papers for a conference on big data and algorithmic accountability to be held on April 1-2, 2016. The best papers will be considered for inclusion in a special issue of the Yale Journal of Law and Technology ([2]YJoLT) (link sends e-mail)
The increasing power of big data and algorithmic decision-making—in commercial, government, and even non-profit contexts—has raised concerns among academics, activists, journalists and legal experts. Three characteristics of algorithmic ordering have made the problem particularly difficult to address. The data used may be inaccurate or inappropriate. Algorithmic modeling may be biased or limited. And the uses of algorithms are still opaque in many critical sectors.

No single academic field can address all the new problems created by algorithmic decision-making. Collaboration among experts in different fields is starting to yield important responses. For example, digital ethicists have offered new frameworks for assessing algorithmic manipulation of content and persons, grounding their interventions in empirical social science—and, in turn, influencing regulation of firms and governments deploying algorithms. Empiricists may be frustrated by the “black box” nature of algorithmic decision making; they can work with legal scholars and activists to open up certain aspects of it (via FOIA and fair data practices laws). Journalists, too, have been teaming up with computer programmers and social scientists to expose new privacy-violating technologies of data collection, analysis, and use—and to push regulators to crack down on the worst offenders.

Researchers are going beyond the analysis of extant data, and joining coalitions of watchdogs, archivists, open data activists, and public interest attorneys, to assure a more balanced set of “raw materials” for analysis, synthesis, and critique. As an ongoing, intergenerational project, social science must commit to assuring the representativeness and relevance of what is documented—lest the most powerful “pull the strings” in comfortable obscurity, while scholars’ agendas are dictated by the information that, by happenstance or design, is readily available. What would similar directions for legal scholars and journalists look like? This conference will aim to answer that question, setting forth algorithmic accountability as a paradigm of what Kenneth Gergen has called “future-forming” research.

Algorithmic accountability calls for the development of a legal-academic community, developed inter-disciplinarily among theorists and empiricists, practitioners and scholars, journalists and activists. This conference will explore early achievements among those working for algorithmic accountability, and will help chart the future development of an academic community devoted to accountability as a principle of research, investigation, and action.

The conference seeks abstracts on topics including:

- The law and ethics of artificial intelligence
- Algorithmic accountability in medicine, finance, journalism, law, and education
- Algorithms and transparency
- How can law enable “innovative” journalism and research?
- The effect of socio-technological environment on professional practices and norms
- What are the black boxes lawyers and policymakers most want exposed?

500-700 word abstracts may be submitted by August 15 to Heather Branch at heather.branch@yale.edu. Notifications of selection will be made by September 10. Full first draft papers are expected on December 15, 2015. The best papers will be considered for inclusion in a special issue of the Yale Journal of Law and Technology (YJoLT) to be published in Spring 2016.
Conference Organizers

Frank Pasquale (Professor of Law, University of Maryland Francis King Carey School of Law), Caitlin Petre (Resident Fellow, Yale Information Society Project), and Valerie Belair-Gagnon (Executive Director and Research Scholar, Yale Information Society Project)

Decolonizing Knowledge: Invitation to participate in workshop (2015-06-25 08:35)

Decolonizing Knowledge
Invitation to participate in workshop
November 2-3, 2015

For at least two centuries, the only knowledge which has been accorded the status "respectable", whether the site of its production is in the "West" (understood as a region, or as the origin of modernity) or elsewhere, is the knowledge created within the modern human and natural sciences; sciences associated with the European Enlightenment and its attendant site of production and dissemination - the modern university. The cultural and historical specificity, as well as the assumed truth and universality, of this knowledge are rarely questioned. Skills, crafts, popular knowledges, tacit, non-systematic, embodied, and gendered knowledges, whether indigenous or not, hold little claim in the face of the 'expert' knowledges produced in the university as well as other privileged sites such as think tanks, governmental agencies, media outlets, and corporations - expertises that are subsequently exported through systems of commerce, trade, development and aid to the rest of the world. More than this, even if other forms of knowledge are recognized, invariably they are domesticated as 'content' to be studied and 'explained'.

The Centre for Postcolonial Studies, Goldsmiths, together with the Linnaeus Centre for Concurrences, Linnaeus University, is proposing a workshop and a special issue of the journal Postcolonial Studies which seek to enquire into the epistemological superiority accorded to modern, Western knowledge, asking whether this is warranted, and what effects it has. To this end, we welcome participants who are engaging in their own work with this theme, either by addressing this knowledge in general, or any of the particular disciplinary manifestations of it, eg, sociology, anthropology, international relations, history and so on. The workshop will be a mix of presentations and of
discussion, so rather than ask for abstracts, we ask those interested in participating to send, by September 1, an outline of their research, of 1000-1500 words, and how it speaks to the theme of the workshop. These outlines will be pre-circulated but because space is limited and also because we wish to keep this workshop intimate, so that sustained conversation is possible, only a small number of those who respond to this call will be asked to present a paper, or provide specific commentary. Participation will be confirmed by September 30.

Topics include, but are not limited to:
- connections between the global distribution of modern western knowledge and a global, economic, geographic, and medialized dominance of the "West"
- whether and how different knowledge traditions can relate to one another and with what consequences
- the entanglement between different and rival knowledge traditions
- indigenous knowledge traditions

The workshop is hosted by Linnaeus University Centre: Concurrences and held at Teleborg Castle in Växjö, Sweden, on November 2-3, 2015. Participants are expected to pay their own travel costs, while the Centre covers accommodation and other workshop costs.

How American Youth (Mis)Understand Science and Religion (2015-06-25 08:37)

[IFRAME: https://www.youtube.com/embed/OaS1SV7xwWQ]
Social theory is something you can’t get away from

From an interview with Margaret Archer in [1]disClosure: A Journal of Social Theory:

Well, social theory is something you can't get away from. It’s indispensible. People in the street are social theorists. They don’t know it, they wouldn’t appropriate the label, but what they’re doing is social theorizing. They do that every time they say things like, “Well, there wouldn’t be any benefits from doing that, would there?” Or, “That's just how you would expect the bankers to behave, isn't it?” It’s social theorizing. It may be crude. Quite often you can find that sociologists, really well established names, are saying very much the same thing. It’s just that their language is more technical or sometimes it’s just more pretentious than lay or folk social theorizing. We should respect lay social theory, not just because we are respecting the people who voice it, which we should do, but because this is what prompts their action. So, whether they’re right or wrong in what they say, that’s why, that’s their motive for acting. It’s usually
a lot more interesting than the alternative. Namely, because we can’t get away from talking about human motives, we, the investigators, impose our own interpretations on them; our beliefs about why they’re doing what they’re doing, and these can be wildly wrong

Margaret Archer on her relationship with Pierre Bourdieu and his work (2015-06-26 08:44)

From this interview in in [1]disClosure: A Journal of Social Theory:

DC: How might you characterize the connection, if any, between your theoretical work and that of Pierre Bourdieu?
MA: Sadly, because he was a good friend. He was very good to me, indeed. This was a not a common experience, for important French professors to be kind to little foreign visiting post-docs. It really wasn’t. So, he was an exception in that sense, and I kind of like put it on record. Therefore, it hurt me, as it hurt many of his research team - people like Luc Boltanski and later Laurent Thévenot, when we came to the parting of the ways. You see, Bourdieu thought, he maintained until he died—and we were good friends, he used to come and stay at my place in London in the 70s and early 80s—he thought that he was putting forward a general theory; general in the sense that it worked everywhere. I wrote an article, which you can check out if you like, in the European Journal of Sociology in 1982, called “Process without System.”

Fundamentally, he was very acute in analyzing the processes of French education, but then he wrongly universalized this by saying that that process was the same anywhere, regardless of the structure of that system. I said, no, I can’t agree. I think the kind of standardization he was talking about was something that a centralized structure monumentally reinforced, whereas in a decentralized structure you could have all sorts of people who didn’t like it, for one reason or another but they could do something about it. Plenty didn’t like it in France either, but could do nothing. Particularly the French industrialists who were coming on the educational scene in the latter part of the 19th century and were finding a very intellectualized syllabus that didn’t help them produce engineers.

Conversely, in England, if you wanted to found what was the beginning of our polytechnics and if you had the money, you just founded one. It could be a school for auto manufacturing or refrigeration. The area where I was brought up, it was manufacturing cement. Well, let’s have a part of the curriculum that is about the chemistry of cement making, then how to make reinforced concrete, so on and so forth. That was why the parting of the ways came. It came over the sociology of education, but more generally it was over the effect of structure on agency.

Vacancy for a Post-doctoral researcher in Sociology / longitudinal ethnographic research (2015-06-27 08:24)

Part of the reason I’m reposting this is because I value longitudinal qualitative research. But I’m also intrigued that part of the job description is to "raise additional funds" - how much of academic life is coming to be dominated by fund-raising?

Vacancy for a Post-doctoral researcher in Sociology / longitudinal ethnographic research
The closing date is July 5.

The Postdoctoral researcher will prepare and conduct research and raise additional funds for a longitudinal ethnographic cohort study with varied families in Amsterdam with the aim of understanding emerging patterns of physical activity and eating in the first 4 years of life, possibly extending to later years. The ethnographic study is embedded within a large multi-disciplinary cohort study on bodily-weight set-up by the newly found Sarphati Institute. The research group actively seeks to give a public role to fundamental research.

The Postdoctoral researcher will closely collaborate with sociologists, anthropologists, epidemiologists, health care professionals and policy makers in Amsterdam. The present appointment is for 2 years, but there is a strong commitment to prolong the position. The research is preferably combined with teaching in the sociology program.

Toilet Talks: A Speaker Event on Bodies, Identities & Design
Monday 29th June, 1:00 - 5:30pm
Lecture Theatre 1, Brooks Building, Birley Campus, Manchester Metropolitan University

Speakers include:

Barbara Penner (Bartlett School of Architecture, UCL)
'Redesigning for the User: Alexander Kira and the Ergonomic Bathroom'

Leo Care (School of Architecture and Co-Direct of Live Works, Sheffield University)
'Around the Toilet: From Social Mess to Architectural Touchstone'

Jo-Anne Bichard (Royal College of Art Helen Hamlyn Centre for Design)
'Extending Architectural Affordance or How to Spend a Penny'
Morag Rose (Sheffield University and Co-Founder of the Loiterers Resistance Movement)  
'Are you Engaged? The Secret World of Manchester’s Toilets'

Clara Greed (Emerita Professor of Urban Planning, University of the West of England)  
Discussant and closing remarks

Tickets are FREE and available via our Eventbrite page:  
https://www.eventbrite.co.uk/e/toilet-talks-a-speaker-event-on-bodies-identities-design-tickets-17072334813

For more information on the event or the project, please take a look at the website:

14 – 16 December 2015, Torino/Turin (Italy)

Workshop : Worker’s Writing in Europe (19th-20th centuries)

A contribution to the cultural history of the worlds of work
Within the framework of constructing a cultural history of the worlds of work "seen from below", this workshop suggests studying workers' writings on the European level.

By "workers' writings", we mean the body of texts produced by working men and women: those writings produced in the heat of political and/or trade union action such as leaflets, weapons for action which reflect (often, though not always) the appropriation of political or union cultures, but which are also cries of revolt against "the factory order" and/or the political regime, as well as texts written in retrospect, such as autobiographies, memoirs, personal diaries and factory journals, literary and poetic texts. These are so many "memories of work" made up of gestures, places and practices of solidarity, but also the desire for liberation or at least an empowerment which is not only collective but also individual.

Through diverse case studies, we propose three axes of reflection for discussion:

• Studying workers' writings as responses to a range of discourses employed by the powerful about workers, most often of a derogatory nature or aiming to stigmatise their alleged behaviour. Worker writers who have read or heard these judgments reject these discourses in various ways, even in an implicit fashion. In this way, these writings may also constitute "political acts" in themselves and means of empowerment.

• Understanding the reasons and conditions for working men and women to engage in writing. In other words, it will be important to consider how these individuals, carriers (or not) of a workers' culture transmitted by their social and familial world, armed (or not) with an ideological and "romantic" baggage typical of political and trade union requirements, and with ideas "poached" from more personal reading, moved from a political/trade-union workers' culture to a "literary" workers' culture. How did they move from writing pamphlets and speeches to other forms of writing? What books and authors who can be considered as "models" or points of reference? Can we identify any "cultural smugglers"?

• Taking account also of writings by working men and women who did not engage with or support political parties or trade unions. What do these texts suggest about the limits of the reach and appeal of the organised labour movement? What experiences and values were shared between militant, "engaged" workers and their non-militant, "apolitical" fellows, and what differentiated them? What role did writing play in the lives of the latter group?

• Starting from thematic and formal analyses of workers' writings, to proceed to comparisons on a European level. We can pose the question whether the European labour movement has built a common universe of militant workers' writings. We can also examine the autonomy of the writings of skilled workers of the generation of 1968 in relation to the labor movement: is the emergence of the emancipatory 'I' limited to these years, and is it a widespread process in all workers' communities in Europe?

These approaches also allow discussion of the effects of these experiences of writing on individuals and therefore on the evolution of worker and/or militant identities at the European level (in the 19th and 20th centuries)

Workshop languages: English and French

We invite you to send an abstract of your contribution (200 words maximum) to the organisers:

Timothy Ashplant, Centre for Life-Writing Research, King's College London, t.g.ashplant@kcl.ac.uk

Nathalie Ponsard, Université Blaise Pascal de Clermont-Ferrand, nat.ponsard@wanadoo.fr

Deadline: 30 June 2015
If so then it seems the British Sociological Association win. This [1]interesting and provocative post about the British International Studies Association (BISA) conference bemoans its exclusionary price:

If you were to ask a handful of early career scholars for their impressions of the recent British International Studies Association (BISA) conference in London they would probably say: “I wasn’t there”. The reason for the dearth in young attendees is that the conference (like all conferences) was prohibitively priced. Its four days costs a whopping £120 for early birds and £150 otherwise. For undergrads and postgrads the fee is £100 (early bird) and £130 (late). Membership to BISA is compulsory, which costs another £30 a year. It’s a hell of an entry fee into the Ivory Tower.

This seems remarkably cheap to me. The Royal Geographical Society is [3]somewhat more expensive at £155.
(members) and £175 (non-members) for those who are low income or without funding. The Social Policy Association is more expensive still at £350 (members) and £450 (non-members). This is comparable to the British Sociological Association’s charge a couple of years ago of £310 (members) and £450 (non-members).

It doesn’t follow from this that BISA are good, only that the SPA and BSA are very bad. I promised myself that I’d stop blogging about these issues after what felt like a very public meltdown a couple of years ago. But it still pisses me off immensely. Perhaps even more so as I gain ever more experience of organising events and increasingly feel confident in my view that these costs are completely unnecessary. If you do not believe they are unnecessary then publish a full breakdown of costs for the conference and engage in a dialogue with your membership about them.

If many of your members cannot afford to attend your conference then the nature of that conference must change to make it affordable. This seems so axiomatic to me that I can barely believe it needs saying. Professional associations are contributing to the disenfranchisement of the constituencies they are supposed to serve. I left my professional association for this reason and I haven’t regretted it for a single moment. I encourage other early career researchers to do the same thing. We can find our own ways of contributing to our disciplines. Ultimately, I do accept they are necessary but I don’t see how they will change while we continue to give them money and free labour en masse and without protest.

Edit to add: I’ll expand on this post and do a systematic comparison of conference fees & costs once my current deadlines are out of the way. Perhaps this could be a regular exercise that other people help me in? It would be interesting to compare national associations.

I don’t think we should ‘steal this conference’. We just shouldn’t go.

annikacoughlin (2015-06-28 12:20:49)
I have tended to think that prices set are the prices that are necessary, so I would definitely be interested in hearing in your view how they could be different and the comparison of costs. Would be quite tricky to compare costs wouldn’t it though because diff associations have different things to take into account e.g. not everyone gets income though journals, some get reduced rate venues, others don’t, some have big sponsors others don’t, some pay permanent admin staff, others don’t etc. Some include accommodation, others don’t. Big spreadsheet time?! Interesting post though!

The Future of Social Critique (2015-06-28 08:36)

Videos of the talks from [1]this seminar at Loughborough:

Bio-power(ful) Cloud-Bodies

Host: Foucault Madness Collective

Date: Saturday, September 26th, 2015.

Location: The Historic Thibodo House (1150 Lupine Hills Drive, Vista, CA)

Keynote Speaker: Dr. Jack Halberstam

The Foucault Madness Conference is back for a second year! This year’s theme brings into critical light how current norms of cyber-based speech-acts create new technologies of selfhood. Many early, and utopian, post-structural theorists of cyberspace, such as Donna Haraway ("A Cyborg Manifesto"), surmised that digital disembodiment might mean greater liberation from the categorizing limits of race, class, and gender.

However, recent events indicate that pure dis-embodiment has not been realized. In fact, the embodied world has been in a dialectical relationship with cyberspace. This relationship is being manifested through varying and widespread occurrences: Gamergate, doxxing threats, the new men’s rights movements, thinspiration. As such, we understand that new forms of gendered aggression and violence are an interplay between both realms of the physical and cyber. In a Foucaultian sense, what are the effects of routing our increasingly post-biological identities into entirely observed data-spaces?

This conference seeks to understand which embodied notions of selfhood have been further re-inscribed through the uncritical participation in cloud-based, “big data” technologies; and, conversely, what are the possibilities for resistance in using these technologies to challenge hegemonic forms of embodiment? Thus, the conference theme recognizes the way that cyberspace is not about pure disembodiment at this point; cyberspace produces new regimes of truth, a third site, that directly affects “real life” corporeality.

The conference solicits a wide range of papers that address the current ways internet technologies (such as social media, mmorgs, cyber communities, communication boards, etc.) directly inform: feminism, gendered norms, activism, trans and queer politics, heteronormativity, post biological colonialism, body politics, community justice, personal relationships, fields of affect, etc.

We are seeking papers from Professors or experts in the field, graduate students, and advanced undergrads. Academic disciplines and methodologies across the humanities and social sciences may be used. Research questions may include, but are not limited to:

- What is the role of rape speech and/or doxxing as a method of constructing the internet as an exclusively male controlled space (Anita Sarkeesian, for example)?
- What are the real possibilities for the subaltern to speak in this new public space, given the “digital divide” and the normative, neoliberal design of the internet?
- What are the legal implications of the collapse between the private and public into a merged space?
- What are the modern norms of surveillance that may be going unnoticed online, and who benefits?
- Does turning the surveillance on the perpetrator engender positive change or reinforce surveillance as hegemony and/or Truth?
• What are the potentials of hactivism and cyber-anarchy (for example, Anonymous)?

• How has the internet affected activism, particularly in regards to race, class, and gender?

• How has web-based social networking affected the goals and practices of feminism and trans politics?

• How is the human body as political site altered by social networking, including "safe spaces" of reprieve (pro-ana, thinspiration, self-branding)?

• What are the effects of the New Men’s Rights Movement, including pick-up artist, and misogynist communities?

• How does cyberspace reconfigure the problem of alienation and anomie?

• How are new cloud body norms, such as neoteny, kawaii, and cuteness reinforced or subverted through cyber representations, photographic angles, the use of "cutsie" avatars and design, etc.?

• How do male gamer communities reinforce paranoid/neurotic masculinities based around the fear of women (Zoe Quinn, for example)?

• What role do internet White Knights play in the re-creation of traditional norms of masculinity, where women require protection?

• How is the policing and norming of marginalized bodies represented in MMORGs and internet spaces?

• How does the cloud affect our relationship to death, heroism, and significance (cosplay, LARPing)?

Submissions: Please submit a 250 word abstract to foucault.madness@gmail.com by July 31st, 2015.

Please NOTE: The emphasis of this conference, apart from the conference theme and quality scholarship, is the role of mentorship and networking. As such, the panels will consist of a similar theme addressed by three speakers: (1) Professor, (2) Grad Student, and (3) Undergrad.

In the email body, please include your name, institutional affiliation, category for submission (professor, grad student, or undergrad) and email address.
These are some notes in preparation for my participation in [1]this panel next week.

I like the title of the event because it neatly raises something which I've been preoccupied by recently and is a key theme in the final chapter of my long overdue book about academic social media. My sense is that there's been a dramatic change in how social media is received within UK higher education in the space of little more than a few years. I'm less sure about other national contexts but I don't see any reason why this would be restricted to the UK.

My impression is that what was once seen as a waste of time at best, seriously questionable at worse, now finds itself increasingly regarded as a necessary activity for researchers. Whereas once people felt the need to justify their use of social media as a scholarly activity, it's now more likely that they'll feel the need to justify not using social media. In higher education, it's perhaps becoming the case that 'social media is the new black'. At the very least, it
feels like the [2]'coming social media revolution in the academy' which Jessie Daniels and Joe R. Feagin wrote about in 2011 has now arrived.

However I wear multiple hats. When I take off my 'social media geek' hat and put on my 'sociologist' one, it strikes me that that I'm being rather hyperbolic. Of course it 'feels' like the social media revolution is here to me: my working life increasingly revolves around social media in a variety of direct and indirect ways. It doesn't take a network scientist to observe the inevitability that this brings me into contact with many others who are similarly orientated towards social media, intensifying the impression that social media is transforming the very nature of academic life. Could it be possible that we're just ratcheting up expectations amongst ourselves about this 'social media revolution' while the rest of the academy goes on with business as usual?

It’s worth seeing this question in terms of the broader influence of digital technology within academic life. How many people still read paper journals? How many people's first recourse for searching a literature is to physically visit the university library? Could the modern university function without e-mail? These examples are so ubiquitous as to seem trivial but this ubiquity illustrates the extent to which academics are already digital academics, before we even begin to think about social media and how its being used. Given this, it seems unlikely to me that academics en masse were ever likely to be hostile in social media in a sustained way, at least if they perceive clear benefits to themselves from using these tools.

Here are some of the benefits that get cited most frequently:

- Increasing the ease with which you can build meaningful connections with others within your field and discipline
- Increasing your public profile and helping find opportunities for collaborations with people outside of the academy
- Increasing the likelihood that your paper will be read and cited
- Increase your skill at communication with those outside of your specialist area

What bothers me about how these benefits are presented is how what are 'outcomes' increasingly get presented as 'aims'. These are things which can result from engaging with social media as an academic but I think these engagements change in important ways if these are the reasons motivating the engagement. Part of my suspicion also stems from the fact that these potential benefits will meet with the approval of managers within most universities.

In a climate where universities are felt to need to justify their position within a changing society, it's becoming increasingly important for academics to demonstrate the capacity for their research to make an 'impact', even if the precise way this is understood might vary between national contexts and remain contested in most of them. In a competitive academic job market (a term I hate), a greater capacity to 'network' (a term I hate even more) and more people reading and citing your papers will be equally welcomed outcomes, helping increase the profile of research done within a university in an over-crowded intellectual market place.

But it's this over-crowding which is part of the problem. The more people dive into social media with these aims in mind, the louder the whole sphere gets and ever more work is necessary to be heard above the din. The more communication takes place, the more communication is necessary to keep up with it. The more people are promoting their papers through social media, the more work is necessary to try and ensure your papers attain any sort of prominence. If some people are scheduling 20 tweets a day, it creates a natural incentive for someone to schedule 30 in order to try and capture more of the sparse and increasingly fragmented attention span of the target audience. But this in turn creates an incentive for someone else to supersede that. Not necessarily by assessing
what others are doing and deliberately surpassing it but simply by experimenting with what works and acting upon it. There’s a process of escalation at work here, on all channels, which is potentially open-ended.

Much like any other field in which viral marketing becomes the name of the game, it’s easy to find examples of people who’ve succeeded and to seize upon these as exemplars of a radical levelling which is in actuality anything but. People have differing capacities to meet these growing demands and the success of those who can do it contributes to the demands placed upon everyone. This is particularly problematic when we consider that this success might make it easier to accumulate the resources necessary to trade prestige for less administrative duties and thus more time to engage in this activity. Or even to hire someone to do it for you.

The fact managers encourage this stuff simply adds to the problem. If you’re doing it because you feel you have to, it’s unlikely that you’ll enjoy it or really derive all that much from it. I’m really interested in the extent to which people do increasingly feel it’s expected of them to use social media in higher education: any thoughts or experiences you’d like to share about this would be really welcome. My impression is that it’s a pervasive expectation but this is ultimately just an impression. However it’s easy to see why this would become so given:

- how central social media is becoming to debates about impact and public engagement
- the growing frequency with which training is offered in universities, though possible to overestimate this
- the message this implies about the desirability of engagement
- people seeking contributions for things like collective blogs: I love these but it hadn’t occurred to me until recently that the sudden visibility of calls for blog posts might expand the scope of things people feel they should be producing
- universities, departments and research centres seeking contributions for such projects obviously has an additional dimension to it
- stories about career success founded on an online presence: a sense that this stuff is crucial for career opportunities, without anyone being able to specify quite why this is the case, perhaps propped up by a few mythical cases
- the anxiety about not missing out on opportunities which inevitably abounds within an unhealthy job market.

Or to put it another way: if you find yourself at a conference where everybody seems to be ‘live tweeting’ and you have no idea what this is, it’s probably going to create some anxiety in you and perhaps lead you to try it. It might also lead you to reject it entirely and this is a position I increasingly respect and would perhaps like to study.

This is a shame because I think it’s possible to enjoy this stuff a lot. Much of the appeal for me has been about blogging as a form of research notebook: constituting a sort of open-source scholarship in which you develop ideas in the open, accumulating visibility and esteem as a by-product of sharing ideas rather than deliberately seeking to win through additional activities over and above your core duties.

This makes the time commitment a lot easier because in some cases it can make your working more efficient: a trivial example would be the ease with which I can look up fragments of thoughts on my blog compared to the difficulty I had deciphering (or even finding) old notes when I wrote by hand. A less trivial example would be the way in which it helps you see connections based on how you’ve tagged and categorised material, identifying themes in your own work and patterns in your interest through what you recurrently feel moved to blog about and how it is then laid out of the screen.

To me this is an organic way in which social media can be integrated into the ‘research life cycle’. It’s possible to be both effective (in instrumental terms) but also personally enjoyable and intellectually valuable. My fear is that if ‘social media is the new black’, something which everyone is expected to do, it becomes harder to sustain this because instrumental concerns will come to squeeze out the more nebulous joys and satisfactions which can be found at present.

I also think that social media can help short-circuit some of the temporal pressures will lead to incivility or at
least a lack of collegiality within academic life: it’s easy to be helpful on Twitter because what constitutes ‘help’ is often little more than a few hundred characters. It doesn’t quite have the same feel as yet another e-mail to answer or, worse yet, a request that will take up valuable face-to-face time as we go through our days checking items off a to-do list that grows faster than we’re able to clear it. There’s a real promise to social media which I’m increasingly concerned could be lost if it becomes something obligatory rather than optional.

the morning after we all became social media gurus | the theoryblog (2015-09-25 16:06:22)

[…] to give, because…academic service. When what was gauche and time-wasting yesterday is The New Black today, it’s handy to have a vanguard of self-taught experts to teach everybody else how to […]

catherinecronin (2015-09-25 19:17:35)

Delighted to find your post, Mark, as well as your tweets from the #SRHE event today. Many thanks. As you say, we who are active in social media tend to see its ubiquity, but this is a partial view, of course. I’m conducting a research study at the moment, exploring open educational practices in higher education. During Phase 1 of the study, in the past few months I’ve interviewed academic staff at one university – across disciplines, seniority levels, employment status (permanent/temporary, full-time/part-time). Overall, there is a relative lack of participation in social media. Many participants expressed a vaguely uneasy feeling of social media as “Another Thing” to do – and of the pressure they felt to “be doing more” re: social media, to update their various profiles, to maintain their digital identities. All of this is layered onto other concerns around data ownership, corporate agendas, and privacy in general. Very complex. I’ll be sharing some of these early findings and analysis at #dlRN next month (and blogging before that) – will you be there, by any chance? In any case, delighted to see your post and to learn more about your work. Thanks.

Sociological Imagination (2015-09-26 17:53:51)

Hi Catherine, I’d be really interested to find out more. Is this the event? http://linkresearchlab.org/dlrn/ Wish I could attend, it looked great. I have no institutional support for anything not connected to my day job unfortunately though. Will do my best to participate remotely!

catherinecronin (2015-09-26 18:57:17)

That’s it, Mark. The hashtag will be very active and you can also tune in via @virtuallyconnecting - see http://linkresearchlab.org/dlrn2015/virtually-connecting/

Congrats, you did not cite any feminist work! (2015-06-29 07:44)

HT[1] Sara Ahmed for this interesting Tumblr blog. It only has one entry at present but it seems likely to grow:

[2]

[3] Congrats, you did not cite any feminist work

Many social theorists now call themselves 'relational sociologists', but mean entirely different things by it. The majority endorse a 'flat ontology', dealing exclusively with dyadic relations. Consequently, they cannot explain the context in which relationships occur or their consequences, except as resultants of endless 'transactions'.

This book adopts a different approach which regards 'the relation' itself as an emergent property, with internal causal effects upon its participants and external ones on others. The authors argue that most 'relationists' seem unaware that analytical philosophers, such as Searle, Gilbert and Tuomela, have spent years trying to conceptualize the 'We' as dependent upon shared intentionality.

Donati and Archer change the focus away from 'We thinking' and argue that 'We-ness' derives from subjects' reflexive orientations towards the emergent relational 'goods' and 'evils' they themselves generate. Their approach could be called 'relational realism', though they suggest that realists, too, have failed to explore the 'relational subject'.

2. http://www.amazon.co.uk/The-Relational-Subject-Pierpaolo-Donati/dp/1107513952
The aims of the workshop are to engage researchers from both Healthcare and Quantified Self communities to discuss key issues, opportunities and obstacles for personal health data research. These include challenges of capturing, summarizing, presenting and retrieving relevant information from heterogeneous sources to support a new vision of pervasive personal healthcare.

# TOPICS OF INTEREST #

We invite submission of papers reporting relevant research in the area of self-tracking for healthcare. We welcome submissions across a broad scope, addressing any of the following guideline topics but not excluding others, relevant to the workshop goals.

- Personal Health Informatics
- Quantified Self for Healthcare
- Activity Monitors and Devices
- Self-Tracking
- Gamification
- Healthcare Knowledge Representation & Reasoning
- Health Data acquisition, analysis and mining
- Healthcare Information Systems
- Biomedical Signal/Image Analysis
- Validity, reliability, usability, and effectiveness of Self-Tracking devices
- Design of Experiments
- Social and Psychological investigation into Self-Tracking practices
- Health Monitoring in clinical and lifestyle environments
- Sensors and actuators for Wellness, Fitness and Rehabilitation
- Innovative Algorithms for assessment of long-term physiological and behavioural data
- Models for interpreting medical sensor data
- Lifelogging, lifecaching, lifestreaming
- Biometric data
- Medical Self-diagnostics

# PAPER SUBMISSION #

All manuscripts must be written in English and formatted following the IEEE 2-column format. We accept full papers (up to 8 pages) and short papers (up to 4 pages). Papers should be submitted using the online submission system available at: https://wi-lab.com/cyberchair/2015/bibm15/scripts/ws_submit.php
# IMPORTANT DATES #

Full/Short Papers Due: September 10th, 2015  
Notification to Authors: September 30th, 2015  
Camera-Ready: October 17th, 2015  
Workshop: November, 2015 (exact date tbd)

# ORGANIZERS #

Frank Hopfgartner, University of Glasgow, UK  
Na Li, Dublin City University, IE  
Till Plumbaum, TU Berlin, DE  
Heather J. Ruskin, Dublin City University, IE  
Huiru (Jane) Zheng, Ulster University, UK

A single train station makes £439,651.30 a year from their toilets (2015-06-30 07:53)

Thanks to @lucyhbmort for flagging up this fascinating finding. I’d often wondered about this and use the train station in question very frequently. Here’s [1]the source - this might seem like an interesting bit of ephemera but I think it could be argued that this trend quite closely tracks broader socio-economic trends in all sorts of direct and indirect ways.
Dear Mr Hoyle,

Thank you for your request on 13th October 2014. You requested what revenue is generated from the toilets on the main concourse at Manchester Piccadilly station. Although Network Rail won't be covered by the Freedom of Information Act until April 2015, in line with our on-going commitment to transparency, we have dealt with your request as if we were.

I can confirm we hold the information you have requested. In the last year the revenue from these toilets was £439,651.30. It is worth noting that any money generated from toilet turnstiles helps fund the upkeep of these facilities and the running of our stations. Any profits that remain from this are invested into stations and the rail network.

If you have any questions about the handling of your request, please contact us at TEDteam[@]networkrail.co.uk.

Yours sincerely,

Kevin Rooney
Transparency Advisor

6.7 July

The Sociology of the Arts Study Group Presents:

‘UNPACKING ART’

ANALYSING THE SOCIAL CONSUMPTION & PRODUCTION OF ART

On Friday 11 September 2015, from 1.30pm-4.30pm
The London College of Fashion, UAL, 272 High Holborn Room 302
In recent years there has been growing sociological interest in the consumption and production of art. This afternoon event launches the BSA Sociology of the Arts Study Group, and in bringing together academics from across the social sciences explores the factors which motivate our consumption of visual arts and asks 'What can the sociology of art and culture learn from other disciplines?'

Registration: £5 BSA Members, £10 Non-BSA Members.
To register please visit: http://portal.britsoc.co.uk/public/event/eventBooking.aspx?id=EVT10438

Registration will start at 1.30pm. Refreshments will be provided.

The programme:
The afternoon will be divided in to two parts. The first, led by Professor Tak Wing Chan, University of Warwick, focuses on the consumption of the arts and specifically the concept of cultural omnivorousness. Tak Wing Chan questions explanations which center on social mobility and instead stresses the importance of education in increasing individuals' consumption of visual arts.

The second part focuses more closely on the production of art, and involves a panel discussion which brings together academics working outside the discipline of sociology, in the areas of art history, psychology, geography and visual culture. The panel highlights the interdisciplinary nature of research exploring cultural production and consumption and asks, 'What can the sociology of art and culture learn from other disciplines?'

Keynote Speaker: Professor Tak Wing Chan
Professor Tak Wing Chan is Chair of Sociology and Quantitative Methods at Warwick University, and has extensively researched social stratification and consumption of the arts. His paper 'Where do cultural omnivores come from?' uses data from a large-scale and nationally representative UK survey to investigate and critique the association between social mobility and cultural omnivorousness.

Panel Speakers:
Dr. Allan Watson is Senior Lecturer in Human Geography in the Department of Geography at Staffordshire University. His research centres on the economic geographies of the creative and media industries, and the cultural economy of cities, with a particular focus on the music and film industries.
Dr. Richard Clay is Senior Lecture in History of Art at the University of Birmingham. Richard’s research considers aspects of late eighteenth-and-early nineteenth-century French and, to a lesser extent, British visual cultures.
Dr. Rachel Souhami is a museum consultant and exhibition maker. Rachel has over fifteen years of experience working with museums and design companies and has previously taught Museum Studies at Imperial College, London. Rachel advises on vision, strategy and planning for exhibition projects, and encourages creative and innovative approaches to content and design development.
Dr. Victoria Tischler is a Chartered Psychologist whose key interests are art/science collaboration and public engagement activities. Her research focuses on the use of creativity and creative outputs to improve health and well-being in people with mental health problems.
Congrats, you have an all male panel! (2015-07-01 07:27)

[1]Congrats, you have an all male panel!

Documenting all male panels, seminars, events, and various other things featuring all male experts.

Please submit! Preferably photos and screenshots. Or links. Make sure it is an all male thing, if not, please explain how it still may count as one. All male references in academic work are also welcome, please submit full bibliographic details on those.

Add a Hoffsome stamp to your photo before submission at: http://www.hautomohattu.fi/hoffsomerator/

Some new developments in #asexualitystudies (2015-07-01 12:02)

I've had a [1]chapter on Asexuality published in this psychology handbook

An interview I did with David Jay has been published in [2]this book.

I've just been sent a review copy of [3]this novel with asexual themes.

Some interesting new sociological papers on asexuality:

[4]You Have to be Normal to be Abnormal: An Empirically Grounded Exploration of the Intersection of Asexuality and Disability

[5]Rethinking asexuality: A Symbolic Interactionist account

[6]Ace of (BDSM) clubs: Building asexual relationships through BDSM practice
The History of New Public Management in UK Universities (2015-07-01 14:56)

This report makes for fascinating (though dry) reading:

he origins of performance management in UK HEIs has been associated in general with the advent of New Public Management (NPM) and, in particular, to the changes proposed by the Jarratt Committee in the management of universities

The NPM movement, which emerged in the 1980s and remains influential today, aims to improve the performance of public

services in terms of their efficiency and their effectiveness. NPM is based on economic rationalism and promotes practices that are typically used in for-profit sector organisations, such as external audits, results-based management, quantitative performance measures, performance targets and individual performance appraisals. NPM defines itself as fundamentally different from old public management characterised by professionalism, self-management, implicit standards and mostly qualitative performance indicators. NPM promotes the view that management and managers are essential and desirable for the appropriate administration of public sector institutions NPM emphasises the idea of accountability and the need for increased transparency and availability of information. The NPM movement has led to an increased focus on performance and performance management at all levels in public services.

In line with the NPM movement, in the mid 1980s a committee of vice-chancellors and principals known as the Jarratt Committee was established to review the efficiency and effectiveness of UK HEIs. The recommendations of this committee introduced significant changes in the management of HEIs. Among other actions, the committee proposed that institutions use performance management practices such as
quantitative performance indicators and staff performance appraisals. It also suggested that HEIs be less
dependent on public funding and more cost conscious when managing their resource.

A feminist leaves the neoliberal university (2015-07-02 07:38)

A moving and important post by Liz Moorish. I think it’s a response to a colleague’s letter of resignation but I’m not certain:

I was very sorry to read your letter of resignation. I was, though, delighted that you decided to circulate it among colleagues at NeoLiberal U, along with an article, rapidly becoming a classic, if my Twitter feed is any predictor, by Mountz et al in the Great Lakes Feminist Geography Collective, offering a manifesto for a slower pace of academic life. This is what you have not found at NLU, and you weren’t prepared to go on sacrificing the possibility of intellectual creativity, family life and personal space forever. Sometimes principles have to be lived by, because that’s the right thing to do. NLU doesn’t seem to have any other principle than to ‘maximize the staffing resource and leverage the maximum from the academic contract’ (I paraphrase).

It has been a long time since we sat down and discussed all this. That is just your point, though. In the speeded up university, with its distorted constructions of academic ‘productivity’, schedules are crafted to eliminate the necessary practices of caretaking. In my field of work, this is known as ‘relational practice’, and in its most benign form, it is attributed to women. I haven’t been doing much relational practice recently, and have been contemplating this neglect during a period of sabbatical. There is a tendency at work to hole up in offices, and scurry past colleagues you know to be in need of support. It is emails like yours that make me aware of how many of us inhabit the same private hell of alienation, shame, stress and guilt.
Read it in full [2]here. There are obviously similarities between the ideas discussed here and those addressed in the [3]Accelerated Academy. There are also differences though. One is that we're very interested in exploring the *pleasures of acceleration*: why do people embrace this way of working? What satisfactions can we derive from this? Reading the post by Liz Moorish makes me realise that it’s important we discuss this in gendered terms.

**Independent Scholar Research Fellowship (2015-07-03 06:55)**

A really welcome initiative that funds independent researchers. See [1]here for full details:

> The Independent Social Research Foundation (ISRF) wishes to support independent-minded researchers to do interdisciplinary work which is unlikely to be funded by existing funding bodies. It is interested in original research ideas which take new approaches, and suggest new solutions, to real world social problems.

> The Foundation intends to award on a competitive basis, to candidates of sufficient merit, up to two Independent Scholar Fellowship grants to support original interdisciplinary research, across the range of the social sciences, to be held from a start date no later than the end of December 2016.

3772
CfP: ‘Who are the ruling class and how do they rule?’ (2015-07-03 06:56)

Critique Special Issue, ‘Who are the ruling class and how do they rule?’

Call for Papers

This special issue calls for papers from authors able to address key questions about the global capitalist class.

The material and ideological basis for a global capitalist class to sustain its’ rule are somewhat at odds. On the one hand, capital has never been centralized in so fewer hands. The volume and intensity of capital never more concentrated within a relatively few global political, financial and economic organizations, head-quartered in global cityscapes, such as London, New York, Paris, Tokyo, Hong Kong, Beijing, whose power dwarfs that of the national economies they reside in. On the other hand, the global population has never been so aware they are the ‘99 %’ looking back with a mixture of anger, fear and resentment at the audacious scales of social economic and political inequalities this centralization and concentration of wealth and power brings forth. Indeed, against the backdrop of a concentrated and centralized material basis for rule, the myth of the free market has long been exposed, along with the ideological veneer of ‘globalization’, leaving the capitalist class with a fragile political basis for rule driven by a coherent ideology.

So who are the ruling class and how do they manage to sustain and organize their rule globally? Is the ruling class best understood as finance capital or transnational capital and what relationship does the ruling class, so defined, have with productive capital? Is the global ruling class aware that they are engaged in a global class struggle and if so how does this awareness manifest? How consciously does the ruling class act in administrating the flow of global accumulation and indeed the contours of recession?

Moreover, how has the ruling class maintained control over the inter-national state in order to develop their global interests? What specific mechanisms, institutions and networks have become instruments of the global ruling class to maintaining its rule, politically, materially and ideologically? To what extent are they able to resist sub-global interests and divisions and maintain global unity of purpose? Does the ruling class have a long-term view of its prospects or have collective horizons become myopic, motivated more by small pragmatic advances than grand visions of future longer run accumulation trajectories?

The deadline for submissions is February 30th 2016. The submission of papers and any queries pertaining to this special issue should be addressed to:
Muslims “Quietly condone Terrorism” — a Desperate Lie (2015-07-03 15:33)

by Ghulam Esposito Haydar

While Muslims around the world have been fasting during the holy month of Ramaḍān, both terrorists and politicians alike have continued in their respective destructive crusades which currently show no sign of abating.

Last Friday saw the deadly destruction of a mosque in Kuwait, the decapitation of a man at a gas plant near Grenoble in France and the mass killings at a tourist beach hotel in Sousse, Tunisia. These are the latest atrocities
which have shocked people of faith and no faith to the core. According to statements on Twitter, ISIS has claimed responsibility for the attacks in Tunisia and Kuwait. (It was interesting to note the language used to describe these attacks differed somewhat to the Charleston and Chapel Hill massacres respectively.[1][2]. Both of these crimes Stateside were proven to be driven by a far-right ideology where the perpetrators hate for Black and Muslim citizens led to a devastating terror attack, yet, the term "terrorism" was seldom used nor was there such a public outcry).

How do we stop such atrocities from taking place? Our Prime Minister David Cameron believes it solely boils down to taking on a poisonous ideology. According to the radicalisation hypothesis, it is an extremist interpretation of Islām known as Islamism which is exclusively responsible for terrorism around the world.

Just last week, Cameron addressed an audience in Bratislava where he said:

“The cause is ideological. It is an Islamist extremist ideology: one that says the West is bad and democracy is wrong, that women are inferior and homosexuality is evil. It says religious doctrine trumps the rule of law and Caliphate trumps nation state, and it justifies violence in asserting itself and achieving its aims. The question is: how do people arrive at this world view? I am clear that one of the reasons is that there are people who hold some of these views who don’t go as far as advocating violence, but do buy into some of these prejudices – giving the extreme Islamist narrative weight and telling fellow Muslims ‘you are part of this’. This paves the way for young people to turn simmering prejudice into murderous intent. To go from listening to firebrand preachers online to boarding a plane to Istanbul and travelling onward to join the jihadis. We’ve always had angry young men and women buying into supposedly revolutionary causes. This one is evil, is it contradictory, it is futile but it is particularly potent today. I think part of the reason it’s so potent is that it has been given this credence. So if you’re a troubled boy who is angry at the world or a girl looking for an identity, for something to believe in, and there’s something that is quietly condoned online or perhaps even in parts of your local community then it’s less of a leap to go from a British teenager to an Isil fighter or an Isil wife than it would be for someone who hasn’t been exposed to these things.”[3]

This is not the first time Cameron has taken to foreign lands to address concerns regarding Muslims. Many have found it deeply concerning that Cameron felt the need to address the subject of national security from foreign shores. If he wanted to attack British Muslims by accusing them of “quietly condoning” terrorism, he should have had the decency to do it on British soil rather than in front of a foreign audience of arms dealers at a security conference in Slovakia.

Charles Farr, director general of the Office for Security and Counter-Terrorism (OSCT), commenting on Cameron’s address said there was a “risk” of oversimplification given around 2.7 million Muslims live in Britain but just a few hundred had joined ISIS in the Middle East. The comments contrast with Cameron’s keynote speech on radicalisation where he toughened his rhetoric on the responsibilities Muslim leaders had to stamp out extremism. Speaking at a Jewish News conference on Israel, Farr warned of the dangers of playing up the numbers of Britons who have headed to the Middle East to join ISIS: “It’s not to say the challenges they pose are not significant, they are. But, the more we overstate them the more, frankly, we risk labelling Muslim communities as somehow intrinsically extremist, which actually despite an unprecedented wealth of social media propaganda, they have proved not to be. So I think we need to be cautious with our metaphors and with our numbers.” [4]

Just as David Cameron did with his Munich address in 2011 which paved the way for the “revised” Prevent strategy, [5] his address in Bratislava was simply a precursor to the implementation of the new Counter Terrorism and Security Bill and the intention to draw up a new “Counter Extremism” bill where he and his neoconservative allies are preparing the ground for the government’s next onslaught. The target will not be terrorism, but “non-violent extremism”. The new Counter-Terrorism measures will legally require nursery schools, teachers, health care service professionals and universities to monitor students and patients for any sign of “extremism” or “radicalisation”. The new powers represent a level of embedded state security surveillance in public life unprecedented in modern times. We already know from the government’s Prevent programme the chilling impact of such mass spying on schools,
where Muslim pupils have been reported for speaking out in favour of Palestinian rights or against the role of British troops in Afghanistan. The “counter-extremism” bill announced in the Queen’s Speech [6] is about to take the anti-Muslim clampdown a whole stage further. The plans include banning orders for non-violent individuals and organisations whose politics are considered unacceptable; physical restriction orders for non-violent individuals and groups deemed “harmful”; powers to close mosques; and vetting controls on broadcasters accused of airing extremist material.

In an address on BBC Radio 4, David Cameron called for a “full spectrum” response to the Tunisia attack, crushing the “appalling death-cult of IS in Iraq and Syria but also fighting extremist’s "poisonous narrative" elsewhere in the world: “Frankly, we cannot hide from this thinking if you step back you become less of a target. They are attacking our way of life and what we stand for, and so we have to stand united with those that share our values. We need to recognise that we’re not just fighting terrorism here, we’re also fighting extremism. There are many extremists who fall short of actually condoning terrorism, but they buy into a lot of the narrative of the terrorists [e.g.] they support [belief in a] Caliphate. We have to say in our country, those views while they fall short of condoning terrorism, they’re not acceptable either. We need to do more to help integrate people into our country. There are some organisations and some people. To those people we have got to say, that is not an acceptable view, and we’re not going to engage with people who believe that their ought to be a Caliphate.” [7]

According to the Prevent strategy [8], non-violent extremism consists of a belief system which opposes ‘British Values’ which has been defined as; democracy, the rule of law, individual liberty, mutual respect and tolerance of different faiths and beliefs [8]. This ideology is the precursor to violent extremism and subsequently terrorism. The theory that was engineered in the right ring neoconservative offices of the Henry Jackson Society (formerly known as the Centre for Social Cohesion) and Policy Exchange (who’s founding Chairman was none other than Michael Gove, the former Education Minister at the heart of last year’s false Trojan Horse allegations and now the current Secretary of State for Justice) is known as the ‘Conveyor Belt’ theory [10] [11]. The theory has already been challenged by many leading academics and practitioners alike who not only cite the total lack of empirical evidence for this theory, but also provide us with a more comprehensive and holistic alternative which references a plethora of driving factors which often leads to an individual turning to violent extremism and terrorism. Earlier this year, Professor Arun Kundnani published an account on how the rhetoric of radicalisation has created “a decade lost”. [12] In it, Kundnani summarises the flimsy empirical basis on which the connection between radical theology and terrorism has been built and the extent to which the burgeoning radicalisation industry, especially in academia, is linked by a revolving door to conservative political lobbyists keen to blame conservative Islam for terrorism.[13]

For any meaningful discussion on “Islamic Extremism”, the government needed to attain a genuinely nuanced understanding of Islam and the make-up of the many different Muslim communities that reside Britain, but in 2013, the government-proposed measures to tackle “Islamic Extremism” failed to engage in any meaningful way with the plethora of voices within the Muslim community [14]. It failed miserably in defining “Islamic extremism”, conflating it with religious conservatism. The report made Muslims feel like a suspect community, further alienated them and caused a great deal of mistrust in the process. This method of disengagement is likely to backfire and cause many Muslims to become even more disenfranchised, disempowered and resent the government. To the majority, it does seem that the government officials in Whitehall are only keen to listen to the opinions which agree with their ideas about Islam and Muslims. Some of the selected (and funded) think tanks researching the causes and threat of terror were specifically set up as “Counter Terrorism” or “Counter Extremism” to receive government funding in the first place. This alone should raise suspicion since these organisations solely rely on government funding for their continual existence and thus are likely to doctor up or exaggerate their findings in order to a create climate of fear.

It does not come at any surprise that proponents of the ‘Conveyor Belt’ theory, the Quilliam Foundation are happy to support characters who re-enforce their narrative [15]. Earlier last week, the fiery foreign cleric Tahir ul-Qadri who is a self-proclaimed supporter of the blasphemy law in Pakistan launched what he referred to as the first Islamic curriculum on Peace and Counter-Terrorism in the world. During an interview with BBC Radio 4 [16],
he explained the purpose of this curriculum and the target demographic. When asked why many people are being radicalised he responded: “I have heard the Prime Minister’s speech and I agree that some Muslim communities are silently condoning extremism and it opens the door to justify acts of terrorism. This problem of radicalisation has not been tackled properly. The government have been dividing extremism into two different categories; violent extremism and non-violent extremism. By defining extremism into two different categories they have allowed extremism to grow into terrorism. Extremism is extremism, so non-violent extremism will become violent ultimately because it will convert into terrorism. Lessons against extremism should be taught at state schools as part of the curriculum. De-radicalisation and counter-terrorism studies should be taught as subjects. It should be made compulsory for Muslim children and optional for non-Muslim children”.

It is interesting to note that even Charles Farr disagrees with such a simplistic narrative bereft of a wider context. Farr revealed the kinds of people who are drawn to the likes of ISIS often have “personal problems” and can be seeking excitement. He said, “The background of broken families, lack of integration into what we might call mainstream society, some level of criminality, sometimes family conflict, are all more than normally apparent. People join terrorist organisations in this country and in others because they get something out of them beyond merely satisfaction of an ideological commitment. Sometimes it’s about resolution of personal problems, sometimes it’s about certainty in an environment which has deprived them of it, sometimes it’s about excitement and esteem, and we should not omit the last two factors. This is the reality in Syria and Iraq but also many other contexts we’ve worked on over the past five or 10 years.” [4]

Barring the exclusion to mention the role of foreign policy, Farr’s own conclusion is not much different to what the academic researchers, practitioners and activists on the ground have been saying for years. Those behind nearly every violent attack or terror plot have cited western intervention in the Muslim world as their motivation. In reality, it should not be difficult to understand why a small section of young alienated Muslims are attracted to fight in Syria and Iraq with ISIS and to blame it solely on ideology without focussing on the factors which lead to it is being wilfully negligent. After all, the pseudo-jihadi “ideology” has been around for a long time, but there were no terror attacks in Britain before US and British forces invaded Afghanistan and Iraq and nor was there such a pull to travel abroad and fight with some of these groups. The government’s admission that violence is driven by injustices and grievance of its own policies in occupying and destabilising of Muslim states, engaging in and supporting torture and state kidnapping on a global scale, and support for dictatorships across the Arab and Muslim world which contradict the apparent 'British Values' it stands for would be an admission of their role in creating terrorism here at home and abroad.

As the journalist Owen Jones mentioned, a History student would be graded a D- if they simply reduced the rise of Nazism to “evil”. In no way would understanding these factors behind Nazism be regarded as somehow legitimising or apologising for it [17]. A fringe ideology does exist but as responsible human beings, we must not fall into the danger of exaggerating the numbers attracted to it nor should we shy away from the reasons why a small but significant number are becoming increasingly attracted towards it. A whole range of factors are involved in radicalisation. It may be different from one individual to another. As Giles Fraser recently put it, it would be facile to reduce it to one thing or the other but to solely focus on an extremist ideology is about as convincing as arguing that the murderous bits of the Bible were solely responsible for the brutality of the Irish Republican Army (IRA). The language of terrorism may borrow its vocabulary from Islamic theology, it’s a useful marker of shared identity, but root motivation is as it always is: politics. [13] In the overwhelming majority of the cases, those who have been persuaded to go and take the law into their own hands by committing acts of terror here in the UK or abroad have not had any real meaningful engagement in the coherent study of Islam. Far from being religious zealots, a large number of those involved in terrorism do not practise their faith regularly. Many lack religious literacy and could actually be regarded as religious novices. Very few have been brought up in strongly religious households, and there is a higher proportion of religious novices who’s lack of Islamic upbringings has made them susceptible to political manipulation coaxed in religious language. MI5 says there is evidence that a well-established religious identity actually protects against violent radicalisation [18]. If terrorism in the name of Islam is really all about politics, then we must acknowledge that the long history of disastrous western interventions in the Middle East is a part of the
cause of the horror that continues to unfold both here in the UK and abroad. We have to face up to our responsibility.

Social and personal factors play a significant role in the pathway to radicalisation. Ideology does need challenging but this only gains traction through grievances. We need services which provide safe places to allow the discussion of grievances without the fear of reporting to Prevent. Under legislation that came into force this week schools are obliged to have "due regard to the need to prevent people from being drawn into terrorism". A teacher's position depends on trust as well as respect. Both could be undermined if teachers are transformed into de facto adjuncts of the police. [19]. We must not shut down means for people to implement change using legitimate political avenues and subsequently accuse them of 'entryism' but rather educate and empower young Muslims to use legitimate avenues of British polity to do something meaningful about their current situation. We must explore and find solutions to factors such as social deprivation, inequalities and personal vulnerabilities which increase the likelihood of a person becoming disenfranchised or disillusioned with life in the UK. We must also explore the role of relentless media hostility, rampant Islamophobia, undue state surveillance and harassment of Muslim communities and the evidence of an increasing level of anti-Muslim attacks. Islamophobia now outstrips hostility to any religion or ethnic group in the UK and this cannot be good when it comes to preventing radicalisation. [20]

This article is an updated version of one originally published earlier this week on Islam21C.com.

Ghulam Esposito Haydar is a Muslim community activist in Manchester. He is one of the Founding Members of the Myriad Foundation, a voluntary organisation that sets up and runs inter-faith initiatives in a range of areas - blood donation, feeding the homeless, hospice buddy support, and mosque collections distributed to Manchester food banks and shelters. He also volunteers with Muslim Engagement and Development (MEND).
Is the @TimesHigherEd "exam howlers" competition driven by metrics? (2015-07-03 19:18)

In the section of my book on 'effective communication online', I've been writing about the informal space of interaction between academics and students that social media opens up. This is an issue which is only going to become more complex with time and I don't try to offer any rules for negotiating the challenges it poses, apart from perhaps being aware that students might stumble across, or even deliberately seek out, things you post online. It's in these terms that I've found myself writing about the Times Higher Education 'exam howlers' competition:

Due to the annual event's popularity, we have extended the deadline for this year's entries until 12 July at 5pm.

For your chance to be crowned the winner of this competition - which comes with a magnum of champagne - please send examples of hilarious typos, unfortunate spoonerisms and daft misunderstandings to [1]john.elmes@tsleducation.com.

I love the Times Higher Education. I really do. But this is just fucking unpleasant. It obviously raises the question of why they continue to do it every year, in spite of the outcry it provokes. The only answer I can come up with is metrics. I bet this is the most shared content they have on the website each year. What do other people think?
The pseudo-normalisation of flying (2015-07-04 08:12)

Most people I know travel frequently. I realised on an intellectual level that there are various factors which mean my friends, family and acquaintances probably travel more than average. But I didn’t realise quite how much more. This [1]Guardian article cites a government report that makes clear what a small proportion of the UK’s population fly regularly:

[2]Over half the UK population doesn’t fly even once a year. A very small minority flies three or more times per year, just 15% of UK residents, and that group accounts for seven out of 10 of all flights taken.

It’s somewhat jarring to realise that the overwhelming majority of people I know are members of that 15%. It would be interesting to see national comparisons for these figures. Is this stratification a common pattern? Is it even more pronounced elsewhere? It’s frequently argued in the UK that low cost airlines have democratised travel, implying that opposition to low-cost flying represents an elitist attempt to return international travel to the restricted few.
But it looks prima facie like the reduction of costs in flying have led a minority to travel much more frequently, rather than making international travel a regular part of life for the majority.

I was struck recently by the discovery that to travel from the West Midlands to Edinburgh cost less than half the price of a train ticket (£90 to £240 if I recall correctly) and took a quarter of the time. The costs are structured in a way that almost seems as if it was designed to incentivise domestic flying. I’ll reluctantly admit that I’ve flown to Edinburgh twice since then. I dislike the idea of domestic flying but I dislike paying twice the cost of a flight for a ten hour round trip on the train even more. As Andrew Simms points out in [4] that article, aviation is "hugely subsidised and compared to other economic sectors enjoys [5] multibillion-pound tax breaks, from its fuel to its VAT-free tickets and duty-free emporia".

This regulatory environment doesn’t emerge naturally. It’s something that’s sought and brought about through lobbying and campaigning. To what extent has its success been founded on creating an impression that flying has been normalised as a fact of life for the majority of the British population?

What does it mean to write with energy? That’s a question [1]Patter addresses on her blog this morning, reflecting on the notion of ‘writing without a parachute’. As she summarises this approach to writing:

1. write what comes up for you – this suggests that you don’t have a plan or prompts and just write what comes into your mind
2. don’t change anything – this suggests you don’t read back what you are writing until you’re actually done. This doesn’t mean you have to write continually, you can stop to consider what is the most interesting, accurate or persuasive way to write something, but you don’t switch gears and go back to ‘fix’ something. You keep going.
3. go where the energy is. This suggests that you write about something that grabs you, that you want to write about.

This is often how I approach blogging. It’s usually astonishingly cathartic to sit and write like this, often finding myself surprised by what I find myself to have written at the end. It’s also energising. It puts me in touch with what I’m interested in. But “what I’m interested in” is not a category that’s immediately accessible to us cognitively. Our cognitive understanding of our interests and our concerns is fallible. It’s often retrospective. We don’t always recognise our enthusiasms and we sometimes misconstrue them when we do. To make time for this ‘writing without a parachute’ could almost be seen as an exercise for grounding our writing in our energy and enthusiasms.
1. http://patthomson.net/2015/07/05/writing-where-the-energy-is/
2. http://patthomson.net/2015/07/05/writing-where-the-energy-is/

This is great, it is something I have tried to write about in my blog in relationship to shame, vulnerability and impression management. My blog is just a way of trying to get sh*t out there without thinking to much.. I talk a bit about flow, play etc in some of the posts https://whatisnottobedone.wordpress.com/2015/02/14/writing-vulnerability-and-shame/

Call for papers: Media Representations of ‘antisocial personality disorder’ (2015-07-05 09:07)

Call for papers:

Media Representations of ‘antisocial personality disorder’

Wednesday, 16th September 2015

Bournemouth University (UK)

ESRC Seminar Series: Cross Disciplinary Perspectives on ‘antisocial personality disorder’

This day-event is being organised as part of the ESRC sponsored seminar series ‘Cross Disciplinary Perspectives on antisocial personality disorder’ (aspd-incontext.org) and is being run in association with the Faculty of Media and Communication at Bournemouth University and the ‘Media and the Inner World’ research network.

We are using ‘Antisocial personality disorder’ as a shorthand for a range of labels used to describe individuals who seem to act in very antisocial ways but who otherwise appear to have a clear understanding of the world. A central thesis of this series is that the kinds of difficulties that are likely to involve the use of labels like ASPD need to be understood within broader historical, cultural and socio-political contexts than many psychological and psychiatric constructs allow.

This event is designed to explore the ways in which the meanings of ASPD have been shaped by the representations of ‘antisocial’ or ‘deviant’ identities in wider culture - in art, literature, film, television and news media. One can find such representations in classic literary depictions of antiheroes like Heathcliff in Emily Brontë’s Wuthering Heights or Camus’s L’étranger. Lionel Shriver’s 2003 novel and later film adaptation, We Need to Talk about Kevin provides a more contemporary example of a portrayal of an antisocial individual that provoked discussion about the gendered dynamics of the family and maternal ambivalence. Cinematic representations of psychological disturbance can be found in the ‘outsider’ despair and destructiveness of Travis Bickle in Taxi Driver (Scorsese, 1976), or in representations of jealous women in films such as Fatal Attraction (Lyne, 1987) or Gone Girl (Fincher, 2014). On TV, the proliferation of forensic detective dramas such as CSI (CBS, 2000) or legal dramas such as Silk (BBC1, 2001), often trouble the boundaries of ASPD and its meanings as a psychological condition. In news media, representations of mental health are also widespread in efforts to understand the subcultural shaping of individuals such as Dylann Roof, Timothy McVeigh, Mohammad Sidique Khan and others committing acts of ‘terror’.

3783
Whilst such images contribute to the cultural shaping of ASPD, they in turn can have influence on legal and psychiatric debates about the nature of dangerous individuals. As the role of Taxi Driver in the trial of John Hinckley (who attempted to assassinate Ronald Reagan) illustrated, the interaction of media, psychiatry and law can be very direct and can have powerful implications. It is important therefore to explore the ways in which images of ASPD in popular culture also influence the fields of forensic psychotherapy, psychiatry and the law.

We are therefore inviting submissions from people who have an interest in media representations of 'antisocial personality disorder' and their significance to psychiatry and socio-legal contexts.

As this is sponsored by the ESRC we be able to pay modest travel and accommodation costs for speakers.

If you are interested in contributing, please send a 300 word abstract to:

* Dr David W Jones, Reader in Psychosocial Studies, University of East London (d.jones AT uel.ac.uk)

Closing Date: 7th August (we will let people know soon after)
On the assumption that at least some of our readers find Yanis Varoufakis as interesting as I do, here’s some links to autobiographical blog posts explaining the unfolding of his own life:

**Job: Race in the Academy (2015-07-06 08:40)**

This seems like an important project:

Please do circulate these details for a Research Officer at the LSE to examine 'Race in the Academy'. This is an exciting qualitative research project that will examine the factors behind the lack of black (African
and Caribbean heritage) staff at the London School of Economics and other universities, and include both staff and PhD students. The project will be based in the Department of Social Psychology and make draw on expertise on the institutionalised racism, identity and agency, as well as other research insights from across the school.

Please see attached documents. Any queries can be directed to Caroline Howarth (c.s.howarth AT lse.ac.uk).

Don’t BELIEVE THE HYPE

[1]Don’t, don’t, don’t
Don’t, don’t, don’t
[2]Back, caught you looking for the same thing
It’s a new thing, check out this I bring
[3]Uhh, oh, the roll below the level, cause I’m living low
Next to the bass, [4]turn up the radio
[5]They claiming I’m a criminal
[6]But now I wonder how, some people never know
The enemy could be their friend, guardian
[7]I’m not a hooligan, [8] I rock the party and
[9]Clear all the madness, I’m not a racist.

Public Enemy, [10]Don’t Believe the Hype

The London bombings, 10 years ago this month, radically transformed the education policy framing of Muslim communities in Britain. The events signified a radical shift away from the politics of racial inequality/multiculturalism to racialised politics of securitisation. A clear example of how minority communities are racialised and also criminalised can be seen through the politics associated with the Counter-Terrorism and Securities Act 2015 and its impact on education policy.

Section 26 of the [11]Act places statutory duties for schools (including nursery schools) to exercise ‘due regard to the need to prevent people from being drawn into terrorism’. The government’s revised [12]Prevent policy published in 2011, as part of the [13]CONTEST 2 strategy, defines extremism as ‘vocal or active opposition to fundamental British values’, these non-negotiable British values, include ‘democracy, the rule of law, individual liberty and mutual respect and tolerance of different faiths and beliefs’. In fact, the new [14]guidance issued to schools this week urges schools to play an active role in promoting British values through the school curriculum. It

3787
also advises school teachers to ‘identify pupils who may be at risk to radicalisation’ and also demands schools to build pupil resilience to radicalisation by promoting ‘fundamental British values’.

In case schools are reluctant to comply with the duty then the Prevent Oversight Board has the ‘power of direction’ through the Secretary of State (see section 30 of the Act) to ensure schools do comply with this section of the legislation. More crucially, Ofsted conscious schools may well draw the conclusion that ‘resistance is futile’ particularly given that promoting fundamental British values and ‘approach to keeping pupils safe from the dangers of radicalisation and extremism’ are key features of the Ofsted inspection criteria (see [15]Ofsted Inspection Handbook). Possible signs of extremism within schools will inevitably fall under the one of the following tropes; this is clear from a close reading of the documentations published in light of the ‘Trojan Horse’ saga and also the subsequent interviews given by leading political actors including David Cameron, Theresa May and more recently the Education Secretary Nicky Morgan:

• Racialised sexual politics: A recurring theme within policy discourse revolves around the notion that Muslims are essentially homophobic and sexist. For example, in a recent interview to the BBC’s Today programme Ms Morgan described how intolerance towards homosexuality could be seen as an example of extremism (readers note that Ms Morgan, a [16]Christian voted against gay marriage). Moreover, anyone reading The [17]School Report by Stonewall will quickly realise that Muslims do not have sole monopoly over homophobic bullying in schools.

• Self-segregation: Claims of Muslims' self-segregation can either take the form of spatial or cultural segregation. This is one of the key features arising from the Trojan Horse discourse; Ofsted Inspectors and the investigations into the Trojan Horse letter by [18]Ian Kershaw and [19]Peter Clarke had a tendency to conflate segregation or self-segregation with extremism.

• Muslim Ummah and the question of loyalty: Global political events around Palestine, Syria and Iraq have had a profound impact on Muslim youths. Questioning of British foreign policy could be translated into giving loyalty towards the Muslim Ummah over the nation state.

What are the implications for the sociology of schooling for minority groups in general and Muslim communities in particular? What implications will this have on the racialised politics of schools for Muslim pupils? More crucially, does this fundamentally change the nature of schooling to what Michael J. [20]Dumas as described as schooling as ‘spaces of Black suffering’.

Firstly, Muslim pupils are no longer individuals with their own autonomy; they are problems that need addressing. Thus conventional debates around educational underachievement, discourses around racial inequality or anti-Muslim racism are all disregarded for broader security concerns. In short, the racialised politics of securitisation incorporates the idea of post-race; that is to say that race is no longer the salient excluding marker that it once was and the continuing racial practices of the state which impact upon racial experiences of minority groups.

Second, it is clear that the Muslim problematic embodied by the image of Dangerous Brown Men (see [21]Gargi Bhattacharyya) is constructed within policy discourse. Thus policy formation is no longer based upon evidence or rational thought but rather as David [22]Gillborn has shown from the following statement by Paul Flynn, member of the Public Administration Select Committee, that ‘much of our policy making is evidence free, prejudice driven and hysteria driven (particularly hysteria generated by the press). A crucial point to note is that ‘extremism’, as defined in the above policy discourses, is often projected onto Muslim bodies and rarely projected from Muslim bodies.

Third, the logic which permeates the current hysteria around Muslims as the existential security threat follows a particular thought pattern, that is, there is a ubiquitous security threat and something exceptional has to be done
about this threat. In the spirit of the moral panic, parameters for these debates around security are so narrowly defined to limit any critical discourse - so that criticism of fundamental British values leads to one being defined as an extremist.

Finally, the debates around Prevent in schools 'marks' Muslims in class as the racialised 'other' a group that is de-humanised and stigmatised; ironically who's de-humanisation and stigmatisation is silenced. The implications of such policy can best understood against a back-drop of the following observation by Judith [23]Butler:

> When we consider the ordinary ways that we think about humanization and dehumanization, we find the assumption that those who gain representation, especially self-representation, have a better chance to represent themselves run a greater risk of being treated as less human, regarded as less than human, or indeed, not regarded at all.

Dr Shamim Miah is a Senior Lecturer at University of Huddersfield. He is the author of *Muslims, Schooling and the Question of Self-Segregation* (Palgrave).

This group is designed as an academic research community for students, scholars and practitioners with an interest in questions of nostalgia and the media. We hope to offer a space fostering discussion and collaboration across fields, disciplines and research contexts. We welcome open debate, inputs, suggestions, or any kind of helpful advice on our members' projects, as well as links to research-related publications, call for papers, conferences, workshops and events.

Call for Papers

The first Sociology Graduate Conference at the University of Leicester will gather masters and PhD students to explore the implications of emerging information and communications technology. The conference is a platform to encourage discussion about the changes that digitalization has brought to the social worlds and new social phenomena. We seek both theoretical and empirical contributions on the status, limitations and problems that social methods – both qualitative and quantitative - currently encounter, as well as the new lines of inquiry that have been opened up because of digital methodological innovations.

Participants will explore the role of social science at a time where citizens, companies and governments are continuously generating, sharing and processing data. Researchers now face challenges to data access, analysis, and dissemination that raise ethical issues related to copyright, data protection, privacy and surveillance. For instance, knowledge dissemination is vital to the advancement of social methods, even creating new links between social researchers and actors, yet it also requires far-reaching revisions to our ethical procedures. We encourage graduate students to present case studies on these topics, and also to show how they deal with these questions in their own research, and to discuss the solutions they reached.

The interest that ICTs have generated in social sciences might render other social processes invisible, which are equally worthy of study, for example social inequality or the role of vulnerable subjects in transnational capitalism. And although offline activity has a long research history in the social sciences, with the use of valid and reliable methods, the appearance of an 'online' sphere has created new implications for carrying out studies into both spheres. In this regard, we welcome contributions illuminating these social processes that either are difficult to study with digital methodologies or require the collaboration between "old" and "new" methods. The conference will deal with the challenges, risks and new possibilities that the digital turn brings for methodologies in social sciences, but also will revise the mere notion of "traditional methods".

The conference will bring together postgraduate researchers from social sciences and humanities engaged in the interdisciplinary studies related to ICTs. The event will give them the opportunity to exchange views about their area of research. Suggestions for presentations topics include, but are not limited to:
digital social research and its implications
understanding Big Data
researching social media and the issues it raises
online identity and risk
social media and social change
people’s relationships with digital media
online activist communities and civic media activism
surveillance, privacy and conflict in the digital public sphere
media, culture and gender
web user experience
open knowledge and data sharing

Please send your abstract proposal (300 words) and a brief biographical note in a Word document to conferencepgsoc AT leicester.ac.uk

**********The deadline for applications is 5 pm on Monday 31st July**********

Conference registration:

Delegate rate £10 (conference fee includes refreshments, lunch and printed materials)

Registration will open on the 1st of August

The Happy Forecast and the quantification of emotion (2015-07-08 09:46)

A new project has just been launched which aims at quantifying and comparing the happiness of different areas of London. The Happy Forecast purports to offer an answer to the question "Which areas of London are best for social wellbeing?" On the website an interactive 3D map of London can be explored down to the level of the postcode.

[1]
3792
At the postcode level a “Happiness Outlook” is given based on:

“over a year of observational social wellbeing research” as well as giving a sense of the “current mood” based on analysis of tweets in the area

The main ranking is based on a "Jen ratio" which is:

"...calculated by the total number of positive micro-interactions over the total number of negative that strangers share during a given period of time, in a given place. Body language, verbal interaction and acts of kindness or aggression were key categories assessed during observation"
The concept of jen is derived from Confucian thought but is definitely twenty-first century in its formulation and the principle behind it can be summarised in the words of its key proponent, [7]Dacher Keltner, as[8] "a simple fraction [which] can tell us whether or not we're truly happy".

Jen is derived from observations of emotions that "transpire between people" such as "compassion, gratitude, awe, embarrassment, and amusement". In order to analyse this it examines "new human languages" like "movements of muscles in the face that signal devotion, patterns of touch that signal appreciation [and] playful tones of the voice that transform conflicts" as well as drawing on aspects of neuroscience which purportedly signal trust, forgiveness, etc (Keltner, 2009). A jen ratio is calculated like this:

"The jen ratio is a lens onto the balance of good and bad in your life. In the denominator of the jen ratio place recent actions in which someone has brought the bad in others to completion—the aggressive driver who flips you off as he roars past, the disdainful diner in a pricey restaurant who sneers at less well-heeled passersby. Above this, in the numerator of the ratio, tally up the actions that bring the good in others to completion—a kind hand on your back in a crowded subway car, the young child who compliments the elderly woman on her bathing suit as she nervously dips her toe in a swimming pool, the woman who laughs as a stranger accidentally steps on her foot. As the value of your jen ratio rises, so too does the humanity of your world."

(Keltner, 2009)

I am not quite sure what to make of this on broad terms yet (and would really like to hear from anyone who has any better formed ideas) but it is an interesting mix of ideas which seems to represent a kind of micro utilitarianism aimed at maximizing the quotient of happiness in a particular situation.

Having just heard many deconstructions of the faith we are encouraged to place in data at a recent conference the use of quantified measures and ratios to "tell us whether or not we're truly happy" strikes me as being part of this fetishisation of big data.

Keltner discusses how the "science" of jen seeks to understand the things which help to "bring the good in others to completion" through performing acts of kindness, it also positions trust as central to this. But he and his fellow researchers at the "[9]Greater Good Science Centre" at the University of California, Berkeley seek to understand these social actions through a Darwinian microbiological approach. They look at the individual neurological transmissions and individual actions such as "a kind hand on your back".

The assumption of this approach seems to be that we can be happy (or unhappy) and not know it and that our happiness lies in aspects of our behaviour and environment rather than our feelings. This reflects a mistrust in people as speaking subjects. For me one of the great strengths of sociology is that it is dialogical, it engages with the voices of people. The jen ratio has similarities with "big data" approaches which seek to simply let the data "speak for itself". With fundamentally human and social phenomena such as happiness might it be better to encourage people to speak for themselves?

A few years ago Zygmunt Bauman (2011) warned that sociology has been compliant in producing their subjects (human beings) as objects by rendering people mute in order to understand them sociologically. He asserted the importance of placing the supposedly ‘inferior ‘conscious motives’ of actors on a level with the superior
renderings of their intentions by their scientific analysts' (Bauman, 2011: 165). In his analysis of the measurement of happiness [10]Will Davies has pointed out that people are coming to be seen as 'unreliable narrators of their own lives' and that 'We need to accept that people often have reasons to feel happy or unhappy, and that those reasons are as important as the feelings themselves' Bauman warned that sociology must must be engaged as a dialogic, or polylogic, discipline this might well mean resisting the kinds of investigation seen in the Happy Forecast despite their enticing immediacy and broad sweep.

kerrysmallman (2015-07-08 10:39:09)
I work at a new research centre at Oxford, The Dalai Lama Centre For Compassion. http://compassionoxford.com. We share a lot of common ground with the guys in Berkeley. Centres/research units which research things like positive psychology and emotions face an uphill struggle because scientific materialism and reductionism is the orthodoxy not only in Universities, but also in the media and popular imagination. If we are to get column inches in newspapers or have an impact, say in policy formulation, we must create a 'metric' for compassion/happiness/empathy etc. Of course, we all know that any metric we devised would be 90% bullshit. The trouble is that the Social Sciences and Humanities have singularly failed to take on board ideas such as subjectivity, consciousness, quantum indeterminacy, Holistic thinking and all those other ways of understanding which break the 19th Century materialist paradigm. They have failed to take them on board because they would lose all credibility in Universities and journals as they currently are. The happiness index you mentioned is an example of what happens when Sociology insists on trying to be a "science". I am firmly of the opinion that the current scientific paradigm is in desperate need of reform in order to take on board the lessons of the 20th century physicists and that once this paradigm shift finally happens, we will have far better ways of describing and explaining psychology and emotion. The men in white coats who are the current gatekeepers of what is deemed appropriate for journals, university courses, television shows, healthcare, warfare and everything else will have to relinquish their power first. Until then, we are stuck with lame behaviourist attempts at explaining human reality from the outside in instead of the other way around.

kerrysmallman (2015-07-08 10:48:24)
For a taster of what lies beyond the current scientific paradigm, this video is a good start: https://www.youtube.com/watch?v=gjYQUmNtwt0

Chris Till (2015-07-08 12:26:30)
Many thanks for your comment, Kerry. Really interesting points. I might be confused but you suggest that the jen ratio I
discussed in the post is the result of sociology trying to be a science. As far as I am aware it was not developed by sociologists or directly incorporated any sociological ideas. It was developed by Keltner and colleagues at the "Greater Good Science Center" at Berkeley who (as far as I can tell) do try to incorporate some of the ideas you have discussed. Again, I may not have completely grasped your point but I don’t agree that the social sciences and humanities have not drawn on concepts such as subjectivity and consciousness (I will concede your points on quantum indeterminacy and holistic thinking as I do not know what these are). Subjectivity is a central aspect of sociological inquiry although of course this is tackled in a different way to how it is in philosophy. There are journals dedicated to it, it is pivotal in the founding texts of the discipline (eg. Weber) and most undergraduate students would encounter Merlau-Ponty amongst others. The video you linked to was great but I think supported the point I made in the post. As Stephen Priest stated in the lecture subjective experience has been devalued in favour of the God’s eye view of science. I argued above that we should listen to the subjective experiences of people rather than imposing an abstractly defined quantitative measure onto them.

PREVENT will have a chilling effect on open debate, free speech and political dissent (2015-07-10 20:09)

[2]The Independent carries a letter from academics collectively critiquing (the already many times discredited) Prevent strategy which has now become a statutory duty directly affecting places of education.

"In an unprecedented intervention, 280 academics, lawyers and public figures claim the controversial law will make Britain less safe as it will force radical political discussion underground.

[3]Among the leading academics who want the Government to rethink the strategy are Karen Armstrong, one of the country’s most prominent writers on religion, as well as Baroness Ruth Lister, emeritus professor of social policy at Loughborough University and Dr Brian Klug, senior research fellow in philosophy at St Benet’s Hall, Oxford."

We, the undersigned, take issue with the government’s Prevent strategy and its statutory implementation through the Counter-Terrorism and Security Act 2015 for the following reasons:
1. The latest addition to the United Kingdom’s counter-terrorism framework comes in the form of the Counter-Terrorism and Security Act 2015 (CTS Act). The CTS Act has placed PREVENT on a statutory footing for public bodies to prevent people from being drawn into terrorism by tackling what is claimed to be ‘extremist ideology’. In practice, this will mean that individuals working within statutory organisations must report individuals suspected of being ‘potential terrorists’ to external bodies for ‘de-radicalisation’.

2. The way that PREVENT conceptualises ‘radicalisation’ and ‘extremism’ is based on the unsubstantiated view that religious ideology is the primary driving factor for terrorism. Academic research suggests that social, economic and political factors, as well as social exclusion, play a more central role in driving political violence than ideology. Indeed, ideology only becomes appealing when social, economic and political grievances give it legitimacy. Therefore, addressing these issues would lessen the appeal of ideology.

3. However, PREVENT remains fixated on ideology as the primary driver of terrorism. Inevitably, this has meant a focus on religious interaction and Islamic symbolism to assess radicalisation. For example, growing a beard, wearing a hijab or mixing with those who believe Islam has a comprehensive political philosophy are key markers used to identify ‘potential’ terrorism. This serves to reinforce a prejudicial worldview that perceives Islam to be a retrograde and oppressive religion that threatens the West. PREVENT reinforces an ‘us’ and ‘them’ view of the world, divides communities, and sows mistrust of Muslims.

4. While much of the PREVENT policy is aimed at those suspected of ‘Islamist extremism’ and far-right activity, there is genuine concern that other groups will also be affected by such policies, such as anti-austerity and environmental campaigners – largely those engaged in political dissent.

5. Without due reconsideration of PREVENT’s poor reputation, the police and government have attempted to give the programme a veneer of legitimacy by expressing it in the language of ‘safeguarding’. Not only does this depoliticise the issue of radicalisation, it shifts attention away from grievances that drive individuals towards an ideology that legitimises political violence.

6. PREVENT will have a chilling effect on open debate, free speech and political dissent. It will create an environment in which political change can no longer be discussed openly, and will withdraw to unsupervised spaces. Therefore, PREVENT will make us less safe.

7. We believe that PREVENT has failed not only as a strategy but also the very communities it seeks to protect. Instead of blindly attempting to strengthen this project, we call on the government to end its ineffective PREVENT policy and rather adopt an approach that is based on dialogue and openness.

CALL FOR CONTRIBUTIONS

I Confess:
An Anthology of Original Essays on Constructing the Sexual Self in Contemporary Moving Image Art, Media and Culture (title-in-progress)

edited by Thomas Waugh and Brandon Arroyo, Concordia University

A twenty-chapter collection of essays on confessionality (self-referencing, first-person and/or autobiographical stories, testimonies or performances) around sexual identity, desire and practices in moving image media over the last quarter-century, principally in the Global North.

The Sexual Revolution of the postwar era was built on a foundation of confessionality. The recorded stories and practices of sexual subjects, a societal spectrum of voices including hitherto silenced sexual, gender and racial minorities, radically transformed the nature of cinema, television and the emerging moving image art scene. They also helped turn scattered individuals on the fringes of society into communities and a new cultural force. However, with the loss of many of those voices to the AIDS crisis, and the ideological destruction of collective empowerment in favour of individual accomplishment during the Reagan-Thatcher-Mulroney regimes of the 1980s, one might have thought that the revolution had slowed down. But in fact the ever-expanding porn industry, in dialogical relation with the inextinguishable and continuous sex/porn wars, maintained the revolution’s critical mass. And the digital revolution underway in earnest in the 1990s kickstarted new energies and aftershocks in the sexual revolution, leading to galactic techno-cultural economies of sexual representation that pioneers from Kinsey and Hefner to Fred Halsted and Barbara Hammer had never dreamed of. These 21st-century sexual-cultural economies clearly corroborate and extend Foucault’s prophetic probings into the interwoven operations of confession, desire, identity, truth and power, but how, why and to what effect?

At the centre of the second (third?) sexual cultural revolution has been an extraordinary, paradigm-shifting proliferation of first-person voices and imagery within moving-image formats in both high and low culture, inflected by subaltern and identity political movements as well as hegemonic backlashes, incorporating both traditional and new media and platforms. Perhaps the most fascinating aspect of millennial confessionality is the way it exists within the in-between spaces and across inherited boundaries of the culture. For example, porn world confessionality offers new ethnographies of porn performers and sex workers. And porn confessionality’s soft core nature has allowed it bleed into G-rated social platforms like Facebook, Instagram and YouTube. Political contradictions are rife: while
confession can be a cornerstone of sexual revolution, the first-person discourses of sexual diversity can also help enforce sexual conformity, and get mired in sexual political correctness, advocate assimilation (in the marriage- and military-consumed gay community), instil fear (as in the false rape "confession" at the University of Virginia), and confirm racial stereotypes (Osama Bin Laden's porn collection which is "too perverted" to release to the public, and The Maury Show's showcase of African-American confessions of sexual irresponsibility). Such contradictions and panics within popular culture stretch across the entire landscape of moving image culture that is the focus of I Confess.

Our book will survey the cornucopia of shifts in sexual voices, stories and iconographies within moving-image culture since the 1990s. Few studies in moving-image visual culture have moved beyond the traditional cloisters and boundaries of cultural analysis. Few have captured within the same analytic scrutiny both licit and illicit, documentary and fiction, queer and straight, subversive and hegemonic, text and flow, trauma and jouissance, north and south, surveillance and empowerment, narcissism and community. I Confess will fill this gap.

Historical and cultural scope: The collection will scan approximately the last quarter-century. While we are focusing on Euro-American culture and the Global North, inflected as in Foucault by the heritage of Judaeo-Christian confessionality and scientia sexualis, we hope the volume will encompass at least as control studies other cultural contexts, notably East Asian and South Asian. Our period is of course the age of the internet, and even those essays addressing localized or non-digital moving image culture in traditional platforms and venues, from the film festival to the art gallery, will situate their object in relation to the ineradicable presence of the net.

Methodologies: While the collection will profit from an eclecticism and interdisciplinarity suitable to our topic, our favoured methodologies include textual analysis—as applied of course to the always evolving platforms of the sexual mediascape—rigorously anchored both theoretically and materially/historically (and confessionally where appropriate!). The book will build on cultural studies and performance studies as well as traditions of cinema and media studies, will benefit from recent advances in queer, gender, sexuality and affect studies, and is open to cross-pollinisations from the social sciences. We will encourage an accessible, jargon-free style and a crossover audience.

Timeline:

Preliminary prospectus. Please submit a 300-word prospectus for your proposed chapter, along with five key words, applicable preliminary bibliography and mediagraphy, and brief c.v. to [1]i.confess@concordia.ca, by October 1 2015. Participants will be notified of inclusion within one month. We envisage testing the water in 2016 through conference panels and/or curated screening programs, perhaps even special issues of periodicals, enlisting selected participants. Publication: both book and electronic format are envisaged. Publishers will be canvassed for interest throughout the end of 2015 and early 2016. In addition to initial funding through a Social Sciences and Humanities Research Council of Canada Insights Grant, the co-editors anticipate a range of internal Concordia University support and further normal grants in support of Canadian arts-related publication. Deadline: final text. October 1 2016. Essays should be between 5000 and 6500 words, using Chicago date-author format. Anticipated publication: Fall 2017 or Winter 2018. Co-editors. Thomas Waugh is Concordia University Research Chair in Sexual Representation and Documentary in the Mel Hoppenheim School of Cinema in Montreal, Quebec. He is the editor of Show Us Life: Towards a History and Aesthetics of the Committed Documentary(1984), co-editor of Challenge for Change: Activist Documentary at the National Film Board of Canada (2010) and The Perils of Pedagogy: The Works of John Greyson (2013), as well as author of Hard to Imagine: Gay Male Eroticism in Photography and Film from their Origins to Stonewall (1996), The Fruit Machine: Twenty Years of Writing on Queer Cinema (2000) Out/Lines: Underground Gay Graphics from Before Stonewall (2002), Lust Unearthed: Vintage Gay Graphics from the Dubek Collection (2004), The Romance of Transgression in Canada: Sexualities, Moving Images, Nations (2006), Montreal Main (2010), The Right to Play Oneself: Looking back on Documentary Film (2011) and The Conscience of Cinema: The Films of Joris Ivens 1912-1989 (2016). Brandon Arroyo, is a doctoral candidate in the PhD in Film and Moving Image Studies at Concordia University in Montreal, Quebec. His dissertation is an affective
reading of contemporary gay male pornography in the popular internet age focusing on the text’s impact on space, identity formation and discourse. He won a Society for Cinema and Media Studies Student Writing Award in 2014 for an essay titled "Pornographic Space and Sexual Affect in the Networked Gay Village," and is the author of the forthcoming essay titled "An Amplification of Being: Chris Crocker and the Making of a Transindividual Porn Star." Both essays will be published in the Porn Studies Journal. Call for Papers: Issues of Power in Social Research (2015-07-12 08:00)

8TH ENQUIRE CONFERENCE: ISSUES OF POWER IN SOCIAL RESEARCH

To colleagues who have submitted abstracts for the 8th Enquire Conference - many thanks. Speaking with a number of colleagues, however, we are aware that there are some who were eager to submit but missed the deadline. So, we have decided to extend the deadline to 7th August 2015. As a reminder, the Enquire Conference is an annual, one day conference organised by PGRs from the School of Sociology and Social Policy, University of Nottingham, this year taking place on 7th November 2015. The theme this year is ‘Issues of Power in Social Research’ and we are excited to announce that we have Lisa McKenzie (LSE), Les Back (Goldsmiths) and John Holmwood (University of Nottingham) as keynote speakers. Please see details below regarding call for papers. This is also attached as a PDF file, as is the poster for the event. Call for Papers Issues of power are central to both theoretical and empirical research in most social sciences (sociology, politics, economics and psychology, for example). As such we invite doctoral and early career researchers to submit abstracts concerned with issues of power in social research. Power here should be understood in a broad sense, and we have deliberately left it undefined. We are interested, for instance, in both substantive research on power and broader reflections on power in the practice of social research. We therefore welcome abstracts for papers concerned with empirical and/or theoretical research based around issues such as, but not limited to:

- **Issues of power at the micro-interactional level of research practice**, for instance between participants, between researcher and the researched, between researcher and gatekeepers, between funding bodies and researcher, or even between supervisor and supervisee during the PhD process.

- **Ethical issues in relation to power**, such as coercion, payment and informed consent.

- **The role of the expert** and associated issues such as the relationship between power and knowledge, dissemination, and implications of research for policy.

- **Macro-level power structures** including those of an institutional kind such as governments and other political organisations, and interactional structures such as ‘race’, gender, sexuality, class, status and age, how they intersect and how they perpetuate inequalities.

- **The lived experience of power**, resistance to it, and attempts to overcome power imbalances through social movements.

- **Grand theoretical debates on power questioning**, for instance: what power is, how it should best be understood, and how and by whom theories of power are written.
This is a one day event taking place on **7th November 2015 costing £15** (£10 early bird rate available: ends 7th September 2015). We welcome **abstracts of 250-350 words for presentations of 15 minutes**, to be submitted to [1]LQ-Enquire@exmail.nottingham.ac.uk. **Extended deadline for submission: 7th August 2015.** We look forward to hearing from you! Kind Regards, **The Enquire Conference Team** Twitter: @enquirenottm #enquirepower Website: [2]http://www.nottingham.ac.uk/sociology/research/enquire/conference/index.aspx

3813
It is that time of year again: Muslims around the world are fasting during Ramadan in the lead up to Eid ul Fitr. The #ShareRamadan concept has long existed as older generations of Muslims have shared their food with their neighbours during and outside of Ramadan, or local community leaders and businesses organise interfaith iftars (breaking of the fast). Last year though three Muslims from Oldham decided they would encourage more young people to engage in interfaith social practices by inviting their work colleagues, friends and neighbours of all faiths and none to partake in the fasting experience.

#ShareRamadan went viral last year as people around the world fasted for one or more days to experience what it was like for their Muslim friends, before attending iftar at their Muslim friends’ homes where they broke the fast together. Some new to fasting had perhaps never visited a mosque before, and thus decided to accompany their Muslim friends for the Tarawih prayer at night. The concept of #ShareRamadan vividly demonstrated
multicultural conviviality as alive and well in Britain. The detailed accounts on social media and the video diaries of the experiences of those who are participating in this religious practice are fascinating for those interested in everyday multiculturalism. [3]Last year, I compiled some of the accounts in a blog post highlighting these practices of multicultural conviviality.

This year I have been keen to follow new accounts of the experience. I have been thinking about “Red Boots” multiculturalism which has been used to describe the idea of food, festivals and fun being the focus of multicultural governmental policies. This once popular type of multiculturalism has rightly been heavily criticised for neglecting the real issues of inequalities. We must never neglect to highlight issues of inequalities, particularly important now more than ever in times of austerity, as observed in the rise of food banks and voluntary organisations assisting the homeless, as well as those struggling to pay for food after rent/bills are paid.

There are Muslims in Britain who have set up voluntary groups to help those who are suffering poverty, again illustrating models of interfaith work that is common throughout Britain. [4]The Myriad Foundation consisting of a small group of volunteers have set up a Feed a Friend Project that provides local foodbanks and shelters with donations from mosque congregations; [5]they also provide run a mobile food kitchen every Wednesday in Piccadilly Gardens in Manchester. Every year another group of [6]Muslims during Ramadan encourage local Mancunians to come and feed the homeless. There are countless positive examples of everyday multiculturalism taking place up and down Britain which the mainstream media outlets would do well to present to their audiences.

With #ShareRamadan we have an interesting case of community cohesion where fasting, food and (religious) festivals can result in multicultural mingling and more as evident in the responses of those engaging in #ShareRamadan, and research into this area would be useful in understanding everyday multiculturalism. One of the Christian participants this year who fasted for four days reflected upon how he would like to do more than just fast as has been prescribed to Muslims, and thus he went out and assisted the Myriad Foundation on their weekly pop up kitchen in Piccadilly Gardens.

Last week, MEND (Muslim Engagement & Development) organised a community iftar for people of all faiths and none to gather together share a Ramadan meal at The Sheridan Suite. They collaborated with the Myriad Foundation and the #ShareRamadan team to put on a splendid informative and entertaining evening. Over 400 people from a variety of backgrounds, people of different faiths and none came together to learn about Islam and Ramadan, the contribution of Islamic civilisation to the modern world, the communal need to challenge Islamophobia and all other forms of hate as well as Muslim contribution to modern day Britain. The three groups (MEND, Myriad & Share Ramadan) invited their friends/colleagues/neighbours to the iftar, in attendance were teachers, academics, public sector workers, union representatives, representatives of synagogues and churches, and many more. Guests also included volunteers from [7]Coffee 4 Craig and [8]Community Awareness Network who regularly work with Myriad in helping the homeless in Manchester. Some of those who learnt more about Ramadan decided they would fast some of the remaining days of Ramadan.
Share Iftar Manchester
Thursday 9th July
7.30pm - 10.30pm

Location
Sheridan Suite, 371 Oldham Road, Manchester M40 8RR
Register at the link below to reserve your place for this free event

#shareramadan
Enjoyed an amazing #ShareRamadan Iftar meal with MEND and Myriad Foundation.... During an interview about Coffee4Craig we kinda egged each other on to fast out the last week of #Ramadan.... So true to our word...

Revy Wevy Risha Lancaster and myself will be fasting and breaking fast at sundown for Monday, Tuesday, Wednesday and right through until we celebrate Eid with our buddies at Myriad over Friday or Saturday next week.

Monday night at 9.39 ish we will break fast with guys from Myriad and the homeless.

Venue and more details TBC but we would like to raise awareness especially in light of the terror attacks in Tunisia and show the world that terrorists are not Muslim, Islam is about unity, peace and we are all one race....

We're joining with our brothers and sisters to be as one and unite our cultures!! Come join us, fast during sunlight and then eat together...

#ShareRamadan

Academic spammer or weird meta-troll? (2015-07-14 08:00)

Has anyone else received e-mails from JPMontfort? I was intrigued by the sheer weirdness of things like this:

FROM YEAR 2210

TO UCHICAGO PRESIDENT ROBERT J. ZIMMER

RECIPIENTS 159.134 FACULTY & STAFF IN BRITAIN

We have a reason to believe that our special envoy to present time Earth, Time Traveler JP.Montfort has been subject to arbitrary, subjective and perhaps discriminatory treatment by the personnel in your institution. Following our specific instructions to become a Generalist, our special envoy has previously graduated from The University of California-Berkeley, The London School of Economics and Columbia University.

We understand that decision makers in your institution have retaliated against JP.Montfort’s exercise of freedom of expression, subjectively and arbitrarily applying the "Authority To Direct" Policy described in your [6]Student’s Manual. We also have a reason to believe that retaliation was incorporated when evaluating JP.Montfort’s application to doctoral and master’s programs at The Harris School in the fall of 2014.

For all of the above we strongly encourage you to take action in order to avoid an escalation of the ongoing issue. We estimate a loss in goodwill for your institution in present time dollars of between $100 Million and $1 Billion between today and 1-January-2051 if you do not act promptly. This message has been typed from Year 2210. Over and out

You may contact the protagonists Dean of Students Teresa Hord Owens at [7]+1 773.702.8217 and Associate Dean Jeremy Edwards at +1 [8]773.834.8177.

There’s an interesting bit of background to this weirdness [9]here: "it is difficult to discern whether Monfort is deluded, a scam artist, or some sort of weird meta-troll".

To everybody who receives all those bloody emails from Mooron #jpmonfort ... Resend ALL and MORE emails you receive, back to his jpmonfort.join@gmail.com And tell that Twat he’s a Fucking Mooron.

review by Bradley Williams

The 2011 Bahraini Uprising seemed to confirm that Bahrain does not conform to the orthodox theory of rentier oil states, referred often to Rentier State Theory. As Gengler (p. 147) asks “What is it about Bahrain qua rentier society that renders its rulers particularly incapable of buying popular political quiet?” The theory of the rentier state, or allocative oil state, predicts that Gulf States garner allegiance from citizens by redistributing the wealth that they accrue from oil revenues. Redistribution of wealth is supposed to alleviate all forms of opposition and protest. This perspective has remained dominant in international relations for roughly the last thirty years. Rentier State Theory was first explained in 1970, in a chapter by Hossein Mahdavy (1970) titled The Pattern and Problems of Economic Development in Rentier States: The Case of Iran. Hazem Beblawi and Giacomo Luciani (1987) produced another influential analysis of Rentier State Theory in The Rentier State (Nation, State, and Integration in the Arab World, Vol 2).
The Royal al-Khalifa Monarchy in Bahrain controls virtually all areas of state and military governance. While Shia Muslims constitute the majority of civil society in Bahrain, they are barred from employment in the police and military and other areas of state governance that are deemed security sensitive. The protests referred to as the Bahrain Uprising have clearly shown that the ideal model of the rentier state and the assumptions that it makes about individual level behavior do not adequately explain the persistence of political opposition to rulers in Bahrain. Via a critique of Rentier State Theory, Justin Gengler shows that the relationship between civil society and the state does not conform to the rentier model at all. Gengler bases his findings on data from his mass survey, collected in early 2009. The survey is representative of the whole country and includes questions concerning political orientation, religion, and other information about ordinary Bahraini citizens. The survey data indicate that the government of Bahrain intentionally exacerbates tensions between Sunni and Shia Muslims. This strategy undermines opposition without compensating either Sunni or Shia Muslims with money in accordance with the rentier state model.

As I briefly noted above, Gengler developed and administered a first-of-its-kind survey instrument. As the author states, the survey is based off of the "Arab Barometer questionnaire” with admittedly minor adjustments to fit the Bahrain context. Chapter Four examines the process of developing and administering the survey and the efforts he and his team underwent to gather data. The whole affair was completed in a short amount of time given that they still gathered 437 completed surveys of their goal of 500. The survey includes at least one respondent from every Bahraini village. I found this chapter to be one of the more interesting parts of the book. The researchers even utilized one challenge in a constructive way. They were able to account for the interaction affects between interviewers and interviewees from different devotional communities.

The findings of the survey seem to completely undermine our general understanding of rentier, allocative Gulf States. The study finds that first, private and public goods are not allocated in a politically neutral, or agnostic, fashion across all populations. Second, the study finds that there are many individual level factors that actually account for political opposition beyond merely economic incentives, or government incentives of any kind. The government and Royal Family in Bahrain have fostered a populace divided by distrust and fear between Sunnis and Shia Muslims. Sunnis surveyed indicated their belief that the state is the sole defense against the perceived threat of an Iranian-inspired Shia insurgency. Because of this fear, rulers in Bahrain are able to keep monetary allocation to Sunnis low while still maintaining strong support from most Sunnis. Shia Muslims, on the other hand, oppose a wide range of government policies based on a wide range of grievances concerning systemic inequalities and not caused by the amount of rent allocation. Because the Shia opposition cannot be dissuaded by a higher rent allocation, the state subdues political opposition with police and military force.

Justin Gengler has written an excellent and succinct examination of Bahrain that explains the recent political opposition and the government’s failure to sustain social order. The only real criticism is that the book is not a bit longer in parts. There are only 159 pages of text. The main text is followed by a seven page index consisting of the tables of data and a twenty-two page Notes section, which seems large in proportion to the main text. Although the book is short, the author adequately presents enough information to make an interesting and convincing argument. Many events, including the Bahraini Uprising and subsequent government repression, have been previously reported in the media. However, this book does compile these events in one place along with a superb, empirically verifiable analysis. Every part of the argument seems necessary.

Thinking of future research, Gengler states that research will need to focus on the consequences of divisive engineering by Gulf state rulers incite inter-sect conflict. Furthermore, one consequence of royal meddling is the rise of Salafist and Sunni militant groups, such as ISIS (Daesh). Gengler insists that research should seek to understand this link between the actions of rulers like the al-Khalifa in Bahrain and the persistence and rise of specifically Salafist and Sunni militant movements.

In conclusion, this book is a singularly important book that advances the fields of political economy and inter-
national relations. This book offers a unique and one of a kind insight into the country of Bahrain. Additionally, the author shows that his explanation of inter-religious conflict and government opposition within the country of Bahrain can be generalized to a broader range of Gulf oil countries. As Gengler puts it, the conditions within Bahrain are "merely the realization of a latent possibility that exists in other Arab Gulf regimes according to their peculiar vulnerability to such conditions" (p.7). This book is intended for an academic audience. It is particularly appropriate book for Gulf state specialists within political economy and international relations. However, anyone with an interest in the future of Bahrain would find this book accessible. This book is definitely unique and invaluable to anyone wanting a fuller understanding of the economic, political, and religious tensions within Bahrain that media outlets and published reports have scarcely revealed.

Bradley W. Williams is a doctoral researcher at George Mason University. He studies transnational governance, social movements, peace and organizational processes.

CfP: Beyond the Master’s Tools: Post- and Decolonial Approaches to Research Methodology and Methods in the Social Sciences (2015-07-16 08:00)

Call for Papers

Beyond the Master’s Tools: Post- and Decolonial Approaches to Research Methodology and Methods in the Social Sciences

University of Kassel, 14-15 January 2016

The contention that “the master’s tools will never dismantle the master’s house” (Lorde) translates into a major critique of Social Science research. Accusations regarding the continuation of “epistemicide” (Santos) highlight the dangers of an occidentalist or Eurocentric research agenda. Post- and decolonial perspectives point to colonial continuities embedded not just in the epistemic foundations and thematic concerns, but also in the actual practices, i.e. the craft of research as canonised in re-search methods and methodologies. A decolonising approach to Social Science research is necessarily twofold: the deconstruction of existing methodologies and methods that (re)produce the coloniality of knowledge; and a reconstruction and/or reinvention of research practice. The conference aims to bring together scholars to discuss methodological and methodical critiques as well as potentially post-/decolonial ways of doing empirical research.

Academic knowledge production has become a highly diversified field. Various turns (argumentative, ethnographic, spatial, practice, intersectional etc.) claim to offer epistemological lenses that allow for a more pluralist, contextualized and enriched understanding of the social world. While these developments may point to a desirable ‘mainstreaming’ of heterodox and critical approaches, we can still observe that the “right to research” (Appadurai) as a universalized hegemony over knowledge production remains the reserve of a minority marked by privileges linked to the history and present of colonialism. “Researching back” (Smith) appears to be a necessary but difficult process. The conference aims to discuss and learn from different approaches that strive to decolonize the field of academic research, i.e. the epistemological conceptualization and selection of research objects and research designs (Mato).

The methodological reflection of ongoing entanglements regarding hegemonic power/knowledge complexes leads to the reflection of decolonial methods and research practice. Feminist, anti-racist and decolonial scholars have focused on developing methods for power sensitive research in order to deconstruct what still appears to be a hegemonic and positivist research paradigm by putting forward concepts such as positional reflexivity, standpoint feminism, situated knowledge or critical whiteness. Analyzing everyday life practices or stories in ethno-methodological methods, reflecting on ‘writing culture’ (Clifford/Marcus) in cultural anthropology, focusing on counter-narratives in biographical research, conceptualizing gaps and silences in discourse analysis or addressing complexity in situational analysis are all approaches that provide useful tools for decolonial research. Furthermore, participatory research methods such as popular education (Freire) or participatory action research (Fals-Borda) open up perspectives for horizontal and collaborative research processes.

While university regulations might require researchers to follow formal guidelines for ethical research – for example, participant information sheets, informed consent, and right to withdraw at any moment –, post-/decolonial critique requires a more profound recognition of ethical issues. It urges us to account for the positionality of the researcher in relation to the field, the people investigated, and the "geopolitics of knowledge" (Mignolo) more broadly. Rather than perpetuating the obscuring stories of how we stumbled across field sites „by chance", it is necessary to bring to the forefront the ways in which researchers are "historically and socially [...] linked with the areas we study" (Gupta/Ferguson). First and foremost, a de-/postcolonial research ethics demands that we choose sides and step away from any pretense of neutrality, objectivity, and impartiality - while we still try to to reach an intersubjective understanding of the world. We thus have to ask (and answer) the highly political question of who benefits from our research. Postcolonial research ethics might even go further and say that it is not up to academics...
to decide on relevance, but that it should be up to the people fighting the decol-nial struggles on the ground. It is not an easy feat, but – in spite of itself being predominantly Western, white, male, bourgeois, heterosexual, and able – academic research needs to be "existentially and poli-tically committed to decolonisation" (Decoloniality Europe).

We invite contributions which engage with the following set of questions:

How do the prevalent geopolitics of knowledge production shape social science research? How do they become productive – and which privileges/visibilities/ capacities or marginalisations/invisibili-ties/ways of silencing does this entail? * How do post- and decolonial perspectives challenge the Eurocentric grounding of research methods, methodologies, and ethics? What (new) empirical approaches, lenses and tools for research do these approaches offer or imply? * What are the implications of decentering or decolonizing methodology? What does this imply in terms of research agendas, research cooperation, case studies, academic discourse and dissemination? How does this relate to traditions of academic writing? How can new forms of expression be mobilised (e.g. story-telling, oral history, auto-ethnography, action-research)? * How can research designs and field access be realized without reproducing power complexes, but enable a process of „studying with“ (Mato) marginalised actors and social groups? * How do requirements of decolonal research ethics clash with academic regulations and guidelines? Are such clashes necessary and to be welcomed; or are there innovative ways to pretend to play by the rules? * If the researcher abandons her*his privileges to select the problem to be analysed and leaves the decision to the decolonal social movements: who decides which social movements are decolonial and according to which criteria? *Is it possible for privileged researchers to unlearn their privileges and conduct research with margi-nalised groups in a political and ethical manner? If so, how? What are the implications for processes of research and knowledge dissemination? Our conference welcomes a variety of forms of academic presentation. Research will be discussed in panels and roundtables as well as in a poster session. The latter format is particularly suitable for dis-cussions on research design and 'work in progress' by both junior and senior researchers. Please send abstracts of no more than 250 words to [1]beyondthemasterstools@uni-kassel.de by 15 August 2015. For the last few months, I’ve been curating a series of essays for The Sociological Review’s website, reflecting on the future of the discipline and related issues. Here are the initial essays:

- [1] Sociology’s Dual Horizons by David Beer
- [2] Are We Seeing the Closing of Sociology’s Mind? by Les Back
- [4] Towards a Philosophical Sociology by Daniel Chernilo
- [5] Swimming Upstream: Sociology Beyond Description by Nicholas Gane
- [6] Committing Sociology: Defending the Public University by Gurminder K Bhambra

There will be more coming soon!

Support Sociological Imagination with a T-Shirt! (2015-07-18 08:00)

In recent years, the once negligible hosting costs of this site have begun to increase. Hopefully this has had some positive impact, as the site had been increasingly unreliable on our old host. Our new host is great. But a lot more expensive. This site has always been a hobby, into which myself, the co-editors and contributors have willingly sunk lots of time. In the case of myself and the Idle Ethnographer we’ve also put money into it. It’s fine really, we do this out of love. But with the new host the money leaving my account each month to pay for the host is more conspicuous than used to be the case. As a way of allowing readers to support the site, without anything so crass as a donations tin, [1]I’ve made some t-shirts. Hope you like them!
In recent months, I’ve become fascinated by [1]Design Fiction as a potential tool for Sociologists. Related to this is the question of counter-factuality: can we use fiction to explore hypotheses about what would have happened if ... in a way that helps explain what actually did take place? This example by [2]A Very Public Sociologist might not be entirely clear to those unfamiliar with the party politics of the United Kingdom, but it’s a very interesting example of how sociologists might go about doing this. Read it in full [3]here:

The polls were with Labour. The feedback on the doorstep was very encouraging. It looked like all the naysayers and the problems of the previous five years had been put to bed. Until that exit poll flashed up on the nation’s TV screens. It gave the Tories a clear lead, and one several seats away from a majority. Then the worst happened. As the night wore on it became increasingly clear Labour were not winning the seats it needed to capture to form the largest party, and by the morning the impossible had happened: David Cameron had pulled the irons of an overall majority from the election fire.
Despite the naysaying and doom laden predictions coming from the left of the labour movement, David Miliband’s leadership of the Labour Party started off well. From the moment he emerged ashened face from behind the curtain at party conference, he set out a stall that confounded expectations. Labelled as the continuity Blair candidate, David’s victory speech - secured across all three sections of the electoral college, albeit very narrowly in a higher-than-expected turnout from USDAW members in the trade union component, emphasised the need to capture economic credibility. He announced an establishment of a commission under Alastair Darling to revisit the rules and responsibility attached to government spending, but he also played to the left by indulging tough rhetoric around the regulation of the entire economy. The behaviour and spending of public bodies wouldn’t be the only ones to be covered by tough new rules: businesses big and small were also expected to behave responsibly and play their part. Concerned to yank back economic credibility from the Tories, he reaffirmed the Darling plan to halve the deficit over the course of the parliament, and made points around the need to develop a proper industrial strategy. Lastly, David Miliband announced an ambitious plan to re-energise and refound Labour as a mass organisation, offering CLPs incentives to recruit people and draw more trade unionists into the party. Jon Cruddas was also announced as the face of the Movement for Change.

______________________________
Returning to blogging (2015-07-20 08:00)

Around two months ago I reluctantly came to the conclusion that I no longer had time to maintain two blogs. I won’t go into the reasons here, but the case seemed pretty unanswerable. So I closed down this blog and decided I would focus on Sociological Imagination. Since then I’ve felt the quality of my writing gradually deteriorate. The reasons for this seem obvious to me: objectively I write much less without a personal blog. The recurrent practice the blog helps ensure writing is a taken for granted part of my everyday life, it’s something which I feel no more anxiety about than other mundane daily activities.

I’ve found my creeping sense of dissatisfaction in the last two months extremely worrying. It’s a new experience for me to look at my writing, conclude “this is crap” and to feel uncertain of how to fix it. It’s not that I was always happy with my writing up to this point. I really wasn’t and I have multiple ‘working papers’ which demonstrate this. But when blogging was a part of my daily routine, my response to difficulty was to keep writing. The challenge added to my enjoyment of the process, rather than contributing to my descent into a seething mass of writerly neurosis.

Having a personal blog enables a cheerful optimism about writing. One which I never want to be without again. In the words of one of my favourite punk bands, it facilitates ‘word acrobatics, performed with both harness and net’. I feel like I learnt to write seriously in the last couple of years of my PhD, when blogging became a daily activity for me. That’s when I began to take profound pleasure in writing for the first time. I’m not entirely sure I can be a writer, as opposed to someone who is contingently obligated to write stuff, without having my own blog. It seems I’m not the only person to have this experience, as [1]A Very Public Sociologist recounts:
Since December 2006 this blog has weighed on my brain like a digital nightmare. Apart from a six month break and a further 18 month leave of absence, I've been writing or thinking about writing content all that time. Even when I took a hiatus, words, phrases, screeds of 500 words or more tangoed across my eyeballs when the shutters came down at night. As our minds have allowed social media technologies to colonise and structure our perceptions - how many times have you thought of a real-life happening in terms of an instagram snap or a sharply-observed tweet - so mine finds half-digested ideas immediately suited to bloggable form

Does anyone else have an experience, of trying and failing to give up blogging, which they'd be willing to share?

Carmen Tong (2015-07-21 04:47:26)
What a coincident! I started blogging again recently, for a week so far. It took a much longer time for me to start writing again... the last time was 2008.

Abs (2015-08-04 21:48:41)
I lasted six months then had to return, spent a very dedicated week catching it up on everything it has missed out on then vowed not to ever go without it that long again!

The @_ISRF @DigitalSocSci and @BigDataSoc Essay Competition (2015-07-20 14:33)

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic 'Influence and Power'. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

I recall watching a documentary about the popular crime novelist Ian Rankin. It’s a documentary that is well worth watching for any writer. The programme followed him through a year in his life. It began in January, as he started preparations for new book, and followed him through to the completion of the publishing cycle. It was a fascinating account of the craft of a professional writer. It began with him sifting through notes and newspaper cuttings to find ideas for the plot, then we saw him working up the plot and writing a draft. The draft was then honed and we saw his response to editorial comments and suggested revisions. Then, somewhere around the middle of the year, the book went to press. Quite a bit of the latter part of the year was then spent on promotional work of various types. I watched the documentary closely for tips. Ian Rankin is a great author and I hoped that I might pick up something from his practices, something that might help. I’ve already spent a lot of time reading Rankin’s work, and I often try to see if I can find a way to capture some of his style and tone in my own work – I can’t manage it, but it gives me something to aim at. I find that reading Rankin’s work whilst I’m working on a writing project really gives me something to aim at, an ideal of clarity, complexity and direct no-nonsense flare.

One of the things that struck me in the documentary was that Rankin worked on an old laptop that had no internet connection. There was another computer in his study with internet connection, but he wrote on this internet free laptop instead. I seem to remember him seeing this as a way of removing distractions or the temptation of procrastination. Disconnected writing is undisturbed writing. When I was looking for tips I thought about this, and I made sure my email was never switched on when I was writing, so as not to receive something that might disturb the flow. Recently though I was forced to follow Rankin’s approach more closely. My old white plastic MacBook stopped connecting to Wi-Fi. I suddenly became a disconnected writer. Remembering the images of Ian Rankin writing away on his disconnected device, I thought that this malfunction might not be a problem. I soon realised though that being connected is central to my own writing practices. It is not until I lost the ability to connect whilst writing that I realised how central it was. This was probably why I managed to mirror some of Rankin’s other writing practices with the exception of the disconnected laptop. The problem became clear when I started trying to add and check references. I found I kept opening the failing internet connection to check a passage I thought might be wrong or to find some missing information or check a year or titles, I kept forgetting. Completing references seemed impossible. I also tend to write quite a few short pieces for web publications now, and those require inserted hyperlinks in the text, which proved to be impossible on a non-connected device. Plus, my reading practices have changed. I now read lots of blog posts and use other online resources in my writing. As a result I’m finding that I now frequently cite such sources. This is impossible without being able to connect to that source to pull out the URL for the reference section, or simply to search through the reading to find relevant bits. Its possible to
write in disconnection, but it is much more difficult. I found being a disconnected writer to be impossible. It was nice to be certain of no distractions, and to avoid the temptation of searching for music or books to buy. But a connection is central to the way I write. This recalls something I read recently in Les Back’s contribution to the recently published book [2]The Craft of Knowledge. In that piece Les reflects on writing and reading in the context of hyper-connectivity. He highlights some of the costs as well as massive benefits of the information to which we can have instant access as researchers, writers and readers. I’ve also found, like Les, that over time my writing practices have increasingly been reworked to rely upon having a connected device upon which to write.

The routine of writers is something that we ponder about quite a bit, if you search around there are quite a lot of reflections on writing practices. My broken laptop forced me to break my own routine and to buy a new laptop. I see my laptop as being a central part of my writing routine and a defining presence in my writing space, I’ve had it for years and I’ve written most of my work on it, so getting a new one was a strange. My writing desk suddenly looks different and sitting down to write today feels a bit alien. This is the first piece that I’ve written with my changed writing space. I’m using this piece to get warmed up and to test out my new writing device. I’ve lost the shared history I had with my old laptop, it had become the kind of [3]evocative object to which Sherry Turkle has referred, it had seen me through some tough writing days. We do develop attachments with such objects, particularly where there is a prolonged history. I wonder if this new device and the disruptions it will bring will change how I write. Maybe it will freshen things up or alter my perspective, perhaps though it will just quickly mould itself into familiarity. Certainly it is good to be a connected writer again and to take advantage of the speed at which I can link, check, add, search and revise. I can understand why Rankin likes to be a disconnected writer, with the undisturbed time and space that it brings. Much as I admire his writing, this is one aspect of his practice that I’ve found I can’t manage to adopt (whether through choice or a broken laptop). Connected writing just seems to be more productive for the type of writing tasks I have – the tricky bit is enabling this connectivity to enrich my writing rather than it allowing it to get in the way.

David Beer is Reader in Sociology at the University of York. His most recent book is Punk Sociology (the first chapter of which is open access [4]here). He is on Twitter @davidgbeer[/nbox]
without trial. Extradited, stripped and placed in solitary confinement for trumped up “terrorist” charges with his only escape from this awful ordeal being a plea bargain. [1]Judge Janet Hall who accepted his plea noted: "There was never any aid given by these defendants to effectuate a plot. By plot, I mean a terrorist plot ... Neither of these two defendants were interested in what is commonly known as terrorism ... It appears to me that he [Babar] is a generous, thoughtful person who is funny and honest. He is well liked and humane and empathetic...This is a good person who does not and will not seek in the future to harm other people." Yet, he did not return to a Britain of compassion, humanity and justice. Rather a Britain which continues its never ending "War on terror" narrative with misleading, irresponsible and sensationalist articles such as "[2]Terrorist slips back into UK after release from US jail". This is a narrative which has seen not only the death of many innocent civilians in Afghanistan and Iraq but also military expenditure spent on bombing civilians in Syria and Libya. What is more, on Wednesday 8th July, the evening prior to the [3]one year commemoration of the latest massacre unleashed by Netenyahu in Gaza, the BBC with its ever “objective" journalism once again released a documentary entitled "[4]Children of the Gaza War" withstanding fair historical, political or social context with regards to the Palestinian plight - especially the [5]effect this has had specifically on Palestinian children. During a recent film showing as part of Manchester Srebrenica Memorial Week 2015, "A Cry to the Grave" was aired, ironically also released by the BBC, one section of the film in particular stood out: blood, limbs and the haunting sound of Bosnian Muslims wailing depicted some of the aftermath Bosnian Muslims suffered at the hands of the Republika Srpska (Bosnian Serb) militia. This was followed immediately by a scene featuring Bosnian Serbs mourning their dead. A local Bosnian Muslim who very narrowly escaped the onslaught carried out by the Republika Srpska (Bosnian Serb) militia took issue with this "objectivity" with the repetition of “They are not Muslim. But they are not Muslim?!” Although there were Bosnian Serb deaths, to depict their suffering as relatively equal to Bosnian Muslims echoes of similar partial BBC journalism we observe today of how Israelis are alleged to suffer just as gravely as Palestinians. The victim is in the same boat as the oppressor apparently. A shameful continuation of a shameful legacy for the BBC. However, the BBC cannot solely be blamed as they are funded by the government. On Monday 6th July during a Civic event in Westminster Abbey, David Cameron recently stressed words of “Never again can we allow this kind of thing to happen” whilst [6]Pro-Palestinian campaigners demonstrating outside the infamous Elbit weapons factory in Shenstone were at the receiving end of severe police brutality and arrested for taking a stand against arms being manufactured and sold to massacring maniacs such as Netenyahu. David Cameron who pledged to “continue funding initiatives which remember Srebrenica“ has recently passed the CTS bill which effectively legally mandates public figures such as doctors and teachers to spy on Muslims in the hope of curbing them from becoming "terrorists". This suspicion and othering is exactly what led Serb nationalists to commit grave human rights abuses including genocide, physical, mental and sexual abuse towards Bosnian Muslims. Bosnian Muslims were “dangerous” Bosnian Serb nationalists alluded; “we will take our revenge from the Turks” Ratko Mladić, former Bosnian Serb military leader and perpetrator of war crimes, is famously quoted to have said. The continuous suppression of historical, political and social facts, overtly and covertly, incites disunity amongst the average person in what is supposed to be a multicultural society, and in the case of Bosnia and Herzegovina led to heinous violence. When certain history is ellipsed, an indirect or direct form of subordination occurs as that group of people are not deemed as important to mention. Bosnian Serb nationalists until this day taunt survivors of the genocide with Ottoman or "Turk" related slurs. This disregards the centuries [7]under Ottoman rule where the Serbian Orthodox community began settling and establishing multiple places of worship in cities like Sarajevo in the first instance. What is more, Muslims in Bosnia are reported to have settled there since the 10th and 11th centuries. Although there were some people who were Slav in origin who converted to Islam during Ottoman rule, there were significant waves of ethnic Muslims to Bosnia and Herzegovina including Muslim Albanians, the Pomaks and the Torbesh, also referred to as the Gorans. Likewise, Muslims have lived peacefully in Britain for more than a century but are now depicted as the greatest threat. This once again disregards Muslim history in Britain through figures such as [8]John Nelson, [9]Pasqua Rosee who is alleged to have brought coffee to Britain, [10]Muhammad Asad, [11]Abdullah Quilliam and many more. The value of the words “never again” have long seemed to be nothing more than fanciful hyperbole. If Britain and its allies truly did honour these words, [12]chemical weapons in the form of Sarin would not have been sold to Bashar al-Assad from six years prior to the Ghouta massacre. [13]The British government and its allies would not pander to the Israeli lobby. Their foreign exploits with the United States of America would cease. For many, particularly in the Global South, “never again” appears to signify nothing more
than “never again” for the same people. Or “never again” in the same geographical location. What national and international leaders fund in one country seems to be what they destroy in another, how else would these actors be relieved of accountability? Mladić stroked the heads of innocent Bosnian Muslim children and the world sighed a temporary breath of relief. When the cameras stopped rolling, he began slaughtering them again, not only does propaganda sell, it "wins" wars. The UN of course is reported to be just as culpable with [14] leaked evidence obtained by renowned journalist, Florence Hartmann. This is in addition to last week’s delay in classifying the Srebrenica genocide as a genocide in the UN Security Council, thus once again failing Bosnian Muslims and bringing to question what use the UN actually serves the average person who has been at the brunt of these atrocities. It is worth also noting that [15] the Hague has forbidden acclaimed interpreter and survivor Hasan Nuhanovic from appearing in the tribunal, thus raising alarms for justice campaigners of where cries for “free speech” and “Western values” happen to be in this case. This is all while the Rohingya continue to be massacred, as do the people of CAR, the people of Iraq, the people of Palestine, the people of Syria, the people of Yemen and sadly the list continues. This “othering” of Muslims within and without Bosnia has led many justice seekers to conclude that they do not expect the UN and its members to recognise the liberation of various independence movements, yet through the commemoration of the dead and in the remembrance of the living, national and international leaders will continue to be exposed for their complicity and their hypocrisy. In their remembrance, justice campaigners aim to continue opposing national and international selectivity and subjectivity. In their remembrance, they will never let national and international leaders forget.

Call for Papers: Righting Feminism (2015-07-22 08:00)

CALL FOR PAPERS
Righting Feminism
In recent years, we have witnessed the multifarious ways in which feminism as an emancipatory project dedicated to women's liberation (whether conceived in liberal, radical, or Marxist terms) has increasingly "converged" with non-emancipatory/racist, conservative, and neo-liberal economic and political agendas. This issue aims to move beyond the well-worn economic-culture dichotomy that tends to inform many of the current discussions about feminism's "co-optation" and to provide a multi-dimensional theorization of how and why feminism has, in certain contexts, increasingly ceased to be an oppositional discourse. The questions this issue aims to address include:

What are the concrete forms of such convergences and why are they taking place with greater frequency? Why might neo-conservative forces and parties with a racist and/or neo-liberal agenda desire to co-opt the emancipatory promise of feminism? What purposes does the mobilization of feminism for non-emancipatory projects serve? Is this co-option merely a strategic ruse or a "natural" (even teleological) folding of certain elements of liberal feminism into these neoconservative movements? How are such convergences affecting the ways in which we can understand the intersection of gender, class, sexuality and race? Is it sufficient to speak about different feminisms today in order to make sense of feminism's rightward movement or do we need a new lexicon for speaking about gender oppression? Alternatively, if feminism has no essential "core" then how might we reclaim feminism for the twenty first century? What alternative politics can and should we propose to counter the evacuation of feminism's emancipatory impetus?

We welcome abstracts of up to 500 words. Please send to rightingfeminism@gmail.com by September 1, 2015.

Decisions will be made within six weeks. Contributors whose abstracts have been accepted will be asked to submit their papers within approximately six months (March 31, 2016).
Sometimes the noise other people make bothers me. I mean really pisses me off. The kind of irritation which makes it impossible to ignore the noise, leaving your attention locked in and your perceptual field narrowed until there is only you and that noise. On those occasions where I talk myself out of it, I often realise there’s nothing particularly egregious about the noise in question. It’s just that a particular confluence of circumstances has conspired to make the noise enormously disruptive to me. The problem of the noise is both relational and emergent. It’s not a problem in and of itself. This is reflected by the fact that on other occasions, similar noise barely registers, maybe eventually prompting me to wonder “has that been audible for a while?”

This is a useful thing to register when learning to live with noise. But there are limits to personal adaptation. It doesn’t follow that disruptive noise is subjective, simply because our experience of it as subjects has an obvious range that is in turn modulated through our responses as subjects. I used to live in between two pubs, literally in between them, one of which attracted what, to me at least, was the most obnoxious clientele imaginable. It’s in Earlsdon in Coventry, for those who know the area and are wondering. There were particular characteristics of the venue, as well as the area itself, which contributed to the production of disruptive noise on the weekends. I might be able to modulate my response to that noise but the circumstances were generative of it, not my own perceptual capacities. Likewise the cockerel who lived in my neighbour’s back garden at the same flat. I didn’t get much sleep that year.

I find ‘disruptive noise’ ontologically interesting because it’s hard to have a substantive discussion about how to regulate it which doesn’t fall into an objective/subjective dichotomy. Subjective prescriptions are inadequate (“why do you let it bother you so much? just try and put it out of your head”) when there’s drunken fights outside your door at midnight and a cockerel crowing outside your window at 5am. I’m very glad I don’t live there any more. Objective prescriptions also seem inadequate to me because of the potentially open-ended character that’s lent to the problem by the subjective dimension, for lack of a better word. If noise becomes disruptive whenever any
particular person at any particular time finds it disruptive then interventions become rather disturbingly authoritarian, allowing fleeting whims of irritated (and sometimes irritating) people to lead to the suppression of activities which most people would find reasonable.

If you google for stories of noise complaints, it soon becomes obvious quite what a range of circumstances councils are called upon to deal with. In some cases, people’s lives are literally destroyed by the noise of others. A couple of minutes down my ex-partner’s street was a house which, for 6 months, had (bad) techno playing constantly at high volume whenever I passed. Living so close to each other, yet not together, I passed that house at all hours of the day and night. The music was always playing. It must have destroyed the lives of the people living next door. On the other end of the spectrum, I’ve found people online complaining that they can hear their neighbours talking after 10pm. From the report, it seems their neighbours are talking at normal volume in their house in the evening. But for whatever reason, the complainers are unable to tune this out and become fixated on this utterly everyday life noise at the expense of their own lives.

This raises the question for me of whether this inability to live with the noise of others, something which I’ve occasionally recognised in myself but learnt to dismiss as unreasonable through my internal conversation, might be on the rise? If we conceive of ourselves as bounded and autonomous, experiencing life through the constraining prism of our own imagined independence and isolation, involuntary exposure to noise takes on an ambivalent status. It both undercuts our imagined atomism, revealing the interdependencies through which sociality is constituted, as well as appears as an attack upon it. It feels like an intrusion of other isolated individuals upon our own isolation, while leaving us inclined to fight it off in order to restore the hermetic seal which perceptually props up our imagined a-relational nature.

When I talk about a-relational here, I mean it in the Thatcherite sense of ‘individuals and their families’. I’ve often wondered about the Tory fixation on council refuse policies and suspect there’s a similar mechanism at work. If an English Man’s home is his castle then what does that make the bins outside, the people who come to collect it each week and the organisational structure this routine presupposes? The politics of bins are a messy and quotidian instance of the politics of individuality.

I’m suggesting that changing policies for bin collection is threatening to this imagined individuality in the same way and for the same reasons that intrusive noise is experienced as an assault upon it. We imaginatively deny our inviolable being-with-others, the fact we are always already placed within a network of relations, such that recurrent reminders of it becomes fetish objects: they take on power and significance far beyond their literal meaning and consequences, challenging us to either fight off this threat to how we conceive of our place within the world or learn to live with it as something other than a threat. Crucially, I don’t think the challenge of being-with-others entails subjective adjustment. It might involve telling yourself that on this particular occasion you should let something lie but it might equally involve taking action, trying to establish a new common ground through which interdependency can be something conducive to flourishing rather than a threat to well-being.
Cameron on Extremism – the good, the bad and the ugly! (2015-07-23 13:05)

by Sufyan Ismail

With extremism in our midst, David Cameron unveils a 5-year plan, with four planks, to tackle one major extremism threat.

David Cameron's speech on his 5-year plan to tackle extremism covered a huge amount of ground to say the least. From parents cancelling children's passports to Cameron financing his brand of 'good Muslims', it was all on show today.

So what's my take?, well the good, bad and pretty ugly are all in here. Let's start with the good:

THE GOOD

British Muslims travelling to Syria to fight for ISIL is undoubtedly a detestable problem; lets be clear, nobody likes ISIL, their philosophy or methods, and on countless occasions Muslims like myself have condemned them. So a genuine desire by the PM (and I believe it is genuine) to tackle the problem head-on is heartwarming. Equally encouraging is the PM’s description of Islamophobia as "sickening" alongside the numerous references to the sickening far-right. Some might, (rather justifiably), say talk is cheap, what has he done to tackle Islamophobia? The Tories pre-election promise to ensure Islamophobia is recorded as a separate category of crime by police forces in England and Wales (similar to racism and anti-semitism currently), has yet to materialize. Equally powerful is the accusation pertaining to the far-right with justified accusations that the Tory government and PREVENT policy has done precious little to tackle the threat of far right extremism and the radicalisation of young people safeguarding them from white supremacist ideologies; verbal condemnation is never enough. For now though, let’s give him the benefit of the doubt and assume ‘intention is the first step to action’.

THE BAD

So now the bad and as the old saying goes, ‘if you start off in the wrong place you will almost certainly end up in the wrong place’. Cameron has a fixation with "ideology" being the primary (arguably even sole) driver of radicalization. This is deeply troubling when empirical analysis tells such a different story.

The Guardian yesterday published an article by Professor Andrew Silke, an academic and advisor to the OSCT on counter-extremism. Silke argued that factors driving individuals to extremism was not ideology but "identity issues".

Silke said the government’s [1]Prevent strategy for tackling terrorism was too focused on extremism with no research to back up such an approach.

Silke wrote: “This theme of fighting on behalf of others and in reaction to the suffering of others ... recurs frequently in accounts of the personal motivation of individual terrorists.”

This is, of course, not just the view of Professor Silke but that of renowned academics, such as Professor Marc Sageman, and the many other academics who signed an open letter last week in a major national newspaper calling on the Government to recognise its Prevent policy failure and set about a strategy based on dialogue with Muslim communities.

Equally important is the anecdotal evidence derived from the mass of British Muslims who also feel ideology is just one (less significant) factor amongst many others causing radicalization. And if the PM wants to “empower”
moderate voices among British Muslims, he should acknowledge that the majority of Muslims are moderates, not the few as is mistakenly trumpeted by interest groups who have made a cash cow of "counter extremism".

One of Cameron’s planks is “identity” and while he posits the appeal of ISIL to young minds who lack a "sense of belonging" to Britain, he does not unpack why young Muslims may be acutely affected by alienation and a lack of attachment to the UK. The lived experience of Muslims looks something like this: –

- **Rising Islamophobia in Britain** – Data published by the Metropolitan Police coupled with FOIs submitted by MEND (Muslim engagement and Development) detailing the number of anti-Muslim hate crimes year on year show that [2] Islamophobia is rising. Something must be done to curb this trend and police recording Islamophobic hate crimes is one advance but not near enough.

- **Deeply negative press coverage on British Muslims** – An academic study by Lancaster University shows that for every one mention of “moderate” Muslims in the British Press, there are 21 mentions of “extremist” Muslims. This tendency for disproportionate negative coverage of Islam and Muslims has a corrosive effect on British Muslims and their treatment by wider society.

- **Employment discrimination** – The ‘double ethnic penalty’ faced by Muslim communities has been policy knowledge for over a decade and despite newer research cementing evidence of the level of employment discrimination faced by British Muslims, [3] the highest of all minority groups, we have seen next to no policy interventions to address the issue. The Tory manifesto paid reference to making the labour market "more inclusive" but said nothing about the worst affected group: Muslims.

- **Inconsistency in the incitement to Race and Religious Hatred law** – The burden of proof required to prosecute incitement to racial hatred crimes, covering communities such as Sikhs, Blacks and Jews, is far lower than the threshold required for incitement to religious hatred which is virtually unworkable due to the ‘burden of proof’ required (proof of intent). Suffice to say that since the law has been in existence, not a single offence has been successfully prosecuted under the religious incitement provisions.

- **Foreign policy** – what Cameron called “grievance justifications” are more than grievances and certainly warrant serious attention given the evidence base of its being an important causal factor. No less than the former head of the security services, [4] Dame Eliza Manningham Buller has spoken about the impact of the Iraq war on radicalising young Muslims.
• **A lack of proactive engagement by Muslims with non-Muslims** – Yes, I firmly believe this to be true. Successive studies show that non-Muslims who have come into contact with Muslims tend to have a better opinion of Islam and Muslims. Muslims definitely need to do more to cultivate ties of friendship.

So with the best will in the world, which I don’t deny Cameron has, you can’t solve a problem without diagnosing it correctly in the first place. Factors such as Islamophobic attacks, discrimination in employment, relentless stereotyping and sensationalizing of Muslims in sections of the British press, and of course foreign policy, all play a role here.

**THE UGLY**

Before I offer concluding remarks, I want to touch on the ugly in Cameron’s speech and there certainly was some of it.

**Trojan Horse (Hoax)** – Cameron reiterated the fictitious Trojan Horse plot (or as I may put it Trojan ‘Hoax’ plot). When the Parliamentary Education Committee concluded that with “the exception of one isolated incident in one school, there was no plot”, what on earth is the PM doing reiterating this nonsense? It’s shocking to find a false premise reiterated to justify interventions of the sort proposed in yesterday’s speech. Policy based on no evidence base is not just bad policy, it is bad reasoning.

**Attacks on NUS and Muslim organisations** – This was really underhanded I felt and not befitting a Prime Minister. In fact I’m trying to remember the last time any PM stooped this low and publicly had a pop at an organization like the NUS. It just doesn’t feel right. He attacked the NUS for ‘allying itself with CAGE’ and then criticised CAGE for the ‘Jihadi John’ saga. I’ll let CAGE defend themselves on the Jihadi John front but if the PM was going to attack the NUS for allying with CAGE then surely he should have balanced his analysis by praising the NUS for its sterling work in exposing the Henry Jackson Society’s erroneously named ‘Student Rights’ organization which the NUS concluded was a ‘anti-Islam’ organization, stating “Student Rights are not a legitimate organisation, with a total lack of transparency and have been the source of many sensationalist stories demonising Muslims”.

The PM derided the NUS for not living up to its history of championing good causes – well, exposing Student Rights was the NUS acting at its best so credit where credit is due.

**Good Muslims, Bad Muslim** – If the PM and his advisory team had started off in the right place, then playing the ‘good muslim, bad muslim’ game is not a bad idea. But if your calibration is deeply deviated from the start and diametrically divergent to empirical evidence, academic analysis and Muslim community experience, then not only are you unlikely to achieve your overall objective of reducing extremism but in truth you could wind up being totally counter-productive and defeating your own cause. As Cameron is obsessed with ideology, irrespective of any proof to back this approach (and worse still so much academic research pointing to the contrary), he is playing in to the hands of the ‘self-appointed’ experts on counter terrorism like the Quilliam Foundation, a deeply neocon supported initiative with precious little experience in counter terrorism and virtually no credibility amongst British Muslims. One can also add the likes of Inspire (a Muslim womens’ empowerment initiative) in this sphere too. The frequent pairing of these two organisations is not accidental, it is calculated, to project the idea of “moderate Muslim”. We already know, from the previous Prevent strategy and the heavy endorsement of Quilliam and the Sufi Muslim Council which flowed from it, what “moderate Muslim” means in policy circles. What’s worse is that Cameron is threatening to potentially bankroll his type of Muslim. Talk about out of the frying pan and into the fire!

**A FINAL DELIRIOUS JUMP FOR JOY!**

There was, however, one part of Cameron’s speech which sent me delirious with excitement and I almost jumping for joy. Mid-way through the intense sweaty encounter Cameron expressed his disgust at those who believe ‘Muslims are secretly taking over the Government, and we should not work with them’.
The idea is often articulated as ‘entryism’ and is regularly levied against Muslims simply wanting to engage in the system as should be perfectly compatible with the PM’s mantra about democracy and British values. This ‘entryist’ allegation is a favourite tactic used by neo-con organisations and detractors to demonise mainstream British Muslims and keep them out of mainstream politics (a tactic which ultimately is in nobody’s interest). Most recently the Islamophobe Andrew Gilligan littered one of his articles with ‘entryist’ references against mainstream Muslims organisations. Thank you Mr Cameron for standing up to such people!

Sufyan Ismail is the CEO of Muslim Engagement and Development (MEND). On the advocacy front, MEND is involved in media engagement, lobbying, and policy research. On the community empowerment front, MEND regularly works with grass roots Muslims to help them tackle Islamophobia locally and to increase their media and political literacy.

The Power of Perception: Common Sense or Nonsense (2015-07-24 08:00)

(HT [1]Robert MacDonald)
I left a successful career as a software developer in London to study Arabic and do a PhD in Middle East Studies. I then had a traditional one-year visiting assistant professor job (in Egypt) and a traditional one-year post-doc (in Singapore), while applying for about 50 academic jobs per year. By then I’d had enough of the academic job hunt, which demanded a great deal of time and effort but offered terrible odds and highly arbitrary results, and my wife and I were tired of moving to a different country every year, especially with a child. I was thinking about going back to software development, but knew I’d have to update my skills, since I hadn’t had a programming job in seven years. My wife then got a job in Germany that gave us a little breathing space, and I taught as an adjunct for a semester while trying to figure out what to do next.

I’d heard of a field called digital humanities, which sounded like it might enable me to use my programming skills while staying in or near an academic environment. It turned out that the Digital Humanities Lab at the University of Basel had an opening for someone with a background both in the humanities and in software development. After a brief exchange of emails, they invited me for an interview and made me an offer immediately, which was certainly a contrast to the typical long, formal academic job application process. I asked for and got a flexible working arrangement: I work in Basel three days a week, and work from home in Germany two days a week. Best of all,
one day a week is set aside for my own research. The lab’s current funding situation doesn’t enable them to offer long-term contracts, so I’m on my second short-term contract (my official title is post-doc), but there’s at least a possibility that this will turn into a permanent job.

Having gone through a period of mourning my former ambition to have a traditional academic career, I think my current situation actually seems better. I don’t take my work home with me, and I have more time for research and writing than I did when I was a visiting assistant professor working 12-hour days and weekends to prepare courses. Since I’m under no pressure to publish anything, I can do the research I’m most interested in, rather than the research I think I can publish quickly. So it seems that I actually have more academic autonomy than I would have in a conventional academic career.

**CfP: World Society in the Making? Varieties of Transnational Institutions** (2015-07-26 08:00)

Call for Papers for the Workshop
World Society in the Making? Varieties of Transnational Institutions
(7-8 December 2015, Duisburg, Germany)

The emergence of a world society is often considered to be a homogenizing process dominated by the extension of Western rationality with its specific forms and functions of social institutions to other parts of the world. Similarly, norm diffusion is mostly portrayed as a top-down process of transferring globally accepted norms to 'local' settings, e.g. through localisation or emulation.

Another general assumption is that growing economic interdependence in the wake of 'globalization' along with the global availability of modern communication technologies drives this process, and the growing need of global cooperation to tackle the world’s problems should create further incentives along these lines. Yet, is this what we truly observe when we look at the various forms of (institutionalized) transnational cooperation? Can we not expect, in contrast to the aforementioned arguments, that the at least partial demise of the West and the rise of new powers, regions and new types of actors has led to a growing cultural and thus also institutional differentiation in the world? And do these different instances of cooperation follow the same assumed rationalities – or do they offer alternative forms and functions of cooperation?

The workshop will take stock of various instances of inter- and transnational cooperation and forms of emerging World Societal institutions. What forms and functions do social institutions assume that facilitate transnational, regional and trans-regional cooperation (e.g. knowledge transfer, identity-building, ethnic and religious community-building, solidarity, civil society representation or social movements etc.)? Can we identify patterns – and do those
challenge established theories?

The aim of the workshop is to identify potential patterns of transnational cooperation and to take a fresh look at processes of institutional diffusion. We are looking for papers that provide (1) conceptual/theoretical contributions that address the question of cooperation in world society (seminal trends of homogenization or of differentiation; functional necessities of global cooperation or the lack thereof etc.) and/or (2) empirical analyses of instances and forms of cooperation (inter- and transnational, regional, trans-regional), searching for patterns of institutionalization.

Please submit paper proposals (max. 500 words) to baumann@gcr21.uni-due and freistein@gcr21.uni-due by August 15th, 2015. Full conference papers should be distributed by the end of November 2015. The workshop will take place at the Centre for Global Cooperation Research in Duisburg on December 7-8, 2015. Expenses for traveling and accommodation will be covered by the Centre for Global Cooperation Research (http://www.gcr21.org/)

The Critical Realism Network (2015-07-27 08:00)

An [1]important new initiative for anyone interested in Critical Realism. This is how Phil Gorski introduces it:

Dear Colleagues,

I am excited to announce the launch of [2]the Critical Realism Network (CRN) which aims to engage a community of academics from sociology and neighboring disciplines about the importance and applicability of Critical Realism (CR) for social science today.

In collaboration with the project team members, I am excited to introduce our new CRN website with an array of different online resources, ranging from a reading plan to a free webinar series. We will also be hosting multiple events throughout the year with the aim of equipping you with the necessary skills to apply CR to your respective field of study and research.

Welcome to the Critical Realism Network and I hope to see you on August 22, 2015, at our ASA reception.

Regards,

Professor Philip Gorski

1. http://www.criticalrealismnetwork.org/
I recently saw the news that ‘Infidelity site’ Ashley Madison had been hacked, with the attackers [1] claiming 37 million records had been stolen. The site is an online forum for infidelity, a dating site explicitly designed to facilitate affairs, something which potentially provoked the ire of the hackers. Or it could be the fact that users are charged a fee of £15 to permanently delete their records from the site, the efficacy of which the hackers dispute. This seems to be indicative of a broader trend in which dating sites as a whole were [2] found by the Electronic Freedom Foundation to have failed to implement basic security procedures and to be near uniformly vague or silent about whether user data was deleted after the closure of an account.

This is a specific instance of a much broader category of problem which I’ve been thinking a lot about recently: escaping the filter bubble. I use this concept in a much broader sense than [3] Eli Pariser’s original use in his (excellent) book. I see filter bubbles as being a matter of algorithmic enclosure but also of information security. In fact I would argue that the former inevitably poses questions for the latter, because filter bubbles rest upon the collection of personal information and intervention upon this basis. Filter bubbles always pose questions of information security because environments designed around them are always information-hungry and mechanisms of personalisation inevitably introduce opacity into interactions between users and a system in an asymmetric way. But I’d like to expand the concept of filter bubble to encompass the entire informational environment in which we find increasingly find ourselves deliberately enclosed through our use of digital technology. Not all of this is applied algorithmically but I would argue, somewhat crudely, we can talk about greater or lesser tracts of everyday life being lived via digital mediation in a filter bubble characterised by varying degrees of enclosure.

What interests me are experience where we don’t realise we’re in a filter bubble. The questions of information security don’t occur. We live with ontological security, sufficiently comfortable with this technology (something which personalisation can contribute to) in order to act ‘as-if’ the filter bubble doesn’t create risks for us. Will Davies [4] offers an analogy which captures this effectively:

I have a memory from childhood, a happy memory — one of complete trust and comfort. It's dark, and I'm kneeling in the tiny floor area of the back seat of a car, resting my head on the seat. I'm perhaps six years old. I look upward to the window, through which I can see streetlights and buildings rushing by in a foreign town whose name and location I'm completely unaware of. In the front seats sit my parents, and in front of them, the warm yellow and red glow of the dashboard, with my dad at the steering wheel.

Contrary to the sentiment of so many ads and products, this memory reminds me that dependence can be a source of deep, almost visceral pleasure: to know nothing of where one is going, to have no responsibility for how one gets there or the risks involved. I must have knelt on the floor of the car backward to further increase that feeling of powerlessness as I stared up at the passing lights.

But when this ontological security is punctured, we can see risks everywhere. What are people doing with our data? What could they be doing with our data? How are our online environments manipulating us? I’m interested in using ontological security as a conceptual frame through which to understand the urge to escape the filter bubble on a psychoanalytical level. As I develop this line of argument, I need to work on making the exact sense of the underlying concept clearer, but leaving that aside for now, I think it offers a really interesting frame for exploration. Here are the propositions I’m going to come back to in order to develop further:

1. We are enmeshed within a filter bubble through our everyday use of digital technology
2. The filter bubble is deliberately designed, indeed redesigned on a sometimes hour-to-hour basis, driven by complex and opaque interests.

3. Our orientation towards the filter bubble is extremely variable, even over time in one life, let alone between people.

But for now what I’m interested in is how we escape the filter bubble. When we see the endemic risks, when the reassuring cocoon of ontological security recedes, what do we do? The problem is that not everyone is equally well positioned to escape the filter bubble. It necessitates technical knowledge, time and energy. Some people don’t care but know what to do. Some people do care but don’t know what to do. Most people fall between these two poles at different points in relation to specific issues. What I’m interested in is how any definite attempt to escape the filter bubble leads to an intensification of cognitive burdens at a time of endemic acceleration. If everyone feels rushed, how does the urge to escape the filter bubble contribute to that experience, constituting just one more thing to worry about? How does this in turn contribute to the problem of what I’ve elsewhere described as [6]cognitive triage? I can imagine an emerging profession, consultant digital escapologist, paid to help the cash-rich but time-poor manage their information security.

2. https://www.eff.org/deeplinks/2012/02/comparing-privacy-and-security-online-dating-sites

Allan McDougall (2015-07-28 13:17:19)
I wonder what your thoughts would be on taking the idea of filter bubble(s) and ontological security and applying them to evidence-based medicine. Individuals and groups (end-users) interacts with the health care system—a patient, patients with the same condition, and families. In many ways, information is filtered through various technologies and filtered in how it is delivered to both health professionals and then end-users. I would argue health status has a lot to do with how individuals and groups situate themselves ontologically. The concept of the filter bubble is one I’ll keep in my back pocket as I move forward in my research. Thank you for this excellent post, Allan

I think that’s a really interesting suggestion, thanks! Will have to ponder some more.

Colin Carré (2015-07-29 10:29:15)
The thing is also that escaping the filter bubble still gives informations to the bubble: what we want to escape from can be as informative (if not more) as what we want to give to the bubble.

Transhumanism's Big Political Blind Spot (2015-07-28 18:54)
For those who still don’t know what it is, transhumanism is basically the application of science and technology to amplify the human condition, potentially well beyond our biological default settings. As someone who has increasingly identified with transhumanism since publishing [1]Humanity 2.0 in 2011, I welcome the ideology’s move
into the mainstream of politics and culture, at least in the English-speaking world. But the form it has taken is rather curious.

Zoltan Istvan, a California-based science fiction writer with columns in *The Huffington Post* and *Vice*, is running for the US presidency in 2016 on the Transhumanist Party ticket – so far without a running mate, it seems. He plans to drive an ‘Immortality Bus’ across America to dramatize his main policy priority: enabling everyone to live forever. A measure of Istvan’s respectability is that he keynoted this year’s [3]Camp Alphaville in London, a meeting point for Silicon Valley and *Financial Times* readers. Meanwhile, [4]Maria Konovalenko, also California-based, is a Russian-born biophysicist who promotes transhumanist lifestyle issues, from cooking to sex, all aimed at immortality as well. She does a lot of fund-raising activities for transhumanist causes, and like Istvan presents a certain vision of transhumanism – infinite youthful vitality, basically – as an inherently attractive ideal for all of humanity.

But what if you don’t share this ideal? I’ve semi-facetiously speculated that such transhumanists must regard [5]most non-transhumanists as zombies who spend their lives waiting to die. Nevertheless, it is not surprising that the mainstreaming of transhumanism has occurred this way, as if reflects issues already on people’s minds, such as health and ageing. Indeed, Istvan and Konovalenko periodically suggest that transhumanism is really just an extension of ‘common sense’, one that happens to promise to cure ‘disabilities’, end degenerative diseases and reprogramme potential criminals. All of these goals, while undoubtedly attractive to many individuals, point to enormous social and ethical problems down the road once scaled up into the realm of public policy. My own version of transhumanism has put these problems in the foreground, typically in an optimistic spirit that sees an opportunity for radical social innovation. However, these scale-related issues are conspicuous by their absence from mainstream transhumanism.

This absence points to transhumanism’s political blind spot, which is related to its default libertarian philosophy. Transhumanists (and here I would also include even some of the more sensible Silicon Valley entrepreneurs) generally believe that all of humanity’s differences – be they in terms of wealth or health – are the result of large organizations, perhaps most of all the state, blocking the flow of information which has the potential to provide a cornucopia of benefits, typically through new technologies, once the information is allowed to develop freely. Of course, the resulting innovations may make a few people rich at first but markets will spur competition, drive down prices, distribute the innovations, etc. What gives this narrative its surface plausibility is that, at bottom, all people are seen as wanting the same things, to be the same way, and so they have a common interest in pushing together towards the envisaged utopia. Whatever value differences seem to exist amongst people can be resolved simply by ‘upgrading’ their existence. Thus, the fact that all societies are anchored in quite specific interpretations of the life cycle is treated as a mere wrinkle that will be ironed out over time as a downstream effect of the cornucopian onslaught.

To be sure, there may well remain irreconcilable value differences. And here the idea of a cornucopian cosmos kicks in. Many transhumanists are open to the idea of humanity’s sub-speciation, a line of thought that implies self-segregating eco-niches, perhaps even corresponding to separate forms of life flourishing on different planets. However, a prospect that one rarely sees transhumanists pursue is that of integrating a much wider range of beings travelling under the banner of ‘humanity’ than ever before under a common system of governance. Yet, people’s intuitions about ‘disability’ are becoming increasingly fluid, connected in part to the popularity of cyborgs, as well as transhumanism’s own idea of ‘morphological freedom’ (i.e. the capacity to move between radically different states of being, especially carbon and silicon).

Indeed, Veronika Lipinska and I have argued in [6]The Proactionary Imperative that a truly free transhumanist society would stretch society’s powers of accommodation and assimilation to levels that no classical liberal theorist could ever have imagined. John Locke and his liberal descendants presumed a ‘natural’ (i.e. biological) equality amongst all people, which in their own way libertarian transhumanists continue to uphold. However, the deep political challenge facing transhumanism is how to integrate a range of ‘humans’ whose resource requirements may differ substantially because, say, their carbon/silicon ratios vary radically – but equally, and more simply, because
people refuse to hop on Istvan’s Immortality Bus. These beings would not be ‘natural equals’ yet they would qualify for some more expansive sense of *Equality 2.0*.

*Thanks to Emilie Whitaker for some well-targeted tweets.*

The @_ISRF @DigitalSocSci and @BigDataSoc Essay Competition (2015-07-29 08:00)

An exciting new project I’ve helped launch: a collaboration between the [ISRF](http://www.isrf.org/)’s [Digital Social Science Forum](http://twitter.com/digitalsocsci) and the journal [Big Data & Society](http://bds.sagepub.com/). See [here](http://www.isrf.org/2015/07/29/freedom-from-self-imposed-metrified-tyranny-some-thoughts-on-the-moral-psychology-of-self-tracking/) for full details:

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic ‘Influence and Power’. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Freedom from self-imposed metrified tyranny: some thoughts on the moral psychology of self-tracking (2015-07-30 08:00)

A couple of years ago I purchased a Nike Fuel Band, partly out of a curiosity driven by my nascent interest in self-tracking and partly out of a desire to rationalise not going to the gym. If I was planning to conduct research
on self-tracking practices then it seemed important to me to actually try them myself. However over the following years, my interest in self-tracking became downgraded to that of something like urbanism, as a topic that fascinates me but that I realise I have nothing useful to say on, while my engagement (entrapment?) in self-tracking practices remained, first through the fuel band then two successive jawbone bands.

I’ve been given cause to reflect on this recently by the fact that my jawbone has broken twice in the space of a week (ouch) giving me a respite from the metricised tyranny to which I had merrily subjected myself over the previous years. In defence of the jawbone: the soft wakeup function can be an extremely pleasant way to wake up. It starts buzzing up to half an hour before a set time when it detects, albeit by way of questionable proxies, you are sleeping most lightly, with the intention of reducing drowsiness. I think there’s something to this but there’s also an obvious invitation to confirmation bias: if you set a device to wake you up without feeling drowsy then you’re much more likely to ask yourself ‘am I feeling drowsy?’ when you wake up and attribute its absence to the magical powers of the band. The sleep tracker was also the first and only experience I’ve had of ‘self-knowledge through numbers’. It turns out I had a persistent habit of going to bed very early when I was sleep deprived then it taking hours for me to get to sleep i.e. it would usually take me 10 minutes to get to sleep if I went to bed 10pm-12pm but hours if I went to bed earlier. Thus undermining the point of going to bed early. I also saw for the first time how much alcohol would undermine the quality of my sleep, prompting a year long experiment with cutting back on and then completely giving up alcohol, which I’m now in turn giving up on (I missed red wine & craft beer) but that was nonetheless enormously healthy for me as a person.

Now those defensive remarks are out of the way: the jawbone is fucking creepy. I’ve written about the idleness alarm and [1]how readily the concept would lend itself to invasive applications. But I’m wondering now about how systematically the measurements have tended to crowd out the value of what is being measured within my own psyche. My standard defence of self-tracking had been that voluntary self-tracking is an augmentation of reflexivity: if you reflexively decide that exercise is good and you want to incorporate more exercise into your life, these technological practices can be useful tools to overcome some of the all-too-human propensities which undermine the projects of self-cultivation we seek to pursue. Furthermore, critics of self-tracking often mistake the narrative of self-tracking (self-knowledge through numbers) for its moral psychology, something which I think is empirically variable but I suspect has far more in common with neo-ascetic regimes like ‘lifestyle minimalism’ and ‘life hacking’ than these critics tend to recognise. The practices, the devices, the contexts and the sensibilities upon which the diffusion of ‘self-tracking’ depends may all be new. But this self-self relation simply isn’t and anyone who fails to recognise this has a poor grasp of ‘the self’, its history or both.

Nonetheless, what I’m now recognising is how what can be reflexively taken up as an extension of one’s agency – in order to increase our capacity to act on 2nd order desires (“I want to want to exercise”) in the face of 1st order whims (“I don’t want to go to the gym today”) – nonetheless acts back iteratively upon the agent in a way that moulds their dispositions towards reflexivity. What do I mean? Firstly, self-tracking practices are outcome orientated. What matters is a completed activity. This doesn’t magically remove your capacity to enjoy an activity but it does mitigate against it: if you’re going for a walk because your jawbone tells you to, it’s not impossible that you’ll nonetheless enjoy the walk, the scenery, being outside etc but the mentality of self-tracking never encourages and sometimes actively undermines the attentiveness necessary for this enjoyment to emerge during the walk. Secondly, this mattering is unstable unless the completed activity is measured in a reliable way: the whole edifice starts to crack if you begin to think about how the instruments may be deliberately or accidentally gamed, as well as the spheres of errancy (e.g. sleep vs. lying perfectly still unable to sleep) that become obvious once you’ve used a band for a bit. That this activity matters to you necessitates continued faith, perhaps ontological security in the sense of a willingness to act ‘as if’ the measurement is as objective as it says it is, in the instruments and your use of them. Thirdly, this mattering is contingent upon continued submission to the system. If your band breaks or you cease using it, perhaps switching to a competitor, the meaningfulness of what you’ve been doing is imperilled in proportion to the scale of the technological transition.
This is all a long winded way of saying that I’ve changed my views on self-tracking. I do find it creepy after all. But I still think many of the critics misunderstand exactly what’s going on here. I think cessation of self-tracking is an enormously important empirical topic, without which discussion of self-tracking will inevitably remain prone to over-generalisation. We also need longitudinal qualitative studies of self-tracking, serious and extended versions of the auto-ethnographic reflections I’ve tried to outline here, in order to better understand how these activities unfold temporally in a way able to change both the person and the activity.

John McCreery (2015-07-31 01:10:06)
Mark, I am serendipitously where you are. My second jawbone bracelet stopped working properly two months ago and has not been replaced. Why? The first two bands were very good for me (age 70) and my wife (age 68). We got the bands because a brush with mortality persuaded our daughter to persuade us that we needed more regular exercise. And they worked! Striving to walk 10,000 steps a day dramatically changed habits once focused on getting as quickly from point A to point B as possible. Now, whenever possible, we extend walks, using longer back-street routes. It was also fascinating to have our sleep patterns monitored and see how different they are. My wife sleeps like a rock, with long stretches of deep REM sleep. I am a rapid cycle type, up and down several times a night (which, one observes, has something to do with being an aging male). So with all these good results, why haven’t the bands been replaced? The new habits have become habits and very enjoyable, too. Long walks and a bit more sleep are, indeed, just what the doctor ordered. Don’t need the constant nagging anymore and it’s nice not having the UP application draining the iPhone battery. There is also wanting something more sophisticated now. We live in a hilly city. Yokohama is much like San Francisco. Would like a device that kept track of ups and downs as well as number of steps walked. And even without an Apple watch the new iPhone Health dashboard seems to do a pretty good job. Time for a walk. Take care.

I identify with that a lot - thanks! I like your emphasis on how the habits can outlast the device you temporarily drew upon to help inculcate them.

Alt-academic careers #2: Adam Riggio (2015-07-31 08:00)

By Adam Riggio

When I decided to leave a career in academia behind, I felt betrayed. Since my early twenties, I had received nothing but encouragement from professors in my own program and at conferences where I’d present.

I met some stodgy profs, whose advice sounded more paternalistic and condescending than inspirational. But most of the professors I met and worked with said that my philosophical writing, research, and thought was valuable and would achieve great things for the discipline.

McMaster University, where I did my doctoral studies, supported my trips around the world to present my work at conferences. I knew the job market was tough, but I had every reason to believe that my work was unique and strong enough to withstand those challenges. I would make my mentors proud, and honour the legacies of my mentors who were no longer alive to see it.

Then I received my doctorate, and everything fell apart.
I never heard back from tenure-track positions I applied for, even though my mentors assured me that my publication and conference presentation rate during my doctorate (finished on time in four years) surpassed that of some long-tenured professors.

Adjunct positions in my region of Canada, which has 12 university campuses in commuting range, were all closed to me because they prioritized seniority in hiring. The head of one adjuncts’ union told a relative of mine that his job was to protect his members’ jobs by keeping applications like mine from being read.

Over three years, I received only one job interview, which turned me down because I said, like an honest professional, that when the contract ended, I would consider other opportunities as well as that of renewing the same contract.

Yes, I feel betrayed. But turning away from the university system for my employment isn't the same as turning away from reading and writing philosophy.

Philosophy is more than an academic discipline, despite these institutions and norms for writing and argument having become so dominant that a philosopher outside the academy is inconceivable. Or else, such a philosopher is pathetic, a pitiable “independent scholar” who attends professional conferences in universities only to be mocked and spat upon. “[1]If you were worth talking to, you’d have a university post.”

When I started working out what my new career after academia could be, I went to [2]Versatile PhD, and was horrified by the first forum I read. It was a chain of joyfully bitter people celebrating having sold all their books, set fire to print-outs of journal articles and their old drafts. Even their printed and bound dissertations themselves. I broke down crying. Was all that work, the dedication of the bulk of my twenties, nothing more than a waste of time fit for a bonfire?

I was sure that philosophy wasn't worthless, that it was more than a few increasingly insular pros desperately trying to keep their departments alive in the face of growing disdain for humanities education among university administrations, government, and the wider business world. Philosophy is more than what philosophy professors in universities do.

Philosophy is a tradition of creativity, developing concepts which we use to understand the world where we live, who and what we are, and what our purpose in life should be.

Such an approach to philosophy – the underlying goal it has always had – would make philosophy an artistic tradition. The philosophical works that have a heritage beyond the fragmenting schools of humanities academia read more like artworks than disciplinary research.

But I have always been driven to produce creative works, and what drew me to philosophy was the creative spirit that drives its landmark works. My work in universities existed in my life alongside my artistic projects, and now I carry out my philosophical research and writing as an artistic project as well.

Last year, I published a science-fiction novel, [5]Under the Trees, Eaten. It’s a feminist take on Lovecraftian style, with a small Canadian company. I’ve published short stories through writing contests, and am preparing a collection of social realist fiction stories about growing up in contemporary Newfoundland that I plan to shop to
publishers over the next year.

My philosophical writing includes regular updates and discussions [8]on my blog, where I track the development of all my artistic work idea by idea. This is where I develop the ideas for my next major work of philosophy, an exploration of utopian political thought from just after the First World War to the present. I adapt ideas from this project to other literary works, which right now includes a screenplay for a [9]science-fiction feature, in collaboration with the young Canadian director, [10]Lee Skinner.

It's a more difficult and diverse career path than the comfortable university office of a philosophy professor. But I think my work will have a wider social impact than it ever would from behind those walls.

Allan McDougall (2015-07-31 14:06:35)
Hi Adam, I'm a PhD(c) with an awesome full-time job in the NGO sector that I've started while writing my dissertation. A lot of your points resonate with me. A colleague of mine told me his mentor worked 15 years in government before having the chance to transition into a tenure track position. During those 15 years she made it her goal to publish 2 papers per year. She told him that this would never have happened had she not published 2 papers per year. So maybe your employer will allow you to protect some time for independent research and scholarship—or, more likely, you’ll find ways to publish ideas that generate from your interesting work. Whatever the case, just remember that you never know what will open up for you in the future.
Cheers, Allan

Beyond the Neoliberal University, 18th September at Coventry University (2015-08-01 08:00)

BEYOND THE NEO-LIBERAL UNIVERSITY

CRITICAL PEDAGOGY AND ACTIVISM

COVENTRY UNIVERSITY - FRIDAY 18th SEPTEMBER 2015

Warwick UCU committee encourages you to attend this UCU-sponsored event.

Around the world there have been a whole series of occupations and protests led by students, as well as actions involving lecturers and teachers, which reflect widespread disillusion with the way universities have come to act primarily as money making institutions. This event will begin with speakers who will set out the social and economic context for the marketisation of Higher Education, followed by participatory workshops on issues of activism, pedagogy and research.

The event begins at 9.30 and concludes at 4.00. Light refreshments will be provided.

This event is free to attend but you must register.

[1]https://www.eventbrite.co.uk/e/beyond-the-neoliberal-university-critical-pedagogy-and-activism-tickets-17390600755 If you are in full time employment and feel you are able to make a contribution, then a donation of £20 can be used to fund travel expenses of those who need financial support in order to attend. If you are unable to attend, please print out the attached files and encourage colleagues to come along instead.

Advice for junior faculty on dealing with the nasty side of social media (2015-08-02 08:00)

This a little old but there's some great advice here. It's written by Kathleen Fitzpatrick, Director of Scholarly Communication at the Modern Language Association. Read it [1]in full here:

1. Do not let dust-ups such as these stop you from blogging/tweeting/whatever.

2. Listen carefully to these debates, though, as they will tell you something important about your field and the folks in it.

3. Use your blog/twitter/whatever professionally.

4. Make your tweets and blog posts your own.

3864
5. If somebody says they’d prefer not to be tweeted or blogged, respect that.

1. [http://www.plannedobsolescence.net/advice-on-academic-blogging-tweeting-whatever/](http://www.plannedobsolescence.net/advice-on-academic-blogging-tweeting-whatever/)

Bloggging your fieldwork (2015-08-03 08:00)

Pat Thompson has written a fascinating post reflecting on her use of blogging to record field notes during an ethnographic project at the Tate summer school. She stresses the ethical challenges of such an activity – particularly the need to negotiate consent with participants, including around photos, as well as the need for a framework for naming and recognition of potential harms – but argues that blogging in this context can provide a really useful 'audit trail': a record of what was done and in what order.

She makes a compelling case that the resulting posts offer many advantages compared to more traditional ways of recording field notes: it's easier to discipline yourself to do the blog post, it's easier to link out in ways susceptible to following up later and the need to make the posts accessible and interesting (e.g. not too long) necessitates editing/filtering which itself requires valuable evaluation of the events of the day. What I found most interesting though were the advantages this can have in terms of building connections, within and beyond the fieldwork site:

(5) participants and research partners like to read the posts each day too. It not only works for you but also works for them as a record of what’s gone on and what resources, people, organisations and “stuff” they used – so they can follow these up too.

(6) participants know more about what you’re doing. We all read our institutional ethics forms about checking with participants and keeping them informed, but this is often not taken very seriously IMHO. A daily post goes a little way to telling people what you’re doing, and...

(7) a post can lead to good conversations with participants. if something is online, people can read it and then – tell you’ve got something wrong, or disagree with you, or discuss something further or tell you what they think. If your notes are locked away in your notebook, then this kind of responsive conversation is less easy to begin.

(8) the telling of the events as they’ve just happened has “live-ness” which is often missing from accounts which are heavily processed long after the event has happened (see [2]"Live methods" by Les Back and Nirmal Puwar)

(9) blog readers may get some ideas of their own from reading about your work (I’ve just been contacted by one of my colleagues who is going to play with GIFs and zines on the back of yesterday’s post.)

This is a wonderful example of what I’ve tried to write about in the past as ‘continuous publishing’: the advantages
that can accrue from doing work in the open that once would have been done in private. Getting the ideas out there in this way, making them public, means they begin to act instantaneously – in this case, in a way that feeds back upon the process that is being documented through blogging.

Sociology Special Issue 2017 - Still Time to Submit! (2015-08-04 08:00)

Global Futures and Epistemologies of the South: New Challenges for Sociology

Call for Papers - Sociology Special Issue

Guest Editors:

Gurminder K Bhambra, Professor of Sociology, University of Warwick and Visiting Fellow in Sociology (2014-15), Princeton University

Boaventura de Sousa Santos, Professor of Sociology, University of Coimbra, and Distinguished Legal Scholar at the University of Wisconsin-Madison

Deadline for submission of full papers: 16 October 2015

This special issue takes stock of the progress that has been made within sociology over recent decades to become a more globally oriented discipline and discusses the new challenges for the future that emerge as a consequence. It rests on two interlinked premises. First, that understandings of the world are much broader than the Western understanding of the world and so for sociology to adequately address its global futures it needs to take into account ways of knowing that exceed Western thinking, including critical Western thinking. Second, that the current configurations of the world are a consequence of global historical processes that have not always been adequately addressed within western-based sociology. For sociology to better conceptualise its global futures, it also needs to address its global pasts. We invite contributions that address the issues raised, both theoretically and through empirical research, across (but not limited to) the following themes:

- Epistemologies of the South and Global Challenges to /for Sociology
- Imagining Global Sociologies: Past, Present, and Future
- The Global South in the North
- Recovering Silenced / Forgotten Sociologies
- Transnational Solidarities, Anti-colonial Struggles and the ‘Rise’ of the South(s)
- Emancipatory Social Movements and Alternative Narratives

Imagining post-capitalism and techno-fascism (2015-08-05 08:00)

Last week Paul Mason posted a provocative Guardian essay suggesting that [1]the end of capitalism has begun. It’s a precursor to his upcoming book [2]PostCapitalism: A Guide To Our Future which is released in a few days time. I’m looking forward to the book, not least of all because it’s an optimistic counterpoint to the gloomy thought experiment I’ve been intermittently working on for months now: what would techno-fascism look like? I finished my first piece of work on this recently, a contribution to the [3]Centre for Social Ontology’s Social Morphogenesis project, making the case that digital capitalism is giving rise to ‘distracted people’ and ‘fragile movements’ while also facilitating surveillance and repression of a degree of efficiency exponentially greater than any security apparatus that has previously existed in human history.

My rather depressing conclusion concerns spiralling obstacles to durablesocial movements exercising a sustained influence over political and social life, though not necessarily to protest, politicisation or critique. As the project progresses, I want to explore two tendencies towards digitally facilitated suppression: the ‘hard’ strand, the openly authoritarian mechanisms through which digital technology is used repressively and how they might diffuse, as well as the ‘soft’ strand, the increasingly designed informational environment and the cognitive costs involved in escaping it, as well as their implications for collective action.

I situate these in terms of post-democracy and the political economy of the second machine age: crudely, I’m suggesting that the interests of elites in defensive repression, in the face of growing structural underemployment and unemployment driven by automation, creates a risk that ‘soft’ repression (already a problem) comes to be conjoined with ‘hard’ repression, with a post-democratic political climate likely to render popular restraints upon
this drift ineffective. This is compounded by a political context in which the war on terrorism is giving way to the war on extremism, normalising repressive measures against those whose ‘ideology’ (let alone their actions) put them outside the political mainstream. Underlying this analysis are some much more specific arguments about ‘distracted people’ and ‘fragile movements’ which I won’t summarise here, as well as an argument I want to develop of where a trend to vertical integration is likely to lead the tech sector and how this might further incline the culture within it in a way susceptible to acquiescing to some rather extreme measures.

It’s a depressing argument. But I’m looking forward to developing it. The project has been on hold since I finished my CSO paper because I need to finish Social Media for Academics. But I’m presenting an initial version of the overall argument at a Futures Workshop in August and then I’ll begin work on a book proposal in September. I’d like to include two chapters of design fiction in the finished book: one envisioning post-capitalism and another envisioning techno-fascism. I don’t believe either outcome is inexorable but I do find my own arguments worryingly convincing (I’m often very critical of my own work but I’m really pleased with the CSO chapter, it went through a slightly brutal multistage review process and it really shows) at least in terms of currently inoperative social mechanisms that one could easily envision kicking in under future politico-economic circumstances not much worse than our present ones. But if Mason’s book is as provocative as I suspect it will be, I’d like to use it as an optimistic foil, not least of all to preserve the social optimism which I’m concerned that I’m in the process of losing.

This extract from a recent Guardian debate with Mason (HT [4]Phil BC) gives a taste of what the book will be like: [5]https://embed.theguardian.com/... (unfortunately it won’t embed on wordpress.com)

5. https://embed.theguardian.com/...
is rooted in an ‘existentialist’ conception of the person. It then uses Goffman’s Asylums and Foucault’s Folie et déraison - both published in 1961 - to illustrate how these methodologies reinforce each other.

The researchers’ survival guide (2015-08-07 08:00)

An [1]important resource produced by UCU:

The guide:

- outlines the rights of research staff and what they can expect from their institutions
- offers practical advice on issues including developing your career, workloads and maternity leave
- suggests ways in which you can seek improvements.

It also outlines how UCU campaigns for researchers and offers a range of support options.

The guide provides a great opportunity to recruit new members so that researchers have a stronger voice in their union and strengthen UCU’s ability to improve research careers.

Sociology Associate Board - Call for Applications (2015-08-08 08:00)

Sociology Associate Board Recruitment
Deadline: Tuesday 18 August 2015

We are seeking 8 new members to join the Sociology Associate Board, from mid-October 2015 until July 31 2018.

Sociology relies on its peer reviewers to maintain high quality scholarship. Alongside the work of members of the Editorial Board, members of the Associate Board help to ensure that the journal makes a timely and constructive response to article submissions.

The Associate Board is a flexible way for individuals to become involved in the ongoing success of the journal and also to engage in regular peer reviewing. It is made up of a wide variety of scholars based around the world with a broad range of areas of interest. Early career researchers are welcome to apply.

Members of the Associate Board must possess either a PhD in sociology (or a cognate social science discipline), or at least two years’ research and/or teaching experience of sociology (or a cognate subject). All candidates must have authored peer reviewed publications.

Full details, as well as the application form, are available on the BSA website: [1]http://www.britsoc.co.uk/publications/pubsvacancies.aspx

If you would like to nominate yourself for membership of the Associate Board, please email a completed form to Sophie Jaques ([2]sociology.journal@britsoc.org.uk) by Tuesday 18 August 2015, 17:00 GMT.

2. mailto:sociology.journal@britsoc.org.uk

Social media and solidarity in higher education (2015-08-09 08:00)

There’s a [1]great article on the THE, in which Caroline Magennis reflects on the success of the conversation she started recently about being an academic from a less privileged background:

What are the challenges of being an academic from a less privileged background? Questions of ‘fitting in’ but also practical issues?

It’s worth [3]reading in full, as is the [4]associated Storify. I’m going to write about it in the final chapter of Social Media for Academics as an example of how social media can allow the emergence of new forms of solidarity, in which public discussion of what had previously been private issues leaves people with a new or renewed sense of shared and systemic problems.
I’ve struggled to see how Snapchat could be used within higher education. I could imagine why academics might end up using it in an entirely personal capacity, but I found it difficult to imagine how it could be used by them professionally. So it was really interesting to read this interview with Newcastle University’s Social Media manager on the Picklejar site. As he points out, “the people we wanted to speak to were there” and they’ve been using Snapchat to find a “new way to engage with current and prospective students that allowed us to showcase different aspects of campus life in a less formal style”. They feel confident that it’s helped them reach their target audience, also citing “anecdotal evidence that it’s working as a way of keeping applicants warm and engaging with our current students”. Interestingly, they’ve found much higher engagement rates than with Twitter, reporting that most stories now receive over 1,000 views (which given they have 1,000 followers presumably means content circulates easily on Snapchat beyond followers).

I’m still a little bemused by Snapchat however. From a sociology of youth perspective, I can understand why it’s popular amongst a certain demographic. But from an institutional standpoint, it seems to me that any success with the platform occurs in spite of rather than because of the distinctive temporality built into the architecture of the platform. Perhaps I’ve simply failed to grasp it. But I wonder if the time invested in Snapchat could be more effectively spent creating content for Instagram which could also be reused on Twitter and Facebook with little to no repurposing. I also still can’t see more substantively academic uses of Snapchat, though would love to hear about any that those reading this might know of.

Emerson Malca (2015-08-11 23:25:05)
We’ve seen librarians offering research help to students and student success centers offering advice and other help to students through StudyRoom. When they initially approached us they expressed the same problem of not being able to reach the students and thus why the need to be where they are. I do think any social media channel is great for communicating with students but as far as academic purposes goes (beyond classroom communication) I think Snapchat is not a great candidate.

Hibben Prejudice: Can Prejudice be Defended? (2015-08-10 09:59)

by Oliver Bonnington

In 1911, John Grier Hibben, who was for twenty years President of Princeton University, wrote A Defense of Prejudice and other Essays; a ‘forgotten’ philosophical text, rarely cited, though recently reprinted. The republishing of a book can give old ideas fresh impetus by apprehending of new adherents. It can also provide an opportunity for us to reflect on its position within an established academic field. Here I just want to offer some reflections on the title essay.

In this work, Hibben set out an individualistic and cognitivist view of the dynamics of prejudice, bypassing, for instance, the roles of affect and social structures, which have themselves gained currency in the study of prejudice and stigma in the last few decades. He argued that prejudice served a ‘legitimate function’ within the mind, reasoning that ‘A prejudice is not always an unreasonable judgement, it may merely be a judgement that is unreasoned’. The main defense he offered boiled down to the idea that non-deliberation is economical in everyday life and such non-deliberative impressions can be a form of prejudice. But, even if both the idea and utility of unreasoned judgement have some validity, and I don’t fully endorse this myself, does it make for an adequate defense of prejudice?

There seem to me to be good grounds for us to reject Hibben’s defense both in the evidence of us as sentient beings who revise our thoughts on matters over time, and as people in search of practical theories that are able to account for change as well as stasis in society. Indeed, ethical imperatives, among others, whether derived through collective or individual reflection, give us cause to avoid cognitive and socio-cultural sclerosis when it comes to issues of prejudice.

It’s doubtful that we’re all constantly nudging ourselves to be critical of our practices or the ideas we and others hold in respect of different social phenomena and what counts as prejudice. Indeed, we forget why we believe certain things or why we’re doing what we’re doing all the time. Moreover, new situations requiring swift action can restrict our ability to deliberate, meaning we partly rely on tacit knowledge. But whilst our relatively non-deliberative acts and habits may enable us to carry out some practices in everyday life with a degree of effortlessness and efficiency, it doesn’t mean that they should go unchallenged, especially if the effects of such practices are deleterious on the wellbeing of others. It also doesn’t mean that they are somehow a natural, innate product of a black-boxed subconscious, as Hibben thought. Instead, prejudice always takes place in socio-cultural contexts, which are never at rest.

It’s worth noting that Hibben didn’t think the cognitive processes of arriving at conclusions were as important as the conclusions themselves: so long as we remember the conclusions, he advised, the processes become unnecessary to retain and we can therefore reliably discard them. Such essentialist thinking about what humans do does violence to the forces of reflexivity in social change and, furthermore, places a thick veil over the power of certain groups and individuals to a) be able to frame, study and draw those conclusions in the first place, and b) to lodge them as ideas with powerful constitutive abilities in the cultural system.
If prejudice is ‘legitimate’ simply because it facilitates the economical workings of the mind, then we should question why an economically working mind is so valued in certain contexts and pay attention to the nature of its social implications. Many people find security, comfort and reassurance in stable ‘facts’ or a tendency to weave neat, linear narratives and assimilate seemingly assorted and contradictory ephemera into them. Yet, to me, it seems obvious that these things are instead quite often troubling. This may lead to a certain degree of reflexive fracturing on my part (by which I mean that my thinking about the world in relation to myself and vice versa often means I fail to act purposively), but I’m much more comfortable being uncomfortable with received wisdom, whether I take it from my or others’ previous conclusions, than with just ploughing on or unreflexively stating my opinions on something because it’s economical to do so.

So, Hibben thought prejudice should be defended. I disagree; prejudice needs to be challenged and this should be a ceaseless endeavour.

Perhaps picking a fight with a dead person of whom relatively few people today have heard is not the most daring or worthwhile thing I could have done. But when Hibben’s ideas were initially published in 1911 they became part of Popper’s ‘World Three’ and we should question why and how they’ve traveled to – or rather been dug up in – the present. Maybe if we look to our current neoliberal context, with its emphases on individualism, self-responsibility and a pre-occupation with the pillorying, marginalization and abjection of certain groups, or to the ascendance (and subordination) of particular disciplinary and philosophical viewpoints, we may find some interesting answers.

Dr. Oliver Bonnington works in the Faculty of Public Health & Policy at the London School of Hygiene & Tropical Medicine.

Oppression and self-promotion on social media (2015-08-13 08:00)

This is a really important post by Eric Grollman that has helped me rethink a part of Social Media for Academics that I was struggling with. The systematic generation of imposter syndrome within the academy is a crucial mechanism through which the costs involved in digital engagement come to be distributed unevenly:

I will grant that self-doubt is [1]not unique to scholars from oppressed communities. But, that is where the commonalities with our privileged colleagues end. For working-class scholars, scholars of color, women scholars, LGBTQ scholars, scholars with disabilities, immigrant and international scholars, and fat scholars, our personal bouts with [2]impostor syndrome — feeling as though we do not belong and/or are not as good as our privileged colleagues — are a symptom of systems of oppression that operate through academia, just as they do through every other important social institution. We cannot help but feel as though we do not belong because academia was not built by us or for us. We had to fight to be let in the front door (and still do), and continue to fight to be included fully; when we do get in, subtle and explicit efforts are made to undermine us at every corner.

This is compounded by the disproportionate risks entailed by digital engagement for the groups Grollman cites. Though this is a subject for another post. Both factors make a requirement for digital engagement, tacit or otherwise, additionally problematic. But Grollman offers a really inspiring account of political agency in relation to these systemic constraints, something which I’ll cite in relation to digital engagement for Social Media for Academics but obviously applies much more broadly:

I push myself because the impostor syndrome that I experience is the same symptom of oppression that my fellow marginalized scholars experience. I push myself because every time I decline an invitation, there is a good chance another person like me may not be invited in my place or also will not accept the invitation; when this occurs repeatedly, we are complicit in the systematic exclusion of the voices of marginalized scholars. I push myself because I cannot afford to turn down the few opportunities that come my way in light of the infinite opportunities that are denied to me because of my identities and politics. I push myself because this job will never be easy; academia is a difficult profession by design, and can be deadly for marginalized scholars.

When marginalized scholars self-promote and speak out, we make space for other marginalized scholars, or at least inspire bravery in others. I simply cannot imagine where I would be if W. E. B. Du Bois, Audre Lorde, Patricia Hill Collins, and the editors of [4]Presumed Incompetent had not dared to...
speak out and promote their own work and perspectives! I doubt sexualities would be the theme of the upcoming annual meeting of the American Sociological Association (ASA) if sexuality scholars (including ASA President Paula England) were too afraid to promote their work as a legitimate and important area of study. Each time I promote my work and voice, I hope that I, too, am having the same positive influence on others.

Allowing ourselves to be heard and visible in academic spaces benefits our privileged colleagues, as well. By daring to promote our work and to speak up, we contribute to disrupting our own systemic exclusion. We challenge the perspective and scholarship of white heterosexual middle-class “normal weight” cis men without disabilities as the default or standard. We force our colleagues to take us seriously and see the importance of our work and our perspectives. Hopefully, we also influence our privileged colleagues to prioritize our voices when citing scholarship, choosing panels and committees, and assigning readings in their courses. To put it bluntly, the exclusion and invisibility of unique perspectives is bad for science and bad for higher education; in this way, we all benefit from diversity and full inclusion.

Marginalisation of Muslims and organisations like CAGE (2015-08-13 17:31)

Alas Max Farrar, the difficulty of your approach is that you consistently fail to accept that collective identities are not predetermined and that the process of mobilization is constitutive of a people. The idea that class based formations are the only legitimate sources of identification and empowerment is continually belied by the experience of ethnic minorities who find solace in what are typically termed religious identities.

There is a clear lack of appreciation, and to some extent a denial, for the possibility of so-called religious identities becoming political. The mobilisation of Muslims in your reading will always be presented as a form of 'fundamentalism' and by definition a reactionary rather than a progressive politics, in which the usual disclaimers apply, e.g. 'women are seen to be 'subordinated' and 'oppressed;' issues around homophobia; restrictions on free speech; victimhood and playing the 'race' card; and of course fairness or equality are 'dismissed' within these communities.

The only answer that your analysis can offer is one based upon an essentialism which determines the characteristics of any politics from the classification from its agents. Therefore, politics (and the political) remain a secondary phenomena throughout ethnicised communities where primordial loyalties and solidarities are immune to the process of political articulation and intervention. Unfortunately in your limited attack of CAGE you can only offer generic notions of 'fundamentalism' at best, which display the Eurocentrism inherent in many sections of the left. As you claim to be a long term fan of Al-Hajj Malik El-Shabazz, I wonder what you would think he would make of your position in aligning yourself with such a neocon led campaign against a human rights advocacy organization?

Katy Sian wrote the above response on social media in support of [4]Tom Mills, [5]David Miller and [6]Narzanin Massoumi who have written about [7]the brilliant work of CAGE, as well as about the attempts to derail this work in the name of War on Terror.

See:

1 [8]Why on earth would leftists go out of their way to support Cage? by TOM MILLS, NARZANIN MASSOUMI,

______________

VJ (2015-08-17 23:27:38)
Could you explain why you say CAGE is a human rights organisation? Even they don’t say they are.

I’d question Katy’s assertions that ethnic minorities mobilise around religious identities; it’s true that many or even most do, but others don’t. It’s important to consider the safety of those that don’t. There’s a massive big row going on about this very issue in Bangladesh – maybe you’ve read about it? Are all those murdered secular bloggers ‘eurocentric’? In terms of religious mobilisations, it’s possible to distinguish between progressive and reactionary mobilisations. I can’t speak for Max Farrar but I expect he’s capable of it too. Some religious groups that seem progressive to me: CDD in Latin America, Jews for Justice in Palestine/Jewish voices for Peace in UK/US, Sisters in Islam in Malaysia, Inclusive Mosque initiative here, etc. CAGE does important legal work, yes, but is it progressive? Does Katy think al Qaeda is progressive? Because CAGE promotes the milieu of al Qaeda. You can see this in their invitation to Abu Qatada at an Iftar last Ramadan. Begg has for years argued for dialogue with Abu Qatada and the al Qaeda milieu e.g. al Nusra front who recently slaughtered a village of Druze. http://www.bbc.co.uk/news/world-middle-east-33092902 This is consistent with Begg’s support for the Taliban at the time when they were engaging in ethnic cleansing of minorities in Afghanistan. Does Katy even read the papers? What a crazy world we’re in when people who don’t think al Qaeda supporters are progressive get labeled ‘eurocentric’. ps - no one, including CAGE, thinks they are a human rights advocacy organisation. LOL.

Redbridge (2015-08-19 16:05:19)
Why do you have a comments section if no one can leave a comment? Mine wasn’t inappropriate, it was a reasonable response to a smear of someone I respect. You can’t just go around calling people racist all the time and expect no comeback.

Redbridge (2015-08-19 16:07:26)
oh I see first comment is still in moderation, sorry, couldn’t see that at first.
Now, above all of it, there's a product referred to as Fitbit that became famous with their model Flex wrist-worn fitness tracker.

Homophobia and Islamophobia: ITV's inappropriate and offensive tweet (2015-08-13 17:40)

[1]

By Jeff Vass in response to [1]this post

Firstly, in view of the way you have problematised the individualistic vs relational self in connection with the noise issue I’d like to make a distinction between ‘descriptive and prescriptive ‘selves’ in the same way that linguistics makes the distinction between describing the actual practices of people and their own ideal, prescriptive rules for governing those practices. In linguistics one has to make a distinction between the grammar that teachers prescribe for ‘Good English’, say, and the actual English(es) that are spoken/written in the myriad contexts in which they occur. The latter are variable, pragmatic, subject to change and variation and, from a prescriptive view, look like an erosion of principles etc. To enforce prescriptive principles seems anti-progressive and most of us tend to live with the linguistic ‘mission drift’ as English evolves. We might argue that the ‘rules’ of grammar should simply follow fashion. Similarly, I see this latter argument in the view that the relational self, by virtue of the fact of its relationality, should simply drift along with any change of conditions in custom and practice in the civic space which embeds it: if the majority uses mobile phones in the quiet carriage on the train I should go with this. By extension, to try to assert my ‘individual rights’ to quietness seems like I am not respecting the relational interdependence that selves have with others if I go against the grain.

However, a relational ontology of the self, if I may, does not mean that we must necessarily impose on ourselves a ‘contingent interdependence’ at all points in civic space. That is to say, if a particularly noisy gizmo comes to market and there is a sudden trend to use it ubiquitously that I find irritating or harmful to my well-being or quality of life, I don’t have to abandon my relational self position in asserting an ‘individualist’ right to be gizmo-free. In other words, from a descriptive sense of the self as relational we are not, by that fact, prohibited from prescriptively taking the self in other ways that we can reasonably sustain as a community. The problem with the Tory view (sic) of individualism is, I think, based on arguing from the apparent empirical outcome, that because we just see individuals everywhere then the ontological basis of social life must be simply collections of individuals. Mrs. 3880
Thatcher’s viewpoint seemed to be, derived from her empirical finding, that she could only see individuals on every horizon she cared to look. From this she reasoned that (I paraphrase) the basic ontology of selves was as primordial individualities. Hence, she did conclude that what seemed to her to be the case ought to be the case. Marx argued that practice was fundamentally ‘co-operative’ in form and that individual productivity is a kind of illusion. I assume he is right. My labour is interdependent. It is dangerous only when we allow the illusion to obliterate the cooperative basis of everything we do. Like Mrs Thatcher he argued that cooperation should form the basis of polity. However, cooperation and relationality do not, in themselves, proscribe ways of organising selves that allow individuals to exercise rights provided that we do not misrecognise the basic interdependencies on which they are based.

I think noise ‘creep’ is harmful and does impact on people’s well-being and does make us forgetful and misrecognise the needs of others. I think it is unlike the problem, say, of the ‘dark sky’ movement (which I also support!). I think we have had light creep from urbanisation and street lighting on a massive scale in the west such that there are parts of the night sky we can now no longer see as a consequence of light pollution. This is sad, but I realise that I have to balance this against the safety of people walking home late at night etc.. Noise I think does adversely impact on well-being, health and the quality of life of people who cannot sleep, cannot concentrate on the things they want to do etc.. Noise also creates new dependencies. In London I lived above a man who had the TV on all waking hours; it was fairly tolerable except that for every news programme he would turn it up to maximum volume. 6AM news, midday news, 6 pm, 9pm and 10pm - the news would go to maximum. I queried this with him. Though he had the telly on all the time he wasn’t always watching it, “but you've got to have something on haven't you?” he said. So, I asked why he had to have every iteration of the news on every channel when basically you get the same stories all day, "well, in case something happens" he said. Since then I’ve lived next to people who likewise need constant noise. One woman found construction noise from pile drivers "comforting". She had the radio on constantly at home and in the car, why was this?: "my brain goes haywire otherwise". Another couple I lived next to did DIY every night and weekend for years. I asked: "why don't you just sit and watch the TV?" the answer was "We can't. After 20 minutes we notice something on the wall and out come the tools". After 8 years they sold up. Why? "There's nothing more to do on the house".

So I realise I may be in a shrinking minority who think that it’s good to be able to sit in the garden and read a book. Many of my neighbours seem to think of their gardens as 'power tool playgrounds'. But they do let me sleep at night, I am grateful for that!

I think we can sustain a descriptive account of the relational self, but also sustain a prescriptive set of ‘rights, duties and obligations’ that we wish to attach to ‘individuals’ in a civic sense without compromising an account of them from the standpoint of relationality. I would promote a concept of ‘sonic footprint’ alongside ‘carbon footprint’. Unlike ‘rights to dark skies’ that are infringed by light pollution I think sonic footprints do impact on others' rights. On the whole I need to be made aware that my carbon footprint shows up a kind of gross negligence that is harmful to others in ways I didn’t intend. Likewise I believe that, in pursuit of our own enjoyments, we corrode public and private spaces and the quality of life of others, often unintentionally, when we generate noise. We do it without extending a due ‘care’ to others. I think that if one wants the civic individual to be informed by their fundamental relationality as social beings then the care principle might be invoked - at least just as easily as the somewhat generous proclivity to learn to live with one’s neighbours’ growing sonic footprints!! I believe that in Germany it is prohibited to use power tools on a Sunday, lawn mowers etc. in residential areas. There has often been a Sunday when I've wished that to be the case here!

On not writing from the PhD (2015-08-15 08:00)

This was originally published on [1]patter:

On March 26th 2014 I finally submitted my thesis for the PhD I had begun almost six years earlier. The event itself was somewhat anticlimactic after a false start the day before when ebullience at having finished gave way to irritation upon realising I’d misread the formatting guidelines and had to get my thesis reprinted. Thus I shuffled into University House the following day, somewhat hungover, with my now correctly printed thesis only to be told that I was in the wrong place and had to make my way across campus if I wanted the university to take receipt of this document which had dominated my life for the past six years. In retrospect this subdued comedy of errors seems rather appropriate because it helped detract from what might otherwise have been unreasonable expectations about how I would feel once it was over. I never really liked being a PhD student yet I never wanted to let go of my thesis. I felt about it rather like this panda feels about his green ball:

![Panda](image)

I’d got used to sitting with it. It’s simply what I was doing: sitting with my green ball. It wasn’t particularly enjoyable and at times it became downright tedious. But it was comfortable and familiar to an extent that made the impending reality of it being snatched away from me feel bizarrely traumatic. But in reality, it wasn’t snatched away, as much as the belittling objectivity of a final deadline from the university made it seem as if it would be. From the mildly chaotic handing in process through to a six month long wait for a viva and the weirdly familiar process of getting a library copy printed and going to hand this in, it simply rolled away from me in a manner I was only dimly aware of at the time. This thing that had provided such structure to my life since the age of 23 faded slowly into the distance until I one day discovered that I was Dr. Carrigan giving a lecture to a room full of masters students. That first lecture on the masters module I convened was the closest thing I’ve experienced to a culmination of the process and it wasn’t all that close. The graduation ceremony was another occasion on which to wear a suit that doesn’t fit me properly, coupled with an ever sillier hat perched upon my head than last time.

The point of this naval-gazing is to address a question Patter asked me after a conversation on Twitter: why I am so averse to going back to publish from my PhD? It’s been over a year since I handed it in and yet a begrudging cover-to-cover reading the day before my viva is the only point at which I’ve looked at in this time. This was the double sided misprint which my false start at handing in left me with, a document I scrawled upon before relegating to the corner of my book shelf. The slightly diminished status of the volume feels oddly appropriate and yet mildly upsetting. Oddly enough for someone who once agonised over whether instrumentalism would win out in deciding what to do with my PhD thesis ([3]http://sociologicalimagination.org/archives/12530) I now find myself struggling to
motivate myself to do anything with it.

When I say ‘my PhD’ what do I actually mean? It occurs to me that it was both process and outcome. It’s something I did for six years, entirely subjugating every other aspect of my life to it, but it’s also the outcome of that process. This lends the document itself a tremendously ambiguous status which I think goes some way to explaining my reluctance to part with at the time of submission. I’ve never known quite how to feel about it, least of all when the university was telling me I had to finally hand it over or they’d kick me out.

My PhD has its material existence as sheets of paper, sequentially bound together according to a strict rubric, upon which its intellectual content is inscribed. But it also has a more spectral existence, something which post-modernists might describe as hauntological: its existence as a physical document brings to a close all which came before it and yet these angst-ridden years linger on through the physicality of those pages. As a marker of intellectual progress, it captures all the mistakes I made and grants an acridulous permanence to the missteps which I realise on a reflective level are an unavoidable part of the process. But it was also the horizon of that progress, as well as my life as a whole during that time in which so much happened to make me the person I am now, some fantastic, a little that was truly terrible and much that was simply tedious. In view of this, the materiality of the thesis seems almost pathetically mundane to me.

I can’t imagine ever feeling comfortable with my PhD. It’s not that I think it’s a bad PhD... it’s an unusual piece of work but I’ve had enough people I respect understand what I was trying to do for me to feel confident that it has intellectual value. But the document itself feels so unendingly strange to me, even now over a year later when I find myself reflecting on it for the first time in weeks, I’d like nothing more than to leave it in the past as an awkward and confusing encounter I doubt I’ll ever be sure what to make of. In spite of this, I know my PhD will in reality follow me wherever I go, intensifying my avoidance in the knowledge that I can’t ever entirely avoid it. I might very well end up producing the handful of journal articles which could very easily be adapted from my thesis. I don’t really want to though and the evidence thus far suggests I probably won’t. Hopefully in writing this I’ve helped explain why this is the case and I’m curious to know if others share my antipathy towards something which the culture of the academy suggests we should be proud of.

2. https://patthomson.files.wordpress.com/2015/05/panda.gif

Enjoyed reading this, Mark, as someone who was told ‘get it done or you lose your job’ and has very similar feelings. Seven years on (actually, I just had to try to work that out - I think it was that long ago) I’ve managed to publish 3 papers. I don’t think it does follow you though, I think it just becomes an even sadder single line in your CV that no-one, least of all you, particularly cares about!

Kathryn (2016-08-11 21:42:17)
As someone on step 1 of the journey (ie: my application has been accepted) I read this with conflicting feelings of excitement and dread! It seems such a long road to travel with plenty of self doubt speed bumps along the way. I hope I enjoy at least 60 % of it!

Steve (2017-06-30 13:50:59)
This resonates with my own experience. I loved and hated being a doctoral student, and the latter mostly revolved around producing the thesis. By the end, I had no faith in what I had written (and still don’t have much) and was amazed to pass the
viva without major revisions. I loved the teaching side of being a doctoral student, and the amount of time/freedom I had to explore whatever particular academic alleyways I felt like exploring, and the associated discussion of ideas, misteps, worries, grand plans, etc. with others going through the same experience. But in the end, submission was disappointing and I didn't even look at the thesis for a couple of years afterwards. I published one article, four years after submission, but I had moved on to a different area of interest in which I have published reasonably regularly. What I learned during that period provides me with a pretty solid grounding as an academic, which I like to think I have built on. When I now read what I wrote, it is much better than I remember, but as whole the thesis (I feel) remains fundamentally flawed. It was an apprentice piece, and remains just that.

Call for papers: Medicine, Health and Self-Tracking (2015-08-16 08:00)

This special issue focuses on the topic of self-tracking as it is used for health and medical purposes. Self-tracking has recently been incorporated into a range of health and medical domains. These include voluntary health promotion and fitness monitoring, fertility, sexuality and reproductive health tracking, patient self-care regimens, corporate wellness and productivity programs, health and life insurance schemes and school-based physical education programs. A new range of digitised devices have come onto the market that can be employed to engage in self-tracking, such as smartphone apps and wearable tech, but some practitioners may prefer time-honoured methods such as using weight scales, diaries or journals to monitor their health and wellbeing.

Articles are invited for this issue that address the social, cultural, political and ethical dimensions of self-tracking practices in health and medicine contexts. The deadline for submission of articles is Friday 27th November 2015.

Submission Process

Submissions must align with the journal aims as well as the themed issue, be prepared in line with the instructions to authors, and be submitted through the ScholarOne system, selecting the option for consideration for this themed issue. For all journal and submission information, visit the [1]journal's homepage.

The final decision about publication will be made by the Editors-in-Chief, but if you are not sure whether your article is appropriate for this special issue, please feel free to send an abstract in the first instance to [2]Deborah.Lupton@canberra.edu.au.
Petition to form an analytical sociology section within ASA (2015-08-17 08:00)

Over the last couple of years, there have been discussions about the possibility of forming an analytical sociology section within the ASA. Growing representation not only in leading sociology journals but also in journals like the Proceedings of the National Academy of Science and Science have convinced us that now is the time to launch this section. The recent successes of the International Network of Analytical Sociologists annual conferences, along with a newly initiated book series in analytical sociology by Princeton University Press, lead us to believe that analytical sociology will quickly establish itself as a vibrant and attractive section of the ASA.

We expect that this section will be of interest to many of the existing ASA members. There is an important niche to be filled for a section that caters to scholars in different substantive fields who do serious theory and research focusing on social networks, social mechanisms, collective dynamics, micro-macro links, and related approaches. This includes many junior scholars pursuing research in mathematical sociology, methods, and computational social science for whom analytic sociology would be an attractive home.

The first stage in the process of forming a new section within the ASA is to get a minimum of 200 ASA members to support the initiative. We very much hope that you will be one of them. Please visit [1]https://www.surveymonkey.com/r/8YR2ZZC in order to register your support. To have the section in place for the 2016 ASA meeting in Seattle, and to be able to put together a highly stimulating set of sessions that reflect the breath and quality of analytical sociology, we kindly ask for your support by Monday, August 17th. With the best wishes, Delia Baldassari Peter Bearman Elizabeth Bruch Damon Centola Karen Cook Filiz Garip Mark Granovetter Peter Hedström Michael Macy Robert Mare Christopher Winship

Allan McDougall (2015-08-17 13:01:24)
Non-sociologist here. Alongside what other schools of thought in sociology would you compare/contrast analytic sociology? Further, which ASA sections have analytic sociologists hitherto presented their work?
This superb post by Cory Doctorow, novelist and editor of Boing Boing, offers a philosophy of blogging extremely similar to what I've described in the past as continuous publishing. I really identify with what he's saying here and it goes some way to explaining why I struggled so much with writing when I tried to give up blogging for a few months recently.

As a committed infovore, I need to eat roughly six times my weight in information every day or my brain starts to starve and atrophy. I gather information from many sources: print, radio, television, conversation, the Web, RSS feeds, email, chance, and serendipity. I used to bookmark this stuff, but I just ended up with a million bookmarks that I never revisited and could never find anything in.

Theoretically, you can annotate your bookmarks, entering free-form reminders to yourself so that you can remember why you bookmarked this page or that one. I don't know about you, but I never actually got around to doing this — it's one of those get-to-it-later eat-your-vegetables best-practice housekeeping tasks like defragging your hard drive or squeegeeing your windshield that you know you should do but never get around to.

Until I started blogging. Blogging gave my knowledge-grazing direction and reward. Writing a blog entry about a useful and/or interesting subject forces me to extract the salient features of the link into a two- or three-sentence elevator pitch to my readers, whose decision to follow a link is predicated on my ability to convey its interestingness to them. This exercise fixes the subjects in my head the same way that taking notes at a lecture does, putting them in reliable and easily-accessible mental registers.

Blogging also provides an incentive to keep blogging. As Boing Boing's hit-counter rises steadily, growing 10-30 percent every month, I get a continuous, low-grade stream of brain-rewards; rewards that are reinforced by admiring email, cross-links from other blogs that show up in my referrer logs, stories that I broke climbing the ranks on Daypop and Blogdex (and getting picked up by major news outlets). The more I blog, the more reward I generate: strangers approach me at conferences and tell me how much they liked some particular entry; people whose sites I've pointed to send me grateful email thanking me for bringing their pet projects to the attention of so many people.

Who’s more popular on twitter? the UK’s top research universities or academic blogs and viral feeds?
(2015-08-19 08:00)

Comparing the follower counts for Twitter feeds based on the [1]2014 REF results (i.e. I mean ‘top’ in a very narrow sense) and an unsystematically chosen selection of the Twitter feeds I’ve been scrutinising this morning as I finish off the book.

Oxford University: 231,000
Cambridge University: 200,000
Shit Academics Say: 129,000
Nein Quarterly: 114,000
Lego Academics: 51,000
Cardiff University: 44,800
Warwick University: 44,300
LSE Politics & Policy: 40,800*
LSE Events: 40,600
Imperial College: 37,900
Kings College London: 37,900
Grad School Elitist: 37,300**
University College London: 34,500
LSE: 23,200
Sociological Imagination: 19,200
Academia Obscura: 17,300
The Sociological Review: 15,500
Manchester University: 11,500
London School of Hygiene and Tropical Medicine: 8,590***

I’m pleased to see so much continued growth. I was quite proud of having more than doubled the follower count when I ran it for six months & hoped it would eventually become the most prominent twitter feed at LSE.

*Not for long! The account has now gone private in the face of widespread condemnation.

**This is actually the Press account. The university doesn’t seem to have a dedicated Twitter feed.

Martin (2015-08-19 10:17:55)
Very interesting and informative. But is it also a case of mistaken attribution?

The politics of data science (2015-08-20 08:00)

A special issue of [1]Discover Society I recently edited:

FOCUS: The Emerging Contours of Data Science
William Housley, (Cardiff University)
VIEWPOINT: The Politics of Data Visualisation
Joanna Boehnert

ON THE FRONTLINE: What is the Data in Big Data?
Jeffrey Alan Johnson (Utah Valley University)

POLICY BRIEFING:A smart city’s perspective
Emma Uprichard (University of Warwick)

The Domesticated Aboutness of Big Data Types
Ana Gross (University of Warwick)

Big Data Seductions and Ambivalences
Deborah Lupton (University of Canberra) and Mike Michael (University of Sydney)

The Growing Power of the Data Analytics Industry
David Beer (University of York)

The Uberfication of the University
Gary Hall (Coventry University)

Bottom of the Data Pyramid: Big Data and the Global South
Payal Arora (Erasmus University)

What does Big Data mean for Official Statistics?
Rob Kitchin (National University of Ireland Maynooth)

A Politics of Counting - Putting People Back into Big Data
Hamish Robertson and Joanne Travaglia (University of New South Wales)

Big Data and the Politics of Discipline
Susan Halford (University of Southampton)

Who owns Big Data?
Evelyn S. Ruppert (Goldsmiths, University of London)
The CFP: The Role of Quantified Self for Personal Healthcare (2015-08-21 08:00)

# # # # # # QSPH’15, Washington D.C., USA, November, 2015 # # # # # #

Second International Workshop on The Role of Quantified Self for Personal Healthcare (QSPH’15)

Workshop held in conjunction with IEEE BIBM 2015 in Washington D.C., USA

The aims of the workshop are to engage researchers from both Healthcare and Quantified Self communities to discuss key issues, opportunities and obstacles for personal health data research. These include challenges of capturing, summarizing, presenting and retrieving relevant information from heterogeneous sources to support a new vision of pervasive personal healthcare.
# TOPICS OF INTEREST #

We invite submission of papers reporting relevant research in the area of self-tracking for healthcare. We welcome submissions across a broad scope, addressing any of the following guideline topics but not excluding others, relevant to the workshop goals.

- Personal Health Informatics
- Quantified Self for Healthcare
- Activity Monitors and Devices
- Self-Tracking
- Gamification
- Healthcare Knowledge Representation & Reasoning
- Health Data acquisition, analysis and mining
- Healthcare Information Systems
- Biomedical Signal/Image Analysis
- Validity, reliability, usability, and effectiveness of Self-Tracking devices
- Design of Experiments
- Social and Psychological investigation into Self-Tracking practices
- Health Monitoring in clinical and lifestyle environments
- Sensors and actuators for Wellness, Fitness and Rehabilitation
- Innovative Algorithms for assessment of long-term physiological and behavioural data
- Models for interpreting medical sensor data
- Lifelogging, lifecaching, lifestreaming
- Biometric data
- Medical Self-diagnostics

# PAPER SUBMISSION #

All manuscripts must be written in English and formatted following the IEEE 2-column format. We accept full papers (up to 8 pages) and short papers (up to 4 pages). Papers should be submitted using the online submission system available at: [2]https://wi-lab.com/cyberchair/2015/bibm15/scripts/ws__submit.php

3890
# IMPORTANT DATES #

Full/Short Papers Due: **September 10th, 2015**

Notification to Authors: September 30th, 2015

Camera-Ready: October 17th, 2015

Workshop: November, 2015 (exact date tbd)

# ORGANIZERS #

Frank Hopfgartner, University of Glasgow, UK

Na Li, Dublin City University, IE

Till Plumbaum, TU Berlin, DE

Heather J. Ruskin, Dublin City University, IE

Huiru (Jane) Zheng, Ulster University, UK

The moral discourse of the ‘reasonable technocrat’ (2015-08-22 08:00)

An [1]excellent piece on Democrat Audit looking at the role of the ‘reasonable technocrat’ in the unfolding of the crisis in Europe. It’s important to analyse the moral underpinnings of technocratic discourse, looking at what makes it plausible and important to those who see the world in this way: a self-congratulatory pragmatism, regarding oneself as a ‘very serious person’ able to take tough and necessary decisions, based on an accumulated expertise that the impressionable public lack:

Can the EU afford to follow the will of turbulent, wavering people? For some, the answer is: no. They propose to hand over decision-making to ‘[2]reasonable technocrats’ instead. This not only promises to save people from their own short-sightedness but would also be preferable over the (impossible) promises of ‘populist’ or the take over of political extremists.

Effectively the ‘reasonable technocrat’ is a second coming of Margaret Thatcher’s (and, more recently: Angela Merkel’s) TINA politics. If ‘there is no alternative’, ‘necessary action’ must be taken. It is arguably the core feature of the above mentioned advocacy coalition to refuse to call their core beliefs on economics into question. All to avoid frightening the markets.
But has democracy proved itself being incapable of coping with the crisis? Maybe one should ask what a 'reasonable technocrat' actually looks like. A reasonable politician may always be urged to follow the wishes of their voters and thus might make wrong decision. In contrast, the reasonable technocrat is bound to a specific theoretical paradigm and therefore runs into the danger to make logical but callous decisions. However, it may be hard to tell the reasonable from the unreasonable technocrat, the one who follows personal interests, affiliates with elites or entertains an ideological world view rather then the impartial assessment of the rational expert.

Putting too much trust in experts (reasonable or not) is always dangerous. For it may herald the hollowing out of European democracy and the marginalisation of the original constituency: the people. Back in 2012, the European Central Bank chief Mario Draghi was determined to ‘save the Euro at all costs’. If these costs include the viability of European democracy, one might ask: what was the Euro saved for?

The case for a philosophical sociology (2015-08-22 11:11)
by Daniel Chernilo
(featured in the newsletter of the European Sociological Association, Summer 2015 Issue 38)

In this short intervention, I offer a plea for sociology’s reengagement with philosophy. To be sure, the extent to which their ties have severed over the past few decades will vary in different national or regional contexts. As far as I know, the case is more pronounced in English-speaking sociologies than in Spanish-, German- or French-speaking ones. Also, the field that is commonly demarcated as ‘the epistemology of social sciences’ remains one way in which both traditions still interact – although one suspects that social scientists pay far more attention to it than philosophers do.

I call this invitation ‘philosophical sociology’ and define it as the attempt to unpack the (mostly implicit) conceptions of the human, humanity and human nature that underpin our conceptions of social life. The main intellectual source for the idea of philosophical sociology comes of course from philosophical anthropology. Originally associated with the names of Max Scheler (2009) and Ernst Cassirer (1977) in the 1920s and 1930s, the tradition of philosophical anthropology was explicitly devoted to the development of a general understanding of ‘what is a human being’. For my purposes, the most important intervention in this field comes from a short book by Karl Löwith (1993). First published in 1932, Löwith’s Max Weber and Karl Marx starts by stating what for us is now the obvious: Weber and Marx shared an interest in the rise and contemporary workings of modern capitalism and offered radically different interpretations of it. Their scientific originality, their ‘sociologies’, is apparent in how their historical and conceptual sophistication wholly transformed our understanding of capitalism. But Löwith argues that these explicit sociologies of capitalism are in fact underpinned by a common philosophical concern that is the
ultimate motif of their work: what it means to be human under the alienating conditions of modern capitalism. Löwith contends that Weber and Marx were ‘essentially sociologists, namely, philosophical sociologists’ because ‘both provide – Marx directly and Weber indirectly – a critical analysis of modern man within bourgeois society in terms of bourgeois-capitalist economy, based on the recognition that the ‘economy’ has become human ‘destiny’ (Löwith 1993: 48, my italics). As philosophical anthropology continued to develop after World War II, the notion that emerged was that a dual scientific and philosophical approach to understanding the human results from, and must be preserved, because of the duality of the human condition itself: humans are partly natural bodies that are controlled by their urges, emotions and organic adaptation to the world and they are also partly conscious beings that are defined by their intellectual, aesthetic and indeed moral insights (Gehlen 1980, Plessner 1970). A key motif of this philosophical anthropology is the claim that no substantive idea of human nature was ever going to capture the essential features of what makes us humans; human beings are fundamentally indeterminate with regards to organic adaptation and this is what makes social institutions and cultural practices essential to human live.

A second insight for the idea of philosophical sociology comes from Max Weber’s lecture on Science as a Vocation (1970). Weber contends there that sociology can make a contribution to public debates by unpacking the various practical and indeed normative implications of different policy options. I translate this insight into the suggestion that normative debates in society – from abortion to euthanasia via migration and welfare reforms – are actually underpinned by ideas of the human that are never fully articulated out. All societies have normative ideas and most sociologists will accept that a good account of social life will have to be able to say something meaningful about how these ideas are actualised; why and how some are preferred over others. Unpacking these ideas of the human is important because normative debates are never fully disconnected from what human beings themselves consider right or wrong, fair or unfair. In the societies we live in, humans have turned themselves into the ultimate arbiters of normativity itself. By means of its expert empirical knowledge, sociology can cast a critical eye on what is exactly being advocated, both in normatively and in practice, in particular instances.

To reclaim the importance of understanding the relationships between our preconceptions of the human and our explicit theories of society does not entail a return to an anthropocentric ‘epistemological obstacle’: thou shall not explain society through the action of individuals (Luhmann 2012). It is instead an invitation to reconsider the idea that social life itself is predicated on the fact that human beings are capable of such collective existence. Humans are beings who have a continuity of consciousness so that they see themselves as themselves throughout their life; human are beings who negotiate a multiplicity of sometimes contradictory identities and recognise each other as members of the same species, and they are also beings who can create and interpret cultural artefacts. Crucially, humans are beings who can deploy a sense of self-transcendence so that they are able to look at the world from somebody else’s point of view and thus conceive new social institutions (Archer 2000, Arendt 1978, Parsons 1978).

But in mainstream contemporary sociology we are missing these insights all too easily. Its social constructionist variant mistakenly treats the social and the human as a zero-sum game, so that bloated notions of the social leave no space for a philosophical enquiry about preconceptions of the human. Conversely, in the ‘combative’ variant as advocated by Bourdieu (1994), conceptions of justice, legitimacy, fairness or democracy need not be included as part of the social world because conflict, power and struggles are deemed to give a full ontology of the social (Honneth 1986). The fundamental reason for these shortcomings lies in the deficient philosophical underpinnings of both: whilst radical constructionism pays no attention to any form of anthropological reflection, Bourdieu’s sociology uses a highly reductionist conception of human nature that cares only for power and strategic bargaining. Indeed, this form of irrationalism has been available within sociology for several decades (Bendix 1970); other candidates being more or less essentialist ideas of ‘identity’ and ‘authenticity’ that figure so highly in postcolonial and intersectional approaches (Connell 2007, Mignolo 2005). This is sociology’s very own self-fulfilling dystopia: although most sociologists do care about normative questions (not least in relation to their own justifications as to why they are doing sociology at all), they feel no particular need to take normative ideas into account as part of they have to explain sociologically (Boltanski and Thévenot 2006).
The history of sociology is of course full of attempts at determining the problem of normative justifications. Even if religion does remain available in contemporary society, cosmological convictions now co-exist with a wide pool of competing justifications and that their (ir)rationality is hotly contested. We have also witnessed the appeal to teleological ideas of secular progress and their belief in the normative power of history; justifications for the rights and wrongs of past and present were to be assessed against the promises of a better future. And society itself has been posited as a source of normative integration. But being subject to permanent historical and cultural changes, society was equally weak for the task of providing stable normative justifications. The ambivalent normative appeal of the nation in modern times, and the need to defend minorities against the nation's unsavoury wishes, illustrates well this point (Chernilo 2007).

As religion, history and society are all in trouble when trying to uphold normative justifications, we can still ask whether the defining anthropological features of our species can do this job – and this is a path philosophical sociology seeks to explore. To be sure, ideas of humanity are socially construed and have themselves changed over time (Fuller 2011). But it seems to me that a key strength of philosophical sociology lies in its taking seriously the humans capacity to reflect on what makes them the kind of being that they actually are. Anthropological arguments remain the best option here because they allow us to consider, simultaneously, that normative arguments are only actualised in society, are to carry the free assent of individual themselves and yet their binding force remains attached to some stable features that all humans possess qua human beings. Indeed, this is precisely why we claim human rights ought to be respected under all circumstances and even especially against society's own will (Habermas 2010, Joas 2013).

For all their claims to originality and intimations that they seek to make sense of a new world that is still in the making, the new strand of post-humanist thinking belongs in the mode that I am describing (Braidotti 2013, Haraway 1991). This genre is constituted by its own combination of partly speculative and partly scientific arguments and echoes previous critiques of humanism. Indeed, its fundamental question remains exactly the same: how open to social manipulation human nature actually is, whether developments in contemporary technology have put an end to the human being as we know it and whether the very idea of humanity has ever been anything but an pernicious illusion. Inside mainstream social science, Bruno Latour (2013) has advanced similar claims about the definitive need for a whole new ontology that can do without the distinction between humans and nonhumans (although the philosophical result of his investigations is an even more reductionist ontology that allows only for the networks). I suggest that we turn their claim to novelty on their head – and not only because there is nothing less original than their claims to originality. The fundamental point that they miss is precisely that their very quest is paradigmatic of the all too human frustration with the irritating inevitability of the question what is to be human. When the post-humanist literature rejects the 'foundationalism' that underpins traditional 'humanist' ideas, they use this term now for exactly the same that, in the 1960s, was deemed mere 'bourgeois' or 'ideological' humanism and, in the 1920s, it was treated as unwarranted 'metaphysics'. What is really going on, however, is that their ontologies of the social are underpinned by too shallow a view of the human.

This anti-humanism is as conventional as it is flawed: it conflates 'Humanism' as the colonial ideology of the West with the legitimate enquiry about anthropological foundations of social life and, as it deconstructs the inconsistencies of the former, it has no difficulty in ubiquitously appealing to traditional humanist values (solidarity, emancipation, subjectivity) for its own justifications. Their explorations into the limits and exceptions to 'Western anthropocentrism' is potentially illuminating, but there is something deeply elitist when this is proclaimed 'on behalf' of the disposed of the world who, quite literally, are dying for the most simple humanist values and institutions are being so arrogantly dismissed here: the right to work, basic human decency, equality before the law. In the old debate on humanism between Sartre (2007) and Heidegger (1993), all the important lessons have been learnt the wrong way round: they misunderstood the deeply humanistic sensibilities of the former (however imperfect) and have instead become intoxicated by the smug self-congratulation of the latter (regardless of how misguided).

The fundamental point remains, therefore: the 'Copernican revolution' of humans stop putting themselves at
the centre of the universe is itself a major human accomplishment (Bachelard 2002). If the current decentering of anthropocentrism is to become sociologically fruitful, we have to accept the fact that this decentering has a limit and is not wholly reversible: the science, law and philosophy that now reflect on the environment, animals and cyborgs remains the wholly human accomplishment of those members of our species that now show an increased sensibility towards them.

If what I have argued so far makes sense, it may already be clear that this is not a task that sociology can fulfil on its own. Given the historical, moral, scientific and indeed theological density of our conceptions of the human, for sociology to pursue this task it needs to reconnect to philosophy. A dual approach, both scientific and philosophical, is needed because this reflects best our human condition – and sociology’s highly sophisticated ability to empirically account for the ways and trends of contemporary society shall prove essential here. We must reconnect our sociological understandings of social life with philosophically informed ideas of the human, humanity and even human nature. After a long history in which sociology tried to differentiate itself from philosophy in order to secure its scientific status, it is now again in need of philosophy. But the idea of philosophical sociology for which I advocate is neither a substitute for empirical sociological research nor a philosophical dissolution of sociology (Chernilo 2014). It rather suggests that the common anthropological traits that define us as members of the same species create the conditions for social life to unfold without this common humanity itself being able to act directly on society (Chernilo 2013). They are also the basis from which ideas of justice, self, dignity and the good life emerge. These are irreducible to material factors because their normative worth ultimately refers back and thus depends on our conceptions of what is to be human. Without disciplinary arrogance or parochialism, a re-engagement between sociology and philosophy can take the form of a mutual learning process between the different knowledge claims that underpin them both: the empirical vocation of sociology as it grapples with the complexities of contemporary society and the kind of unanswerable questions that we still associate with the best of the philosophical tradition. At stake here is the fact that as long as sociology continues to raise the big questions about life in society – the powers of agency, the relationships between nature and culture or the dialectics between domination and emancipation – these are all questions that also transcend it: good sociological questions are always, in the last instance, also philosophical ones.

I think this is an interesting line of inquiry; I've made similar proposals in private conversations with sociologists and anthropologists (as well as other philosophers) and am glad to see other folks engaging with the conversation. As I think about it, there are two dimensions to this sort of program. (1) There is an ethical dimension that involves considering the normative (including ethical, political, religious, social, economic, etc.) implications of the relationship between sociology and philosophy, the concept of human, or person, or of having a certain sort of moral status; (2) there is a methodological dimension that involves considering the ways in which we evaluate problems, the conceptual backdrop against which we make such evaluations, etc. (I do not mean to suggest that the two are discrete; a great deal of good feminist and post-colonial theory is really bringing together these dimensions in a useful way.) With that in mind, I think the gap is often understated. You do a good job of evaluating (1), here, but consider that there are going to be cases where methods of analysis in the various social scientific and philosophical traditions diverge so substantially that the norms start to come apart. One such example has to do with the very terminology present here; to "unpack... conceptions of the human, humanity and human nature that underpin our conceptions of social life" is problematic in an era where many prominent views in philosophy reject the notion that "human" is the appropriate family of related concepts to start an analysis in (1). I have in mind here, among others, philosophers like Peter Singer, David DeGrazia, Jeff McMahan, and Tom Regan. There are other related worries about more technically intrenched concepts and approaches that weigh heavily on many of the claims you make here. (e.g.) "... the common anthropological traits that define us as members of the same species create the conditions for social life to unfold without this common humanity itself being able to act directly on society." There are some philosophers who are inclined to agree (Matthew Liao, for example, in his recent writing on human rights) while there are others who won’t, including the various advocates of certain sorts of animal rights and a wider scope for personhood claims, as well as those who are skeptical of certain sorts of moral responsibility claims. My general point is this: The various social sciences are heavy with assumptions that are not made in philosophy, some of which are well supported and justified, and some not. There is a lot of work that has to be done in literacy between the two sets of disciplines before it is plausible to have a really robust sort of interdisciplinary discourse.

2015 Quantified Self Europe Conference - Sept 18-19, Amsterdam (2015-08-23 08:00)

A reminder from QS Labs:

I wanted to send along a quick email to invite you all to the [1]2015 Quantified Self Europe Conference. On September 18th and 19th we’re continuing our tradition of community-supported, peer-to-peer learning conferences with our fourth Quantified Self Europe Conference
at the beautiful canal-side, Casa 400 hotel, a few minutes bike ride from central Amsterdam. We invite you to join us in this relaxed and vibrant atmosphere to learn, share, and engage with self-trackers and toolmakers from around the world.

As always, this will be a "carefully curated unconference" which means we hand craft the program based on who is coming. If you have something to share we want to hear from you! We would love to have research projects, discussions, and self-tracking projects from the Quantified Self Research Network represented in the program.

[2]Register today to take advantage of our €149 Early Bird rate, before the price increases to €249.

Why we should be shoppers – not disciples – in intellectual matters (2015-08-23 11:18)

However much it offends their narcissistic natures, most academics are disciples of one or maybe 2-3 masters. This applies across all the disciplines, though the nature of the discipleship differs among them. In the human sciences, which tend to collapse the distance between what one does and who one is, the sense of discipleship is a secular version of the classic religion model. Thus, a sense of imitation that begins as the sincerest form of flattery can end up as a priestly parody. In contrast, the natural sciences are more medieval, even today, as one still refers to lab 'apprenticeship', where the journeyman acquires a style of research which he or she then carries forward as an independent inquirer. However, nowadays one may need to apprentice in 2-3 or more labs, often turning the scientist into a 'jack of all trades' personality, with little commitment to any of them.

In either case, you can probably predict two-thirds of what academics think just by knowing who they studied – either in text or in person. The other third you can predict, once you know the conditions under which they're deploying this legacy – or accumulated capital – to produce what is honorifically called 'original work'. On this view, the difference between the greater and the lesser lights of a discipline is simply the number of masters that they dextrously handle: i.e. 2-3 versus just 1.

The luminary status of people like, say, Slavoj Zizek and Judith Butler can be explained largely in this fashion, namely, their insights are reducible to the key people they read (very well, to be sure), with a small residue that reflects their own idiosyncratic reading habits. In turn, they attract a mass following because many people in their day will also have read – or at least would want to appear as having read – the same people, say, Marx, Freud, Lacan, Foucault, etc. Academics of this sort are easy to explain in terms of both their influences and the influence they exert over others. In 1998 Randall Collins published The Sociology of Philosophies, which very impressively applied this master-disciple thesis to understand 'global intellectual change', as he put it. It will be a very long time before the institutional history of intellectual life is bettered in all its details.

However, that's not the only intellectual history that can be done, even from a sociological standpoint. In a book I published ten years ago, The Intellectual, I spoke of 'one-stop shopping for the mind' to characterize authors like Zizek and Butler. In contrast, the true intellectual is one of who is always shopping around for new ideas – but
we need to take the idea of shopping literally. Shopping can’t be reduced to ‘following fashion’ because shopping implies thinking in terms of the personal suitability of a good on sale. Indeed, there is a tendency to underestimate the amount of kickback that shoppers give to fashion. You try on the garment or test-drive the car. If you purchase the good, you shape it at least as much as it shapes you.

In this respect, I’m more a shopper than a disciple in intellectual matters. Here it is important to distinguish the customer from the consumer of ideas. The distinction turns on two senses of ‘buying’. The customer ‘buys’ an idea simply in the sense of ‘purchase’, i.e. investing one’s own resources to acquire the idea. Thus, I buy a book, read it, but I may then ignore or inveigh against it – or, best of all, incorporate it in some creative way that makes the book’s ideas my own. Thus, the intellectual customer may well operate against the grain of an idea’s producer by appropriating it in ways that the producer had not intended – or even would approve.

In contrast, the consumer falls more easily into the discipleship mode. That consumers are no more than disciples with a credit line has spurred businesses to increase and extend their brand recognition, such that once a branded product is purchased, its producers will try to ensure that the consumer will also buy many if not all of its affiliated lines, or ‘apps’. Apple and Microsoft are perhaps the most obvious cases in our own day. Moreover, because intellectual movements – no less than commercial enterprises or political parties – are ultimately fields of competing forces in search of coherent productivity, they necessarily have an idiosyncratic character. Thus, discipleship is easily spotted in, say, actor-network theory, given that as soon as Bruno Latour’s reading patterns shift to Alfred North Whitehead, John Dewey and Walter Lippmann – perhaps in a pique of nostalgia for early 20C American thought – all of his disciples follow suit. This is not true shopping: It’s the sort of ‘one-stop shopping’ that comes from buying on subscription.

In British English, ‘shopping’ has an interesting meaning that accentuates the sense of ‘shopping’ I am advocating. If you ‘shop someone’, you are informing them to the authorities, presumably because you managed to gain their confidence, which led them to confess something criminal. This is akin to the profound Italian adage, traduttore tradittore, which I first learned in my student days when Jacques Derrida was fashionable: ‘To translate is to betray’. While it’s often presented as a counsel of despair against the prospect of adequate translation, the adage is best understood as a formula for turning a double negative into positive: You give the impression that your time spent on someone else’s thought is to follow it, but in practice your intention is to supersede it by creatively misunderstanding the thought.

The fiction future of faculty: an afternoon of sociological design fiction (2015-08-24 08:00)

I’m organising a design fiction event in Manchester on September 16th, with James Duggan and Joseph Lindley. It’ll be great. You can register here: [1]https://www.eventbrite.com/e/the-fiction-future-of-faculty-an-afternoon-of-sociological-design-fiction-tickets-18169546603

The ability of storytelling to help us envision and discuss a gamut of plausible futures, from dystopian visions to everyday utopias, is increasingly being harnessed using the nascent practice of ‘design fiction’. Design fiction, a term coined by author Bruce Sterling, “tells worlds not stories”. Although inspired by sci-fi, design fiction is less about the “hocus pocus” of far-flung techno-futures, and instead is more practical, hands-on, and mundane. Design fictions extrapolate from current data, trends,
research and technologies, not in an attempt to predict the future, but to interrogate the plurality of plausible futures by forging a discursive space form which insights may emerge. This session will explore how design fiction can help us illuminate preferable, or indeed undesirable, futures of academia.

The university is a site of managerial and neoliberal transformation, with increased applications of competitive logics and performative technologies to re-define academia and academic practice. There are however examples of resistance and hope, with everyday utopian experiments such as the Social Science Centre, Lincoln. In this exploratory session, we use design fiction as an approach for exploring the potential for change latent within current circumstances, through contrasting utopian and dystopian visions for the future of higher education.

If you are interested in the future of the University and academic practice, or if you have a position or provocation to share, then please come and join us. During the session we will present two contrasting visions of the academy in 2020, one dystopic and one utopian. These positions will provide the foundations for a broader conversation about the future and design fiction. We will unpack questions such as can design fiction inform a better future for Universities? Are dystopian or utopian visions of the future more likely to help us get to a better future? What is ‘better’ anyway?

Judith Butler explained with video games (2015-08-25 08:00)

by Bradley Williams
In Organizations, Strategy, and Society, Rodolphe Durand draws attention to the ways in which organizations affect and provide meaning to peoples’ public and private lives. Organizations are not merely temporary groups of individuals or groups of aggregate interests. Organizations are mediators between people and large scale social, political, and economic processes that create a sense of disorganization and loss of meaning in late modernity. Organizations provide solutions to their problems, while people grant organizations with greater legitimacy. The pattern described by Durand is cyclical, though by providing solutions, organizations help individuals move beyond current crises and forward toward new challenges. Durand’s conception of organizations is similar to both field theory and the linked ecologies perspective, because all three describe largely self-reproducing social orders. This approach is perhaps most similar to Fligstein and McAdams A Theory of Fields which came out in 2012. Durand is, however, singular in his description of the animating drives embedded within modern organizations. In this sense both field theory and the ecological perspective lack by comparison.

Durand introduces readers to a new discipline, termed orgology, which attempts to invigorate the study of organizations. Drawing from current sociological, economic, and management theories, orgology “not only studies the world of organizations, their logics of action, their respective advantages and their internal consistency but also the organization of our known-worlds” (p. 4). Known-worlds are the reality apparent to persons. This perspective is meant to counter both the “glorification of the individual” and the over-socialized concept of the individual characterizing dominant perspectives in both sociology and economics.

The book is fairly short, with 164 pages of text. It is divided into five main parts, with a main section titled Entry and an afterward titled Exit. While the reader could read the Exit sections and get the general approach of the book, the main sections are filled with examples to demonstrate the main argument and a much fuller description of the correlative processes. Adding an element of artistic inspiration, each chapter features an illustration by artist Stéphane Barry.

Durand describes the current state of disorganization which characterizes both macro and global processes and the lived realities of individuals, which he calls ‘known-worlds.’ He uses the example of the 2008 financial crash and subsequent recession to illustrate the perspective which orgology is said to be a corrective. By examining the rhetoric of financial leaders of the time, particularly Alan Greenspan, it becomes clear there is little to no mention of the positive and negative consequences of organizations. Individuals seem to control, or most often not control, the macro-economic processes in which they are embedded. Durand refers to this dominant perspective in economic explanations which renders organizations unspoken and invisible the ‘quant’ thesis. As he shows, even calls for financial caution from within the economic community concern only the individual’s relation to macroeconomic
processes. Durand contends that the absence of attention paid to organizations is why systemic crises like the Great Recession are so devastating and why solutions to the problem are largely ineffective at providing usable solutions to people’s sense of lived disorder.

Part One continues with a well-written discussion presenting organizations as the units of investigation. Durand centers his analysis on organizations, which operate as mediators between individual and macro-level phenomena. Similar to Fligstein and McAdams’s strategic action fields, Durand credits organizations with having a great deal of agency. His theory is based on the singular role of organizations, unlike both individualistic and macro-theoretical sources of social solidarity and meaning creation. Starting from the premise that solutions to the personal sense of disorganization within our lives created by organizations, Durand critiques two branches of sociological thought, which he terms the ‘sociology of the social’ and the ‘sociology of association.’ For Bourdieu, the sources of meaning are determined by an individual’s habitus by class, which governs their behavior within a hierarchy of social fields. In this view, fields are much more stable and fixed, with individuals entering and leaving them based on their own competence. In an alternative thesis, Latour is credited with a more fluid theory involving the individual’s embedding within various networks which constitute the individual by association. Orgology offers an alternative perspective to both of these. As mentioned above, orgology pays attention to the work of organizations to mediate between the individual and macro-process levels of analysis. In this view, individuals are credited with having less agency than Latour’s method, though a bit more than in Bourdieu conception.

In Part Two, Durand explicates the two sources of disorganization, loss of legitimacy and competition. Both are a result of the way in which organizations provide solutions. By solutions, Durand means “very broadly, the products, services and deals that are offered for our attention, consumption and use and that drive our everyday actions” (p.39). He terms the meaning intrinsic in the solutions organizations provide ‘res-sources,’ or “reservoirs of meaning” (p.40). When organizations are not able to provide meaningful solutions to individuals’ problems, the result is a loss of legitimacy for the providing organization. This also results in the strengthening competition and meaning depreciation of the providing organization. Part Three examines the ‘logics of action’ employed by organizations in the public sphere, or public spaces. Here Durand draws from theories of institutional logics to understand how meaning depreciation occurs and is sustained. To demonstrate his argument, Durand analyzes the ubiquitous logic of ‘the market.’ He critiques all notions of markets as autonomous entities which seem to act directly on individuals with no alternative mediation. He finds the market is not autonomous, nor is the sovereign rule of law enforced by states. This is important since the state is seen as the dominant check on market autonomy. The logic of the market is the aforementioned ‘quant’ perspective indoctrinated into economic explanations of social activity. Organizations offer competing logics which provide meaning to individuals, in a mutually-reinforcing relationship, than what the author refers to as ‘performance tests.’ Performance tests cannot provide meaningful solutions. They only reinforce the standards of market calculability, and ultimately increasing the apparent disorganization which destabilizes the peoples’ lives.

Part Four deals with the history of ‘temporary advantages’ and the over-theorized individual. Throughout the book, Durand discusses the competition existing between organizations in relations to the solution they are able to propose. While many organizations manage to create temporary advantages for themselves within the particular production arena they are competing, organizations must make more lasting decisions to overcome both competition and the loss of legitimacy that follows. Concurrently, sociologists and even many organization theorists have focused almost exclusively on the individual as the source of their own welfare and mobility. Durand contends it is the individuals association to organizations which gives their actions direction and meaning. This section deals with many of the assumptions which underlie contemporary failures to account for individual success in relation to large social and economic processes.

In Part Five, Durand shows how a new understanding of the valuable roles people play when they work through organizations and not around them. The ‘organizations individual,’ as he calls it, must constantly re-evaluate their position within the myriad of organizational association they maintain, and seriously utilize those association to make sense of their own known-world. Durand refers to this corrective process as the reprise, or re-ensensing, of known-worlds. Successful organizations provide solutions to these issues and thus contribute this re-contextualization. They learn to manage their resources in order to both meet the needs of employees, partners, shareholders, and other associates, while keeping in pace with the changing competitive market for their products and services. Durand
notes the critical role of management within organizations, particularly the management of the various competing logics of action. Organizations respond to the very real needs of associates, while concurrently providing solutions directing them toward new challenges and away from prolonged crises like those experienced during this last great economic recession.

This book is appropriate for both undergraduate and graduate students. While many of insights might not be as revolutionary to scholars, this book should be read by organization theorists wishing to conduct research that takes organizations seriously. Durand has written a great work which promotes an honest look at the principle role organizations play in our lives. This book does not replace most sociological and management literatures on organizations, but supplements much of the confusion within these studies stemming from a lack of organizational understanding, particularly in regards to personalized elements of organizations.

40 reasons why you should blog about you research (2015-08-26 08:00)

We recently had some new submissions to [1]this post. I had thought it was finished but seemingly there are more reasons yet to be shared... can we get it up to 50 reasons to blog about your research?

1. http://sociologicalimagination.org/archives/13910/comment-page-1
The self and the selfless (2015-08-27 08:00)

Call for Papers: Regulating the ‘Sharing Economy’ (2015-08-28 08:00)

Call for Papers for Special Issue of Internet Policy Review on *Regulating the 'Sharing Economy'*

**Special Issue editors:** Kris Erickson, Research Fellow, CREATe, University of Glasgow & Inge Sørensen, Research Fellow, CCPR, University of Glasgow.

You are ‘the new infrastructure’, an entrepreneur breathlessly explains to the Wall Street Journal in a recent piece on sharing economy start-ups (9 March 2015). Conceived in the early 2000s to describe alternative practices
of creativity and distribution, the sharing economy has become the rallying call for an array of new businesses which rely on networked connectivity of users willing to exchange, sell and purchase services from one another. The co-optation of online 'gifting' by capitalist interests is a story which traces the progression of many digital social phenomena, from community discussion fora to digital video youth culture. The sharing economy raises important issues for regulators: When does 'sharing' cease to be a private activity and become a public concern? When do affective relationships become exploitative? When is something a gift, and when is it labour? How do we ensure that risks and costs are accurately reflected in the provision of goods? And how should costs be divided between collaborative consumers, businesses, and the public?

This special issue will consider both informal norms of governance as well as formal legal structures governing sharing communities and services. As a result, contributions are likely to touch on a range of disciplines and approaches, including sociological, economic, technological and legal. It is the hope of the editors that this collection of individual contributions will lead to identification of issues of theoretical importance across different configurations of sharing economy practices, and help crystallise future areas of inquiry for empirical study.

Contributions should focus on the impact of technological and social innovation in this area, with specific reference to European societies and digital regulatory frameworks. In particular, we seek papers which address the following topics of interest for regulators:

- Crowdfunding and venture crowdfunding networks
- Economic impacts of sharing economy on traditional sectors
- Informal governance, ratings, reviews and crowd intelligence
- Future of transportation, utilities, and 'smart' urban provision
- Peer-to-peer production and distribution of media
- Alternative digital currencies, legal and financial systems
- Citizenship and civic engagement
- Open data, privacy and accountability

In addition to the above topics, we welcome proposals for original, forward-looking contributions with a focus on the European digital regulatory environment (or that of a national or local jurisdiction in Europe). By critically examining this emerging topic, this special issue will generate EU-specific understanding of policy issues, and expand our scholarly understanding of economic and social trends with potential for long-term impact.

This Call for Papers is open to researchers from the fields of policy studies, sociology, law, philosophy, data, information and technology studies, economics and management. Emerging scholars are particularly encouraged to submit a proposal.

**Important dates**

7th September 2015: Deadline for expression of interest and abstract submission (500 word abstracts) to the co-editors [2]Kristofer.Erickson@glasgow.ac.uk and [3]Inge.Sorensen@g.lasgow.ac.uk

29th September 2015: Feedback on abstract submissions
Viral media and unionisation (2015-08-29 08:00)

I’ve been interested in Upworthy for a long time. It was founded by Eli Pariser, author of the Filter Bubble and key figure in MoveOn.org, in order to leverage the dynamics of viral media to promote ‘meaningful’ and progressive content. But a few years on, with a change in Facebook’s algorithms having brought about a 48% drop in traffic within two months, the company is struggling badly. Hence their stance that, though they support the right of their staff to unionise, [1]they shouldn’t because it would be bad for the company. This was a sentiment echoed by BuzzFeed founder Jonah Peretti:

“I think unions have had a positive impact on a lot of places, like if you’re working on an assembly line, and if you’re negotiating with management it can make a huge difference, particularly when labor is more replaceable. And I think I don’t think a union is right for BuzzFeed for two reasons.

One, I think the way we pattern BuzzFeed is after companies like Google and Facebook, and the tech startups are very, very competitive for talent. They’re all trying to get the very best talent. That’s how I see BuzzFeed as well. We need to provide amazing benefits, we need to provide as much incentive for people to pick BuzzFeed over any other company.

A lot of the best new-economy companies are environments where there’s an alliance between managers and employees. People have shared goals. Benefits and perks and compensation are very competitive, and I feel like that’s the kind of market we’re in. A lot of times when you look at companies that have unionized, the relationship is very different. The relationship is much more adversarial, and you have lawyers negotiating for comp and looking at comparable companies and trying to keep compensation matched with other companies.

I think that actually wouldn’t be very good for employees at BuzzFeed — particularly people who are writers and reporters — because the comps for writers and reporters are much less favorable than
comps for startup companies and tech companies. In general, I don’t think it’s the right idea for us. The only thing about BuzzFeed is that we’re global, most unions are national. We have people who move between different roles and in general unions do a lot of defining clearly what individual roles, and what the job function is. So for a flexible, dynamic company, it isn’t something I think would be great for the company.”

I’m very interested in how a self-congratulatory corporate culture (“we’re disrupting the world, solving wicked problems, making it a better and more exciting place!”) interacts with the accumulation of vast wealth. Or in this case, how the avowedly moral stance of someone like Pariser falls by the wayside when his company falls on difficult times.

309 Regent Street, London W1B 2HW
Mobile work-life arrangements: exploring conceptual challenges (2015-08-31 08:00)

OPEN CALL

MOBILE WORK-LIFE ARRANGEMENTS: EXPLORING CONCEPTUAL AND METHODOLOGICAL CHALLENGES. An Interdisciplinary Late-Summer School

9-18 October, 2015

University of Freiburg, Germany

Convened by: COME (Research Group Cultures of Mobility in Europe) and ANTHROMOB (EASA Anthropology and Mobility Network)

Anna Lipphardt (Freiburg); Jamie Coates (Waseda/Sheffield) and Roger Norum (Leeds/UCL)

Funded by Volkswagen Foundation

OVERVIEW

The interdisciplinary field of mobility studies has produced a broad spectrum of theoretical works and structural analyses, driven by research focusing on recent innovation in transport and communication. Within that field, economic and work-related aspects of mobility, are often treated as distinct from other life practices. This late-summer school aims to contribute to the field of mobility studies with respect to two key issues: First, it will turn attention to the interplay between work and non-work (e.g. leisure, family life, well-being) spheres of life linked to mobility. Second, it focuses on the complexities of mobile work-life arrangements as they play out in the everyday lives of an ever-growing number of people worldwide, across the economic spectrum and across diverse professional and socio-cultural fields.
The late-summer school explicitly aims to bring together people studying a range of empirical cases including (but not limited to) research across the following subjects

- peripatetic and pastoralist groups
- transport-sector professionals
- artists, creatives and travelling entertainers
- seasonal and project-based labourers
- academics
- lifestyle migrants.

OBJECTIVES AND KEY QUESTIONS

The late-summer school has two core objectives:

1. Providing a forum for discussing qualitative methodological approaches to mobility, including multi-sited, mobile or trajectory ethnography; life-course and life-world analyses; and newly-emerging ICT-based methods;

1. Exploring the differing forms of knowledge production concomitant with mobile work-life arrangements, it will encourage a critical reflection of the theoretical frameworks, empirical operationalisations and political discourses that implicitly or explicitly inform much research on mobile groups. Our intention is to bring together different epistemic communities, thus fostering a comparative perspective.

Key questions which the late-summer school will address are:

- How do we develop a critical analytical position in light of the complex entanglements between the political and economic discourses on certain mobile groups, the conceptual approaches of our respective research disciplines, and the emic perspectives of the people we study?

- What are the advantages, challenges, and limitations of differing analytical models such as multi-sited ethnography, qualitative case study, life-course analysis, or phenomenology in exploring mobile work-life arrangements?

- How can we compare or generalise insights gained from qualitative studies on specific mobile fields? And how can we employ empirical research to advance theoretical stances on mobility, both within a given research area and across disciplinary divides?

PROGRAMME AND WORKING FORMATS

The programme includes keynote lectures and advanced seminars by Noel Salazar (University of Leuven), Michaela Benson (Goldsmiths University) and Huub van Baar (University of Amsterdam/Giessen University). It also comprises presentations by doctoral students, workshops on mobile methods and representational strategies, informal
discussions on practical issues of mobile/multi-sited fieldwork, career and professional development sessions, a film screening, and recreational activities. The working language is English.

WHO WE ARE LOOKING FOR

The programme is aimed at doctoral students working on projects situated in qualitative social research focusing on issues related to mobile work-life arrangements. The common ground for all participants will be their interest in the labour/economic aspects of the mobile empirical fields they study, their footing in qualitative social research, and a shared interest in the epistemology of Mobility Studies. We welcome applications from doctoral students based in disciplines such as cultural and social anthropology, sociology, political science, social work, education, geography, and relevant interdisciplinary research fields including mobility, communication, environmental, transport and labour studies. Doctoral students at any stage of their research - including beginners - are invited to present work in progress and to discuss central research issues with which they are currently concerned. To ensure an open and collaborative learning environment, the number of participants will be limited to a maximum of 25.

APPLICATION

Interested applicants are asked to submit the following materials to the convenors by email up until August 10, 2015:

1. Curriculum Vitae (1 page);

1. Short description of your dissertation project (1-2 pages);

1. Personal statement (1-2 pages) that answers the following:

- Why do you wish to attend the Mobile Work-Life Arrangements Late-Summer School?
- What specific aspects of your dissertation and fieldwork are you most interested in discussing?

Successful applicants will be notified by email by the 3rd week of August.

ACCOMODATION AND TRAVEL GRANTS

It is expected that participants take part in the full duration of the late-summer school. All meals and accommodation will be covered, as will reimbursement for the following travel expenses: up to 150 Euro for participants from Germany; up to 300 Euro for those from other European countries; and up to 800 Euro for students who come from overseas. Participants from developing countries and from countries affected by current economic crises are eligible to apply for full travel funding.

For more information, please see [1]www.mobworklife.net. Please feel free to contact us for specific questions about the programme or application.
We are all equal before Google (2015-08-31 08:00)

This snippet from an interview with the [1]new Google CEO, Sundar Pichai, intrigued me:

Pichai has said that he's attracted to computing because of its ability to do cheaply things that are useful to everyone, irrespective of class or background. “The thing which attracted me to Google and to the internet in general is that it’s a great equalizer,” he said in [2]a video interview last year. “I’ve always been struck by the fact that Google search worked the same, as long as you had access to a computer with connectivity, if you’re a rural kid anywhere or a professor at Stanford or Harvard.”

I'm very interested in the moral self-understandings which are common within the tech industry: do other senior corporate figures think in these terms? To what extent does it motivate the work they do? Or is it simply a retrospective story which they tell to congratulate themselves on their disruption?

2. https://www.youtube.com/watch?v=TguamcqrQjI

Colin Carré (2015-08-31 10:07:40)
It works the same, yet the results aren't the same depending on who does the search...

Thinksocialtheory (2015-09-01 22:17:22)
There's an element of truth in this I guess. I've recently done a blog post about one of Paul Virilio's books and I was surprised to see that if I search for an overview of this book on google my webpage is one of the first that can be accessed via the search engine. on the contrary though there are now business's that pay for technical expertise of people who specialise in SEO and this practise would potentially give evidence for the fact that it is not a level field and that those who can afford to pay for technical expertise will have the edge.

TajdarOC (2016-10-17 13:04:40)
I'm more concerned about which parts of our learnings are limited by virtue of the personalized filter bubble that one's activity creates. Search results are tailored to Google's assumed understanding of who we are through our actions and cannot equate for cognizant dissonance when one wants to reset... therefore only giving us what the AI thinks we need rather than what we are really after at times. Repetition and conditioning makes for a very troubling reality.

The fiction future of faculty: an afternoon of sociological design fiction (2015-09-02 10:18)

I’m organising a design fiction event in Manchester on September 16th, with James Duggan and Joseph Lindley. It’ll be great. You can register here: [1]https://www.eventbrite.com/e/the-fiction-future-of-faculty-an-afternoon-of-sociological-design-fiction-tickets-18169546603

The ability of storytelling to help us envision and discuss a gamut of plausible futures, from dystopian visions to everyday utopias, is increasingly being harnessed using the nascent practice of ‘design fiction’. Design fiction, a term coined by author Bruce Sterling, “tells worlds not stories”. Although inspired by sci-fi, design fiction is less about the “hocus pocus” of far-flung techno-futures, and instead is more practical, hands-on, and mundane. Design fictions extrapolate from current data, trends, research and technologies, not in an attempt to predict the future, but to interrogate the plurality of plausible futures by forging a discursive space form which insights may emerge. This session will explore how design fiction can help us illuminate preferable, or indeed undesirable, futures of academia.

The university is a site of managerial and neoliberal transformation, with increased applications of competitive logics and performative technologies to re-define academia and academic practice. There are however examples of resistance and hope, with everyday utopian experiments such as the Social Science Centre, Lincoln. In this exploratory session, we use design fiction as an approach for exploring the potential for change latent within current circumstances, through contrasting utopian and dystopian visions for the future of higher education.

If you are interested in the future of the University and academic practice, or if you have a position or provocation to share, then please come and join us. During the session we will present two contrasting visions of the academy in 2020, one dystopic and one utopian. These positions will provide the foundations for a broader conversation about the future and design fiction. We will unpack questions such as can design fiction inform a better future for Universities? Are dystopian or utopian visions of the future more likely to help us get to a better future? What is ‘better’ anyway?

Social media and the promise of never again being alone (2015-09-03 08:00)

From Liquid Surveillance: a conversation by Zygmunt Bauman and David Lyon, pg 22-23. I heard Bauman make these arguments at re:publica earlier this year and was rather impressed. As ever with him, it’s immensely impressionistic but I think he identifies something important that has been substantiated by other work, most obviously Alice
Marwick’s ethnography of the tech scene in Silicon Valley: the fear of exclusion, anxiety in the face of the prospect that we fail to make the cut in occupational structures that increasingly reward only the superstars and doom the rest to a lifetime of precarity, engenders a neurotic embrace of possibility in the hope that we become somebody, rather than being consigned to life as a forgotten nobody.

On the one hand, the old panoptical stratagem (‘you should never know when you are being watched in the flesh and so never be unwatched in your mind’) is being gradually yet consistently and apparently unstoppably brought to well-nigh universal implementation. On the other, with the old panoptical nightmare (‘I am never on my own’) now recast into the hope of ‘never again being alone’ (abandoned, ignored and neglected, blackballed and excluded), the fear of disclosure has been stifled by the joy of being noticed.

Having one’s own complete being, warts and all, registered in publicly accessible records seems to be the best prophylactic antidote against the toxicity of exclusion – as well as a potent way to keep the threat of eviction away; indeed, it is a temptation few practitioners of admittedly precarious social existence will feel strong enough to resist. I guess that the story of the recent phenomenal success of ‘social websites’ is a good illustration of the trend.

And on page 27 Bauman further expands upon the moral psychology of publicity in ‘liquid modernity’: again, it’s rampantly impressionistic and the way he writes obscures a profound empirical variability he seemingly has no interest in recognising, but he offers an important insight into a socio-cultural trend:

These days, it is not so much the possibility of a betrayal or violation of privacy that frightens us, but the opposite: shutting down the exits. The area of privacy turns into a site of incarceration, the owner of private space being condemned and doomed to stew in his or her own juice; forced into a condition marked by an absence of avid listeners eager to wring out and tear away the secrets from behind the ramparts of privacy, to put them on public display and make them everybody’s shared property and a property everybody wishes to share. We seem to experience no joy in having secrets, unless they are the kinds of secrets likely to enhance our egos by attracting the attention of researchers and editors of TV talk shows, tabloid front pages and the covers of glossy magazines.

But there are, inevitably, things which bug me immensely about this text. For instance he draws upon a lengthy quotation from a book edited by Nicole Aubert, L’Individu hypermoderne, describing remarks published in 2004 as ‘recent’ observations, implying they tell us things of interest about social media that basically didn’t exist at the time of their writing and intimating they are grounded in substantial empirical consensus which he makes no effort to convey.

It’s just lazy scholarship and I’m increasingly bothered by the manner in which Bauman gets applauded for it, all the while crowding out other voices through his endless capacity to riff upon a metaphor of liquidity which even on the most charitable interpretation has nothing more than heuristic value. To any critics bristling at this: I’ve probably read more Bauman than you (I’ve read upwards of 15 of these cover to cover) so, if you think I’m being unfair, offer some textual justification of this before you have a go at me. I don’t want to repeat the tedious exchanges about Zizek I got locked into a couple of years ago.
I take Bauman’s fundamental point to be a familiar one about the necessity of self-marketing under contemporary circumstances. As he writes on page 31 and 32:

They are simultaneously promoters of commodities and the commodities they promote. They are, at the same time, the merchandise and their marketing agents, the goods and their travelling salespersons (and let me add that any academics who ever applied for a teaching job or research funds will easily recognize their own predicament in that experience). In whatever bracket they may be filed by the composers of statistical tables, they all inhabit the same social space known under the name of the market. Under whatever rubric their preoccupations might be classified by governmental archivists or investigative journalists, the activity in which all of them are engaged (whether by choice or necessity, or most commonly both) is marketing. The test they need to pass in order to be admitted to the social prizes they covet demands them to recast themselves as commodities: that is, as products capable of drawing attention, and attracting demand and customers.

As with the earlier material, I find the broad brush strokes used by Bauman rather dissatisfying. But I think he offers suggestions about something important: the moral psychological mechanisms underpinning branding and self-promotion. Fear of redundancy drives us to embrace usefulness, embodied in the relentless articulation of our instrumental value in the broader scheme of things.

Christian (2016-01-11 03:52:12)
Hi Mark, On the last point about the moral psychological mechanisms and underpinning branding and self-promotion, I’m thinking of an entry into that, but it gets spread out very quickly for me and I lose an approach (ie. evolutionary mechanisms, cultural or individual values). What do you think is the best lens for at looking at this?

» The Cultural Politics of Automation The Sociological Imagination (2016-03-14 08:02:11)
[...] facing occupational futures? Though the basis for his claims is somewhat unclear, I find Zygmunt Bauman’s analysis of this intuitively plausible. He suggests that the spectre of exclusion, the possibility that we won’t [...]

The Socilality of Sharing Conference, September 23rd (2015-09-04 08:00)

CIM – The Socilality of Sharing Conference

Warwick 23rd September 2015

The ‘sharing economy’ has become a popular term to describe the transformations in sociality under way in the information economy. But what are the practices of sharing that are invoked here? We suggest that they emerge at the intersection of two sets of processes: on the hand, the socialization of the economy, and on the other, the subsuming of social relations by an economic logic. Seen in relation to both these tendencies, the sharing economy refers to such diverse phenomena as new forms of ‘collaborative’ production and consumption, the solidarity of co-workers, the publicity oriented ‘sharing’ that marks reputation-seeking social media users, and the emerging pirate economy of fast and cheap improvisations in the global technological commons that supplies the popular classes in the global South with access to cell phones, computers and other informational products.
In this workshop we would like to investigate these and other examples of the sociality of sharing to ask: what sort of social relations are created in a sharing economy where the boundaries between the economy and everyday life are disappearing? How does the sharing economy relate to wider transformations of sociality in contemporary culture and in particular to the obligations and opportunities to participate offered by digital culture? And can we connect today’s theories of sharing and the collaborative economy with the traditions of mainstream social theory?

For the provisional programme and to register please see our web page: [1]http://www2.warwick.ac.uk/fac/cross_fac/cim/events/sociality_sharing/

The private eye’s guide to being a plain speaking politician (2015-09-05 08:00)

This might be a bit mystifying to non-UK readers but Jeremy Corbyn, a left-wing politician likely to be the new leader of the British Labour Party, has provoked what we might call an enthusiastic reaction in the British media. In this feature the satirical magazine Private Eye (HT countless people on my twitter feed) compare what he has said to how it was reported. While Corbyn has generated much enthusiasm for his earnest plain speaking, surely this shows that its the headline writers themselves that cannot be matched in this respect?

Post-democratic political culture: how good leaders go bad (2015-09-05 08:00)

Absolutely fascinating [1]comments offered by Varoufakis in response to unfolding events in Greece:
In the wake of Tsipras’s unexpected move on Thursday to call early elections, Varoufakis said: “Tsipras made a decision on that night of the referendum not only to surrender to the troika but also to implement the terms of surrender on the basis that it is better that a progressive government implement terms of surrender that it despises than leave it to the local stooges of the troika, who would implement the same terms of surrender with enthusiasm.”

As a result, Syriza once the hope of Europe’s anti-austerity movement, had not only betrayed the cause but mutated into the very thing it had set out not to be. “This mutation I have already witnessed. Those in our party/government who underwent it, then turned against those who refused to mutate, the result being a split in the party that our people, the courageous voters who voted No, did not deserve,” he wrote.

Tsipras’s rash decision to resign and call elections – the third poll to be held in Greece this year – the MP argued, amounted to a concerted effort by the leader to purge the party of dissent. “For it is clear,” he continued, “that once you start implementing policies it becomes untenable to say constantly: ‘I am passing law X through parliament even though I think it is toxic.’ At some point either you resign or you remove the cognitive dissonance by beginning to believe that law X ain’t that bad; perhaps it is what the doctor ordered.”

I wonder what went on during the negotiations? As Nikos Mouzelis has pointed out on many occasions, face-to-face meetings between international leaders are an example of macro events that look micro. But the interactional dynamics that micro-sociologists study still obtain: how was the situational logic, which Varoufakis alleges his former colleague has now internalised, enforced and enacted through a perverse sort of peer pressure in the meeting itself?

The Five Pillars of Islamophobia (2015-09-06 19:03)

[1]David Miller, Professor of Sociology at Bath University and key contributor to [2]Spinwatch, will be joining Sufyan Ismail, CEO and founder of [3]Muslim Engagement and Development (MEND), to discuss the impact of the Islamophobia industry at free events in Manchester, Leeds, Birmingham and London next week.
Monday 14th Sept -
Manchester

Tuesday 15th Sept -
Leeds

Wednesday 16th Sept -
Leicester
Thursday 17th Sept -
London

[5]Spinwatch is run by journalists and academics with extensive experience in key social, political, environmental and health issues in the UK and Europe.

[6]MEND is a leading UK Muslim organization dedicated to tackling Islamophobia via advocacy in Westminster and grass roots community empowerment. MEND gave evidence to the Leveson Inquiry on press ethics; MEND sits on the CPS’s national hate crime panel and works nationally with Police Crime commissioners to tackle Islamophobia. MEND also has an extensive grass roots Muslim empowerment programme across the UK.

In recent years, anti-Muslim hate crime has been on the rise with official figures disclosing an alarming rate of increase in racial and religious hate crime; 45% increase in religious hate crime between 2012/13 and 2013/14 according to figures released by the Home Office. Moreover, analyses of the British Social Attitudes survey denote a disturbing trend in the growth of racial prejudice, especially anti-Muslim prejudice, among Britons.

While Muslim organisations, like MEND, are challenging anti-Muslim public discourse, tackling biased reporting in the media, and working with police and local authorities to improve reporting of anti-Muslim hate crime, the wider context and factors which facilitate the creation of an environment congenial to anti-Muslim hatred and prejudice are less well known.

This event will explore the five facets to Islamophobia and its impact on British Muslim citizens; their lives, their civil and political rights and their well-being.

It is a view widely held that frustrations with self-confidence and a confused identity are consequential to the susceptibility of people to extremism and radicalisation. How we cultivate a strong sense of British identity and foster a sense of belonging is crucial to the success of British Muslim integration.

We hope you will join us as we examine the factors that contribute to Islamophobia in the UK and nurture social activism in support of diversity and social cohesion.

Please contact Professor David Miller, Sufyan Ismail or Sadia Habib if you have any queries or questions.

BSA Sociology of the Arts Study Group: "Unpacking Art", September 11th (2015-09-07 08:00)

Full details here. The BSA have started promoting everything via PDFs, which aren't blog friendly.

Deadline extended for the Social Media, Activism, and Organisations Symposium (2015-09-08 08:00)

Call for Participation

2015 Social Media, Activism, and Organisations Symposium (#SMAO15) - November 6, 2015 @ Goldsmiths, University of London

FREE Registration at: https://www.eventbrite.co.uk/e/social-media-activism-and-organisations-smo15-tickets-17290579589
Social media (from mainstream platforms such as Twitter to organization-specific tools) have become increasingly pervasive. This is exemplified by the diversity of uses ranging from Twitter and Facebook use during the Arab spring to the use of Snapchat by highly surveilled activist groups. Many social movements have increasingly seen social media as a means to collaboratively crowdsourcing, to network and communicate with diverse stakeholders. In large organizations, social media is often supported because the technology can help foster the sense of a "digital village", where individuals are able to "see" the lives of others within their organization and feel closer to them. However, the literature on social movements and social media has not fully grasped just how much social media has fundamentally changed the landscape of organizational communication, ranging from stakeholders being able to directly mobilize resources to making grassroots transnational social movements more organizationally feasible. Social Media, Activism, and Organisations ( #SMAO15) seeks to better our understandings of how social media has shaped social movement organizations and the organization of social movements.

The Social Media, Activism, and Organisations symposium will be held in London, England on November 6, 2015 at Goldsmiths, University of London. The symposium is sponsored by The Sociological Review, The Centre for Creative & Social Technologies at Goldsmiths, and the Centre for the Study of Global Media and Democracy at Goldsmiths.

We invite you to submit abstracts and short papers which explore the social media-influenced intersections of social movements and organisations. Full papers are not required for this conference, only short papers (2500 words, excluding references) and abstracts (up to 750 words) related to the broad theme of "Social Media, Activism, and Organisations".

Abstracts and short papers should be submitted by September 14, 2015 via Easy Chair at https://easychair.org/conferences/?conf=smao15 and there is no preset template for submission. If selected, the author(s) will be invited to give a 15-minute oral presentation followed by a 5 min Q &A period at the symposium.

Author(s) of accepted paper abstracts may also be invited to submit full papers to a special issue of The Sociological Review, published by Wiley.

#SMAO15 TOPICS OF INTEREST

- Organisational communication and social media
- Democratizing organisational structures via social media
- Gender, social media, activism, and organisations
- Activist knowledge aggregation techniques
- Enterprise applications and social activism
- Collaboration, social media, and activism
- Virtual teams, social media and activism
- Activist networks and organizational communication
- Social media and organizational leadership
• Communicating organizational messages via social media

• Social media and advocacy organizations

• Inter-movement organizational communication and social media

• Visual social media and organisations

• Implications of anonymous social media

We welcome both theoretical and empirical abstracts and papers and the symposium seeks to showcase a variety of case studies to advance our understandings of how social media has shaped social movement organizations and the organization of social movements.

The fiction future of faculty: an afternoon of sociological design fiction (2015-09-09 08:00)

I’m organising a design fiction event in Manchester on September 16th, with James Duggan and Joseph Lindley. It’ll be great. You can register here: [1]https://www.eventbrite.com/e/the-fiction-future-of-faculty-an-afternoon-of-sociological-design-fiction-tickets-18169546603

The ability of storytelling to help us envision and discuss a gamut of plausible futures, from dystopian visions to everyday utopias, is increasingly being harnessed using the nascent practice of ‘design fiction’. Design fiction, a term coined by author Bruce Sterling, “tells worlds not stories”. Although inspired by sci-fi, design fiction is less about the “hocus pocus” of far-flung techno-futures, and instead is more practical, hands-on, and mundane. Design fictions extrapolate from current data, trends, research and technologies, not in an attempt to predict the future, but to interrogate the plurality of plausible futures by forging a discursive space form which insights may emerge. This session will explore how design fiction can help us illuminate preferable, or indeed undesirable, futures of academia.

The university is a site of managerial and neoliberal transformation, with increased applications of competitive logics and performative technologies to re-define academia and academic practice. There are however examples of resistance and hope, with everyday utopian experiments such as the Social Science Centre, Lincoln. In this exploratory session, we use design fiction as an approach for exploring the potential for change latent within current circumstances, through contrasting utopian and dystopian visions for the future of higher education.

If you are interested in the future of the University and academic practice, or if you have a position or provocation to share, then please come and join us. During the session we will present two contrasting visions of the academy in 2020, one dystopic and one utopian. These positions will provide the foundations for a broader conversation about the future and design fiction. We will unpack questions such as can design fiction inform a better future for Universities? Are dystopian or utopian visions of the future more likely to help us get to a better future? What is ‘better’ anyway?
Williams, Marcuse, and Smythe in the Age of Social Media (2015-09-10 08:00)

The astonishingly prolific Christian Fuchs gives an overview of his development of critical theory for digital capitalism.

The necessity of digital sociology (2015-09-11 08:00)

It’s far from the most sophisticated argument I’ve heard made to this end, but I appreciate the spiritedness with which David Lyon defends the necessity of digital sociology in his *Liquid Surveillance* book with Zygmunt Bauman pg 3924
Sociology is now obliged to come to terms with the digital, or miss investigating and theorizing whole swaths of significant cultural activity. To begin with, the simple fact of technological dependence has to be factored into any social explanation worth its salt. So many relationships are conducted in part – or completely – online that a sociology without Facebook and its ilk is simply inadequate. Whatever an older generation makes of it, Facebook has quickly become a basic means of communicating – of ‘connecting’, as Facebook itself rightly calls it – and is now a dimension of daily life for millions.

In my new project I’m thinking about this in terms of Digital Capitalism and what a Sociology adequate for its study would look like. I’m finding this a really useful frame of reference through which to draw together a variety of topics that have dominated my interests for some time.

CfP: My Day Job: Politics and Pedagogy in Academia (2015-09-12 08:00)

2016 Annual Meeting
EASTERN SOCIOLOGICAL SOCIETY
CALL FOR PAPERS
My Day Job: Politics and Pedagogy in Academia
The Boston Park Plaza Hotel and Towers, March 17-20, 2016

The online abstract submission system for the ESS annual meeting is now open at http://www.meetingsavvy.org/ess or through the website at http://essnet.org.

Academics are a bit like aspiring rock stars: we have our passion, and we have our day jobs. We do our valued gigs when we can get them, and we do our day job. For rock stars, that day job might be waitressing. For academics, it might be teaching Intro, or working on department and university committees. We do that work, our day jobs, so that we can pursue our passion – our research, our work with our colleagues and sometimes our students.

Much of what we present at meetings like the ESS is our art, our life, our valued work. And what we do to pay the mortgage, put shoes on the kids, get the money to go to meetings like this, is teach. We sit in sessions and talk about our work; and we go to the bar and talk about our day jobs, what is happening to our colleges and universities, how they are becoming corporatized, how we have less and less control over our work in our day jobs. This is going to be a different meeting – we will sit at the thematic sessions together and talk about what is happening to our universities. We will of course have plenty of other sessions to talk about our research.

While the ESS welcomes submissions, as it always has, which address any and all of the topics of interest to sociology, drawing on every methodology, the 2016 meeting will have a special focus on the current state of colleges and universities. We will have many substantive sessions on research interests, and many wonderful themed mini-conferences. But when we gather at thematics, we will be looking at our under-researched, under-theorized day job.
Some of us — more and more of us — are doing our teaching as piece work, course by course, and as in pre-union days, without any 'benefits.' As courses move online, for some that work —like old style garment industry piecework — is done in our homes, one corner of our living space used for production, providing our own supplies, laptops now rather than sewing machines. For others, luckier, teaching is done as a full time job with full benefits, from a solid college or university base, whether on-line, in person or both, doing our 10 community college courses a year, or our 6 or so undergraduate courses, or even just a lovely one or two doctoral courses, or whatever mix we’ve worked out for ourselves. But that teaching, our day job, most often slips under the radar when we meet as professional sociologists.

At this meeting, we can and will talk about our interesting publications and our grant-funded research and all of that — but let us also talk about our day jobs. While papers will be welcomed in all areas of sociology, and mini-conferences will address a range of issues and concerns, the theme of the conference will be our day jobs. What is happening to universities and colleges as America becomes ever-increasingly corporatized and privatized, as more and more of all work is outsourced, as students and their families become ‘customers’ and faculty are responsible for ‘product’? How are we managing, coping, and rising above all that? How do we remain dedicated to our craft of teaching, our vocation of transmitting our sociological imagination?

Although the ESS particularly encourages submissions related to this year’s theme, we welcome submissions on all sociological topics, drawing on all methods and formats, including:

- Individual papers (please include abstracts of 250 words or less; longer drafts are also welcome via email to the program committee)
- Wholly constituted sessions (with names and affiliations of all presenters)
- Thematic conversations (panels of two or more scholars engaged in debate or exchange)
- Workshops on specific topics and techniques
- Special sessions organized around prominent scholars and their work
- Roundtable and poster session presentations

We particularly encourage the development of ‘mini conferences,’ three or more sessions around a specific theme. Anyone interested in developing a mini-conference should please get in touch with the program committee as quickly as possible with a deadline of September 15.

Paper submissions and session proposals are due by October 31, 2015. Undergraduate abstracts for poster submissions are due December 15, 2015. See Annual Meeting Undergraduate information on the website for more information.

Questions, suggestions, program ideas should be sent to: easterns2016@gmail.com
Program Committee Chair: Vilna Bashi Treitler, Baruch College and CUNY Graduate Center
A Summary of the Speech

Jeremy Corbyn’s winning speech after a stunning win of an undisputed majority today came after 99 rallies around the country. Today was poignantly the 100th gathering. And what a remarkable inspiring speech. A true leader: just, dignified and motivating.

He was critical of all the reasons people are turned off politics, providing hope and possibility for a better national and global society. Things can and will change, he told us.

He showed great appreciation for the work of his Labour party colleagues, praising the rivals in the race: Liz Kendall for standing up for what she believes in, Yvette Cooper for vocalising public support for aiding refugees, and Andy Burnham for his passionate work for the NHS. He thanked the MPs who nominated him in the spirit of inclusion and democracy. He thanked the unions for their overwhelming support, and showed opposition to the Tory government’s trade union bill.

He strongly condemned the malicious media intrusion into his family’s lives. Yes politicians can be critiqued, but the underhand dirty tactics of involving innocent people in a smear campaign need to be halted. He expressed the need for humanity when dealing with the refugee crisis. He will be at the rally later in aid of supporting refugees.

Change must come: governments cannot fund wars, whilst their citizens suffer poverty and inequality. Poverty isn’t inevitable. Things can and will change.

He highlighted the importance of engaging youth participation and voice, and welcomed new party members, and welcomed back old party members who had become disillusioned with Labour policies and practices. And he reached out to Scottish Labour supporters.

Exciting times! Hopefully there will be even more people joining the Labour party next week! Bring on the next election!

[1]
Don’t we need to take into account a researcher’s philosophical presuppositions amid calls for greater research replicability? (2015-09-13 08:00)

by John-Paul Smiley

Calls for greater replicability in social research are seemingly increasing by the day. The issue has garnered renewed attention in light of the LaCour incident and has prompted a flurry of debate across both traditional and new media platforms. What is rarely mentioned in these discussions, however, is the commensurability of replicability with differing ontological and epistemological positions. The calls for replicability arguably rest on positivistic presuppositions concerning the nature of reality; ones not necessarily shared by alternative schools of thought.
Hoping to spark debate, this brief piece considers the implications of adopting one such alternative ontological position for research replicability – an ontology of becoming.

Though the idea of an ontology of becoming can be traced back to the ancient Greeks with Heraclitus, in the modern era, it is Alfred Whitehead (1929) who has done most to popularise the concept, with Chia (1995) bringing attention to it most recently in management and organisational research circles. Leclerc (1958), summarises Whitehead’s position by stating that, ‘...an actual entity’s “being” is constituted by its "becoming". In other words, its existing is constituted by its ‘process” (Leclerc: 1958: p. 69). Consider, for example, the Moon. You may look upon it night after night and ascribe to it a state of permanence. But this is true only relative to your perception of time. In actuality, the Moon, like any other physical entity, is in a state of becoming, of flux. It has emerged at a particular point of time; it is, from moment to moment, changing (through, for example, surface erosion), and it will eventually, in time, cease to exist. The object that we perceive to be objectively there, is there, but only as a temporary formation of matter in a particular configuration.

The same is true for humans – we are born, we grow up, and we die. Along the way, we are socialised into whatever particular communities and institutions we are born into and later, once a certain level of awareness and development is achieved, we dabble with alternatives as we see fit. The point is that human researchers are themselves always changing – the eighteen-year-old researcher is not the same as the twenty-five year old, or the forty-five years old, or the sixty-five year old. Change is not unusual, it is the only constant. Humans are thus constantly interpreting and meaning-making against a backdrop of physical reality which is itself in a continual process of change – and this includes the physical bodies of humans. That entities appear relatively static is solely due to the limitations of humans to perceive minutiae of change. Bodies, whether we are referring to human or planetary, are constantly in a state of flux and change. What we recognise as an ‘entity’ is thus an abstraction based on a perceived momentary state of being. The problem is that humans, due to our limited lifespans, have difficulty perceiving that what is meant by ‘moments’ is relative to your perception of time and can include timespans far exceeding the average human lifespan (consider, for example, the notion of ‘historical moments’, paradigms, and zeitgeists, which often last decades or centuries).

In terms of social ontology, the implication of this is that social and political institutions are constantly in a state of movement and all that can ever be captured at any one moment is an interpretation of a perceived static entity that is in actuality in flux. Social entities may, then, exist in a variety of configurations and relationships, all of which are marked by flux and transience. What is actually perceived is only ever a researcher’s interpretation of a particular level, moment, or stage of being of the action or institution under consideration and never the totality. And this realisation, in turn, has implications for research method, as, following Chia (1995), it is believed in such an approach, that, ‘...reality is deemed to be constantly in flux and transformation and hence unrepresentable in any static sense’ (Chia: 1995: p. 579 – emphasis added). Indeed, the researcher’s and participant’s own understandings at any moment are always themselves characterised by becoming – of constant movement as new interactions, research, and work bring new appreciations, interpretations and understandings. This point, now seemingly forgotten, was made by Lasswell (1936) almost eighty years ago when he stated that, ‘From analysis, then, we can expect no static certainty. It is a constant process of re-examination which brings new aspects of the world into the focus of critical attention’ (Lasswell: 1936: p. 19).

Strict replicability, then, does not, and cannot, apply to research if one adopts on an ontology of becoming. Each moment, the researcher and the subject and/or object of study are in flux – they are different, changed – if only to a degree. The implication of this is that one would not expect research to be accurately replicable over time, indeed it is considered impossible. The more time that passes, the more that both the subject(s) and object(s) change, with the resulting interpretations being different than those previously held – even if unbeknownst to the holder. The forty-year old researcher repeating an analysis of interview data they carried out twenty years earlier, for example, will never replicate his/her work exactly. Moreover, this holds regardless of whether qualitative or quantitative methods are utilised.

3930
Critical readers may suggest that a deliberately extreme example has been used here, and it has. But the point of this piece has not been to suggest that researchers should adopt an ontology of becoming for their studies. Rather, the point has been to recognise that differing ontological and epistemological perspectives have varying implications for conceptualisations of 'appropriate' criteriology – including the perceived potential desirability and feasibility of replicability. More nuanced consideration needs to be given to this issue and researchers can assist in these discussions by more clearly stating their adopted positions and then explicating the logical consequences of such. There is a danger, particularly as we enter the 'Big Data' era, that social research is increasingly likely to converge on an unreflective homogeneity of method – one that pays scant consideration or respect to alternative philosophical presuppositions. This is exactly the fear articulated by interpretive scholars, that, 'The idol of methodological rigour typically acts to obscure prior philosophical issues or even to prejudge such issues to support positivism' (Bevir and Rhodes: 2006: p. 81). But unless we are to suggest that we have resolved all metaphysical debates, that we are certain as to the nature of reality, then a little less hubris, a touch more humility, and greater sensitivity to competing ontological claims would arguably serve us better going forward.

The Mike Wallace Interview: Erich Fromm (1958-05-25) (2015-09-14 08:00)

In a sign of how far the quality of television has slipped in past decades, Erich Fromm was invited to take part in this series discussing “the problems of a free society and what it must do to survive” in 1958. Who are the equivalent figures addressing such big issues on the contemporary intellectual scene? Do they stand a chance of being invited on to prime time television?
Some of this material is astonishingly prescient. He talks about how "the symbol pushers" are increasingly forced to "sell their own personality". What would Fromm have made of social media?

**Call for book proposals: New Visions of the Cosmopolitan** *(2015-09-15 08:00)*

New Visions of the Cosmopolitan

Series Editors:
Dr Patrick O’Mahony
Dr Tracey Skillington

New Visions of the Cosmopolitan explores how the forces of contemporary social change release a cosmopolitan energy that dilutes the relevance of the nation-state. The ‘transnational turn’ creates tendencies toward greater world openness. A more pluralist, multi-perspectivist late modernity requires a cosmopolitan research framework capable of illustrating how world histories and futures are in these new conditions intricately connected. This series offers a body of work exploring how cosmopolitan ideas, emerging from encounters between local and global currents, generate impulses towards social, cultural, legal, political and economic transformation.

The series invites contributions that focalize this contemporary situation using theories, perspectives and methodologies drawn from multiple disciplines. Of particular, although not exclusive, interest are proposals exploring:
transnational visions of justice and solidarity; cosmopolitan publics; researching cosmopolitan worlds; cosmopolitan memory; the cosmopolitics of contemporary global capitalism; borders of the cosmopolitan; cosmopolitanism in the non-western world; security, war and peace in a cosmopolitan age; multiple modernities; divergence and convergence; political culture and multi-level governance.

For books published in the series so far, see http://www.peterlang.com?NVC. For information on how to submit a book proposal, please contact Christabel Scaife, Senior Commissioning Editor, Peter Lang Ltd, c.scaife@peterlang.com.

Selling the UK by the offshore pound (2015-09-16 08:00)

The Private Eye has launched a new data journalism initiative, analysing the growing ownership of the United Kingdom by offshore companies based in tax trusts. Explore the map [1]here.

OVER the last year Private Eye has revealed the extent of ownership of British land by offshore companies, generally for tax avoidance and often to conceal dubious wealth. Now the Eye has created an easily searchable online map of these properties, revealing for the first time the British property interests of companies based in tax havens from Panama to Luxembourg, and from Liechtenstein to the South Pacific island of Niue. Using Land Registry data released under Freedom of Information laws, and then linking more than 100,000 land title register entries to specific addresses, the Eye has tracked all leasehold and freehold interests acquired by offshore companies between 2005 and 2014.

Most millennial resists the millennial label (2015-09-18 08:00)

The increasing prominence of the category ‘millennial’ irritates me. I thought this was a sociological objection. As this [1]superb n+1 essay observes, the category builds systemic conditions into the dispositions of the generational cohort and so disguises the former through highlighting the latter:

Of course the kids stay home because they can’t get jobs that pay rent. But the function of millennial-speak is to disguise structural causes (the lack of jobs) as human desires (the kids want to stay home), and to justify further measures (make hiring and firing easier) in terms of those desires. This is why millennials are constantly figured as happily zigzagging from job to job, fleeing long-term employment, luxuriating in the intense anxiety of a precariousness said to be uniquely theirs. If they (we?) don’t like a job, what use is there in organizing or demanding more from it? Just quit and move on, we’re told,
and so we tell ourselves the same. (Another paradoxical statistic: a majority of millennials look fondly on unions, but are also less likely than previous generations to join or form one.) Having been told for decades that they are creative snowflakes, “knowledge workers” laboring in a new kind of capitalism, younger cohorts have been encouraged to recognize themselves as operating in a wholly different, less fair economy than that of their parents — which is one way of ensuring that such an economy actually comes into being. In this way articles that worry over the socialization of millennials function as a way of socializing them into an unequal society.

But it seems that my objection is perhaps an expression of my millennial nature. As this [3]new Pew study finds, "Just 40% of adults ages 18 to 34 consider themselves part of the ‘Millennial generation’". Even if we largely reject the meaningfulness of analysis in generational cohorts, I think it’s an important sociological challenge to explain the variability with which each cohort embraces a generational label.

CfP: Power and the Body (2015-09-20 08:00)

Power and the Body

Paper Session for the 2016 ESS Annual Meeting

Power is a topic that is commonly explored through its traditional channels of action, such as political parties, bureaucratic structures, and formal organizations. This panel, however, aims to explore the composition of power through the lenses of the body. It aims to explore the nature of domination, privilege and lack-of-privilege from a corporeal standpoint. This session wants to create a dialogue among scholars using the body as an analytical lens to examine a wide range of sites and activities, such as racial dynamics in formal/informal organizations, gender interactions in the leisure/public sphere, and class relations in un/academic settings, to mentioned a few. Please submit an abstract (200 words) directly to [2]hrc209@lehigh.edu. We will alert you asap about whether or not the presentation will be included in the panel so that you can pop the abstract into the general system in plenty of time to be slotted in another session.

Abstracts of paper proposals should not exceed 200 words.

Session organizers: Hugo Ceron-Anaya, Lehigh University, USA.

Power, Acceleration and Metrics in Academic Life
2nd-4th December 2015, Prague (Vila Lanna)

Organised by the Institute of Philosophy of the Czech Academy of Sciences and supported by the Strategy AV21.

For more details see our webpage at [1]accelerated.academy
There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement, quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life. Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays. Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This three-day conference investigates the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- *empirical and theoretical engagements with the acceleration of higher education*
- *the origins of metrification of higher education*
• metrification as a form of social control
• the challenges of self-management posed by metrification and/or acceleration
• common strategic responses to these challenges
• the relationship between metrification and acceleration
• how metrification and acceleration relate to a broader social crisis

Keynote Speakers

Roger Burrows (Goldsmiths, University of London) – Ancient Cultures of Conceit Reloaded

In 1990 the sociologist Ian Carter published Ancient Cultures of Conceit – a brilliant analysis of campus fiction. It provides a wonderful rendering of a world we have lost – a world where academic life was slower paced and where spreadsheets, metrics, business plans and impact agendas were largely unknown. This paper attempts to carry forward Carter’s analysis over the last 25 years examining more recent examples of the campus fiction genre but also including fictional representations of campus life to be found on social media.

Philip Moriarty (University of Nottingham) – The Power, Perils and Pitfalls of Peer Review in Public

There are major deficiencies in traditional peer review. Not only can clearly flawed papers easily pass ‘scrutiny’ with flying colours, but the idea that a study is accepted into the scientific literature on the basis of a handful – or, not infrequently, one – set of anonymous reviewer comments seems quaint and archaic in a Twitter-, blogosphere-, and BuzzFeed-enabled world. Post-publication peer review, enabled by sites such as PubPeer, is an exceptionally important tool for online critique, analysis, and scrutiny of published papers. For the next generation of researchers, PPPR will almost certainly be de rigueur. Before we get to that point, however, there are quite a number of teething problems that need to be addressed. These include, in particular, the key issue of the role of anonymity and moderation in online commentary.

Susan Robertson (University of Bristol) – Vertigo: Time and space in the contemporary university

One of Henri Lefebvre’s great intellectual contribution was not only how we think about the spatiality and temporality of social life but that lived/in spaces and their social relations are the outcome of ongoing cultural, political and economic projects and their dynamics. In this lecture I explore the changing nature of the contemporary university, and the ways in which recalibrations of time and space are also simultaneously the medium, object, and outcome of these projects and dynamics. I invoke the idea of ‘vertigo’ – the sensation of the world moving, and profound anxieties about the potential for a loss of height – as a way of exploring the complex ways in which governing the university through temporal and spatial strategies mediates the ongoing experiences of living, learning, and working, in the university.

James Wilsdon (University of Sussex) – The Metric Tide: Reflections on the UK’s Independent Review of Metrics in Research Assessment and Management

There are powerful currents whipping up the metric tide. These include growing pressures for audit and evaluation of public spending on higher education and research; demands by policymakers for more strategic intelligence on research quality and impact; the need for institutions to manage and develop their strategies for research; competition within and between institutions for prestige, students, staff and resources; and increases in the availability of real-time ‘big data’ on research uptake, and the capacity of tools for analysing it. Citations, journal impact factors, H-indices, even tweets and Facebook likes – there are no end of quantitative measures that can now be used to
assess the quality and wider impacts of research. But how robust and reliable are such indicators, and what weight - if any - should we give them in the management of the UK’s research system? Over the past year, the UK’s Independent Review of the Role of Metrics in Research Assessment and Management has looked in detail at these questions. The review has explored the use of metrics across the full range of academic disciplines, and assessed their potential contribution to processes of research assessment like the Research Excellence Framework (REF). It has looked at how universities themselves use metrics, at the rise of league tables and rankings, at the relationship between metrics and issues of equality and diversity, and at the potential for ‘gaming’ that can arise from the use of particular indicators in the funding system. The review’s final report, The Metric Tide, was published on 9 July 2015. In his talk, James Wilsdon will reflect on the review process, outline its main findings, and consider the opportunities and obstacles to more responsible uses of metrics in the research system.

Oili-Helena Ylijoki (University of Tampere) – ‘Projectification’ and conflicting time orders in academic knowledge production

Under the current conditions of academic capitalism and market-driven managerialism, university research is increasingly conducted in large projects on external, competitive funding from various national and international sources. The project format offers a fixed-term, fast and flexible organizational mode which fits together with constantly changing needs of the turbulent university environment. This paper argues that the ‘projectification’ of science creates a special project time which stands in conflict with process time. Project time, embedded in standardized and abstract clock time, is decontextualized, linear, cumulative and predictable, entailing a strictly defined timeframe with a fixed beginning and end. This is in a sharp contrast with nonlinear, context-dependent and unpredictable process time involving unforeseen periods of standstill, deceleration and acceleration. Furthermore, project time includes 1) commodification of time by translating research process into money, 2) control of time by dividing research into beforehand determined phases in which accountability of the use of time is required, 3) compression of time by speeding up research productivity, and 4) colonization of time by subordinating alternative temporalities in research. The paper discusses how the intensification of project time reshapes and remoulds research practices and academic subjectivity, and what possibilities for alternative temporalities can be created and sustained at the accelerated academy. This is done by distinguishing temporal dilemmas and ways to live with them: long-term commitment vs. short-term funding; fast pace vs. slow thinking; time efficiency vs. wasting time; linear career time vs. circular project rat race; and work time vs. existential time.

**Philip Abrams Prize 2016 - Nominations Open (2015-09-21 08:00)**

Nominations are now being sought for the BSA Philip Abrams Memorial (PAM) Prize 2016.
The PAM prize is awarded to the best first and sole-authored book within the discipline of Sociology published between [1]1st December 2014 and [2]30th November 2015. The winner of the PAM Prize is awarded a monetary prize of £1,000 plus one year’s free subscription to The Sociological Review published by Wiley-Blackwell. The winner also receives an invitation to the BSA 2016 Annual Conference (to be held at Aston University, Birmingham in April), with free conference registration, accommodation and travel (within the UK).

We look forward to receiving your nominations.

The general criteria for eligibility are as follows:

- Nominated authors must be current, fully paid-up, members of the BSA
- Nominated authors must be resident within the UK
- Nominated authors should be within the first seven years (or full-time equivalent) since starting their first academic post within the discipline of sociology
- The nominated book must be the author’s first monograph. If the author has previously co-authored a monograph, they are not eligible for the prize. If the author has previously edited or co-edited a book, they are still eligible.
- The nominated book must be a sole-authored book
- The nominated book should be concerned with the discipline of Sociology
- There is an expectation that the author has observed the contents of the BSA’s Authorship Guidelines for Academic Papers (adopted April 2001)
- Nominations should comprise the official nomination form (duly completed), a brief curriculum vitae of the author, and five copies of the nominated book

HT to [1]NotRightRuth for sharing this amazing [2]Doonesbury cartoon:

CFP: Sexualities Special Issue ‘Trans Genealogies: Gender, Sexuality and the Emergence of Trans’ (2015-09-23 08:00)

Guest editors: L Moon, R Pearce and DL Steinberg

Forthcoming 2016

Deadline for submission of papers: November 30 2015

We would like to invite submissions for a forthcoming Special Issue of [1]Sexualities on the topic of ‘Trans-Genealogies: Gender, Sexuality and the Emergence of Trans’. Below please find email contact information for the Guest Editors, a synopsis of the Special Issue and advice for authors. The Guest Editors will be very happy to discuss your ideas for papers in advance of submission.

Contact:
D.L.Steinberg@ warwick.ac.uk
L.Moon@ warwick.ac.uk
R.Pearce@ warwick.ac.uk

Please submit your papers by November 30 2015 for consideration for the Special Issue

Special Issue Synopsis

This special issue of Sexualities focuses on the emergence of Trans as a growing vernacular of identity, intersubjectivity and feeling on the intersecting terrains of gender and sexuality. The issue draws its impetus from the recent ESRC seminar series: ‘The Emergence of Trans: Retheorising Gender and Sexuality’ (2012-14).

Authors are encouraged to address at least one of the following three questions:

- How does the emergence of Trans challenge, develop or extend understandings of gender and sexuality, reconfigure everyday lives or herald new normativities?
- How do Trans lives and discourses articulate with issues of rights, citizenship and (complex and intersectional modes of) discrimination, health and welfare, education and popular commonsense?
- What challenges do Trans identities present for clinical and therapeutic practice, for gender and sexuality theory and for everyday articulations of identity and intersubjective and communal connection?

Thematic Focus / Advice for Authors

The Special Issue will pursue and be organised around four key thematic axes:

1. Trans Genealogies: shifting paradigms and practice in clinical and therapeutic contexts
Emergent themes include: narratives of ‘authenticity’ that guide clinical protocols, psychotherapeutic approaches
and patient self-identifications; ‘pathways of care’ surrounding interventions and management of Trans bodies; professional discourses (educational, diagnostic) and clinical and practice protocols vis a vis patient or client experience; and ‘alternative’ therapeutic discourses and the Trans self-help context.

2. Trans in everyday culture: social networks, social movements, everyday lives and everyday repertoires
The focus here concerns the emergence of Trans social networks, social movements and citizenship struggles, including the impact of digital technology and web based resources on gender and sexuality activism and new identifications. Key themes include: communal, popular and ‘everyday’ repertoires of body, identity, feeling and experience; the impact of digital technology and social networking, and Transformations in everyday vernaculars of gender and sexuality, everyday lives and ‘on the ground’ experiences.

3. Trans in Popular representation
A third thematic focus concerns the spectacular, social semiotic, aesthetic and visual repertoires of Trans. Trans has emerged as a cross-media phenomenon involving traditional and new media from film and television to web-based media to photography to performance art, giving rise to emergent popular and commonsense dimensions of Trans.

4. Trans Epistemologies: retheorising gender and sexuality
The fourth thematic focus concerns the epistemic, intersubjective and affective implications of Trans culture, discourse and practice. Key questions in this context include a) to what degree and in what terms does the emergence of Trans challenge conceptual norms across different cultural sites from professional to popular to everyday practice; and b) what challenges do the epistemic underpinnings of Trans herald for sexuality and gender studies? Does Trans, for example, represent a ‘postcloset’ epistemology? Does it represent an emergent meta-narrative and, in its wake, a Transformed ‘post Kinsey’ understanding of gender, sexuality, bodies and experience?

Call for proposals: BSA Early Career Forum Regional Events 2016 (2015-09-25 08:00)

Call for BSA Early Career Forum Regional Event Proposals 2016

BSA ECF members are eligible to apply for this fund to arrange an event relevant and/or appropriate for early career BSA members. £1,000 is available to fund the event which can be used to hire space, pay for speakers/attendees travel, refreshments and so on.

Co-funding sought from another source is looked on favourably.

Bids for the fund would need to provide a short justification and description of their proposed event, a budget, and an explanation as to how relevant for ECF members the proposed event is. As this a regional event fund, we encourage events outside of London.

Applications should be no more than 1,000 words. Please include your name, current position and years since awarded PhD or working.

Please email all expressions of interest to [events@britsoc.org.uk](mailto:events@britsoc.org.uk) and address all correspondence: BSA ECF REGIONAL EVENT 2016.

**Deadline:** [04 December 2015](http://airmail.calendar/2015-12-04%2012:00:00%20GMT)

*Please note the following criteria will be used to judge applications*

All applications will be considered by the membership services directors, the treasurer and the ECF convenors. A final decision is then made by the Trustees taking into consideration the feedback from the ECF convenors and based on the following selection criteria:

- Breadth of appeal beyond the organising group
- Centrality to sociological concerns
- Quality of information provided
- Geographical spread
- Distinctiveness from previous events and institutions

For further information, please visit [http://www.britsoc.co.uk/events/postgraduate-day-events.aspx](http://www.britsoc.co.uk/events/postgraduate-day-events.aspx)

1. mailto:events@britsoc.org.uk?subject=BSA%20Regional%20Postgraduate%20Events
2. http://airmail.calendar/2015-12-04%2012:00:00%20GMT
3. http://www.britsoc.co.uk/events/postgraduate-day-events.aspx
I’ve recently been writing about the fragility of many contemporary movements: the organisational weakness that can emerge from digitally mediated assembly because the logistical labour formerly necessary to bring people together provided an important foundation for collective reflexivity. Collective projects become harder to sustain without regular face-to-face meetings, shared practical challenges and other forms of mundane encounter which facilitate the emergence of collective bonds. Movements that are fragile in this sense struggle to adapt to changing circumstances, revising tactics and strategy in light of new factors which are relevant. They fracture and break, though potentially in a way which leaves those active within them more motivated than ever to participate in new movements.

I think political culture can intensify this problem. Specifically what Nick Couldry calls ‘[1]the myth of us’: the assumption that digital technology has liberated a natural sociality, allowing a rehumanisation of the world that can lead to the spontaneous amelioration of social problems through the power of the crowd. This could be seen as a particular recent spin, in part propagated by social media platforms for obviously self-interested reasons, upon an older faith in the power of self-organising systems.

Now I want to incorporate Anonymous into this analysis. This line of thinking has left me cynical about the whole notion of digitally native politics. Therefore I’ve come to find Anonymous increasingly fascinating, in terms of their (basically) apolitical origins but also their growth ‘offline’. However I’m discovering that the political culture of Anonymous is much more complex than I realised. From Gabriella Coleman’s [2]Hacker, Hoaxer, Whistleblower, Spy

In the midst of all this, a pastebin.com message titled “Anonymous is NOT unanimous” was picked up and read by many participants: Anonymous has a perception problem. Most people think we’re a group of shadowy hackers. This is a fundamental flaw. Anonymous is *groups* of shadowy hackers, and herein lies the problem. Anonymous has done a lot of good in just the past 9 months. It has helped with other groups in providing aid to people on the ground in countries where “democracy” is a bad word. The mainstream media needs to understand that Anonymous isn’t unanimous. I’ve yet to see wide scale reporting make this distinction. A destructive minority is getting a majority of the press, while those of us who toil in the shadow doing good work for people at home and abroad go unthanked. 22 This statement captures Anonymous’s commitment to difference, plurality, and dissension—similar in form to the type of adversarial politics advocated by radical theorist Chantal Mouffe. 23 Anons often disagree and engage in a strong war of words. But very little energy is spent on systematically trying to eliminate difference, or carving out some “middle ground” resolution. Instead, differences are loudly voiced, listened to, responded to, and reluctantly accepted; Anons widely acknowledge that nothing drastic or meaningful can be done to eliminate differences, and they carry on with their interventions or, if the disagreements are unbearable, break away to form a new node.

The idea this leaves me with is of collective reflexivity taking a fractal form. Collective projects and commitments are precarious achievements, something which I’m arguing has become much more true under digital capitalism. But the breaking off of new collectives, pursuing new projects, after the open confrontations of accepted differences complicates my understanding of collective reflexivity. I also wonder if the communicative affordances which characterise a polymedia environment help facilitate this because my hunch would be that fractal collective reflexivity presupposes an intensivity of exchange which would harder to achieve with older modes of mediated communication.

1. [http://www.lse.ac.uk/media@lse/documents/MPP/Nick-Couldrys-LSE-INAUGURAL-SCRIPT.pdf](http://www.lse.ac.uk/media@lse/documents/MPP/Nick-Couldrys-LSE-INAUGURAL-SCRIPT.pdf)
This one-day workshop is an opportunity for scholars of political economy to discuss and debate how they teach the many facets of this interdisciplinary field of study. A teaching focus workshop seeks to bring the same peer-led engagement of research focused workshops & conferences to the teaching element of academic work. All participants are encouraged to share their teaching methods by bringing along course outlines, teaching resources (newspaper articles, films, blogs etc.), assignments, social media tools, games and simulations to share with the group.

The morning session will focus on ‘Decolonising Political Economy’ which takes seriously calls to no longer simply reproduce dominant orthodoxies by reflecting on the European Enlightenment bias in the political economy cannon. The afternoon session focuses on 'Learning Political Economy through Games and Simulations' which seeks to foster collaborative engagement on how games can transforming how political economy is taught and learned.

You are warmly invited to participate in this event and the ESRC covers travel expenses, please register here: [2]http://www.eventbrite.com/e/innovations-in-teaching-political-economy-tickets-17187040902

Timetable

10:30 am Welcome

11 am Gurminder Bhambra – Global Social Theory project ([3]globalsocialtheory.org)

11:45 am Break-away session – Decolonizing the Political Economy Syllabus

Report Back on Morning Session

1pm Lunch

2pm Chris Clarke – Political Economy Games
The Innovations in Teaching Political Economy workshop series builds on from a successful series of events the University of Warwick and Goldsmiths over the past five years. We seek to bring teachers of political economy together to debate and discuss the pedagogy of political economy. We are not seeking to devise a definitive way of teaching political economy but to promote innovative practices through peer-based learning.

Sponsored by the ESRC Seminar Series (ES/M003051/1) [4]From Recovery to Discovery: opening the debate on alternatives to financialisation and Politics and International Studies Department (PAIS) at the University of Warwick

(HT Su Oman)

Military Sociology in the Early 21st Century (2015-09-28 08:00)

My Day Job: Military Sociology in the Early 21st Century

We invite submissions of abstracts for a mini-conference on military sociology. This mini-conference will be held as part of the annual meeting of the Eastern Sociological Society, which meets in Boston Park Plaza Hotel and Towers, [2]March 17-20, 2016 (specific mini-conference dates within these dates to be announced in January). Information about ESS is here: [3]http://www.essnet.org/.

We invite submissions from faculty, graduate, and undergraduate students related to the military broadly defined, and we particularly welcome submissions connected to the conference theme of "My Day Job: Politics and Pedagogy in Academia" (see [4]http://www.essnet.org/annual-meeting/overview/). Some examples of future and past sessions include the following:

Pedagogy in Military Sociology, War, Peace or Social Conflict

3950
Teaching Veterans

Free Passion, Politics and Teaching in Military Settings

Service and Research Work in Military Academies

War, Peace, and Social Conflict

Life Course Perspectives and Military Service

Civil-Military Relations

Recruitment and Retention

Military Missions Other than War

Military Spouses and Partners

Technology and Culture in the Military

Post-DADT

Peace, Morality, Respect and Justice in Peace and Conflict

Post-Combat Exclusion/Inclusion

Gender Inclusion and the Military

Sexual Assault and Mental Health in the Military

Military Children

The Military and Other Social Institutions

Transgenderism and the Military

Humans and Technology in War

Veterans in Higher Education

Soldier Scholars

Abstracts must be submitted NO LATER than by October 7, 2015. To be considered, please email a title, affiliation, contact information, and abstract of no less than 250 words to Ryan Kelty (rkelty2@washcoll.edu) and/or Morten Ender (morten.ender@usma.edu). All abstracts not accepted for the mini-conference will be forwarded for consideration for the regular paper sessions.

Please also feel free to email the organizers with inquiries.
Call for papers: Qualitative Methods and Data in Digital Societies (2015-09-28 19:31)

Call for papers: Themed Issue

Qualitative Methods and Data in Digital Societies

Qualitative Research [html: http://qrj.sagepub.com]

Edited by William Housley (Cardiff University), Bella Dicks (Cardiff University) and Karen Henwood (Cardiff University).

The explosion of digital social data in recent years has required a response from both the social science and computational science communities. This has been framed as an attempt to move beyond the coming crisis of empirical sociology (Savage and Burrows, 2007, 2009; Edwards et al., 2013; Housley et al., 2014). The opportunities and challenges for social science from this 'data deluge' are wide ranging and a spectrum of thinking is emerging across the community that includes enthusiasts, skeptics and those with deep reservations. Yet, the rise of digital data and the claims being made for it also rest on human practices and social life in multiple ways (Dicks, 2012; Smith, 2014). Consequently, Qualitative Research is central to understanding how digital data is accomplished, lived and analysed.

This themed issue invites contributions that address the role of Qualitative Methods in responding, challenging and contributing to the reflexive interrogation and scoping of data in digital societies at situated, networked and system levels. The advent of Web 2.0, the open data movement and the rhetoric of 'Big Social Data' have opened up opportunities to analyse big qualitative data streams, such as those associated with social media, in ways that are not yet fully understood; new digital data developments include those associated with the emerging contours of the 'Quantified Self' movement and the navigation of health metrics through the use of body proxemic technology giving rise to forms of life characterised by data responsibilisation and self-analytics.

The themed issue will invite papers that report on these and associated developments. Topics of interest include:
• Ethnographic studies of interdisciplinary collaboration in the area of digital data analysis, digital tool development, platform development and the associated context(s) of occupational identities and expertise.

• The Qualitative dimensions and issues surrounding coding and annotation practices through new methods such as crowdsourcing techniques and citizen social science. Qualitative studies of the social life of methods in the digital era and the observation of ‘naturally occurring’ data generation practices that make use of new networked technologies in the pursuit of self-management and performance. This might also include studies that demonstrate how digital actors reflexively navigate data streams in ways that are nuanced and complex and not akin to being a ‘cultural dope 2.0’.

• The interaction order in the digital age; the ‘Self’, identity and digital data.

• Methodographic studies of the design and use of algorithms in digital tool development and data harvesting, the examination of code and machine learning as an accomplishment and artefact, the social organisation of statistics and modelling, the examination of demographic proxies in social media analytics and issues surrounding inference and evidence within the Big Social Data imaginary.

• The relationship between ‘small’ and ‘big’ social data. Innovations in the Qualitative analysis of Big Text data and social media streams.

• The ethical dimensions and politics of data in the digital age. Data inequalities: gender, race, class and the accomplishment of data.

Please send an abstract of no more than 250 words to: [1]JonesA7[at]cardiff.ac.uk by 31 December 2015. Abstracts will be reviewed for fit. You will be informed if the article is invited for review. Full manuscripts are due by
There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement, quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life. Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays. Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This three-day conference investigates the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- *empirical and theoretical engagements with the acceleration of higher education*
• the origins of metrification of higher education
• metrification as a form of social control
• the challenges of self-management posed by metrification and/or acceleration
• common strategic responses to these challenges
• the relationship between metrification and acceleration
• how metrification and acceleration relate to a broader social crisis

Keynote Speakers

Roger Burrows (Goldsmiths, University of London) – Ancient Cultures of Conceit Reloaded

In 1990 the sociologist Ian Carter published Ancient Cultures of Conceit – a brilliant analysis of campus fiction. It provides a wonderful rendering of a world we have lost – a world where academic life was slower paced and where spreadsheets, metrics, business plans and impact agendas were largely unknown. This paper attempts to carry forward Carter’s analysis over the last 25 years examining more recent examples of the campus fiction genre but also including fictional representations of campus life to be found on social media.

Philip Moriarty (University of Nottingham) – The Power, Perils and Pitfalls of Peer Review in Public

There are major deficiencies in traditional peer review. Not only can clearly flawed papers easily pass ‘scrutiny’ with flying colours, but the idea that a study is accepted into the scientific literature on the basis of a handful – or, not infrequently, one – set of anonymous reviewer comments seems quaint and archaic in a Twitter-, blogosphere-, and BuzzFeed-enabled world. Post-publication peer review, enabled by sites such as PubPeer, is an exceptionally important tool for online critique, analysis, and scrutiny of published papers. For the next generation of researchers, PPPR will almost certainly be de rigueur. Before we get to that point, however, there are quite a number of teething problems that need to be addressed. These include, in particular, the key issue of the role of anonymity and moderation in online commentary.

Susan Robertson (University of Bristol) – Vertigo: Time and space in the contemporary university

One of Henri Lefebvre’s great intellectual contribution was not only how we think about the spatiality and temporality of social life but that lived/in spaces and their social relations are the outcome of ongoing cultural, political and economic projects and their dynamics. In this lecture I explore the changing nature of the contemporary university, and the ways in which recalibrations of time and space are also simultaneously the medium, object, and outcome of these projects and dynamics. I invoke the idea of ‘vertigo’ – the sensation of the world moving, and profound anxieties about the potential for a loss of height – as a way of exploring the complex ways in which governing the university through temporal and spatial strategies mediates the ongoing experiences of living, learning, and working, in the university.

James Wilsdon (University of Sussex) – The Metric Tide: Reflections on the UK’s Independent Review of Metrics in Research Assessment and Management

There are powerful currents whipping up the metric tide. These include growing pressures for audit and evaluation of public spending on higher education and research; demands by policymakers for more strategic intelligence on research quality and impact; the need for institutions to manage and develop their strategies for research; competition within and between institutions for prestige, students, staff and resources; and increases in the availability of...
real-time 'big data' on research uptake, and the capacity of tools for analysing it. Citations, journal impact factors, H-indices, even tweets and Facebook likes – there are no end of quantitative measures that can now be used to assess the quality and wider impacts of research. But how robust and reliable are such indicators, and what weight – if any – should we give them in the management of the UK’s research system? Over the past year, the UK’s Independent Review of the Role of Metrics in Research Assessment and Management has looked in detail at these questions. The review has explored the use of metrics across the full range of academic disciplines, and assessed their potential contribution to processes of research assessment like the Research Excellence Framework (REF). It has looked at how universities themselves use metrics, at the rise of league tables and rankings, at the relationship between metrics and issues of equality and diversity, and at the potential for ‘gaming’ that can arise from the use of particular indicators in the funding system. The review’s final report, The Metric Tide, was published on 9 July 2015. In his talk, James Wilsdon will reflect on the review process, outline its main findings, and consider the opportunities and obstacles to more responsible uses of metrics in the research system.

Oili-Helena Ylijoki (University of Tampere) – ‘Projectification’ and conflicting time orders in academic knowledge production

Under the current conditions of academic capitalism and market-driven managerialism, university research is increasingly conducted in large projects on external, competitive funding from various national and international sources. The project format offers a fixed-term, fast and flexible organizational mode which fits together with constantly changing needs of the turbulent university environment. This paper argues that the ‘projectification’ of science creates a special project time which stands in conflict with process time. Project time, embedded in standardized and abstract clock time, is decontextualized, linear, cumulative and predictable, entailing a strictly defined timeframe with a fixed beginning and end. This is in a sharp contrast with nonlinear, context-dependent and unpredictable process time involving unforeseen periods of standstill, deceleration and acceleration. Furthermore, project time includes 1) commodification of time by translating research process into money, 2) control of time by dividing research into beforehand determined phases in which accountability of the use of time is required, 3) compression of time by speeding up research productivity, and 4) colonization of time by subordinating alternative temporalities in research. The paper discusses how the intensification of project time reshapes and remoulds research practices and academic subjectivity, and what possibilities for alternative temporalities can be created and sustained at the accelerated academy. This is done by distinguishing temporal dilemmas and ways to live with them: long-term commitment vs. short-term funding; fast pace vs. slow thinking; time efficiency vs. wasting time; linear career time vs. circular project rat race; and work time vs. existential time.

The rise of "connexionism" through online-offline integration (2015-09-29 09:54)

When checking in for a flight recently I was offered the opportunity to "Discover who's on board". By connecting my Facebook, Linkedin or Google+ account I could see who else had done the same. So, this makes it possible (in KLM’s words) to "...see who sits where [and] choose or change your seat".

3956
This opens up the possibility for strange surveillance or stalking potential. The presence of more business-oriented networks (LinkedIn and Google+ along with the dominant social network, Facebook) rather than leisure and youth focused ones such as Snapchat and Instagram seems to be indicative of a more corporate mentality. But is also indicative of the rise of what [2] Luc Boltanski and Eve Chiappello call "connexionism" outside of the strictly corporate arena.

Boltanski and Chiappello identify the connexionist ideal in 1990s management culture with these characteristics:

"Connection

<Natural relations between beings>

Connecting,

Communicating,

Co-ordinating,

Adjusting to others,

Trusting
In a connexonist world, a natural preoccupation of human beings is the desire to connect with others, to make contact, to make connections, so as not to remain isolated. To succeed they must trust and be trusted, know how to communicate, discuss openly, and also be capable of adjusting to other people and situations depending on what the latter demand of them, without being held back by timidity, rigidity or mistrust. This is the price of co-ordinating themselves in mechanisms and projects.

Engaged, Engaging,

Mobile

<Condition of great man>

Enthusiastic, Involved,

Flexible, Adaptable,

Versatile, Having potential,

Employable, Autonomous,

Not prescriptive, Knows how to engage others,

In touch, Tolerant,

Employability

(providing)"

(Boltanski and Chiappelo, 2005: 111-112)

Many of the traits and qualities they identified seem to be central to social networking sites particularly those related to the avoidance of "isolation" and the desire to "connect". But many of the fears which the management literature was trying to encourage people to overcome are the same as those which the owners of social networking sites had to train out of people.

People had to be encouraged to trust other people enough to "friend" them and to overcome timidity in airing their views to strangers. "Enthusiasm" and a desire to be "involved" to be constantly "in touch" with others and "engaging" are central parts of the successful social media operator.

Social networking sites in general could be seen as manifestations of this connexionist mentality but their integration with real world scenarios such as catching a flight help to reconfigure another space in a connexionist fashion. An aeroplane seating plan becomes a reserve of potential connections who might enable further career (or other) progression.
What on earth is that? An answer to all your research methods questions (2015-09-30 08:00)

A fantastic resource by the National Centre for Social Research Methods: [1]films of their "what is?" sessions from the 2012 festival of research methods:

Academia Obscura is an irreverent look inside the Ivory Tower, proving that university life isn't all stuffiness, elbow patches and greying old men.

Please go to unbound.co.uk and help me to fund this book!

Academia Obscura is proof that the university life isn't all stuffiness, elbow patches and greying old men. Researcher (and procrastinating PhD student) Glen Wright takes an irreverent look inside the ivory tower, uncovering the amusing and often bizarre world within. Cats and dogs writing scientific papers, real life nutty professors, and some super-specific scientific research that might just change your life. Academia Obscura takes the reader on a unique journey through the groves of academe. Starting with the earliest in-jokes of medieval scribes, the book exposes Easter eggs buried in peer-reviewed papers, guides the reader through the art and science of academic publishing and conferences, and finds that occasionally the mad scientist stereotype is pretty spot on. Academics will never take themselves too seriously again. Neither will anyone else."

What is Neurophilosophy? (2015-10-02 08:00)

HT [1]Paul Raymont for this engaging introduction to the fascinating topic of [2]neurophilosophy:
Workshop and Symposium: The Question of the Human in Social Theory and Social Research  
(2015-10-02 20:27)

25th November 2015, 11:00 to 17:00  
WT0.05, University of Warwick

This workshop and symposium will explore the, mostly implicit, conceptions of the human, humanity and human nature that underpin various contemporary conceptions of social life. In the context of much-publicised post-human futures, this is an invitation to reconsider the idea that social life itself is predicated on the fact that human beings are capable of such collective existence. Humans are beings who have a continuity of consciousness so that they see themselves as themselves throughout their life; human are beings who negotiate a multiplicity of sometimes contradictory identities and recognise each other as members of the same species, and they are also beings who can create and interpret cultural artefacts. Crucially, humans are beings who can deploy a sense of self-transcendence so that they are able to look at the world from somebody else’s point of view and thus conceive new social institutions.

The main focus throughout the day will be on how questions about the human are encountered in social theory and social research and what are the various implications and challenges of taking these seriously in our work.
The day of activities will be divided into two parts. During the morning, we will have a participatory workshop for PhD students and early-career researchers. The goal of the workshop is to help participants negotiate the sometimes abstruse scientific, philosophical, moral, and even theological underpinnings of asking questions about ‘the human’ in the context of their own research projects. Dr Daniel Chernilo (Loughborough University) will offer a general overview of this field of enquiry as well as reflect on its various implications. We will also invite participants to reflect on their own research projects by making a brief (10-minute) presentation of their research projects and how questions about the human have been or are expected to be encountered within them. We’d like to ask all participants to reflect in advance on conceptions of the human and how they pertain to their projects. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day! In the afternoon, we will have a symposium in which Dr Mark Carrigan, Professor Margaret Archer and Daniel Chernilo will engage with questions of the human as they unfold in their own work on digital sociology (Carrigan), the morphogenetic society (Archer), and philosophical sociology (Chernilo).

To register your interest, please contact D.Chernilo@lboro.ac.uk and Mark@Markcarrigan.net with a brief description (500 words or less) of your research and how questions of the human are relevant to it by **October 31st, 2015**. The event is free but places are limited. Travel bursaries are available for those in need of it, please ask for more details.

**ESS Annual Meeting Call For Papers: Developing Bodies** *(2015-10-03 08:00)*

**Call for Abstracts for session titled “Developing Bodies”**

Any work that lies at the intersection of critical development studies and embodiment, broadly considered, is welcome for review. For example, possible topics may include:

- Critiques of global or regional health campaigns (HIV/AIDS, TB, hand washing, etc);
- Explorations of the rise of social entrepreneurial efforts to address poverty and health;
- Analyses of corporate social responsibility engagements with the new Sustainable Development Goals;
- Empirical studies of raced, classed and/or gendered representations of **those in need** in development materials (brochures, social media, etc)

Please send a brief abstract (no more than 200 words) to [1]chris.bobel@umb.edu by 10.12.15. Presenters will be contacted by the organizer about whether or not their presentation will be included in the session, so that they can submit their abstracts through the general submission portal for consideration for another session before the submission deadline.

The ESS Annual Meeting is scheduled for March 17-21, 2016, and is being held at the Boston Park Plaza Hotel and Towers in Boston, Massachusetts. The theme for the 2016 meeting is "My Day Job: Politics and Pedagogy in Academia." For general information about the ESS 2016 Annual Meeting, please visit [2]http://www.essnet.org/
There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement, quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Digital Social Science Essay Competition (2015-10-05 08:00)

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of 3966
CHF 1,000 for the best essay on the topic ‘Influence and Power’. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a re-thinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF’s criteria and goals may be viewed [1]here.

Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal's key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.

The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition's theme and falls within the remit of BD &S's goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.

The submitted essays will be judged and the winning essay will be chosen by an academic panel (the ISRF Essay Prize Committee). The panel's decision will be final, and no assessments or comments will be made available. The result will be notified to applicants by email during April 2016 and will then be announced by posting on the websites of the ISRF and of BD &S. The ISRF and BD &S reserve the right not to award the prize, and no award will be made if the submitted essays are of insufficient merit.

The winning essay will be accepted for publication in the Journal; the author may be asked to make some revisions before publication. Other applicants may have their submissions accepted for publication in the Early Career Researcher forum of BD &S subject to the Journal's peer review and decision-making process.

The details and criteria are:

**Essay topic:** Influence and Power (This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field.)

**Eligibility:** Participants should either be current doctoral students or within three years of being awarded their doctorate.

**Essay length:** 5,000 to 7,000 words

**Essay format:** Follow the BD &S Author Guidelines, available on the BD &S website.
What on earth is Social Theory? Call for contributions! (2015-10-05 08:00)

So, I signed up for a working group on Social Theory. I have so far spent my short academic life trying to avoid anything theoretical, but as I am about to enter the second year of PhD study I realised I cannot and should not escape it for any longer. So I figured the best way to better understand social theory is to join a group that are designing an online platform to teach social theory – genius!

I haven’t denounced social theory altogether, I am pretty hot on feminist theoretical debates, and have dabbled in Bourdieu, Foucault and Marx. So what is it about the idea of social theory that has got me in such a bother? I am pretty good at this academic stuff otherwise, so why shy away from something so innocuous as conversations about studying the social world? Conversations about grand theories, meta-theories, induction and reduction, epistemology or ontology, positivism and interpretivism….. sorry, it’s too much, I need to sit down.

Social theory is a language that helps us understand and explain the social world, suggested my colleague. And that’s when I realised why I find social theory so daunting and so, well...hard. It is like learning a foreign language. Social theory, like many other languages, is taught in a classroom of students where most know a one or two words or none at all, but need to learn more words as well as how and when to use them. Then there are others in the class who know a few words, but like to use these words over and over again, not always in the right context but just saying them at any opportunity just to prove they know some words. Those people always make me feel stupid and put me off learning languages.
Like learning any language, the usual pedagogic techniques don’t suit everyone trying to learn social theory. So for that reason this Social Theory Research Group, led by Michael Hammond and Milena Kremkova at Warwick, are developing an interactive, online platform to help budding researchers get to grips with social theory. The aim is to make social theory more approachable by taking it down of its scholarly pedestal, and provide accessible tools for learning and sharing information about a wide range of theoretical ideas.

We are considering glossaries, dictionaries, literature maps, metaphors and discussion forums, as well as utilising the power of social media from Facebook to Twitter to Blogs. **To do this we need your help, and would like to find out about your own relationship with social theory: What has been easy? What has been hard? What are your positive and negative experiences when exploring social theory? We would like to hear your stories, the good, the bad, and the theoretically ugly.**

Please send your comments

Lots of open access papers by Andrew Abbott (2015-10-07 08:00)

I’ve always found [1]Andrew Abbott an intriguing figure. He’s someone I’ve come across in a diverse range of contexts: methodology, computational science, sociological writing, meta-theory, research methods, the sociology of higher education and information systems. Looking through his website, I realise that he’s even more wide ranging than I had thought. He also seems to have self-archived meticulously, making many of his papers (particularly hard to access ones) available for free online. You can check them out [2]here.

Academic conference panels normally consist of three speakers, who are optimally arranged as follows: The first speaker is normal and predictable. He or she gives the textbook expectation of the topic under discussion. The second speaker is dopey and forgettable. He or she hasn't quite mastered the topic or is simply a bad presenter. The third speaker is crazy and brilliant. He or she puts an unexpected spin on the panel's topic, which suddenly takes it to a new and hopefully higher level.

Perhaps the most fundamental justification for this arrangement comes from cognitive psychology, where 'primacy' and 'recency' effects in memory studies have been long known. People tend to remember the first and the last items in a sequence and blank out the middle. So a good academic panel organizer knows how to play to that bias, given the set of speakers on offer. (I'm assuming for the sake of argument the perhaps controversial assumption that an academic panel is mainly designed to maximize interesting academic discussion.)

But there are more specifically sociological reasons for arranging academic panels this way. And these points will help future anthropologists figure out something about how academics operate in real life. Much of the audience for an academic panel arrives after the panel has begun. In that case, it’s good to have the most normal speaker go first because then the audience will have effectively missed less 'content' (from an information-theoretic standpoint), given just how much stuff that this person says will be what the audience already knows. (Perhaps this level of semantic redundancy serves to reinforce a sense of common identity – I leave that to the anthropologist.)

One can even go ‘gonzo’ on this – as I have done on several occasions – by arriving in the last few minutes of the first speaker’s talk and then asking a question of this sort: ‘I realize that I’ve only heard the last three words of your talk, but given the topic of this panel, have you considered…?’ If you’re already on top of the topic – and even better the speaker’s published views on it – you’re almost assured a blindsiding performance. However, as I have tried to suggest, such a display of interrogative genius is, like magic, heavily front-loaded. Nevertheless, it makes one wonder whether the ultimate socio-epistemic function of the first speaker is anything more than to provide a minimal ‘portal’ to the topic, say, in the manner of a doorstop.

The second person on the panel really shouldn’t be on it. But there are mitigating circumstances. This person has friends in high places, or (typically a junior academic) has been told to join the panel by people in high places, or is simply not sufficiently incompetent to be ineligible for the panel. (Evolutionary biologists stress the importance of ‘neutral drift’ in just sense, which is something that neo-liberalism seems designed to weed out.) Since by this point, the audience is stuck into the panel, there will be considerable good faith listening to at least half of what is said. The Q &A, assuming there is one, will alight upon any distinctive persons and concepts raised by the speaker without serious engagement with what was said. Questions will be asked more in the spirit of throwing a life preserver to someone drowning, hoping that they can redeem the situation.

The final speaker is on the panel to remind the audience that the panel – either because of the speakers or the topic – is really not what it's cracked up to be, and so something else is needed. Thus, the speaker will begin by saying s/he is offering a reflection on what the previous speakers have said, but really they simply provide this speaker with a platform to launch into ‘something completely different’ that might actually raise the wattage of the
Workshop and Symposium: The Question of the Human in Social Theory and Social Research
(2015-10-08 08:00)

25th November 2015, 11:00 to 17:00
WT0.05, University of Warwick

This workshop and symposium will explore the, mostly implicit, conceptions of the human, humanity and human nature that underpin various contemporary conceptions of social life. In the context of much-publicised post-human futures, this is an invitation to reconsider the idea that social life itself is predicated on the fact that human beings are capable of such collective existence. Humans are beings who have a continuity of consciousness so that they see themselves as themselves throughout their life; human are beings who negotiate a multiplicity of sometimes contradictory identities and recognise each other as members of the same species, and they are also beings who can create and interpret cultural artefacts. Crucially, humans are beings who can deploy a sense of self-transcendence so that they are able to look at the world from somebody else’s point of view and thus conceive new social institutions.

The main focus throughout the day will be on how questions about the human are encountered in social theory and social research and what are the various implications and challenges of taking these seriously in our work. The day of activities will be divided into two parts. During the morning, we will have a participatory workshop for PhD students and early-career researchers. The goal of the workshop is to help participants negotiate the sometimes abstruse scientific, philosophical, moral, and even theological underpinnings of asking questions about ‘the human’ in the context of their own research projects. Dr Daniel Chernilo (Loughborough University) will offer a general overview of this field of enquiry as well as reflect on its various implications. We will also invite participants to reflect on their own research projects by making a brief (10-minute) presentation of their research projects and how questions about the human have been or are expected to be encountered within them. We’d like to ask all participants to reflect in advance on conceptions of the human and how they pertain to their projects. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day! In the afternoon, we will have a symposium in which Dr Mark Carrigan, Professor Margaret Archer and Daniel Chernilo will engage with questions of the human as they unfold in their own work on digital sociology (Carrigan), the morphogenetic society (Archer), and philosophical sociology (Chernilo).

To register your interest, please contact D.Chernilo@lboro.ac.uk and Mark@Markcarrigan.net with a brief description (500 words or less) of your research and how questions of the human are relevant to it by October 31st, 2015. The event is free but places are limited. Travel bursaries are available for those in need of it, please ask for more details.
Global Futures and Epistemologies of the South: last chance to submit (2015-10-09 08:00)

Sociology Special Issue: Last Chance to Submit!

Dear Colleagues,

The deadline for Sociology’s special issue on Global Futures and Epistemologies of the South is fast approaching. Any authors who wish to send through an article for consideration need to submit it by **Friday 16 October** please.

Articles should be submitted via the ScholarOne Manuscripts site: [1]https://mc.manuscriptcentral.com/soc. Help guides, information on how to prepare your manuscript and a cover sheet can be downloaded from the same site, by clicking on ‘Instructions & Forms’.

If you have any queries about submitting to the special issue, please contact [2]sociology.journal@britsoc.org.uk as soon as possible. Editorial questions can be sent directly to the guest editors at: [3]bsantos@ces.uc.pt and [4]g.k.bhambra@warwick.ac.uk

The full Call for Papers is available on the BSA website: [5]http://www.britsoc.co.uk/publications/publications-vacancies.aspx

**Guest Editors:** Gurminder K Bhambra, Professor of Sociology, University of Warwick and Visiting Fellow in Sociology (2014-15), Princeton University; Boaventura de Sousa Santos, Professor of Sociology, University of Coimbra, and Distinguished Legal Scholar at the University of Wisconsin-Madison

This special issue takes stock of the progress that has been made within sociology over recent decades to become a more globally oriented discipline and discusses the new challenges for the future that emerge as a consequence. It rests on two interlinked premises. First, that understandings of the world are much broader than the Western understanding of the world and so for sociology to adequately address its global futures it needs to take into account ways of knowing that exceed Western thinking, including critical Western thinking. Second, that the current configurations of the world are a consequence of global historical processes that have not always been adequately addressed within western-based sociology. For sociology to better conceptualise its global futures, it also needs to address its global pasts. We invite contributions that address the issues raised, both theoretically and through empirical research, across (but not limited to) the following themes:

- Epistemologies of the South and Global Challenges to /for Sociology
- Imagining Global Sociologies: Past, Present, and Future
- The Global South in the North
- Recovering Silenced / Forgotten Sociologies
- Transnational Solidarities, Anti-colonial Struggles and the ‘Rise’ of the South(s)
- Emancipatory Social Movements and Alternative Narratives
- Sociological Futures: Rethinking Social Justice in a Global World
What Can Data Visualisation Do? (2015-10-09 09:00)

Details below for an event on data visualisation which sounds great and is taking place as part of [1]Sheffield universities' ESRC Festival of Social Science.

Presentations and discussion with experts and practitioners considering what data visualisations – that is, the visual representation of data in charts and graphs – can contribute to society.

Speakers include Alan Smith (Former head of the Office for National Statistics' Data Visualisation Unit & now head of data visualisation at The Financial Times), Thomas Clever (from award-winning Dutch visualisation agency Clever Franke), Valentina D'Efilippo (award-winning data visualisation and information designer), William Allen (The Migration Observatory, University of Oxford) and Giulio Frigieri (The Observer).

Public and third sector organisations, designers, campaigners, analysts, visualisers, and people with a curiosity about open data and the visual representation of data, are all welcome.
Book Review: Between Samaritans and States: The Political Ethics of Humanitarian INGOs
(2015-10-09 20:14)

Between Samaritans and States: The Political Ethics of Humanitarian INGOs by Jennifer C. Rubenstein

1. http://festivalofsocialscience.group.shef.ac.uk/
How should scholars, activists, and states understand not only the activities of humanitarian INGOs, but also ethically? Humanitarian INGOs (international non-governmental organizations) tend to be characterized by ‘donor’ countries, those usually western countries that provide assistance, as either purely altruistic Samaritans, as unqualified and intrusive agents, or as cold and calculating corporate organizations.

Rubenstein shows that none of these conceptions is adequate and instead proposes intelligent alternatives far more complex than these all or nothing identities. This book illustrates a ‘political ethics’ approach that elides all simplification. Rubenstein identifies four main questions that she thoroughly examines:

- what kind of actors are humanitarian INGOs?
- what types of ethical predicaments do humanitarian INGOs regularly face?
- are there better and worse ways for them to respond to the ethical predicaments they face?
- how does close study of humanitarian INGO political ethics broaden our understanding of democratic, humanitarian, egalitarian, and justice-based norms?

**EIGHT CURRENT APPROACHES**

Rubenstein outlines eight approaches to understanding the work of humanitarian INGOs that are dominant in scholarly literature, public and governmental discourse. Due to the depth of analysis provided in the book, I will generally highlight some of the many insights that can be found.

First, INGOs are seen as apolitical ‘rescuers’ that only respond to crises. This suggests that INGOs do not go
through significant planning or only rescue in short-term, one-off operations. Actually, INGOs “deliberate, in advance, about how to allocate about how to allocate their limited resources among countries, regions, issues, and types of activities, including tradeoffs between emergency aid and other activities” (p.31). This insight corresponds to a critique, which Rubenstein makes, of how humanitarian norms are operationalized in the work of INGOs.

Second, humanitarian INGOs can be characterized as ‘partner.’ Partnership implies that INGOs have an equal status as domestic NGOs, community-based and civil society organizations, and government agencies. INGOs have different, often greater access, to resources that are not bound by the sovereign jurisdiction of the state of the country in question. Also INGOs have priorities that often conflict with any responsibility to empower domestic actors with which they communicate.

Third, Rubenstein notes that INGOs have responsibility to meet the preferences or interests of their donors. Yet, INGOs are normatively guided by principles that do not fit easily with the political priorities of any one or group of donors. While donors might have distinct moral interests, it seems misleading to primarily characterize INGOs as even being capable of navigating effectively between competing normative priorities. As Rubenstein also points out, not only do donors influence INGOs, but INGOs also project a significant amount of influence of their donors, by shaping their perceptions about issues of severe poverty and famine, for instance (p.39).

Fourth, humanitarian INGOs are sometimes thought of as ‘agents for their intended beneficiaries.’ This means that INGOs are merely required to fulfill the interests of the populations to the extent that there is no need for a discussion of political ethics. Like their relationship with donor, INGOs often have somewhat competing priorities with their beneficiaries. Beneficiaries are also not bound by the resource limitation of INGOs.

Fifth, INGOs have a responsibility to be first and foremost ‘accountable.’ Accountability ensures that INGOs can justify their actions to the various parties affected by their work and meaningful sanctions if they fail to meet these standards. INGOs are rarely accountable to any one group, or sanctioned in a way that would somehow provide a meaningful compensation for failing to meet stated responsibilities.

The sixth account of humanitarian INGOs states that they are primarily identifiable by their adherence to traditional humanitarian principles. According to the International Committee of the Red Cross, these principles include “humanity,” “impartiality,” and “independence.” Of course, these principles only apply when performing humanitarian activities, and as Rubenstein clearly states, there is much more to the work of INGOs than humanitarianism could encompass.

The seventh characterization is that of ‘neo-colonialist.’ This is the most negative of the list and implies that “any account of INGO political ethics is beside the point, and indeed serves only to further legitimate organizations that should not exist” (p.45).

Finally, the eighth account sees INGOs as merely another form of multinational corporation (MNC). This is the account addressed in works such as Alexander Colley and James Ron’s The NGO Scramble. This account sees an analogy between INGOs and MNCs, donors and shareholders, aid recipients and customers. Rubenstein clearly defines a much more accurate portrayal, by describing, if anything, donors as analogous to customers, because donors can use market forces to check INGOs that do not perform to their liking.

Furthermore, MNCs are guided by principles that characterized as ‘business ethics’ (p.49). The ethical principles would be in such disharmony with democratic, egalitarian, justice-based, and humanitarian norms as to make the work of INGOs make little sense or be totally ineffective. This does not seem to be the case for any organization, let alone an INGO, which lasts for any length of time.

Rubenstein continues to describe four ethical predicaments that seem to be unaccounted or not fully accounted for in the eight accounts of humanitarian INGOs. INGOs are sometimes somewhat governmental, in that they often
enact governance activities, such as conventional governance similar to states and they also enact global governance activities by seeking to change the structure and operation of international governance structures.

Also, INGOs are often “second-best actors,” in that they may either displace actors such as domestic NGOs, civil society or local government organizations that could better meet the needs of beneficiaries. As Rubenstein points out, it is sometimes the best plan of action for INGOs to know when to back away from directly promoting a population and empowering populations or domestic organizations to act on their own behalf. INGOs are highly political. They exercise discursive power through the framing of issues. Secondly, INGO activities often have unintended consequences, such as when violent groups repurpose aid resources. INGOs are given ‘moral permissions,’ specific entitlements granted to them based on the level of responsibilities they have. This complicates the activities of INGOs, because again INGOs are often 'second-best actors,' that should not be held to the same standards as governments.

After describing the limitations of orthodox conceptions of INGOs’ ethics, Rubenstein offers four political ethical areas that can better characterize some of the politically sensitive predicaments they encounter. She uses an interesting cartographic analogy that helps the reader navigate the otherwise dense material. Her analogy of maps is an innovative interpretive frame that I think other scholars could benefit from. For instance, in situations where INGOs should decide whether or not to leave when their actions may actually perpetuate the injustices that they seek to alleviate. She states that INGOs should justify their decision to stay or go and that they are morally responsible for their decisions.

INGOs should be aware of their capabilities and always be ready to relinquish their position to other actors that can better serve beneficiaries, particularly ones that have more experience “on the ground” (125). Rubenstein also provides a nuanced approach to conceptualizing the ethical conundrum of INGOs faced with questions about minimizing harm and refusing to act when harmful situations seem unavoidable or unmanageable. Finally, Rubenstein describes a situation she calls the “moral motivation tradeoff” (p.185). This describes situations where the images used in campaigns, which are seen as beneficial for gaining donors, yet run the risk of degrading the people they portray. This is an interesting issue, and one that previous literature has not adequately dealt with.

Though I have not previously read Rubenstein’s work, I think her work is very interesting. Regarding the focus of the book, I think this is one of the most insightful works available on the subject. Much of the book addresses the question of whether or not a discussion of political ethics is necessary, which I think she successfully answers: yes, it definitely is. The book addresses most of the competing approaches with depth and clarity, leaving nothing of importance wanting from the discussion. Rubenstein does not wholly discount any of the other ethical approaches. This book is useful for anyone that finds the sheer number of approaches hard to navigate. The book definitely progresses the discussion, and I think scholars will be remiss not to cite it when conducting research into the ethical implication of humanitarian INGOs. It is a great tool for students of non-state governance in various fields, practitioners, and educators.

CfP: The Dark Matter of the Urban: Forces, densities, velocities, affects, and more (2015-10-10 08:00)

Call for Papers: Association of American Geographers (AAG) Annual Meeting, March 29-April 2, 2016 San Francisco

The Dark Matter of the Urban: Forces, densities, velocities, affects, and more.

Session organizers:
Michele Lancione (University of Cambridge, UK) Francisco Calafate-Faria (Goldsmiths, University of London, UK)

Deadline for submission of 250 words abstract: 20th of October.
Deadline for registration on AAG website 26th of October.
The sessions will be followed by a panel including some of the scholars cited in this CFP discussing on 'Urban Dark Matter'

Being-in-the-city means being caught up in a maelstrom of bodies, technologies, atmospheres, velocities, and both fixed and fluid elements that are not easy to pin down and understand. Although sociology, anthropology, and human geography have built up a substantial body of scholarship on the urban form – one providing insights into analytically manageable aspects of being-human-in-the-city (such as the economic, the cultural, and the socio-relational spheres) – much has been left out of the picture. In recent years, a new scholarship proposing a focus on urban change and process, and a post-human perspective on the city has contributed greatly to a more nuanced understanding of how cities are and how they become. Outlines of a new urban theorization are emerging from scholars interested in urban assemblages (McFarlane, 2011b; Farías and Bender, 2010; Jacobs, 2012), socio-technical infrastructure (Amin, 2014; Simone, 2004; De Boeck, 2012; Silver, 2014), and vitalist ontologies (Amin, 2007; Braidotti, 2011; Bennett, 2010; Lancione, 2016).

Yet, it seems to us that there is something about cities that escapes the grammar currently employed to describe them. The increasing number of conceptualizations brought forward to grasp urban articulations is a disquieting signal of the tantalizing slipperiness of the urban form. These include Simone’s ‘people as infrastructure’ (2004) and his more recent ‘generic blackness’ (forthcoming); Amin’s ‘animated space’ (Amin, 2015); Chattopadhyay’s ‘infra-structure’ (2012); Pierete’s effort to grasp the ‘unknowable’ of the African city (2013); Thrift’s ‘oustitincts’ (2014); McFarlane’s makeshift notions of learning and dwelling (2011a); Gandy’s ‘cyborg urbanization’ (2005), and De Boeck ‘knotting’ (2015) – to cite just a few.

Instead of seeing these attempts as theorization detached from urban praxis, we understand them as concrete attempts to come to terms with what we cannot see, yet perceive; with what we cannot properly theorize, yet foresee; with a new politics of the urban that is largely undefined, yet urgently needed. This is what we are provisionally calling the ‘dark matter’ of the urban: a substance made of times, spaces, forces, densities, velocities, movements, encounters, processes, and affects that is still largely unknown if palpable, perceived, and imaginable.

We derive the term from Nigel Thrift and his discussion of Bruno Latour’s ‘hidden masses’ of the social (Latour, 2005). As Thrift puts it, ‘the human world contains a vast hinterland of ‘dark matter’ or ‘plasma’ that we do not understand and of which we often only feel as echoes and intimations which we cannot scry’ (2014, p.4). To research the city is often an attempt to understand such forces, of which we can only, at first, grasp the effects. When we think about and discuss urban assemblages, circuits, networks or meshworks, composed of data (ibid), knowledge (Macfarlane, 2011), human labor (Simone, 2004), finance capital (Simone, 2010), circulating materials (Knowles, 3980
heterotopic waste technologies (Campos, 2013), or migrants and elusive cosmopolitan elites in Michael Keith's description of the "new dark London", we are attempting new dialogues that may help us grapple with real problems lived by real people in various cities and in the city as form and process. In this sense, ‘dark matter’ is not here, as in physics, a product of theoretical speculation and rational calculation waiting to be disproved or confirmed by empirical facts. Reversely, the ‘dark matter of the urban’ signals the possibility that there is something unknown and potentially powerful that escapes our current understanding of being-in-the-city, that can be assessed in close dialogue with the empirical. How can we grasp this matter and its potential? How can we think about and theorize it? What do we do to research and account for it? Can it be possible to use it to imagine a radical, alternative form of urban theory and politics?

With this call, we are seeking cutting-edge, provoking papers – of both an empirical and theoretical nature – exploring ‘urban dark matter’, even if not necessarily using this formulation. We particularly welcome contributions from radical feminist, LGBT, and southern perspectives, which are currently underrepresented in the new urban theory we rely upon. As Santos (2014) and others we believe in the epistemological potential of underrepresented viewpoints. Papers should cover one or more of the aspects listed below:

- The city as a repository of energies and forces
- Empirical case studies on forces, densities, velocities, and affects
- Empirical or methodological reflections on accessing hidden processes of urban becoming
- Feminist, LGBT, southern, and non-mainstream perspectives on ‘urban dark matter’ and new urban theory
- Methodological challenges of investigating ‘urban dark matter’
- Oppositional and radical understanding of ‘urban dark matter’ and its potential
- The politics of ‘urban dark matter’ (new political imaginings brought forward by investigating the urban through its hidden forces)
- Critiques of existing scholarship on urban theory
- New theorizations of ‘urban dark-matter’

We plan to organize a few sessions revolving around the above points, followed by a panel including some of the scholars cited (whom we will ask to provide insights into what they conceive as the ‘dark matter’ of the urban, using selected videos and photos as a springboard for discussion). We also welcome presentations in non-traditional and participatory formats. Abstract selection will be based on relevance to the CFP, boldness, and quality of the proposal. Short papers or presentations of max. 3,000 words must be circulated two weeks in advance of the conference.
Please send abstracts of no more than 250 words to Michele Lancione ([ml710@cam.ac.uk] and Francisco Calafate-Faria ([f.calafate@gold.ac.uk]) by the 20th of October. We will confirm acceptance by the 23rd and we expect you to register and submit your abstract on the AAG website by the 26th ([http://www.aag.org/cs/annualmeeting/how_to_submit_an_abstract](http://www.aag.org/cs/annualmeeting/how_to_submit_an_abstract)).

Why do you #lovesociology? (2015-10-11 08:00)

The ASA have launched a new project, [1]Speak for Sociology, asking people on social media: why do you #lovesociology?

ASA wants to know why you love sociology. We want to hear from sociologists in all fields, at all levels, at a variety of institutions—early-career academics; teachers at community colleges; sociologists in government, research, or non-profit organizations; or undergraduate/graduate students.

Through social media accounts (i.e., Twitter, Facebook, Instagram, YouTube, blogs), use the hashtag #lovesociology and let us know your name, your institution or school (optional), and

- What got you into sociology?
- What keeps you in sociology?
- How do you use sociology in your daily life?
- What important contributions does sociology make in various fields?

We will curate the most memorable posts and include them in [2]ASA's Storify account. Note that Facebook posts must be made public or you need to tag the [3]American Sociological Association.

One problem that we have as teachers of sociology and social theory is that we are so quick to assert our authority that we end up inhibiting the honest and probing questions from our supposedly ignorant students. Nevertheless, these questions sometimes do get asked. One that I have encountered over the years is epitomized in the title of this piece.
Normally this question arises after some detailed discussion of Marx and Marxism. To someone not steeped in the history of the last two centuries, it would be easy to think that Marxism was a theory about how to make capitalism work to maximum efficiency – namely, by not inhibiting the full range of productive forces in society. On this view, Marxism is about getting capitalism to live up to its own principles, which are ones that celebrate the indefinite productivity of people. In the end, machines that we invent will do all the heavy lifting for us, while we write poetry all day – since poetry is the sort of thing that humans can clearly do better than machines.

I exaggerate – but only slightly. To be sure, ‘real’ capitalists oppose immigration restrictions, protected inheritances, preferential trade arrangements, and all of the other historic inhibitors to the full use of the factors of production – including perhaps intellectual property itself. Here Liberals and Socialists sing from the same hymn sheet – especially when both are thinking globally and not locally. The differences between the two positions arise over the power invested in the state as an agent in this process.

Liberals have tended to be much more relaxed about any overarching sense of goal or utopia in which capitalism might eventuate, whereas Socialists believe that without explicit state intervention only dystopia will result. This difference in world-historic intuition leads Socialists to be more alert to issues like 'underdevelopment' and 'inequality' as indicative of a system that cannot run well if left to its own devices. Put bluntly: Income will not be redistributed and talent will not be cultivated at sufficient levels if the future of society is made hostage to the good will of rich people. In response, Liberals invoke the fullness of time either to resolve these problems or to reveal them to be figments of the impetuous Socialist imagination, which wants utopia on demand.

From a sociological standpoint, perhaps the most interesting difference between Capitalism and Socialism is that Capitalism offers the original modern flat ontology of society, a la actor-network theory. For the capitalist, the state is simply one among many agents in the market, to be sure one with its own distinctive knowledge – but it's a knowledge that is subject to the same strengths and weaknesses of other forms of knowledge. It is not superior knowledge in the sense of enjoying a pre-emptive right to speak on behalf of others without explicit delegation. Now, this sounds nice until one records the downstream consequences. A tremendous amount of patience, good humour if not outright insensitivity is required.

Socialism, in contrast, is motivated by a sense that technocrats (or academics or some other vanguard) always already know what everyone would want if they had the opportunity to think through things for themselves. (And of course, a key Socialist ambition is to enable ordinary people to think Socialist things for themselves!) This is why ‘false consciousness’ is such a pivotal and controversial concept in Socialist thinking. Socialism is quite explicit about the temporary need for a paternalistic state to facilitate the relevant redistributions and investments that the potential beneficiaries are not in a position to decide for themselves. But ‘temporary’ means how long? In practice, Socialists are much better at speaking and doing on behalf of others than at allowing them to do so for themselves.
This event is designed to explore the ways in which citizenship has become intertwined with formal and informal education. It aimed to generate discussion about the concept of citizenship in educational systems in the UK and internationally. The day is organised around a series of keynote talks and oral paper presentations that will allow for the exchange of ideas and experiences. You can view all abstracts on the blog ([1]https://bsacitizenship.wordpress.com/2015/09/03/citizenship-and-education-event-programme/).

Keynote speakers include: Prof. David James (Cardiff University) 'Bringing the local knowledge back in? Contrasting citizenships in urban schooling' Dr Bridget Byrne (University of Manchester) 'What is the Britishness in 'British values' and the citizenship process?'

Workshop and symposium: the question of the human in social theory and social research  
(2015-10-12 09:11)

25th November 2015, 11:00 to 17:00  
WT0.05, University of Warwick

This workshop and symposium will explore the, mostly implicit, conceptions of the human, humanity and human nature that underpin various contemporary conceptions of social life. In the context of much-publicised post-human futures, this is an invitation to reconsider the idea that social life itself is predicated on the fact that human beings are capable of such collective existence. Humans are beings who have a continuity of consciousness so that they see themselves as themselves throughout their life; human are beings who negotiate a multiplicity of sometimes contradictory identities and recognise each other as members of the same species, and they are also beings who can create and interpret cultural artefacts. Crucially, humans are beings who can deploy a sense of self-transcendence so that they are able to look at the world from somebody else’s point of view and thus conceive new social institutions.

The main focus throughout the day will be on how questions about the human are encountered in social theory and social research and what are the various implications and challenges of taking these seriously in our work. The day of activities will be divided into two parts. During the morning, we will have a participatory workshop for PhD students and early-career researchers. The goal of the workshop is to help participants negotiate the sometimes abstruse scientific, philosophical, moral, and even theological underpinnings of asking questions about ‘the human’ in the context of their own research projects. Dr Daniel Chernilo (Loughborough University) will offer a general overview of this field of enquiry as well as reflect on its various implications. We will also invite participants to reflect on their own research projects by making a brief (10-minute) presentation of their research projects and how questions about the human have been or are expected to be encountered within them. We’d like to ask all participants to reflect in advance on conceptions of the human and how they pertain to their projects. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day! In the afternoon, we will have a symposium in which Dr Mark Carrigan, Professor Margaret Archer and Daniel Chernilo will engage with questions of the human as they unfold in their own work on digital sociology (Carrigan), the morphogenetic society (Archer), and philosophical sociology (Chernilo).

To register your interest, please contact D.Chernilo@lboro.ac.uk and Mark@Markcarrigan.net with a brief description (500 words or less) of your research and how questions of the human are relevant to it by October 31st, 2015. The event is free but places are limited. Travel bursaries are available for those in need of it, please ask for more details.

Learning to say ‘no’ in academic life (2015-10-13 08:00)

A really interesting reflection by Stuart Elden, editor of Progressive Geographies, about the [1]challenge of saying ‘no’ to requests and invitations. There’s a lot here that people at a much earlier stage in their career can learn from. My own experience has been that beginning to get invitations to do stuff is so flattering that it’s easy to say ‘yes’
to things that you don’t actually want to do, or are not in a position to be able to do. Read Stuart’s post in full [2]here:

When I was recently away, I came back to a lot of requests and I needed to say ‘no’ to most of them. Now I’m on sabbatical and trying to focus on writing, I’m being as focused as I can be (see my self-imposed rules, [3]here). It is a never-ending task to consider all such requests, to work out which I can do and which I can’t, and then to say ‘no’ to some in as nice a way as possible. For me at least, a non-reply is not an option.

Academic identity in the digital university: current trends and future challenges (2015-10-14 08:00)

Some talks from a really interesting [1]Society for Research Into Higher Education event are now available as podcasts:
Dr. Antonella Esposito: [2] PhD researchers using social media: Exploring the emergent trajectories of academic identities

Dr. Mark Carrigan: [3] Surviving life in the accelerated academy: prospects and problems for digital scholarship

1. http://www.srhe.ac.uk/events/pastevents/details/?eid=194

The Challenge of Sociological Writing (2015-10-14 16:20)

In this event organised by [1] The Sociological Review’s Early Career Forum, a panel of accomplished writers with a long history of supporting younger scholars reflect on the challenges of sociological writing. Each participant will give a short talk, discussing a particular aspect of the challenge of writing, before the panel opens up for a general discussion with the audience. Building on the previous work by the journal in support of ECRs, there will be a particular focus upon the difficulties encountered in writing by early career scholars in the neoliberal academy, but
also upon the pleasures and opportunities which writing offers.

Les Back - Start Writing and Keep Writing: Notes, Drafts, Proofs, Papers

Les Back is a Professor of Sociology at Goldsmiths, University of London. His main fields of interest are the sociology of racism, popular culture and city life. His work attempts to create a sensuous or live sociology committed to searching for new modes of sociological writing and representation. This approach is outlined in his most recent book “The Art of Listening” (Berg 2007). He also writes journalism and has made documentary films. In 2011 he published a free on-line book called Academic Diary (http://www.academic-diary.co.uk/) that argues for the values of scholarship and teaching in the face of austerity and the attacks on the university. His research interests include sociology of youth, ethnography, political sociology, racism and right wing extremism, music, auditory and popular culture, race and social theory, photography and urban culture and the sociology of sport.

Inger Mewburn - Title TBC

I am a researcher, specialising in research education since 2006. Prior to this I lectured in architecture and worked in architecture offices for around a decade.

I am currently the Director of Research Training at The Australian National University where I am responsible for co-ordinating, communicating and measuring all the centrally run research training activities and doing research on student experience to inform practice.

Aside from editing and contributing to the Thesis Whisperer, I write scholarly papers, books and book chapters about research student experiences. I am a regular guest speaker at other universities and do occasional media interviews. Some details of these other activities are below. For further information, view my Linkedin Profile, contact me by email on inger@mewburn.net or visit my Google Scholar page.

Pat Thomson - Organising your writing

Pat Thomson is Professor of Education in the School of Education, The University of Nottingham. Her research is centred primarily on how schools might change to be more engaging and meaningful for more children and young people. She mostly researches the arts, creativity and other kinds of experiential approaches in school and community settings, including galleries and museums. Much of this research has been conducted with her colleague Professor Christine Hall. She also has a long-term partnership with Tate Learning. She also works in researcher education and, together with Professor Barbara Kamler, researches and writes about the writing that scholars want to, and must, do.
Digital Sociology Mini-Conference (2015-10-15 08:00)

In keeping with the Eastern Sociological Society's theme of "My Day Job: Politics and Pedagogy in Academia," the Digital Sociology Mini-Conference seeks papers that address the many digital ways of knowing, particularly as those impinge on the work we do as scholars, both within and outside the academy. We seek abstracts, and wholly constituted panels, on a wide range of topics, including, but not limited to, the following themes:

· **Public Scholarship, Digital Media and the Neoliberal University:** How is the participation of scholars on public, digital media platforms regarded within the neoliberal university?

· **Digital Sociologists, Legacy Institutions:** What does it mean to do digital sociology within institutions that are steeped in legacy modes of rewarding scholarship? How are scholars navigating the landscape of getting hired, tenured and promoted with a strong digital presence, or without one?

· **Digital Sociological Methods:** How do traditional, analog sociological methods become digital? Are there new, “born digital” sociological methods? Is knowledge production different now? Will big data replace survey methodology?

· **Critical Theories of the Digital Itself:** How have we theorized the digital? What challenges does the digital pose to epistemologies underlying sociological methods?

· **Digital Structures, Digital Institutions:** The datafication of everyday life is posing unique challenges to the composition of social institutions and giving rise to new instantiations of education, finance, labor, and governance. How do we theorize, study, and conceptualize the recomposition of these institutions?

· **Identity, Community, and Networks:** How do sociological concepts of micro and macro, personal and public, "front stage" and "back stage," evolve as digital and mobile technologies increasingly blur these boundaries? How do digital environments shape identities of race, gender, sexuality and queerness? And how do the identities of those who create the platforms we use shape the platforms? How do race, gender, sexuality and queerness shape the
communities and networks in which we participate?

- **Digital Pedagogies, Digital Sociology:** How are digital technologies changing the sociological classroom? Beyond simply a recitation of ‘what I did in my class,’ we’re interested in theoretical and empirical explorations of how to think about digitally-informed pedagogies in the sociology classroom.

We encourage submissions from scholars at all levels, and are particularly enthusiastic to support the work of graduate students and early career researchers. We welcome submissions for individual papers and for entirely constituted sessions. The organizers share a commitment to creating a field that honors diverse voices, and as such are excited to see scholars from groups that are typically underrepresented in sociology. When proposing entirely constituted panels, please keep this commitment to diverse voices in mind.

If you have any questions about proposals, topics, or session ideas please contact one of the organizers: Leslie Jones ([1]lesjones@sas.upenn.edu), Tressie McMillan Cottom or Jessie Daniels ([2]jdaniels@hunter.cuny.edu).

For individual presentations, please submit an abstract of no more than 250 words, as well as the title of the paper, name of presenter, institutional affiliation and contact details. For wholly constituted sessions, please include a short description of the concept behind your session, and then include all of the abstracts (along with names and affiliations of presenters) in one document. Deadline: **October 19, 2015.** Please email your submissions to: [3]ESSDigitalSociology@gmail.com. Those whose proposals are not accepted for the Mini-Conference will be alerted in time to submit to the ESS general call for submissions.
How do young people come of age in the 21st Century? (2015-10-16 08:00)

Over-Reach By Unelected Technocrats (2015-10-17 08:00)

This is the debate which the [1]Financial Times says has been prompted by Mark Carney’s [2]intervention on climate change earlier in the week. His point seemed rather incisive to me, observing that “Since the 1980s the number of registered weather-related loss events has tripled” and that furthermore “Inflation-adjusted insurance losses from these events have increased from an annual average of around $10bn in the 1980s to around $50bn over the past decade”. Given the climatological evidence suggests that “challenges currently posed by climate change pale in significance compared with what might come”, it’s a systemic issue for insurance which needs to be addressed. His concern stems from what he terms the tragedy of the horizon:

We don’t need an army of actuaries to tell us that the catastrophic impacts of climate change will be felt beyond the traditional horizons of most actors – imposing a cost on future generations that the current generation has no direct incentive to fix.
That means beyond:

- the business cycle; [3]9
- the political cycle; and
- the horizon of technocratic authorities, like central banks, who are bound by their mandates.

The horizon for monetary policy extends out to 2-3 years. For financial stability it is a bit longer, but typically only to the outer boundaries of the credit cycle – about a decade. [4]10

In other words, once climate change becomes a defining issue for financial stability, it may already be too late.

As someone who is instinctively and reflectively hostile to technocrats, this strikes me as one of the strongest arguments it is possible to point to for the value of such figures. Their appointment frees them from narrowly political concerns, facilitating interventions which would be constrained by, among other things, the temporal horizons of other actors. This ‘freeing’ is both narrow and shallow. It is also a profoundly political act in its own right, representing a crucial strategy for placing increasing portions of economic questions beyond political scrutiny. But an adequate sociology of technocrats should recognize that insulating policy from politics will tend, all other things being equal, to grant a degree of freedom to the policy maker which is lacking for the politician (though indeed many other constraints may follow from the institutional arrangements in which the technocrat is embedded).

I find the reaction to Carney’s speech curious because I find his intervention itself so plausible. But some have argued that this ‘over-reach’ risks politicizing his role in a way that would lead appointees to be made on the basis of political criteria in future. The interesting question becomes whether such criteria might be applied to other technocrats whose role within contemporary Europe I find much less persuasive. Can we see a nascent elite cultural reaction against the encroachment of technocracy in Europe over recent years? Or is ‘over-reach’ simply what technocrats do when one disagrees with the views they are espousing?
In every democratic institution there is a push and pull between elected members and the officers - it’s one of the eternal dynamics and tensions and is essential. Officers generally have the depth of experience (and should be offering advice like this, either internally or publicly), members have the democratic mandate (and should inform how things are done, as they only rarely have the depth of knowledge). Technocrat is a derogatory term which implies that they are going further than they should - but that can only be the case if members have insufficient influence. In Europe, that is arguably because national politicians have never been willing to give directly elected MEPs the power they should have over the executive. A bigger problem is where politicians adopt a technocratic ethos, as if there is simply one objective and obvious solution, and anyone else is simply being ‘political’.

Call For Papers: Qualitative Methods and Data in Digital Societies (2015-10-18 08:00)

Call for papers: Themed Issue

Qualitative Methods and Data in Digital Societies

Qualitative Research [html: [1]http://qrj.sagepub.com %5D

*Edited by William Housley (Cardiff University), Bella Dicks (Cardiff University) and Karen Henwood (Cardiff University).*

The explosion of digital social data in recent years has required a response from both the social science and computational science communities. This has been framed as an attempt to move beyond the coming crisis of empirical sociology (Savage and Burrows, 2007, 2009; Edwards et al., 2013; Housley et al., 2014). The opportunities and challenges for social science from this ‘data deluge’ are wide ranging and a spectrum of thinking is emerging across the community that includes enthusiasts, skeptics and those with deep reservations. Yet, the rise of digital data and the claims being made for it also rest on human practices and social life in multiple ways (Dicks, 2012; Smith, 2014). Consequently, Qualitative Research is central to understanding how digital data is accomplished, lived and analysed.

This themed issue invites contributions that address the role of Qualitative Methods in responding, challenging and contributing to the reflexive interrogation and scoping of data in digital societies at situated, networked and system levels. The advent of Web 2.0, the open data movement and the rhetoric of ‘Big Social Data’ have opened up opportunities to analyse big qualitative data streams, such as those associated with social media, in ways that are not yet fully understood; new digital data developments include those associated with the emerging contours of the ‘Quantified Self’ movement and the navigation of health metrics through the use of body proxemic technology giving rise to forms of life characterised by data responsibilisation and self-analytics.

The themed issue will invite papers that report on these and associated developments. Topics of interest include:
• Ethnographic studies of interdisciplinary collaboration in the area of digital data analysis, digital tool development, platform development and the associated context(s) of occupational identities and expertise.

• The Qualitative dimensions and issues surrounding coding and annotation practices through new methods such as crowdsourcing techniques and citizen social science. Qualitative studies of the social life of methods in the digital era and the observation of 'naturally occurring' data generation practices that make use of new networked technologies in the pursuit of self-management and performance. This might also include studies that demonstrate how digital actors reflexively navigate data streams in ways that are nuanced and complex and not akin to being a 'cultural dope 2.0'.

• The interaction order in the digital age; the ‘Self’, identity and digital data.

• Methodographic studies of the design and use of algorithms in digital tool development and data harvesting, the examination of code and machine learning as an accomplishment and artefact, the social organisation of statistics and modelling, the examination of demographic proxies in social media analytics and issues surrounding inference and evidence within the Big Social Data imaginary.

• The relationship between 'small' and 'big' social data. Innovations in the Qualitative analysis of Big Text data and social media streams.

• The ethical dimensions and politics of data in the digital age. Data inequalities: gender, race, class and the accomplishment of data.

References

Please send an abstract of no more than 250 words to: [2]JonesA7[at]cardiff.ac.uk by 31 December 2015. Abstracts will be reviewed for fit. You will be informed if the article is invited for review. Full manuscripts are due by 1 June 2016.
The Pre-History of the Internet of Things (2015-10-19 08:00)

I had no idea how long this notion had been around for. Blair Newman was a notoriously drug addled technologist (who once tried to claim cocaine as a business expense) into whose failed venture Microsoft ploughed $50,000 in the late 70s. At the same time, he was also kicking around the idea of an architecture for the Internet of things, predicated upon overly optimistic assumptions that have only recently been proved correct. Quoted from Gates, by Stephen Manes and Paul Andrews, loc 3423-3442

The idea, as expressed in an early document, was that "by the end of the 1980s, experts predict microprocessors will be a part of almost every electrical consumer product selling for more than $20." The logical extension of this prediction—which actually turned out to be more or less true—was that for virtually no additional cost, these microprocessors could be designed to communicate with each other, forming "a modular intelligent network . . . the central nervous system of the microcomputerized home of the future." Shades of the 1962 Seattle World’s Fair! "Energy Conservation . . . Personal Safety . . . Convenience." With Home Bus, you could remotely control everything from your blender to your hot tub. Newman’s Home Bus Standards Association, in conjunction with the research firm SRI International, would develop a single home bus standard that everyone could agree on, and chipmakers and home computer makers would jump gleefully on board. Bill Gates was one of the Association’s original three directors. An outfit called 3Com, masterminded by Robert Metcalfe, who had invented the seminal Ethernet computer network in his Xerox days, was doing Home Bus consulting for General Electric. The idea was that GE would produce its own computer—code name Homer—that could via some sort of network—Home Bus!—control all the GE toasters and blenders and dishwashers in the house.
Available for pre-order now! See [1]here for the cheapest place to buy it online, as well as table of contents & summary.

Workshop and Symposium: The Question of the Human in Social Theory and Social Research
(2015-10-20 08:00)

25th November 2015, 11:00 to 17:00
WT0.05, University of Warwick

This workshop and symposium will explore the, mostly implicit, conceptions of the human, humanity and human nature that underpin various contemporary conceptions of social life. In the context of much-publicised post-human futures, this is an invitation to reconsider the idea that social life itself is predicated on the fact that 4000
human beings are capable of such collective existence. Humans are beings who have a continuity of consciousness so that they see themselves as themselves throughout their life; human are beings who negotiate a multiplicity of sometimes contradictory identities and recognise each other as members of the same species, and they are also beings who can create and interpret cultural artefacts. Crucially, humans are beings who can deploy a sense of self-transcendence so that they are able to look at the world from somebody else's point of view and thus conceive new social institutions.

The main focus throughout the day will be on how questions about the human are encountered in social theory and social research and what are the various implications and challenges of taking these seriously in our work. The day of activities will be divided into two parts. During the morning, we will have a participatory workshop for PhD students and early-career researchers. The goal of the workshop is to help participants negotiate the sometimes abstruse scientific, philosophical, moral, and even theological underpinnings of asking questions about ‘the human’ in the context of their own research projects. Dr Daniel Chernilo (Loughborough University) will offer a general overview of this field of enquiry as well as reflect on its various implications. We will also invite participants to reflect on their own research projects by making a brief (10-minute) presentation of their research projects and how questions about the human have been or are expected to be encountered within them. We’d like to ask all participants to reflect in advance on conceptions of the human and how they pertain to their projects. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day! In the afternoon, we will have a symposium in which Dr Mark Carrigan, Professor Margaret Archer and Daniel Chernilo will engage with questions of the human as they unfold in their own work on digital sociology (Carrigan), the morphogenetic society (Archer), and philosophical sociology (Chernilo).

To register your interest, please contact D.Chernilo@lboro.ac.uk and Mark@Markcarrigan.net with a brief description (500 words or less) of your research and how questions of the human are relevant to it by October 31st, 2015. The event is free but places are limited. Travel bursaries are available for those in need of it, please ask for more details

Janet Salmons (2015-10-20 19:11:47)
Will this symposium be entirely face-to-face or will there be an online component? Online presenters?

Digital Social Science Essay Competition (2015-10-21 08:00)

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic ‘Influence and Power’. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful
essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a re-thinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF’s criteria and goals may be viewed [1]here.

Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal’s key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.

The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition’s theme and falls within the remit of BD &S’s goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.

The submitted essays will be judged and the winning essay will be chosen by an academic panel (the ISRF Essay Prize Committee). The panel’s decision will be final, and no assessments or comments will be made available. The result will be notified to applicants by email during April 2016 and will then be announced by posting on the websites of the ISRF and of BD &S. The ISRF and BD &S reserve the right not to award the prize, and no award will be made if the submitted essays are of insufficient merit.

The winning essay will be accepted for publication in the Journal; the author may be asked to make some revisions before publication. Other applicants may have their submissions accepted for publication in the Early Career Researcher forum of BD &S subject to the Journal’s peer review and decision-making process.

The details and criteria are:

**Essay topic:** Influence and Power (This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field.)

**Eligibility:** Participants should either be current doctoral students or within three years of being awarded their doctorate.

**Essay length:** 5,000 to 7,000 words

**Essay format:** Follow the BD &S Author Guidelines, available on the BD &S website.

**Language:** English

**Submission deadline:** 31 January 2016

**Queries:**
[2]essayprize2016@isrf.org

Submissions should be made online at [3]https://mc.manuscriptcentral.com/bdas and authors should indicate...
Since first encountering the notion of discretionary effort, I've been fascinated by it. This is a definition I found on page one of Google:

Discretionary effort is the level of effort people could give if they wanted to, but above and beyond the minimum required. Many organizations manage performance in such a way that motivates employees to do only enough to get by and avoid getting in trouble (negative reinforcement).

What renders discretionary effort so problematic is how difficult it is to verify the amount of effort people could give if they wanted to. Particularly if employees are conceived as rationally seeking to minimise their effort, it can license all sorts of performance related interventions in order to mine discretionary effort: heating up the floor to see who can keep hopping the longest, in the pithy phrase used by Will Davies which I've been obsessed by since coming across it.

But things looks rather different is arenas where passion dominates occupational self-understanding. This is something I've blogged about a lot before but it's been on my mind recently since I interviewed the team behind The Sociological Review's excellent Gender and Creative Labour monograph (podcast coming soon on [2]@thesocreview). The invocation of passion offers an entirely new way to mine discretionary effort, one that is perhaps more congruent with the day-to-day necessities of knowledge work orientated towards creative production. This is how a programmer described the experience of being a new hire in the early days of Microsoft, a place renowned for the expectations of long working hours that were perceived to dominate the employment culture of the firm. Quoted from Gates, by Stephen Manes and Paul Andrews, loc 2993:

Fresh from academe, he loved the challenge. “It wasn’t like there was pressure to work twelve-hour days. It’s like you were an astronaut or something. You just kind of loved working so much.”
Loc 2993

#icanhazpdf (2015-10-23 14:35)

This new way of finding articles is cool. Three people sent me this link in the last few days (two mathematicians and one social scientist). It’s not new, but it is the first sign of organisation spreading beyond social scientists’ personal friendship lines.

But it is a piecemeal approach, a laborious micro-rebellion. Seriously, when will we in the social studies and humanities realise that what we really need is a much larger, concerted movement against the outrageous system of academic journals? What we need is our own version of the [2]ArXiV which is currently used by everyone in the mathematical and computer sciences, physics, statistics, quantitative biology and quantitative finance. We aren’t children. We must make the rules, not break them.

1. http://qz.com/528526/academics-have-found-a-way-to-access-insanely-expensive-research-papers-for-free/
There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement, quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life. Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays. Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This three-day conference investigates the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis
Keynote Speakers

Roger Burrows (Goldsmiths, University of London) – Ancient Cultures of Conceit Reloaded

In 1990 the sociologist Ian Carter published Ancient Cultures of Conceit – a brilliant analysis of campus fiction. It provides a wonderful rendering of a world we have lost – a world where academic life was slower paced and where spreadsheets, metrics, business plans and impact agendas were largely unknown. This paper attempts to carry forward Carter’s analysis over the last 25 years examining more recent examples of the campus fiction genre but also including fictional representations of campus life to be found on social media.

Philip Moriarty (University of Nottingham) – The Power, Perils and Pitfalls of Peer Review in Public

There are major deficiencies in traditional peer review. Not only can clearly flawed papers easily pass ‘scrutiny’ with flying colours, but the idea that a study is accepted into the scientific literature on the basis of a handful – or, not infrequently, one – set of anonymous reviewer comments seems quaint and archaic in a Twitter-, blogosphere-, and BuzzFeed-enabled world. Post-publication peer review, enabled by sites such as PubPeer, is an exceptionally important tool for online critique, analysis, and scrutiny of published papers. For the next generation of researchers, PPPR will almost certainly be de rigueur. Before we get to that point, however, there are quite a number of teething problems that need to be addressed. These include, in particular, the key issue of the role of anonymity and moderation in online commentary.

Susan Robertson (University of Bristol) – Vertigo: Time and space in the contemporary university

One of Henri Lefebvre’s great intellectual contributions was not only how we think about the spatiality and temporality of social life but that lived/in spaces and their social relations are the outcome of ongoing cultural, political and economic projects and their dynamics. In this lecture I explore the changing nature of the contemporary university, and the ways in which recalibrations of time and space are also simultaneously the medium, object, and outcome of these projects and dynamics. I invoke the idea of ‘vertigo’ – the sensation of the world moving, and profound anxieties about the potential for a loss of height – as a way of exploring the complex ways in which governing the university through temporal and spatial strategies mediates the ongoing experiences of living, learning, and working, in the university.

James Wilsdon (University of Sussex) – The Metric Tide: Reflections on the UK’s Independent Review of Metrics in Research Assessment and Management

There are powerful currents whipping up the metric tide. These include growing pressures for audit and evaluation of public spending on higher education and research; demands by policymakers for more strategic intelligence on research quality and impact; the need for institutions to manage and develop their strategies for research; competition within and between institutions for prestige, students, staff and resources; and increases in the availability of real-time ‘big data’ on research uptake, and the capacity of tools for analysing it. Citations, journal impact factors, H-indices, even tweets and Facebook likes – there are no end of quantitative measures that can now be used to assess the quality and wider impacts of research. But how robust and reliable are such indicators, and what weight – if any – should we give them in the management of the UK’s research system? Over the past year, the UK’s Independent Review of the Role of Metrics in Research Assessment and Management has looked in detail at these questions. The review has explored the use of metrics across the full range of academic disciplines, and assessed their potential contribution to processes of research assessment like the Research Excellence Framework (REF). It has looked at how universities themselves use metrics, at the rise of league tables and rankings, at the relationship between metrics and issues of equality and diversity, and at the potential for ‘gaming’ that can arise from the use of particular indicators in the funding system. The review’s final report, The Metric Tide, was published on 9 July 2015. In his talk, James Wilsdon will reflect on the review process, outline its main findings, and consider the opportunities...
and obstacles to more responsible uses of metrics in the research system.

Oili-Helena Ylijoki (University of Tampere) – ‘Projectification’ and conflicting time orders in academic knowledge production

Under the current conditions of academic capitalism and market-driven managerialism, university research is increasingly conducted in large projects on external, competitive funding from various national and international sources. The project format offers a fixed-term, fast and flexible organizational mode which fits together with constantly changing needs of the turbulent university environment. This paper argues that the 'projectification' of science creates a special project time which stands in conflict with process time. Project time, embedded in standardized and abstract clock time, is decontextualized, linear, cumulative and predictable, entailing a strictly defined timeframe with a fixed beginning and end. This is in a sharp contrast with nonlinear, context-dependent and unpredictable process time involving unforeseen periods of standstill, deceleration and acceleration. Furthermore, project time includes 1) commodification of time by translating research process into money, 2) control of time by dividing research into beforehand determined phases in which accountability of the use of time is required, 3) compression of time by speeding up research productivity, and 4) colonization of time by subordinating alternative temporalities in research. The paper discusses how the intensification of project time reshapes and remoulds research practices and academic subjectivity, and what possibilities for alternative temporalities can be created and sustained at the accelerated academy. This is done by distinguishing temporal dilemmas and ways to live with them: long-term commitment vs. short-term funding; fast pace vs. slow thinking; time efficiency vs. wasting time; linear career time vs. circular project rat race; and work time vs. existential time.

Dying alone in New York (2015-10-25 08:00)

A fantastic, chilling ethnography of death in the modern metropolis - and of a life forgotten and pieced together from postmortem scraps. This text gives insights not only into the journey of a death person through a number of complex social institutions, but also into the world of different professionals employed in dealing with death.

[1]The Lonely Death of George Bell, by N. R. Kleinfield, photography by Josh Haner

"In discovering a death, you find a life story and perhaps meaning. Could anything in the map of George Bell’s existence have explained his lonely end? Possibly not. But it was true that George Bell died carrying some secrets. Secrets about how he lived and secrets about who mattered most to him. Those secrets would bring sorrow. At the same time, they would deliver rewards. Death does that. It closes doors but also opens them."
The International Journal of Social Research Methodology Seminar Competition (2015-10-25 08:00)

The Board of the *International Journal of Social Research Methodology (IJSRM)* is pleased to announce the launch of our new Seminar Competition. Our aim is to support the development of critical and innovative approaches to on-going and emerging methodological debates across a range of approaches, both qualitative and quantitative, and including mixed and comparative methods, as these relate to philosophical, theoretical, ethical, political and practice issues. Seminars may consist of single or multiple day events. Topics can include any area of social research methodology.

**Available funding £1500**

**Guidelines for Applicants**

We are seeking proposals that are concerned with debate and critical development of original cutting edge work of methodological significance. Seminars may bring together established and new researchers. They should be collaborative in approach across different institutions and disciplines and may include colleagues from relevant, non-HE, organisations. Proposals should have clear goals and outcomes with evident concern to the methodological contribution of the Seminar. In addition, a core purpose of the Seminar series is to engage with, and contribute to the development of an international community of social researchers. Accordingly, proposers may consider how their events can be recorded for non-participants and posted on the IJSRM multimedia site. Proposers should also consider including the production of new papers for potential publication in *IJSRM*. Such papers will be subject to the normal review procedures of *IJSRM* with no guarantee of publication.

**Format**

We are open to suggestions for format either in the form of a single day seminar or in the form of multiple days across the year 2016. It is expected that the funding will be used towards meeting the cost of room and equipment hire, hospitality, consumables and travel for speakers. It is expected that there are no costs for delegate attendance.

**How to Apply**

Further details and an application form can be obtained from Alice Edwards, Journal Administrator, tsrm-editor@tandf.co.uk.

**Closing date for applications: 30 November 2015**

**Assessment Criteria**

All submissions will be reviewed by a Committee drawn from the Board of *IJSRM* and will be assessed against the following criteria:

- Contribution to the development of methodological innovation and debate;
- Relevance to the aims and scope of *IJSRM*;

- Projected outputs and impact;

- Value for Money

**Notes**

- All successful seminars will have a named Principal Organiser and named Co-Organiser. The Principal Organiser will be responsible for all promotion and management of the programme of work, including arrangements for the venue, rooms, facilities, dealing with expense forms, submitting claim forms for event costs to *IJSRM*.

- Travel, at standard return rail fare rates and reasonable subsistence for speakers is permissible. Fees will not be paid to speakers.

- Delegates will not be paid expenses for attendance.

- The events will be promoted by the Principal Organiser and co-organisers through their research networks, institutions and departments. All communications with participants and publicity of events will acknowledge sponsorship by the *International Journal of Social Research Methodology*.

- Further promotion will be undertaken by Taylor & Francis as appropriate.
This workshop and symposium will explore the, mostly implicit, conceptions of the human, humanity and human nature that underpin various contemporary conceptions of social life. In the context of much-publicised post-human futures, this is an invitation to reconsider the idea that social life itself is predicated on the fact that human beings are capable of such collective existence. Humans are beings who have a continuity of consciousness so that they see themselves as themselves throughout their life; human are beings who negotiate a multiplicity of sometimes contradictory identities and recognise each other as members of the same species, and they are also beings who can create and interpret cultural artefacts. Crucially, humans are beings who can deploy a sense of self-transcendence so that they are able to look at the world from somebody else’s point of view and thus conceive new social institutions.

The main focus throughout the day will be on how questions about the human are encountered in social theory and social research and what are the various implications and challenges of taking these seriously in our work. The day of activities will be divided into two parts. During the morning, we will have a participatory workshop for PhD students and early-career researchers. The goal of the workshop is to help participants negotiate the sometimes abstruse scientific, philosophical, moral, and even theological underpinnings of asking questions about ‘the human’ in the context of their own research projects. Dr Daniel Chernilo (Loughborough University) will offer a general overview of this field of enquiry as well as reflect on its various implications. We will also invite participants to reflect on their own research projects by making a brief (10-minute) presentation of their research projects and how questions about the human have been or are expected to be encountered within them. We’d like to ask all participants to reflect in advance on conceptions of the human and how they pertain to their projects. Uncertainty
here is not a problem, in fact it will be a useful contribution to discussions on the day! In the afternoon, we will have a symposium in which Dr Mark Carrigan, Professor Margaret Archer and Daniel Chernilo will engage with questions of the human as they unfold in their own work on digital sociology (Carrigan), the morphogenetic society (Archer), and philosophical sociology (Chernilo).

To register your interest, please contact D.Chernilo@lboro.ac.uk and Mark@Markcarrigan.net with a brief description (500 words or less) of your research and how questions of the human are relevant to it by October 31st, 2015. The event is free but places are limited. Travel bursaries are available for those in need of it, please ask for more details.

Media and the Environment: 2016-2017 Media@McGill Postdoctoral Fellowship (2015-10-26 06:51)

Call for Application: 2016-2017 Media@McGill Postdoctoral Fellowship

Description: Media@McGill is a hub of interdisciplinary research, scholarship and public outreach on issues in media, technology and culture, located in the Department of Art History and Communication Studies at McGill University in Montreal, Canada. To see the list of postdoctoral fellowships, click here.

Media@McGill offers every year one Postdoctoral Fellowship to a promising scholar engaged in media-related research, as defined in Media@McGill's mission statement.

Fellows are provided with a workspace, and are expected to take an active role in the research activities and academic life of Media@McGill (participation in conferences, seminars, etc.). They may also have the possibility of teaching a course within the Department of Art History and Communication Studies at McGill.

Eligibility: The Media@McGill Postdoctoral Fellowship is open to both national and international scholars who have completed their doctoral degree in a university other than McGill no earlier than June 1, 2012. Candidates must have defended their dissertation and received their PhD by May 1, 2016. Fluency in English is essential; working knowledge of French is an asset.

Value and Duration: The stipend for the Media@McGill Postdoctoral Fellowship is $45,000 CAD for 12 months (this includes a travel research stipend) beginning in September 2016.

Application Process Deadlines: Media@McGill will be offering one Postdoctoral Fellowship for 2016-2017.

- In a cover letter, applicants must stipulate how their research is related to Media@McGill's mission statement and Media@McGill's 2016-17 theme: Media and the Environment. Applicants should also identify a potential faculty supervisor from the McGill Department of Art History and Communication Studies, who is a member of Media@McGill and whose research is closely tied to that of the applicant. Please do not contact the potential supervisor at this stage.

The following should be included in all statements of interest and be sent in a single pdf (the application will not be 4012
accepted otherwise). The documents’ order follows the list below:

- a cover letter;
- a research proposal (750 words);
- a Curriculum Vitae (maximum 5 pages).

**Deadline:** Completed statements of interest should be sent to sophie.toupin@mcgill.ca by **Friday, January 29, 2016 at 5:00 p.m. E.D.T.**

- Statements of interest will be reviewed by the Media@McGill potential supervisor, and candidates will be notified of results shortly after. If successful, the short-listed applicants will be asked to provide the following additional documents:
  - official copies of transcripts during graduate studies;
  - three letters of recommendation (one of which is by the potential Media@McGill faculty supervisor);
  - a writing sample (maximum 20 pages).

**Deadline:** Completed applications should be sent to sophie.toupin@mcgill.ca by **Thursday, March 24, 2016 at 5:00 p.m. E.D.T.** Applications will be reviewed by Media@McGill's Steering Committee, and candidates will be notified of results in early May 2016.

For additional information, please contact sophie.toupin@mcgill.ca

Work, Employment and Society Editorial Board: Call for Applications (2015-10-26 08:00)

Work, Employment and Society Editorial Board

Call for Applications

Deadline: Thursday 5 November 2015, 17:00 (GMT)

Work, employment and society is seeking 10 new members of its Editorial Board to serve for three years from January 2016 to end of December 2018.

The Board welcomes applications involving any areas of methodological, theoretical and empirical expertise, though all applicants should be able to demonstrate an interest in and understanding of sociology.

Candidates with expertise in the following areas are particularly needed:

- Quantitative Methods
- Political Economy
- Comparative Employment Relations
- Theory (especially Social Theory)
- Sociology of Health
- Body Work/Sex Work
- Sociology of the Professions
- Self-employment

WES seeks academics based in the UK for the editorial board, but welcomes members from diverse backgrounds – both cultural and academic – to contribute to the diversity of research published by the journal.

The full call and application form are available on the BSA website:

For further information, please contact Sophie Jaques at [2]wes.journal@britsoc.org.uk

2. mailto:wes.journal@britsoc.org.uk
Rethinking UK Research Funding - Manchester, November 4th (2015-10-27 08:00)

Rethinking UK research funding

- Do you have strong opinions about the way academic research is funded in the UK?
- Maybe you're a researcher employed on one short term project after another and have ideas about how things could be better organised?
- Maybe you are concerned about the effect the competitive culture in research has on the quality of results and their reproducibility and believe changes in the way funds are allocated could improve the situation?
- Or perhaps you believe that the current system for research funding is basically excellent, but have a strong view about one particular issue that needs to be addressed?

If any of the above apply to you, you should consider attending a **FREE** one day event being held as part of Manchester [1]Policy Week 2015, [2]Rethinking UK Research Funding on 4th November. You can register your interest [3]here.

Confirmed speakers include:

- Adisa Azapagic, Professor, Chemical Engineering, The University of Manchester
- Elizabeth Bohm, Senior Policy Advisor, The Royal Society
- Iain Cameron, Head of Research Careers and Diversity, Research Councils UK
- Colette Fagan (Session Chair), Professor of Sociology, Faculty of Humanities Deputy Dean & Associate Dean – Research, The University of Manchester
- Ruth Gilligan, Manager, Athena Swan, Equality Challenge Unit
- Laurence Hopkins, Universities and Colleges Employers Association, Head of Research
- Michael MacNeil, National Head of Bargaining & Negotiations, University and College Union
- Andrew Miller, former MP for Ellesmere Port and Chair of the House of Commons Science and Technology Select Committee (to 2015)
- Peter Simpson, Director of the N8 Partnership and former Director of Discovery Sciences at AstraZeneca
- Nalin Thakker (Session Chair), Professor of Molecular Pathology and Genetics, Associate Vice-President for Compliance, Risk and Research Integrity, The University of Manchester

There will be two speaker/panel discussion sessions in the morning: "Research Reproducibility, Ethics and Outcomes" and "Creating Sustainable Researcher Careers/ Researcher Quality of Life" and in the afternoon delegates will take part in a number of workshops aimed at developing ideas for innovative approaches to research organisation, or changes to current models, which should positively influence:

- Research reproducibility, ethics and outcomes
• How research funds are allocated and spent
• Researcher quality of life
• Creating sustainable researcher careers

A summary programme for the day can be downloaded [4]here.

### How to shift sociological product: lessons from the career of Tony Giddens (2015-10-28 08:00)

Taking the lead from Peter Walsh’s laudible work [1] on academic celebrity, here’s some lessons from the career of Tony Giddens which I inferred from [2] this excellent review article Peter pointed me towards, coupled with my own reading of Giddens, who was the major protagonist for my PhD:

• Choose your targets well. Take early aim at the established masters. Draw upon the established canon but re-articulate it in a idiosyncratic way.

• Demonstrate a mastery of the classics that is cashed out in terms of their translation into contemporary concerns.

• Tie your interests, however general they may be, into the most pressing topics of the day.

• Cultivate both your critics and yours fans: engage often and generously.

• Publish lots, ideally in a way that combines repetition with reliable progress into new intellectual domains.

• Write texts books. Seriously.

• Own the company that publishes your books. Or, if you can’t, at least exercise substantial influence over the channels through which you disseminate your work.

• (Re)define the canon in a way easily taken up by others.

• Edit the major journal(s) outside of your professional stronghold

• Seek prestigious institutional positions and deploy them to maximal effect in disconnected arenas.

Interestingly, [3] Clegg writes in 1992 that “few have sought to challenge with a competitive strategy based on equivalent market penetration”. But since then many have. Stiegler, Bauman and Zizek, to name but three, have all achieved a rate of publication far beyond that which led Clegg to be so fascinated with Giddens. However, at least the latter two have self-plagiarised extensively, perhaps pointing to Giddens as having pushed the productivity bar...
to the maximum extent possible before one is forced to start copying & pasting from one book to the next in order to keep the profitable publications flowing.

Humanity on a Budget, or the 'Value-Added' of Being Human (2015-10-28 10:14)

This piece is dedicated to [1]Stefan Stern, who picked up on – and ran with – a remark I made at this year’s [2]Brain Bar Budapest, concerning the need for a 'value-added' account of being 'human' in a world in which there are many drivers towards replacing human labour with ever smarter technologies.

In what follows, I assume that 'human' can no longer be taken for granted as something that adds value to being-in-the-world. The value needs to be earned, it can't be just inherited. For example, according to animal rights activists, 'value-added' claims to brand 'humanity' amount to an unjustified privileging of the human life-form, whereas artificial intelligence enthusiasts argue that computers will soon exceed humans at the ('rational') tasks that we have historically invoked to create distance from animals. I shall be more concerned with the latter threat, as it comes from a more recognizable form of 'economistic' logic.

Economics makes an interesting but subtle distinction between 'price' and 'cost'. Price is what you pay up-front through mutual agreement to the person selling you something. In contrast, cost consists in the resources that you forfeit by virtue of possessing the thing. Of course, the cost of something includes its price, but typically much more – and much of it experienced only once you've come into possession. Thus, we say 'hidden cost' but not 'hidden price'. The difference between price and cost is perhaps most vivid when considering large life-defining purchases, such as a house or a car. In these cases, any hidden costs are presumably offset by 'benefits', the things that you originally wanted – or at least approve after the fact – that follow from possession.

Now, think about the difference between saying, ‘Humanity comes at a price’ and ‘Humanity comes at a cost’. The first phrase suggests what you need to pay your master to acquire freedom, while the second suggests what you need to suffer as you exercise your freedom. The first position has you standing outside the category of 'human' but wishing to get in – say, as a prospective resident of a gated community. The second position already identifies you as 'human' but perhaps without having fully realized what you had bargained for. The philosophical movement of Existentialism was launched in the mid-20th century by playing with the irony implied in the idea of 'human emancipation' – the ease with which the Hell we wish to leave (and hence pay the price) morphs into the Hell we agree to enter (and hence suffer the cost). Thus, our humanity reduces to the leap out of the frying pan of slavery and into the fire of freedom.

In the 21st century, the difference between the price and cost of humanity is being reinvented in a new key, mainly in response to developments – real and anticipated – in artificial intelligence. Today 'humanity' is increasingly a boutique item, a 'value-added' to products and services which would be otherwise rendered, if not by actual machines then by humans trying to match machine-based performance standards. Here optimists see 'efficiency gains' and pessimists 'alienated labour'. In either case, 'humanity comes at a price' refers to the relative scarcity
of what in the past would have been called ‘craftsmanship’. As for ‘humanity comes at a cost’, this alludes to the difficulty of continuing to maintain the relevant markers of the ‘human’, given both changes to humans themselves and improvements in the mechanical reproduction of those changes.

Two prospects are in the offing for the value-added of being human: either (1) to be human is to be the original with which no copy can ever be confused, or (2) to be human is to be the fugitive who is always already planning its escape as other beings catch up. In a religious vein, we might speak of these two prospects as constituting an ‘apophatic anthropology’, that is, a sense of the ‘human’ the biggest threat to which is that it might be nailed down. This image was originally invoked in medieval Abrahamic theology to characterize the unbounded nature of divine being: God as the namer who cannot be named.

But in a more secular vein, we can envisage on the horizon two legal regimes, which would allow for the routine demonstration of the ‘value added’ of being human. In the case of (1), the definition of ‘human’ might come to be reduced to intellectual property-style priority disputes, whereby value accrues simply by virtue of showing that one is the originator of something of already proven value. In the case of (2), the ‘human’ might come to define a competitive field in which people routinely try to do something that exceeds the performance standards of non-human entities – and added value attaches to that achievement.

Either – or some combination – of these legal regimes might work to the satisfaction of those fated to live under them. However, what is long gone is any idea that there is an intrinsic ‘value-added’ to being human. Whatever added value there is, it will need to be fought for tooth and nail.

Israel Contreras (2017-04-23 01:54:59)
Dr. Fuller, Interesting thoughts. I have a few questions. How can humans add value in a world where technology (AI, robots) can bypass them in almost every way? After all, the world only needs so many people working on “creative” endeavors. What happens to the people that can only do the repetitive tasks? Your phraseology “out of the frying pan of slavery into the fire of freedom” invokes a negative connotation of freedom? How can that be? Exactly what do you mean by the following “the term human can no longer be taken for granted as something that adds value to being in the world.” That seems to trivialize what it means to be human. What do you see as the ethical consequences of taking such a view? How does your comment stand against the possible ethical consequences of taking such a view of humanity? What does this do to human rights? Who gets to determine what is valuable? What happens to humans that dont prove their worth? Respectfully

Steve Fuller (2017-04-24 06:07:21)
I'll respond to your questions in successive paragraphs, corresponding to your own: It’s not clear that we need humans to do repetitive tasks or that we need so many humans in the first place. After all, what Marx and others called ‘dehumanization’ was all about people being reduced to repetitive tasks. So, if that’s all people were doing, that wouldn’t necessarily be a life worth living. I’m simply trying to show that the move from slavery to freedom doesn’t mark a straightforward improvement in the human condition. It has costs as well as benefits, though we generally take the benefits to be worth the costs. For example, one ‘cost’ of freedom is that you’re legally obliged to take personal responsibility for your actions. This is not necessarily the case under a slave regime, in which the master may be held accountable for a slave’s behaviour, just as the owner of a dangerous dog might be today. Actually I do not take what I’m saying here as especially controversial. After all, the concept of ‘human rights’ in its legally binding sense – as opposed to a philosophical or theological fantasy – came into being only with the 1948 UN Universal Declaration on Human Rights because prior conceptions of ‘civil rights’ were not adequate, for a variety of reasons, to safeguard
our humanity. After all, civil rights can be both granted to and taken from individuals and groups by the state. Consider the case of Jews in Nazi Germany. In this respect, civil rights are not sufficient to safeguard humanity because to be 'human' is more than simply being a citizen in good standing with the state. Implied here is a 'value added' notion of what it means to be human.

Israel Contreras (2017-04-28 16:39:30)

Dr. Fuller, I will follow your taxonomy with the paragraphs and answering questions... So what happens to those who only can do repetitive task type jobs? Or for that matter, those who technology simply passes up? What does that do to a job market based on repetitive tasks? What happens to people that have not previously done something or created something previously recognized as valuable? Why would it be necessary to explore the negatives of moving from slavery to freedom when civil freedom is the highest value we hold? I'm just a little confused why that is even part of the discussion. Are you entertaining the idea that people who don't prove their worth be slaves? Regarding human value....Respectfully, I don’t see how your comment answers any of my questions. When you say that you don’t take anything here as especially controversial, that seems to say that there is some long standing tradition that has already recognized that humanity is something that has to bought and maintained through value. This seems to be a remarkable departure from western civilization where all humans are created equal and endowed with certain inalienable rights. I've seen this line of thought in many alt right circles but under the guise of culturalism. What you are saying appears to be some form of that but only in a technological sense...or at least a sense in which no one can be human that hasn't done something that someone somewhere with power and authority deems as valuable. I'm having trouble understanding why you think since civil rights are not perfect and can’t be protected from every type of assault that they shouldn’t exist as a basis for being human. Further questions or questions I didn’t see how your response in the third paragraph answered... Doesn’t making humanity based on value become something even worse than the nazis? What happens to humans who have not added value? Did you have a certain animal rights argument in mind as the basis What do you see as the ethical consequences of taking such a view? How would it play out to have a society where only people who have added value get human dignity? How does your comment stand against the possible ethical consequences of taking such a view of humanity? What does this do to human rights? Who gets to determine what is valuable? What happens to humans that dont prove their worth? Respectfully submitted

Steve Fuller (2017-04-30 15:17:47)

I think I've already covered much of this. You perhaps don’t accept my answers. I’ll try to be more pointed. 1. We have had this problem since the dawn of capitalism, as technology inherently targets repetitive tasks and hence periodically renders much of the labour force redundant. People adapt to the change, perhaps not everyone and many adapt only fitfully. This is what education – including mid-career retraining and lifelong learning – is supposed to be about. I guess I don’t believe that some people are just fit for repetitive tasks. In any case, people who do share you worry tend to support the idea of a Universal Basic Income, so you don’t need to prove your worth through work. 2. If you really believe in freedom, then you also have the freedom to become a slave. Note that slavery need not be someone’s permanent condition. People have been able to buy their way out of it or have their slavery commuted in some other way. Not all slave societies are hereditary and irreversible. One advantage of being a slave is that someone else takes responsibility for your actions. Admittedly that might not be enough of a selling point to prefer a slave’s life, and of course both capitalist and socialist societies have placed taboos on slavery. My only point is that freedom doesn’t come for free – it imposes its own burdens, which are summed up in the word ‘responsibility’. 3. Actually I did answer your question, and it has nothing to do with what alt-right people say these days. Civil rights are rights you have by virtue of being a citizen of a country. To be a citizen is to be ‘more’ than simply being a human being. It both empowers and obliges you in ways that non-citizens are not. If you leave your country or renounce your citizenship, your legal standing becomes uncertain. Of course, countries with good diplomatic relations normally host each other’s citizens – though you often need a visa. Now, what happens when you’re a refugee or for some other reason ‘stateless’? How does your humanity help you under those circumstances? The answer is unfortunately radically unclear, as we see in the never-ending refugee crises and ‘failed states’ around the world. My point is that even before we start talking about futuristic worlds where AI takes all our jobs, we have yet to accord the sheer fact of ‘being human’ all the much normative standing. We’re already looking for the ‘value added’ of a human life. It’s a disgraceful state of affairs, considering the endless talk about ‘human rights’. But we seem to live with it on a daily basis.
Dr. Fuller, Thanks again for your response. It’s not that I don’t accept your answers. It’s just that I don’t see your answers recognizing certain issues that are bound to arise. Nor do I see your answers adequately refuting certain preconceptions.

1. How can even middle class wages pay for college throughout their life? I attend college due to a law passed in Texas for veterans. This allows me not to pay tuition. However, if it wasn’t for this, which I daresay is not the case for most individuals, it would be impossible for me to attend college and support my family. I can see your criticism of repetitive tasks and I can see automation freeing humans up from this labor as a good thing. However I think most would rather choose freedom and a job of repetitive tasks than slavery.

2. Which brings me to my next point....I actually don’t believe that people have the freedom to become slaves. Liberty is an inalienable right which means that no one, not even yourself, can take that away from you. I don’t often agree with the Alabama State Constitution. But it has a section entitled declaration of rights....the very last declaration is a section that the previous rights are inviolate which means they can’t be taken away. So, since I don’t think people have a right to sign away their freedom, and am no fan of Nozick’s ideas that contracts form the basis of ethics and society, I can’t accept your conclusion since I don’t agree with you premises. Freedom very well doesn’t come free. But that doesn’t mean freedom is worse than slavery....

3. You seem to be undercutting the idea that human beings have basic dignity. But your examples seem to be in the context of real life situations. I have in mind the theory. Perhaps that is where we are speaking a big incommensurably. Sure there are many examples where humans have been discarded....to our failure as a race no doubt. But that doesn’t mean we should just double down in theory on what exists due to politics of certain regions. Also, I think your perception of states as failed is another point of departure. I don’t see countries that exist today as failures. They just have issues they need to solve. In some cases, they have severe issues they need to solve. But that doesn’t mean it’s time to throw out Locke and build another slave culture. I appreciate you taking the time to make your point more clearly. For me it’s all about learning more and understanding more. In saying that I have in mind the point you made where you view the work we still have yet to do on making being human a much more dignified situation. We definitely have some work to do there. But is rejecting the theory of human dignity because human practice has work to do really the answer? Maybe that’s not what you are explicitly saying. But it seems that’s the tree around which you are beating around. Once again...I very much appreciate you taking the time to answer my questions. Respectfully, Israel
human too closely to a particular bodily form that can only be treated in a certain range of ways. I know this sounds scary. But now think about all those who object to, say, vaccines, medical treatments, nutritional regimes, etc. even in life-threatening situations. They typically appeal to a natural/unnatural distinction based on world-views that actually identify the human very closely to the body. Yet, the law tends to regard such complainants as outliers if not outlaws. In other words, the law itself is already open to forcing people to have things done to them that violate their bodies in the name of redeeming some sense of ‘humanity’ that transcends how they might otherwise exist. This suggests to me that the law ultimately regards the default human body as a platform for the promotion of some normatively desirable sense of humanity. The question then is how to reinstate some meaningful sense of ‘dignity’ in a world where unwanted physical interference is already given legal standing.

The 2015/16 @sociowarwick seminar series (2015-10-29 08:00)

This year’s seminar series in the Sociology department at Warwick looks like an interesting mix:

[1]
deadline tomorrow! the question of the human in social theory & social research (2015-10-29 12:05)

25th November 2015, 11:00 to 17:00
WT0.05, University of Warwick

This workshop and symposium will explore the, mostly implicit, conceptions of the human, humanity and human nature that underpin various contemporary conceptions of social life. In the context of much-publicised
post-human futures, this is an invitation to reconsider the idea that social life itself is predicated on the fact that human beings are capable of such collective existence. Humans are beings who have a continuity of consciousness so that they see themselves as themselves throughout their life; human are beings who negotiate a multiplicity of sometimes contradictory identities and recognise each other as members of the same species, and they are also beings who can create and interpret cultural artefacts. Crucially, humans are beings who can deploy a sense of self-transcendence so that they are able to look at the world from somebody else’s point of view and thus conceive new social institutions.

The main focus throughout the day will be on how questions about the human are encountered in social theory and social research and what are the various implications and challenges of taking these seriously in our work. The day of activities will be divided into two parts. During the morning, we will have a participatory workshop for PhD students and early-career researchers. The goal of the workshop is to help participants negotiate the sometimes abstruse scientific, philosophical, moral, and even theological underpinnings of asking questions about ‘the human’ in the context of their own research projects. Dr Daniel Chernilo (Loughborough University) will offer a general overview of this field of enquiry as well as reflect on its various implications. We will also invite participants to reflect on their own research projects by making a brief (10-minute) presentation of their research projects and how questions about the human have been or are expected to be encountered within them. We’d like to ask all participants to reflect in advance on conceptions of the human and how they pertain to their projects. Uncertainty here is not a problem, in fact it will be a useful contribution to discussions on the day! In the afternoon, we will have a symposium in which Dr Mark Carrigan, Professor Margaret Archer and Daniel Chernilo will engage with questions of the human as they unfold in their own work on digital sociology (Carrigan), the morphogenetic society (Archer), and philosophical sociology (Chernilo).

To register your interest, please contact D.Chernilo@lboro.ac.uk and Mark@Markcarrigan.net with a brief description (500 words or less) of your research and how questions of the human are relevant to it by October 31st, 2015. The event is free but places are limited. Travel bursaries are available for those in need of it, please ask for more details.
A few places have opened up for tomorrow's event:

**The Sociological Review’s Early Career Researchers Event: Working Outside of Academia**  
*Organised by The Sociological Review Early Career Researcher team*

For those with a background in social science, career paths do not always followed a straight forward traditional academic trajectory. With the current shortage of entry-level academic jobs and the opportunities in academia being short term or exploitative for recent graduates, many may seek employment outside of the academy.

Social scientists have a lot to offer other employment sectors. Whether you are activity pursuing employment outside of academia or thinking of taking a new direction in your career, this event will provide an insight into the world of social scientists engaged in practice outside the university.

Please join The Sociological Review’s Early Careers Researchers’ event for what is going to be informative and stimulating event.

**Speakers include:**

Carole McNaughton Nichols (Director at Truth),  
Simon Roberts (Stripe Partners),  
Kandy Woodfield (Higher Education Academy)  
George Julian (Indie researcher)
The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic ‘Influence and Power’. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful
essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a re-thinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF’s criteria and goals may be viewed [1]here.

Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal’s key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.

The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition’s theme and falls within the remit of BD &S’s goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.

The submitted essays will be judged and the winning essay will be chosen by an academic panel (the ISRF Essay Prize Committee). The panel’s decision will be final, and no assessments or comments will be made available. The result will be notified to applicants by email during April 2016 and will then be announced by posting on the websites of the ISRF and of BD &S. The ISRF and BD &S reserve the right not to award the prize, and no award will be made if the submitted essays are of insufficient merit.

The winning essay will be accepted for publication in the Journal; the author may be asked to make some revisions before publication. Other applicants may have their submissions accepted for publication in the Early Career Researcher forum of BD &S subject to the Journal’s peer review and decision-making process.

The details and criteria are:

**Essay topic:** Influence and Power (This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field.)

**Eligibility:** Participants should either be current doctoral students or within three years of being awarded their doctorate.

**Essay length:** 5,000 to 7,000 words

**Essay format:** Follow the BD &S Author Guidelines, available on the BD &S website.

**Language:** English

**Submission deadline:** 31 January 2016

**Queries:**
[2]essayprize2016@isrf.org

Submissions should be made online at [3]https://mc.manuscriptcentral.com/bdas and authors should submit...
cate that their submission is for the special theme, ‘ISRF Essay Prize.’

The Politics of Data (2015-10-30 08:00)

Our latest series delves into the politics of data. Data has become an increasingly complex force, influencing more and more aspects of social life. This series will explore the role of data and algorithms in research and society, critically interrogating data-driven processes and epistemologies.

According to Hegel's bird's eye-view of the world, the Owl of Minerva takes flight at dusk. If this bird is supposed to be the personification of philosophical insight, then we start thinking deeply about the nature of something only once its existence is in jeopardy. And so it is with the nature of 'being human', which seems to bring out the best in thinkers under the shadow of war or some generalized sense of gloom and doom – of the sort that, say, capitalism routinely invites. Thus, we want to know the difference made by being human because we feel that we might be in the process of losing it.

The standard way to begin such investigations is to ponder the essence of humanity. But 'essence' can mean one of two things, depending on whether one comes from the Greco-Roman or Judaeo-Christian side of the issue. My use of these phrases is somewhat polemical, but I'm interested in normatively amplifying a distinction which already exists – typically in a bloodlessly understated fashion – within analytic philosophy of language.

The Greco-Roman style of essence is about essential properties, understood as functional or morphological
characteristics that are normally on display. Aristotle put this conception on the table, and even after the formal abandonment of the Aristotelian world-view it acquired a scientific second life in Linnaeus’ ‘binomial nomenclature’ of species, the basis on which natural phenomena are classified (e.g. Homo sapiens for humans).

The Judaeo-Christian style of essence is more about the construction of essences - that is, the means by which something is said to have a distinct identity, which entails that it is not anything else: the ‘difference that makes the difference’. Thus, God – and Adam before the Fall – calls the world into being by giving things unique names. Even among the irreligious, this view has enjoyed a second life in science as the search for the ultimate set of fundamental entities (concepts, numbers, elements, etc.) by which the entire world could be generated by some combination of these logical forms.

A quick-and-dirty way of understanding the two sorts of essence is that the Greco-Romans see essence as a product, while the Judaeo-Christians see it as a process. For their part, analytic philosophers recognize the distinction in terms of, on the one hand, the theory of definite descriptions and, on the other, the causal theory of reference - the former associated with Bertrand Russell and the latter with Saul Kripke. For Russell, the essence of something is its normally distinguishing features, whereas for Kripke the essence is whatever happens to make the thing distinct from other things, even under liminal conditions (i.e. 'in every possible world'), which typically requires further investigation. Thus, Russell's 'water' is the life-sustaining fluid, whereas Kripke's 'water' is H2O. The former focuses on what water normally does, the latter on water's overall potential (much of which may be normally unrealized).

Now, let's think about the 'essence of humanity' in light of this distinction. Most social theories today either simply deny the essentialist premise (e.g. postmodernists) or presume one or the other essentialist position without explicit argument (e.g. naturalists). The only contemporary movement that really takes the distinction seriously, albeit implicitly, is transhumanism, which is literally about projecting what is distinctive (and presumably good) about the human to the 'next', perhaps ultimate level. If the 'human' has an essence that is knowable, then it should be possible to project future cases of humanity based on past ones.

But what exactly are we supposed to be projecting? One thing is clear: The projection is more than simply an empirical prediction about certain future beings - though transhumanists often try to make life too easy for themselves by talking the language of prediction. It is also about how those beings would or should be regarded: Are they still 'human'? Transhumanism projects two quite distinct futures for the 'human'. They are not incompatible in principle, but they certainly pull the essence of humanity in quite different directions.

On the one hand, we might live in the bodies of our birth in a state of indefinite health. On the other, we might upload our minds into a more durable silicon platform that would enable us to thrive in perpetuity. Both views clearly dispense with the classical idea of mortality as essential to the human condition. This is where many humanists (and others!) argue that the 'human' has – in the spirit of Elvis – already left the building (i.e. no longer in a state of Heideggerian 'indwelling').

However, assuming the transhumanist premise, the former case is more Russellian in its fixation on our de-fault Homo sapiens embodiment, whereas the latter case is more Kripkean in suggesting that such embodiment is only contingently related to our essence, which may be more clearly expressed in some other medium, especially one that also clarifies the distinctness of our place in the greater scheme of things.

If one wished to write a proper history of humanity, one would need to deal with the genealogies of these two strands of transhumanist thought. The Russelian history would be about locating and accommodating (or not, as has often happened) a sense of the 'normal human', whereas the Kripkean history would be about pushing the limits of the 'human' in ways that treat the 'normal' with suspicion. The former would invite a more 'population' based sense of social ontology fixated on the distribution of physical individuals, and the latter a more 'corporate' sense expressly looking to social formations that achieve more than what any presumptively normal individual might.
This may be because, in the end, the Russellian view takes the ‘human’ to be a kind of self-sufficient animal, whereas on the Kripkean view the exact nature of the ‘human’ is much less clear, and may ultimately be an instantiation of some other, more cosmically inscribed essence altogether.

The esoteric appeal of Tony Giddens (2015-10-31 08:00)

From [1]How to become an internationally famous British social theorist by Stewart Clegg, 585-586:

"Giddens's later concerns with structure and agency allow him to tap into many prestigious intellectual products as resources, such as linguistics, analytical philosophy and the Heideggerian tradition. These connections allow for far great consumption in more differentiated markets. The vague term 'social theory' gives freer scope, allowing Giddens to range freely and widely. The theoretical strategy has been to announce, from New Rules on, the deficiency of the orthodox consensus in some critical respect such as consideration of 'war', 'space', 'time', and then to borrow from cognate disciplines, such as international relations, history and geography, to remedy the defect. This gives Giddens a master key, wrapped up in the grammar of structuration, for addressing some important things that other theories omit. One can claim both transcendence of everything that has gone before and modesty in dialogue with friends and admirers who bring to attention other things not yet integrated into the system. Learn the Giddens system and you unlock the doors of greater perception by becoming acquainted with disciplines, ideas and figures whom one would not normally meet. If you are not familiar with a field, no worries – once you've read Giddens on 'space-time' distanciation you will appear as knowledgeable as the next human geographer – all the time you are doing social theory. The programme is infinitely stretchable (although in practice it rarely addresses contemporary economics). Moreover, when specialists, offer corrections, that simply offers the opportunity for further debate, perhaps subsequent adjustment. It all keeps the product in the discerning public eye.

This review essay is fascinating for many reasons. But perhaps the most important is that it opens up the connections between what Nicos Mouzelis convincingly analyses as intellectual de-differentiation with the political economy of scholarly publishing. Crudeley, blurring intellectual boundaries expands the market for social theorists.

Predatory Publishers Lapping up Content (2015-11-01 08:00)

Recently, Gmail failed to filter out a spam email sent by a company called LAP Lambert Academic Publishing. I don’t usually receive these, as they land straight into my Junk box, so I googled the name of the company. It turns out, they are successful spammers, and have fooled many. Joseph Stromberg takes upon himself to investigate the shady world of pseudoacademic publishing by selling them his undergraduate dissertation in this exciting article: [1]http://www.slate.com/articles/technology/future_tense/2014/03/lap_lambert_academic_publishing_my_trip_to_a_print_content_farm.3.html

Liberating yourself from leisure activities (2015-11-02 08:00)

I came across this advert in Dublin advert. On the surface, it’s interesting on a straight forwardly chronopolitical level: with sufficient resources, it’s increasingly possible to outsource tasks for others in order to save yourself time. But what stood out to me about this was the increasingly formal category of ‘relaxation’: it’s becoming that which awaits us when all other obligations are met, which of course they never are due to the escalation dynamics which kick in as we reflexively orientate ourselves towards demands upon our time.

[1] 4030
Having spent the day hanging around airports due to circumstances beyond my control, I've been struck by how orientated the space is towards the stimulation of shopping, eating, boozing and gambling. Manchester Airport literally has betting terminals scattered at regular intervals around the airport, even near some of the gates. Surely the justification for the centrality of these activities is that they constitute leisure. So what exactly is the personal shopping service saving time in order to help people do?

Register for the accelerated academy (2015-11-03 08:00)

Power, Acceleration and Metrics in Academic Life
2nd-4th December 2015, Prague (Vila Lanna)

Organised by the Institute of Philosophy of the Czech Academy of Sciences and supported by the Strategy AV21.

[2]Powered by Eventbrite

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered
transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement, quantification of scholarship and the consolidation of business-driven managerialism and governance modes are commonplace in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life. Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays. Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This three-day conference investigates the techniques of auditing and their attendant practices and effects and will also probe into scholars' complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- **empirical and theoretical engagements with the acceleration of higher education**
- **the origins of metrification of higher education**
- **metrification as a form of social control**
- **the challenges of self-management posed by metrification and/or acceleration**
- **common strategic responses to these challenges**
- **the relationship between metrification and acceleration**
- **how metrification and acceleration relate to a broader social crisis**

**Keynote Speakers**

**Roger Burrows (Goldsmiths, University of London) – Ancient Cultures of Conceit Reloaded**

In 1990 the sociologist Ian Carter published Ancient Cultures of Conceit – a brilliant analysis of campus fiction. It provides a wonderful rendering of a world we have lost – a world where academic life was slower paced and where spreadsheets, metrics, business plans and impact agendas were largely unknown. This paper attempts to carry forward Carter’s analysis over the last 25 years examining more recent examples of the campus fiction genre but also including fictional representations of campus life to be found on social media.

**Philip Moriarty (University of Nottingham) – The Power, Perils and Pitfalls of Peer Review in Public**

There are major deficiencies in traditional peer review. Not only can clearly flawed papers easily pass ‘scrutiny’ with flying colours, but the idea that a study is accepted into the scientific literature on the basis of a handful – or, not infrequently, one – set of anonymous reviewer comments seems quaint and archaic in a Twitter-, blogosphere-, and BuzzFeed-enabled world. Post-publication peer review, enabled by sites such as PubPeer, is an exceptionally important tool for online critique, analysis, and scrutiny of published papers. For the next generation of researchers, PPPR will almost certainly be de rigueur. Before we get to that point, however, there are quite a number of teething problems that need to be addressed. These include, in particular, the key issue of the role of anonymity and moderation in online commentary.
**Susan Robertson (University of Bristol) – Vertigo: Time and space in the contemporary university**

One of Henri Lefebvre’s great intellectual contributions was not only how we think about the spatiality and temporality of social life but that lived-in spaces and their social relations are the outcome of ongoing cultural, political and economic projects and their dynamics. In this lecture I explore the changing nature of the contemporary university, and the ways in which recalibrations of time and space are also simultaneously the medium, object, and outcome of these projects and dynamics. I invoke the idea of ‘vertigo’ – the sensation of the world moving, and profound anxieties about the potential for a loss of height – as a way of exploring the complex ways in which governing the university through temporal and spatial strategies mediates the ongoing experiences of living, learning, and working, in the university.

**James Wilsdon (University of Sussex) – The Metric Tide: Reflections on the UK’s Independent Review of Metrics in Research Assessment and Management**

There are powerful currents whipping up the metric tide. These include growing pressures for audit and evaluation of public spending on higher education and research; demands by policymakers for more strategic intelligence on research quality and impact; the need for institutions to manage and develop their strategies for research; competition within and between institutions for prestige, students, staff and resources; and increases in the availability of real-time ‘big data’ on research uptake, and the capacity of tools for analysing it. Citations, journal impact factors, H-indices, even tweets and Facebook likes – there are no end of quantitative measures that can now be used to assess the quality and wider impacts of research. But how robust and reliable are such indicators, and what weight – if any – should we give them in the management of the UK’s research system? Over the past year, the UK’s Independent Review of the Role of Metrics in Research Assessment and Management has looked in detail at these questions. The review has explored the use of metrics across the full range of academic disciplines, and assessed their potential contribution to processes of research assessment like the Research Excellence Framework (REF). It has looked at how universities themselves use metrics, at the rise of league tables and rankings, at the relationship between metrics and issues of equality and diversity, and at the potential for ‘gaming’ that can arise from the use of particular indicators in the funding system. The review’s final report, The Metric Tide, was published on 9 July 2015. In his talk, James Wilsdon will reflect on the review process, outline its main findings, and consider the opportunities and obstacles to more responsible uses of metrics in the research system.

**Oili-Helena Ylijoki (University of Tampere) – ‘Projectification’ and conflicting time orders in academic knowledge production**

Under the current conditions of academic capitalism and market-driven managerialism, university research is increasingly conducted in large projects on external, competitive funding from various national and international sources. The project format offers a fixed-term, fast and flexible organizational mode which fits together with constantly changing needs of the turbulent university environment. This paper argues that the ‘projectification’ of science creates a special project time which stands in conflict with process time. Project time, embedded in standardized and abstract clock time, is decontextualized, linear, cumulative and predictable, entailing a strictly defined timeframe with a fixed beginning and end. This is in a sharp contrast with nonlinear, context-dependent and unpredictable process time involving unforeseen periods of standstill, deceleration and acceleration. Furthermore, project time includes 1) commodification of time by translating research process into money, 2) control of time by dividing research into beforehand determined phases in which accountability of the use of time is required, 3) compression of time by speeding up research productivity, and 4) colonization of time by subordinating alternative temporalities in research. The paper discusses how the intensification of project time reshapes and remoulds research practices and academic subjectivity, and what possibilities for alternative temporalities can be created and sustained at the accelerated academy. This is done by distinguishing temporal dilemmas and ways to live with them: long-term commitment vs. short-term funding; fast pace vs. slow thinking; time efficiency vs. wasting time; linear career time vs. circular project rat race; and work time vs. existential time.
call for contributions: digital sociology and the future of the discipline (2015-11-03 08:55)

In recent years Digital Sociology has emerged as an increasingly prominent trend within the discipline at an international level. But it remains unclear precisely what this tendency represents, provoking enthusiasm and skepticism in equal measure. In this special section for The Sociological Review’s website, we invite short blog posts (1500 words or less) addressing digital sociology and the questions it raises for the future of the discipline. This could include but is by no means limited to:

• What does the 'digital' in digital sociology really mean? Is there a risk that digital sociology fetishises the 'digital'?

• Should digital technology lead us to reconceptualise the social?

• What, if anything, distinguishes digital sociology from fields of inquiry such as cyber cultures, web studies and the sociology of the internet?

• How does digital sociology relate to parallel trends in cognate disciplines e.g. digital anthropology, digital geography and the digital humanities?

• How should we conceptualize the 'offline', the 'online' and the relationship between them? Should we reject this dichotomy entirely?

• What role can digital sociology play in an intellectual landscape increasingly dominated by data science and computational social science?

• Does digital sociology change the relationship between sociology and other disciplines?

Please contact Mark Carrigan with submissions or any questions relating to the special section: mark@markcarrigan.net. The deadline for contributions is December 1st 2015.
What kind of machines do self-tracking devices make us into? (2015-11-03 10:00)

Sociologists have been telling us for a long time that the use of new technologies does more than merely give us new potential functions but actually impacts on our subjectivity; it changes who we think we are what we think is possible. For instance, the introduction of the telephone brings with it the expectation, not just the possibility, of communication over vast geographical distances. The telephone network becomes part of our social identity.

Along these lines I have been wondering what the impact of self-tracking devices might be. One of the more interesting suggestions has been from [1]Deborah Lupton who has proposed that the use of such devices might encourages us to think in terms of a machinic metaphor with the individuals engaging with themselves as self-experimenters with the body defined in terms of inputs and outputs.

I think there is certainly some truth in this although I think the experimentation aspect is perhaps most relevant for the early adopter Quantified Self types. The way in which the everyday self-tracker who uses "out of the box" apps and platforms is likely to be different. If this machinic metaphor does have some traction the interesting question (at least for me) is: what kind of machine?

Rather, than conducting experiments on themselves in order to gain "[2]self knowledge through numbers" and developing their own apps or analytical methods like Quantified Selfers, most people (I think) use devices mostly in the way in which they are intended. For example, most people probably use Fitbits to encourage themselves to walk or run further every day or week.

Most tracking devices seem to focus less on "understanding" or "experimentation" and more on some form of "productivity"; they function to encourage people into more physical exercise or to be more productive. [3]The Fitbit Surge smartwatch is advertised through commanding the customer to be more productive:

Work hard.
But, also, work better.

Designed with advanced smartwatch features, Surge lets you run your day, your way. Text and call notifications keep you on your game throughout the day, while music control helps you find the motivation you need to prepare for a big meeting or beat your best in a big race.

These devices often seem to work on the basis of applying the [4]"nudge" principle to ourselves. The nudge philosophy suggests that if in order to get people to behave in a certain way then the best way to achieve this is to manipulate their environment (or their "choice architecture") to make the preferred choice easier. Alternatively, a [5]gamification approach is used in which the goal (such as walking a number of steps) is made more desirable through the awarding of prizes or medals.

It is assumed that such an approach leads to good "habit formation". So people will automatically engage in the positive behaviour without it directly bothering their consciousness. The monitoring of data and the response to stimuli becomes an integrated part of a person's everyday life and they automatically respond in the desired way.

The development of a new device seems to take this automatic response and integration of technology/data with bodies and subjectivity further. The soon to be released [6]Doppel is a bracelet which gives off a pulse which can manipulate the level of relaxation of alertness of a user. The co-creator [7]told The Guardian that:
“Everyone tries to change their state – they listen to music, they drink coffee, they meditate – and we see this as another tool and a very effective tool because it is so discreet and it is controllable,”

He continues:

‘Everyone tries to change their state – they listen to music, they drink coffee, they meditate – and we see this as another tool and a very effective tool because it is so discreet and it is controllable,” They found that a beat connected to the body could mirror the tempo of music and how it stimulated and calmed. ‘We found that we could change someone’s state in this way. We had something which could only ever be a [8]wearable in that it had to be touching [the skin]”

The self is seen as something which is not entirely under our rational control. Rather, we have to almost trick ourselves into behaving in a certain way. [9]Evan Selinger has warned of the possibility that a nudge approach emphasises “automatic processing at the expensive of deliberative alternatives”.

The Doppel reminded me of a point made by François Guéry and Didier Deleule a long time before the emergence of self-tracking devices in their book [10]The Productive Body (originally published in French in 1972). They suggested that for capitalism:

‘[The] ideal machine would be a blind one [whose] every problem can be resolved through touch, in which robotic hands become part of the wonderful mechanical repetition of the productive gesture’ (Guéry and Deleule, 2014: 120).

The ultimate capitalist machine, for these philosophers, would be one which is entirely integrated with the human body and works on the corporeal not the mental level. Such a machine would maximize the productivity of human beings through encouraging useful and repetitive behaviours and discouraging rational reflection on the process.

Is the machine of self-tracking an unthinking machine?

Call for Proposals: Sociological Futures Series (2015-11-04 08:00)

A new initiative undertaken by Routledge in collaboration with the BSA. Some of the initial books look excellent. Find out more [1]here:

Call for Proposals: Sociological Futures Series - in collaboration with the BSA

[2]Sociological Futures aims to be a flagship series for new and innovative theories, methods and approaches to sociological issues and debates and 'the social' in the 21st century. The series editors are accepting proposals on a wide variety of themes. To submit a book idea please contact the editors:[3]profeegreen@hotmail.com[4], [5]jdhorne@uclan.ac.uk, [6]caroline.oliver@compas.ox.ac.uk,[7]l.ryan@mdx.ac.uk. [8]Click here for more information.

Michel Foucault's 1981 Louvain lecture series 'Wrong-Doing, Truth-Telling' is a wonderfully insightful book. It provides a detailed examination of the role of truth-telling throughout antiquity and its development into a key stone of contemporary European juridical proceedings. Specifically, Foucault investigates, within the discourse of criminal law and criminal justice, the use of 'avowal' as a particular form of truth-telling; the process through which an individual identifies themselves as the criminal subject, rather than merely as the author of a crime. Foucault guides the reader through the history of truth-telling within society, how it is constructed and how it affects power, knowledge, and the subject. Using vivid historical, philosophical and literary examples, Foucault constructs a coherent genealogy of the subject (Brion and Bernard, 1981: 271), and how truth-telling aids individuals' development of a sense of self. The lectures are delivered with great zeal and open a window onto Foucault's own politicization, particularly his involvement with the French Maoist political party, Gauche Prolétarienne, during the early 1970s. In culmination the reader is provided with an impassioned analysis of "the points where the techniques of the self are integrated into structures of coercion or domination" (1981: 300).

The inaugural lecture (April 2, 1981) introduces the theme of avowal in the context of a doctor-patient relationship during the mid-nineteenth century. The French psychiatrist, Doctor Leuret, subjected his patient to a series of ice-cold showers in the interest of producing an avowal of madness. Foucault introduces two core issues with this case; firstly the antiquity of the truth-telling/purity duality, and secondly the notion that an avowal can only exist within a power relationship. The post-enlightenment rhetoric employed here is reminiscent of 'Discipline and Punish' (1975) and the panopticism of discipline, however by introducing the notion of the 'avowal' and the avowing sub-
ject, Foucault shows how power is created within discourses. The avowal acts as a tool for the admission of the untold and a submission to one’s superior (2014: 17). The inaugural lecture emphasises the role of the subject in their own domination, and how truth-telling in judicial and medical discourses leads to the construction of a distinct ‘self’ for the avowing subject. Avowal not only changes the reality of a given situation, it changes the understanding of oneself.

The first lecture (April 22, 1981) strengthens the argument for avowal as an altering force in professional power relationships. It uses the chariot race between Antilochus and Menelaus in Homer’s Iliad, to illustrate truth-telling as a social practice which modifies relations of power and institutional structures. Foucault interprets the race as a demonstration of truth; the competitors vary greatly in their ability and thus, in essence, it is not a fair race. Herein, it serves only as a dramatization of an order of truth that is predetermined by the gods. Alas, when Antilochus fails to slow down and allow Menelaus, the anticipated victor, to win, the truth is not revealed. To redress the unexpected altercation Antilochus must issue a truth statement; from a struggle (the *agon*), a judicial procedure is born. Nevertheless, Antilochus refuses to take the oath, as it would mean the *agon* would remain a dispute, and “transfer the agonistic structure from man to the gods” (2014: 41); from Menelaus to Zeus. In doing so, Antilochus enacts a quasi-avowal; he renounces the struggle rather than admits a fault to a judicial body. This subtle variation gives Foucault the opportunity to demonstrate how an avowal, and truth-telling more generally, do not need to be verbalised (as an admission of fault), but can be an action which allows the truth manifest itself. Applying the avowal to the competition detaches the concept from institutional discourses in such a way that clarifies the exact role and purpose of truth telling in society; a bridge between the subject and power (2014: 283).

The second lecture (April 28, 1981) brings in a new component. It reflects on Sophocles’s ‘Oedipus Rex’, to present evidence for the mechanism of recognition (*anagnorisis*) in truth-telling, that is, individual recognition; the emergence of truth in the subject, and chorus recognition; the emergence of the truth in citizens. Despite its historicity, one can draw strong correlations between Oedipus’s (subject) recognition, and the chorus’s (societal) recognition, to techniques employed by the mass media to invoke public opinion on issues including crime, culture, and politics. Indeed the value of lecture two is how it brings the theory into the contemporary; the ease with which parallels can be drawn validates a theory which could otherwise be accused of being obsolete.

The third (April 29), fourth (May 6), and fifth (May 13) lectures all concern the religiosity-avowal binary, and will therefore be discussed collectively. This section raises some fascinating questions about avowal as an expressive and symbolic manifestation of the self and how religion became juridified. These issues are situated firstly in early Christianity; Foucault identifies avowal as a means of penance after sinning to cleanse the soul. Similarly in the monastic cultures of the fourth and fifth centuries, individuals sought guidance and knowledge from a master, a sentiment clarified in the proverb “he who has no director- he who is not directed, falls like a dead leaf” (2014: 134). Thus, in both cases truth-telling about oneself became an indispensable condition for subjection to a relationship of power with another. Through the verbalization of the truth, one destroys oneself as a self, and projects oneself onto, and at, the mercy of another.

The sixth lecture (May 20, 1981) converges upon the increasing role of the avowal in judicial institutions after the twelfth century. Avowal became intricately linked to legal proof, and held the largest relative weight of any element of evidence in a case. Foucault alludes to the cementation of avowal within legal discourses during the eighteenth and nineteenth centuries. It became an explicit tool in the regime of truth, and was employed as a means of getting the subject to recognise the principles and authority of penal law and sovereignty. To acknowledge the rule of the state is a prerequisite for acknowledging oneself as the subject of a criminal. Foucault uses rhetoric of avowal and truth-telling to cleanly identify the point at which criminal culpability and subjectivity became an integral part of criminal proceedings; the subject and their life were made accountable, and in turn, crime was made rational. Truth-telling facilitated the amalgamation of the archetypal, interpersonal *accusatory procedure* in law, and the sovereign, hermeneutic, *inquisitorial procedure*, from which the judge began to ask “Don’t just tell me what you did, without telling me, at the same time…who you are” (2014: 214).
To conclude, 'Wrong-Doing, Truth-Telling' is truly a satisfying, and illuminating read and deserves all the praise it receives. As an orator Foucault is captivating; he draws upon unique historical examples to construct a theory that is rich in knowledge and has a breadth of study that does not fail to impress. A great sense of passion and enthusiasm emanates from the book, and at the heart of this, is the centrality with which Foucault places the subject. In doing so there is a considerable personal element to the lectures; one is invited into Foucault’s politicized, historical world view, whilst simultaneously one empathises with the plight of the avowing subject. One of its greatest strengths comes from its accessibility; the direct translation of Foucault’s vernacular speech opens up his theories in a way that transports the reader into the audience to which Foucault was speaking.

In his interview with André Berton, Foucault describes how “within human practices, there is a moment when, in one sense, what is obvious becomes muddied, the lights go out, evening comes, and...as a result, a new light is necessary” (2014: 244). This imagery encompasses the effect of ‘Wrong-Doing, Truth-Telling’ on the historical role of truth-telling and its influence on the self. The lectures are a new light within the fields of critical philosophy, criminal law, and criminal justice.

Rosie Smith is a PhD student in Sociology at the University of York. Her research looks at ‘spectacular justice’ and challenges the Foucauldian panoptic privatisation theory of justice. She is interested primarily in crime, justice, media, and Foucauldian theory.

international journal of social research methodology: ask the editors @ijsrm! december 1st at 11am (2015-11-04 12:00)

In my capacity as social media associate editor of the International Journal of Social Research Methodology, I’m arranging an ask the editors session on Twitter. It will take place on Tuesday 1st December, 11.00—12.00.

We’ll definitely have Ros Edwards and Christina Hughes. We’ll possibly have Malcolm Williams participating as well. We’ll use the hashtag #IJSRM for the discussion.

If you can’t be online at the date and time, e-mail me (mark AT markcarrigan.net) and I can ask the question on your behalf. Otherwise see you on December 1st!
Call for papers: The Archers in fact and fiction (2015-11-05 08:00)

Call for Papers

The Archers in fact and fiction: Academic analyses of life in rural Borsetshire

Cara Courage, University of Brighton, Nicola Headlam, University of Liverpool and Peter Matthews University of Stirling invite the submission of abstracts to a seminar to take place on 17th February 2016 at University of Liverpool in London, Finsbury Square.

The seminar intends to take an academic perspective on life in Ambridge and Borsetshire, with papers from across academic disciplines. Papers might include:

- A historical analysis of rural Britain as heard through Archers' storylines
- A cultural analysis of Archers’ fandom
- A sociological analysis of class dynamics in rural Britain through the lives of Archers’ characters
- A hydrology of the Am valley following the recent flooding events
- Elderly care provision in the rural setting
- Participatory and strategic planning in rural areas
- Rural and village economics, from the village store to agribusiness
- The statistical probability of no Ambridge residents listening to radio 4 at 2:00pm or 7:00pm

This list is not meant to be exclusive or exhaustive, but is meant to inspire you to think how your academic research can illuminate and explain life for the Archers and Ambridge. The day is intended to give academic fans of The Archers a platform to exercise their love of the programme and their subject area.

If you are a fellow Archers fan and academic please submit your abstract of 200 words to cara@caracourage.net, headlams@gmail.com and peter.matthews@stir.ac.uk by 16th November 2015.

Do sociologists work outside universities? (2015-11-06 08:00)

Nice post about possible career paths for sociologists by April Schuets, on [1]SociologyInFocus:

[2]Do sociologists work outside universities?

2. [http://sociologyinfocus.com/2015/10/do-sociologists-work-outside-of-universities/?hootPostID=935c7b8d7083431b79dbbc3b9b9941c8](http://sociologyinfocus.com/2015/10/do-sociologists-work-outside-of-universities/?hootPostID=935c7b8d7083431b79dbbc3b9b9941c8)

CfP: Queer Partnering 2016 (2015-11-08 08:00)

QUEERING PARTNERING 2016 - CALL FOR PAPERS

Queering Partnering is the 1st International Conference stemming from the large ERC funded study INTIMATE: Citizenship, Care and Choice – The micro-politics of intimacy in Southern Europe ([1]www.ces.uc.pt/intimate). This year the Conference will focus on LGBT/queer partnering.

The ways in which people choose to be, or are constrained into being, coupled have been at the centre of public debates on intimate citizenship. From legal demands voiced by activists to the de/construction of love and relationality proposed by academics and the constant advancement and setbacks echoed by the media, never as strongly as today could we speak of diversity when it comes to partnering.
Faced with challenges advanced by non-heteronormative partners, the time has come to think critically about queer intimate relationships.

- How central is the idea of couple, and to what extent, and in what ways, is that idea being queered?
- What does the recognition of a relational orientation or relational diversity entail?
- Where do we see the resurgence of new normativities?
- What is absent, what is achieved?
- How are the processes of European/global precarization affecting LGBT partnerships?
- What is the role of LGBT and queer studies, often caught at the cross fire between mainstream academia and outraged collective actors?

Within the broader theme of LGBT and queer partnering, we encourage abstracts from academics and/or activists addressing one or more of the following issues:

- Media representations of LGBT/queer partnering
- Qualitative methods in researching LGBT/queer partnering
- Queering gender, bodies and sexual practices through LGBT/queer partnering
- Queering citizenship: legal frameworks and social policies in relation to LGBT/queer partnering
- Queering public sociology: activism and academia
- Relational diversity, non-monogamies and LGBT/queer partnering

We are committed to promoting interdisciplinary, intersectional, reciprocal knowledge production and sharing in academia and beyond. Therefore we are open to the submission of academic abstracts but also proposals stemming from artistic accounts and activists' reflexive contributions.

Due to logistic constraints, the work language during this conference will be English. The venue is accessible to wheelchair users.

Abstracts should not exceed 300 words and should be submitted through Submission Form.

Deadline: 30 November 2015

Notification of acceptance: 15 December 2015

Group of 56 scholars launches petition calling upon universities and academic professional associations to greatly reduce flying-related footprint as part of effort to cut greenhouse gas emissions

A group of 56 scholars from more than a dozen countries launched a petition today calling upon universities and academic professional organizations to greatly reduce their flying-related footprints as part of the effort to limit the destabilization of the climate system. The signatories represent a diverse set of academic disciplines—from psychology and medicine to sociology and philosophy—in addition to fields (e.g. environmental studies, geography, and earth science) normally associated with climate and other ecological concerns. One is also a former flight instructor and licensed commercial pilot, turned scholar of climate policy and ethics, who no longer flies for conferences and vacations.

Launched less than two months before the international climate negotiations open in Paris, the petition’s release comes on the heels of increased attention to climate change during the U.S. visit of Pope Francis in September. It also comes one week after a study published on October 12 in *Nature Geoscience* that foresees a doubling of surface melting of Antarctic ice shelves by 2050, and a significant risk, if high amounts of greenhouse gas emissions continue, of their collapse by century’s end, a development with potential implications for rising sea levels.

Such signs, and the fact that emissions are cumulative, are why signatories and climate scholars Kevin Anderson and Alice Bows-Larkin at the University of Manchester (U.K.) say that “radical and immediate emission reductions” are needed to avoid extremely dangerous levels of climate change. Professor John Wiseman, another signatory and Deputy Director of the Melbourne Sustainable Society Institute at the University of Melbourne (Australia) highlights the important leadership role which institutions of higher education can take in reducing emissions from aviation. "Universities and academic professional associations often embrace sustainability," he notes, "but they also tend to have very large carbon footprints—to a significant degree due to frequent flying by members of their academic communities."

Laurie Zoloth, a bioethicist and Professor of Religious Studies at Northwestern University (U.S.A.) as well as the former president of the American Academy of Religion (2014), contends that the changes demanded by the petition are matters of environmental justice. “They may seem trivial,” she says, but “they are cumulative, part of a world so clean and easy for people with wealth, so hard and dirty for the poor. It is a world in which the wealthiest have garnered the vast majority of wealth, burning the vast majority of carbon at the expense of the lives and the health of the poor.”

With moderate sacrifice, university-based faculty, administrators, and students can make large reductions in their total greenhouse gas emissions and, in the process, help bring about a more just and sustainable world. The petition makes some concrete suggestions on how to reduce flying as part of an effort to bring about a broad-ranging discussion within academic communities.

**Background:** Flying contributes significantly to global climate change. It is responsible for 2-3 % of annual global CO$_2$ emissions—about the same percentage that Germany and the city of Beijing, for example, contribute each year. Flying’s share of global emissions is growing steadily as the growth in total flying miles outstrips improvements in fuel and engine efficiency. Because flying releases various pollutants at high altitude, its detrimental impact is far greater than that caused by CO$_2$ emissions alone. One round-trip flight from New York City to London or San Francisco incurs a warming effect equivalent of more than two metric tons of carbon emissions per economy passenger—about 20 percent of the total annual emissions of a typical person in Finland, and more than 100 percent of those generated by an average person in India. For more information, please visit [www.flyingless.org](http://www.flyingless.org), or write
The challenge of sociological writing (2015-11-10 08:00)

In this event organised by [1]The Sociological Review’s Early Career Forum, a panel of accomplished writers with a long history of supporting younger scholars reflect on the challenges of sociological writing. Each participant will give a short talk, discussing a particular aspect of the challenge of writing, before the panel opens up for a general discussion with the audience. Building on the previous work by the journal in support of ECRs, there will be a particular focus upon the difficulties encountered in writing by early career scholars in the neoliberal academy, but also upon the pleasures and opportunities which writing offers.

Les Back – Start Writing and Keep Writing: Notes, Drafts, Proofs, Papers

Les Back is a Professor of Sociology at Goldsmiths, University of London. His main fields of interest are the sociology of racism, popular culture and city life. His work attempts to create a sensuous or live sociology committed to searching for new modes of sociological writing and representation. This approach is outlined in his most recent book “The Art of Listening” (Berg 2007). He also writes journalism and has made documentary films. In 2011 he published a free on-line book called Academic Diary ([3]http://www.academic-diary.co.uk/) that argues for the values of scholarship and teaching in the face of austerity and the attacks on the university. His research interests include sociology of youth, ethnography, political sociology, racism and right wing extremism, music, auditory and popular culture, race and social theory, photography and urban culture and the sociology of sport.

Inger Mewburn – Title TBC

I am a researcher, specialising in research education since 2006. Prior to this I lectured in architecture and worked in architecture offices for around a decade.
I am currently the Director of Research Training at The [4]Australian National University where I am responsible for **co-ordinating, communicating and measuring** all the centrally run research training activities and doing research on student experience to inform practice.

Aside from editing and contributing to the Thesis Whisperer, I write scholarly papers, books and book chapters about research student experiences. I am a regular guest speaker at other universities and do occasional media interviews. Some details of these other activities are below. For further information, view my [5]Linkedin Profile, contact me by email on inger@mewburn.net or visit my [6]Google Scholar page.

**Pat Thomson – Organising your writing**

Pat Thomson is Professor of Education in the School of Education, The University of Nottingham. Her research is centred primarily on how schools might change to be more engaging and meaningful for more children and young people. She mostly researches the arts, creativity and other kinds of experiential approaches in school and community settings, including galleries and museums. Much of this research has been conducted with her colleague Professor Christine Hall. She also has a long-term partnership with Tate Learning. She also works in researcher education and, together with Professor Barbara Kamler, researches and writes about the writing that scholars want to, and must, do.

WHEN Monday, December 7, 2015 from 2:00 PM to 5:00 PM (GMT) – [7]Add to Calendar

**Algorithmic Interventions Against Asylum Seekers (2015-11-11 08:00)**

Thanks to [1]Peter Holley for sharing this with me. The Finnish Foreign Ministry has[2]launched a “don’t come” Facebook campaign in Iraq and Turkey:
The thrust of the Ministry’s Facebook campaign is to persuade young men coming from conflict-ridden areas that it’s not work the risk and expense to come to Finland, said Finns Party MP Sampo Terho.

“This realistic message about the possibility of receiving asylum status in Finland is in the best interests of Finland as well as those who are planning the journey. If it’s practically a sure bet that you will be repatriated, why then would you waste up to 10,000 euros on the trip?” Terho queried.

According to the Finns Party parliamentary group the campaign has been rolled out in Arabic and is directed at young men planning to travel to Finland to seek refuge. The Foreign Ministry said Friday morning that the Facebook update had received close to 80,000 views.

Terho, who is the head of the Finns Party parliamentary group, said that the aim of the campaign is to try to curb the so-far “uncontrolled” influx of people.

It makes the British Home Office’s ‘Go Home’ van seem remarkably low tech in comparison:

×

Given what seems likely to be a hardening climate of opinion across Europe, it strikes me that some disturbing examples of digital authoritarianism might be enacted, in a register of exceptionalism, normalising their potential wider application in the future. As Peter observed to me, it’s the use of the capacity for modelling built into the Facebook platform that’s really interesting here: the efficacy of the intervention rests upon a claimed capacity to identify and engage with “young men planning to travel to Finland to seek refuge”. How might this same ambition manifest itself domestically?

The coding skills bubble (2015-11-12 08:00)

As we enter the second machine age, it’s easy to assume that coding skills will be in ever increasing demand. But this TechCrunch feature suggests both that the skills shortage will likely prove fleeting, due to the impending automation of much coding, as well as that bullshit abounds in schemes which aim to address the contemporary shortfall:

It’s an ingenious business model. There’s a dearth of skilled coders in the marketplace to fill the five million computing jobs available in this country. For somewhere between free and $36,000, you learn to program computers in less than a year. If you’re one of the lucky few, you will hit your aha moment with programming and develop a personal passion for it, as well land a real job.

In 15 years, those hard-won skills will be obsolete — if they ever stuck in the first place. Despite their promises, coding academies don’t manufacture coders. They cast wide nets to discover new talent that has not yet been exposed to code. Most people don’t find coding enthralling or interesting enough to continue to pursue it as a career. Given the changing nature of software, they probably shouldn’t.

I see coding shrinking as a widespread profession. Not because software is going away, but because the way we build software will fundamentally change. Technology for software creation without code is already edging toward mainstream use. Visual content creation tools such as Scratch, DWNLD and Telerik will continue to improve until all functionality required to build apps is available to consumers — without having to write a line of code.

Who needs to code when you can use visual building blocks or even plain English to describe intent? Advances in natural-language processing and conceptual modeling will remove the need for traditional coding from app development. Software development tools will soon understand what you mean versus what you say. Even small advances in disambiguating intent will pay huge dividends. The seeds are already planted, from the OpenCog project to NLTK natural-language processing to MIT’s proof that you can order around a computer in your human language instead of code.

Granted, the author has a vested interest as the developer of one of these automation tools. But he makes an interesting point about the growth of what might be conceived as a coding skills bubble, with 175 percent growth in US academies between 2013-14 and an estimated $2.2 million revenue per school. There’s a lot of money to be made here, with a growing stream of people gravitating towards one of the few occupations popularly understood to be entering a boom time. But those willing and able to make money from providing such an education are disproportionally able to shape public perceptions of coding as an occupation, as well as having an obvious financial incentive to do so. Why entertain challenging questions about the future of coding as an occupation when there’s so much money to be made now?

The way myths about coding spread seems strikingly similar to other spheres of the digital economy. The TechCrunch author has a wonderfully succinct phrase: publicize successful outliers to propagate the illusion. The visibility of those who have ‘made it’, who are living the dream and doing what they love, licenses commitment and investment by a much greater cohort who have no prospect of doing so. Sound familiar? I’d love to explore this more rigorously at a later date, because the prospect of a homologous opportunity structure between coding and much of
the creative industries is a fascinating hypothesis. Now what about data science? Is there an equivalent data science bubble developing?

7. https://github.com/opencog

mark johnson (2015-11-17 18:49:27)
A lot of confusion about this. The mentality to skilfully exploit automated coding systems is very similar to that of writing any kind of code. It's still Zen and the art of motorcycle maintenance or Winograd and Flores's wonderful Understanding Computers and Cognition. It's dealing with breakdown, modelling behaviour, exploring possibilities, playing... entanglements. If there's now a loss of faith it's because the "dead hand of education" manages not to address the things that matter about coding. And teachers who are forced to teach it will do so monotonously or rigidly and be terrible models for students. There is a pedagogical deficit.

Call For Papers: Qualitative Methods and Data in Digital Societies (2015-11-13 08:00)

Call for papers: Themed Issue

Qualitative Methods and Data in Digital Societies

Qualitative Research [html: [1]http://qrj.sagepub.com %5D

Edited by William Housley (Cardiff University), Bella Dicks (Cardiff University) and Karen Henwood (Cardiff University).

The explosion of digital social data in recent years has required a response from both the social science and computational science communities. This has been framed as an attempt to move beyond the coming crisis of empirical sociology (Savage and Burrows, 2007, 2009; Edwards et al., 2013; Housley et al., 2014). The opportunities and challenges for social science from this 'data deluge' are wide ranging and a spectrum of thinking is emerging across the community that includes enthusiasts, skeptics and those with deep reservations. Yet, the rise of digital data and the claims being made for it also rest on human practices and social life in multiple ways (Dicks, 2012; Smith, 2014). Consequently, Qualitative Research is central to understanding how digital data is accomplished, lived and analysed.

This themed issue invites contributions that address the role of Qualitative Methods in responding, challenging and contributing to the reflexive interrogation and scoping of data in digital societies at situated, networked and system levels. The advent of Web 2.0, the open data movement and the rhetoric of 'Big Social Data' have opened up
opportunities to analyse big qualitative data streams, such as those associated with social media, in ways that are not yet fully understood; new digital data developments include those associated with the emerging contours of the ‘Quantified Self’ movement and the navigation of health metrics through the use of body proxemic technology giving rise to forms of life characterised by data responsibilisation and self-analytics.

The themed issue will invite papers that report on these and associated developments. Topics of interest include:

- Ethnographic studies of interdisciplinary collaboration in the area of digital data analysis, digital tool development, platform development and the associated context(s) of occupational identities and expertise.

- The Qualitative dimensions and issues surrounding coding and annotation practices through new methods such as crowdsourcing techniques and citizen social science. Qualitative studies of the social life of methods in the digital era and the observation of ‘naturally occurring’ data generation practices that make use of new networked technologies in the pursuit of self-management and performance. This might also include studies that demonstrate how digital actors reflexively navigate data streams in ways that are nuanced and complex and not akin to being a ‘cultural dope 2.0’.

- The interaction order in the digital age; the ‘Self’, identity and digital data.

- Methodographic studies of the design and use of algorithms in digital tool development and data harvesting, the examination of code and machine learning as an accomplishment and artefact, the social organisation of statistics and modelling, the examination of demographic proxies in social media analytics and issues surrounding inference and evidence within the Big Social Data imaginary.

- The relationship between 'small' and 'big' social data. Innovations in the Qualitative analysis of Big Text data and social media streams.

- The ethical dimensions and politics of data in the digital age. Data inequalities: gender, race, class and the accomplishment of data.

Call for Papers: Sociology of Religion Study Group Annual Conference (2015-11-14 08:00)

BSA Sociology of Religion Study Group

Annual Conference 2016 – Call for Papers

The theme for the BSA Sociology of Religion Study Group Annual Conference 2016 is ‘Construction and disruption: The power of religion in the public sphere’.

The purpose of the conference is to examine these and other characteristics of contemporary religion in order to achieve a greater understanding of its constructive and disruptive impact in the public sphere. What are the key categories, discourses, contexts and institutions through which this question can be explored? How do practitioners navigate these characteristics?

The conference welcomes a wide range of topics relating to religion in society and hopes to encourage a space where different faith perspectives can come together.

For more information about the conference and how to submit your paper please click [1]HERE

Methods for Studying Creativity: Ahead of the Curve (2015-11-15 08:00)

Researhing creativity, collaboration and co-ordination requires methods that span disciplinary, quantitative and qualitative, and textual, visual and aural boundaries. Michael Schober (New School, New York), Carey Jewitt (UCL Institute of Education) and Matthew Purver (Queen Mary University of London) discuss and demonstrate developing methods for studying creativity creatively.

---

MICHAEL SCHOBER: Creativity in joint musical improvisation
Musical improvisation is a prototypically creative act, not only in obvious cases of "spontaneous composition" in free jazz but even in classical chamber musicians' improvisatory adjustments to each other's gestures in performances of notated music. This presentation focuses on two sets of studies as examples of methods for studying what happens in joint musical improvisation, where performers' improvisations constrain and are constrained by the actions of the other performers. One experiment analyzes millisecond-level synchronization and blind-juror ratings of the playing of 30 pairs of jazz pianists and saxophonists as they played a specially-composed piece (with notated and improvised sections) face-to-face, via remote video, and via remote audio. Another set of case studies uses a retrospective think-aloud method to examine how performing pairs in free jazz, be-bop, and classical chamber music individually characterize—immediately after performing—what just happened, e.g., their partner's intentions, what worked and what didn't. These studies then quantitatively examine the extent to which performers' characterizations overlap, and the extent to which performers endorse (on Likert-type scales) their partner's interpretations any more than interpretations by an outside listener.

Michael Schober is Professor of Psychology and Associate Provost for Research at The New School in New York City

CAREY JEWITT: Methodological innovation: the digital body and the sensory
I will use case studies from the MIDAS project, which explored methodological innovation across the social science and the arts with a focus on the body in digital environments. Drawing on the MIDAS case studies, I will discuss the potential synergies for social science generated by engaging with arts-based methods from fashion, performance and design. One aspect of this is how researchers might be able to identify and exploit the different ways in which the social sciences and the arts case studies zone and fragment the digital body, bring the sensory into view, and create different trajectories and boundaries between the physical and the digital-physical when they research the body. Carey Jewitt is Professor of Technology and Learning at the UCL Institute of Education.

MATTHEW PURVER: Studying Creativity via Computational Modelling
One way to investigate creativity is to build artificial agents which might be capable of creative output – perhaps basing them on theories of human cognition and creativity – and see how well they work. This talk will describe recent and ongoing work on a range of projects in the Computational Creativity Lab at Queen Mary University of London, explain how they relate to general models of human cognition, and discuss what insights they can give us. We will examine general statistical models of sequential and hierarchical learning, discuss how they can be connected to higher-level conceptual structures, and show how they can be applied to model language and music while generating interesting, novel outputs. Matthew Purver is Reader in Computational Linguistics at Queen Mary University of London

Agenda:
1.30 Registration and tea/coffee
2.00 Event starts - Chair and introduction by Patrick Sturgis
2.15 Michael Schober - paper 25 minutes, 10 minutes questions
2.50 Carey Jewitt - paper 25 minutes, 10 minutes questions
3.25 Tea/coffee
4.00 Matt Purver - paper 25 minutes, 10 minutes questions
4.35 Discussion between speakers and participants
5.00 Close

Everyday Life in Salford (2015-11-16 08:00)

I am pleased to present the book of Everyday Life in Salford. Through this project, we have supported six people to be able to represent their own lives through photography, storytelling and info-graphics. The participants in the project and authors of the book - the two Janes, Christine, Glyn, Beth and Letitia - all have powerful individual stories to tell, which also document current issues in our society. It has been a humbling, inspiring and emotional project to be part of.

Each participant took photographs that reflected their sources of everyday support and also issues that caused them struggles or anxieties, and then shared the story behind their photographs in a supportive environment. As one participant said: “By just taking pictures that mean something to you, a meaningful story emerges”. Through these stories, we also considered shared themes and how these related to wider social issues that affected the whole community. In addition to this, the public policies that affected people's everyday lives were identified and the group came up with ideas on how to represent these through infographics co-produced with our graphic designer [4]Dan Farley. It has been a positive experience for everyone involved; Jane Fearns, who tragically lost her son last year, has said how the project has provided “a reason to get dressed and go out” while Glyn noted that “sometimes you only look at the negatives and don't see the positives, but by going out and taking these pictures it reminds you of what’s good about your life”.

Public policy, the media and social science research can often reduce the complexity and individuality of people in order to make sense of our society – but this can lead to negative stereotypes that are rooted in misrepresentation and untruths. It can also neglect the context in which people are living in, individualising blame for the effect of structural inequalities and ignoring the particular life-histories of people. The worst results of this can be the stigmatisation of working class communities and unjust social policies that seem to largely gain public consent.

Four days left to register for the accelerated academy! deadline nov 20th (2015-11-16 16:14)

Power, Acceleration and Metrics in Academic Life
2nd-4th December 2015, Prague (Vila Lanna)

Organised by the Institute of Philosophy of the Czech Academy of Sciences and supported by the Strategy AV21.

[1]Register here

There is little doubt that science and knowledge production are presently undergoing dramatic and multi-layered transformations accompanied by new imperatives reflecting broader socio-economic and technological developments. The unprecedented proliferation of audit cultures preoccupied with digitally mediated measurement, quantification of scholarship and the consolidation of business-driven managerialism and governance modes are
conspicuous in the contemporary academy. Concurrently, the ever-increasing rate of institutional change, (the need for) intensification of scientific and scholarly production/communication and diverse academic processes seem to characterize the overall acceleration of academic life. Quantification and metrics have emerged not only as navigating instruments paradoxically exacerbating the general dynamization of academic life but also as barely questioned proxies for scientific quality, career progression and job prospects, and as parameters redrawing what it means to be/work as a scholar nowadays. Metrification now seems to be an important interface between labour and surveillance within academic life, with manifold affective implications.

This three-day conference investigates the techniques of auditing and their attendant practices and effects and will also probe into scholars’ complicity in reproduction of such practices. It will consider processes of social acceleration within the academy and their implications for the management of everyday activity by those working within it. This will include:

- empirical and theoretical engagements with the acceleration of higher education
- the origins of metrification of higher education
- metrification as a form of social control
- the challenges of self-management posed by metrification and/or acceleration
- common strategic responses to these challenges
- the relationship between metrification and acceleration
- how metrification and acceleration relate to a broader social crisis

Keynote Speakers

Roger Burrows (Goldsmiths, University of London) – *Ancient Cultures of Conceit Reloaded*

In 1990 the sociologist Ian Carter published *Ancient Cultures of Conceit* – a brilliant analysis of campus fiction. It provides a wonderful rendering of a world we have lost – a world where academic life was slower paced and where spreadsheets, metrics, business plans and impact agendas were largely unknown. This paper attempts to carry forward Carter’s analysis over the last 25 years examining more recent examples of the campus fiction genre but also including fictional representations of campus life to be found on social media.

Philip Moriarty (University of Nottingham) – *The Power, Perils and Pitfalls of Peer Review in Public*

There are major deficiencies in traditional peer review. Not only can clearly flawed papers easily pass ‘scrutiny’ with flying colours, but the idea that a study is accepted into the scientific literature on the basis of a handful – or, not infrequently, one – set of anonymous reviewer comments seems quaint and archaic in a Twitter-, blogosphere-, and BuzzFeed-enabled world. Post-publication peer review, enabled by sites such as PubPeer, is an exceptionally important tool for online critique, analysis, and scrutiny of published papers. For the next generation of researchers, PPPR will almost certainly be de rigueur. Before we get to that point, however, there are quite a number of teething problems that need to be addressed. These include, in particular, the key issue of the role of anonymity and moderation in online commentary.

Susan Robertson (University of Bristol) – *Vertigo: Time and space in the contemporary university*
One of Henri Lefebvre’s great intellectual contributions was not only how we think about the spatiality and temporality of social life but that lived/in spaces and their social relations are the outcome of ongoing cultural, political and economic projects and their dynamics. In this lecture I explore the changing nature of the contemporary university, and the ways in which recalibrations of time and space are also simultaneously the medium, object, and outcome of these projects and dynamics. I invoke the idea of ‘vertigo’ – the sensation of the world moving, and profound anxieties about the potential for a loss of height – as a way of exploring the complex ways in which governing the university through temporal and spatial strategies mediates the ongoing experiences of living, learning, and working, in the university.

James Wilsdon (University of Sussex) – The Metric Tide: Reflections on the UK’s Independent Review of Metrics in Research Assessment and Management

There are powerful currents whipping up the metric tide. These include growing pressures for audit and evaluation of public spending on higher education and research; demands by policymakers for more strategic intelligence on research quality and impact; the need for institutions to manage and develop their strategies for research; competition within and between institutions for prestige, students, staff and resources; and increases in the availability of real-time ‘big data’ on research uptake, and the capacity of tools for analysing it. Citations, journal impact factors, H-indices, even tweets and Facebook likes – there are no end of quantitative measures that can now be used to assess the quality and wider impacts of research. But how robust and reliable are such indicators, and what weight – if any – should we give them in the management of the UK’s research system? Over the past year, the UK’s Independent Review of the Role of Metrics in Research Assessment and Management has looked in detail at these questions. The review has explored the use of metrics across the full range of academic disciplines, and assessed their potential contribution to processes of research assessment like the Research Excellence Framework (REF). It has looked at how universities themselves use metrics, at the rise of league tables and rankings, at the relationship between metrics and issues of equality and diversity, and at the potential for ‘gaming’ that can arise from the use of particular indicators in the funding system. The review’s final report, The Metric Tide, was published on 9 July 2015. In his talk, James Wilsdon will reflect on the review process, outline its main findings, and consider the opportunities and obstacles to more responsible uses of metrics in the research system.

Oili-Helena Ylijoki (University of Tampere) – ‘Projectification’ and conflicting time orders in academic knowledge production

Under the current conditions of academic capitalism and market-driven managerialism, university research is increasingly conducted in large projects on external, competitive funding from various national and international sources. The project format offers a fixed-term, fast and flexible organizational mode which fits together with constantly changing needs of the turbulent university environment. This paper argues that the ‘projectification’ of science creates a special project time which stands in conflict with process time. Project time, embedded in standardized and abstract clock time, is decontextualized, linear, cumulative and predictable, entailing a strictly defined timeframe with a fixed beginning and end. This is in a sharp contrast with nonlinear, context-dependent and unpredictable process time involving unforeseen periods of standstill, deceleration and acceleration. Furthermore, project time includes 1) commodification of time by translating research process into money, 2) control of time by dividing research into beforehand determined phases in which accountability of the use of time is required, 3) compression of time by speeding up research productivity, and 4) colonization of time by subordinating alternative temporalities in research. The paper discusses how the intensification of project time reshapes and remoulds research practices and academic subjectivity, and what possibilities for alternative temporalities can be created and sustained at the accelerated academy. This is done by distinguishing temporal dilemmas and ways to live with them: long-term commitment vs. short-term funding; fast pace vs. slow thinking; time efficiency vs. wasting time; linear career time vs. circular project rat race; and work time vs. existential time.

Streams of Consciousness: Data, Cognition and Intelligent Devices (2015-11-19 07:39)

Streams of Consciousness: Data, Cognition and Intelligent Devices

21st and 22nd of April 2016 Centre for Interdisciplinary Methodologies University of Warwick "What's on your mind?" This is the question to which every Facebook status update now responds. Millions of users sharing their thoughts in one giant performance of what Clay Shirky once called “cognitive surplus”. Contemporary media platforms aren’t simply a stage for this cognitive performance. They are more like directors, staging scenes, tweaking scripts, working to get the best or fully "optimized" performance. As Katherine Hayles has pointed out, media theory...
has long taken for granted that we think "through, with and alongside media". Pen and paper, the abacus, and modern calculators are obvious cases in point, but the list quickly expands and with it longstanding conceptions of the Cartesian mind dissolve away. Within the cognitive sciences, cognition is now routinely described as embodied, extended, and distributed. They too recognize that cognition takes place beyond the brain, in between people, between people and things, and combinations thereof. The varieties of specifically human thought, from decision-making to reasoning and interpretation, are now considered one part of a broader cognitive spectrum shared with other animals, systems, and intelligent devices. Today, the technology we mostly think through, with and alongside are computers. We routinely rely on intelligent devices for any number of operations, but this is no straightforward "augmentation". Our cognitive capacities are equally instrumentalized, plugged into larger cognitive operations from which we have little autonomy. Our cognitive weaknesses are exploited and manipulated by techniques drawn from behavioural economics and psychology. If Vannevar Bush once pondered how we would think in the future, he received a partial response in Steve Krug’s best selling book on web usability: Don’t Make Me Think! Streams of Consciousness aims to explore cognition, broadly conceived, in an age of intelligent devices. We aim to critically interrogate our contemporary infatuation with specific cognitive qualities – such as "smartness" and "intelligence" – while seeking to genuinely understand the specific forms of cognition that are privileged in our current technological milieu. We are especially interested in devices that mediate access to otherwise imperceptible forms of data (too big, too fast), so it can be acted upon in routine or novel ways. Topics of the conference include but are not limited to: - data and cognition - decision-making technologies - algorithms, AI and machine learning - visualization, perception - sense and sensation - business intelligence and data exploration - signal intelligence and drones - smart and dumb things - choice and decision architecture - behavioural economics and design - technologies of nudging - interfaces - bodies, data, and (wearable) devices - optimization - web and data analytics (including A/B and multivariate testing)

Confirmed Speakers: LOUISE AMOORE, JAMES ASH, DAVID BERRY, WILLIAM DAVIES, MICHAEL DIETER, STEVE FULLER, JENNIFER GABRY, ANTOINETTE ROUVROY, NATASHA SCHÜLL, NICK SRNICEK, NIGEL THRIFT, MICHAEL WHEELER.

Please submit individual abstracts of no longer than 300 words. Panel proposals are also welcome and should also be 300 words. Panel proposals should also include individual abstracts. The deadline for submissions is Friday the 18th of December and submissions should be made to cimconf@warwick.ac.uk. Accepted submissions will be notified by 20th of January 2016.

Flawed cosmopolitanisms of being human: mediation and worldmaking in media discourses of terrorism (2015-11-19 07:43)

by Rodanthi Tzanelli

There is little to say about the Paris attacks that does not touch upon the phantom of the so-called War on Terror. What has been produced in journalistic and intellectual cycles certainly concurs on one thing: invisible violence of this sort challenges the tired cosmopolitan declaration of human togetherness, as it is based on de facto nihilistic actions of self-obliteration in the name of community values. There is much truth in Vijay Prashad’s recent discussion of the ways especially Western leadership has espoused a macho language about "pitiless war" to reinforce its national and global role. Far from peace-making, this role obeys to a global gender order that fits nationalist militarist discourse into a globalised civilising process, presenting social (gender) as cultural (East vs. West, North vs. South, developed vs. underdeveloped) hierarchies.

But it all functions at the level of metaphor to do the job of politics: men rule and those conforming to other
gender or sexual conventions follow. How much does this reveal about the pillars of the present ideological work in leadership headquarters – and how are we to think about the agential basis of this civilising language? What are the consequences of such discourse for the maintenance of our already frail cosmopolitan togetherness? I think it all boils down to an economy of violence. By this I do not refer to classical economics but to the reduction of supposed universal givens, such as the right to be recognised as a human being (as well as the responsibility to recognise others as humans and the intermittently stressed these days norms that regulate our rights and responsibilities in this type of recognition and self-recognition). The economy of violence after the France events is fixated upon measuring one’s humanity against a stabilised (by Western civilisation) factor: the ability to circulate and enable circulations of habitus across markets, phantasmagoric industries and pleasure business.

I do recall here Steve Fuller’s observation on the economic rationale of being human. He starts by distinguishing between the expressions ‘Humanity comes at a price’ and ‘Humanity comes at a cost’. He notes: [2] ‘The first phrase suggests what you need to pay your master to acquire freedom, while the second suggests what you need to suffer as you exercise your freedom’. Though using this to reflect on the role of artificial intelligence in contemporary articulations of the human, his notes have far broader implications and implementations in the context of the Paris attacks. If anything, they suggest that masters do not go invisible in global events whereas the unfree have to suffer publically to be acknowledged and noticed by others. It is only then – and only when the slave achieves representation as sufferer, a dispossessed, an ‘acted upon’ object – that they enter the visible fields of the media as human. Bombers and shooters remain invisible in this respect in an ever more mediatised world in the sense that their motivations and actions do not obey to the economy of violence but inverse roles for a while, by humiliating masters on the global stage.

But first things first: if not carefully unpacked, the rationale of ‘costing’ and ‘pricing’ is in danger of mistaking a cultural recurrence in world societies as an economic activity divested of its utopian origins (reciprocal giving). At the same time, Fuller’s elaboration on costing reproduces Prasad’s argument that nihilist violence of the Paris type tends to mutate and spread like a virus to victimised societies at the level of leadership. If the ISIS terrorist perceives of himself – notably, rarely herself – as a victimised slave regaining self-respect through the ultimate heroic act (self-sacrifice), Western leadership feels that it has to reassert their master place on the world stage by discursive means. Such self-presentational games are characterised by an intersubjective perversion not that dissimilar to those explored by Hegelians such as Alexander Kojève and, more recently, Axel Honneth. They also seem to obey to other processes involving the transvaluation of values within societal formations in which terrorist enclaves originate. But again, they speak of a dramaturgical platform on which roles, duties and resentments are discharged without questioning how their cosmological foundations are laid and how audiences come to accept and finance the ‘play’.

It is here that the notion of the human meets the cultural principles of markets proper, turning the economy of violence into the maiden of capitalism. Note that, as an extension of Fuller’s essay, my understanding of ‘markets’ encompasses ideas of genealogical debts to civilisation and civility – two concepts irrevocably connected to Western and European histories of being human. Such debts refer to our responsibility to maintain and reproduce the pillars of our Western civilisation, which were laid on violence exercised upon racialize others to support ideals of compassion, belonging, equality and fraternity (paradoxically and perversely in the case of an ex-colonial power and current European and world player, France). If this sounds too irrelevant to the Paris events at first, I invite readers to reconsider the power of markets - especially media markets - in producing particular world pictures and hence notions of humanity. While we all mourn the dead of Bataclan – [3] note how a pair of abandoned shoes outside the theatre signifies in Instagram the absence of humans in the violent site - a dear Japanese friend posted on Facebook a shocking statistical chart from the Global Terrorism Index indicating that in 2013 about 80[4] % of terrorist deaths took place in 2013 in 5 countries, none of which located in the Western hemisphere.

These statistics are more elusive in mainstream global media platforms, allowing (by omission) a message to dominate our fully network homes: the West has the only victims worthy of mourning in minute-long silences and annual commemorations; outside its imagined solidarity terrain there are animals and beings that refuse to join the
civilised world of humans. I do not wish to endorse violence of this or any other sort as a response to Western violence, only to highlight how the good old reciprocal cycle (of human recognition) now turns into an accelerating cycle of human self-destruction. Not only does the message reproduce the brutal bipolar logic of the World on Terror, it also promotes it to a worldmaking monologue: an axiomatic picture about foreign realms of being (the lands and heritage domains from which terrorist come, as if there is no home-grown Western terror) managed by global media conglomerates that make de-make or re-make whole populations, destinations and heritages that share little with the perpetrators of terrorist acts (save possibly nationality). Western worldmaking is not always evil in its intentions, but it tends to follow the economy of violence by default: we tend to forget that terrorism does not affect only Western European domains, where civilised mobilities of business, tourism and media flows happen, as there is little to talk about outside them. Who would 'buy into' such unpopular calls anyway? And our world picture remains unchanged and unchallenged until the next bombing tailors a bit more the notion of human existence to our Western, European and civilised measures.

Rodanthi Tzanelli is Associate Professor of Cultural Sociology at the University of Leeds. She works on globalisation with an emphasis on tourism, digital mobilities cultural industries and transformations of collective memory in post-national environments.

In his talk, James Wilsdon will reflect on the review process, outline its main findings, and consider the opportunities and obstacles to more responsible uses of metrics in the research system.

Oili-Helena Ylijoki (University of Tampere) – ‘Projectification’ and conflicting time orders in academic knowledge production

Under the current conditions of academic capitalism and market-driven managerialism, university research is increasingly conducted in large projects on external, competitive funding from various national and international sources. The project format offers a fixed-term, fast and flexible organizational mode which fits together with constantly changing needs of the turbulent university environment. This paper argues that the ‘projectification’ of science creates a special project time which stands in conflict with process time. Project time, embedded in standardized and abstract clock time, is decontextualized, linear, cumulative and predictable, entailing a strictly defined timeframe with a fixed beginning and end. This is in a sharp contrast with nonlinear, context-dependent and unpredictable process time involving unforeseen periods of standstill, deceleration and acceleration. Furthermore, project time includes 1) commodification of time by translating research process into money, 2) control of time by dividing research into beforehand determined phases in which accountability of the use of time is required, 3) compression of time by speeding up research productivity, and 4) colonization of time by subordinating alternative temporalities in research. The paper discusses how the intensification of project time reshares and remoulds research practices and academic subjectivity, and what possibilities for alternative temporalities can be created and sustained at the accelerated academy. This is done by distinguishing temporal dilemmas and ways to live with them: long-term commitment vs. short-term funding; fast pace vs. slow thinking; time efficiency vs. wasting time; linear career time vs. circular project rat race; and work time vs. existential time.
Digital capitalism and the form of social science it encourages (2015-11-20 08:00)

I’ve published a [1]great piece on The Sociological Review blog, by Sage’s Ziyad Marar, which really resonates with some of the concerns shaping my new project:

Yet our digital culture may exacerbate this problem by tilting us even further toward speed, simplicity and utility. In what is often called the ‘attention economy’ (where information overload makes attention the scarce resource) there is a clear need to filter our consumption efficiently, therefore inviting the twin enticements of automation and aggregation. The hope is that we can navigate the suffusion of information by using big data, algorithms and metrics of many types and thereby cope with the tidal wave of knowledge without drowning.

But this trend favours certain types of information, the more standardised the better, and relies on a metaphor of knowledge as a process of discovery, yielding up simple enough nuggets that will be grist to the mill of aggregation. This is all very well for simpler, tamer problems that are commonly dealt with by physical and natural science. When it comes to messier and more ‘wicked’ problems, which are to a larger extent the focus of social science and the humanities, interpretation is often a more apt mode of enquiry. And the results are usually more ambivalent and need careful digestion and patience and need to be assessed with a multi-dimensional framing

Later on this year, I’m planning a short piece, building on the question of digital capitalism and the form of social science it encourages, discussing digital capitalism and the form of social science it needs. We’re seeing the emergence of a potentially dominant approach to digital social science which contributes to the systematic mystification of the political economy of digital capitalism.

A short film about the presentation of self in everyday life (2015-11-21 08:00)

Thanks to Les Back for linking to this short film about the presentation of self in everyday life:
The first gold rush of digital capitalism (2015-11-22 08:00)

From *Elon Musk*, by Ashlee Vance, pg 10-11. I think this understates the degree to which 'playing hard' was driven by a potent mix of fear and aspiration. But it’s a nice overview of circumstances which intruige me:

And, in 2000, San Francisco had been over- taken by the boom of all booms and consumed by avarice. It was a wonderful time to be alive with just about the entire populace giving in to a fantasy— a get- rich- quick, Internet madness. The pulses of energy from this shared delusion were palpable, producing a constant buzz that vibrated across the city. And here I was in the center of the most depraved part of San Francisco, watching just how high and low people get when consumed by excess. Stories tracking the insanity of business in these times are well- known. You no longer had to make something that other people wanted to buy in order to start a booming company. You just had to have an idea for some sort of Internet thing and announce it to the world in order for eager investors to fund your thought experiment. The whole goal was to make as much money as possible in the shortest amount of time because everyone knew on at least a subconscious level that reality had to set in eventually.

Valley denizens took very literally the cliché of working as hard as you play. People in their twenties, thirties, forties, and fifties were expected to pull all- nighters. Cubicles were turned into temporary
homes, and personal hygiene was abandoned. Oddly enough, making Nothing appear to be Something took a lot of work. But when the time to decompress arrived, there were plenty of options for total debauchery. The hot companies and media powers of the time seemed locked in a struggle to outdo each other with ever-fancier parties. Old-line companies trying to look “with it” would regularly buy space at a concert venue and then order up some dancers, acrobats, open bars, and the Barenaked Ladies. Young technologists would show up to pound their free Jack and Cokes and snort their cocaine in porta-potties. Greed and self-interest were the only things that made any sense back then.

The idea I’m playing with is that a certain culture developed in this febrile atmosphere, before eventually becoming relatively autonomous from it through the mediation of tech books, magazines and blogs, as well as the diffusion of people into other aspiring tech hubs. The culture has become more extreme since then, while also becoming detached from the state of exceptionalism which initially licensed these extremes.

One week left! The @ijsrm seminar competition (2015-11-23 08:00)

The Board of the International Journal of Social Research Methodology (IJSRM) is pleased to announce the launch of our new Seminar Competition. Our aim is to support the development of critical and innovative approaches to on-going and emerging methodological debates across a range of approaches, both qualitative and quantitative, and including mixed and comparative methods, as these relate to philosophical, theoretical, ethical, political and practice issues. Seminars may consist of single or multiple day events. Topics can include any area of social research methodology.

Available funding £1500

Guidelines for Applicants

We are seeking proposals that are concerned with debate and critical development of original cutting edge work of methodological significance. Seminars may bring together established and new researchers. They should be collaborative in approach across different institutions and disciplines and may include colleagues from relevant, non-HE, organisations. Proposals should have clear goals and outcomes with evident concern to the methodological contribution of the Seminar. In addition, a core purpose of the Seminar series is to engage with, and contribute to the development of an international community of social researchers. Accordingly, proposers may consider how their events can be recorded for non-participants and posted on the IJSRM multimedia site. Proposers should also consider including the production of new papers for potential publication in IJSRM. Such papers will be subject to the normal review procedures of IJSRM with no guarantee of publication.

Format

We are open to suggestions for format either in the form of a single day seminar or in the form of multiple days across the year 2016. It is expected that the funding will be used towards meeting the cost of room and equipment hire, hospitality, consumables and travel for speakers. It is expected that there are no costs for delegate attendance.
How to Apply

Further details and an application form can be obtained from Alice Edwards, Journal Administrator, tsrm-editor@tandf.co.uk.

Closing date for applications: 30 November 2015

Assessment Criteria

All submissions will be reviewed by a Committee drawn from the Board of IJSRM and will be assessed against the following criteria:

- Contribution to the development of methodological innovation and debate;
- Relevance to the aims and scope of IJSRM;
- Projected outputs and impact;
- Value for Money

Notes

- All successful seminars will have a named Principal Organiser and named Co-Organiser. The Principal Organiser will be responsible for all promotion and management of the programme of work, including arrangements for the venue, rooms, facilities, dealing with expense forms, submitting claim forms for event costs to IJSRM.
- Travel, at standard return rail fare rates and reasonable subsistence for speakers is permissible. Fees will not be paid to speakers.
- Delegates will not be paid expenses for attendance.
- The events will be promoted by the Principal Organiser and co-organisers through their research networks, institutions and departments. All communications with participants and publicity of events will acknowledge sponsorship by the International Journal of Social Research Methodology.
- Further promotion will be undertaken by Taylor & Francis as appropriate.
How come – at least in the UK – you don’t come across people working in industry, business, the civil service, or pretty much anywhere outside academia or independent research organisations, who have ‘sociologist’ in their job title? Sociologists seem to all reside in universities, unlike psychologists and economists, who have colonised all kinds of settings. There just don’t seem to be any practical sociology jobs out there.

And yet most sociologists believe our subject is essential for understanding the world around us. Or to resolve contemporary problems, from gender violence to climate change. We have the concepts (like ‘cultural capital’ or ‘moral panic’) and the theories (social mobility, socialisation). But where are the practical sociology jobs? Why do so few of those ideas in the sociology journals get applied on a daily basis?

Of course, sociology graduates work in all kinds of jobs, using their knowledge to greater or lesser extent. And some do make a living as independent ‘consulting sociologists’. In the US, people have jobs as ‘clinical sociologists’, addressing problems for all sorts of organisations and corporations.

But what would it take to establish a ‘practical sociology’ in the UK and elsewhere, with sociologists employed to use sociology concepts and models to address problems in industry, business, government, education or health?

In 2016, we’re planning an event that aims to establish an agenda for practical sociology. These are some pressing questions to answer if sociology is to break out from the academy into the outside world.

What has prevented the emergence of practical sociology in the UK?

What are the core knowledge and models that are needed to solve the problems that organisations, businesses and
the public sector face?

What kinds of skills would be needed to work as a practical sociologist?

How would a practical sociology career pan out?

We'll keep you posted. If you'd like us to contact you directly with updates, please e-mail mark@markcarrigan.net and n.j.fox@sheffield.ac.uk with the e-mail subject "subscribe to practical sociology".

Nick J Fox, BSA Sociologists outside Academia

Mark Carrigan

Gabriel (2016-03-01 01:01:16)
At the risk of stating the obvious, it seems to me an important reason for the lack of development of a practical sociology is that industrial, business and civil service organisations involve power structures. An important objective of sociology has always been to expose/reveal these structures. Given that it is usually the powerful within organisations that pay the salaries and fees there would seem to me to be an inherent resistance in these organisations to hiring anyone who specialises in understanding power structures and consequently to the development of a practical sociology. Psychologists and economists on the other hand tend not to be concerned with power structures.

Mark Carrigan (2016-03-03 22:46:10)
As enthused as I am about the idea of practical sociology, I think the idea that sociology's lack of purchase is because the powerful are scared of us verges on self-deception.

Dave Ashelman (2016-07-21 14:28:46)
Before I started working on my PhD, I spent 20 years in Human Resources with a Sociology undergraduate degree. I could think of no better application of Sociology that HR. Then it became about economics, and the psychology of labour economics. Today, Human Resources have very little to do with actual "humans," and especially in social conditions. All humans are independent representative agents of an aggregate labour force. My having a front row seat in the rise of Neoliberalism, I think it's worth critiquing Sociology as a discipline on this front. While Economics and Psychology were doing push-ups in Neoliberal boot camp, developing what would become "behavioral economics," Sociology was distracted by the shiny objects of post modernism. When Sociology finally got around to critiquing things like workplaces and neoliberal takeovers of social institutions, the only thing they could offer was Marx - the very thing that Neoliberal movements were fighting against. Sociology provided no alternative, and failed to add anything useful to the transformations taking place in the 1970s & 80s. Instead, Sociologists in the late 1970s told us that "latch key kids" was the new social problem as more women entered the workforce to supplement falling incomes from union disintegration and stagflation - suggesting that women NOT enter the workforce. Sociologists warned us of Malthusian overpopulation in the 1980s, instead of seeing that resources weren't all that scarce anymore - they just had an unequal distribution. When everyone's workplace retirement funds disappeared in the G7 countries in the 2000s, there was almost nothing from Sociology on it. Even today, more papers on inequality have been published by economists than Sociologists. John Myles' paper "Where have all the sociologists gone" noticed this in 2003. Mitchell Dean's 2014 paper "Rethinking Neoliberalism" notes that Sociology has largely sat on the sidelines, calling the plays of the game, but left the heavy lifting to economists. So the answer to the question of why there are no Sociology professions has to start with looking in the mirror. How do we get back our seat at the policy table, the labour table, and gain legitimization overall? I don't know. I think it starts with a return to science & scientific thinking on Sociology's part. As long we keep screaming things in public that have nothing to do with people's everyday life, or the practice application of
solid theory (as opposed to creating theories that have no practice application in the public’s everyday life), we’re shooting ourselves on that front. As Sociologists, we have to legitimize sociology - and we’ve just been derelict in that for the past 40 years.

Toby Bennett (2016-07-30 16:12:17)
My feeling - and I am not a sociologist by training but an interested observer with a little bit of experience researching this area - is that ‘the business world’ (to rather absurdly assume a unified field for a moment) is sympathetic with sociology as a discipline but unsympathetic with the academy as an institution. It is more about being ‘out of touch’ with ‘the real world’ than being threatening, as such. The university is a assumed to be a place for Mode-1, or ‘theoretical’ knowledge, model-building, where we need more Mode-2, contextual, applied knowledge. This is clearly insensitive to the long history of interaction between these modes but it is the assumption, I think Business has its indigenous sociologists: market researchers, HR, management consultants, “thought leaders”. Academic sociological, even critical, concepts and methods circulate widely in these disciplines - but typically isolated from the broader framework in which they reside (or sociological imagination, perhaps). Indigenous sociologists are legitimate because (and only as far as) their knowledge is pitched primarily at - or, at the very least, is compliant with - the pursuit of competitive advantage and, secondarily, other industrial or civic norms that are important to the particular context of application. An insightful article from Martin Parker on sociology and business schools: http://onlinelibrary.wiley.com/doi/10.1111/1467-954X.12166/full So I think the question ’where are the sociology jobs?’ is an existential one that needs a two-pronged response. The first is about convincing the wider world of it’s worth; getting a seat at the table(s). This isn't really a disciplinary argument, it’s an institutional one. So perhaps the question should be rephrased in terms of what role sociology might play in the academy’s broader transformations: the expansion of higher education, not just in student demographics but also impact agendas and the possibility of ‘alternative providers’ on the horizon; and, outside the university, the role of vocational education, professional training and accreditation, internships and so on. The second's more about the methods and institutions of pedagogy in light of those changes, as they play out on the ground. It's almost a Gramscian question. How do you retain not just the “useful” concepts but the need for theory and a sociological imagination? This will be a more fruitful line of inquiry for sociologists, I think. But the two are obviously mutually interdependent.

Mark Carrigan (2016-08-02 12:52:05)
Fancy extending that a little bit? Would make a lovely blog post

Ian (2016-09-05 19:27:24)
I became a documentary filmmaker as an alternative way of doing sociology. I guess what I do is therefore a form of Practical Sociology.

Call for proposals: @thesocreview seminar competition (2015-11-23 19:41)
The Board of The Sociological Review are pleased to announce that the journal is sponsoring a single-themed Research Seminar Series (which may consist of three or more research seminars) as well as three One Day Symposia events. The Board hopes to make this funding available on an annual basis.

Guidelines for Applicants
The proposed Research Seminar Series and each of the three Symposia should have clear goals, bring together established and new researchers in any area of sociology and focus upon producing imaginative cutting-edge work of sociological and social significance. We seek proposals that involve collaborations across institutions and disciplines and welcome those that connect sociology to wider communities and the arts.

An important aim of the series and symposia, is to produce papers that will result in innovative publications of interest to the readership of SR (the journal and/or the Monograph series) as well as an on-line Special Issue, the journal would have first refusal on all papers. Papers would need to go through the usual reviewing procedures and
there is no guarantee of publication.

As part of The SR's mission to serve and enhance the future sociological community, seminars and symposia should be open to members of sociological teaching groups in colleges and schools. For example, a number of places could either be made available to local colleges/6th forms. or sessions could be video recorded and offered to these audiences.

Format:

Either:

a) a single-themed Research Seminar Series (eg three seminars each with four - six speakers presenting papers).

One grant of up to £6000 is available.

Or:

b) a single Symposia event lasting one day.

Three separate grants of up to £2000 each are available.

It is expected that funding will provide for room and equipment hire, consumables, hospitality, travel and accommodation expenses for speakers. It is expected that delegates will not be charged a fee for attending.

NB The funding from The Sociological Review could be match funded with other sources. For instance funding from elsewhere might facilitate and enable connections and scholarly exchange with artists and sociologists working with and for communities and/or to support the presentation and development of new/ongoing research projects.

How to apply

Further details and an application form are available from The Sociological Review. Contact Mark Carrigan at mark@markcarrigan.net

Deadline for applications:

2015-6 Open 1st November, 2015 – Close 20th December, 2015

NOTES

(i) Organizers would consist of the nominated grant-holder (Principal Organizer) plus two additional named participants (co-applicants). The principal organizer will liaise with a named colleague from The Sociological Review. The Principal Organizer will organize, promote and manage all aspects of the programme (organizing seminars, dealing with expense forms, submitting claims to the office of The Sociological Review, etc).

(ii) Topics may include any area within the field of sociology, or topics that engage with key social/sociological issues either through other disciplines or through inter-disciplinary work.

(iii) Reasonable travel and subsistence expenses for speakers are permitted but not for delegates. Secretarial costs, consumables, hire of room and presentation facilities may also be included.
Fees will not be paid to speakers.

Delegates will not be paid expenses, but there will be no charge for attendance.

NB – Value for money will be one of the criteria used to evaluate proposals.

(iv) The events will be promoted by the grant-holder/core members through their research networks and through their own departments and institutions. All communications with participants and publicity of events will acknowledge sponsorship by *The Sociological Review* (eg The University of X in association with *The Sociological Review*) and the seminars will be promoted as The Sociological Review Seminar Series with the Programme and Abstracts circulated in advance. The help of Wiley-Blackwell will be sought in matters of ‘branding’. Events should be advertised on the websites of participating institutions. The Programme would also be advertised by *The Sociological Review* and Wiley Blackwell.

(v) Applications will be assessed by a Committee drawn from the Board of *The Sociological Review*. The criteria for assessment will include:

1. Sociological innovation.
2. Relevance to *The Sociological Review* journal
3. Relevance as appropriate topics for Monographs
4. General contribution to sociological analysis.

____________________

**international journal of social research methodology: ask the editors @ijsrm! december 1st at 11am**

(2015-11-24 07:15)

In my capacity as social media associate editor of the International Journal of Social Research Methodology, I’m arranging an *ask the editors* session on Twitter. It will take place on Tuesday 1st December, 11.00—12.00.

We’ll definitely have Ros Edwards and Christina Hughes. We’ll possibly have Malcolm Williams participating as well. We’ll use the hashtag #IJSRM for the discussion.

If you can’t be online at the date and time, e-mail me (mark AT markcarrigan.net) and I can ask the question on your behalf. Otherwise see you on December 1st!
Transparence and opacity in digital capitalism (2015-11-24 08:00)

It seems that Mark Zuckerberg has a secret back room in his private Facebook office, allowing him to retreat into opacity while sustaining the glass fronted and open plan layout of the corporate offices. From from The Boy Kings, by Katherine Losse, pg 196:

Mark's office sat adjacent to our pod, with its secret back room (for especially important meetings, because the front room of his office had a glass window onto the hallway that made meetings transparent) hidden behind a wallpapered door and a single table illuminated by a Mad Men –style modern lamp, receiving a constant stream of celebrities and tech luminaries and wealthy Russians in silk suits.

This is the same Zuckerberg who [1]bought four homes adjacent to his in order to ensure his own privacy. His own power dramatically illustrates the politics of transparency and opacity in digital capitalism. We can see this even more dramatically in [2]the private retreats of the digital elites: if transparency gets tiring, why not just head off to your super yacht or Hawaii estate for a while? As Zuckerberg describes it, quoted on pg 198: "We are pushing the world in the direction of making it a more open and transparent place, this is where the world is going and at Facebook we need to lead in that direction." The key terms here are pushing and lead. The pushers and the leaders are able to take a break when they'd like, without worrying about someone else perpetually trying to push and lead them.

I think this could be analysed in a similar way to how Bauman explored mobility in his work on globalisation: those at the bottom of the hierarchy are transparent because they lack the resources to escape the filter bubble, while those at the top of the hierarchy are usually transparent as a function of their own commercial success. But one condition is forced, leaving the people in question susceptible to manipulation, while the latter is chosen and can be voluntarily withdrawn from in private life.

got an idea for a monograph? submit to @thesocreview monograph call (2015-11-24 08:58)

The international refereed journal The Sociological Review is home to the Sociological Review Monograph Series. This series publishes edited collections of outstanding and original scholarly articles on issues of wide sociological interest and is dedicated to promoting emerging as well as established academics. For more information, see [1]www.sociologicalreviewmonographs.com

CALL FOR PROPOSALS: We are currently seeking proposals for two monographs to be published in January/February 2018 (deadline for completed ms = beginning of March 2017).

THE DEADLINE FOR PROPOSALS is Friday 11th December 2015. Completed proposals should be emailed to the series editor, Professor Steve Brown (s.d.brown@le.ac.uk). All decisions will be made by the end of January 2016.
Proposals should be no more than seven pages long (double spaced, Times 12 font) and should include names and
details of editors and contributors, rationale for and aims of the collection, provisional titles and abstracts of papers,
an account of the appeal of the collection to readers of The Sociological Review, and marketing justification for the
collection (e.g. distinctiveness of collection in relation to existing publications).

All articles published within the monographs are fully refereed and are included within the ISI Journal Citation
Reports and the Social Science Citation Index. The usual length of final completed collections (after refereeing
decisions have been made) is approximately 80,000 – 100,000 words. However, it is permissible for the proposed
word length of the entire collection to be up to 120,000 words.

Milton Friedman vs. Frances Fox Piven on Free Enterprise (2015-11-25 08:00)

A fascinating exchange between one of the US's most accomplished Sociologists and the intellectual hero of the
American right:

IFRAME: [1]https://www.youtube.com/embed/JQkdSj6arn0

1. https://www.youtube.com/embed/JQkdSj6arn0
The centre for social ontology book series (2015-11-26 08:00)

We’re now up to book number 4. This is the first one I’ve contributed to personally & it’s due to be published in early 2016. These are the first three volumes in the series:

Here’s the coverage of the books that I know of. Please do let me know if you come across something else! I’ll keep this list updated over the coming months:

- [5]Review of Volume 1 by Tom Brock
- [8]Daniel Little’s Reflections on Social Morphogenesis and Meta-Theory
- [9]Graham Scambler describes the project in terms of Archer’s intellectual trajectory

CfP: the dehumanisation of contemporary societies (2015-11-26 18:27)

International Association for Critical Realism (IACR)
19th Annual Conference

Wednesday 20 - Friday 22 July 2016

Pre-conference workshop: Monday 18 - Tuesday 19 July 2016

Postgraduate Teaching Centre, Cardiff Business School
Colum Drive, Cardiff CF10 3EU

De/humanisation

The dehumanisation of contemporary societies

In many ways, our current epoch witnesses dehumanised social relations. While alienation (Marx) and disenchantment (Weber) or the deficit in social solidarity (Durkheim) are by no means recent phenomena, processes of dehumanisation continue to prevail in most spheres of society. In the public sphere, discussions privilege compliance with bureaucratic regulations and quantifiable indicators (such as GDP and its growth) over human needs and flourishing, have the effect of excluding large portions of the electorate from public debate while accelerating the demise of the Welfare State.

In the economic sphere, the financialisation of the economy and the spread of market ownership tend to privilege economic profitability over human well-being. Corporate Social Responsibility is thus deployed as a rhetorical device whose injunctions are followed mostly when they are profitable to corporate shareholders. Yet, contemporary observers of capitalism witness suffering, destitution and ethical corrosion, both in richer and in poorer countries. Equally worryingly, the private sphere also seems to have undergone dehumanisation: for instance, impersonal relations are the lot of ever-growing urban centres, whilst familial duties of care are gradually replaced either by indifference or by reliance on salaried transactions with professional carers.

The dehumanisation of the social sciences

The dehumanisation of society is mirrored, and perhaps intensified, by the exclusion of the notion of ‘human’ and ‘humanity’ from the social sciences and humanities in the second half of the 20th Century. While philosophers such as Foucault, or more recently Butler, have warned against taken for granted conceptions of the human, their warnings seem to have produced effacement, rather than problematisation, of the category of ‘human’.

The realist tradition provides, however, salutary exceptions to this trend. In his dialectical critical realism, Bhaskar
(1993, 1994) advances a theory of human flourishing alongside a diagnosis of the ills of modernity. Neo-Aristotelian authors such as Sen and Nussbaum have developed political philosophies that place human capabilities at the centre of the stage. In feminist studies, Lawson (2009) advocated 'minimal humanism' and in sociology Archer (2000), Sayer (2011) and Smith (2010) have taken stock of the absence of human subjects from social scientific accounts and sketched the contours of a humanist social science.

Rehumanising society and the social sciences?

The purpose of this conference is to explore how critical realism (CR) can contribute to rehumanising both society, and the social sciences. We welcome contributions from all areas of the humanities and social sciences. Equally welcome are contributions inspired by the various voices of CR, both within Bhaskar’s philosophy (critical naturalism, dialectical critical realism, metaReality) and by the various authors who contributed to CR’s flourishing.

Full details are available on: [1]https://www.eventsforce.net/cbs/156/home

The organising team is Ismael Al-Amoudi, Tim Edwards & Joe O’Mahoney.

Please circulate this call to your Networks.

____________________________

Nicolás (2015-11-29 09:22:01)
Please, when writing a date and time, tell us which time zone you are referring to! :)

Mark Carrigan (2015-11-30 08:51:35)
sorry, reproduced from elsewhere! This is GMT.
The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic ‘Influence and Power’. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a re-thinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF’s criteria and goals may be viewed here.

Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal’s key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.

The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition’s theme and falls within the remit of BD &S’s goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.

The submitted essays will be judged and the winning essay will be chosen by an academic panel (the ISRF Essay Prize Committee). The panel’s decision will be final, and no assessments or comments will be made available. The result will be notified to applicants by email during April 2016 and will then be announced by posting on the websites of the ISRF and of BD &S. The ISRF and BD &S reserve the right not to award the prize, and no award will be made if the submitted essays are of insufficient merit.

The winning essay will be accepted for publication in the Journal; the author may be asked to make some revisions before publication. Other applicants may have their submissions accepted for publication in the Early Career Researcher forum of BD &S subject to the Journal’s peer review and decision-making process.

The details and criteria are:

**Essay topic:** Influence and Power (This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field.)

**Eligibility:** Participants should either be current doctoral students or within three years of being awarded their doctorate.
This is an interesting development: there’s clearly an interest served by the announcement but the potential success of this positioning could prove influential if legal challenges to contract labour gain some traction:

Shift, an on-demand startup that helps people buy and sell cars, is looking to make employees out of its contract-based labor force. Almost 100 California-based “car enthusiasts” — what Shift calls the people who do price checks, coordinate inspections, facilitate test drives, and otherwise help with the transaction — are being given the opportunity to join the company as employees, starting December 1.

Use of contract labor by tech companies is a hot topic. Companies including Postmates, Washio, Handy, Lyft and Uber are currently being sued by workers who say they should be receiving the benefits and compensation befitting employees.

Not all on-demand companies use independent contractors — Munchery, WashUp, Alfred and Managed by Q, to name a few, use employees. Still others, such as Shyp, Instacart and Sprig, have announced intentions to transition their workforce from contract-based to employee status.

Another BuzzFeed article gives an excellent overview of a legal challenge currently being mounted by four amazon staff over their status as contract labour:
Amazon contractors — drivers who worked for Prime Now, Amazon’s two-hour local delivery service, and were hired through a third-party contracting company — have proposed a lawsuit against the company, accusing Amazon of misclassifying them as contractors.

The drivers, their lawyer Beth Ross argues, should be classified as employees for a number of reasons, including that they work shifts rather than on a gig basis, have to wear shirts and hats with company branding, and are told by the company where to be and when. In addition, the workers are concerned that the cost of gas, tolls, and other incidental expenditures makes their total income below the legal minimum wage in California. (Amazon advertises that the drivers will make around $20 an hour; the minimum wage in California, where these workers live, is $9.)

Mark Zuckerberg’s philosophy of techno-fascism (2015-11-29 08:00)

From The Boy Kings, by Katherine Losse, pg 201. Losse was asked to write blog posts about Mark Zuckerberg’s philosophy, something which he outlined to her in general terms:

"It means that the best thing to do now, if you want to change the world, is to start a company. It’s the best model for getting things done and bringing your vision to the world." He said this with what sounded like an interesting dismissal of the other models of changing the world. I could imagine, like he may have, that countries were archaic, small, confined to one area or charter. On the other hand, companies— in the age of globalization— can be everywhere, total, unregulated by any particular government constitution or an electorate. Companies can go where no single country has gone before. "I think we are moving to a world in which we all become cells in a single organism, where we can communicate automatically and can all work together seamlessly," he said, by way of explaining the end goal of Facebook’s "big theory."

My sense is this view of 'companies over countries' is a relatively common one amongst the digital elite. It's also key to understanding philanthrocapitalism: the political complexity of the world melts away in the face of a single minded concern to discover the most efficient way of bringing your vision to the world.

But what are the political implications of this? As Losse goes on to write, "It sounded like he was arguing for a kind of nouveau totalitarianism, in which the world would become a technical, privately owned network run by young "technical" people who believe wholeheartedly in technology's and their own inherent goodness, and in which every technical advancement is heralded as a step forward for humanity." This is roughly speaking what I'm trying to explore with the techno-fascism idea: how will what is currently a vague musing on the part of digital elites
develop as part of a broader set of social transformations currently underway? How will their own vested interests, against a background of growing social upheaval and threats to their accumulated wealth, shape the development of what is at present little more than a mystical faith in solutionism and the singularity?

The extent to which this idea is discursive can be overstated, as Losse explains, she told Zuckerberg that she struggled to articulate his philosophy for him in a coherent way:

The question was what did any of these values actually mean, and why should we want them? This was something only Mark could explain. I told him that I was having trouble coming up with satisfactory essays on the topics he’d assigned, and asked him to schedule time to explain his ideas in more detail, but he was too busy or wasn’t inclined to explain further— it was hard to tell. I came to the conclusion that perhaps he thought I could invent these arguments of whole cloth, or that we already were cells in a single organism and I should be attuned enough to intuit what he meant, but I couldn’t, and so the essays were never written or posted.

international journal of social research methodology: ask the editors @ijsrm! TOMORROW at 11am (2015-11-30 07:16)

In my capacity as social media associate editor of the International Journal of Social Research Methodology, I’m arranging an ask the editors session on Twitter. It will take place on Tuesday 1st December, 11.00—12.00.

We’ll definitely have Ros Edwards and Christina Hughes. We’ll possibly have Malcolm Williams participating as well. We’ll use the hashtag #IJSRM for the discussion.

If you can’t be online at the date and time, e-mail me (mark AT markcarrigan.net) and I can ask the question on your behalf. Otherwise see you on December 1st!
Available for pre-order now! See [1]here for the cheapest place to buy it online, as well as table of contents & summary.

---

by Debra Bassett

"I mean, they say you die twice. One time when you stop breathing and a second time, a bit later on, when somebody says your name for the last time" Banksy.

The ubiquitous nature of hardware technology such as smart phones ensures social networking sites have become part of our everyday norms and routines. However, whilst some use social networks to inform people of
the important – and not so important – events in their lives, others are using communication technologies to deal with issues surrounding death, dying, and grieving. The opportunity to “live on” and the ability to create digital memories, which can be left behind for future generations, may be compelling to some: but what about those left behind? How will people use these technologies, and crucially will they help or hinder the bereavement process?

Those who have made the difficult decision to delete the telephone number of a deceased friend or relative from their mobile telephone know only too well the conscious thought process involved in doing this. So what about the decision making process involved with switching off a person’s digital life support machine? Or, importantly, making the decision not to “interact” with the social media platforms of the dead? My research with the University of Warwick seeks to explore these issues.

In my 2015 paper “[1]Who Wants to Live Forever? – Living, Dying and Grieving in Our Digital Society” I introduce the term “digital zombies” to describe the resurrected dead who remain “alive” and “active” in our digital society. Four years after he died, Bob Monkhouse appeared in an [2]advertisement to raise awareness for prostate cancer. Through the wonders of technology, he was digitally resurrected; allowing him to appear at his own graveside and discuss his own death. This type of resurrection is nothing new to the rich and famous, for example celebrities such as Fred Astaire, Steve McQueen and Tupac have all been digitally resurrected. However, the ability to “become immortal” is now on offer to non-celebrities and companies such as [3]Eternime and [4]LifeNaut are using artificial intelligence algorithms to create avatars which, they claim be will be a virtual interactive "you". This technology is available today and the exponential growth of big data ensures this human-computer interaction will increase as more services providers join the market. [5]Dead Social the UK based organisation offers an ‘end user’ planning tool, it works alongside hospices, charities and healthcare workers in an attempt to empower those facing end of life decisions, by enabling the creation and future delivery of messages to lose left behind. The website also offers practical advice regarding digital legacy issues.

Here, I think it is important to differentiate between the creation of ‘digital data’: passwords, account information, digital assets and digital property and the creation of ‘digital selves’: personal videos, messages, photographs and even the creation of avatars. In my paper I suggest “digital legacy” should be used for digital data and “digital memories” for the digital selves. These two categories are very distinct and therefore should be treated and understood in different ways. Because these two concepts are often blended together by service providers it can appear confusing to the users, I suggest clarity is needed.

My interest lies with the creation of digital memory boxes and how we can assist in designing these boxes in a positive and ethical way. Here, I am talking about a physical box, rather like a music box, which could be customised to individually represent the person, this idea is a progression of the idea of a [6]Story Shell’ which is created by the living, following the death of a loved one. However, I think the creation of digital memory boxes could be an important and empowering ‘work in progress’ for the creator and I envisage the contents of these boxes would be curated and added to throughout people’s lives. They may prove a useful tool to those with the early onset of Alzheimer’s, who may wish to fill their digital memory boxes with memories of the past and hopes for the future before their memories are locked away and lost forever.

For me the crucial point to these boxes is that these memories are kept in a special place outside of the daily digital lives of the bereaved – not on a platform on their laptops, phones or tablets - thereby ensuring they do not ‘pop up’ unexpectedly. Those who inherit the box would then be able make a conscious decision when, and how frequently, to open the box and the memories within, rather than having these digital memories on the devices they use in their daily lives. The need to be remembered is a powerful desire for some, because ultimately you only have one chance to make a good last impression!

Debra Bassett is a PhD Candidate at the University of Warwick. Her research interests lie in whether thanatechnology will affect the process of bereavement. During the research she will expand on her ideas of digital zombies.
and the creation of physical memory boxes.

structure, culture and agency: selected papers of margaret archer (2015-12-01 08:00)

The Amazon page has gone live for [1]this book I’m editing with Tom Brock and Graham Scambler. As well as the titular selected papers, it will include an interview with Archer, an annotated bibliography, a foreword by Doug Porpora and an extended introduction to her work.

This edited collection of papers seeks to celebrate the scope and accomplishment of Margaret Archer’s work, distilling her theoretical and empirical contributions into four sections, capturing the essence and trajectory of her work over almost four decades. Long fascinated with the problem of structure and agency, Archer’s work has constituted a decades long engagement with this perennial issue of social thought. Through an initial empirical study and two expansive trilogies, Archer has developed an explanatory framework that comes to grips with the complexity of social processes at different levels of analysis over time. The Morphogenetic Approach and, later, her work on the Internal Conversation, together, provide a detailed account of the interrelated processes by which structure, agency and culture come to take the forms they do. However in spite of the deep interconnections which unify her body of work, it is rarely treated as a coherent whole. Though its range and depth has been widely acknowledged, it nonetheless has an unclear place within the cannon of sociological theory. The proposed collection seeks to address this relative neglect through collating a selection of papers, spanning Archer’s career, which collectively elucidate both the development of her thought and the value which can be found in it as a systematic whole. It seeks to illustrate the empirical origins of her later ideas in her early work on the sociology of education, as well as foregrounding the diverse range of influences which have conditioned her intellectual trajectory: the systems theory of Walter Buckley, the functionalist Marxism of David Lockwood, the critical realist philosophy of Roy Bhaskar and, more recently, her engagement with American pragmatism and the Italian school of relational sociology.

How to Kill Foreigners Democratically (2015-12-02 09:50)

by Daniel Fairbrother

The debate on airstrikes and token special forces action seems to have a certain gravity about it. Of course it is serious, but what I mean instead is that once a single, apparently proactive proposal has been considered, this seems to present individuals, especially MPs, with a dilemma: act or not. This pulls us between the single plan our PR minded PM has managed to scramble together - or nothing. As a national defence strategy, this seems a bit hit and miss.

Rhetorically, it is very hard to be "against action". Consequently, how, in public and parliamentary debate, can we consider more than one course really as action taken to make us safer? Is there a major structural problem built into the way motions are tabled "for and against" in parliament which distorts the rationality of our decision making and enhances the chances of our acting from a desire for revenge rather than a rational discussion about our best interest? What if parliament were now deciding between 4 or 5 different ways to make us safer? Surely this would be a greater tribute to those who died in Paris, that most illuminated of Enlightenment cities.

Various possible courses of response to the Paris attacks seem to have been side-lined, both those more Hawkish and those more Doveish. It is precisely the regime of half-measures which seems so dangerous for the UK, America, and Europe. If we’re going to fight, let’s win. If we are civilized enough to want control rather than (or maybe as) revenge we need to take a deep, Hawkish breath, invade places and instigate our desired systems of political authority.

Or, if we decide that is a bridge too far, we need to decide what we are capable of controlling. The money and effort to be spent on bombs might be better directed, Doveishly, towards domestic defences and intelligence. Yet more Doveishly, maybe the answer is more social than military. What if (perchance) we made our society more worth being a part of, so that all can contribute more wholeheartedly and no one needs to bother looking for weirdo international ideologies?
Both Hawks and Doves can be strong, but we have to choose. At the moment, we have neither. Cameron looks less like a Chicken Hawk - as they say in the US - than a flapping parrot.

If we stick with this terrible "yes or no" way for parliament, and the public, to engage with decisions about national defence policy, we’ll always be offered the worst of both worlds. Parliament needs to act, and to be enabled to act, much more like Gary Kasparov (don’t tell Putin), and much less like a toddler offered a mushy dinner for the final time.

Daniel Fairbrother is a PhD student in Sociology at Warwick University. He is working on theoretical issues in historical sociology.

Does your monograph not deserve a trailer? (2015-12-03 08:00)

The idea of a trailer for an academic monograph might seem rather strange at first sight. But it’s a potentially extremely effective way of promoting a book which, as social media for academics continues to institutionalise, will only become more potent. Here’s the most recent example I’ve seen, produced by a video editor [1]specialising in academic trailers:

IFRAME: [2]https://www.youtube.com/embed/s4CcVAG1N0

But the best example I’ve seen is still this trailer for Offshoring by John Urry:
1. [http://www.academictrailers.com/#!collection/c1p9k](http://www.academictrailers.com/#!collection/c1p9k)
2. [https://www.youtube.com/embed/s4CcVAGJ1N0](https://www.youtube.com/embed/s4CcVAGJ1N0)
3. [https://www.youtube.com/embed/CChAOh1X5CA](https://www.youtube.com/embed/CChAOh1X5CA)

Digital Health/Digital Capitalism One Day Conference CfP 4th July 2016 (2015-12-03 14:16)
Digital technologies have had a profound impact on the ways in which people live their lives, relate to one another and think about themselves and their capacities. This event will bring together scholars who are interested in the impacts of the digital on ideas and practices of health and the workings of capitalist economies and how the two come together.

The generation and management of vast amounts of health data has been enabled through digital means. In particular this has enabled fine grained analysis of particular types and groups of people in relation to a diversity of factors. Private and profit making enterprises have become increasingly involved with personal health data through partnerships with health services and the generation of new kinds of data through commercial devices apps and websites.

Digital capitalism has produced new approaches to work and profit generation. Human bodies are now intensively digitised due to the (self) tracking and monitoring conducted by commercial enterprises. New digital ways of working have freed some workers from the office while increasing the amount of time and attention they are expected to dedicate to work tasks and the length of time spent sedentary. The productivity and activity levels of some workers are closely monitored leading to increasing physical and psychological stress.

Questions addressed at this event will include but not be limited to:

- How has the digital changed the ways in which bodies and health are understood, managed and experienced?
- How does the management of health data by commercial enterprises (public-private partnerships and sharing and collaborative websites such as PatientsLikeMe) impact on health outcomes and peoples’ engagement with themselves, others and their health and bodies?
- In what ways are digital technologies affecting work practices which themselves impact on wellbeing, physical and mental health?
- How has the blurring of work and non-work life through an “always on” digital culture created new health problems and new potential strategies for managing health?
- What can existing theories tell us about the changes brought about by digital health and digital capitalism? What theoretical innovations are needed?
- Does the commercial monitoring of health and wellbeing (through areas as diverse as corporate wellness initiatives and telehealth) enable greater freedom and stimulation for healthier lives or intensify surveillance?
- What potential is there in digital management of health and work for increasing or decreasing existing health inequalities or producing new ones? Will the digital divide transfer to these arenas or be minimised?

If you would like to talk at this one day event please send a title and abstract of no more than 250 words to Chris Till [c.till@leedsbeckett.ac.uk](mailto:c.till@leedsbeckett.ac.uk) by Monday 15th February 2016. Registration will open 1st March.

The event will take place on Monday 4th July, 2016 at Leeds Beckett University.

This BSA Digital Sociology Group and BSA MedSoc Yorkshire event is supported by a grant from Leeds Beckett University.
The intensification of work and the competitive busyness of ceos (2015-12-04 08:00)

The culture of competitive sleep deprivation has reached weird heights in recent years. This Guardian feature, detailing the times at which CEOs wake up, gives some sense of the extreme forms this can take. Concern for sleep pervades productivity culture, most obviously on sites like Life Hacker, with sleep routines given parity to software choices in their interviews with prominent creatives.

This emerging cultural politics of sleep is a really interesting aspect of what I’m trying to analyse in my new book as cognitive triage (or rather triaging strategies, driven by and in turn driving, the intensification of work). This ’sleep deprivation arms race’ tracks the ossification of opportunity structures across many careers, as well as an acceleration of personal resources being deployed for professional gain. As Lucy Rock [3]observes,

Margaret Thatcher accelerated the sleep deprivation arms race when it emerged she ran the country on four hours’ sleep a night. From Donald Trump’s three to four hours a night to Bill Clinton’s five to six hours when he was president and Condoleezza Rice’s habit of getting up at 4.30am to go to the gym when she was US Secretary of State, minimal sleep has become a sign of your commitment to the job.

Angela Ahrendts, head of retail at Apple who was the first woman to top Britain’s executive pay league when she was CEO at Burberry gets up at 4.35am. She gets a headache if she sleeps for more than six hours. It is, she said, “my inspirational time, my time to find peace, to watch the sun rise”. Marissa Mayer, Yahoo’s chief executive takes between four to six hours a night; Indra Nooyi, chairman and CEO of PepsiCo, a mere four hours.

Now we can be plugged into the world of work day and night, it feels more than ever that to work more and sleep less is the way to the top. Knocking off at 6pm? Hmmm… the boss will be answering emails until 9 and her boss until 11 and as for her boss, well, she only needs three hours’ sleep a night.
But where did it come from? One part of addressing this question involves analysis of the pleasures of acceleration. But another concerns role modelling. There’s a great paper by Ismael Al-Amoudi which I need to go back to in order to develop my analysis of this in terms of modes of reflexivity. But meanwhile, I just wanted to record this little extract from the end of the great Bill Gates biography I’ve been reading recently. From Gates, by Stephen Manes and Paul Andrews, loc 10268-10287:

"He is the world’s busiest man, bar none," said Charles Simonyi, citing one trip that included "Eleven meetings in five days in Europe—you know, like there were days there would be two countries. And he doesn’t fly a private plane, either." Gates still managed a schedule as packed as anyone’s, but as he headed toward his forties, he seemed to be modestly tempering his legendary workaholism—and seemed vaguely defensive about it: Most people have an overblown view of how many hours they work. It’s hard: Working eighty hours is very hard. You can’t do much else if you’re gonna do that. So there’s lots of weeks I work eighty hours, but I think my average is lower than that. . . .On average I take every other weekend off. . . .I’m probably more like seventy average now. There are some weeks I work more than eighty. Like those weeks I travel to Europe: That’s all I’m doing, is working, sleeping, working, sleeping. So you can get weeks where I’ll put in over ninety. . . .I assume you don’t count reading business magazines, the Journal or the Economist. Upon recomputing, he decided that an average of seventy-two hours was the proper figure. Though in recent years Gates had vacationed in the Dominican Republic, Thailand, and Australia with his girlfriend, he could barely contemplate the idea of a longer period of relaxation: “It’s possible I’d take a month off in the next three years. I don’t know what that would be like. I’ve never taken more than a week off with weekends on both ends.”

How much influence did the first billionaire boy-king of technology have in generating this ensuing arms race of competitive sleep deprivation? What does he think of the results? What did he personally gain from this? Was it good and/or necessary for the business? Was it good and/or necessary for his self? I’ve argued in the past that embracing acceleration, pursuing busyness as something desirable, can function in the same way as drink or drugs to help ‘blot out’ unwelcome internal conversation. This comment by an ex girlfriend certainly hints at this explanation in the case of Gates, from loc 10287 of the same biography:

“I don’t know what he would do if he had some time to spend alone with himself,” said one short-term girlfriend who tired of his strange blend of selfishness and selflessness. “He has a significant data storage device. But I don’t think he has a lot of wisdom.” And she didn’t think he was all that happy either. “So many times he complained about how he’s got to be here and got to be there. You say ‘Why don’t you say you’re not going to show up?’ but he won’t do that. He’ll stand up for everybody, but he won’t stand up for his happiness.”

But of course, the cognitive costs of living like this will continue to mount up. This is why I’ve argued for the importance of zones of strategic deceleration. Gates pursues this in a more individualistic way. From loc 9826-9846 in Gates:

Shortly before the Akers flap became public, Bill Gates had gone to the Gateaway complex for one of his “think weeks,” a tradition that had begun on the return from Albuquerque, when Bill would take a week
off to spend time with Gam at her place on Hood Canal. Alone with his thoughts, he would strategize, read, play with competitors' software, and "write a lot of memos."

However this is a form of temporising, compensating for but doing nothing to change the underlying process. I'm not sure how, if at all, the holidays he took can be included within this analysis. But they're notable nonetheless. From loc 8242 in Gates, as recounted by an ex girlfriend:

"Winblad even convinced Bill to take a vacation now and then by coming up with "reading themes . . . We had a physics vacation once, a biotech vacation once, and we had an F. Scott Fitzgerald vacation." Winblad was responsible for picking and packing all the reading material."

please tell early career scholars: the isrf social media essay competition (2015-12-05 08:00)

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic 'Influence and Power'. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a re-thinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF's criteria and goals may be viewed [1]here.
Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal’s key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.

The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition’s theme and falls within the remit of BD &S’s goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.

The submitted essays will be judged and the winning essay will be chosen by an academic panel (the ISRF Essay Prize Committee). The panel’s decision will be final, and no assessments or comments will be made available. The result will be notified to applicants by email during April 2016 and will then be announced by posting on the websites of the ISRF and of BD &S. The ISRF and BD &S reserve the right not to award the prize, and no award will be made if the submitted essays are of insufficient merit.

The winning essay will be accepted for publication in the Journal; the author may be asked to make some revisions before publication. Other applicants may have their submissions accepted for publication in the Early Career Researcher forum of BD &S subject to the Journal’s peer review and decision-making process.

The details and criteria are:

**Essay topic:** Influence and Power (This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field.)

**Eligibility:** Participants should either be current doctoral students or within three years of being awarded their doctorate.

**Essay length:** 5,000 to 7,000 words

**Essay format:** Follow the BD &S Author Guidelines, available on the BD &S website.

**Language:** English

**Submission deadline:** 31 January 2016

**Queries:**
[2]essayprize2016@isrf.org

Submissions should be made online at [3]https://mc.manuscriptcentral.com/bdas and authors should indicate that their submission is for the special theme, ‘ISRF Essay Prize.’
Exploring Epistemic Violence (2015-12-05 17:12)
call for papers/contributions

EXPLORING EPISTEMIC VIOLENCE

one-day workshop, 10 a.m. – 6 p.m., Monday February 22nd 2016, London

at the School of Politics and International Relations Queen Mary University of London

Mile End Campus, Room TBA

in cooperation with the Centre for Peace Research and Peace Education, Alps-Adriatic University of Klagenfurt (Austria) and the Colonial/Postcolonial/ Decolonial Working Group at BISA

WHAT IT IS ABOUT While the notion of epistemic violence is well-known in post- and decolonial studies, it is still relatively absent in IR, in Peace and Conflict Studies, in Political Philosophy and in other fields of knowledge that deal with issues of political violence. This workshop will discuss the supposedly simply question of what epistemic violence actually is. How can we frame it as a concept, and how can we approach phenomena that we would describe with that notion? How can we discern a post- and decolonial concept of epistemic violence from or link it with other wide understandings of violence, such as structural, symbolic, discursive, visual violence etc. that stem from a Eurocentrist tradition of thought? From a post- and decolonial point of view, should we give up common and narrow concepts of violence altogether or can we find plausible ways to link them with a thicker concept of epistemic violence? In which ways would it change our analyses of direct and physical political violence, if we developed a theory of epistemic violence?

Papers may include empirical examples of epistemic violence, but the focus should be on theoretical aspects, by bringing together perspectives from a range of disciplinary backgrounds of scholars who are interested in better understanding the entanglements between direct and physical political violence on the one hand and epistemic violence on the other. HOW WE WILL WORK The workshop will cultivate an explorative, egalitarian and creative atmosphere. Participants will read 4-8 papers in preparation of the workshop, prepare a presentation and openly interact with each other during the day. Papers are not presented by the authors themselves, but by another participant and vice versa. After presentation, the whole group will discuss the paper. The author steps in for comments and clarifications in the last part of the session. This ‘counter reading principle’ has proven to be very productive and helps to create a fair and mutually respectful atmosphere of debate. A final plenary discussion will sum up central issues, eventually sketch further prospects of cooperation and exchange, and allow to evaluate the process.

For those who can stay in the evening, we will arrange a screening of a film that creatively illustrates the entanglements between political violence and epistemic violence while investigating World War I from a postcolonial perspective.

4094
**COSTS/FUNDING** There is a small budget in order to co-finance travel expenses, if needed. We want to primarily support colleagues without institutional financing or PhD students. Please indicate in your application whether you would like to apply for a full or partial reimbursement. Drinks and snacks will be provided.

**APPLICATION** If you would like to participate in this one-day workshop, please send an abstract of your potential contribution (max. 1 page), your contact details and a few lines about who and where you are (max. 1 page) to Claudia Brunner[1]claudia.brunner@aau.at and Robbie Shilliam [2]r.shilliam@qmul.ac.uk by December 15th 2015. We will get back to you in the beginning of January 2016 to confirm the participation of a maximum of 8-10 presenters/discussants. If you wish to attend the workshop without a paper and presentation, please do also mention the context of your work, affiliation and motivation. Depending on the number of applications, we can possibly also include non-presenting participants. **ACCEPTANCE OF ABSTRACTS/PREPARATION FOR THE WORKSHOP** After confirmation, participants will have about four weeks to write their papers (of about 10 pages/3,000 words) and send them in again in the beginning of February. The organizers will match teams of ideally two persons, who will present their colleague's work (and vice versa). All participants should read all papers in order to guarantee a productive discussion.

**BSA Sociology of Religion Study Group Annual Conference 2016 – Call for Papers - 1 Week Left to Deadline**

BSA Sociology of Religion Study Group

Annual Conference 2016 – Call for Papers - 1 Week Left to Deadline

Dear Colleagues,

The theme for the BSA Sociology of Religion Study Group Annual Conference 2016 is ‘Construction and disruption: The power of religion in the public sphere’.

The purpose of the conference is to examine these and other characteristics of contemporary religion in order to achieve a greater understanding of its constructive and disruptive impact in the public sphere. What are the key categories, discourses, contexts and institutions through which this question can be explored? How do practitioners navigate these characteristics?

The conference welcomes a wide range of topics relating to religion in society and hopes to encourage a space where different faith perspectives can come together.

For more information about the conference and how to submit your paper please click [1]HERE. Submission abstract deadline is 11 December 2015.

Best wishes

BSA Sociology of Religion Study Group

BSA Events Team
The expanding ambitions of digital elites (2015-12-06 08:00)

From Elon Musk, by Ashlee Vance, pg 16. I think a sociological analysis of contemporary digital elites needs to treat these ambitions seriously, while nonetheless recognising how these cultural formulations intersect with material interests.

While the “putting man on Mars” talk can strike some people as loopy, it gave Musk a unique rallying cry for his companies. It’s the sweeping goal that forms a unifying principle over everything he does. Employees at all three companies are well aware of this and well aware that they’re trying to achieve the impossible day in and day out. When Musk sets unrealistic goals, verbally abuses employees, and works them to the bone, it’s understood to be — on some level — part of the Mars agenda. Some employees love him for this. Others loathe him but remain oddly loyal out of respect for his drive and mission. What Musk has developed that so many of the entrepreneurs in Silicon Valley lack is a meaningful worldview. He’s the possessed genius on the grandest quest anyone has ever concocted. He’s less a CEO chasing riches than a general marshaling troops to secure victory. Where Mark Zuckerberg wants to help you share baby photos, Musk wants to ... well ... save the human race from self-imposed or accidental annihilation.

Given the mimetic proclivities of status conscious digital elites, I find it hard not to wonder how the scale of these ambitions may cycle upwards over time. Musk’s vision is enticing to anyone who grew up on science fiction but it’s easy to conceive of comparable visions that are much less welcome. The rich vein of dystopian fiction about digital capitalism that is beginning to emerge (e.g. The circle, whisky tango foxtrot, super sad true love story) could be read as in large part about the future ambitions of digital elites and the dangers that follow from their possession of a “meaningful worldview”.

digital capitalism and the acceleration of bullshit (2015-12-07 08:00)

This is a slightly crude attempt to thematise something which I’ve been struggling to express for a while: has there been an acceleration of the rate at which bullshit emerges in the digital economy? Here’s an example of what I have in mind. I’ve been looking through Amazon for business books about the newer social media and sharing economy companies for part of my new project. This is what I find when searching for Instagram in the books section of Amazon:

[1]
If you can’t read the screenshot closely enough, trust me when I say they look crap. What appear to be a uniformly substitutable array of questionably written books united by the underlying motif of *how to get rich from Instagram*. I’ve found something similar for almost every search I’ve undertaken in the last half hour.

The presence of many crap books on Amazon might not be a revelation. But what interests me is the motivations of those writing them. The buzz around a new platform presents an opportunity to establish oneself as a guide to that platform. But the nature of this buzz means awareness of that opportunity is almost as pervasive as awareness of the platform itself. The barriers to entry are minimal and the rewards appear to be great, particularly given the tendency of those who have ‘made it’ to [2] “publicize successful outliers to propagate the illusion”. Furthermore, there’s a broader acceleration of the rate at which people seize on opportunities against a structural background of destructured careers and a cultural background of entrepreneurial individualism.

The result: we find ourselves drowning in an ever expanding pool of bullshit. The cognitive costs entailed by sorting the wheat from the chaff become ever more onerous, our reliance upon human and algorithmic intermediaries tends to increase as a result, making a small but meaningful contribution to the upwards spiral of individual distraction and collective fragmentation that I’m increasingly convinced is perhaps the defining characteristic of digital capitalism.

Deborah Talbot (2015-12-07 08:31:58)
The funny thing is that if you dig further you’ll find that many of these contributions are ghost written by freelancers paid very little for the pleasure. The same is true of blogs.

JNoel (2015-12-29 20:39:54)
Actually, it’s been theorised before that given more and more access to technology, certain products of technology become watered down and of less quality. Music, for instance. Instruments used to be nearly impossible to attain. And digital music production has changed the face of music forever. Now that everyone can start a garage band or be a DJ, the overall quality of music as a whole is thought to have become less sophisticated over the past 60 decades.

Beyond the ‘self-tracking’ craze: Towards a true technological enhancement of human intelligence
(2015-12-07 18:00)

This mini-essay forms the basis of my contribution to the [1]‘self-tracking and the emergence of hybrid beings’ panel at the University of Liverpool’s Being Human Festival on 10 December 2015. The reader will see that I’m not especially enamored by the framing of the topic.

Of the various ‘hybrid beings’ that are emerging between humans and increasingly intelligent machines, the ‘quantified self’ has taken centre stage – but mainly because it captures a pervasive phenomenon on which critical theory is well suited to offer commentary. The idea, already implicit in Foucault, involves the alienation of one’s sense of freedom to a range of possible metric values over which one acquires mastery. Many forests will undoubt-edly be felled talking about the character and necessity of the ‘structured agency’ permitted by the quantified self, including the issues of privacy and security, all of which turn on the increasingly fluid boundaries dividing selves from one another. Perhaps the most interesting angle on self-tracking is from the standpoint of political economy, especially if mass technological unemployment – even among professionals – is a long-term consequence of our inhabiting a world of artificial intelligences. In that case, self-tracking may be key to how we earn a livelihood – namely, by selling our consumption patterns, perhaps administered in the form of automatic micropayments.

While some have written positively about the ‘enhanced’ character of human life that may result from self-tracking technologies, the ‘enhancement’ is mainly at the level of amplifying tendencies already registered to some degree by the subject. In contrast, a much more interesting sense of smart technologies capable of enhancing the human condition is captured by the idea of ‘data surfing’, which has been proposed as a counterbalance to ‘data mining’, a long-standing technique in knowledge management systems.

In ‘data mining’, algorithms are used to survey big data streams to find specific patterns, etc. the end-user has already identified of relevance. The traditional advantage of data mining systems is that they ‘cut through the noise’ to get at what the end-user wants. This means, however, that the end-user never really sees the full range of data available. After all, the data may contain patterns of potential interest but because they were not specified by the end-user (no doubt due to ignorance), they were not programmed into the data-mining algorithm. Manifesting these latent data patterns requires ‘data surfing’ techniques, which consists of algorithms designed to structure large amounts of data in ways that enable the end-user to search for patterns inductively – that is, with a relatively loose sense of what might be of interest. Whereas data-mining reinforces your cognitive biases, data-surfacing genuinely extends your cognitive range – to see things you hadn’t seen before.

A characteristic feature of data-surfacing techniques is that they require significant human input through the life of the algorithm in order for the output to be represented in a way that enables the end-users to gain maximum
advantage. Thus, the great champion of data-surfacing, the Silicon Valley cybersecurity firm Palantir, prides itself in selling not only data-surfacing platforms but also installing its own engineering staff to enable end-users to discover things about the data at their disposal that they perhaps would not never have thought of looking for before. While these services are compelling in the concrete context of anticipating the next cyber-attack, they underscore just as concretely how human intelligence may be literally expanded – and not merely replaced or disciplined – by machine intelligence.

______________

towards a meta-critique of data science (2015-12-08 08:00)

In their new book *Retrieving Realism*, Hubert Dreyfus and Charles Taylor describe what they term a *meta-critique*. From loc 592:

The idea of a metacritique here is, as the name suggests, to inquire into the basis of first- order critical theory. This latter claims to reflect on the conditions of our everyday or scientific knowledge claims, and to upset the ordinary precritical view we have of them. The metacritique reflects in turn on the conditions of our making this kind of critique.

In this sense, data science often constitutes critical theory, even though it clearly doesn't understand itself as such. This can be seen most clearly in a book like Dataclysm, subtitled ‘who we are when we think no one’s looking’, but I’d argue that it manifests itself in more subtle ways in much of the self-presentation of data science (and data scientists). The impulse here is to reveal the reality of human behaviour at scale: the conditions of both our everyday and scientific knowledge claims are implicitly understood to offer only a limited perspective on what it is humans actually do: what they really do, as opposed to what they tell social surveys and interviewers they do.

To offer a meta-critique of data science would entail, as Taylor and Dreyfus put it in Loc 611 in relation to a different target, necessitates unsettling the ensuing picture of human behaviour that is offered by

bringing out the background we need for the operations described in the picture to make sense, whereby it becomes clear that this background can’t fit within the limits that the disengaged view prescribes. Once understood against its background, the account shows itself to be untenable.

In other words, what does the ensuing picture assume about human behaviour that it cannot account for in its own terms? To answer this question properly would entail tracking the place of human reflexivity in data science: the assumption of it in the construal of its objects, the operation of it in the motivation of its practitioners, the imputing of it to those locked into world views which are the target of its critical theory and the absence of it in the substantive data scientific view of the world.
CONFERENCE ANNOUNCEMENT AND CALL FOR PAPERS

Social Media & Social Science Research Ethics

Location: 33 Finsbury Square, London. EC2A 1AG

Date: Monday 21st of March, 2016

The Research Ethics Group of the Academy of Social Sciences and the NSMNSS network invite abstracts and poster/video submissions for a one-day conference that aims to further develop and explore the ethics of social science research using social media. Our purpose is to move the debate forward and provide examples of good practice. Two Keynote speakers will be confirmed shortly.

As Social Media plays an increasing role in Social Science research, the practicalities, benefits and challenges of making legitimate use of it constitute an important arena for ethical reflection and dialogue. This event builds on earlier conferences, workshops and discussions, organised by the Research Ethics Group of the Academy of Social Sciences and, in particular, the common principles of social science research ethics.

We invite abstracts for full papers or posters/videos* from those whose research makes use of social media. The following 4 themes may offer some guidance:

Ethics & Practicalities: Consent in social media research.
Privacy, ownership and legal dimensions: The use of social media data for research.
Blurred lines: Relationships between researchers and participants in social media research.
Critical ethical reflections: Improving ethical practice.

A copy of our CfA can be found here [.pdf]. 250 word abstracts should be submitted on this form [.docx] and sent to [1]acss.ethics@gmail.com by Friday the 8th of January 2016. There will be a £100 prize for the best poster/video as well as a number of discounted places and travel bursaries for postgraduate students. Following the conference we aim to produce an e-book of the presented papers. Any inquiries should be directed to: [2]nsmnss@natcen.ac.uk

Decisions will be made by the end of January 2016.

We envisage that videos will be the equivalent of posters and should, therefore, not be longer than 2 mins (approx).

---

Letter to Stella Creasy MP re: Syria (2015-12-09 22:57)

by Heena Khaled

Dear Stella Creasy

Around 2009 I met you for the first time at an event, and then you came and spoke at a women's event I organised. I followed you ever since and you have been an inspirational woman who I looked up to, admired and wanted to be like. Your activism blew me away and the way you had time for anyone and everyone in your constituency made me proud.

I spent the years showing off about how you were my MP and how lucky I was. You stood in mosques, churches, synagogues and against the EDL, with YOUR residents in solidarity, genuinely. I doubt politicians a lot but you were one of the few politicians I felt was real and truly cared about our voices.

You once told me I should become a labour councillor and till this day I have contemplated it and wanted to free some time to work with you and aspired to that dream you showed me, because you taught me that politics can be about people and not just the power hunger we usually consider it to be.

Tonight I saw your status- saying you voted FOR air strikes in Syria. Even though most of your constituents were against it, you voted in support for strikes. You were the one trying to empower poor residents by fighting loan sharks, yet you have supported an expense we shouldn’t contribute to both morally and monetarily.

My faith in democracy has left tonight, my faith in genuine politicians has withdrawn from the little gleam of hope I had in my heart. I no longer aspire to be a politician as of tonight and I am extremely saddened by the truth of my skepticism and your actions.

With great sadness- I don’t have the strength and on a morality level I can no longer support you as my MP because that would mean wiping my hands with blood of innocent civilians who will be killed and become what you regard as ‘collateral damage’. I worked hard in preventing extremism, and now your vote will make us more unsafe.

However I will continue to be a human rights activist and I will continue to speak through moralistic means and I will remind you and everyone of what democracy should look like and why we should reject this hidden dictatorship we have evolved into.

From one of your long time supporters, maybe not so much now.

Heena Khaled

Heena Khaled works for Open Society Justice Initiative and is also a human rights activist tackling issues around Muslim women, discrimination and counter-radicalisation. She holds an LLM in Human Rights and BSc in Sociology and Criminology.
The Pleasures, Pain and Promise of Sociological Work Outside the Academy (2015-12-10 08:00)

by Keith Kahn-Harris

The following is adapted from a talk given at the British Sociological Association SA Sociologists Outside Academia Group's 10th Anniversary Event

Being a sociologist working completely or (as in my case) partially outside academia is not an easy thing. For that reason, it is vital that mechanisms to support people like myself - such as the BSA's Sociologists Outside Academia Group - exist and that they grow in the future. But it's not just a question of providing support and increasingly the visibility of Sociologists Outside Academia (SOAs); as I will argue, a consideration of the position of sociology outside of academia raises important questions about the nature of the discipline itself.

A brief overview of my own career might help to illustrate some of the challenges that SOAs face. In particular, the idiosyncrasies of my career clearly illustrates how, if you do not take a conventional academic career path as a sociologist, there is simply no one generalizable model of how to be a SOA. I doubt anyone in the world would ever see me as a role model for anything, but if anyone was foolish enough to want to follow in my footsteps they simply couldn’t. And that is a major problem for an organization like the BSA’s SOAG group – how to support a disparate collection of people whose experiences are so very different from each other?

So who am I, professionally-speaking? Well, it was pretty simple until I was 29 years old. That was the year (2001) in which I received my PhD in sociology from Goldsmiths College (on the sociology of the global extreme metal scene), following on from my MA, also from Goldsmiths in sociology, and my BA in Social and Political Sciences from Cambridge. Other than a couple of years spent working and travelling, it was all pretty standard stuff.

Post-PhD was where the fun began. Although I love scholarship, academia and teaching, I had, by the time I finished my doctorate, resolved to attempt something difficult – to pursue a career both within and without the academy, drawing on the strengths of both. The reasons were threefold: First of all, I was apprehensive about taking on the mental and physical demands of a academic lectureship. Since my second year as an undergraduate I had suffered from moderate but persistent Chronic Fatigue Syndrome and it was still with me by the end of my PhD. The second reason for my ambivalence towards full time academia was a revulsion at the ravages of managerialism and what was then the Research Assessment Exercise. I didn’t want to become a point-scoring journal article producing machine; I didn’t want to be discouraged from publishing things people would actually read in favour of things that ‘scored’ well. The third reason was that, having worked part time as a researcher in the UK Jewish community as a postgraduate, I wanted to contribute more to Jewish communal life in my work.

My vision, insofar as I had one, was to work towards a position where I would be employed half by some kind of Jewish organization and half by an academic institution – ideally combined into one post. So I started my ‘campaign’ post-PhD with a fellowship for Jewish educators, in which I would begin to re-train from a specialist in metal, to a specialist in Jews.

14 years later, where am I?
Some things haven’t changed: I still have moderate but persistent chronic fatigue syndrome. I’m still revolted by academic managerialism and the REF. I still try and contribute to Jewish communal life.

Some things have not been possible to achieve: I have no stable position that fulfills my 2001 vision.

Some things have surprised me: I thought I would gradually drift away from scholarship on metal, instead I have continued writing on the subject. I’ve also been surprised how my interests have broadened and my passion for work actually increased following the birth of my children in 2003 and 2006 – I had assumed that I would become more content with ploughing a single furrow by the time I hit middle age, instead I am more eclectic and enthused by the possibilities of sociology than I have ever been.

So what, exactly, is it that I do? A chronological list of things I’ve done would be tedious to recount. Instead, I’ll briefly summarise the categories of work I’ve done and continue to do:

I’ve worked as a part time lecturer at the Open University, Birkbeck College and Leo Baeck College.

I’ve held visiting and honorary positions and fellowships at universities in Australia, Israel, Sweden, Germany and Finland.

I privately tutor graduate and postgraduate students.

I’ve held research grants from the ESRC and from private foundations (and bid unsuccessfully for others).

I’ve worked as a research consultant for a number of Jewish organisations and organisations promoting inter-faith dialogue.

I’ve published 4 books and edited several more.

I’ve written dozens of op ed pieces and features for newspapers and magazines.

I’ve done things that don’t fit into any easy category – like speaking at a TEDx event and acting as a trustee for various organisations.

In short, I’ve had a rich and rewarding career. I have a modest reputation in a few specialized areas. I have a great deal of freedom to follow my own interests. I have a family whom I love.

But I also have virtually no job security. I earn way less than someone with my experience should earn. My pension is ridiculously small. Almost everything I’ve achieved I have had to hustle for. I can never have a sabbatical and I may never be able to fully retire. My wife is under intense pressure in her job as she has to provide the lion’s share of our income. I sometimes need to resort to parental help to get through sticky months.

At the age of 43 I’m getting a bit tired of this. The freedom I have is becoming less and less compensation for the other stuff that goes along with it.

**

But enough about the pleasures and pains of being me. I have tried hard throughout my work to look beyond my own life and to use my vantage point on the various worlds I move through as a way of developing a sociological understanding of what a sociological career can consist of.
So here’s what I think I have learned:

There is a slowly emerging movement made up of people like us

While an organization for sociologists outside academia is still a rare thing, there is more and more attention being paid to the work and the problems of scholars who work outside academia. This stems in part from the increasing instability of academic careers and university’s reliance on part-time faculty: simply put, there are more and more people with PhDs who cannot find permanent and stable jobs within the academy. There is also a more positive reason for the attention being paid to scholarship outside academia: spurred on by increasing tuition fees, the intrusion of managerialist prerogatives into the universities and the expanding possibilities of new technology, people are beginning to explore alternative ways of learning outside the traditional university.

So some kind of movement is emerging, but it is very much at an early stage. To give a couple of examples: the Social Science Centre in Lincoln has been going for a few years now and is providing free social science university-type classes on a co-operative basis. The Para-Academic Handbook, published in 2014, attempted to sketch out a mode of scholarship that both leverages and critiques the situation of the precariously employed academic.

Whilst I do find it comforting and inspiring that people who share my interests and concerns are beginning to come together, there is – at this stage anyway – a major limitation. No one, to my knowledge, has yet been able to collate ideas and suggest a new and sustainable model for earning a living outside the academy. To go back to my two examples, they are as disappointing as they are inspiring: the Social Science Centre still relies on unpaid labour; the contributors to the para-academic handbook hand interesting things to say about developing a non-academic scholarly identity, but there were few suggestions as to how to support oneself.

It may be that the best way to do scholarship outside the academy is either to work for a think tank or consultancy – which, as I will argue shortly, has certain limitations – or to get a full time ‘day job’ and be a scholar in one’s spare time. For those like me who cannot or don’t want to embrace either option, it’s possible that the way that I’ve managed to sort of make my career work for me is ‘at good as it gets.’ If so, that’s quite a depressing thought!

‘Sociologist’ remains a largely academic identity

Unlike psychology, for example, the sociological identity seems to be largely confined to the academy. Of course, sociological work has always been done outside of the academy. Social researchers and market researchers are sociologists, although their policy-orientation means they usually contribute little to sociological theory as such. Yet it is telling that social and market researchers have their own associations in the UK – the Social Research Association and the Market Research Society – rather than forming sections within the BSA. Their professional identities are largely ‘semi-detached’ from sociology.

So it is that, despite the efforts of the BSA SOA group, I see little evidence that the identity of sociologist is becoming disentangled from that of academic. This remains a source of sadness to me. I still call myself a sociologist and embrace this identity but I cannot help sometimes feel like a bit of a fraud in doing so.

3) Some scholarly activities remain very hard to do outside of academia

There is a range of scholarly activities that form an expected – and hence, implicitly, remunerated - part of the academic’s life, but are almost impossible to fund outside academia. Such activities include writing, refereeing and editing articles for scholarly journals, contributing to scholarly conferences and writing sociological theory. Most non-academic jobs that involve sociological work are more narrowly focused and more tied to specific funded pieces
of work. While research from think tanks does make it into scholarly journals, the think tank or contract researcher may find it difficult to find the time and to convince managers of the need to referee articles or write 'blue skies' sociological theory. For most sociologists outside academia, a significant chunk of scholarly activity can only be done unfunded, perhaps subsidized by a well-page job or project.

The problem is that without doing such activities, one inevitably becomes distanced from the mainstream of scholarly activity and important forms of networking. In my own case I have tried extremely hard to do these things, to referee articles, speak at conferences, write for journals and so on, but as my need for remunerated work has increased, my ability to keep going with such unpaid labour is gradually diminishing. There is, of course, some small comfort that regular academics also find their numerous duties difficult to balance! Once again, SOAs might be seen as the canary in the coalmine – advanced signs that the expectations of the scholarly life are becoming unmanageable.

Part-time and temporary academic work rarely 'works' in terms of status and remuneration

One of the most difficult things about not having a full time and permanent academic berth, has been witnessing one’s peers climbing the career ladder while I myself remain at the same level. I am not someone who is obsessed with titles and status, but the fact remains that the way one is seen by the world does depend in part on such things. Some of those who were contemporaries of mine while we were studying for PhDs are now readers and even professors. In contrast, I cannot encapsulate in a title what exactly it is that I do. It’s almost inevitable that some people who don’t know my work may think that I am a dilettante or someone who just isn’t good enough for a ‘proper’ position. The opposite problem can also occur: I have at times been assumed to be a professor and my part-time teaching gig at Birkbeck has been inflated into something more than it actually is – correcting such misapprehensions is embarrassing.

Aside from the status issue, part time and temporary academic posts often work out financially to be less than the sum of their parts. Part-time teaching invariably involves more hours than one is actually paid for. Temporary research contracts can be decently paid but they always end eventually, leaving researchers with an impossible choice – spend the last few months of the contract preparing a new application rather than actually doing research, or face a barren period between grants.

For those who are unable or unwilling to either accept the insecurity and low status of temporary and/or part time work, or to enter full time conventional academic employment, there are precious few options. Part-time, permanent academic posts that are on the track that can lead to a professorship are simply – as far as I can see – non-existent. Academia is still a ‘one size fits all’ profession.

Some of the time at least, being a SOA can have real advantages

To add to the mountain of other commitments that academics today have, they are supposed to demonstrate the ‘impact’ of their work. In this respect, the REF is completely contradictory and absurd: REF submissions are judged, in the main, on ‘products’ of research that, by being published largely in the academic sphere, are by definition limited in their impact. So the REF has had to demand additional impact case studies that are based on activities that cannot be counted positively in the rest of the exercise.

Blessedly, SOAs do not have to perform such impossible contortions. Research can be communicated in any form that is appropriate. SOAs can, if they wish, do theoretical blue skies research that has no impact beyond specialists. They can also write books that communicate with the wider public – as I have done – without being pressured to salami-slice them into journal articles from which the public is excluded by paywall. They can do policy-oriented research that can be communicated to the public without having to jump through the hoops of the REF.
Potentially then, the freedom of being a SOA isn’t just personally liberating, it also allows us to do sociology we choose to do without at least some of the constrictions of contemporary neo-liberal academia. To an extent at least, the spirit of the academy can be retained outside the academy whilst our universities are ravaged by managerialism.

**

It’s become increasingly clear to me that the issues that being a SOA raises go beyond simply the exigencies of how to pursue a viable and sustainable career – vital those these issues are – and touch on more fundamental matters: what does it actually mean to be a sociologist? While, as I’ve said, I have stubbornly embraced this identity even though it seems for the most part a largely academic one, defining what a sociologist actually is remains difficult.

By ‘difficult’ I don’t mean that definitions of sociology are not widely available. Any sociological textbook will do this. The BSA’s ‘Discover Society’ pamphlet – that seeks to introduce sociology as an option for prospective students – offers the following:

Sociology seeks to understand all aspects of human social behaviour, including the social dynamics of small groups of people, large organisations, communities, institutions and even entire societies. Sociologists are typically motivated by their desire to better understand the fundamental principles of social life, believing that an understanding of these principles will help improve people’s lives through more enlightened and effective policies.

Although one might quibble with some of the wording (‘enlightened’ for example), this seems to be as good a brief definition as might be achieved. It certainly describes much of what I’ve tried to do in my own career as a sociologist.

The difficulty for me lies in how to define being a sociologist when one’s relationship to academia is ambiguous or distant. The problem is that, given the overwhelming dominance of academic sociology, the core activity of most sociologists is contributing to the ever-expanding sociological canon. When academic sociologists publish, they are inserting their own work into a dense, multi-dimensional and self-referencing network of publications. When academic sociologists teach, they are inducting students into this network.

What happens, then, when a sociologist outside academia is unable or unwilling to embed themselves into this vast network of words? As I mentioned earlier, it can be extremely difficult to remain in touch with the ever-growing deluge of academic sociological writing. Can someone be outside of this network and still be able to call themselves as sociologist? Is there a sociological sensibility whose presence can make someone a sociologist without reference to what other sociologists write? Is there a bedrock on which sociology rests whose existence both underpins and transcends specific manifestations of sociological writing?

One might return to the BSA’s concise definition or other works such as C Wright Mills’ *Sociological Imagination*, and say ‘yes, of course there is such a bedrock.’ Yet, for most practical purposes, the identity of sociologist is still confined largely to those who embed themselves in the network I have mentioned. With rare exceptions, it is not enough to simply be enthused with a sociological sensibility to be recognized by others as a sociologist, one has to demonstrate one’s familiarity with and ability to add to the work of other sociologists.

Now I want to make two things clear at this point: First, I am not suggesting that those who wish to identify as sociologist should not read the work of sociologists and reference them accordingly. Second, I am not suggesting that I myself do not do this!

What I am suggesting though, is that if sociology is to be more than an internal conversation, it does need to recognize and nurture the possibilities for doing sociology that are not reliant on a constantly-updated familiarity.
with the enormous academic sociological literature. This is where SOAs are potentially in the front line of sociology.

Of course, SOAs are doing this already. When sociologically-informed social researchers publish policy reports they are expanding sociology beyond academia. When sociologically-informed journalists and bloggers communicate to the public they are expanding sociology beyond academia. When those with a sociological training bring what they have learned to a whole range of professions they are expanding sociology beyond academia. What is missing – and what SOAs are not generally doing – is loudly and unapologetically claiming the identity of sociologist outside the academy.

It may be that many of the difficulties that I and many others have had developing a career outside academia are insoluble. We are, after all, living in an age of radical insecurity in employment and it would be odd if sociologists did not share in this insecurity too. However the identity issue is something we can do something about. And in doing so we can contribute not just to the dignity and status of those of us who work in whole or in part outside of academia, but to the expansion and deepening of sociology as a practice and a sensibility.

In one’s hand: an extension of self and society (2015-12-11 08:00)

by Mike Duggan

The materiality of things, both physically and symbolically, alongside our fetishisation of things is clear to see in our relationships with personal technologies. Simple observations of people waiting; on train platforms, for the bus or at the bar with a device of one kind or another in hand, are examples of which we are all well accustomed. In contemporary society the objectification and, crucially, the personalisation of digital technologies - smartphones in particular - is perhaps the latest, and most obvious, iteration of our fascination with technical objects. Observations in public space(s) are now seldom described without a narrative portraying the varying degrees with which people engage with the screens of their personal devices. People are touching, tapping, typing, swiping, clicking and stroking their screens all around us. Such instances are described to us by others and observed for ourselves each and every time we walk out into the street.

We have become both familiar and used to this, as well as fond and disparaging of these motions. There are for instance, countless narratives that reiterate the absent presence of smartphone users, most of which explicitly characterise the non-humanness of these interactions. In addition there exists an overflowing vat of positivity and marketing
jargon around the benefits of using our smart mobiles, most of which we are weary of. And yet we persist, both in our telling of these tales and indeed in our use of these technical things. Why? One way of looking at it is that they can be fascinating, interesting, pleasing, practical, comforting, convenient and reflective of whom we think we are or would like to be, as well as plainly annoying, disruptive, trivial, faceless, isolating, exclusionary and symbolic of ubiquitous conformity.

The screens of these devices, and the capabilities of the devices themselves are undoubtedly alluring. They often hold our gazes for longer than we would like, and sometimes for not long enough. Such devices are much liked by their users; loved even. The result being that we increasingly have quite personal relationships with these devices, or at least with what they can do or how they can be used. Engaging with them can mean interacting socially, culturally, economically and politically with a society at large, or simply with close friends and family. Indeed, engagements can also produce long periods of detrimental or even desirable periods of isolation. Moreover playing with them in our hands can indulge a nervous moment or satisfy that slight and yet still seductive sensory stimulus created by the tactility of smooth surfaces. Smartphones tend to play on our social as well as our tactile and embodied desires and discomforts.

Whilst the objectification and fetishisation of technical matter is nothing particularly new - we have long sought personal relationships with both analogue and digital technical objects in an effort to make the seemingly banal and lifeless a part of us; a curated reflection of us - the spectacle of the smartphone in use appears a significant shift in the way these relationships have previously been manifested in public. The relationships we have with other technologies are apparently hidden far from view, perhaps only really taking effect in the privacy of our minds. We do not, it appears, offer similar demonstrations of affection to the other personal technologies intertwined with our lives, and yet we do remain affectionate towards other things.

Many may attribute this cultural, and it must be said visual, shift to the rise of Apple and particularly the personal devices created under the supervision of the late Steve Jobs. Such devices, beginning with the iMac (1998) and then later the iPod (2001) and most recently and most successfully the iPhone (2007) have transformed the ways in which people have engaged with digital technologies on a personal as well as cultural scale. Following the success of Sony’s Walkman, Apple and perhaps most notably Jobs, pushed forward the idea that people could have and would want a personal relationship with digital technologies in similar ways to that which they had with analogue technologies. The evocable “i” that precedes Apple’s product ranges is most telling. As is the sheer diversity of the accessory’s market that has spawned from it.

In the same way that people objectify and fetishise fashionable clothing, home ware, mechanical apparatus, and children’s toys, people now objectify and fetishise the smartphones in their pockets. The difference being that now such dedications to things are glaringly obvious. Nevertheless, much like other technical objects, smartphones are now extensions of the self and therefore reflections of the self, both to oneself and to others.

However, is it really the case that our use of these complex boxes of digital components and accompanying software’s has revealed new ways of interacting with technical artifacts, or even new ways of being? Perhaps it is simply that
these interactions appear to us, initially so alien, as epochal changes in how we have pored over technical things for centuries? There is much rhetoric over a smartphone revolution and yet the social and embodied processes produced by our personal interactions with technical things is hardly exclusive to the smartphone. It is perhaps the sudden shifts in what we see on the street that has prompted this reaction, for take-up in technology is rarely so swift.

Let’s take the analogue watch as an example. The watch is bound up in the minute social processes of identity as well as in the broader ideals of the social, economic and political systems that help produce the world for its wearer. Furthermore, wearing and working the watch is something of a sensory and embodied experience. The turning of the wrist, its captivating face, the reassuring sound of time, the occasional sharp niggle felt as a link catches on a hair all come together to produce the intimate relationship one may have with their device. A watch and its bearer - a technical object and its user - are committed to the dynamic relationship produced by the workings of society and an object’s sensory affects.

Whilst the smartphone is undoubtedly kitted out with more functionality, encased in an aesthetic that appeals to many more people than a single watch design does - no doubt down to the excessive promotional push of their makers - the basic concept remains remarkably similar. The smartphone is similarly involved in the minute processes of social and personal identity curation as well as the broader socio-political and economic systems that govern our time. It is a device that reflects the identity of its user whilst also being a complex computer whose use and affects are molded by the society in which it is connected. In use it is bound up in the very being of one’s lifeworld. It has become an extension of oneself. It is both physically and metaphorically a tool to hand. Indeed, using a smartphone has become constitutive of the phenomenological experience for many.

According to British anthropologist Tim Ingold, objects in what he calls life’s ‘meshwork’ are things - meaningful, symbolic and valuable coming-togethers of matter(s) and practice that emerge along lines which are susceptible to the entanglements of life’s complexities. Ingold’s work suggests that objects are always things in our life-world, no matter how technically complex, for all of life is a series of emerging entanglements woven with the lines of things. Whether things are breathing bodies, organic structures or technical apparatus is irrelevant. Each works with, through or against the other in an emerging meshwork otherwise known as a life, or more objectively as an always-emerging process. Smartphones are hardly exempt from this understanding of technics and being. The phone itself lays down a line and becomes part of life’s meshwork, entangled with the lines of our own lives as well as those of other beings and matter.

Nonetheless, and in response to our current smartphone saturated situation, perhaps it’s best to ask what is new about our apparent fascination with these screening things? Do such engagements reveal novel insights into how we want to be in the world, or do they highlight just how alluring technical objects with highly dynamic functionality can be in establishing our place in the world? Alternatively is our fascination revealing of a society increasingly tailored towards a mode of production committed to ‘always-on’, isolating and attention seeking production and consumption practices? Most likely is that the allure of our pocket-sized screens is revealing novel insights into all of the above and more. It is the latest iteration of a popular technology - perhaps the most popular of our time - that pushes our understanding of what it means to be human.
A smartphone is sold, and brought, on the promise of its functionality as well as its desirable and socially affective aesthetic. Design teams - spearheaded by the likes of Apple, Samsung and HTC - have undoubtedly created personal devices that deliver in spades on all fronts. And yet there is no true telling in how these, or indeed any technologies are folded into the social, political, economic and embodied dynamism of one's life-world, especially from the position of the observer. Certainly such complexity, design and marketing have done more to entice current consumers than the analogue watches on offer, but that is not to say that with the first editions of the wrist watch - alongside a relative understanding of the market and marketing forces at the time - similar desires were not evoked amongst those that knew about and had access to said devices.

If the prescribed mundanities of everyday life continue to be passed off onto these devices, alongside the desire for the latest technical thing, the allure of the smartphone and the resulting fascination isn't likely to evaporate anytime soon, despite the encroaching 'wearables' revolution. More likely such allure and use will seep into the background of everyday life, similarly to the personal technologies of ages gone by. The watch, trainers, notebooks and pens have all successfully filtered into the background of everyday life. These technologies remain relevant as they continue to co-constitute our identities, produce and reflect our society. There is no reason to think that smartphones will not follow suit. At such a point perhaps the touching, tapping, typing, swiping, clicking and stroking of smartphones will go unnoticed, or at least unquestioned.

Smartphones are fast becoming the central hub to which many of our everyday practices are directed through. Many of the mundane workings of everyday life are increasingly dealt with, processed and spat out again by these devices. If we are continually chasing to keep up, or to put it another way, periodically seduced by the social and sensuous lifestyles sold to us by personalised technologies, we are likely to continue to rely on these devices. Moreover as smartphones continue to play a major role in social and economic complexities of daily life we become inclined to blindly opt-in or agree with the terms and conditions all too often accepted without question. The alternative can be exclusionary. The result observationally obvious.

The question is whether one must be wary of their decision to be included, for the smartphone lugs with it the kinds of baggage that other technologies do not. The baggage of 'big data' for instance, with all its pockets omitting privacy concerns, rights to be forgotten and digital wastage are important considerations to examine in one's use. As are one's decision to ignore or accept the entanglements and inequalities of a smartphone's manufacture and distribution. The line laid by a smartphone is entangled in a dynamic mesh of lines of which we do not always know the origins or trajectories of. Whereas our engagements with analogue watches remain largely known, our interactions with smartphones appear endlessly open and accessible in the cloud, to those we do not know and perhaps should not trust so forthrightly.

Mike Duggan is a Cultural Geographer interested in how digital technologies have become entangled everyday experiences of place. He is a PhD candidate within the Social and Cultural Geography Research Group at Royal Holloway University of London. His PhD is in collaboration with Ordnance Survey and the EPSRC.
The proliferation of digital technologies, virtual spaces, and new forms of engagement raise key questions about the changing nature of gender relations and identities within democratic societies. Over two days the colloquium will bring together scholars, graduate students and policy makers/advocates to explore how our everyday leisure lives are being transformed by technology in ways that inform and challenge gender injustice for women, men, and transgender citizens. Identifying leisure related practices that are virtual and visceral the discussion will be broadly oriented around three digital dilemmas:

1. How do virtual voices influence issues at the intersection of gender and (in)justice?

2. How do innovative methodologies enable new insights into the social transformation of gender relations, digital cultures, and social justice?

3. How is digital technology shaping relationships between diverse citizens, communities and policy makers in the context of gender equity?

Adopting an interdisciplinary approach the colloquium will draw upon different theories, methodologies, and applied (policy and practice related) perspectives to examine the interrelationships of gendered leisure, advocacy, and civic engagement. In doing so, we seek to advance new approaches to understanding, critiquing, and mobilizing action within the complex gendered relations between leisure spaces and digital practices. The two keynote speakers for the event include:

Dr. Brittany Cooper, Rutgers University co-founder Crunk Feminist Collective.

Dr. Aimée Morrison, University of Waterloo, co-founder Hook and Eye: Fast feminism, slow academe.

**Academic submissions**

We welcome abstracts from academics that address these questions from diverse social science and humanities disciplines. We will select six academic papers for 30 minutes presentations and provide subsidized funding for travel costs. The event will provide an opportunity for additional academic contributions to round table discussions during the colloquium and networking. We will be proposing a special issue of an interdisciplinary journal to support the publication of colloquium papers.
Graduate students submissions

We welcome abstracts from graduate students that address these questions from diverse social science and humanities disciplines. We will select four graduate students to contribute their research to a panel discussion and we will provide subsidized funding for travel costs. The event will provide networking and mentoring opportunities for graduate students.

Please submit your 300 word abstract including name, title, academic/graduate student status, institution and contact details to: [mailto:digitald@uwaterloo.ca]

Organising Committee: Dr. Diana Parry and Dr. Corey Johnson, University of Waterloo and Dr. Simone Fullagar, University of Bath.

Supported by the Social Sciences and Humanities Research Council Canada, the University of Waterloo and the University of Bath, UK.

CfP Everyday analytics: The politics and practices of self-monitoring track at 4S 2016 (2015-12-14 09:18)

We welcome submissions to our open track on ‘everyday analytics’ at [1]4S/EASST, Barcelona, 2016

Track convenors: Kate Weiner, Catherine Will, Minna Ruckenstein, Christopher Till and Flis Henwood.

Everyday analytics: The politics and practices of self-monitoring

Self-monitoring is a pervasive part of contemporary life, entwined in many spheres of the everyday, for example work, health, fitness, energy consumption, finance. The analysis of these activities, once the preserve of scientific, professional and technology experts, is expanding, as the scanning, recording, memorising and tracking of daily life using digital technologies becomes increasingly possible. Yet self-monitoring involves a variety of technologies and techniques, some digital some considerably more mundane.

Tracking may be voluntaristic, but may be encouraged, promoted or required through corporate and governmental initiatives - and is of interest to numerous commercial sectors. While the term ‘self-monitoring’ invokes the image of an individual tracker, it may involve a variety of collectives, for sharing data and experiences and creating collective knowledge. Collectives may operate at more local levels too, as people and things mediate in the everyday work of tracking.

We invite papers that explore everyday analytics, self-tracking practices and its different meaning: Who and what is involved? What emotions, projects and relationships are important in these practices? How is data interpreted? How and when does data flow where and how does it get stuck? When and how does self-tracking become embedded and normalised in everyday life? What is the scope for resistance, rejection or exclusion? We expect that the papers will contribute to either theoretical or methodological developments relating to self-tracking in practice, investigating how it promotes new forms of individuality, sociality, politics and markets - or moments when it fails to engage people.

Abstract submissions will open soon and the deadline will be 21 February 2016

If you have any questions about the track, please feel free to contact us:

Funded Places Available at the @BritSoci Conference (2015-12-15 08:00)

Important announcement via the [1]BSA Sociologists Outside of Academia list:

This year there are 40 places available for **40 BSA Concessionary members**. 20 places are being funded by the BSA Support Fund and 20 places by SAGE Publications. Applicants must be paid up members in the UK Concessionary category, must be living in the UK, and must be a member for 12 months prior to applying for this free registration. Members are limited to one Support Fund claim – if you have previously received an award, you are not eligible.

Are we all Deleuzians now? Or, Why Susan Greenfield may be right, after all (2015-12-15 13:01)

Oxford neuropharmacologist [1]Susan Greenfield has become notorious for arguing that the internet is warping our minds. Many people – myself included – regard her as a [2]scaremonger. Nevertheless, in a recent history of
neuroscience that I've been reading for other purposes, I've run across Eugen Bleuler's original 1911 account of the key symptoms of schizophrenia, a mental illness of his coinage. They consist of the "4A's":

(1) a blunted affect resulting in diminished emotional responding; (2) a loosening of associations causing disorganised thought; (3) ambivalence or an inability to make decisions; and (4) autism referring to a preoccupation with one's own self or thoughts (Taken from Andrew Witkins, A History of the Brain from Stone Age to Neuroscience, Psychology Press 2015, p. 261).

Not only prolonged exposure to the video screen but also postmodern thought more generally may lead to schizophrenia – n'est-ce pas? Perhaps this is why Giles Deleuze, co-author of Capitalism and Schizophrenia, killed himself in 1995. After all, 1995 marked only the dawn of the World Wide Web, which massified this particular vision of reality, against which Greenfield (and others) continues to struggle. From this standpoint, Deleuze may seem so luminous today because he personally lived a world that is now more widely available – and, crucially, more tolerable – than ever before.

In case the lesson of this story is not clear: What passes for 'critical' thinking nowadays is often a rationalization of a lived situation, i.e. an 'enjoyment of the symptom' as Lacan/Zizek might say. In the old days, we called it 'making a virtue out of necessity'.

Dave Harris (2015-12-15 20:48:37)
Since when has Deleuze been 'luminous'? . Did he not argue for greater attention to 'affect', at least in the classic sense? OK, I'll let you have disorganized thought, ambivalence and autism, although nowhere near to the same extent as autoethnography. Exponents of that really do enjoy the symptom...

CfP: The Lives and Deaths of Data (2015-12-16 08:00)

Open Track: The Lives and Deaths of Data

Convenors: Sabina Leonelli and Brian Rappert, Department of Sociology, Philosophy and Anthropology & Exeter Centre for the Study of the Life Sciences (Egenis), University of Exeter, UK (see also the Exeter Data Studies group: [1]http://www.datastudies.eu)

Abstract: This track investigates the relational constitution of data: how stages in the life of data articulate to one another and the challenges involved in storing, moving, classifying, manipulating and interpreting them. The session is intended to explore the collectivities emerging through data collection, dissemination, assemblage and analysis. Analysing the ways in which information becomes taken as given things, the manner in which data and their varying contexts of use are co-constituted, and the means by which utility is invested and divested in them provides a platform to explore and challenge the powers attributed to "Big" and "Open" data by governments, lobby groups and institutions around the world. With its long standing attention to the conditions of knowledge production, STS scholarship is well positioned to reflect on the value(s) attributed to data under a variety of different circumstances, how such attribution changes in time, and what this indicates about the properties of the objects being identified
and used as ‘data’ and of the communities involved in such identification and use. Questions to be addressed include: What would it mean to speak of the birth of data? How do they develop, especially when they are used for a variety of purposes by different stakeholders? Do they ever cease to be data, and how can we conceptualize situations in which data are dismissed, forgotten, erased, lost or regarded as obsolete? This session will be organised as a set of individual presentations encompassing several different aspects and areas of data use.

Process: The deadline for submitting an abstract is 21 February 2016. If you want to participate in this open track then you will need to select it when you submit your abstract to the 4S/EASST Conference. Instructions for submission of your abstract are available at [http://www.sts2016bcn.org/](http://www.sts2016bcn.org/)

If you would like to discuss the relevance of your paper to the open track, then please contact either or both of us: s.leonelli@exeter.ac.uk and b.rappert@exeter.ac.uk

What are your favourite Sociology books of 2015? (2015-12-17 08:00)

Taking the lead from Brain Picking’s list of the [1]best science books of 2015, we’d like to hear from you about your favourite Sociology books of the year. Let us know in the comments box or tweet them to me @mark_carrigan and I’ll compile the list and add them into this post.

CfP: A Celebration of Star Trek (2015-12-18 08:00)

Call for Papers and Topic Proposals:
A Celebration of "Star Trek"

(Apologies for cross-posting)

Now accepting submissions and ideas for the fourth annual Pop Culture Colloquium at DePaul University in Chicago!

The Media and Cinema Studies program, along with the College of Computing and Digital Media, the English Department, and the Department of American Studies at DePaul University is hosting a one-day celebratory colloquium in honor the fiftieth anniversary of "Star Trek" on Saturday, May 07, from 9am-6pm. This event will feature roundtable discussions from scholars and fans of "Supernatural", speaking about the cultural impact of the show, as well as analyzing aspects of the episodes. The even will also feature keynote speaker Brannon Braga (executive producer, writer, and director of multiple episodes and films), screenings, screenwriting workshops, a costume contest, and more.

The audience for this event is both graduate and undergraduate students, both fans and scholars, and the focus should be on informed and enlightening discussion rather than formal academic papers. "A Celebration of "Star Trek" " will take place on DePaul's Loop campus.

If you're interested in speaking on a round table, please send a 200 word abstract of your topic and a CV or resume to Paul Booth ([1]pbooth@depaul.edu) by Mar 01. Please aim your abstracts for a more general audience and for a discussion rather than a paper presentation. For more information, please check out the website [2]www.mcsdepaul.com/a-celebration-of-star-trek.html and sign up for updates on Facebook (search "A Celebration of Star Trek"). We hope that you will be able to join in the discussion and celebration! A Celebration of Star Trek (DePaul University, 07 May)

CfP: Political Theory on Refugees (2015-12-19 08:00)

Call for Papers

University of Augsburg, 17-18 November 2016

CONFERENCE: POLITICAL THEORY ON REFUGEES

Working Groups: Democracy and Flight: Political Theories on Refugees and the transcultural and comparative
Convenors: Sybille De La Rosa (Heidelberg University), Melanie Frank (University of Augsburg) and Viktoria Hügel (University of Brighton)

Keynote speaker: Matthew Gibney, Oxford University

Political exclusion and the resulting struggles for inclusion have been in the focus of political theory in general and of democracy theory in particular for a long time. Hence, the aim of this conference is to identify theoretical concepts which focus on the problem of inclusion and exclusion and could, thereby, be an important contribution to refugee studies. Even when these concepts do not genuinely refer to refugees, they could certainly help to address the problems linked to flight and exclusion accurately. Thus, the possibilities of a beneficial argumentative exchange on the topic of refugees can be enhanced.

Participants are invited to "use" political theories in order to transcend the empirical question about 'what is' and rather ask 'what should be'. Doing so, it will be possible to criticize our perception of the problem and, thus, also brings in new consequences for the problem solving. For instance, if one understands refugees as a characteristic feature of a more and more globalized world and, hence, as an inevitable challenge for modern societies and their ability to integrate, one quickly exceeds the perception of refugees as a short-term administrative problem. In consequence, questions are raised about proper integration and representation modi as well as about our responsibility towards strangers and ways of transcultural communication. Hence, it gives us new perceptions and narrations for a new, global and maybe even cosmopolitan self-understanding.

Contributions may consult concepts of representation theory, democracy theory as well as hegemony theory, postcolonial theory, work on transcultural conceptions and communitarianism etc.in order to successfully apply them to refugee studies or address questions like: Does the democratic idea call for the representation of refugees and why? Which kind of representation theoretical and empirical could be best to include refugees' demands? Which democratic practices and institutions could be extended or opened for refugees? Which level of representation would be best, local, regional, European, or global? Which are the transcultural challenges that can emerge when refugees are integrated in modern democracies?

Please send abstracts (250 – 300 words) for twenty-minute papers (in English) along with the name of your institution to sybille.delarosa@ipw.uni-heidelberg.de no later than January 15, 2016.

Depending on the composition of participants, the conference will be either held in German or English. We expect every participant to be ready to present his or her paper in English.

"Liking" it on Facebook (2015-12-21 08:00)

by Javier de Rivera

The "Like" is one of the most common and successful features on social networking sites. It was the hallmark of Facebook from the beginning, it is the main form of social interaction on Instagram, and Twitter has recently changed the “Fav” by hearts that represent "likes".
Twitter’s evolution with this feature is particularly interesting. At the beginning of its great expansion in 2009, Favs were being used more as a way to archive relevant tweets, mostly containing links, than to praise a fellow user. At that time, the Fav felt like Internet Explorer’s Favorites, a sort of bookmarking feature for archival purposes. Appreciation and acceptance was shown with words like “thanks!”,”cool!” or “u r great!”, or by old-style emoticons. Along with these, the Retweet was a high form of showing appreciation, which also had the important functionality of disseminating relevant content.

On Facebook, both functionalities - social appreciation and dissemination of valuable content - were always mixed in the “Like”. Although users have always had the option to “Share” content without liking it, it seemed unfair to do it that way... and people usually prefer to share content by showing appreciation at the same time. This overlapping of functionalities may look irrational, but when the main purpose is social interaction, usability is more important than direct ‘rationality’.

In this case, the multiple functionalities of the “Like” increase its relevance as a system feature, which probably has something to do with the success of Facebook. The evolution of Twitter seems to be going in the same direction, by experimenting with the Favs and changing them to Likes, establishing the trend that started several years ago - for using this feature to show appreciation rather than for archival purposes. Here, overlapping is not possible, by choosing Hearts as a mean of social interaction we are deploying its value as an archival resource: our list of bookmarks would be flooded with the less memorable tweets we chose to mark as an expression of appreciation.

Considering the issue from another perspective, social positive reinforcement is one the most important motivations for humans to act, together with other (social and biological) gratifications such as having sex or eating. All we all really want is to feel valuable, to feel that people like us, that we are relevant, that we worth it; in the end, that is what motivates every human being. There are individual differences in the way we look for it, but, in general, just hearing good comments cheer us up.

For this reason, when these social applications make it so easy to show off or “be ourselves” and still receive attention and “Likes” from other people, they become like sugar candy for our self-esteem and sense of social acceptance. In face to face interaction it is not so easy to show your appreciation for another person, it can feel awkward or inadequate. Nonetheless, the scarcity of social appreciation can be the cause of great suffering.

On the other hand, the sensibility we have towards different forms of positive reinforcement or social appreciation is what defines us as individuals. Some people desperately look for the approval of parental figures, some are crazy about being admired from below, others can rather get the silent admiration of their partner or the sense of belonging to a cohesive group of peers. There are also many people driven by more pragmatical reinforcement experiences, like a pay rise or a good sexual encounter.

Our sensibility towards gratifications and positive reinforcements determines what drives our desire and will; and in the end it is what defines who we really are. If we are most interested in a pay rise or the parental recognition, we might not be as good coworkers as if we were driven by peer acceptance and companionship. What attracts us the most is both our weakness and our strength, and it constitutes the core of our identity.

In social networking sites positive reinforcement is abundant. After all giving a “Like” is easy, does not cost anything and we know the other is going to like it. The only condition for engaging in this positive and inoffensive social interaction is accepting its mechanical nature, and the process of standardizing and quantifying social gratification. By doing so, all the nuances involved in direct gratification - be it face to face, on the phone or by writing - are filtered out and reduced to a simple click.

This is the reason why the standardization of positive reinforcement can be problematic, especially for young users.
and for those who do not have a strong priority towards the kind of appreciation that they are looking for. It might be that instead of developing a personalized sensibility in the focus of our desire for acceptance - good or bad, but personalized and adapted to our social conditions - users get used to trade themselves in an abundant market of the equally quantifiable “Likes”. This also transforms positive reinforcement and reputation into a digital/social currency.

The abundance of mechanical positive reinforcements is deployed by commercial social networking sites as a decoy for users, thirst for social acceptance and interaction. After all, we are more likely to return somewhere where we feel accepted and praised, than somewhere where people criticize, despise or ignore us.

The "Likes" have yet another marketing strategic functionality. In order to make users’ information valuable for the market it is important to know what they like, what attracts their attention, and this could eventually help frame them as marketing targets. What they do not like, or the strength of their opinions towards things that happen in the world, lacks an equivalent economic interest. That is why there are no features to develop the negative and dialectic style that is the mark of social criticism.

Everything has to be framed and quantified in a positive way. Protestors can freely gather around a protest page where their “Likes” can be added up. Their “anti” feelings and attitudes get turned upside, “positivized”, and can happily exist side by side with the "pro” feelings of their social rivals. In fact, everything can co-exist – not cohabit - producing different market niches to fulfill the long-tail economy.

Unfortunately, public space means sharing the same ground, experiencing the same reality, all together, instead of parallel virtual realities. We all share the same material world, in which our actions affect each other. There are many issues that are of public interest and should be discussed publicly by the communities that more affected by them.

Allowing people to express their social and political opinions online is great, but that does not serve any purpose if they are unable to discuss and work as a community. The way in which social networking sites work systematically discourage the production of shared realities, collective discourses or social spaces. The positive logic of these commercial sites generates spaces without friction, social interactions without society and networks without community.

Against ‘hybrid beings’ as a way of understanding our entanglement with digital tech (2015-12-22 08:00)

My objection to the notion that we should understand the ubiquity of digital technology within person life in terms of ‘hybrid beings’ is a fundamentally methodological one. At the level of social theory, I find it relatively unobjectionable as an attempt to conceptualise the entanglement of human beings with technology. But in a sense I find it trivial because we have always already been hybrid beings. We make and use tools and our lives are changed by the tools...
we have made and used. They open up new possibilities and close down others. Our horizons expand in some ways and contract in others. What we can do and what we conceive of ourselves as being able to do develops [crucially I think there's always a gap between the (epistemic) self-conception and the (ontological) causal capacity] develops from the interplay with the tools we made, which in turn have their own biographies of innovation and diffusion that act back upon their makers, contrary to any sense they may have of absolute autonomy over the instruments and artefacts they have produced.

The only way the novelty of hybrid beings can be maintained is to imply a tipping point, beyond which we become ‘hybrid beings’ whereas before we were merely homo faber. But how could such a tipping point be conceptualised? How could it be operationalised? Why even try and draw a line? The differences between our ‘entanglement’ with contemporary technologies and past ones is at most a difference of degree rather than of kind. Even then I’d caution that a prevailing tendency within sociological thought to focus upon the novel and the cutting edge, at the expense of the quotidian and well-established, risks blinding us to the much older forms of ‘hybridity’ all around us. I don’t see much of interest in claiming that my glasses make me a ‘hybrid being’ but I depend on them much more than my iPhone. If hybridity is ubiquitous than I don’t find it interesting or helpful to pronounce the emergence of new hybrid beings. It might unsettle ‘taken for granted dualisms’ but my disinterest in this form of cultural politics is another issue, with its tendency to dissolve political activism into arcane and esoteric philosophical disputes, while congratulating itself on its resolutely political stance. It’s an example of what Bourdieu once described as the tendency to “mistake revolutions in the order of words or texts for revolutions in the order of things, verbal sparring at conferences for ‘interventions’ in the affairs of the polis”.

My more substantive problem is that ‘hybrid beings’ ontologizes a variable process, imputing a category of being where in reality there are dynamic and diverse relations unfolding across a range of contexts. It risks substituting philosophy for empirical social science. This isn’t an inexorable result but I’d suggest that where analysts of new hybrid beings shed empirical light on these trends, they do so in spite of rather than because of the concepts they’re using. I think the underlying dangers here at that we either see human being as being moulded by these new technologies or human beings as simply using neutral technologies for their own ends.

To talk of hybrid beings gets beyond this, recognising co-development, but at the expense of inclining us towards general statements about the ceaseless dance of co-constitution rather than opening up specific cases in a way that allows us to explain them. Because it’s these specific cases which make these explanations urgent. We should not be talking about the new kinds of humans who are coming into being but rather about the many ways in which digital technologies are leading to the reconfiguration of relations within subjects, and between subjects: in personal life, working life and political life. From my standpoint the role of theory should be to support empirical investigation into these issues, as well as incorporating their results, rather than to pre-empt it philosophically.

Towards a sociology of human flourishing (2015-12-23 08:00)

From this [1]interesting interview with Phil Gorski on The Imminent Frame:

That would certainly be a hope of mine, and it’s something that I’ve been thinking about a great deal lately, whether there’s a limited kind of moral realism that we could defend, and that we might actually be able to contribute to through social science or at least through academic reflection of some kind or
another? My suspicion is that there is; I just don’t know what the scope of it is. It would have to be premised on some understanding of human flourishing—that human beings are put together biologically, neurologically, in a certain way—that they have certain kinds of capacities or propensities—that their flourishing and well-being in general involves the development and cultivation of these propensities and capacities.

Of course I’m simply channeling a lot of research that’s being done in neighboring fields. There’s recent work in positive psychology, for example, which is starting to get a great deal of attention by people like Jonathan Haidt and Marty Seligman. There’s a neo-Aristotelian virtue ethics tradition that people like Martha Nussbaum and Richard Kraut have revived and defended in recent years. Even some folks like Amartya Sen have tried to make a basis for a different way of thinking about economics and development policy.

So the question is, “How do you develop a theory of the human good which doesn’t become a kind of hardened dogma, a sort of a one-size-fits-all understanding of what a life well-lived is going to mean?” We don’t live in Athens anymore. We live in a much more diverse, much more egalitarian, much freer society. Clearly there has to be a great deal of room for people to act freely. Part of flourishing is also making mistakes and learning and developing, so it’s not the idea that you simply prescribe some kind of a lifestyle. I think this notion that Nussbaum has developed, a kind of capacities approach to justice—that you need to create a basic set of preconditions for people to explore their own particular talents, capacities, inclinations—that that probably strikes the right balance between liberalism and a more robust form of moral realism.

I think where sociology might contribute to this is in thinking harder about how you create the preconditions for the sorts of social connections and communities that are clearly part of human flourishing. We know that this is one of the clear results of recent work in positive psychology: that relationships to other people are critical. There’s a lot of confirmation for this in evolutionary biology and psychology, the mounting evidence of pro-social characteristics of human beings. But most of these disciplines are really focused on the human organism, or they’re focused on the human psyche. They don’t really think deeply about the social, per se, so this is where sociology might actually step in and make some kind of a contribution to this, I think.

But I expect there’ll be a lot of resistance. One of the first things that you learn in graduate school in the social sciences is about the fact/value distinction, that there is no way of knowing or discovering what’s good. I don’t think people really believe that. I think that’s why most people go to graduate school, because they think this will help them answer these kinds of questions. But you get professionalized and socialized out of this during your first few years in graduate school. It’s salutary to the degree that we learn to establish a certain kind of reflexive distance to our tacit assumptions about what’s good, but I think the next step is to return to those basic practical questions that really animate people and get them interested in academic life and scholarship in the first place.

If Sociology has to find a new role for itself, against the background of an empirical crisis, perhaps this could be it?
Susan Shallcross (2016-01-08 12:36:30)
I agree with you about human flourishing. I have just started studying sociology at une and I am interested on what living a good life looks like for different people.

New forms of cultural capital (2015-12-24 08:00)

A video and podcast from an interesting event at LSE, in which some of the team from the Great British Class Survey reflect on new forms of cultural capital:

A panel of leading international experts discuss whether traditional forms of 'highbrow' cultural capital associated with the dominance of the classical and historical canon are being eclipsed by newer and more fluid kinds of cultural tastes, associated with contemporary music and art, sport, and engaging with the social media and computer games.

Philippe Coulangeon is Director of Research at SNRS, Sciences Po and Visiting Professor in the Department of Sociology at LSE.

Sam Friedman is (@SamFriedmanSoc) Assistant Professor in Sociology at LSE.

Laurie Hanquinet (@LHanquinet) is Lecturer in Sociology at University of York.

Mike Savage (@MikeSav47032563) is Martin White Professor of Sociology and Co-Director of the International Inequalities Institute at LSE.
The Sociology of Christmas Lights (2015-12-25 08:00)

A great video by Les Back about the sociology of Christmas lights:

Happy christmas!

Calling PhDs & ECRs: @thesocreview conference funding competition is now open! (2015-12-26 08:00)

The Sociological Review has launched the next round of its support scheme for unfunded PhDs and ECRs. Find out more and apply [1]here:

We are pleased to announce our latest round of funding, supported by The Sociological Review Foundation.

Funds of **up to £1000 per applicant** are be available for unfunded PhD students and postdocs (within 3 years of completion) to facilitate their attendance and participation of conferences.

To apply, please first check that you meet the criteria for applying (below) and then access and fill in the form below by our **deadline of 31st January 2016**.

You will be informed by 28th February of the outcome of your application.

CfP: Surveillance and Security in the Age of Algorithmic Communication (2015-12-27 08:00)

Surveillance and Security in the Age of Algorithmic Communication
An IAMCR 2016 pre-conference

University of Leicester

26 July 2016

Deadline for abstracts: (500 words): January 15, 2016

The call as pdf:

The Snowden leaks have put mass surveillance on the public and academic agendas. Data collection, interception and analysis by both state and commercial actors are increasingly discussed and investigated, and instances of mass data leaks underline the challenges of big data gathering and storage. So what does the reality of surveillance and the precarity of data security mean as our world is increasingly structured by algorithmic decision-making, artificial intelligence, the internet of things, and robotic cultures? What are the challenges and solutions, and what
new concepts and practices need to be considered? What next?

Academic debates on posthumanism, futuristic philosophical endeavours, and scholarly fields such as science and technology studies have approached these questions, but they have not been very prominent at IAMCR. This preconference will therefore address these current debates on the future of media and communications.

We welcome researchers who are eager to discuss the consequences of algorithmic communication and artificial intelligence to the field of media and communication. We particularly invite studies on the long-term challenges to privacy and surveillance in digital networks as they are emerging in the area of ethics and politics of algorithmic communication, and on the employment of AI in areas such as policing, healthcare, social services, education, the digital economy and the cultural industries.

For this pre-conference workshop we are interested in the following themes:

- The politics and ethics of algorithmic communication and security
- Challenges of the employment of AI in policing, social services, etc.
- Privacy and security in the context of the internet of things
- Roles and implications of corporate, governmental and civil society production of algorithmic communication
- Accountability and agency in the ‘black box society’?
- The role of human/civic rights in the context of AI and algorithmic security
- Necessary policies, regulatory frameworks, and relevant standards
- Robot protests: sociopolitical cyberconflicts and resistance to algorithmic security
- The pre-conference is associated with the projects The Common Good: Ethics and Rights in Cyber – Security and Digital Citizenship and Surveillance Society.

 Imagining the Millennial Fascist (2015-12-28 08:00)

A [1]really interesting post by David Banks, reflecting on the possible forms that fascism might take amongst millennials, with the particular experiences of social and political life they share as a generation:

Barring some extreme changes in the political climate the following will be true of the American electorate in 40 years: There will be no living memory of a time when real income rose for anyone but...
the super wealthy. No one, save the oldest citizens will have had a post-9/11 adulthood with all of the normalization of war that entails. Schools will be understood as prime targets for extreme acts of violence even as rates of property and violent crime fall in the aggregate. The total lack of confidence in all established institutions with the exception of police, military, and small business will continue as major cities are washed away as governments look on and refuse to invest in any kind of infrastructure. This will also be happening as America reaches a major demographic milestone: whites (as we presently define them) will no longer be a statistical majority.

Academic life in the measured university: pleasures, paradoxes and politics (2015-12-29 08:00)

The University of Sydney

June 29th to July 1st 2016

Submissions

To submit [1]CLICK HERE

Submissions are due by Friday 15 January 2016.

Themes

The conference welcomes submissions from staff and students (especially collaborations among students, and between staff and students), across the full spectrum of disciplinary lenses on the themes described below. We are especially keen on receiving submissions that address or re-work the themes below drawing on arguments about Indigenous knowledges and southern theory. Please note that the questions at each theme are intended as prompts only:
• Teaching, learning and curriculum: How are changes to teaching, learning and curriculum shifting the identities of staff and students? What kinds of ‘welcome’ and ‘questionable’ identities, roles, and practices have emerged in the measured university for staff and students, and with what consequences? What sorts of theories, approaches, and evidence are now needed to confront and re-work teaching, learning and curriculum in the measured university?

• Research & research education: What are the pleasures, paradoxes, and politics inherent in measuring research? How does the curriculum of research training / doctoral education prepare research students for engaging with (or speaking back to) the demands of the measured university? How do we form and sustain communities that nourish our identities and practices as researchers and scholars?

• Service: How does service manifest in the measured university? What has driven the transformation of ‘service’ into administration/bureaucracy? What are some innovative examples of the recognition and reward of service in the measured university?

• Community engagement: How do staff and students take up the desire by universities for increased community engagement? How are staff and students renewed by their participation in community engagement activities? In what ways does the increased focus on community engagement relate to the demands of the measured university?

• Academic careers and promotion: In what ways has the measured university helped, hindered and shaped the nature of academic careers? What does the emergence of new third space/para-academic roles tell us about the changing nature of the academic workforce in the measured university?

• Leadership: What is the intellectual role of the professoriate in the measured university? What forms of disciplinary and departmental leadership are needed for academic work in the measured university? How do we understand the relation between the restructuring of academic labour and university leadership?

• Governance: In what ways is the measured university transforming academic governance structures? Are we in a time when data has replaced discussion? Does data develop dissent or compliance? How is an understanding of what counts as data informing shifts in academic governance? What is the future role of collegial governance in the measured university?

• Ideas about the university under the conditions of measurement: In the measured university, what languages of description have we become lumbered with, and enabled by? How do practices of care, kindness, critique, and pleasure play out in the measured university? How do we continue to be committed to the idea of the university despite its reputation for being a ‘greedy institution’? What can be done to act both with, and against, the drift, scale, and reach of the measured university? Is it possible to redirect the measured university to different ends? If so, what might those ends be and how shall we go about it?

Submission types

We welcome four types of conference submission. No matter which type you choose, aim to prepare no more than a 500-word submission (which should include no more than five scholarly references). The references should be included in your word count.
Paper/Symposium (30/60/90 mins)

Single-paper presentations explore one or more dimensions of the conference themes. The goal of these sessions is to share work-in-progress and engage in dialogue with conference participants, so timing should be balanced between presentation and discussion (20m+10m is optimal). You should also aim to demonstrate how your paper/symposium contributes (or is likely to contribute) to the existing body of scholarly research. Where presenters have two or three thematically linked papers, you may propose a symposium with a maximum time of 90 minutes. In that case, you need to give an overarching abstract for the symposium as a whole, as well as titles and reduced abstracts for each paper within the symposium. Please nominate a contact person for the symposium.

Roundtable (60 mins)

Roundtable discussions provide the opportunity for a lively discussion around a particular topic or area of research. They are an ideal opportunity for networking and for building collaborations. If you wish to propose a roundtable discussion, the submission should include an overview of the topic, and pose some critical questions that the roundtable discussion will explore. These sessions will be chaired by the person who proposes the roundtable.

Performance (30/60 mins)

Performance-based presentations provide an opportunity for presenters to draw on forms, expressions and traditions of arts-based inquiry as a vehicle for exploring the conference themes. We welcome performance in all its variety. Some possibilities include: readers' theatre, performance ethnography, and poetic representations of research. If you wish to propose a performance, your submission will need to be strong in both the idea (related to the conference themes), and in the description of the type of performance. If the performance involves audience participation, you will need to indicate that as well in your submission.

Pecha Kucha Forum (30 mins)

Presenters show 20 slides for 20 seconds each, giving a total of 6 minutes and 40 seconds for each presentation. The aim is to exchange ideas in a concise and stimulating way. Presentations are image based, which keeps
them engaging. Each forum will have three pecha kucha presentations followed by time for group reflection and discussion. Individual and group proposals are welcomed.

**CHF 1,000 for the best essay on the topic 'Influence and Power' (2015-12-29 13:10)**

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic 'Influence and Power'. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

*Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.*

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a re-thinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF’s criteria and goals may be viewed [here](#).

Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal’s key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.

The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition’s theme and falls within the remit of BD &S’s goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.

The submitted essays will be judged and the winning essay will be chosen by an academic panel (the ISRF Essay Prize Committee). The panel’s decision will be final, and no assessments or comments will be made available. The result will be notified to applicants by email during April 2016 and will then be announced by posting on the websites of the ISRF and of BD &S. The ISRF and BD &S reserve the right not to award the prize, and no award will be made if the submitted essays are of insufficient merit.

The winning essay will be accepted for publication in the Journal; the author may be asked to make some revisions before publication. Other applicants may have their submissions accepted for publication in the Early Career...
The details and criteria are:

**Essay topic:** Influence and Power (This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field.)

**Eligibility:** Participants should either be current doctoral students or within three years of being awarded their doctorate.

**Essay length:** 5,000 to 7,000 words

**Essay format:** Follow the BD & S Author Guidelines, available on the BD &S website.

**Language:** English

**Submission deadline:** 31 January 2016

**Queries:**
[2] essayprize2016@isrf.org

Submissions should be made online at [3]https://mc.manuscriptcentral.com/bdas and authors should indicate that their submission is for the special theme, ‘ISRF Essay Prize.’

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. Inside the Lives of the 1% – How Power and Inequality Operate in Britain (2015-12-30 08:00)

INAUGURAL LECTURE BY [1]PROF AERON DAVIS, CO-DIRECTOR OF PERC

5.30-7.30PM, 26TH JANUARY

Over two decades Aeron Davis has interviewed some 350 elite subjects from the worlds of business, finance, politics and media: from Nigel Lawson to Jeremy Corbyn, Peter Oborne to Polly Toynbee, Martin Sorrell to Charlie Mayfield. He has simply asked them about their daily working lives, about how and why they do what they do. In this talk, he presents a mix of personal anecdotes and more generalised findings to explain how our leaders have become increasingly detached from their publics. He discusses these tendencies through four themes: the insularity of elite cultures; professionalism and precariousness in public life; risk-reward structures at the top, and; the mundane numbers game of leadership. In each of these discussions he explains how Britain’s leaders in their working lives, sustain power and contribute to inequality, social and political sclerosis.

In the Ian Gulland Lecture Theatre in [2]Goldsmiths, University of London

Refreshments will be served in the Foyer of the Whitehead Building.

Free event – all welcome – but please register your attendance on the Eventbrite link below so that we may know numbers for catering purposes.

Digital Health/Digital Capitalism One Day Conference CfP 4th July 2016

Digital Health/Digital Capitalism One Day Conference CfP 4th July 2016

Digital technologies have had a profound impact on the ways in which people live their lives, relate to one another and think about themselves and their capacities. This event will bring together scholars who are interested in the impacts of the digital on ideas and practices of health and the workings of capitalist economies and how the two come together.

Questions addressed at this event will include but not be limited to:

- How has the digital changed the ways in which bodies and health are understood, managed and experienced?
- How does the management of health data by commercial enterprises (public-private partnerships and sharing and collaborative websites such as PatientsLikeMe) impact on health outcomes and peoples’ engagement with themselves, others and their health and bodies?
- In what ways are digital technologies affecting work practices which themselves impact on wellbeing, physical and mental health?
- How has the blurring of work and non-work life through an “always on” digital culture created new health problems and new potential strategies for managing health?
- What can existing theories tell us about the changes brought about by digital health and digital capitalism? What theoretical innovations are needed?
- Does the commercial monitoring of health and wellbeing (through areas as diverse as corporate wellness initiatives and telehealth) enable greater freedom and stimulation for healthier lives or intensify surveillance?
- What potential is there in digital management of health and work for increasing or decreasing existing health inequalities or producing new ones? Will the digital divide transfer to these arenas or be minimised?

If you would like to talk at this one day event please send a title and abstract of no more than 250 words to Chris Till [1]c.till@leedsbeckett.ac.uk by Monday 15th February 2016. Registration will open 1st March.

The event will take place on Monday 4th July, 2016 at Leeds Beckett University.

Follow [2]this link for more information.

This BSA Digital Sociology Group and BSA MedSoc Yorkshire event is supported by a grant from Leeds Beckett University.
Survey Non-Response: An @IJSRM Virtual Issue (2016-01-02 08:00)

Survey non-response represents a major challenge to data analyses. It results in smaller samples, lower statistical power, incomplete histories in a longitudinal context, and more worryingly bias in sample composition. In this virtual issue, eight articles focusing on issues of survey response are republished.

Five articles explored the impact of survey practices on response, while the remaining three focused of the determinants of response and the consequences on sample representativeness. The eight articles cover longitudinal and cross-sectional surveys in addition to different survey modes such as postal, web, and face to face surveys.

The growing climate of political repression in the UK (2016-01-03 08:00)

As anyone who follows party politics in the UK will have noticed, the home secretary's rhetoric on 'extremism' has been getting increasingly bellicose in recent months. While it remains an open question as to what extent she believes this, as opposed to simply positioning herself to the right of Osborne and Johnson for the coming leadership election, it builds upon many statements by David Cameron of the need to attack 'non-violent extremism' because it provides an environment conducive to violent extremism:
In her speech last year, May talked about Prevent having previously been focused only on the ‘hard end’ of the ‘extremism spectrum’ and promised new policies that move beyond this. This is framed in terms of bringing other bodies (not least of all the charity commission) into an anti-extremism framework, either through ‘toughening up their powers’ or creating new statutory responsibilities to combat extremism. The ‘extremism spectrum’ encompasses a wide range of extremist groups:

This strategy will be devised and overseen by the Home Office, but its implementation will be the responsibility of the whole of government, the rest of the public sector, and wider civil society. It will aim to undermine and eliminate extremism in all its forms – neo-Nazism and other forms of extremism as well as Islamist extremism – and it will aim to build up society to identify extremism, confront it, challenge it and defeat it.

How does one define ‘extremism’? It is opposition to ‘our values’. These values resist codification in anything but the most vacuous and general of terms, lending a dangerous elasticity to the concept of ‘extremism’. Extremism risks sliding into being whatever bodies charged with combating it say that it is. In this sense, we might come to see extremism everywhere, which would explain why such a wide range of initiatives are seen to be necessary:

Also among the measures within the counter-extremism strategy are:

- A full review of public institutions such as schools, further and higher education colleges, local authorities, the NHS and the civil service to ensure they are protected from “entryism” – or infiltration – by extremists
- An official investigation into the application of Sharia law in the UK
• Extremism disruption orders to stop individuals engaging in extremist behaviour
• Closure orders for law enforcement and local authorities to close down premises used to support extremism
• Tougher powers for broadcasting regulator Ofcom so action can be taken against radio and television channels showing extremist content
• Demands that internet service providers do more to remove extremist material and identify those responsible for it
• Anyone with a conviction or civil order for extremist activity will also be automatically barred from working with children and vulnerable people

It’s worth remembering that this comes from a government which defines the leader of the Labour party as an ‘extremist’. David Cameron and other senior figures use [5]precisely the language of extremism to denounce Jeremy Corbyn. I’m not for a second suggesting that an attempt to ban the Labour party is even remotely imminent (or anything remotely along those lines). But I do think it’s likely we’ll see a hardening of opinion, as well as an institutional environment in which groups on the periphery of the Labour party see themselves frustrated and undermined, either directly through the government or indirectly through over-eagre intermediaries keen to avoid becoming a target themselves. I suspect this is what is currently taking place with the Palestinian Solidarity Campaign:

An activist organisation which has Labour leader Jeremy Corbyn as patron has had its accounts closed down over fears that it may be inadvertently funding terrorism.

Palestine Solidarity Campaign (PSC), whose patrons also include the Oscar winning actress Julie Christie and the playwright Caryl Churchill, was told by the Co-operative Bank that "risk-appetite" was the reason for closing its account.

In a statement, the bank said that due to the "high risk" locations in which PSC operates and send funds to, it had to carry out "advanced due diligence checks" on their accounts to ensure that funds do not "inadvertently fund illegal or other proscribed activities".

The statement concluded that it was “not possible to complete these checks to our satisfaction and the decision to close a number of accounts, including the PSC and some of its affiliates, is an inevitable result of this process".
Note there’s no actual accusation here. Yet Google News is full of headlines which link PCS and terrorism. Their operations are becoming increasingly difficult in the wider environment created by the Government’s ‘war on extremism’ and I think what we’re seeing here is the start of something that could get out of control far more quickly than people seem to realise.

David Harvey on the power of ideas (2016-01-04 08:00)

A fascinating panel discuss structured around David Harvey. He reflects on the power of ideas, how Marx changed over his career, the limitations of economics and the possibility of radical political change:
Sociology jobs at Utrecht University  (2016-01-04 11:07)

The department of Sociology at Utrecht University searches for 2 Assistant Professors in Sociology (1.0 FTE)

Job description

The two assistant professors will be working in the Department of Sociology. The department has strong re-
search traditions in a wide range of topics in sociology including cooperation problems, social networks, stratification
and inequality, families and work, and ethnic relations.

The department is part of the Dutch research school Interuniversity Center for Social Science Theory and
Methodology (ICS). We teach a bachelor programme in sociology and two master programs: the one-year master:
"Sociology: Contemporary Social Problems” and a two-year research master Sociology and Social Research.

Both positions span 60 % teaching and 40 % research time. Teaching will take place mostly in the bachelor
and in the one-year master.

Qualifications
A Ph.D in Sociology or a closely related field, e.g., social psychology, economics with affinity to sociological problems and sociological approach mentioned below;

- Affinity with problem driven quantitative sociology;

- Excellent track record in research;

- Demonstrable teaching skills. Being able to teach in Dutch as well as English will be an asset. Candidates who do not speak Dutch will be requested to learn to speak Dutch as soon as possible such that also teaching in Dutch is possible after some time;

- Have obtained the Basic Teaching Qualification (at Utrecht University or equal) or willing to achieve this qualification in the near future;

- Both positions are open to any field of specialization, although expertise in the fields of work, families, or care will be an asset for one of the positions.

- Experience with writing research proposals to obtain research grants is an asset;

- Team player.

Offer

We offer for both positions a temporary full-time position for one year. After a positive evaluation the appointment will be extended until at most four years. Your salary will range from a minimum of €3,399 to a maximum of €5,288 per month based on a fulltime appointment (i.e. salary scale 11/12 according to the Collective Labour Agreement for Dutch Universities). In addition, we offer attractive and flexible secondary terms of employment such as an annual holiday pay of 8 %, an end-of-year bonus of 8.3 % per year and partially paid parental leave. We also provide an attractive working environment and a vibrant research climate. For more information visit Working at Utrecht University.

About the organization

A better future for everyone. This ambition motivates our scientists in executing their leading research and inspiring teaching. At Utrecht University, the various disciplines collaborate intensively towards major societal themes. Our focus is on Dynamics of Youth, Institutions for Open Societies, Life Sciences and Sustainability.

The Faculty of Social and Behavioural Sciences is one of the leading faculties in Europe providing research and academic teaching in cultural anthropology, educational sciences, interdisciplinary social science, pedagogical sciences, psychology, and sociology. Research and teaching activities are concentrated in five areas: Behaviour in Social Contexts; Child and Adolescent Studies; Cognitive and Clinical Psychology;

Education and Learning; and Methodology and Statistics. More than 5,600 students are enrolled in a broad range of undergraduate and graduate programmes. The Faculty of Social and Behavioural Sciences has some 850 faculty and staff members, all providing their individual contribution to the training and education of young talent and to the research into and finding solutions for scientific and societal issues.

Additional information

Additional information about the vacancy can be obtained from: prof. dr. ir. Vincent Buskens, telephone
number: +31 30 253 1848, v.buskens@uu.nl or drs. Ellen Janssen, e.janssen@uu.nl.

Apply

Please send your application accompanied by a letter of motivation, a curriculum vitae and the names and contact info of at least two persons who are able to provide professional reference. You can apply this link:

We expect job talks to take place between January 21 and January 28.

The application deadline is 11/01/2016

Taking the Cake: Reflecting on A/Sexuality (2016-01-05 08:00)

A documentary project I was interviewed for earlier in the year:

Interview with Steve Fuller on 'Open Access' Academic Publishing with Rabble.ca. (2016-01-05 14:56)

I was recently asked to respond to a variety of issues concerning academic 'open access' publishing, especially in light of the boycott of the publisher Elsevier and other related initiatives happening in Canada. These are detailed in [1]this article in Rabble.Ca. However, my comments which were indeed designed to be a general reflection, were heavily excerpted, so their sense may not be entirely clear. Below is the full response I gave to the reporter, Cory Collins:

I'm somewhat more sceptical than many of the open access movement. I see it as addressing a rather limited set of problems surrounding academic knowledge production and specifically underestimating the role that publishers play in the process. To be honest, I'm surprised that publishers aren't putting up more of a principled defence of their activities.

I think the best way to see the open access movement is as akin to a consumer's revolt. A consumer's revolt doesn't address fundamental problems with capitalism, but it does tackle issues surrounding high prices and value-for-money. Similarly, open access doesn't deal with, say, the power structures inherent in academia's peer review process or the technical language in which academic work is couched. Rather, it simply removes what is seen as an unproductive 'middle man', namely, the publisher, whose efforts at producing and distributing journals don't seem to justify the high price to universities.

I say this because 'open access' is often associated with 'democratizing' knowledge, but at most it is democratizing it for professional academics who are already the beneficiaries of the publishing system. It doesn't 'open' up academia in any other meaningful sense. Even if the open access journals are freely available on-line, you still need to be able to make sense of them (i.e. know the lingo) and submit your papers to its peer review processes. Those are arguably bigger obstacles for non-academics than even the price of journals.

Now, as for the publishers themselves. They do more than simply profit from gullible universities. They actually organize the peer review process and ensure a regular flow of academic product to fill the volumes of the journals. In other words, they industrialize the process. This is not a trivial function: Such a rationalization of the work process cuts against the relatively unreliable character of academic practices. (It's very very hard for peer review to work in a timely fashion unless someone is cracking the whip.) If open access works as a large scale phenomenon in academia, it will be by being parasitic on production systems established by commercial publishers.

Moreover, publishers have incentives, which established academics typically don't have, to look for new fields that can be the basis for new journals, and hence new income streams. In other words, in their endless pursuit of profit, publishers end up promoting innovation on a regular basis, which might not otherwise happen if academics are left to their own devices. Cultural studies, gender studies, etc. may be seen in retrospect to have been publisher-driven movements, based on how these topics were beginning to be picked up in traditional history, sociology, literature, etc. courses in the 1980s.

As for whether to pay for peer review, I've made an argument here: [2]http://blogs.lse.ac.uk/impactofsocialsciences/2014/06/16/a-modes-t-proposal-to-solve-the-problem-of-peer-review/. My basic proposal is that 'peer
review’ should be taken out of the professional academics’ hands entirely and be put in the hands of academically trained people who work for the publishers of the journals.

Noam Chomsky: The Singularity is Science Fiction! (2016-01-06 08:00)

This interview is broader than the title suggests, covering a lot of interesting ground. But it’s particularly interesting to hear Chomsky’s views on the technological singularity:

IFRAME: [2]https://www.youtube.com/embed/0kICLG4Zg8s
ISRF Mid-Career Fellowship Competition

Launch: 4th January 2016  
Deadline: 19th February 2016

The Independent Social Research Foundation wishes to support independent-minded researchers to do interdisciplinary work which is unlikely to be funded by existing funding bodies. It is interested in original research ideas which take new approaches, and suggest new solutions, to real world social problems.

The Foundation intends to make a small number of awards to support original interdisciplinary research, across the range of the social sciences, **to be held from a start date no later than the end of December 2017**. Scholars from within Europe are eligible to apply.

The award is intended to enable a scholar at the mid-career stage to pursue his/her research full-time, **for a period of up to 12 months**. The amount will be offered to buy out the costs of replacing all teaching and associated administration in the applicant’s home institution, and will be considered to a **maximum of £60,000** per successful applicant. Within that sum, reasonable support for research expenses may be considered on a matched-funding basis with the host institution.

The applicant should normally hold a salaried position at an institution of higher education and research, and be **10 years or more from the year of their PhD award**. However, a shorter time from PhD award may exceptionally be considered, if the candidate has other qualifications to be considered as mid-career.
Applicants should consult the Criteria as set out in the Further Particulars and show that they meet them. Applicants should follow the Application procedure and should present their Proposal in the format specified there.

CfP: (Dis)empowering technologies (2016-01-08 08:00)

“TransMissions: Journal of Film and Media Studies”, new online academic journal affiliated at the Jagiellonian University, Poland announced its first CfP: (Dis)empowering technologies.

The main areas of our interests are:
- social movement activism
- ethnic, national and religion minorities and their technologies
- women and their technologies
- queer and their technologies
- disabled and their technologies
- migrants and their technologies
- methodological aspects of researching (dis)empowering technologies
- prosthesis as (dis)empowering artifact
- social media
- mobile media
- community radio

We are awaiting abstracts till 31 January 2016.

For more information about journal please visit our web site:

The full CfP may be found here: [2]http://transmissions.edu.pl/call-for-papers/

-----------------

**Bruno Latour on the relationship between Philosophy and Social Sciences (2016-01-09 08:00)**

A thought provoking extract from the dialogue between Bruno Latour and Graham Harman transcribed in [1]The Prince and the Wolf: Latour and Harman at the LSE, pg 46:

So if you are a pragmatist, it doesn’t mean there are a few small details that the social sciences would solve while the basic principles and foundations are provided by philosophers. I resent that because I think it’s wrong, and that’s not the way to collaborate between philosophy and the social sciences. Philosophy is too important to be the foundation of the social sciences. Philosophy is the calisthenics necessary to be as subtle as the case at hand.

1. https://books.google.co.uk/books/about/The_Prince_and_the_Wolf.html?id=M9WmAEEACAAJ&hl=en

-----------------
Yesterday I was speaking with a doctoral student, Morteza Hashemi Madani, about the point of social theory, especially given the recent revelation that Zygmunt Bauman plagiarises not only himself but also Wikipedia – shock, horror! As someone who has always had mixed views about ‘this thing called social theory’, I addressed ‘the point of social theory’ in terms of the spirit in which one might read such works. Below I offer a fourfold typology for your consideration that theorizes my own practice of reading social theory.

• Most works of ‘social theory’ are simply exercises in scholasticism, including the ones written by some of the top names in the field, such as Habermas. What I mean by ‘scholasticism’ is the original academic practice of summarizing what others have said on a common topic, weighing the opinions and drawing a conclusion that does some justice to all of them. This was a notable medieval practice of knowledge transmission, especially given the paucity of books and translations. Scholastics pre-read everything for you, which is why textbooks continue to have this character. The practice also stamped one’s own authority on a topic, as the scholastic basically tells students who is and is not relevant to the topic and how seriously their respective opinions should be taken. In the High Middle Ages, the scholastics themselves – as personalities – were quite powerful people since their judgements varied significantly (consider: Aquinas, Scotus, Ockham were all scholastics). However, in the modern period, scholasticism has maintained its power through sheer redundancy of content across scholastics, which in turn gives the impression of a continuous ‘tradition’ of thought. In that case, the logical next question is ‘Who from the current generation will be included in the next generation’s canon?’ But if you look at the so-called canon, you’ll realize that virtually all the names could be replaced by others, and that only the repeated scholastic presentation holds the ‘tradition’ together – just as was the case in the Middle Ages when the scholastics presumed that Aristotle and the Bible were natural bedfellows.

• Some works of social theory are better read for their references than their main text – a bit like Wikipedia articles. Anthony Giddens falls in this category for me. This is clearly a guy who can spot a good text when he sees one, which he then incorporates into his own text, which turns out to be a pastiche of the contents of several such well-spotted texts, overladen by a vague but dispensable conceptualisation that is Giddens’ own original theoretical contribution. The trick here is to read what Giddens has read but then re-theorize it for yourself, ignoring Giddens’ own weak formulations. I single out Giddens but he’s by no means the only social theorist in this vein. Anglophone postmodern theorists (not the original French guys, more about whom below) apply here too. The way to think about such people is as art connoisseurs who make the mistake of creating artworks themselves, failing to realize that their hand is not as good as their eye. However, my guess is that such people would be quite good at running academic institutions, in terms of knowing the right people to hire, the fields in which to invest, etc.

• Then we turn to people like Bauman – and possibly Beck – who are the jingle writers of theory. Jingles are those catchy tunes used in marketing campaigns to keep a product in the listener’s mind, which work not only because of their own play on words but because they also trigger some deeper sonically coded memories, perhaps from the history of music itself or the sounds of everyday life. Starting in the 1950s, New York jingle writers were instrumental in the conversion of popular music to the 3-minute sonic ‘hit’ that we take for granted today. Bauman and Beck can be seen as theory tunesmiths in this sense. Thus, we might think of Bauman’s career as modulating between ‘Adorno Lite’ (in his more normative moods) and ‘Simmel Lite’ (in his more descriptive
moods). So what might make a music purist recoil from saying that Burt Bachrach is a great composer equally applies to those who might claim that Bauman is a great theorist. In this respect, Beck is a bit different because more concerted efforts have been made to translate his theory-jingles – especially the ‘risk society’ – into proper empirical research programmes on the basis of which policy has been made. They make Beck more ‘serious’ than he himself was capable of being. Behind this move is what Stephen Turner a quarter-century ago identified as ‘conceptual capture’, the technique Robert Merton used to streamline and repackage difficult (often because untranslated) continental social theoretic conceptions for the empirically oriented American sociological market. Thus, one might think of the resulting ‘middle-range theory’ as akin to ‘middle-brow music’, at least vis-à-vis its original sources.

- Finally, there is the most interesting category of ‘social theory’, which is where it really earns the right to be seen as something different from ‘sociological theory’. Here the author is literally thinking his/her way through a body of data. This is neither an application nor a testing of theory. Rather, it is something closer to realizing an idea in an artistic medium, where the theory is the idea and the data are the medium. In terms of recognized ‘modern masters’ of social theory, Bourdieu excels at this. Seen in conventional academic terms, Bourdieu is provincial in his scholarship and sloppy in his method. After all, we always warn students to distinguish theory and data and then show how they interact. Bourdieu profoundly failed at that task – but to good effect. What he gives us instead is a sense of the process by which one tries to come up with a coherent understanding of disparate bits of evidence that he feels need to be understood together. Moreover, he does this in a way that is sufficiently constrained and even driven by the evidence that we don’t think he’s just making it up – yet that very fact then makes it difficult to figure out exactly what the theory is. Hegel attempted this sort of understanding on a world-historic scale, but I also think this is the best way to read people like Deleuze, Foucault and Derrida – all of whom are usefully understood as re-thinking different slices of the history of the sciences, often getting into remarkable detail (albeit distorted, so say critics) about past events. This is a more ‘participatory’ style of theorizing in the Platonic sense of literally merging with what one is talking about. I know that sounds mystical, though there are precedents in philosophers of history such as Collingwood, in turn influenced by Dilthey. One concrete effect of this mode of theorizing is that it becomes easy for the theorist to be him/herself a moment in history. I don’t simply mean that you become a celebrity (though that is one manifestation) but more importantly, you are seen as a kind of prophet in your own time.

_________________________
I agree on Habermas and Bourdieu. But I would love to know where would Steven clasify the only guy who worked out not just social theory but a theory of society in society (or is he folloween the conventional anglosaxon desdain towards him?): Luhmann.

christo22 (2016-01-11 00:06:45)
Which category does Steve Fuller fall into?

Steve Fuller (2016-01-11 07:46:42)
These responses are short because they open up into too many issues. To Cristian M: I think Luhmann falls into category 4 (unlike his mentor Parsons, who despite using the same systems-language, is more in category 1). However, I think Luhmann’s enterprise is closer to the early Hegel (of Phenomenology of the Spirit) than the later, more explicitly historicist Hegel (which is
the model for most of the people in category 4). To Christo22: I think of myself as instinctively in Category 4, though there are elements of the other categories. I actually think that each of the 4 categories has a role to play in intellectual life. For example, I don’t think you can really give a good academic talk unless you have something of category 3 in you: You need to be able to self-vulgarize.

[...] De-institutionalisation: Even sociology has seen the de-institutionalisation of theory at the graduate level so that the teaching of theory is reduced “to a single ‘omnibus’ course that attempts the impossible task of going from Montesquieu to Judith Butler in one semester”. Moreover, theory is generally no longer taught by theorists but by those whose work is only ‘relatively theoretical’. Devaluation: within the academy theory has been devalued in favour of empirically ‘applied’ work which produces ‘useful’ research. Destructuration: there is no longer any sort of ‘hierarchy of modes of doing theory’. We are left with a confusing and ‘rudderless heterodoxy’, and ‘very little agreement as to the “rules” of the theoretical game’(Lizardo). (But see Fuller’s deftly witty four-fold categorisation/hierarchy of theorising in which he rightly locates Luhmann in the fourth category: available here) [...]

Hello, after reading this amazing post i am too glad to share my knowledge here with colleagues.

I don't know if it’s just me or if perhaps everybody else experiencing problems with your site. It appears as though some of the written text on your posts are running off the screen. Can someone else please provide feedback and let me know if this is happening to them as well? This might be a issue with my internet browser because I've had this happen previously. Thanks 

d/s lifestyle jewelry (2018-10-22 04:59:53)

We have found random strangers at bars, strip clubs as soon as a crew member on a cruise ship. If you’re like thousands or millions of other people worldwide, you actually want to lead and live a normal lifestyle - and who doesn’t. Then you can add one extra exercise session for at least thirty minutes once a week, until that becomes only a given part of your week. 

internet cable (2018-10-24 04:23:30)

And live in the arms of this fictitious Adonis you have conjured as your fantasy mate. Think “news” and ensure your posts seem like news articles with pictures and all. You must realise that when you open a brand new Forex position that you are, in reality, trading currency pairs like a single unit. 

ignition casino coupons (2018-10-27 12:40:38)

What a information of un-ambiguity and preserveness of valuable familiarity concerning unpredicted feelings. 

education blog bd (2018-11-02 05:48:36)

Stick with your work, or find another and better marketing strategy to exchange the classified ad strategy. Anyone can compose and come up with any topic, from hobbies to political vies. The inforkal style of your blog gives Internet consumers a chance too familiarize yourself with individuals who’re behind the company better, which makes it easier so they can trust you andd also buyy your site.
Most people understand God by some form.

On extended drives, you'll get what you can get.

May I simply say what a comfort to discover somebody that genuinely understands what they are discussing online. You certainly know how to bring a problem to light and make it important. More and more people need to look at this and understand this side of your story. I was surprised that you are not more popular given that you most certainly possess the gift.

Hi there, this weekend is good in favor of me, since this point in time i am reading this impressive informative post here at my residence.

It's truly very complicated in this active life to listen news on Television, thus I simply use world wide web for that purpose, and take the hottest information.

Hi mates, good paragraph and pleasant urging commented here, I am in fact enjoying by these.

This post is really a nice one it assists new internet users, who are wishing for blogging.

In case you fill this in, you may be marked as a spammer.

Good day very cool web site!! Guy .. Excellent .. Wonderful .. I will bookmark your web site and take the feeds also? I'm happy to search out numerous useful information right here within the put up, we need develop more techniques on this regard, thanks for sharing. . . . . .

I feel this is one of the so much significant info for me. And i am satisfied studying your article. However wanna commentary on some basic issues, The web site style is great, the articles is in point of fact excellent :D. Excellent process, cheers.

That is a good tip especially to those fresh to the blogosphere. Brief but very accurate info... Thanks for sharing this one. A must read article!

I think other website owners should take this website as an example, very clean and fantastic user pleasant style.
It has grown out of a number of different combat sports, many dating back too hundreds, if not 1000s of years. Now before you go on and rave regarding how amazing and fantastic this idea happens to be, in fact hybrid fighting techniques have been about for hundreds of yeazrs already. Thai boxing had some alterations in the initial half in the 20th century though the experience itself has not yet changed dramatically.

excellent put up, very informative. I'm wondering why the other experts of this sector do not understand this. You must continue your writing. I am sure, you have a huge readers’ base already!

I believe everything published made a great deal of sense. But, what about this? Suppose you were to write a awesome headline? I ain’t saying your information is not solid, however what if you added a post title that grabbed folk’s attention? I mean » Steve Fuller’s Guide to Reading Social Theory The Sociological Imagination is kinda vanilla. You could look at Yahoo’s home page and note how they write post titles to get people interested. You might add a related video or a related pic or two to get readers interested about what you’ve written. Just my opinion, it would bring your posts a little bit more interesting.

Arthur C Clarke predicts the existence of the internet in 1974

Unfolding the origami of collective existence using digital data (2016-01-11 08:00)

A provocative paper co-authored by Bruno Latour, calling for a new spirit of collaboration between social scientists and natural scientists:

This does not mean, of course, that the modeling tradition of natural sciences ceases to be relevant for the study of collective life. Quite the contrary! Such experience is crucial to develop the new methods necessary to handle larger and more diverse datasets. At the beginning of the 19th century natural and social scientists developed together a new discipline, "statistics", that helped them to interpret the new data available at that time ([2]Hacking 1990; [3]Desrosières 2002). Today, the advent of digital data poses a similar challenge and calls for a similar alliance. Micro-macro models have run their course. The time is now to develop the formal techniques necessary to unfold the origami of collective existence and this should be the aim of the renewed alliance between the social and natural sciences. For the next few years, at least, efforts should be shifted from simulating to mapping, from simple explanations to complex observations.

Activism in 2016: Art, Land and Technology (2016-01-11 12:53)

ACTIVISM IN 2016: ART, LAND AND TECHNOLOGY

WEDNESDAY 23RD MARCH 2016, MILLBURN HOUSE, UNIVERSITY OF WARWICK

Invited speaker: Dr Jenny Hughes, University of Manchester

This one-day conference sponsored by the Humanities Research Centre will explore contemporary forms of political activism and their relationship to the arts. We will explore the world of social media, not only as a means to inform and organise real-life demonstrations, but also as a discrete arena of discussion and activism. We will analyse the practice of demonstration and occupation from a multidisciplinary approach, including sociological, geographical and political analysis. We will also investigate the aesthetic and political value of performance, drawing connections between arts practice and political protest. Activism is a very wide topic and offers many opportunities to think about the role of groups in our society and in the space surrounding us, the way we stand for our political beliefs and how we create, disseminate and express values. This conference will maintain an interdisciplinary perspective, hoping to attract staff and students from various academic fields, including Geography, Theatre Studies, Sociology, Politics and International Relations to name but a few, as well as creative professionals.

Research questions include, but are not limited to:

- What challenges and opportunities does technology present to extra-parliamentary political activity?
- What is the role of traditional forms of activism in the contemporary political landscape?
- What is the connection between territory and activism?
- How do contemporary artists engage with politics?
- What are the connections between protest and artistic performance?

We welcome proposals for 15 minutes presentations. Please send a 250-word abstract and a 150-word biography to a.borchi@warwick.ac.uk by January 17th 2016.

We also welcome contributions from artists and creative professionals of all disciplines, including:

- Provocations on the topics listed above (max. 15 minutes).
- Visual artworks to be exhibited in the foyer of Millburn House, University of Warwick, on the day of the conference.
- Performances (max. 15 minutes).

Please send a 250-word proposal (including technical details and photographs in the case of artworks and performances) and a 150-word biography to a.borchi@warwick.ac.uk by January 17th 2016.

2. mailto:a.borchi@warwick.ac.uk

The Second Convention for Higher Education

The HE Green Paper:
The Threat to the Public University
...and what we can do about it

Saturday 27 February, 10am-5pm

Christopher Ingold Chemistry Building, University College London

Speakers from: UCU, Campaign for the Public University, Council for the Defence of British Universities & more

Organisation

The Convention will be structured around the stated premises of the Green Paper in order to coordinate a collective collegiate response to it. Sessions are intended to be both informative and participatory.

The Convention is open to everyone who cares about the future of the Public University and the threat the
Green Paper represents to academic freedom.

Sessions on:

- **Teaching quality, social mobility and the TEF** – the rise of metrics and the uncapping of fees
- **Opening the market to private providers** – easy come, easy go?
- **Measure anything, fail everyone?** – the rise of ‘performance management’
- **Deregulation, the attack on governance and statutes** – academic freedom under threat
- **The future of research funding**
- **Strategies to win**: How can we defend the Public University?

Timeline

The closing date for the official government consultation on [2]the Green Paper is **15 January**. The Convention will take place five weeks after, ahead of the publication of the White Paper.

In order to facilitate debate we will post responses to the Green Paper from colleagues across the sector on our website.

Publicity resources

- [3]HE Convention A4 poster
- [4]HE Convention A5 leaflet (2-up)
- [5]Motion to pass formally through your union branch or other organisation

[6]Register via eventbrite

4158
Eventbrite will ask you to make a contribution of £5 to help cover speakers’ expenses.

Mini-conference on *Moral Economies of the Digital* (2016-01-13 08:00)

Call for papers for mini-conference at the Society for Advancement of Socio-Economics (SASE) 28th Annual Conference ‘Moral Economies, Economic Moralties.’ June 24-26, 2016, University of California, Berkeley.

Organizers: Dean Curran, Dave Elder-Vass, Elisa Oreglia, Nikos Sotirakopoulos, and Janaki Srinivasan

DEADLINE FOR ABSTRACTS: January 18, 2016

Digital technologies have opened up new opportunities for novel forms of economic practice and for the economic empowerment of individuals and communities. But what happens when they encounter the mesh of pre-existing social, cultural, and economic relations within which they are deployed in practice? We invite papers that explore the moral economies underpinning the use of digital technologies, and examine how they encourage or constrain the use of technologies to renegotiate existing power structures and economic practices. We are particularly interested in the following themes:

1. How do existing moral economies shape digital economies?
   - The moral economy of digital economic forms. To what extent do new digital economic forms draw on consciously ethical practice and does this open up awareness of different approaches to the economy? Do they offer promising alternatives to mainstream market capitalism or are we already witnessing a gradual subordination of digital gift practices to the accumulation of capital?

   - Explaining new digital economic forms. Between nakedly capitalistic market-oriented models at one extreme, and the almost purely gift economy model of Wikipedia at the other, there lies a continuum of innovative and often hybridised forms of economic practices. Can sociology, oriented to practices, explain how these economic forms operate, how they develop, and how they hybridise, where economics, oriented to markets, cannot?

   - Gender and the moral economy of digital technologies. How do the moral economies of the family, of the community, and of the workplace influence notions of the ‘appropriate’ engagement of men and women with digital technologies, and how does this vary between the Global North and Global South?

2. How are moral economies reworked in the digital world?
- Encounters between the ‘new’ sharing economy and the moral economy of the communities they work in. Are companies such as Uber and AirBnB a new type of moral economy? Do they re-create space for community enterprise or merely seek to evade forms of regulation that have long protected consumers?

- Subaltern communities and the moral economy of digital technologies in the Global South. What processes and circumstances allow digital technologies to be incorporated successfully (or not) into the moral economies of subaltern communities?

- The digital public sphere. In what way are the power relations and social practices associated with digital economies affecting contemporary public and private spheres?

- How do value propositions associated with the introduction of digital technologies, such as disintermediation, or the death of distance, play out in practice?

The films deal with short passages of original philosophical text and interpret them visually. The text concern themes like how we perceive the look of the other (Sartre), what becoming might be (Deleuze/Guttari), and how the spirit refers to itself (Hegel). The aim of the films is to twofold: Firstly, they explore how these text employ language to develop and convey their ideas. They investigate in the phenomenology of the texts: their modes of construction of meaning, their main metaphors, etc. Secondly, these texts by white famous males that are normally seen as rigid and rational. The films try to make their emotional and sensual aspects visible.
Veronika Reichl works as a filmmaker, writer, and lecturer in Berlin. She received her PhD from the University of Portsmouth. Her doctoral thesis investigates in the relationship between linguistic and pictorial information and the nature of visual metaphors. Her book and DVD Sprachkino [Language Cinema] is about the interface between abstract language and images. It was published in 2008. Veronika Reichl did a Diploma in Graphic Design and a Master of Arts in European Media at Merz Akademie, Stuttgart. She was born in Baltimore, USA.

Re-Embedding the Social: New Modes of Production, Critical Consumption and Alternative Lifestyles (2016-01-14 11:52)

Mini-Conference at the Annual Conference for the Advancement of Socio-Economics (SASE) Location: Berkeley, University of California Date: June 24-26, 2016 Mini-conference organisers: Francesca Forno, Paolo R. Graziano, Lara Monticelli, and Torsten Geelan Extended abstract: approx. 1000 words to be submitted through the SASE website, clearly stating that you wish to be considered for this mini-conference Abstract deadline: February 1st, 2016 Expected output: edited collection or special issue Extra-conference activity: visiting/dining at a local cooperative/eco-village (tbc) Any questions: email miniconf13.sase@gmail.com Call for Papers (extended version attached): The recent and yet unresolved Great Recession has revealed all the limitations and flaws of the 'economic moralities' embedded in neoliberalism which have been guiding the functioning of economic and political institutions in numerous countries. In tandem with the rise of new social movements and the success of radical political parties, everyday economic practices of production and consumption are also being questioned and challenged by a growing number of 'critical' citizens. These attempts often take the form of local, horizontal and collaborative initiatives such as consumer-producer networks, cooperatives, ethical banking, co-working spaces, and the like. All these practices share a steadfast belief in the idea of 'social sustainability', and a desire to move towards a society which promotes not just environmentalism but also values of equality, diversity, and social cohesion. Such economic practices and ideas have the potential to gradually disrupt the economic moralities underlying many capitalist modes of production and the ways in which we consume goods and services. This Mini Conference welcomes theoretical and empirical contributions from around the world and across the social sciences (sociology, political science, development studies, economics, anthropology, business, and philosophy) that touch on the following three themes: 1) New Modes of Production The social economy refers to economic activity that is directly organized and controlled through the exercise of some form of social power - rooted in the voluntary association of people in civil society, and based on the capacity to organize people for collective action of various sorts. Nestled between the private sector (business) and the public sector (Government), this includes worker-owned cooperatives, social enterprises, charities, and non-profit organisations. The range of economic activities that can be organized through the social economy is very broad and includes recycling, childcare, housing, healthcare, disaster relief and web applications. The vibrancy and effectiveness of which can be enhanced through institutional design, such as state subsidies, social economy investment funds (e.g. crowdfunding), governance through associational democracy, and participatory democratic forms of organisation. This stream welcomes contributions that: o Critique existing modes of production in the social economy; o Provide empirical examples and theoretical accounts of how the social economy could be further enhanced through institutional design; o Identify and explore cases of organizing economic activity through the social economy in hitherto unexamined countries, economic sectors, and geographical levels (local, regional, national, and supranational). 2) Critical Consumption Over the past years, new social movements (Sustainable Community Movement Organizations) have emerged, going beyond more traditional forms of mobilization and of contentious politics. SCMOs are focused on exploiting alternative forms of consumption as a political tool: organizations and
movements such as solidarity-based exchanges and networks, new consumer-producer cooperatives, barter groups, urban gardening, time banks, local savings groups and fair trade, are all examples of SCMOs, which have gained increasing relevance globally. The crisis has provided further space for such organizations, which have helped – and are still helping – to build new social relationships and resistance in a context of radical revision of the function of the market. The growth in the number of ‘political consumers’ has generated considerable scholarly interest. Many of the studies on the topic, however, have analyzed this phenomenon mainly from the individual consumer perspective while less attention has been paid to the role of social movements promoting collective political actions. This strand welcomes contributions discussing theoretical challenges posed by SCMOs and/or empirical illustrations in both the Global North and the Global South. We are particularly interested in papers that investigate: o Why, how and whether Sustainable Community Movement Organizations emerge and succeed in triggering sustained political engagement; o To what extent and how are SCMOs linked to specific movements such as the global justice movement and the indignados movement etc.; o Where, and in what form, are grassroots economic initiative emerging and engaging the public; o How can developments in political consumerism, and critiques thereof, inform the development of social movement research and vice versa; o What is the effectiveness of such organizations in local, national and international political contexts. 3) Alternative Lifestyles In our final stream we will discuss theoretical and empirical (academic and/or activist based) research on all those, increasingly diffused, everyday practices that are based not (or not only) on monetary transactions but on trust, interchange and reciprocity. Examples range from daily ‘sharing economy’ practices - such as car sharing, couch-surfing, house swapping, co-working - to more radical and explicitly anti-capitalistic ones like eco-villages or intentional communities. We welcome papers that address: o The extent to which these practices constitute (or not) ‘coping mechanisms’ for socio-economic exclusion; o The way through which these practices manage to provide not just material goods but services outside a ‘market’ logic; o The extent to which these practices succeed (or fail) in introducing societal values and norms (reciprocity, exchange, mutual help) that are an alternative to neoliberal ideology, and help foster a ‘new imaginary’ for progressive social change.

Workshop: Conceptual Challenges in Interdisciplinary Social Media Research (2016-01-15 08:00)

I’m very excited that the [1]Digital Social Science Forum’s workshop has been accepted at Social Media & Society in London this year. Susan Halford, Les Carr, Emma Uprichard and Evelyn Ruppert will be speaking at the workshop & I will be facilitating. It will take place on Monday July 11th and you’ll have to [2]register for the (excellent) conference to take part.

Many, if not all, affirm the value of interdisciplinary collaboration in social media research, as different disciplinary backgrounds contribute different skills to the analysis of complex socio-technical objects. However such collaborations also entail conceptual challenges, encountered at the level of substantive theoretical commitments but also in terms of taken-for-granted assumptions that inform everyday practice.

The workshop as a whole will aim both to familiarise participants with common conceptual challenges confronted in interdisciplinary social media research, as well as drawing upon their own experience and understanding to unpack these challenges and explore potential routes beyond them. In doing so, we hope to develop new perspectives on these issues, including the disciplinary origins of these conceptual challenges, which can constitute the basis for further work and the production of practical toolkits to inform interdisciplinary working.
Only a few days left! Digital Methodologies – Beyond Big & Small Data (2016-01-16 08:00)

Digital Methodologies: Beyond Big & Small Data
9th International Conference on Social Science Methodology (RC33)
September 11th – 16th, 2016, University of Leicester ([1]http://www.le.ac.uk/)

Session Organizer
Christian Bokhove, University of Southampton, United Kingdom, [2]C.Bokhove@soton.ac.uk
Mark Carrigan, University of Warwick, United Kingdom, [3]mark@markcarrigan.net
Sarah Lewthwaite, University of Southampton, United Kingdom, [4]s.e.lewthwaite@southampton.ac.uk[5] Richard Wiggins, Institute of Education, United Kingdom [6]r.wiggins@ioe.ac.uk Session Abstract In recent years the challenge of Big Data has become a dominant theme within discussions of social science methodology. But these debates have too often been played out within a limited methodological frame of reference, in which the virtues and vices of Big Data are counterpoised or the call is made to supplement Big Data with Small Data. This stream will critically analyse this methodological framing of Big Data, its strengths and limitations, with a view to developing digital methodologies which move beyond Big Data and Small Data. In doing so, we hope the stream will also addressed a broad range of related issues, such as:

- The methodological challenge of big data and digital social research
- The practical challenges of mixed methods approaches to digital social research
- The role of theoretical ideas in digital methodologies
- The relationship between Virtual Methods, Digital Methods, Technology Enhanced Methods etc.
- The methodological utility of data mining and the dangers of data fishing
- The continued utility of sampling in digital social research, for example with regard to collection methods involving Amazon’s Mechanical Turk and Twitter streams.
- What are the ethical and social implications of linking and accessing administrative data?
- What are the implications for epistemologies, data collection and analysis of the pace of change in which social life is increasingly played out online?

The stream seeks to incorporate technical issues pertaining to digital methods into a broader discussion of the impact of digital methodologies. We are particularly keen to receive papers that reflect upon and bridge existing methods and draw out a vision for the future of social science research and practice. The session is organised jointly between the Independent Social Research Foundation’s Digital Social Science Forum and the International Journal of Social Research Methodology. DEADLINE: 21st January, 2016 Submission Instructions:

1. To submit a paper abstract for the RC33 9th International Conference on Social Science Methodology, you should visit: [7]http://www2.le.ac.uk/departments/sociology/research/rc33-conference After landing on the homepage, navigate to 'Abstract Submission', which appears in the top left hand column of the webpage, see image below:
2. Complete the form in full. You may wish to cut and paste your abstract into the Abstract field from another document.

3. Choose the relevant session for your stream. To do so you will need to select the relevant lead session organiser from the drop-down menu highlighted in the image below. To check you are submitting to the correct session, you can view a table of sessions and session convenors by clicking the link entitled ‘View the list of sessions and session convenors’. Once complete, click submit.
Muslims and education are frequently ‘hot topics’ in media and political discourses. Academics have highlighted how pessimistic media and political rhetoric about segregated ghettos and cultural clashes lack empirical evidence; when statistics and claims, even those presented by academics and well-intentioned government organisations, are properly scrutinised it is found that selective evidence is being utilised to set a sensationalist agenda (Finney and Simpson, 2009). Similarly [3]Muslims, Schooling & The Question of Self-Segregation by Shamim Miah deconstructs
simplistic narratives regarding the ‘self-segregation’ of Muslims by illustrating the complexities of contemporary multicultural belongings from the perspectives of engaged and active Muslim parents and students. It is particularly helpful and fair that the author has sought to (re)present the voices of parents and students who are often marginalised and neglected in media, political and policy discourses. I would argue that Muslim parents and students are usually ‘constructed’, and simultaneously judged, by public discourses as holding certain beliefs and as indulging in certain practices; this book addresses the imbalance and lack of representation/voices of marginalised British citizens by giving us empirical evidences about Muslim communities and their views and practices regarding integration and schooling.

Part One of the book examines key historical events, such as the 7/7 bombings, that influenced policy discourses. These are clearly and succinctly outlined for us to understand how these led to 1) current socio-political themes promoting assimilation through the Fundamental British Values agenda, 2) proposed policies of Counter Terrorism and Security. The highly accessible and engaging book offers a valuable critique of contemporary political and policy discourses of British identity, particularly the impact upon British Muslims who are constructed as the terrifying Other. The author also examines how debates on housing and spatial segregation influenced ‘community cohesion’ narratives, and resulted in coercing schools to merge with other local schools to unsuccessfully enforce ‘integration’. Thus Part One of the book introduces key policies and practices relevant to contemporary thinking on multicultural British society.

Part Two of the book draws focus on empirical research conducted in cities containing large Muslim communities. We learn about Muslim students’ perspectives on integration, segregation and belonging to Britain, as well as about the parental choices on residence and neighbourhood. Muslim students from faith schools, as well as their parents, are presented as integrating and integrated through their faith. The connections between social class, integration and belonging show how Muslim parents experience poverty and inequalities, and the consequences of their lived experiences on school choices for their children. The author places emphasis on the importance of taking into account how intersectionalities work when it comes to understanding Muslim students and schooling experiences and options.

The book significantly shows that ‘Britishness’, ‘integration’ and ‘segregation’ are complex and contested notions frequently misunderstood or distorted in public discourses. The timely book supports ideas prevalent in the literature on multicultural Britishness. Firstly, that Britishness is interconnected with broad concepts of citizenship, national identity and multiculturalism, just as the notions of borders and diaspora cannot be discussed without reference to one another (Brah, 1996). The book supports arguments that terms like multiculturalism, Britishness and citizenship are contested and contingent on context for meaning, requiring regular critical analysis that deconstructs taken for granted descriptions and assumptions (Ward, 2004, Faulks, 2006, McGhee, 2008, Haste, 2010). Following Edward Said’s Orientalism (Said, 2003), the author interrogates master narratives that construct the frequently demonised and pathologised Muslim Other and provides the reader with much needed counter-narratives. Muslims, Schooling & The Question of Self-Segregation is very useful research that deconstructs taken for granted societal assumptions, labels and notions by providing up-to-date critical analysis of policies and practices regarding community cohesion and modern multicultural society. This is an important core text for academics and policymakers working on topics of multiculturalism, integration, British Muslim identity and social justice/equality. The author’s academic arguments and grassroots insights provide robust and detailed explanations of British Muslim perspectives on education and British identity.

Only a couple of weeks left: the @BigDataSoc and @DigitalSocSci essay competition (2016-01-17 08:00)

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic 'Influence and Power'. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a re-thinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF’s criteria and goals may be viewed [1]here.

Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal’s key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.
The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition's theme and falls within the remit of BD &S's goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.

The submitted essays will be judged and the winning essay will be chosen by an academic panel (the ISRF Essay Prize Committee). The panel's decision will be final, and no assessments or comments will be made available. The result will be notified to applicants by email during April 2016 and will then be announced by posting on the websites of the ISRF and of BD &S. The ISRF and BD &S reserve the right not to award the prize, and no award will be made if the submitted essays are of insufficient merit.

The winning essay will be accepted for publication in the Journal; the author may be asked to make some revisions before publication. Other applicants may have their submissions accepted for publication in the Early Career Researcher forum of BD &S subject to the Journal's peer review and decision-making process.

The details and criteria are:

Essay topic: Influence and Power (This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field.)

Eligibility: Participants should either be current doctoral students or within three years of being awarded their doctorate.

Essay length: 5,000 to 7,000 words

Essay format: Follow the BD &S Author Guidelines, available on the BD &S website.

Language: English

Submission deadline: 31 January 2016

Queries:
[2]essayprize2016@isrf.org

Submissions should be made online at [3]https://mc.manuscriptcentral.com/bdasand authors should indicate that their submission is for the special theme, 'ISRF Essay Prize.'

In this [1]intensive seminar for doctoral candidates (5 ECTs), we examine how the concepts of human rights and intersectionality might together inform educational theory and praxis to enable social justice. It is open to international participants researching educational inequalities in diverse contexts, from a range of disciplinary perspectives. The starting point is that learning communities are not neutral places and educators have a choice about whether to work to interrupt or ignore systemic injustice. Human rights present a utopian vision, recognising multiple identities and offering a moral and legal framework for justice. Intersectionality offers researchers a tool to examine how multiple and interwoven inequalities (related to gender, ethnicity, sexuality, migration status and so on) impact on achievement, citizenship and participation. Through formal presentations, discussions, workshops, guided reading, and preparation for a written paper, participants will have opportunities to discuss research and share experiences in a supportive environment.

How I’d LOOOVVVVEEEE to take this course!!!! But, alas... no PhD...

The Challenge of Life Planning in a Digital Age (2016-01-18 08:00)

I just got back from the CSO workshop in Paris where I gave a paper on the challenge of flourishing amidst variety. My interest is in how social digitalisation 'opens up' the archive, albeit in a deeply uneven way, as well the implications this has for the process of shaping a life.

However the paper needed a bit of work in order to elucidate the mechanism connecting these two factors. I've argued that the digitalisation of the archive tends to create more awareness of alternative ways of looking at the possibility available to a subject at a given point in time. The missing concept here could be what Daniel Little terms 'space of choices' in [1]this insightful post on life planning:

A life plan isn't like this, however. Consider the space of choices that confronts the 20-year old college student Miguel: what kind of work will satisfy me over the long term? How much importance will I attribute to higher income in twenty years? Do I want to have a spouse and children? How much time do I want to devote to family? Do I want to live in a city or the countryside? How important to me is integrity and consistency with my own values over time? These kinds of questions are difficult to answer in part because they don't yet have answers. Miguel will become a person with a set of important values and commitments; but right now he is somewhat plastic. It is possible for him to change his preferences, tastes, values, and concerns over time. So perhaps his plan needs to take these kinds of interventions...
The space of choices can become overwhelming for contemporary adolescents, as well as complicating the relationship between perceived choice and materially feasible possibilities. Coupled with an increase pace-of-change which means that stable circumstances cannot be relied upon in any domain of social life, other strategies for shaping a life may be necessary, as Little suggests:

It is worth asking whether life plans actually exist for anyone. Perhaps most people’s lives take shape in a more contingent and event-driven way. Perhaps guided opportunism is the best we are likely to do: look at available opportunities at a given moment, pursue the opportunity that seems best or most pleasing at that point, and enjoy the journey. Or perhaps there are some higher-level directional rules of thumb — “choose current options that will contribute in the long run to a higher level of X”. In this scenario there is no overriding plan, just a series of local choices. This alternative is pretty convincing as a way of thinking about the full duration of a person’s life, as any biographer is likely to attest.

There are simply too many contingencies to plan for. I explored two possible responses to this some time ago, looking at the strategies of Ken Gergen and the CEO of Spotify. The former advocates embracing the situation, while the latter aims to enact five year long missions:

Ek describes himself as “missionary,” by which he means he likes to formulate five-year missions for himself. “That's how I think about life,” he said. “Five years is long enough for me to achieve something meaningful but short enough so I can change my mind every few years. I'm on my second five-year commitment on Spotify. In two years, I will have to make my next one. I will need to ask myself if I still enjoy what I'm doing. I'm kind of unusual that way, but it gives me clarity and purpose.”

The Sound of 18th-Century Paris (2016-01-20 08:00)

Paris as you have never heard it before! This novel experience is offered by Mylène Pardoen, a musicologist at the Passages XX-XXI laboratory, through the Bretez Project. The name is not without significance: the first historical audio reconstitution created by this team of historians, sociologists and specialists in 3D representations is set against the backdrop of 18th-century Paris as it appears in the famous Turgot-Bretez Map of 1739. Turgot was the provost of the merchants of Paris who commissioned...
the map, while Bretez was the engineer in charge of surveying the city's streets and buildings.

70 sonic tableaux

More specifically, the 8'30" video takes the viewer to the heart of the Grand Châtelet district, between the Pont au Change and Pont Notre Dame bridges. "I chose that neighborhood because it concentrates 80% of the background sound environments of Paris in that era, whether through familiar trades—shopkeepers, craftsmen, boatmen, washerwomen on the banks of the Seine, etc.—or the diversity of acoustic possibilities, like the echo heard under a bridge or in a covered passageway," Pardoen explains. While historical videos with soundtracks are nothing new, this is the first 3D reconstitution based solely on a sonic background: the quality of the sounds (muffled, amplified...) takes into account the heights of the buildings and their construction materials (stone, cob etc.).

David Cameron & Muslim Women: Old Orientalism, New Racism (2016-01-20 22:33)

By announcing that £20m will be spent to “teach thousands of Muslim women to speak English”, David Cameron’s portrayal of them as linguistically deficient, culturally suppressed and visibly alien is reminiscent of a long line of colonial repression.

The prime minister is playing the “white male saviour”, seeking to rescue this meek and downtrodden Muslim woman from barbaric and backward Muslim males, by giving her the freedom of the English language, the power of speech and by unveiling her to the world.

It is powerful men like Cameron who are the real cultural oppressors, who can dictate political and media agendas to humiliate and disempower British Muslim women, turning wider society against them.

As a consequence, British Muslim women will continue to face already sky-high levels of Islamophobia and anti-Muslim abuse and attacks.

The prime minister’s plans for language lessons have been greeted with sighs and scepticism, particularly in light of extensive cuts in adult education and English language classes.

Although the money is welcomed by adult education professionals, why has there been a specific focus on Muslim women? This money would be better distributed for the good of all those adults who are seeking to develop their literacy, numeracy and employability skills.

It is laughable that Cameron claims the purpose of the new funding is to tackle segregation and extremism, while at the same time admitting there are no links between a person’s level of English and extremism. Muslims responding to these outrageous declarations by their prime minister are quite rightly angry at the continuous demonisation of Islam, and scapegoating of Muslims.

Marginalising Muslims through political, policy and media practices and rhetoric is responsible for making British Muslims – who call Britain their home – feel like they don’t belong to Britain. Disturbingly, even when ethnic minorities self-identify with Britishness or British values, they may find themselves excluded.

Google Anything, So Long as It’s Not Google (2016-01-21 08:00)

I just came across this fascinating article, now 10 years old, detailing how former Google CEO Eric Schmidt cut off relations with CNET after a reporter there had the temerity to detail the information she was able to find out about him via Google:

Last month, Elinor Mills, a writer for CNET News, a technology news Web site, set out to explore the power of search engines to penetrate the personal realm: she gave herself 30 minutes to see how much she could unearth about Mr. Schmidt by using his company’s own service. The resulting article, published online at CNET's News.com under the sedate headline "Google Balances Privacy, Reach," was anything but sensationalist. It mentioned the types of information about Mr. Schmidt that she found, providing some examples and links, and then moved on to a discussion of the larger issues. She even credited Google with sensitivity to privacy concerns.

When Ms. Mills’s article appeared, however, the company reacted in a way better suited to a 16th-century monarchy than a 21st-century democracy with an independent press. David Krane, Google’s director of public relations, called CNET.com’s editor in chief to complain about the disclosure of Mr. Schmidt’s private information, and then Mr. Krane called back to announce that the company would not speak to any reporter from CNET for a year.

At some point, I’ll collate all the cases like this I can find: it’s grimly fascinating to watch digital elites react with anger to the transparency they seek to impose on everyone else. In this case Schmidt seems to be rather averse to the assumptions about transparency that Google have long sought to inculcate in their users. From pg 177-178 of *In The Plex*:

Omitting a delete button was supposed to teach you to view email—and information itself—the way Google did. The implicit message was that the only thing that should be deleted was the concept of limited storage. Not everybody at Google subscribed to this philosophy—Eric Schmidt had long before instituted a personal practice of making his emails "go away as quickly as possible" unless specifically asked to retain them.

From pg 178 of the same book, concerning how Google see privacy organisations. Note how the epistemic asymmetry, in terms of access to and understanding of internal technical processes, allows criticism to be dismissed:
To most people at Google, though, automatic archiving was a cause for celebration, and gripes from privacy do-gooders were viewed as misguided or even cynically—exploiting a phony issue for their own status and fund-raising. “Even to this day, I’ll read people saying that Google keeps your [deleted] email forever. Like, totally false stuff!” says Buchheit. Buchheit called his critics “fake privacy organizations” because in his mind “they were primarily interested in getting attention for themselves and were going around telling lies about things.”

Call for book proposals: Theory as method in education research (2016-01-22 08:00)

From Mark Murphy at [1]Social Theory Applied:

I am currently in negotiations with a book publisher regarding a potential book series on the topic: *Theory as method in education research*. I am keen to talk to those of you who are interested in this topic and have ideas/plans for publishing in this area – that includes those of you who are nearing completion of doctoral theses as well as more established academics. The series has enormous potential for breaking new theory/method ground and I am open to suggestions from all areas of social theory, methodology and research topic. Please have a read of the short summary below and if you are interested in discussing this further, please get in touch with me, Mark Murphy via [2]mark.murphy.2@glasgow.ac.uk (don’t forget the .2!)

All the best, Mark

**Summary:**

This series is designed to provide a set of books exploring various applications of social theory in educational research design. Each book will provide a detailed account of how theory and method influence each other in specific educational research settings, such as schools, early years, community education, further education colleges and universities. The series will represent the richness of topics explored in theory-driven education research, including leadership and governance, equity, teacher education, assessment curriculum and pedagogy and policy studies. It will also provide a timely platform for highlighting the wealth of work done in the field of social theory and education research a field that has grown considerably in recent years and has made the likes of Pierre Bourdieu and Michel Foucault familiar names in educational discourse.

It is envisaged that the series will include a variety of texts, including single/co-authored monographs, edited volumes and potentially readers/anthologies.
Key features and benefits:

- Explicit connections between theory and research practice
- Accessible and illuminating accounts of applied social theory
- Provides innovative ways of thinking about methodology in educational research design

Pedagogical features

Embedded in the design of the series is a strong pedagogical component – with a focus on the ‘how’ of applying theory in methods and an emphasis on operationalising theory in research. This pedagogical remit will be addressed explicitly in all texts – the responsibility of addressing this will fall to the authors and editors, but can take the form of case studies, learning activities, ‘focus’ sections and glossaries detailing the key theoretical concepts utilised in the research.

“now listen you queer!”: the origins of contemporary political punditry (2016-01-23 08:00)

I just watched [1]Best of Enemies, a great film about the rivalry between William Buckley and Gore Vidal that was most famously captured in this scene:
A subsequent exchange of words in high brow magazines then led to an exchange of lawsuits. I've been fascinated by this video since I first came across it. However until watching Best of Enemies, I hadn't realised how central the debates that led to this scene was to the emergence of contemporary political punditry.

ABC television had instituted this format as they attempted to assert themselves against better established rivals, lacking both the standards and budgets of other networks. These debates, as well as their repetition for the later Democratic convention, were a huge success in ratings terms and laid the ground for a slide into the superficial and polemical which characterises so much of contemporary coverage of politics.

One Week Left! The @bigdatasoc & @digitalsocsci essay competition (2016-01-24 08:00)

The Independent Social Research Foundation (ISRF) and Big Data & Society (BD &S) intend to award a prize of CHF 1,000 for the best essay on the topic 'Influence and Power'. This is a topic, not a title. Accordingly, authors are free to choose an essay title within this field. The winner will also be invited to present the work during a special event at Social Media & Society 2016 and will have the conference fee waived and travel costs covered.

Please read these details carefully before submitting your essay for consideration or contacting the Independent Social Research Foundation or Big Data & Society with a query.

The essay will be judged on its originality and independence of thought, its scholarly quality, its potential to challenge received ideas, and the success with which it matches the criteria of the ISRF and BD &S. The successful essay will be intellectually radical, orthogonal to existing debates, and may articulate a strong internal critique across the field of social science in relation to the digital. Its challenge to received ideas will have the potential to provoke a rethinking of the topic. The ISRF is interested in original research ideas that take new approaches and suggest new solutions, to real world social problems. The full statement of the ISRF’s criteria and goals may be viewed here.

Big Data & Society publishes interdisciplinary work principally in the social sciences, humanities and computing and their intersections with the arts and natural sciences about the implications of Big Data for societies. The Journal’s key purpose is to provide a space for connecting debates about the emerging field of Big Data practices and how they are reconfiguring academic, social, industry, business and government relations, expertise, methods, concepts and knowledge.

The ISRF and BD &S invite submissions from scholars across the social science disciplines, philosophy, and the humanities, whose work has implications for the competition’s theme and falls within the remit of BD &S’s goals. For the purposes of the competition, participants should either be current doctoral students or within three years of being awarded their doctorate.
The Higher Groupthink: A Look at the Academic Spin Cycle in a Workshop (2016-01-24 09:32)

I recently attended a workshop in which some very intelligent and informed people from several countries were brought together to discuss a range of topics that had been presented in advance as a set of interconnected, open questions. Although everyone had contributed some relevant texts for the occasion, there were no formal
presentations. Instead each session was structured around one of the questions and the discussion was allowed to go its own way.

The discussions involved considerable back referencing to others’ comments to legitimate one’s own contributions. You know what I mean: ‘I just want to follow up what X said and bring in what Y said earlier in response to Z...’ One participant managed to name-check eight of the fourteen people in the room in a contribution that lasted just over three minutes. Much of the discourse had the feel of washing other people’s laundry. At the end of the workshop, there was a general sense of satisfaction at this ‘refreshing’ format, which had created an atmosphere of consensus, even though no one dared try to capture the nature of this agreement – and how, if at all, it related to the issues that brought about the workshop. But we plan to meet again, nonetheless.

Ernest Gellner used to say that Popper’s main insight for sociology was that there is an inverse relation between forms of social interaction that aim for truth and aim for solidarity. Stated so bluntly, the insight involves a confusion of logical levels. There needs to be some measure of solidarity even among the truth-seekers, if truth is not to become purely idiosyncratic. However, the sense of solidarity is at the second-order level, i.e. the level that enables us to agree to disagree. However, there is nothing epistemically luminous about agreement at the first-order level. It is simply groupthink, unless it provides a space from which significant disagreements may emerge, which may include marginalizing what some of the contributors say – which in turn would either motivate them to conform or to argue more forcefully. Maybe that will happen next time we meet...

Dear PhDs/ECRs: need funding to go to a conference? @thesocreview can help (but ask now!) (2016-01-25 08:00)

The Sociological Review is running another round of its support scheme for unfunded PhDs and ECRs. Find out more and apply [1]here within the next few days :

We are pleased to announce our latest round of funding, supported by The Sociological Review Foundation.

Funds of up to £1000 per applicant are be available for unfunded PhD students and postdocs (within 3 years of completion) to facilitate their attendance and participation of conferences.

To apply, please first check that you meet the criteria for applying (below) and then access and fill in the form below by our deadline of 31st January 2016.

You will be informed by 28th February of the outcome of your application.

“in an ideal world, American sociology would look like British sociology before it became Americanised” (2016-01-26 08:00)

A really nice interview with Doug Porpora by Tim Rutzou. But it ends on a jarring suggestion: “in an ideal world, American sociology would look like British sociology before it became Americanised”. What do you think?

Making The Familiar Strange: A Festival of Critical Social Thought (2016-01-26 13:00)

A small collective is currently in the early stages of planning *Making The Familiar Strange: A Festival of Critical Social Thought* for summer 2017. See [1]here for some background to the event. If you’d like to get involved, we’re having a planning meeting:

Tuesday 23rd February 12:00-16:00.
Room G05 (ground floor) of Cloth Hall Court
Leeds Beckett University
Directions: http://qu2.leedsmet.ac.uk/cloth-hall-court-leeds.htm

All welcome! Please pass on this message to anyone you know who might be interested.

Terraced House, not Terrorist House (2016-01-26 16:21)
by Amar Alam

Racist bullying: Far-right agenda on immigration ‘being taken into classrooms’ THE INDEPENDENT.

The case of a 10 year old Muslim boy who mistakenly [2]wrote "terrorist house" instead of "terraced house" when his teacher asked him to write down the type of house he lived in was documented recently by BBC News.

While Muslim and non-Muslim commentators have focused their attention on the child’s mistake and the disproportionate reaction to the news by his teachers and the police services, there is a greater issue at hand that needs
What impact is the government’s Prevent strategy and the ensuing counter-extremism legislation brought forward by the Conservatives having on ordinary Muslims, especially children?

We constantly hear ambiguous rhetoric from the government that their new anti-extremism laws are not targeting Muslims, rather they are targeting all types of extremist activity within British society, including that of the far-right and "Islamists”. However, contrary to the government’s claims, a number of news and media outlets over the last twelve months have mentioned that the policies put in place by the government suggests the intended target of such legislation are indeed the Muslim community.

What impact are these laws having on Muslim children? The question that must be asked is why would an innocent child mistakenly use the word "terrorist” in a sentence in relation to a topic that has nothing to do with any form of extremism? It seems the government’s Prevent strategy and the negative media portrayal of Muslims is having such a detrimental impact on Muslim children that they are now subconsciously internalising the belief that they are regarded as "terrorists”.

This is deeply worrying. At a time when the government have spent millions trying to prevent young people from being radicalised, their own policies and bias media reporting about Muslims are creating an environment that could potentially push them on to the path of radicalisation.

Only last month, a [3]teacher in Rotherham called a young Muslim pupil a "terrorist" in class. There has also been a dramatic rise in bullying as a result of racist and Islamophobic sentiments in schools. A recent [4]report by the NSPCC documented a 69 % increase in such racist and Islamophobic abuse in schools across Britain. The common theme was for young people to be called a “terrorist” or "bomber”. Research recently published by academics from the universities of Newcastle, St Andrew's and Edinburgh found that a [5]majority of Muslim pupils in Scottish schools have experienced Islamophobia with children routinely being called “terrorists” and "Pakis”. A newspaper in France also found that shortly after the terrorist attack in Paris last November, the events had a particularly damaging impact on Muslim children in France. One child had mentioned that he did not want to be a Muslim anymore because he would be called a terrorist.

This is the impact that the government’s counter-extremism policies and biased media reports against the Muslim community are having on Muslim children across Britain. Therefore, is it surprising that children are mistakenly writing words such as "terrorist" on their school papers? If all you hear about your ethnic and religious community are words such as “extremism” and "terrorists”, it should come as no surprise that children have internalised such words and their response out of anxiety and fear is to mistakenly use them during the most inappropriate occasions.

An atheist observes online Islamophobia after showing solidarity #JeSuisHijabi (2016-01-26 17:08)

by Sadie Hamilton

Last week, York University in Toronto, where I study, set up tables in the halls. University approved organizations may use this space for fundraising, recruiting members for their club, or raising awareness.

As I was passing by a table for the Ahmadiyya Muslim Students’ Association (AMSA), I saw a friend talking to them and checking out their booth. I decided to join her to see what they were promoting. These amazing women were promoting love, tolerance, and freedom, for women in Islam.

We got talking and they asked if I would like to try on a Hijab. I was quite excited, but worried about whether or not that is considered disrespectful, as I am not a Muslim. She reassured me and helped me put it on, letting me keep the beautiful scarf. They asked me to tweet with the hashtag ‘#JeSuisHijabi’, and I decided to wear it for a couple of hours. It made me feel beautiful, empowered, feminine and happy.

I posted a photo of myself on Twitter in solidarity with Muslim women, knowing how important the campaign...
is to debunk Islamophobic myths.

When I woke up the next morning I found strangers responding hatefully online to my tweet. Death threats, insulting my appearance, intelligence, and attacking Islam in general. I responded to 2-3 of the hateful messages but it just became too overwhelming.

I cannot imagine the harassment, fear, and hate that Muslims must deal with because of this ignorance. For only around a year, I have become more and more aware of the struggles Muslims face in Canada, and other parts of the world. I was not shocked, only saddened by the comments that were made.
Sadie is an atheist, and an intersectional feminist. She is in her first year of studying Psychology at York University in Toronto.

Women should be able to wear whatever makes them comfortable and happy. #SolidarityWithIslam #JeSuisHijabi
This week David Cameron (your prime minister) suggested that English language classes for Muslim women could help stop radicalisation. Yes, you read that correctly. He went on to explain that Muslims arriving in the UK on a five-year spousal visa will have to take a test after two and a half years to show they are trying to improve their English, and a failure to do so would lead to deportation.

This is by no means a unique Islamophobic attack on British Muslims by Cameron and his Government. But, it is one worth further analysis.

Firstly, Cameron's strategy is highly ironic as £45 million was cut from English for speakers of other languages (Esol) classes less than a year ago. Secondly, it is based on an ill-informed and unproven connection between Muslim mothers having difficulties speaking English and that of Islamist extremism. As Dr. Nafeez Ahmed [2] wrote, “What you have done, Prime Minister, is abused your position of authority to broadcast a false, and absurd, image of an incoming swarm of dangerous migrant Muslim women giving birth to potential jihadists, that can only be stopped with extensive English language lessons.” Lastly, the figures used by Cameron are inaccurate and misleading, but essential for the ‘us and them’ rhetoric peddled out and used by the neoconservative establishment to frame Muslims as ‘the other’.

Othering – a term created by Cultural theorist [3] Edward W. Said – is a commonly used agenda that seeks to ‘other’ a minority group on the basis that their culture and beliefs are fundamentally different (and deemed as a threat) to the rest of society. By deliberately creating the idea of an alien ‘other’ it reinforces difference and promotes [4] social and political dominance over the group deemed as being ‘the other’.

Said, in his 1978 book, *Orientalism* explains that, "Orientalism is a study based on the re-thinking of what had for centuries been believed to be an unbridgeable chasm separating East from West" he suggests that we should, "challenge the notion that difference implies hostility, a frozen reified set of opposed essences, and a whole adversarial knowledge built out of those things."

Using the theory of ‘otherness’, we can deconstruct Cameron's unsubtle attack on Muslim females, in which he deliberately portrays, "them as linguistically deficient, culturally suppressed and visibly alien is reminiscent of a long line of colonial repression." Sadia Habib goes on to write that, "The prime minister is playing the 'white male saviour', seeking to rescue this meek and downtrodden Muslim woman from barbaric and backward Muslim males, by giving her the freedom of the English language, the power of speech and by unveiling her to the world."

Cameron's antagonistic approach enables the morally tranquilised Non-Muslim media consumer to not only agree with the ‘othering’ of UK Muslims but to also feel in a place of security and comfort in belonging to a (supposedly) superior group defined by shared beliefs, values and culture.

"The distinction between difference and otherness is that difference is descriptive, whereas otherness is strategic. Otherness describes the distribution of power; the differences between known and unknown are not mediated equally or neutrally. Othering always refers to the other party being repressed in a relation. When the other is being judged, the emphasis is on what differentiates instead of what connects. The encounter with the other is dominated by our preconceptions, which depend on public representations. The less one knows about distinct people, the easier one interprets these people through presupposed characteristics; the “knowledge” and perceptions one gains are stabilised as simplifications and stereotypes that become part of the common stock of knowledge through inter-subjective activity" [7]The Othering of Islam in a European Context

It is clear that the ‘Othering’ theme permeates mainstream media used to promote and support racist government strategies, but is it evident in schools and education? Do we do enough in our schools to promote and celebrate the various different cultures of all the students present in our schools?

And, we need to do so much more than the well-intentioned yet insensitive attempt of looking at different cultures through a ‘[8]saris, samosas, and steelband’ approach.

Are we really doing enough to challenge the unbridgeable chasm, as Edward Said describes?

"Individuals who know the world only from their own cultural perspectives are denied important parts of the human experience and are culturally and ethnically encapsulated. These individuals are also unable to know their own cultures fully because of their cultural blinders. We can get a full view of our own backgrounds and behaviours only by viewing them from the perspectives of other cultures." (An Introduction to Multicultural Education, James A. Banks. 2013)

The Eurocentric curriculum that many schools promote, "negatively affects many students of colour because they often find the school culture alien, hostile and self-defeating. Because of the negative ways in which students of colour and their cultures are often viewed by educators and the negative experiences of these students in their communities and in the schools, many of them do not attain the skills needed to function successfully in a highly technological, knowledge-orientated society" (Conchas & Vigil, 2012: Darling-Hammond, 2010)

We must design and embed a curriculum and a "culturally relevant pedagogy" (Ladson-Billings, 1994) that identifies the cultures and communities of all our students as assets rather than things to be replaced. As I have written [9]before, we see examples where schools have intentionally decided to, “de-culturalise their pupils and convince them into believing that it is necessary to cast off their own backgrounds, values and culture in order for
them to become ‘successful’ and ‘achieve’.”

Carol Lee (2004) supports this idea by saying that, “teachers must be better equipped to investigate what is going on in the lives of their students generally so that their curriculum and pedagogy can be reflective of those lives.”

In their 2008 book, The Art of Critical Pedagogy: Possibilities for Moving from Theory to Practice in Urban Schools; Jeffrey M. Duncan-Andrade and Ernest Morrell suggest that, "Nothing promotes tolerance more, than a pedagogy that enables students to arrive at an implicit understanding of what they have in common with those they are taught (through media and education) to perceive as different.”

In a morally bankrupt society where ‘otherness’ is used by the governments, assisted by the media, to insight hate and promote inequality of ‘the other’, perhaps education is the only solution? As Michael D. Yates writes in Henry A. Giroux’s new [10]book, “Without transformational education, society is doomed to ignorance and autocracy. No democracy can function without the people having a strong sense of public values, seeing themselves in others, and willing to suppress self-interest for the common good. It is critical education that embodies and disseminates this sense.”

Tait Coles is a Vice Principal in a school in Bradford. He is the author of [12]Never Mind the Inspectors: Here’s Punk Learning.

In November 2015 - I decided to learn Arabic. As we go along, I shall speak of the reasons why. For now, I would like to say that this idea, which has turned into a great adventure, full of challenges and joy, as all great adventures should consist of. The challenges have been made easier, by the online links of the Sudanese teacher Shaykh Munaf Mohamed – and by another, known as Colette, who comes from Dubai. Other assistance – unknowingly - has been given by international celebrities, such as David Attenborough and Jamie Oliver!

For the last couple of weeks, I’ve been pondering the idea of keeping a diary of this learning. Recently, while sitting on the balcony, enjoying the early morning quiet, enhanced by a blue sky and mild weather - I decided to begin this daily recording.

It’s turning out to be, not only a celebration of the Arabic language and sub-Saharan Islamic scholarship, and the great teachers; but a celebration also, of inter-generational learning and the community activism of East Oxford. All in all, its a homage to learning and culture.

The Diary of Natty Samuels - 20 December 2015

by Natty Mark Samuels

Dec.20th

Amongst other words in my head as I awoke this morning, was the name Eric Clapton! Every morning when I awake, I give myself a review, of the previous day’s learning. Yesterday, one of the words I learnt, was the one for night: Layla.

Just found out that Dr Imran Alawiye – not quite sure in which country his roots lie, but of African descent – got his first degree in Arabic Language and Literature, from the Islamic University of Madinah. He received his doctorate in the same subject matter, from the School of Oriental and African Studies (SOAS), University of London. I shall be using his Arabic From The Beginning series, when I commence the learning of the writing of the script. Watching a short clip, I was immediately drawn to his teaching style.

One reason why I want to learn Arabic, is that after years of reading West African Arabic texts in translation, it is time I learnt to read them in the original! Can’t wait till the day, when I can read the poetry of the Nigerian Nana Asma’u – and of the Senegalese, Amadu Bamba, as they were first written. Looking forward to being entranced by the verse, of the great teachers of Somalia – especially those who shone, during the 19th century. Seeing as this is
Christmas – *eid al-milad* – there are lots of food programmes. Normally, I don’t watch such broadcasts, but as an aid to language learning, they’re perfect! Missed Nigella, but caught the second half of Jamie’s Cracking Christmas. The famous chef was demonstrating ideas of what to do with leftover turkey. I was able to name four - incl. turkey - of the six main ingredients, for his Boxing Day turkey curry. So alongside the turkey – *deek roomi* - there was roasted squash (one of my favourites), peanuts, assorted spices, potatoes – *batates*; onion – *basal*: olive oil – *zayt zaytoun*. Wish he’d done a curry of vegetables – *khadrawat!* Anyway, four out of six wasn’t bad! Wherever I am, I name what I can – even it’s only in the singular! Sitting on the balcony, I say the generic word for bird – *ta'er* – as two make their way across the 4.30 sky. Always, as I sit in my favourite spot on this elevated place, I see the tops of the trees. I repeat the word for tree several times; not just for practice, but for the beauty of sound – *shajara* - with the r that rolls. Shajara, shajara. Fitting that something so essential, should be named so sweetly – beauty expressing beauty. As time turns into a 5pm sky, the first stars – *anujoom* – faintly appear; and the aeroplane – *zayara* – flashes white light, as like the bird, it makes its way to destination. I think again, of being able to read *Lamentation for Aisha*, by the aforementioned Nana Asma’u, the outstanding female scholar, of 19th century Nigeria. To me, it ranks as one of the great elegies. This thinking enthralls me, spurring me on. The language challenges me, in such words as *asmelh* (salt) – those words ending in h. Then again it entrances me, with words like *shalil*, meaning waterfall.

**SmartPhones and Workplace Repression (2016-01-27 08:00)**

A really interesting [1]BuzzFeed article about the use of smart phones on building sites to increase efficiency (the 30 % of on-site time that is regarded idle, for reasons attributed to ‘miscommunication and disorganisation’) and their implications for workplace surveillance. What’s particularly striking is that inefficiencies are often the result of the complex subcontracting arrangements now ubiquitous within the construction industry:

According to Frinault, 30 % of time workers spend on-site at commercial construction projects is idle — not because workers are lazy, but largely because of miscommunication and disorganization. There’s also the problem of “rework” — doing a task, and then having to do it over again. For example, a subcontractor might be told to cover a hole with drywall; the next day, an electrician who wasn’t finished wiring an outlet comes in and tears that drywall out again, and the drywall hanger has to come back and redo it. With Fieldwire, Frinault hopes to improve the communication channels between subcontractors.

His app, which raised $6.6 million in October, doesn’t locate workers on a map; it locates tasks on a blueprint — tasks that foremen can then check off in real time as they are completed. The purpose of Fieldwire is to record and share information as synchronously as possible. "It may seem invasive," said Frinault’s co-founder Javed Singha, “but the reality is these guys are recording all this information manually anyway.”

This app is apparently being used on over 35,000 construction sites internationally. An even more invasive app has
Rhumbix, an app meant to be in the hands of the workers themselves, is making an even bolder ask in terms of transparency. Not only do workers clock every hour of their day on Rhumbix, but the app also tracks their location, and even some of their movements. Rhumbix is the invention of two former Navy engineers, Drew DeWalt and Zach Scheel, who took a class together at Stanford and decided to build a startup. "I said, every phone has GPS in it," Scheel told BuzzFeed News. "Let’s try to create a system like the ones we use now in the military to help improve the system we use for construction."

With Rhumbix, workers clock in and out at the beginning and end of each work day. While they’re on the clock, the app tracks their movements, both in terms of motion (moving or stationary?) and location (on the job or out to lunch?). This data is presented to managers in two ways: as a live safety snapshot, which shows where workers are at any given time, and as aggregated and anonymized labor time data that can help the bosses figure out how much is being spent on different activities. This tracking can benefit the worker — for example, a worker who had passed out on a hot roof due to sunstroke was discovered when the Rhumbix app alerted his foreman that he wasn't moving. But the app can also be used to, say, prove that workers who claim they worked through lunch actually didn't.

At present the Rhumbix data is anonymised and aggregated when presented on the dashboard for managers. But how long can this last? As a general rule, if a weakly held moral commitment is the only thing preventing a service-provider from offering a much demanded service to existing customers, it’s unlikely to provide durable in the face of, say, declining sales or a difficulty raising further venture capital. Charmingly, their take on this question is to say “You’re going to have to trust us a little bit”.

It’s worth considering this in terms of what was until recently established practice within the construction industry. Given the existence of a UK industry wide blacklist has been conclusively established, ruining the lives of many who had the temerity to demand basic safety obligations be met on site, you’d have to be painfully naive to imagine these new technologies won’t be used for work place repression. For instance, if a manager wanted to rid a site of a ‘trouble maker’, use their Rhumbix data to demonstrate an unacceptable amount of 'idle time' as grounds for dismissal. Furthermore, it’s easy to imagine how Rhumbix could end up tracking collective organisation on site. Even if the data is aggregated, surely it would represent a grouping of the work force for a face-to-face meeting? It doesn’t take much imagination to see how this technology can be used for workplace repression and I fear we’re on a slippery slope.

Environment and Human Health – Social Perspectives (2016-01-27 08:46)

BSA Climate Change, Environment & Health, and London Medical Sociology study groups present

Environment and Human Health – Social Perspectives

London School of Hygiene & Tropical Medicine, Keppel St, London

Friday 19 February 2016, 10am – 4.30pm

Keynote speaker: Professor Hilary Graham, University of York

We invite you to this day workshop event, to explore perspectives on current research and theory into the environment and human health.

The interactions between the natural environment and human health have become increasingly the focus of social analyses and scrutiny. Social research has shown how human health may be threatened by environmental factors, such as air or water pollution and by climate change impacts, such as flooding and heat waves. Meanwhile, improvements in health threaten the environment through population growth, greater longevity of life, and health technology developments.

Research further indicates how improving the environment can enhance human health, for instance through clean water and food security, while initiatives can also reduce the environmental impact of health care, such as preventing run-off from pharmaceutical production.

This wide-ranging research area thus presents an important agenda for social analysis across the multi-disciplinary areas of environment and human health.

Submissions for this event are now closed and a detailed event programme will be available shortly.

Provisional Programme

10.00 a.m. Coffee and Welcome from the organisers

10.30 a.m. Keynote: Professor Hilary Graham

11.30 a.m. Short papers

1.00 p.m. Lunch

2.00 p.m. Short papers

3.30 p.m. Panel discussion and next steps
4.30 p.m. Close

Registration

BSA Members £20; Non-members £25; BSA Concessionary members and full-time

20% off Social Media for Academics (2016-01-27 19:48)
Social media is an increasingly important part of academic life that can be a fantastic medium for promoting your work, networking with colleagues and for demonstrating impact. However, alongside the opportunities it also poses challenging questions about how to engage online, and how to represent yourself professionally.

This practical book provides clear guidance on effectively and intelligently using social media for academic purposes across disciplines, from publicising your work and building networks to engaging the public with your research. It is supported by real life examples and underpinned by principles of good practice to ensure you have the skills to make the most of this exciting medium.

You'll find advice on:

- Using social media to publicise your work
- Potential pitfalls and how to avoid them
- The evolving role of social media in higher education
- Defining digital scholarship
- Managing your identity online
- Finding time for social media
- Near-future trends in academia.

Endorsements for the book:

Mark Carrigan understands academic engagement with social media to require more than enthusiastic exhortations or dumbed down lists of rapidly out-of-date apps. Social Media for Academics offers a rich mix of research, scholarly commentary, discussion of key debates and potential pitfalls, personal experience and practical guidance which focuses not just on the how, but also the why of digital scholarship.

Pat Thomson, Professor of Education
University of Nottingham @ThomsonPat patthomson.net.

Carrigan has achieved what I thought to be impossible - produced a clear cut, incisive guide for the contemporary academic who is confused (as most of us are) about how to engage fruitfully with
social media. One of the most difficult things about social media is finding a way to be true to your own personal style, while projecting an appropriate academic identity. Carrigan manages this by organising the types of social media options in what I think is a way that won’t date quickly. I highly recommend this book to my colleagues and to PhD students contemplating an academic career in a world that increasingly values public engagement and impact.

Inger Mewburn
The Australian National University

If you’d asked me in 2009 what the future would be in academia for a messaging/micro-blogging system limited to 140 characters, I’d have said - zilch. Yet Twitter + blogs and many other social media have transformed science and academic practice in the interim. Mark Carrigan gives the first book-length and in-depth advice on the many ways in which scientists and academics are developing new paradigms of collective thought, writing and scholarly practice using social media. If you’re still hesitating, get involved by starting here.

Patrick Dunleavy
Professor of Political Science and Public Policy, London School of Economics

There is no one in the world better placed than Mark Carrigan to offer advice to academics on how to operate in the new informational environment. This book is brimming with ideas and practical tips for how academics might communicate better in the Twitter age. Brilliant, thoughtful and entertaining.

Les Back
Goldsmiths, University of London

The Language of Donald Trump (2016-01-28 08:00)

An entertaining (and accurate) video [1] via Phil BC:
The Hypnotic Inanity of Donald Trump

The Sociological Imagination (2016-02-16 08:01:01)

[...] found them weirdly hypnotic, albeit intellectually deadening. Perhaps this explains the strange quality of Trump's [...]
Jonathan Freedland in the Guardian has suggested that Cameron calling Calais a 'bunch of migrants' is 'beneath him'. I don't think so. I think it is him.

It comes from his milieu. There's an 'us' who are normal, right and good. There are people who are loyal to 'us' and they are normal, right and good. They might be inferior but they're good. Then there are the 'other'. The 'other' are suspect, dangerous, surplus to requirements, and a possible or probably threat to the order that 'we' rule and run.

That's why it's a 'bunch of migrants'. If this country were bombed or invaded, Cameron might find his family were a 'bunch of migrants'. But only very rarely in history do the Camerons become the 'other'. It happens but rarely. For now, and for the rest of his life, he'll be OK, I'm sure. He'll go on 'bunching' the 'other'.

I always call my great-grandparents a 'bunch of migrants' and would love it if other people called them that. Especially if Cameron did #classy

Ah Cameron defenders are coming out of the woodwork defending his use of 'bunch of migrants'. Try some others, guys: 'bunch of blacks', 'bunch of Jews', 'bunch of Scots', 'bunch of Irish'. Nice? OK? Appropriate use of 'bunch'?

Some of Cameron's forebears were a 'bunch of migrants' but he only mentions that when he's not condemning migrants, of course.

Cameron: 'My Jewish ancestry is relatively limited but I do feel just some sense of connection. From the lexicon of my great, great grandfather Emile Levita, a Jewish man who came from Germany to Britain 150 years ago... etc etc

The Diary of Natty Samuels - 21 December 2015 (2016-01-28 17:30)

by Natty Mark Samuels

As yesterday, I focused on reflection - and the writing of the first installment of the diary - so today, I review the words of the previous day, including fire – nar; field – haql; forest – ghaba, plus the aforementioned night – layla. Got motivated to enter further into nature’s glossary, by watching another adventure, with the great Attenborough. The word for whale reminds me of laughter and the owl, because the word for whale is hoot.

Colette of Dubai says wajh, an Egyptian link says wish. Whose version do I follow, when learning the word for face? I look for other links, searching for general consensus, as I do with other words. In the end, like other multiple choices, I settle for personal preference: I decide on wajh.

My nine year old son Bingy, is a little fed up with me! A temporary loss of patience with his father’s learning, as I attempt to boomerang words back to him in Arabic, that he has said to me. But right now, he wants to hear yes, no and thank you - not na'am, la and shukran. He isn’t in the mood to play with words. But I know that later on, when sounding out the alphabet, he’ll voluntarily join in! Later on, his room will once again, become a den of excited deciphering.

Talking of the alphabet, I still feel unsure about the gh sound - the nineteenth letter of twenty-eight. Hearing words starting with this sound, in different national and regional variations, doesn’t help! But as I said yesterday, great adventures must have challenges within them.

Through my association - poetry and articles published - with the Foundation for Science, Technology and
Civilisation and its affiliate Muslim Heritage, I've taken more interest in the scientific and medical work, of the sub-Saharan scholars. Now, I'm looking forward to one day digging into the university and archival centres of Nigeria, to read the medical works written by the brother of Nana Asam'u, Muhammed Bello. Said to have been the leading scholar on medical issues, in 19th century Central Sudan – Nigeria, Niger, Chad and Cameroon. Things he explained in the early 19th century, are what many nutritionists are speaking and writing of now. According to Mukhtar Umar Bunzu, he once healed the Emir of Zaria of kidney trouble - through a mailed diagnosis and prescription.

I go from kitchen, to bathroom, to bedrooms and living room - feeling like Adam, naming the animals! Feels good to be able to name more and more each day. To begin to put a three or four word sentence together!

For an alphabet reminder- a pronunciation top-up - I return to my first learning aid, which I was able to recommend to a Teaching Assistant at Mable Prichard School, where I sometimes work: Madinah Arabic - Learn Arabic Online. This organization is based in Norwood, in south-east London.

I think of Ibrahim al-Kanemi – from Chad - the first known sub-Saharan scholar, to have written in Arabic: in the late 13th century. He was published in Morocco, as Malik Sy (Senegal), was published in Tunisa – and the mathematician Muhammed al-Fulani al-Kishnawi (Nigeria), published in Egypt. Buzzing with the potential, of the knowledge of Arabic. Next month, with a widened vocabulary, I intend to engage Arabic speakers that I know, who reside in Oxford. Following on from this, to help the refugees and migrants, who have no knowledge of English. Be good to go back to work at Open Door – at East Oxford Community Centre - the refugee drop-in, where I worked when it was first set up about twenty years ago! Edyta, Bingy's mother – an archeology student - tells me that my knowledge of Arabic, will prove useful to her in time to come. I can almost imagine the future ecstasy, when conversing with the teachers in Mali - as well as the inhabitants of the Moroccan streets. Natty Mark Samuels is a poet and the founder of African School, a Cultural Education project based in Oxford. This initiative provides teaching in African Studies with a focus on pre-colonial sub-Saharan and Islamic cultures and early Black journalism. Formerly a Visiting Tutor at Ruskin College and other academies, Natty Mark also tutors on the Oxford Study Abroad Programme.

Special issue of @bigdatasoc on data and agency (2016-01-29 08:00)

Guest Editors:
Helen Kennedy, University of Sheffield
Thomas Poelle, University of Amsterdam
José van Dijck, University of Amsterdam

This special theme explores the location of agency in the massive flows of data circulating between devices, institutions, industries and users. Because Big Data facilitates new regimes of governance, control and discrimination, the special theme creates a space to reflect on alternative forms of Big Data, forms which enable small-scale public organisations and community groups to act with agency in the face of the rising significance of data.

Steve Fuller (@ProfSteveFuller) (2016-02-07 12:10:34)
There is much right about this but around minute 29 it goes wrong. In fact, technology played a very important role in the medieval Christian mentality, even before the Industrial Revolution – and indeed helped to foster capitalism and the Industrial Revolution that way. Here I refer you to David Noble’s greatly underrated The Religion of Technology: https://books.google.co.uk/books/about/The_Religion_of_Technology.html?id=9PXXAAAAMAAJ &redir_esc=y. Communism and Silicon Valley are both piggybacking on this long-standing strand of Christian theology, i.e. ‘making a heaven on earth’.

The ISRF Mid-Career Fellowship Competition (2016-01-31 08:00)

ISRF Mid-Career Fellowship Competition

Launch: 4th January 2016
Deadline: 19th February 2016

The Independent Social Research Foundation wishes to support independent-minded researchers to do interdisciplinary work which is unlikely to be funded by existing funding bodies. It is interested in original research ideas which take new approaches, and suggest new solutions, to real world social problems.

The Foundation intends to make a small number of awards to support original interdisciplinary research, across the range of the social sciences, to be held from a start date no later than the end of December 2017. Scholars from within Europe are eligible to apply.

The award is intended to enable a scholar at the mid-career stage to pursue his/her research full-time, for a period of up to 12 months. The amount will be offered to buy out the costs of replacing all teaching and associated administration in the applicant’s home institution, and will be considered to a maximum of £60,000 per successful applicant. Within that sum, reasonable support for research expenses may be considered on a matched-funding basis with the host institution.

The applicant should normally hold a salaried position at an institution of higher education and research, and be 10 years or more from the year of their PhD award. However, a shorter time from PhD award may exceptionally be considered, if the candidate has other qualifications to be considered as mid-career.

Applicants should consult the Criteria as set out in the Further Particulars and show that they meet them. Applicants should follow the Application procedure and should present their Proposal in the format specified there.
Some thoughts on responsibility (2016-02-01 08:00)

At an event in Liverpool recently, I was asked by Steve Fuller about what I understood responsibility to mean in a sociological sense. He was sceptical that I could support claims of responsibility given my understanding of human agency as situationally performative but biographically continuous. In essence I understood him to be asking: do I think there’s something about the human being in relation to which responsibility can be assigned? This is a question I’d never really thought about explicitly, though once I began to I’ve realised that it actually knits together the full range of my interests.

Part of my difficulty with the question is that I think ‘responsibility’ encompasses a number of different things which we need to unpack:

Responsibility as moral agency: how an individual comes, through internal and/or external conversation, to assume a stance of responsibility towards their own actions. To me it seems obvious that this is a matter of what Charles Taylor calls disengaged agency. It’s a mode of engagement with the world that usually involves stepping back from social encounters in order to reflect on one’s own actions within them, though I do believe sometimes we confront these questions when in the flow of the social situation.

Responsibility as interpersonal ascription: how an individual comes, through social interaction, to be held accountable for their actions. This can, but by no means necessarily does, lead to the first sense of responsibility as moral agency. This is about social judgement, holding someone to account in terms of putatively shared standards in relation to which their behaviour can be evaluated.

Responsibility as structural enforcement: how an individual comes to be formally held responsible for their actions, in relation to codified rules and regulations which are sufficiently durable to be both enforceable and recognised as binding. Legal systems are the obvious example of this but I’d include disciplinary proceedings within workplaces within this category as well. The point is the process is formalised and the rules are codified. It’s not tied to the social situation, a term I use in Goffman’s sense, in the same way as the earlier forms of responsibility.

These are interconnected in complex ways. But by analytically distinguishing between them, we’re able to recognise how they can vary independently. Under contemporary social conditions, I would argue that we have seen the following changes:

People are more likely to over-actively exercise moral agency, often to the point of blaming themselves for personal outcomes that are systemically produced. This individualisation contributes to the fragmentation of normative consensus, as individual reasoning acts as a vector of deviance amplification: the more intensively people think about these things, through the filter provided by their own particularity, the less likely they are to straightforwardly reproduce ‘common sense’.
The interpersonal ascription of responsibility is becoming more contentious because of this fragmentation of normative consensus. If we can’t take ‘common sense’ for granted, interventions of this sort will tend to be experienced as arbitrary impositions of power. This leave them experienced as something inherently contentious, which I’ve written about as the ‘paradox of incivility’: when consensus breaks down, attempts to enforce civility are actually experienced as rude and aggressive.

‘Common sense’ supplies the intuitions upon which enforcement is grounded. In its absence, normativity comes to seem less binding, incentivising alternative penalty-based enforcement that doesn’t attempt to seek grounding in moral agency. Margaret Archer describes this as ‘anormative regulation’ in an upcoming paper.

Having only recently grasped quite how interesting case law is, thanks to the conversation with Steve and Joseph, I’d now like to start to refine the outline I’ve sketched above and apply it to thinking through the challenges posed by emerging technologies.

Call for book proposals: Critical Digital & Social Media Studies OA book series (2016-02-03 08:00)

"Critical Digital & Social Media Studies" is a book series edited by Christian Fuchs on behalf of the Westminster Institute for Advanced Studies and published by the University of Westminster Press. It publishes books that critically study the role of the Internet, digital and social media in society and make critical interventions.

We invite submissions of book proposals that fall into the scope of the series.

Deadline: March 1, 2016

The books in the series are published in an open access format available online without payment using a Creative Commons licence (CC-BY-NC-ND) and simultaneously as affordable paperbacks. We are able to publish a number of books in the call without any book processing charges thanks to support by the University of Westminster Library.

Details:

[3]http://www.westminster.ac.uk/wias is a new interdisciplinary institute at the University of Westminster. Its inaugural research theme is critical digital & social media research. Subscription to its newsletter is possible here: [4]http://www.westminster.ac.uk/newsletter The University of Westminster Press is an open access publishing house. Media, communication & cultural studies is one of the academic publishing fields it specialises in:
Speakers: Prof Gurminder K Bhambra (University of Warwick and Linnaeus University, Sweden), Prof Alf Nilsen (University of Bergen), Dr Lisa Palmer (Birmingham City University) Dr Srila Roy (University of the Witwatersrand), Prof Beverley Skeggs (Goldsmiths) and Dr Robbie Shilliam (Queen Mary)

More speakers to be confirmed soon.

If C. Wright Mills was correct in stating that the pivot of the sociological imagination is the imaginative capacity to join the dots between structure and historical process on the one hand and agency and individual biographies on the other hand, it is also correct today to argue that the sociological imagination has to engage the challenge of the global as a process, as a scale, and as an imaginary that is simultaneously constitutive of and constituted by the specific locales, institutions, and phenomena that are the focus of attention in sociological research. This workshop will be dedicated to exploring what it entails to develop a genuinely global sociology - both theoretically and analytically, but also - to invoke Mills once again - in terms of the capacity of the sociological imagination to address urgent public issues.

You can register for a place here: [1]https://www.eventbrite.co.uk/e/sociology-in-and-through-the-global-south-tickets-20915777654 Please note places are limited.

Plagiarism: Observations on Academia’s Self-Induced Moral Panic (2016-02-04 21:43)

Nowadays whenever students submit essays at my university, it goes through the computerized 'Turnitin' system that surveys the internet for textual overlap with previously published material, resulting in some statistical figure of degree of overlap. If the figure is beyond 20-30 %, a tribunal is set up to adjudicate the matter, in which the student makes some sort of representation. In any case, all essays pass through this system before they are marked. Some of the offending essays would have been spotted by the instructor in the normal course of marking because the student has lifted quite obvious sources - and in combinations that jar in terms of prose style. So, the real issue is the stuff that the marker might not have normally picked up, perhaps because the sources are quite diverse, appropriated with some judgement, and executed in a way that papers over more glaring stylistic differences among the original texts. Turnitin catches this stuff too, and it is often advertised as the great virtue of the system.
My view on plagiarism and other forms of academic fraud has been consistent throughout my career. I think a fixation on such activities speaks poorly to academic self-esteem – and the more mechanized version that we experience these days only makes matters worse. In short, statistically speaking, a confident academic culture would prefer an examination regime that ends up with ‘false negatives’ than ‘false positives’ in matters of fraud.

The arts have had a much healthier attitude to plagiarism, forgery, etc. – namely, to treat it as a game of ‘cat and mouse’. If an experienced practitioner or connoisseur can’t spot the fraud, then the artist gets away with it – though there will always be opportunities for future critics and scholars to return to the ‘scene of the crime’, so to speak. Indeed, the greater public visibility and notoriety enjoyed by the artwork, something that every true artist desires, the more vulnerable it becomes to this treatment. (It is thus easy to see why the great art historian Ernst Gombrich was a fan of Karl Popper.) Indeed, the return visits to an artist’s sources have sometimes served to alter their reputations, as people come to realize that an apparent ‘original’ really got all his or her best ideas from people who had gone unnoticed at the time. But sometimes even this additional knowledge doesn’t seem to matter much. The artist’s reputation remains intact – if only because of the cleverness with which the artist papered over the cracks between the borrowings. Indeed, this is the ‘art’ of the artist. Harold Bloom crafted an interesting psychoanalytic account of artistic creativity on the back of this point when I was a student in the 1970s, under the rubric of ‘the anxiety of influence’.

It is too bad that academia does not adopt this relatively relaxed attitude to plagiarism and fraud, which would effectively leave the uncaught student to dwell productively in his or her guilt. In contrast, our current practices draw attention to just how much academics feel the need to protect their turf from unworthy interlopers. Yet, what is the source of this need? Perhaps academics feel that their insights are so hard won, so naturally scarce, that someone who simply steals them or makes them up whole cloth is doing an injustice to the sense of labour implied by genuine academic achievement. Artists don’t generally have this hang-up. Rightly or wrongly, they believe that they are full of ideas and the real challenge is to harness them together in some coherent fashion. Artists often know the source of their most productive ideas, but they don’t feel the need to assign credit. This is for two quite sensible reasons: (1) under a slight change of circumstances, they might have got those very same ideas from other heads, including their own; (2) the artwork that they create from those sources will speak for itself by doing something significant that the source works did not do. Once again, the intended publicity of the artwork ultimately puts both propositions to the test.

Meanwhile, back on Planet Academia, we continue to live in a world where ideas are scarce, not abundant, and their value is judged in terms of what made them rather than what we make of them. Thus, we fail to appreciate that the most devious forger of original work will have mastered the skills that we would have demanded of them. The key difference is that the forger treats ‘the archive’ (aka ‘the internet’ for today’s generation) as an extended memory store, not as something ontologically distinct from his or her own being. But make no mistake: I am not trying to re-package a crisis of ego identity (‘boundary issues’) as some higher epistemic virtue – or even claim that we are already cyborgs (though there may be something to that). Rather, I am asserting an unconditional right of someone who has been allowed into society’s epistemic sphere to range freely within it, as a ‘commons’, unless specifically stopped by a relevant authority for ‘poaching’ or ‘polluting’. In short, the burden should be placed on academics to demonstrate epistemic trespass among those who they have already admitted as their equals. Moreover, these demonstrations would be cast more in aesthetic than moral terms. In that case, the problem with detected plagiarism is more that it is detected than that it is plagiarised: It was not good enough to pass as original.

One way to shift the normative character of fraud from a moral to an aesthetic basis for would be for a software firm to develop a counter-Turnitin programme aimed at the student market. The programme would alert students to whenever their texts have entered into prohibited fraud territory – and then offer alternative formulations that might take them out of that zone. In effect, the onus of judgement would be put back on the academics, since they would receive the student submission without knowing whether it had undergone this plagiarism-cleansing
process: A higher form of 'cat and mouse'.

Reiner Grundmann (2016-02-04 22:03:13)
Steve, you write it would be good 'to develop a counter-Turnitin programme aimed at the student market. The programme would alert students to whenever their texts have entered into prohibited fraud territory - and then offer alternative formulations that might take them out of that zone.' Many universities already offer students to test their draft essays in that way. Your analogy with art is interesting but the mode is different, it is homage, play, irony. It takes a connoisseur to realise the contexts and allusions. In academia we have the quote, and the creative assemblage of previous work which needs to be acknowledged. What you describe may be the disdain of academics for their colleagues who do not respect this convention. But what about students who lift entire essays from the web, without any creative input?

Steve Fuller (2016-02-05 08:16:29)
Thanks for this! I didn't know about the Counter-Turnitin programmes. Is there a website advertising them? My point is not to get rid of the plagiarism as an offence but to roll the offence into more general considerations of the quality of student essays - i.e. whether they are saying anything inspired. Even before Turnitin, competent teachers could spot or at least suspect more blatant instances of plagiarism (and the internet serves to test the suspicions). But if the teacher doesn't flag the plagiarism, and the student passes the teacher's other evaluative criteria, then the student should be allowed to pass overall: A teacher fooled is a student learned. Suppose you're worried that this might encourage students to game the system. Of course, some students will think in terms of how to craft together sources from elsewhere into something they present as their own 'original' work. However, the skills involved here - especially if the teacher is very competent - will need to be pretty sophisticated, approximating those that the essay-writing exercise is designed to test for. The only thing missing from an excellent forgery is the acknowledgement of the source, But to whom is this fact so important, if the work is brilliant on its face? Well, it is important to academics who see knowledge as operating in a condition of scarcity and hence subject to strict property rules which need to be respected.

Reiner Grundmann (2016-02-05 16:18:38)
Several universities allow students to upload draft essays to turnitin so they can check they are 'safe'. I am surprised you said that 20-30 % similarity triggers a disciplinary hearing. This number is normal in many good essays, indicating quoted material. It is up to the lecturer to check this before any steps are taken against a student. Yes, art and science have many things in common but there are crucial differences as well. I don't agree with this statement of yours: 'The only thing missing from an excellent forgery is the acknowledgement of the source, But to whom is this fact so important, if the work is brilliant on its face?' We have an obligation to teach students the rules of the game. Crafting a paper requires the acknowledgement of sources so claims made can be checked. And I guess we are not so much after brilliance but new ideas and evidence.

Steve Fuller (2016-02-05 18:04:08)
I don't know the similarity figure that triggers a tribunal, but as I said in the article, it is beyond 20-30 % of overlap. In any case, artists are also taught the rules of their game, but the issue here is the spirit of enforcement. Artists are just as interested as academics in determining the sources of works. However, it is less in a spirit of criminality than of gamesmanship. After all, the 'rules of the game' don't have a supernatural existence. They are made by and for humans, and it is humans who judge their efficacy. The fetishizing of plagiarism and fraud ends up alienating academics from their own normative order by turning them into protectors of other people's intellectual property: From gamers to gamekeepers! Not a good look, I'm afraid.

Reiner Grundmann (2016-02-05 20:16:12)
Steve, i have the impression that we are somehow talking past each other. Maybe one last try. There are two points: we teach the craft of proper writing (there is much more freedom in art in comparison), and we want recognition (not only enforcement of property rights). The craft aspect is not be neglected, it helps avoiding making unsubstantiated claims (as we often see in
students' essays, but also in colleagues work, and of course in our own).

**Plagiarism The Sociological Imagination (2016-02-06 17:15:18)**

Ursula (2016-02-06 18:51:04)

Yes, I always allow my students to have a 'review & resubmit' option in Turnitin. Often they can correct it themselves. Especially UGs where it's just a case of naivety. Have you read Vardi's work in this area?

Steve Fuller (2016-02-06 23:07:41)

Ursula, you mean this person, right? https://vardiconsulting.wordpress.com/papers/

“Good research is a messy business...” - The Social Hand Grenade (2016-02-08 21:00:47)

Plagiarism: Observations on Academia's Self-Induced Moral Panic | teaching knowledge and creativity (2016-02-12 10:15:16)

 [...] Sourced through Scoop.it from: sociologicalimagination.org [...] 

Dr. Mike Reddy (2016-09-24 07:39:58)

I disagree with this on several levels. The 20-30 % originality threshold belies a total misunderstanding of both Turnitin and cut and paste plagiarism. To leave it unchallenged, like a forgotten 'straw man' argument, might denote a lack of clarity; it could show something worse. The analogies to Art doesn't hold water. While I agree we should take a different lesson from the Internet - this generation’s extended phenotype as knowledge carvers, rather than crafters or hunter-gatherers - and the need for assessment to change in light of technological advance, there still is value in declaring provenance. The sources of information matter even more now that anyone can publish anything. Plagiarism isn't a 'crime' because of the copying, it's the taking credit. The reason for citation isn't (or shouldn't be) "because that's how we do it" or "because we (academics) say so". It is to ascribe sources, because the source of knowledge is important in science, etc, where it isn't (necessarily) in Art. Art is a transformative process. In Academia, this transformation requires both a foundation - to justify its significance and relevance - and context, because the product AND the process are important. If I say Drug A is safe, it matters if I'm an online seller of said drug, or the person who did the double blind ten year clinical trial. That is why referencing is important, not the taking/giving credit. The explicit explanation of the process of gathering or creation of knowledge requires the method or origin to be recognised.

 [...] would be far less need for law enforcement strategies if universities took a bit more responsibility for how their sector approaches the representation of knowledge. I urge students to speak out about [...] 

**The Pessimistic Turn in Modern French Thought (2016-02-05 08:00)**

A really interesting lecture about the pessimistic turn in modern French thought: the roots of a transition to be found in an intellectual culture "haunted by the universal".
A reading list of critical research on self-tracking (2016-02-06 08:00)

A really useful resource curated by Deborah Lupton: [1]https://simplysociology.wordpress.com/2016/01/12/critical-social-research-on-self-tracking-a-reading-list/

Plagiarism (2016-02-06 17:15)

[1]by Michael Palkowski
Professor Steve Fuller, an eminent sociologist at the University of Warwick recently published a provocative blog post on the ways in which academia deals with plagiarism, titled "Plagiarism: Observations on Academia’s Self-Induced Moral Panic". In this article, I will discuss the main arguments he outlines and explain why I believe they are misguided.

The central argument of the piece is concerned with moving from what Fuller (2016) describes as a 'moral' view of plagiarism, to an 'aesthetic' view. I believe that plagiarism is a moral issue and believe that the "aesthetic view" of plagiarism is ineffective at maintaining academic standards. Fuller in the blog notes that we should take lessons from the art world when trying to deal with plagiarism issues and that a fixation on issues such as forgery and fraud merely reflects low academic self esteem. To quote him directly:

"It is too bad that academia does not adopt this relatively relaxed attitude to plagiarism and fraud[...]

According to Fuller, having an institutional fixation on checking for plagiarism merely "draw[s] attention to just how much academics feel the need to protect their turf from unworthy interlopers." Having an interest in maintaining rigorous academic standards, is somehow the same as prohibiting particular voices from being heard. The idea that is contentious here, is that the fraudulent contribution is somehow not unworthy. At the end of his blog, he states the following:

"I am asserting an unconditional right of someone who has been allowed into society's epistemic sphere to range freely within it, as a 'commons', unless specifically stopped by a relevant authority for 'poaching' or 'polluting'."

A major point of contention is the notion between privately owned and publicly owned knowledge, what Professor Fuller refers to in his article as a 'commons'. Students already have the 'unconditional right' to enter into the epistemic space he describes. Fuller in saying these points wants to highlight the fact that all knowledge is free reign for the student. However, it is not within the student's right to be cavalier with that knowledge and to treat it with disrespect and to ultimately present it as a product of their own, without reference. Forgery is not qualitatively the same thing as an original, even if it passes as a genuine piece of work. However according to Fuller, if they bypass detection, then it is as good as the original. Passing as genuine is somehow sufficient, even if the material is ultimately an uncredited patchwork. That is why programs like Turnitin are so important for detecting counterfeits.

Fuller suggests an alternative program, one which in essence would protect and guard those willing to submit forgeries. The program would alert students to when their material was in the 'danger zone', and offer alternatives in order to prevent work from being regarded as plagiarism.

Fuller will be aware that Turnitin is already used in this manner, often tutors encourage their students to submit 'drafts' in order for their original content score to be amended. However, Fuller is advancing something different here. His hypothetical program would offer clear suggestions to students on how they can cover up their misdemeanours. It is not the case that plagiarism should be discouraged, it is simply that we should hide that it even happens by playing elaborate games of "cat and mouse". Fuller seems eager to dismantle the very academic standards that got him to a position of relative authority as a professor.

Plagiarism was openly advocated and celebrated by writers such as Guy Debord (1994) [1970] and his situationist international colleagues, for precisely the same reasons that Professor Fuller wants plagiarism to be a "cat and mouse game" in the academy. The plagiariser was to reproduce material in an aesthetic fashion. It was a way of initiating 'progress', a way of 'erasing false ideas' with the 'right ideas'. This was entirely abstract as is Fuller's notion of an aesthetic approach to plagiarism. Regardless, Debord and his ilk were appropriating the artistic principles that Fuller describes so glowingly in his blogpost. The problem that this amounts to is comparing apples with oranges. Despite this, it is always convenient to justify stealing other people's work.
In the Society of the Spectacle, Debord directly highlights the aesthetic approach to plagiarism:

"Plagiarism is necessary. Progress implies it. It embraces an author’s phrase, makes use of his expressions, erases a false idea, and replaces it with the right idea."

Professor Bauman was outed in 2014, when it became apparent that he had reproduced content directly from Wikipedia without citing it (Jump 2014). In doing so, he replicated many of the errors that were present in these publicly available articles. When a PhD student at the University of Cambridge highlighted these claims in depth, Bauman rebuffed these serious claims by suggesting that high quality scholarship did not require ‘obedience’ to ‘technical’ rules of referencing. It caused a controversy and rightly so. Many realised that there are different standards at different levels of the ivory tower. There is a sense that eminence leads to an insistence on different rules to be applied at different times. A PhD student could not wilfully disregard referencing content and especially could not defend to other academics that citing is merely being obedient to archaic rules that insist on maintaining academic integrity and standards. It cannot be argued that there is a level playing field when it comes to being lackadaisical with referencing and writing with integrity. Hence why academic articles stressing the need to be less anal about technical rules of referencing, are inevitably articles from people who have nothing to lose in such a change. They can hide behind their positions of authority.

It sends the wrong message to place forgery on the same level as scholarship. Forgery that "passes for an original" is not an original, regardless of the aesthetic tricks that the writer took. Forgery can be interesting in the way that a found poem can be interesting. I think this is what Fuller has in mind when he thinks about aesthetic plagiarism of academic texts. Autoethnographic writers like Stacy Holman Jones, Tony Adams and Carolyn Ellis (see Adams et al 2015) sometimes use a technique called text spinning where passages from academic writing are juxtaposed together in order to stimulate new ideas. Often the purpose of this exercise is to help the researcher’s own experiences come out and ‘spin’ with the theoretical canvas. The difference is apparent, the citations are clearly marked. The original contribution to knowledge is not fabricated. The process is often the starting point for the researcher, in beginning to think creatively and critically about a subject.

Mary Ruefle’s (2006) ‘found poetry’ is often about taking a pre-existing text such as a Victorian novel and eliminating words with white out until a coherent message is found in the novel, that is ‘found’, that is new. This is not however on the same level as a poem that was written without the aid of the Victorian novel as a canvas. Further, it is not copying exact passages, it is using the book as a impetus for stimulating original thought. Another suggestion made by Fuller is that the aesthetic plagiariser uses the ‘archive’ (the internet) as an extended memory store. To quote him directly:

"The key difference is that the forger treats ‘the archive’ (aka ‘the internet’ for today’s generation) as an extended memory store, not as something ontologically distinct from his or her own being."

The internet is a resource and as a resource, it must be used ethically when appropriating content. It is patently absurd to make such a claim in order to defend what is an indefensible outcome. Students plagiarise using the internet because they understand the internet as an extended memory bank, so therefore it is fine? Fuller apparently holds charlatans to high praise as is demonstrated here:

"Thus, we fail to appreciate that the most devious forger of original work will have mastered the skills that we would have demanded of them"

The forger has not mastered anything, other than stealing other people’s work. The present quote gets at the heart of what is wrong with the aesthetic approach to stealing people’s ideas. As Fuller notes himself:
"The problem with detected plagiarism is more that it is detected than that it is plagiarised: It was not good enough to pass as original."

Fuller presents an incredibly negative view of what it means to be a teacher in this passage. This is what happens when we apply the principles of postmodernism to integrity in the academy. Students who play elaborate games of trickery in reproducing others work, who might not even understand any of the words that are pasted together, are somehow on the same level as the student trying hard to understand and write coherent, thoughtful and powerful essays that come from their own study and their own understanding of concepts, theory and experience. Why should students even bother in such a toxic environment, if their friends could skilfully juxtapose a bunch of academic texts together and get a better grade?

Academia can be regarded as a mental bricolage, in the sense that we wrestle with ideas and attempt to establish a coherent picture of many different parts. It is like a puzzle and you want to get the right pieces to make your picture look right. Qualitative researchers are quick to say research is messy and it is. There is an argument to have that ideas are not original, that our interpretation of ideas are hardly novel. This however does not mean that all ideas are aesthetically plagiarised, or that written material is in essence copied. The process of the forgery and the progress of the genuine article have different antecedents that are important. Scholarship that takes years to complete, with research strategies that collect data that is meaningful and reflexive of a particular community for example, is qualitatively different from someone going on the internet and copy and pasting passages from that piece of work and then "aesthetically" copy and pasting it within passages of Jane Eyre and then claiming credit.

Fuller wants us to remove the very tools we have in place to try and reduce fraud in our institutions, by putting the onus of plagiarism detection entirely on stressed out, overworked and overburdened academic markers. We should be helping our academics with every tool possible to help detect forgeries. We do not read everything. We are not infallible.

Fuller in wanting to remove or undermine the tools we use to detect plagiarism also states that doing so would "leave the uncaught student to dwell productively in his or her guilt". This makes about as much sense as deregulating the banks and expecting them to do the right thing every time. Why undermine tools that can assist this process?

It is easy to see why Fuller is making these sort of arguments. It is in the very heart and soul of sociological inquiry to stand up for the underdog, as Howard Becker (1967) famously pointed out. Fuller might see the plagiarising student as being someone who is victimised, or someone who does not fit into a prescriptivist academic climate. It is clear however that if we want to have an academic discipline that people take seriously, we need to defend integrity and make sure we are doing our best to combat corruption. Fuller in his aesthetic approach to plagiarism showcases a very negative view of intellectual labor and the intellectual process. Intellectual ideas are there for everyone to come and take, if they can get away with it. Fuller wants the average student to turn into Shia LaBeouf and it is in everyone’s interest that this does not happen.

References

Michael Palkowski is a PhD student at Edinburgh Napier University. He is interested in sociological understandings of hospitality, public space and urban theory. He is also interested in the sociology of the body and has published a book with Palgrave, (co-authored with Dr Kathy Charles) looking at Feederism from a sociological and psychological perspective.

Baslan Shev'la (2016-02-06 17:43:11)
I knew Fuller’s post bothered me, and I think you’ve articulated why beyond my stubbornly nonacademic "I worked my ass off on that shit, and this is a GD knowledge economy. BETTER give credit where it’s due!"

Steve Fuller (2016-02-06 18:35:38)
This is an interesting, if slightly sad piece. It seems to want to force academics into a position of defending the distinctiveness of their profession in terms of its capacity to protect intellectual property – something which in the future may be done better by a machine than by the academics themselves. We have reached a sorry state when the ‘teaching’ side of our profession has become so preoccupied with evaluating work, rather than demonstrating why such work might be worth undertaking in the first place. I actually don’t think of myself as a postmodernist, and most people who think of themselves as postmodernists don’t see me as one of their number. However, I do believe that there are some deep lessons in postmodernism – and maybe they are informing my argument. The difference between art and scholarship is that the artist sees plagiarism on a sliding scale, and hence the ‘anxiety of influence’, whereas the scholar often makes an arbitrary cut. That cut takes place when words are appropriated without formal attribution; hence, Turnitin looms largely in current academic practice. However, more thoughtful scholars think more like artists: They don’t rate people – students or scholars – who abide by the rules yet manage to say things that depend so much on properly acknowledged sources that their pieces could have been generated by a computer programme that was given a set of references as input data. Much of what passes for academic work in this period of mass publishing has exactly this character. Such work plays by the rules and does so competently, and we generally reward it, even if we do not declare them works of genius. But to my mind, these works sit closer to a kind of ‘plagiarism’ that is worth worrying about: The ‘Plagiarism Plus’ that constitutes what Kuhn called ‘normal science’. There are only two things that students learn when they learn how to reference academic sources properly: (1) They learn how to communicate in a way that their scholarly audience will easily understand; (2) they learn how to think about academic work as intellectual property that they can rent for their own purposes through proper citation. However, the connection between mastery of these two points and mastery of a domain of scholarship is by no means obvious. Surely, I’m not the only reader of well-placed sociology journal articles who often wonders whether an author has understood the impressive list of cited works, given how the works are featured in the author’s text. My point here is that by fetishizing plagiarism to such an extent that we see it as qualitatively ‘Other’ to proper scholarship,
we are demystifying academic work to such an extent that it will be eventually reduced to computer-programmed articles evaluated by computer-programmed markers. Palkowski bemoans the plagiarist’s tendency to make life easy for him/herself by avoiding the hard graft of scholarship. Yet, if the history of technology is any indication, defenders of the ‘craft of scholarship’ will need to do more than extol sheer energy expenditure as a virtue. The plagiarist already has efficiency on his/her side.

rogan (2016-02-12 11:29:26)

Essentially, what Fuller is saying as I understand it is that he dislikes how people own knowledge and defend their right to it’s use because it was their idea - which does seem very egotistical and non-conducive to human knowledge development. But this negative view could not be more short-sighted. The fundamental function of any assignment for the student varies depending on the skills needed to complete the task. However, it is always true that the assignment is a test of the student’s understanding of the topic, ability to bring together ideas from various locations and come to a logical, reasonable conclusion on their findings... and not a test of their ability to ‘hack’ the system (although hacking is a skill of it’s own, it’s not the point of academia). Where this point becomes even more potent, is when a professional academic plagiarises. The academic is not there to get a degree so that they can leave university and start telling people what to do in a hipster marketing apartment; they are there to teach, and to pursue the advancement of human knowledge. And to that effect, they should share, collaborate, and combine knowledge. They should be proud of the fact that they read and expanded on the work of another human with whom they share that same goal, for it underpins their work as an extension of previous well-founded discoveries and assuages doubt and inaccuracies in their findings. Knowledge is not art, nor is art knowledge.

**The Art of the Steal (2016-02-07 08:00)**

A really interesting film via [1]Dan Silver:

>This is a fascinating documentary film about the longstanding financial problems of the Barnes Foundation, a $25-billion collection of mostly Modernist and post-Impressionist artworks, and the foundation officers’ successful effort to break Albert C. Barnes’s will and move the collection from Lower Merion to downtown Philadelphia. The emphasis of the film is on the breaking of Barnes’ will.

**BSA Work, Employment and Society Conference 2016 - Call for Papers (2016-02-08 08:00)**

Abstract submission closes at midnight on Monday 7 March

**Work, Employment and Society Conference 2016**

4220
Work in Crisis

Dates: Tuesday 6 – Thursday 8 September 2016 (Postgraduate Workshop: 5 September 2016)

Venue: University of Leeds

The BSA and the Work, employment and society Editorial Board are pleased to announce that the WES Conference 2016 will be hosted by the University of Leeds. Like the journal, the conference is internationally focused and sociologically oriented, though it welcomes contributions from related fields.

The conference comes at a critical time for the study of work internationally. The impact of the global financial crisis has not only been profound, but enduring. The crisis has not led to any fundamental reappraisal of the nature of capitalism, or how to 'govern' it. For the majority in work conditions have deteriorated, while those without employment have been subject to ever more punitive sanctions. Inequalities are increasing and working lives becoming more precarious. The WES 2016 conference will bring together sociologists of work from across the globe to consider the crisis within, and the possibility of moving beyond, capitalist work relations.

The full Call for Papers can be viewed at: [1]http://www.britsoc.co.uk/media/93221/WES2016_conference_CFP_070316.pdf?1448377582546

Collaborative Work and Social Media: Responding to the rapid spread of provocative content (2016-02-08 14:01)

Special issue call for the Journal of Computer Supported Cooperative work

Deadline for submissions March 7th 2016

These call details are also available online at [1]https://sites.google.com/site/digitalwildfiresrc/jcscw

Special issue editors

Marina Jirotka – University of Oxford

William Housley – Cardiff University

Rob Procter- University of Warwick

Helena Webb - University of Oxford

The rapid spread of provocative content on social media

Social media platforms such as Facebook, Twitter, Instagram, Tumblr etc. create new spaces in which users...
can 'meet', interact and exchange content. This content is often then forwarded on through shares, retweets etc. so that single posts can be seen and responded to by multiple others. Our modern status of hyperconnectivity means that social media content can spread spontaneously across the globe in a very short period of time. As social media platforms have gained in popularity over the last ten years they have become particularly associated with the posting and rapid spread of provocative content. This provocative content may take various forms including: extreme or inflammatory sentiment - in particular relating to politics, class, race, sexuality or gender; inflammatory or incendiary comments directed towards particular individuals or groups; commentary and speculation regarding unfolding social events and crises; political debates and campaigns; and humanitarian and solidarity messages and campaigns.

Provocative content on social media can undoubtedly take constructive forms – for instance in the galvanising of a clean-up effort after the London riots of 2011 and the spread of solidarity messages such as #JeSuisCharlie #BlackLivesMatter. However much public and political attention has focused on the prevalence and rapid spread of more negative content such as hate speech, harassment and unverified rumour. Concerns have been expressed over the harms this content can cause to individuals, groups and populations, and questions have been raised over how social media can and should be regulated. Provocative content at times overlaps with illegal content and in some countries may be actioned under civil or criminal codes in relation to defamation, hate crime etc. However many kinds of provocative content do not breach any legal codes. Similarly, most social media platforms adopt terms of use that enable them to remove certain kinds of offensive or harmful material where necessary but allow users to post provocative content of various kinds. Indeed, many of these platforms are run on principles supporting freedom of expression and actively uphold the right for posts and posters to be provoking and/or inflammatory.

A 2013 report by the World Economic Forum (WEF) characterises contemporary concerns over the spread of provocative content across social media. The report highlights the global risk factor of ‘digital wildfires’: scenarios in which provocative content involving multiple users spreads widely and rapidly across social media and results in serious negative offline consequences. For example the massive spread of misinformation can harm the reputation of individuals, organisations and markets before there is a chance to correct it. Alternatively, abusive and incendiary messages can cause considerable harm to individuals and generate social tension during critical events such as civil disturbances, health scares and natural disasters. The WEF report argues that the risks posed by digital wildfires prompt re-evaluation of the current governance of digital social spaces. This may take the form of new legal or technological restrictions on content balanced against the principle of freedom of speech. Alternatively, there is scope to promote a ‘global digital ethos’ by encouraging social media users to behave responsibly in the monitoring and regulation of their own and others’ online behaviours.

CSCW and social media

Work conducted within the framework of computer supported cooperative work offers to greatly advance understanding of the rapid spread of provocative content on social media. In the first instance, CSCW perspectives can shed light on the role of collaboration in the occurrence of these socio-digital phenomena. Relevant research questions include: how does the rapid spread of different kinds of provocative content occur in real time? How do social media users, who may not even know each other, collude and collaborate to enable to spread this content? How might these users collaborate to adopt responsible online behaviours and what forms would these behaviours take? How can the online and offline consequences of provocative online content be identified, assessed, replicated and understood? What roles can different forms of regulation play in the management of the spread of provocative content and the pursuit of a global digital ethos?

In addition, CSCW approaches also support collaborative interdisciplinary research on the prevalence of provocative content on social media. For instance, opportunities exist in: collaborative and crowd source coding for phenomena such as the spread of rumour or hate speech; the co-design of digital tools or platforms capable of scoping and analysing the propagation of provocative content; and collaborative and interdisciplinary approaches to ethics and responsible innovation with regard to social media.
Journal special issue

The special issue takes up these research opportunities by exploring the relationships between collaborative work and social media in the context of the rapid spread of provocative content. For this special issue we welcome contributions including, but not limited to:

- Case studies or comparative analyses of social media phenomena involving the rapid spread of provocative content.
- Papers that report on the ‘collaborative work’ of digital agents in propagating, responding to and regulating the content and diffusion of provocative content on social media. This may include: the design and use of digital tools/platforms to scope and assess online content; crowd-source coding for provocative content; or qualitative examinations of the lived orderliness and practical accomplishment of social media interactions.
- Examinations of governance practices relating to the regulation of digital social spaces. For example, work based ethnographic studies of social media regulation and response to the spread of provocative content during critical events such as disasters, civil emergencies or public health scares.
- Papers that report on collaborative and interdisciplinary approaches to ethics and responsible innovation for the governance of digital social spaces.
- Papers that report on the opportunities and challenges presented by the collaborative interdisciplinary study of the spread and prevalence of provocative content on social media.

We seek contributions from a range of disciplinary backgrounds that can advance theoretical, practical, technical and/or social understandings in CSCW and related fields.

Submission details and further information

Please submit your paper by **March 7th 2016**. Round 1 notifications will be sent in mid-June 2016.

Manuscripts must follow the journal's format standards [2]Instructions for Authors (pdf, 366 kB).

Submit manuscripts to [3]http://www.editorialmanager.com/cosu/ and indicate in your cover letter that the submission is for the special issue.

For questions and queries please contact coordinating guest editor [4]helena.webb@cs.ox.ac.uk

The special issue forms part of the ongoing research project ‘Digital Wildfire: (mis)information flows, propagation and responsible governance’. To find out more about the project, visit our website [5]www.digitalwildfire.org or contact [6]helena.webb@cs.ox.ac.uk.

A soft apartheid towards Muslims is emerging in Britain (2016-02-09 08:00)

Submissions to Association of Internet Researchers 2016 (5-8 October, Berlin) now open (2016-02-10 08:00)

Dear colleague,

We are pleased to open submissions for proposals for AoIR 2016: Internet Rules! (Berlin, Germany, 5 - 8 October, 2016). To re-familiarize yourself with the call for proposals and types of submissions solicited, please see here: [1]http://aoir.org/aoir2016/call-for-proposals/.

Accepted paper and panel submissions will be included in our open access
conference paper archive, Selected Papers of Internet Research (SPIR). SPIR helps us further publicize the work of our members and introduce our research to a wider audience. All submissions should follow our SPIR formatting requirements, which includes a consistent header and style format for the papers that will enable people to easily locate author and title information, identify the papers as part of the AoIR conference. This format is only intended to bring consistency to basic elements (such as typeface and spacing), not to impose any disciplinary constraints. You can download a Word template here:

Please note that if you submitted a proposal to the conference through ConfTool last year, you will need to re-register. If you have recently received an email invitation to register as a reviewer, your account will also allow you to submit contributions. When submitting, please take the time to read the submission categories and topics carefully. You may enter a total of four submissions for the conference (understood broadly as presenting a paper to speaking as part of a fishbowl or panel).

If you have any questions about the submission process, please email [3]aoir2016@aoir.org. We look forward to seeing your proposals.

Click below to go o the submission site:

We look forward to your proposals, and to a vibrant and stimulating conference in Berlin!

Sincerely,

Cornelius Puschmann, AoIR 2016 program chair

Towards Digital Social Ontology (2016-02-11 08:00)

This is a brief write up of a talk I gave at the first meeting of the Digital Social Science Forum in January 2016. Digital Social Ontology should be an important part of how we approach Digital Social Science given the ISRF’s commitment towards a “better understanding of social entities and processes” that can be used to solve “subject
specific problems”.

Part of the problem facing the Digital Social Sciences is the vast array of disciplines and approaches being subsumed under this term: Digital Sociology, Digital Anthropology, Digital Geography, Social Informatics, Human-Computer Interaction, Web Science, The Digital Humanities, Data Science, Critical Data Studies, Platform Studies, Software Studies. As a whole these represent a profound restructuring of knowledge production and even academic labour, if we see the ascendancy of Data Science through the lens of the Sociology of Work.

This is why a Digital Ontology to accompany the Digital Social Sciences holds such promise. I would understand Ontology quite straightforwardly as the study of what exists and what existent things have in common. But I think [2]Tony Lawson’s distinction between Ontology in this sense and Ontographology is very useful: the former being the study of things and the latter the study of how those things are theorised.

Given their rapid proliferation, comparative Ontographology could be an important exercise in clarifying the internal structuring of the Digital Social Sciences, as well as identifying convergences and divergences in how they conceive of their often overlapping objects. But it could also be a tool of productive criticism, for instance drawing out contradictions between implicit and explicit ontological commitments.

This would be a matter of mapping ontological issues being confronted across disciplines and fields, asking fundamental questions of philosophical ontology informed by the questions of regional or scientific ontology already being asked within specific disciplines and fields. The concern here would therefore be taxonomic: bringing clarity across fields of study and elucidating key issues where the impulse towards clarification is contentious.

Part of the ambition here would be meta-theoretical: mapping the diversity of different approaches to these questions and bringing them into the same argumentative space. Rather than their current existence as incommensurable paradigms, not permitting of intellectual advancement through dialogue with alternative understandings.

2. [http://www.csog.group.cam.ac.uk/A_Conception_of_Ontology.pdf](http://www.csog.group.cam.ac.uk/A_Conception_of_Ontology.pdf)

**Relating to data through visualisation: three funded PhD studentships in the UK (2016-02-12 08:00)**

*Deadline for applications: 5th March 2016.*

Start date: October 2016.*

Relating To Data: understanding data through visualisation* is a network of three funded PhD studentships which focuses on how people relate to data through their visualisation, the narratives and meanings people attach to visualisations and the potential understanding produced by them. The successful candidates will be located at one of the universities of Leeds, Sheffield or York, depending on the studentship for which they apply (see below). The network brings together supervisors with expertise in data
visualisation, big data/data power and user-centred digital design with two
world-leading and award-winning data visualisation agencies, Clever-Franke (1)[https://www.cleverfranke.com/] and Visualising Data (2)[http://www.visualisingdata.com/]. As such it provides exciting
opportunities for three PhD students interested in the social scientific
study of data in society.

The network is funded by the UK’s ESRC (Economic and Social Research
Council) WRDTC (White Rose Doctoral Training Centre). As such, it is only
open to UK and EU nationals. Applicants who have been resident in the UK
for three years prior to the start date will be eligible for a fees +
maintenance award; applicants not resident in the UK for the three years
prior to the start date will be eligible for a fees only award.

Studentship topic 1: **Developing Visualisation Literacy.**

- Principal Supervisor: Helen Kennedy, Department of Sociological
  Studies, University of Sheffield.
- Co-Supervisor: Alex Hall, Department of Politics, University of York

To apply: *(3)[https://www.sheffield.ac.uk/postgradapplication/]

Studentship topic 2: **Engaging Diverse Users in Visualisation Production
and Evaluation**.

- Principal Supervisor: David Beer, Department of Sociology, University
  of York.
- Co-Supervisor: Rosemary Lucy Hill, Department of Sociology and Social
  Policy, University of Leeds

To apply: *
[4]https://www.york.ac.uk/study/postgraduate/fees-funding/research/esrc/

Studentship topic 3: **Measuring Visualisation Engagement.**

- Principal Supervisor: Christopher Birchall, School of Media and
  Communications, University of Leeds.
- Co-Supervisor: Paul Clough, Information School, University of
  Sheffield

To apply: *

For more information about the network and the studentships, visit
contact the academic lead, Helen Kennedy, for more information.

On ‘disruption’ and ‘innovation’ (2016-02-13 08:00)

Even though I believe the concepts of ‘innovation’ and ‘disruption’ refer to sociologically significant phenomena, I cringe slightly whenever I hear someone use the terms. Particularly in the case of the latter, a whole theory of social change at the meso level is implicit within it: it’s deeply ideological and we need to unpack it, rather than reinforce it by invoking the concept of ‘disruption’.

Part of the problem here is analytically distinguishing between the trends these concepts invoke and the discursive resources they provide for managers to give an account of their organisation. On this note, the following infographic was interesting to come across, even if the appropriate resolution leaves it so small as to be difficult to read:

A search of annual and quarterly reports filed with the Securities and Exchange Commission shows companies mentioned some form of the word “innovation” 33,528 times last year, which was a 64% increase from five years before that.

More than 250 books with "innovation" in the title have been published in the last three months, most of them dealing with business, according to a search of [1]Amazon.com.

As a descriptive term, used to refer to what Eric Schmidt defines as items that are both surprising and offer new
functionality (*How Google Works* loc 2909), I have no problem with the notion of 'innovation'. The difficulty comes in how it’s drawn upon as a matter of reflex to aggrandise things that are lacking on one count and/or the other. Interestingly, this isn’t something confined to technology firms:

And inevitably, where there is bullshit, there is an army of consultants whose fortunes are tied to upholding the perceived intellectual legitimacy of this bullshit in order that they can continue to peddle it:

The innovation trend has given birth to an attendant consulting industry, and Fortune 100 companies pay innovation consultants $300,000 to $1 million for work on a single project, which can amount to $1 million to $10 million a year, estimates Booz & Co. innovation strategy consultant Alex Kandybin. In addition, four in 10 executives say their company now has a chief innovation officer, according to a recent study of the phenomenon released last month by Capgemini Consulting.

But as the WSJ article goes on to note, of the 4 in 10 global corporations which now have a chief innovation officer, "an online survey of 260 global executives and 25 in-depth interviews, suggest that such titles may be mainly ‘for appearances.’" The slippage between the two uses of the term has material consequences: invoking ‘innovation’ to account for what we are *already* doing in more positive terms leads to an apparatus of innovation emerging within the organisation. In other words, ‘disruption’ and ‘innovation’ talk aren’t just window dressing, in the sense that the entrenchment of this discourse has intra-organisational implications. Note: I’m not saying these changes have any capacity to produce disruption or innovation in the *descriptive sense*, only that these are real changes rather than mere talk.

Should academics blog? (2016-02-15 08:00)

In this video from a workshop I did in Hull last year, I rather unsurprisingly say 'yes' to the question 'should academics blog?'
I just surprised myself by sitting through this entire 40 minute compilation of Donald Trump's insults during the Republican primaries:
I found them weirdly hypnotic, albeit intellectually deadening. Perhaps [2]this explains the strange quality of Trump's speech?

Podcasts: Towards a Digital Social Ontology (2016-02-17 08:00)

Podcasts from the [1]Centre for Social Ontology's symposium last year:
International Summer School: Social Studies of Algorithms (2016-02-18 07:15)

Call for applicants: Summer School of the International Algorithm Studies NetworkPlease disseminate widely

Date: 4-8 July, 2106 Place: Stockholm, Sweden

Algorithms are everywhere! This international summer school explores the increasing importance of algorithms in society and the socio-cultural transformations that this tendency implies. The point of departure is that algorithms become implicated in society and culture: for example in media narratives, in mundane artefacts, or in organizations. Through their output and functioning, algorithms come to classify, hierarchize, value and shape different social phenomena, often well beyond their initial purpose.

The aim of this summer school is to address algorithms through a number of themes that shine light on different aspects of algorithms in society and culture: in big data, music, law, surveillance and medicine. The summer school takes place at a few thematically chosen venues in Stockholm: at some government agencies and private organizations. How do these organisations work with algorithms and how can we as scholars understand their omnipresence?

Themes

Algorithms and Music
Algorithms and Law
Algorithms and Surveillance
Algorithms and Big Data
Algorithms and Medicine

Confirmed Teachers
Baki Cakici (Goldsmiths, University of London) Bill Maurer (University of California, Irvine) CF Helgesson (Linköping University) Dennis Broeders (Erasmus University Rotterdam) Evelyn Ruppert (Goldsmiths, University of London) Nick Seaver (Tufts University) Pelle Snickars (Umeå University) Philip Roscoe (University of St. Andrews)

Where
The summer school will take place in beautiful summer Stockholm: the home town of Spotify, Dice, Paradox Interactive, Minecraft, the Pirate Bay, Candy Crush, and countless other digital actors and phenomena. The school is hosted by the Department of Thematic Studies: Technology and Social Change at Linköping University, Sweden.

Who should apply?
The summer school invites doctoral students from the social sciences and the humanities.

Application and Deadline
Fill in the application form below as well as a 500 word motivation on how the issues addressed in this summer school is relevant for your research. Attach your CV.
Send applications to: [1]algorithmnetwork@gmail.com.

Deadline: Friday, 18 March 2016. Participants will be notified no later than March 31. Reading lists and more information will be sent out in the beginning of June.

The summer school is free to attend. Participants will pay for and arrange their own accommodation and most
meals. Some accommodation with fellow participants will be available, but we welcome your own arrangements.

In the application please note: full name, affiliation, address, dietary restrictions. Please also note if you are interested in staying with a fellow participant.

[2] Call for Applicants feb 17

Call for Abstracts: Themed Issue on Body Weight and Digital Media (2016-02-18 08:00)

This themed issue, to be edited by Deborah Lupton, focuses on the ways in which digital media and technologies are used to represent and manage body weight and size. It will be published in the journal [1]Fat Studies: An Interdisciplinary Journal of Body Weight and Society. Fat Studies is the first academic journal that critically examines theory, research, practices, and programs related to body weight and appearance.

If you are interested in contributing to this themed issue, please send Deborah ([2]deborah.lupton@canberra.edu.au) an article title and an abstract of 200-250 words outlining what you would propose to cover by 29 February 2016. Final submissions should be no longer than 7,000 words, including the abstract, all notes and references.

In keeping with the journal’s emphasis on ‘body weight and society’, the themed issue will include contributions that address the following and related topics from a critical sociocultural perspective:

- representations of body weight and size in the digital news media (and also how readers may comment on news reports online)
- apps and wearable devices for weight control, physical fitness and energy expenditure
- selfies and body size
- the discussion and portrayal of such issues as weight loss, body size, fat activism, thinspo, fitspo, pro-ana, pro-mia and fat pornography and erotica in blogs, social media platforms and other websites
- big data and body weight

If your abstract is accepted, the following deadlines apply:

- Full papers by 31 May 2016
- Revised final versions by 30 August 2016
Contribute to the Warwick Sociology Journal (2016-02-18 08:00)
Warwick Sociology Journal is a student-founded and led sociological journal seeking to publish high-quality undergraduate and postgraduate work. We are currently accepting student submissions for our Spring issue and would love to receive any essays, articles or reviews you have produced.

Please send papers for our consideration to [sociologyjournal@warwick.ac.uk](mailto:sociologyjournal@warwick.ac.uk). The submission deadline for our Spring issue is midnight on Friday 26th February, 2016. We welcome contributions from students from any discipline, so long as the work in question has clear sociological relevance. Please note we require submissions to be Harvard referenced and at a maximum of 7,500 words. Please don't hesitate to get in touch with any queries.

We look forward to hearing from you!
Feel free to follow us on twitter @sociojournal

A brief introduction to Niklas Luhmann's concept of society (2016-02-18 18:45)

There's a definite lack of English language resources online related to Luhmann. Does anyone have suggestions we could add to the attached?
By knowing more about society as a concept, we can see that society relates to and shapes people and populations. It can act as a set of rules and can constrain people in important ways.

Public health practice might seek to act on the overarching concepts that sustain society, for example by defining and building on concepts of health and illness, social justice, public health, and the underpinning mechanisms that produce inequalities. Society is also constructed out of multiple realities and by knowing about these we can see that each public health problem may in fact be composed of many different dimensions.

But in order to deal with this chaos, we create th
Special Issue of Discover Society on Digital Futures (2016-02-19 08:00)

Co-edited by Mark Carrigan and William Housley

Social media is conventionally located within a commercial narrative that theorises an array of emerging ‘disruptive technologies’ that includes big data, additive manufacture and robotics. These and related technologies are underpinned by computational developments that are networked, distributed, digital and data driven. It has been argued that these technologies not only disrupt markets; but also wider social and economic relations and organization. These include social institutions such as the family, work, health care delivery, education, relationships and the ‘self’.

Social media is one of the first waves of digital disruptive technologies whose mass global take-up via multiple platforms is still being assessed and understood, as a social force in it’s own right. Standardly, ‘social media as data’ has provided a plethora of studies and projects that have examined the big and broad social data opportunities provided by the social media for understanding populations on the move 'in real time'.

In some cases this has led certain commentators to enthusiastically claim that the analysis of social media as data offers opportunities for prediction and the forecasting of behavior at the population level although this rhetoric is not without it’s skeptics and critics. Furthermore, these methodological opportunities and oracular imaginaries are being accompanied by an ‘ontological velocity’ generated by the social and economic implications of social media as data, practice and a globalizing networked communicative force that is shaping being and becoming in the digital age. A key issue here is the relationship between social media, society, time and the ‘future making’ capacities and affordances of these and allied technologies.

Yet little work has been carried out on the temporal ramifications of social media (and other disruptive technologies) in relation to emerging digital ‘timescapes’. To this extent the study of the relationship between social media and society remains under conceptualized especially in relation to our understanding of late modernity at the beginning of the 21st century. The relationship between social media and the social generation of risk, it’s contributions to new digital timescapes and the trajectory of the self and identity alongside empirical concerns is sociological work in waiting. In addition to this social media as a mass networked ‘digital agora’ can also be understood as a reflexive space in and through which different agents and actors are imagining the future in a variety of ways. In temporal terms the networked character of social media is characterized by instantaneity, commodification, time space compression, temporal colonization and social control. This is inclusive of a digital discursive terrain where different agents promote specific framings of the future, inclusive of the social imagining of new technologies and ‘social futures’ more generally, via social media platforms and communications. Thus, it is in this context that this proposed panel aims to consider the role of time, temporality and digital futures in relation to social media and society. For this special issue of Discover Society we welcome short articles (1500 words) that relate to the above and the following topics:

- Social Media, Timescapes and Futures
- Social Media, Prediction and Critical Data Imaginaries
• Visioneering, ‘Futures’ and Social Media

• Tracing Emerging Technologies in the Digital Agora

• The Future of Social Networks: Social Organization, Data and Engineering

• Digital Afterlives? Social Media, Time, Traces and Accountability

See the Discover Society website for more details about [1]formatting requirements. The final articles will be required by December 1st 2016. If you intend to submit an article, please contact [2]Mark Carrigan to discuss your contribution.

Deadline TOMORROW: Digital Methodologies – Beyond Big & Small Data (2016-02-20 08:00)

Digital Methodologies: Beyond Big & Small Data
9th International Conference on Social Science Methodology (RC33)
September 11th – 16th, 2016, University of Leicester ([1]http://www.le.ac.uk/)

Session Organizer
Christian Bokhove, University of Southampton, United Kingdom,[2]C.Bokhove@soton.ac.uk
Mark Carrigan, University of Warwick, United Kingdom, [3]mark@markcarrigan.net
Sarah Lewthwaite, University of Southampton, United Kingdom,[4]s.e.lewthwaite@southampton.ac.uk[5] Richard Wiggins, Institute of Education, United Kingdom [6]r.wiggins@ioe.ac.uk Session Abstract In recent years the challenge of Big Data has become a dominant theme within discussions of social science methodology. But these debates have too often been played out within a limited methodological frame of reference, in which the virtues and vices of Big Data are counterpoised or the call is made to supplement Big Data with Small Data. This stream will critically analyse this methodological framing of Big Data, its strengths and limitations, with a view to developing digital methodologies which move beyond Big Data and Small Data. In doing so, we hope the stream will also addressed a broad range of related issues, such as:

• The methodological challenge of big data and digital social research
• The practical challenges of mixed methods approaches to digital social research
• The role of theoretical ideas in digital methodologies
• The relationship between Virtual Methods, Digital Methods, Technology Enhanced Methods etc.
• The methodological utility of data mining and the dangers of data fishing
• The continued utility of sampling in digital social research, for example with regard to collection methods involving Amazon’s Mechanical Turk and Twitter streams.
• What are the ethical and social implications of linking and accessing administrative data?
• What are the implications for epistemologies, data collection and analysis of the pace of change in which social life is increasingly played out online?

The stream seeks to incorporate technical issues pertaining to digital methods into a broader discussion of the impact of digital methodologies. We are particularly keen to receive papers that reflect upon and bridge existing methods and draw out a vision for the future of social science research and practice. The session is organised jointly between the Independent Social Research Foundation’s Digital Social Science Forum and the International Journal of Social Research Methodology. **DEADLINE: 21st February, 2016 Submission Instructions:**

1. To submit a paper abstract for the RC33 9th International Conference on Social Science Methodology, you should visit: [7]http://www2.le.ac.uk/departments/sociology/research/rc33-conference After landing on the homepage, navigate to 'Abstract Submission', which appears in the top left hand column of the webpage, see image below:

![Abstract Submission](image)

2. Complete the form in full. You may wish to cut and paste your abstract into the Abstract field from another document.

3. Choose the relevant session for your stream. To do so you will need to select the relevant lead session organiser from the drop-down menu highlighted in the image below. To check you are submitting to the correct session, you can view a table of sessions and session convenors by clicking the link entitled ‘View the list of sessions and session convenors’. Once complete, click submit.
Unpicking the political economy of digital cats (2016-02-21 08:00)

Much deserved [1] Guardian coverage of the weird phenomenon that is the internet cat video festival. What grips me about things like this is not the fact that people are trying to make money from their cats, but rather that many others people are trying and failing to make money from their cats. Not unlike the aspiring professional pick up artists, though you'll have to read [2] this brilliant paper to see what I'm getting at.

I'm increasingly convinced that a tendency to '[3]publicize successful outliers to propagate the illusion' can be seen across the web, as a few people who make a living within a novel field wilfully co-operate with platform
providers to promulgate the notion that other people could do this too. The result is inevitably a rather off-putting stampede of aspirants which must be read against the background of contracting structures of opportunity which can be seen across more established sectors within an increasingly low-wage and precarious economy.

There's an interesting BBC programme about the rise of Vloggers which has left me thinking about this:
[4]http://www.bbc.co.uk/iplayer/episode/b06zw04s/rise-of-the-supers tar-vloggers It’s very descriptive but it’s interesting to see these people asked about what they’re doing now and how it relates to what they were doing previously.

   g-man

The peak experiences of intensified work (2016-02-22 08:00)

In the Hard Thing About Hard Things, Ben Horowitz recounts his experiences of his company Loudcloud coming close to failure. At a climatic moment, he makes a speech to his staff declaring the commitment they will have to show over the coming months. From pg 48:

“I have some bad news. We are getting our asses kicked by BladeLogic and it’s a product problem. If this continues, I am going to have to sell the company for cheap. There is no way for us to survive if we don’t have the winning product. So, I am going to need every one of you to do something. I need you to go home tonight and have a serious conversation with your wife, husband, significant other, or whoever cares most about you and tell them, ‘Ben needs me for the next six months.’ I need you to come in early and stay late. I will buy you dinner, and I will stay here with you. Make no mistake, we have one bullet left in the gun and we must hit the target

He initially feels guilty about asking them to entirely subordinate their lives to the company during this difficult time. But years later, he discovers that perhaps his staff enjoyed the experience when one says this. From pg 48-49:

Of all the times I think of at Loudcloud and Opsware, the Darwin Project was the most fun and the most hard. I worked seven days a week 8 a.m.–10 p.m. for six months straight. It was full on. Once a week I had a date night with my wife where I gave her my undivided attention from 6 p.m. until midnight. And the next day, even if it was Saturday, I’d be back in the office at 8 a.m. and stay through dinner. I would come home between 10–11 p.m. Every night. And it wasn’t just me. It was everybody in the office. The technical things asked of us were great. We had to brainstorm how to do things and translate those things into an actual product. It was hard, but fun. I don’t remember losing anyone during that time. It was like, “Hey, we gotta get this done, or we will not be here, we’ll have to get another job.” It was a tight-knit group of people. A lot of the really junior people really stepped up. It was a great growing experience for
them to be thrown into the middle of the ocean and told, “Okay, swim.” Six months later we suddenly started winning proofs of concepts we hadn’t before. Ben did a great job, he’d give us feedback, and pat people on the back when we were done.

Can we see this as the pleasures and challenges of acceleration? While it’s important not to assume that because one relatively senior figure enjoyed the experience then all did, it’s nonetheless an experience which I think ought to be treated seriously. As I’ve argued here, there are pleasures to be found in acceleration:

1. Time-pressure can be a symbol of status and flaunting it can represent one of the few socially acceptable forms of conspicuous self-aggrandisement available.
2. Time-pressure can reduce the time available for reflexivity, ‘blotting out’ difficult questions in a way analogous to drink and drugs.
3. Time-pressure can facilitate a unique kind of focus in the face of a multiplicity of distractions. If we accept that priorities are invested with normative significance (i.e. they matter to us in direct and indirect ways) then prioritisation can be pleasurable. This can take the form of people who rely on deadlines to ensure things get done. More prosaically, it can undercut procrastination by leaving one with finite temporal resources to utilise for non-negotiable obligations.
4. Time-pressure can leave us feeling that we are living life most fully. If the good life is now seen as the full life then living fast feels like living fully.

Periods of collective crisis within an organisation represent acceleration of a particular sort: temporally bounded and intensely sociable. I think something of this is conveyed in the way Horowitz elsewhere talks of the distinction between being a ‘wartime CEO’ and ‘peacetime CEO’.

The Sociology of Executive Coaching (2016-02-25 08:00)

As you may know, executive coaching is an increasingly common phenomenon, particularly in some sectors like tech. This is how Eric Schmidt and his co-author describe the necessity of it in How Google Works loc 2440:

Whenever you watch a world-class athlete perform, you can be sure that there is a great coach behind her success. It’s not that the coach is better at playing the sport than the player, in fact that is almost never the case. But the coaches have a different skill: They can observe players in action and tell them how to be better. So why is it that in the business world coaches are so unusual? Are we all like Eric when he started at Google, so confident of ourselves that we can’t imagine someone helping us to be better? If so, this is a fallacy.

As a business leader, you need a coach. The first ingredient of a successful coaching relationship is a student who is willing to listen and learn. Just like there are hard-to-coach athletes, there are hard-to-coach executives. But once they get past that initial reticence, they find there are always things to learn. Business coaches, like all coaches, are at heart teachers, and Bill Campbell, the best coach around, tells us he believes that management is a skill that is completely learnable.
This is something which suggests an obvious comparison to sports, not just in terms of the language used to describe this relationship. James Surowiecki, author of Wisdom of Crowds, draws out the connection in an interesting essay about the increasing competitive advantage accrued when performance is already at a top level:

The key part of the "performance revolution" in sports, then, is the story of how organizations, in a systematic way, set about making employees more effective and productive. This, as it happens, is something that other organizations started doing around the same timeline.

But can managerial performance really be measured in these terms? I don't think it can and the belief to the contrary strikes me as a really interesting conceit, reflecting interestingly on the culture of managerialism: a kind of moral athleticism amongst prominent CEOs in which they aspire to be all that they can be.

If we look at the same phenomenon further down the organisational ladder, we get to enforced performance reviews and sanctions ensuing from a failure to meet imposed expectations. We get to sleepless nights and diffuse anxiety saturating into everyday life, all generated by concerns over ‘performance’. Coaching still exists but it becomes a very different phenomenon, as this interview I did about the sociology of work-life coaching suggests:

Coaching usually consists of individual or group meetings that continue for a few months. In the beginning of these meetings, a goal is set for the whole coaching process, and then the process continues with for example personality tests or exercises that the clients do in order to achieve the set goal. The coaches that I interviewed were often a bit vague in their answers when I asked about the specific practices of coaching. They would rather talk about 'realising the inner potential of the individual', though what this means specifically is rather unclear.

In general, it seems that coaching is for most part about discussing one’s hopes and realities with the coach and getting feedback for both the exercises and tests and for the plans that one has and the actions that one takes. The focus on ‘potential’ is telling of how coaching is quite oriented towards the future but at the same time relies on something that is thought to already exist within the self. As it happens, coaching concentrates on the individual. This means that all the work that is done in coaching centers on changing oneself in order to achieve the goals that one wants to achieve.

This is reflected in the practices of coaching in the sense that they demand self-reflexivity and focus on getting to know oneself and reflecting for instance on one’s personality with the help of tests and exercises. In terms of employment, this means that questions that concern wider social structures or even organisational structures are left outside the scope of the things one needs to change. It thus begins to seem that change always starts within the individual self – and also that if there is a need for change it is the self that is at fault. In the case of unemployment then, for example, the structural reasons for unemployment are not accounted for but rather it is thought that if the individual just works hard enough to change themselves then they will also find employment – and if one is unemployed it just means that one has not yet found the ‘true self’ and the right goals that would solve the problem. In other words, if one does not find work, it is implied that this just means that one has not worked hard enough on improving oneself.

As a relational technology of the self, work coaching has to be read against the background of metricisation. It naturalises metrics and their attendant apparatus of control, scrutiny and intervention. The issue becomes a narrow one of 'performance' rather than one's place over time within an organisation.

I’ve nonetheless become a bit obsessed with Bill Campbell. He turns up time and time again in business books about Silicon Valley. It also turns out he was actually a football coach originally:

Son of a local school official, Campbell was born and raised in Homestead, Pennsylvania, near Pittsburgh. He attended Columbia University where he played football under coach Buff Donelli from 1959 to 1961. In his senior year, he was named to the All-Ivy Team. He graduated in 1962 with a bachelor’s degree in economics. In 1964, he obtained a master’s degree in education from Teachers College, Columbia University.[2] He was head coach of Columbia’s football team, the Columbia Lions from 1974 to 1979. Prior to this he was an assistant at Boston College for six years. He met his first wife, the former Roberta Spagnola, while she was the assistant dean in charge of Columbia’s undergraduate dormitories.

He joined J. Walter Thompson, the advertising agency, then Kodak where he rose to run Kodak’s European film business. Hired by John Sculley he became Apple’s VP of Marketing, then ran Apple’s Claris software division. When Sculley refused to spin Claris off into an independent company, Campbell and much of the Claris leadership left. Since 1997, when Steve Jobs returned to Apple, Campbell has served as a corporate director on Apple’s board of directors.

Campbell became CEO of GO Corporation, a startup pioneering a tablet computer operating system. After successfully selling GO Eo to AT&T Corporation in 1993, Campbell was CEO of Intuit from 1994 to 1998. Campbell announced that he would be retiring as the Chairman of the Board of Directors at Intuit starting January 2016.[3]

Campbell is an adviser to a number of technology companies, and was elected Chairman of the Board of Trustees at Columbia in 2005.

According to CNN Money, he is worth $200 million.[4]

To what extent is it a marker of prestige to be coached by Campbell? Is it still a status symbol for lesser executives to be coached by lesser coaches? Do these celebrity coaches and celebrity clients underwrite the demand elsewhere? Do all these coaches have top level business experience?

SHARE THIS:
The Messianic Zeal of Eric Schmidt (2016-02-26 08:00)

A bit later in [1]Battle of the Titans, Fred Vogelstein transcribes a talk he saw Eric Schmidt give at a technology conference. From loc 1904-1918:

We have a product that allows you to speak to your phone in English and have it come out in the native language of the person you are talking to. To me this is the stuff of science fiction. Imagine a near future where you never forget anything. [Pocket] computers, with your permission, remember everything—where you’ve been, what you did, who you took pictures of. I used to love getting lost, wandering about without knowing where I was. You can’t get lost anymore. You know your position to the foot, and by the way, so do your friends, with your permission. When you travel, you’re never lonely. Your friends travel with you now. There is always someone to speak to or send a picture to. You’re never bored. You’re never out of ideas because all the world’s information is at your fingertips. And this is not just for the elite. Historically, these kinds of technologies have been available only to the elites and not to the common man. If there was a trickle down, it would happen over a generation. This is a vision accessible to every person on the planet. We’re going to be amazed at how smart and capable all those people are who did not have access to our standard of living, our universities, and our culture. When they come, they are going to teach us things. And they are coming. There are about a billion smartphones in the world, and in emerging markets the growth rate is much faster than it is anywhere else. I am very excited about this.

I don’t think it’s hyperbolic to suggest this vision can and should be analysed using the conceptual resources provided by the Sociology of Religion. In fact Schmidt has[2]apparently used that term himself:
But what would such a study look like in practice? I don’t think I’m qualified to do it but I’d love to help someone with a background in this area who is interested in this topic. Given the power wielded by devotees of this nascent religion, with [3]only 5 tech companies sitting on $430 billion in cash between them, it seems urgent to better understand how these new elites interpret their own place within the world and orientate themselves to it.

1. [http://www.amazon.co.uk/Battle-Titans-Transforming-Previously-Published-ebook/dp/B00CW6F060](http://www.amazon.co.uk/Battle-Titans-Transforming-Previously-Published-ebook/dp/B00CW6F060)

Inside America’s For-Profit Bail System (2016-02-27 08:00)

A fascinating documentary by Vice about the $2 billion per year bail bond industry in the US. At present the US and the Philippines are the only countries in the world to commercial bail. But how long until we see it elsewhere?
Have any readers seen this film yet? Was it impressive? I’ve heard good things and I’m trying to track down a copy, as this could be a potential film for our first Sociological Imagination film night in Manchester this summer.
Two upcoming events at the Centre for Social Ontology (2016-02-28 13:30)

A workshop on the morphogenetic approach:

June 21st, 10am to 5pm
The University of Warwick

This one day workshop is intended for those currently using or planning to use the morphogenetic approach in their research. In the first half of the workshop, Margaret Archer will give an overview of the morphogenetic approach and its development, as well as address conceptual and methodological questions that participants might have. In the second half of the workshop, there will be plenty of time to present work-in-progress or planned projects, get feedback and discuss with others who are doing similar work.

If you'd like to participate then please e-mail mark@markcarrigan.net with a brief biography and description of your project.

A workshop on investigating the internal conversation:
Reflexivity Forum  
10am-5pm, May 24th 2016  
R1.04, University of Warwick

Following from a successful initial meeting last year, this event will be the first of a hopefully ongoing series of events aimed at those investigating human reflexivity through empirical research. The ‘internal conversation’ was developed by Margaret Archer as a solution to the problem of structure and agency: a mediating mechanism that accounts for how society’s objective features influence its members to reproduce or transform society through their actions. Since initially discussed in Being Human, this account of human reflexivity has been developed through a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

The event is free but registration is essential. If you would like to speak at the event, presenting a work in progress, please register by March 31st with a title and 100 word abstract. If you would like to attend then please register by April 30th.

To register contact mark@markcarrigan.net

Early Career Researcher Event @TheSocReview: A Master-Class with Professor Éric Fassin (2016-02-28 13:32)

The Sociological Review Foundation invites applicants to take part in a masterclass with Éric Fassin, who will delivering our [1] Annual Public Lecture on the same day at SOAS at 6pm.

The master-class will explore:

- How are sex, gender and sexuality racialised in contemporary Europe and the world?
- In what ways are nation-states implicated in sexual politics and identities?

If your research involves thinking through the intersections of race, nation, migration, sexualities and gender, this masterclass offers a wonderful opportunity to work through critical issues in your work with Éric Fassin.

Format

- All participants will read Éric’s work (circulated in advance).
• Each participant will prepare a 3 minute presentation about their research – highlighting a particular issue they are struggling for Éric and the group to discuss.

• The masterclass will be 2 hours long. It will begin with some introductory remarks from Éric and then proceed with the presentations and group discussion.

Application

This event is FREE but places are limited to 10 people. To apply for a place, please fill in [2] this online application form by 5pm on 1st March 2016.

Applicants will be notified by 1st April 2016.

Please note: ECR means PhD students or postdocs (within 3 years of award of doctorate)

Any questions may be directed to [3] Brigit McWade: [4] b.mcwade@lancaster.ac.uk

About Professor Éric Fassin

After teaching in the United States from 1987 to 1994 (at Brandeis University and New York University), and at the École normale supérieure in Paris from 1994 to 2012, Éric Fassin is now a professor of sociology in the Political Science Department and co-chair of the Gender Studies Department at Paris 8 University. He is a founding member of the new Laboratoire d’études de genre et de sexualité – Research Center on Gender and Sexuality Studies (LEGS, CNRS / Paris 8 / Paris 10). His work focuses on contemporary sexual and racial politics, including immigration issues, in France, in Europe, and in the United States – often in a comparative perspective. He is frequently involved in the French public debates on issues his work addresses – from same-sex marriage and gender parity to the politics and policies of immigration and race, but also on the evolution of the left. In English, he has regularly published in French Politics, Culture & Society, French Historical Studies, Public Culture, differences, Contemporary French Civilization.

Foucault at 90 (2016-02-29 08:00)
International Conference

University of the West of Scotland [1]Ayr Campus, Scotland, UK

Call for Papers
This year marks the 90th anniversary of the birth of the French thinker Michel Foucault (1926-84). This interdisciplinary conference aims to reflect on the work of Michel Foucault and in particular on the question of its abiding relevance and value.

Keynote speakers include Stephen Ball, Mark Olssen, and Clare O’Farrell. Based at our attractive [2]Ayr campus, on the scenic west coast of Scotland, this conference promises to be a stimulating and enjoyable event.

My main areas of interest are in education policy analysis and social theory. 1 - Changes in governance and new state modalities. 2 - The Global Education Reform Movement. 3 - The relationships between education and education policy and social class. I bring to bear on these issues the tools and concepts of "policy sociology" and in particular the methods of Michael Foucault and Pierre Bourdieu. In 2008, I was involved in launching the BERA Social Theory and Education SIG.

Professor Mark Olssen:[4]http://www.surrey.ac.uk/politics/ people/mark _olssen/

Dr Clare O'Farrell:[5]http://staff.qut.edu.au/staff/o farrell

Clare continues her work on Foucault. She:

- has written [6]two books on Foucault
- edited a [7]large volume on Foucault's work
- was a founding editor of the first four issues of the online international peer-reviewed journal,[8]Foucault Studies
- runs a [9]major website on Foucault
- runs a [10]blog with occasional Foucault content.
runs a [12]reading group dealing with the work of Michel Foucault.

Research paper submissions are now sought on the conference themes listed below. Abstracts should be up to 400 words in length and cover the context of the research, research questions, theoretical framework, methodology, findings, significance. Abstracts should be readied for blinded peer review. The conference will run as a series of 90-minute sessions with 3 or 4 papers allocated to each.

Symposia: the conference welcomes submissions for symposium sessions. These should comprise a set of four or more related paper submissions (as above) with an agreed Chairperson and Discussant.

Posters: posters will be displayed throughout the conference, with a set time agreed for presenters to be available to discuss their work with conference delegates. Posters should be submitted in A1/upright form and be accompanied by a 250 word abstract.

Conference/Abstract themes:

The conference seeks papers which deal with the work of Foucault in relation to any of the following themes:

- Education
- Health
- Justice
- Criminology
- Psychiatry/Psychology
- Methodology
- Sexuality
- Culture/aesthetics
- Philosophy
- Politics
Key dates

- Abstract submission opens (papers/posters/symposia) 15th October 2015
- Abstract submission ends March 1st 2016
- Notification of peer review/abstract acceptance March 22nd 2016
- Early Bird Registration commences 15th February 2016
- Presentation times announced 15th April 2016
- Early Bird Registration ends March 22nd 2016

Conference fees

**before 1st May 2016**
**after 1st May 2016**

**Delegate**
£149  
£179

**Postgraduate student**
£99  
£129
Registration fee includes:

- Conference pack and programme booklet (issued at the registration desk)
- Lunch on each day, coffee and snacks during breaks
- Registration fee does not include the cost of evening meals or hotel

Contact

Abstract submissions should be emailed by attachment to: foucaultconference@uws.ac.uk

Please select the option applicable to you below. This will take you to the online shop

- [14] Postgraduate Student Early Bird £99 (before 1st May 2016)
- [15] Postgraduate Student £129 (after 1st May 2016)
- [16] Delegate Early Bird £149 (before 1st May 2016)
- [17] Delegate £179 (after 1st May 2016)

7.3 March

Zygmunt Bauman on the trap of social media (2016-03-01 08:00)

I'm not convinced by Bauman on this topic (increasingly true of all his other topics as well) but some of our readers might find [1]this interview interesting:

The question of identity has changed from being something you are born with to a task: you have to create your own community. But communities aren't created, and you either have one or you don't. What the social networks can create is a substitute. The difference between a community and a network is that you belong to a community, but a network belongs to you. You feel in control. You can add friends if you wish, you can delete them if you wish. You are in control of the important people to whom you relate. People feel a little better as a result, because loneliness, abandonment, is the great fear in our individualist age. But it's so easy to add or remove friends on the internet that people fail to learn the real social skills, which you need when you go to the street, when you go to your workplace, where you find lots of people who you need to enter into sensible interaction with. Pope Francis, who is a great man, gave his first interview after being elected to Eugenio Scalfari, an Italian journalist who is also a self-proclaimed atheist. It was a sign: real dialogue isn't about talking to people who believe the same things as you. Social media don't teach us to dialogue because it is so easy to avoid controversy... But most people use social media not to unite, not to open their horizons wider, but on the contrary, to cut themselves a comfort zone where the only sounds they hear are the echoes of their own voice, where the only things they see are the reflections of their own face. Social media are very useful, they provide pleasure, but they are a trap.

Kieran (2016-03-01 08:44:32)
I'm doing research around users of legal highs and online 'communities' at the moment, and I can see what Bauman is saying - especially in terms of social media 'echo chambers' - but conversely many of my participants simply cannot find a community (offline) to engage with others in their interests (trying novel substances, harm reduction), and so the online community formed 'naturally' online as like-minded individuals with similar interests, out of necessity, came together. I suppose this is the difference between this type of self-sustaining 'organic' community and the social media 'network' which is ready-made for you to recreate (or not) your existing offline or online communities: the latter facilitates existing communities by providing a digital network which you can control, edit and manipulate to your suiting. In a community that control is much less a conscious individual decision and very much a group decision or process. In this sense then, are social media networks both less 'organic' and less democratic than online or traditional offline communities? At any rate this has been an interesting aspect to consider in terms of my research, so thanks!

Call for papers: Legacies of the Tricontinental, 1966-2016: Imperialism, Resistance, Law (2016-03-02 08:00)

CALL FOR PAPERS

Legacies of the Tricontinental, 1966-2016: Imperialism, Resistance, Law

22-24 September 2016
Centre for Social Studies, University of Coimbra, Portugal

Deadline for abstracts: 1 May 2016

The conference organisers invite paper proposals for a transdisciplinary conference marking the 50th anniversary of the 1966 Tricontinental Conference. The conference aims to reflect on the Tricontinental’s enduring political, legal and economic importance, while also bringing together academics and activists to reflect on broader issues of imperialism and anti-imperial resistance.

We welcome papers on both the Tricontinental itself and related topics. Topics include, but are not limited to:

- The history and significance of the Tricontinental
- Theoretical and historical legacies of the Tricontinental and ‘tricontinentalism’: Third World Marxisms, Third World Approaches to International Law (TWAIL), postcolonialism, global subalternity
- Anti-imperialist struggle then and now
We seek contributions from scholars and activists with an interest in imperialism and anti-imperialism, regardless of disciplinary affiliation.

Plenary speakers include Professor Richard Drayton, with more speakers to be confirmed soon.

We welcome both paper and panel proposals. Abstracts of up to 250 words should be sent to tricontinental50@gmail.com by no later than 1 May 2016. For panel proposals, please include a brief description of the proposed panel as well as contact information and abstracts for all participants.

Conference organisers are in contact with publishers and selected papers will be invited for publication in a special journal issue and/or edited collection.

Further information can be found at the conference website: www.tricontinental50.net

Organising committee: Teresa Almeida Cravo (Coimbra), Tor Krever, (LSE/Coimbra), Robert Knox (Liverpool), Christopher Gevers (KwaZulu-Natal), Luis Eslava (Kent), Christine Schwöbel-Patel (Liverpool)

Conference Abstract

The 1966 Solidarity Conference of the Peoples of Africa, Asia and Latin America, or Tricontinental Conference as it is better known, remains one of the largest gatherings of anti-imperialists in the world. More than 500 representatives from the national liberation movements, guerrillas and independent governments of some 82 countries gathered in Havana, Cuba to discuss the burning strategic questions confronting the anti-imperialist movement of the day. Amongst the delegates were some of the most important figures in the anti-imperialist movement including Fidel Castro, Che Guevara, Salvador Allende and Amilcar Cabral.

Building on the earlier 1955 Bandung Conference and 1964 UN Conference on Trade and Development (UNCTAD), the Tricontinental represented the extension, into the Americas, of Afro-Asian solidarity begun at Bandung.
As such, the Tricontinental marked a highpoint in the emergence of a non-aligned movement and the construction of a Third World anti-imperialist project. At the same time, the Tricontinental represented a break with those earlier efforts. Whereas Bandung was a relatively modest affair, in which the various political currents in the Third World came together to articulate a minimum programme, the Tricontinental was avowedly more radical, explicitly attempting to align anti-imperialism with a wider challenge to capitalism. In the words of Mehdi Ben Barka, Moroccan socialist leader and organiser of the Conference, the Tricontinental aimed to 'blend the two great currents of world revolution: that which was born in 1917 with the Russian Revolution, and that which represents the anti-imperialist and national liberation movements of today'. Indeed, the Conference featured leftist guerrillas who were busy fighting against their own Third World governments.

In keeping with this radical orientation, the Conference condemned imperialism, colonialism and neo-colonialism, declaring its solidarity with the Vietnamese struggle against the United States. The Conference called more widely for solidarity amongst the radical currents in the Third World and debated what role they would take in relation to the United Nations. In so doing, the Conference created much controversy in the developed world, becoming the target of numerous attempts at subversion.

The Tricontinental was a large influence on the Non-Aligned Movement. In fact, its legacy includes a whole host of developments. On the legal front, General Assembly Resolutions such as the Friendly Relations Declaration and the Declaration of the New International Economic Order flowed directly from the Conference. Similarly, the ideas of military solidarity which animated the Conference bore fruit in events such as Cuba's 1973 intervention in Angola against Portuguese colonialism.

However, despite this importance, the Tricontinental has received very little attention. Scholarship has tended to focus on the relatively modest demands of the Bandung Conference, and neglected the political cleavage represented by the Tricontinental. This has been especially true in international legal scholarship. Thus, whilst the Third World Approaches to International Law movement has paid close attention to the legal arguments of the Third World during the anti-colonial movement, the Tricontinental has not figured heavily in this account. This is representative of a wider erasure of the radical wing of the Third World movement from international legal histories. Yet this means that a key element of the Third World story has been missed. Indeed, the rich heterodox theoretical and political perspectives put forward by the Tricontinental remain lost to us.

The 50th anniversary of the First Tricontinental is an opportunity to reflect on its enduring political, legal and economic importance. We wish to consider both the historical importance of the Conference and its role as a key site for the Third World project, as well as its legacy, both intellectual and political, today.

Creating and Exploring Digital Empathy (2016-03-04 17:44)

Creating and Exploring Digital Empathy (CEDE) is an EPSRC-funded research project jointly held between UCL, the University of Sheffield and Lancaster University. The CEDE project had five core aims and objectives:

1. To explore and develop the concept of Digital Empathy and how it can be facilitated via innovative methods;

2. To improve quality of life by enabling a fuller expression of digital personhood;

3. To reduce isolation across communities/groups and individuals;

4. To develop new design principles that can be incorporated into systems design to enable empathy to be effectively communicated across the network;

5. To open up a new domain in digital personhood, applicable across a variety of sectors.

6. To build the Voight-Kampff machine.....

‘Clean for the Queen’: Toryism, Elitism and Austerity (2016-03-04 19:29)

by Laura Clancy

Photo credit: https://twitter.com/CBellUK/status/703552348707233792

Despite appearing to be a sycophantic fantasy, Clean for the Queen is actually a real thing. Launched by (aristocratic-loving) Country Life magazine and Keep Britain Tidy, ‘Clean for the Queen’ is billed as ‘a campaign to clear up Britain in time for Her Majesty the Queen’s 90th birthday’ in June. Britons are encouraged to volunteer their time on the weekend of 4th-6th March to go out and clean the streets, ‘in honour’ of our Queen. Thousands of volunteers have signed up, but the Twitter hashtag #cleanforthequeen has since been hijacked by those who don’t appreciate the campaign’s sentiment. ‘Clean for the Queen’ is everything that’s wrong with Cameron’s Britain. It is elitist, it perpetuates working class stereotypes, and it limits the boundaries of national belonging. It is even sponsored – hilariously – by capitalist monsters such as McDonalds, Costa, Greggs and Wrigley, who are presumably some of the top brands you’ll find in a rubbish pile; evidencing another area of social politics where big corporations
are allowed to run wild under the Tories. In this article, I want to explore how 'Clean for the Queen' works as a tool for the reification of inequalities in contemporary Britain. Although often omitted from a classed analysis, the British royal family is the pinnacle of extreme wealth inequality, and needs to be critically examined as part of academic research on contemporary inequalities. In 'Clean for the Queen' the Queen is politicized as part of Cameron's Big Society, acting as a powerful symbol through which discourses around austerity, and classed/national belonging are conveyed. The biggest irony of the campaign is its introduction amidst George Osborne's announcement of further cuts to public spending to 'boost the economy' under the Conservative's austerity programme: cuts which will no doubt further detriment local councils, who have seen 40 % decreases in funding in two years. As a result, those who were actually employed to clean the streets have often been fired, thus leaving 'grot spots' around the country, as the 'Clean for the Queen' Twitter account so insidiously captions images of waste. Birmingham, one of the places shamed on social media as a 'grot spot', saw 16,000 people visit food banks in the 6 months between April – September 2015. 'Clean for the Queen' is another example of the Tory party's incessant attempts to define poverty as a moral deficiency, as opposed to the result of punitive party politics and aggressive neoliberalism. As Dowling and Harvie suggest, as part of the political economy of the Big Society the state retreats away from social reproduction, 'placing the associated costs onto the unpaid realms of the home and the community' (2014:870). The same people who are reliant on food banks are now being called upon to do the council's work for free, volunteering their time to "help the local community" when the government have done everything in their power to decimate that community. The state can shirk responsibility for the social crisis they have inspired, while reaping the rewards from the "community spirit" that they want to take its place. The framing of the 'Clean for the Queen' campaign chimes with the popular recourse to post-war austerity as a cultural, as well as an economic, model. In The Cultural Politics of Austerity (2013), Rebecca Bramall outlines how vintage and nostalgic iconographies have undergone a contemporary reworking, where 'austerity chic' becomes a source of cultural capital in modern day "austerity Britain". The branding of 'Clean for the Queen' directly reproduces perhaps the best example of 'austerity chic': the ubiquitous 'Keep Calm and Carry On' poster, which has been reproduced so many times with such a range of ironically reassuring messages its become a national institution. Its message – hardiness in the face of adversity – perfectly encapsulates all of the contradictions of Toryism: individualizing responsibility and masking state culpability. 'Clean for the Queen's appropriation of the 'Keep Calm and Carry On' emblem exploits its historical affiliations (even if these meanings might not be historically accurate), and works to present the campaign as part of the fashionable shift to thrift culture and community spirit. This appeal to national sentiment is further achieved through the image of the Queen. Her 90th birthday is being hailed as an historical national event, with a variety of "celebrations" planned around the country. The construction of the Head of State as a national figurehead is not a new phenomenon, but the extraordinary popularity of Elizabeth II, particularly as she gets older, is somewhat harder to account for. Although she has weathered some criticism (the "annus horribilis" of 1992, for example), in recent years particularly she has arisen to somehow above condemnation, and widespread analysis of the monarchy in terms of increasing wealth inequality is virtually non-existent. The implication that the Queen is a worthy recipient of voluntary cleaning work makes assumptions about national sentiment towards her, and the campaign can only mobilize this discourse because of the lack of general critique of the Queen as figurehead. 'Clean for David Cameron', for instance, would not work in the same way, but would achieve the same end goal. The construction of Queen Elizabeth II as the embodiment of Britain allows her to be manipulated as an ideological tool for Big Society aspirations. The particular representations of the Queen within the campaign attempt to draw on commonsense understandings of "Britishness". In the following passage from the 'Clean for the Queen' website, the Queen's coronation is reproduced as a key moment of national history to exemplify the oft-cited Toryism that "society is breaking down":

When she came to the throne litter was not the problem that it is today. Food packaging, plastic bottles, takeaway meals and cigarette butts have all contributed to a growing menace that affects our wildlife, streets, countryside and sense of pride. What better way could we show our gratitude to Her Majesty than to clean up our country?

Litter is positioned as a modern phenomenon: the direct result of contemporary lifestyles reliant on consumerism and material goods (ironic, when this text is sponsored by McDonalds). Wildlife and countryside – some of the key
emblems of traditional Britishness, which we are “proud” of – are under threat from this modern day menace. In order to return to the better life Britons experienced when Elizabeth II was crowned, we must clean the streets. The framing of the excerpt implicitly positions cleaning as a moral choice, which is to be undertaken for the good of the country and the environment. “We” have caused this problem with our consumerist obsessions, so “we” must tidy it up. Furthermore, this excerpt implicitly references working-class stereotypes in its indications towards ‘takeaway meals and cigarette butts’. Unhealthy lifestyle choices have long been coded as evidence of the deficiencies of the “un-deserving poor”, and these references work to construct the littering as a moralistic problem perpetuated primarily by the working-class. This framing also, I would suggest, works towards the persistent Tory objectives of social cleansing against these working-class “scroungers”, as the “good” (middle/upper-class) Britons are encouraged to come together to cleanse the country of the working-class “threat” to respectable society. ‘Clean for the Queen’ explicitly attempts to appeal to a nationalist sentiment, but the framing of the campaign leads to questions around who is allowed to “belong” to this national discourse. Its endorsement by a white, upper-class, heterosexual woman limits the ability for many to identify with British nationalism, and indeed the problems with seeing Britain as a “national family” headed by the royals has been the subject of [8]much historical scholarship. Furthermore, the images of politicians like Boris Johnson and Michael Gove clutching litter-picking equipment has done little to make the campaign more accessible for those outside of the Establishment. As British institutions become [9]increasingly dominated by a small, privileged elite class, campaigns like ‘Clean for the Queen’ can be seen as part of continued efforts to normalize and reproduce this authority, and reinscribe the values of Toryism on the populace. **Laura Clancy is a PhD Candidate in the Department of Sociology at Lancaster University.**

By Sadia Habib

*On Critical Pedagogy* by Henry A. Giroux is a collection of essays providing engaging, confident and hopeful insights, as well as “an important set of theoretical tools” enabling contemporary ways to benefit from critical pedagogies, particularly “in dark times” of neoliberal economics and socio-politics adversely affecting culture and pedagogies (p3). Democracy needs education, and more than that Giroux argues, democratic societies benefit from “citizens who are critical, self-reflective, knowledgeable, and willing to make moral judgements and act in a socially responsible way” (p3).

Critical pedagogy is a “theoretical and political practice”, not just a teaching technique (p3). Critical pedagogy sees social inequalities and injustices as impacting upon the lives of ordinary people, and thus, crucially provides hope and possibility for oppressed and marginalised communities (Freire, 2000, Freire and Freire, 2004, Darder et al., 2009, Apple et al., 2009, Giroux, 2013). Critical pedagogy "represents a transformational educational response to institutional and ideological domination, especially under capitalism" (Gruenewald, 2003:4).

Schools are sites where hegemony is perpetuated through teachers and students (Apple, 2013, Giroux, 2013). Critical pedagogues recognise resistance is possible - students can challenge hegemonic practices through complex modes of agency and resistance (Giroux, 2001, Anyon, 2011). Critiquing of curriculum and pedagogy can disrupt hegemony and challenge the “invisibility... of subjugated knowledges”(Edgeworth, 2014:38).

Educationalists witness growing neoliberal education philosophies producing non-autonomous state subjects, rather than critical citizens (Di Leo et al., 2014). Classrooms and curriculums too frequently serve to “function as modes of social, political and cultural reproduction” by utilising banking methods, rote and transmission teaching, and through instilling “a culture of conformity and the passive absorption of knowledge” (p5). Such passive pedagogies contribute to the construction of a docile and unresisting student, who in turn will become a citizen in the same submissive mould:

Students learn to be passive or cynical in classes that transfer facts, skills, or values without meaningful connection to their needs, interests or community cultures. To teach skills and information without relating them to society and to the students' contexts turns education into an authoritarian transfer of official words, a process that severely limits student development as democratic citizens (Shor, 1992:18).
In pressing need of a radical solution, we seek to enhance our philosophies and practices of education with “an
enobling, imaginative vision” (p5). We can look to critical pedagogues and their philosophies of education: the argu-
ment for the relatively new concept of critical pedagogy, influenced by Paulo Freire, is that it is “ethically responsible
to scrutinize, challenge, and oppose people, structures, and systems that oppress and dehumanize” (Kirylo, 2013:xix),
and to challenge mechanisms of oppression in order to demand equal opportunities to participate in the world.

Giroux’s book highlights the ways critical pedagogy provides essential tools to reflect and act upon social
struggles and social problems in specific contexts with local communities and students inhabiting these local
places. For the educational researcher, critical pedagogy, as a theory, helps us ask necessary questions needed
to better understand the social world (Kincheloe and McLaren, 2002). Teaching and learning “entails judgements
about what knowledge counts, legitimates specific social relations, defines agency in particular ways, and always
presupposes a particular notion of the future” (p6). We can ensure students and teachers become critical agents
if they begin to interrogate commonsense assumptions about the nature of legitimate knowledge, social relations,
and ideologies (Giroux, 2013). Critical pedagogy encourages students to use their counter-narratives to “critique
the world in which they live and, when necessary, to intervene in socially responsible ways in order to change it” (p14).

Section II Pedagogy as Cultural Politics introduces differing views on knowledge production – is it teachers
who are uncritical or is it the system that dominates the ways they teach? Some argue teachers are not engaging in
critical deconstruction of dominant assumptions about the nature of teaching and learning, whilst others state social
control results in policies and practices being imposed upon powerless teachers (Giroux, 2013). We also learn about
the “death of history” (p20) and “depoliticizing education through historical amnesia” (p30).

Giroux outlines how the culture of positivism has greatly impacted upon social studies and classroom pedago-
gies (p31). He then draws upon the works of Gramsci to emphasise connections, in education and wider society,
between cultural hegemony and political ideologies. Giroux provides us with hope and possibility about social trans-
formation and democratization through the “promise of critical pedagogy” (p69) by discussing the “responsibility of
teachers as public intellectuals”, as well as critical pedagogies in the classroom (p73).

Section III Critical Pedagogy and the Politics of Youth brings forth neoliberal ideas about commodification and
disposabley, as well as their impact upon youth identities. We are urged to “reclaim” Higher Education:

“one of the few sites left in which students learn the knowledge and skills that enable them not only
to mediate critically between democratic values and the demands of corporate power and the national
security state, but also to distinguish between identities founded on democratic principles and identi-
ties steeped in forms of competitive , unbridled individualism that celebrate self-interest, profit-making,
militarism, and greed” (p100).

Thus leading us towards a “politics of educated hope” (p120). Section IV Neoliberalism, Public Pedagogy, and the
Legacy of Paulo Freire develops Freirean thought on possibility and hope by outlining his promise of critical pedagogy.
Section V Does Critical Pedagogy Have a Future? is an interview of Giroux by Manuela Guilherme summarising
Giroux’s engaging principles and notions of critical pedagogy possibilities.

Critical pedagogy is “a position that threatens right-wing private advocacy groups, neoconservative politicians,
and conservative extremists” (p158). It may never have occurred to some students, and teachers, to question
the status quo, to interrogate prevailing ideologies that serve to privilege the elite, to challenge media/political
narratives that perpetuate hegemony. Students may need to explicitly explore their situationality through the
problem-posing education, advocated by Freire (2000), developing critical consciousness in order to better grasp
how social institutions control and repress communities.

Education should not be about creating subservient automatons unwilling to rise up to transform social injustices pervading local, national and globalised space. Education needs to inspire and enable students to grow in confidence to critique the social order that subjugates social beings perceiving them as the “other”. Critical pedagogy gives students space to be more than “merely disengaged spectators” (p13) as they come to understand their multiple and diverse relationships with the social world. Critical pedagogy emphasises “critical analysis, moral judgements, and social responsibility”, going “to the very heart of what it means to address real inequalities of power at the social level and to conceive of education as a project for freedom” (p158). Giroux's *On Critical Pedagogy* is highly recommended for all pedagogues who are keen to counter the negativities of neoliberal ideologies in educational sites and practices by guiding their students towards criticality and alterative futures.

Collaborative Work and Social Media: Responding to the rapid spread of provocative content (2016-03-05 21:39)

**Collaborative Work and Social Media: Responding to the rapid spread of provocative content**

*Special issue call for the Journal of Computer Supported Cooperative work*

New extended deadline for submissions March 28th 2016!

These call details are also available online at [1]https://sites.google.com/site/digitalwildfiresrc/jcscw

**Special issue editors**

Marina Jirotka – University of Oxford

William Housley – Cardiff University

Rob Procter - University of Warwick

Helena Webb - University of Oxford

**The rapid spread of provocative content on social media**

Social media platforms such as Facebook, Twitter, Instagram, Tumblr etc. create new spaces in which users can 'meet', interact and exchange content. This content is often then forwarded on through shares, retweets etc. so that single posts can be seen and responded to by multiple others. Our modern status of hyperconnectivity means that social media content can spread spontaneously across the globe in a very short period of time. As social media platforms have gained in popularity over the last ten years they have become particularly associated with the posting and rapid spread of provocative content. This provocative content may take various forms including: extreme or inflammatory sentiment - in particular relating to politics, class, race, sexuality or gender; inflammatory or incendiary comments directed towards particular individuals or groups; commentary and speculation regarding unfolding social events and crises; political debates and campaigns; and humanitarian and solidarity messages and campaigns.
Provocative content on social media can undoubtedly take constructive forms – for instance in the galvanising of a clean-up effort after the London riots of 2011 and the spread of solidarity messages such as #JeSuisCharlie #BlackLivesMatter. However much public and political attention has focused on the prevalence and rapid spread of more negative content such as hate speech, harassment and unverified rumour. Concerns have been expressed over the harms this content can cause to individuals, groups and populations, and questions have been raised over how social media can and should be regulated. Provocative content at times overlaps with illegal content and in some countries may be actioned under civil or criminal codes in relation to defamation, hate crime etc. However many kinds of provocative content do not breach any legal codes. Similarly, most social media platforms adopt terms of use that enable them to remove certain kinds of offensive or harmful material where necessary but allow users to post provocative content of various kinds. Indeed, many of these platforms are run on principles supporting freedom of expression and actively uphold the right for posts and posters to be provoking and/or inflammatory.

A 2013 report by the World Economic Forum (WEF) characterises contemporary concerns over the spread of provocative content across social media. The report highlights the global risk factor of ‘digital wildfires’: scenarios in which provocative content involving multiple users spreads widely and rapidly across social media and results in serious negative offline consequences. For example the massive spread of misinformation can harm the reputation of individuals, organisations and markets before there is a chance to correct it. Alternatively, abusive and incendiary messages can cause considerable harm to individuals and generate social tension during critical events such as civil disturbances, health scares and natural disasters. The WEF report argues that the risks posed by digital wildfires prompt re-evaluation of the current governance of digital social spaces. This may take the form of new legal or technological restrictions on content balanced against the principle of freedom of speech. Alternatively, there is scope to promote a ‘global digital ethos’ by encouraging social media users to behave responsibly in the monitoring and regulation of their own and others’ online behaviours.

CSCW and social media

Work conducted within the framework of computer supported cooperative work offers to greatly advance understanding of the rapid spread of provocative content on social media. In the first instance, CSCW perspectives can shed light on the role of collaboration in the occurrence of these socio-digital phenomena. Relevant research questions include: how does the rapid spread of different kinds of provocative content occur in real time? How do social media users, who may not even know each other, collude and collaborate to enable the spread this content? How might these users collaborate to adopt responsible online behaviours and what forms would these behaviours take? How can the online and offline consequences of provocative online content be identified, assessed, replicated and understood? What roles can different forms of regulation play in the management of the spread of provocative content and the pursuit of a global digital ethos?

In addition, CSCW approaches also support collaborative interdisciplinary research on the prevalence of provocative content on social media. For instance, opportunities exist in: collaborative and crowd source coding for phenomena such as the spread of rumour or hate speech; the co-design of digital tools or platforms capable of scoping and analysing the propagation of provocative content; and collaborative and interdisciplinary approaches to ethics and responsible innovation with regard to social media.

Journal special issue

The special issue takes up these research opportunities by exploring the relationships between collaborative work and social media in the context of the rapid spread of provocative content. For this special issue we welcome contributions including, but not limited to:

- Case studies or comparative analyses of social media phenomena involving the rapid spread of provocative
content.

- Papers that report on the 'collaborative work' of digital agents in propagating, responding to and regulating the content and diffusion of provocative content on social media. This may include: the design and use of digital tools/platforms to scope and assess online content; crowd-source coding for provocative content; or qualitative examinations of the lived orderliness and practical accomplishment of social media interactions.

- Examinations of governance practices relating to the regulation of digital social spaces. For example, work based ethnographic studies of social media regulation and response to the spread of provocative content during critical events such as disasters, civil emergencies or public health scares.

- Papers that report on collaborative and interdisciplinary approaches to ethics and responsible innovation for the governance of digital social spaces.

- Papers that report on the opportunities and challenges presented by the collaborative interdisciplinary study of the spread and prevalence of provocative content on social media.

We seek contributions from a range of disciplinary backgrounds that can advance theoretical, practical, technical and/or social understandings in CSCW and related fields.

**Submission details and further information**

Please submit your paper by **March 7th 2016**. Round 1 notifications will be sent in mid-June 2016.

Manuscripts must follow the journal's format standards [2]Instructions for Authors (pdf, 366 kB).

Submit manuscripts to [3]http://www.editorialmanager.com/cosu/ and indicate in your cover letter that the submission is for the special issue.

For questions and queries please contact coordinating guest editor [4]helena.webb@cs.ox.ac.uk

The special issue forms part of the ongoing research project 'Digital Wildfire: (mis)information flows, propagation and responsible governance'. To find out more about the project, visit our website [5]www.digitalwildfire.org or contact [6]helena.webb@cs.ox.ac.uk.

**From Savage to Self: The History of Anthropology (2016-03-06 08:00)**

HT Rachael Kiddey for flagging up this excellent BBC series:
When ITV invited the former leader of the British Union of Fascists onto national TV (2016-03-07 08:00)

With recent debates about no platform that are unfolding in the UK, it’s interesting to stumble across this footage of the (by then former) leader of the British Union of Fascists being interviewed by David Frost:

IFrame: [2]https://www.youtube.com/embed/rd7LcaXZzUs

The Shifting Plate Tetonics of the Human Sciences (2016-03-08 08:00)

This is a wonderful account by Felicity Callard and Des Fitzgerald, in their new book on interdisciplinarity, concerning the radical restructuring of academic labour that is currently underway within the university. I’ve come at this from a different angle, specifically the implications of data science for the social sciences, but in the last year or so I’ve begun to understand this as part of a much more all encompassing process with radical implications for what scholarship will mean in the 21st century. They describe it much more incisively, as well as artfully, then I have been able to:

The more we wander down strange interdisciplinary tracks, the more apparent it becomes to us that being disciplined isn’t playing it safe: the truth is that staying within the narrow epistemological confines of –for example –mid-twentieth-century sociology, while it may produce short-term gains, is not, in fact, the best way to guarantee a career in the twenty-first century (and we mean ‘career’ in its most capacious sense here: we are not using it with the assumption that everyone wants a permanent post at a university, but to express an idea that many would like to find some way to advance their projects, ideas, and so on). The plate tectonics of the human sciences are shifting: we here describe our own forays into one small, circumscribed niche between the social and natural sciences, but expand this horizon to epigenetics, to the emergence of the human microbiome, to all kinds of translational research in mental health, to ‘big data’ and the devices that append it, to the breakdown of the barrier between creative practices and research, and to a whole host of other collapsing dichotomies, and it becomes apparent that ‘neuro-social science’ is only one local effect of a much broader reverberation.
A lot is up for grabs under these circumstances. The Digital Social Science Forum is a long term project intended to intervene in and shape this terrain.

The Feral Interdisciplinary (2016-03-09 08:00)

I find it hard to express quite how drawn I am to this conception offered by Robert Frodeman in Sustainable Knowledge, loc 665:

There is another model possible. It is where the interdisciplinarian goes feral, largely abandoning his or her disciplinary roots. It’s an entrepreneurial approach where one circulates among a changing roster of partners—not too quickly, for experience and trust must be built up—with only occasional visits back to one’s reference community to check in on new insights and to recruit fellow travelers.

He’s contrasting this to a model of interdisciplinarity in which these nascent experts collectively construct the trappings of a new discipline for themselves.

I’m struck by how readily social media affords such feral behaviour. The same medium and long term constraints operate, mediated through the mechanisms of career progression, but the short term ones have loosened profoundly as all manner of new opportunities have opened up.

Janet Salmons (@einterview) (2016-03-10 15:35:13)

Mark, As someone with a PhD in Interdisciplinary Studies, your post struck a chord. The term I would use when someone “leaves disciplinary roots behind” is “transdisciplinary” although “feral” has a nicely wild connotation. See: http://vision2lead.com/what-we-do/e-collaboration for my take. From my view, we need to think bigger to address complex issues, and that means going beyond any single discipline. Its hard, even in the digital age, because our academic departments, professional associations, even journals focus within a specific discipline. Disciplines shape our world view, ways of thinking—and ways of doing research to create new knowledge. Truly integrating ways of thinking (interdisciplinary) or transcending boundaries to create new ways of thinking (transdisciplinary) involves going beyond simply dipping into one another’s conversations. Its not easy and we can feel a bit like homeless orphans at times! Love to chat with others who share this interest in bridging disciplines—especially as related to research and scholarship in the digital age. Find me @einterview.
The Sociological Review Annual Lecture (2016-03-10 08:00)

The Great Divide: Sociology, Anthropology, and Race in France since Lévi-Strauss

**Keynote:** Professor Éric Fassin (Université Paris-8)

**Discussants:** Professor Gurminder K Bhambra (University of Warwick, UK and Linnaeus University, Sweden) and Dr Imogen Tyler (Lancaster University)

Professor Éric Fassin will bring together the disciplines of anthropology and sociology to demonstrate how the boundaries that were drawn around them were part of an academic struggle for power in which the term 'race' and the politics of decolonization were central to the war of disciplinary position.

Claude Lévi-Strauss published the Elementary Structures of Kinship in 1949 as a sociologist. Only in 1950 was he to appropriate the term "anthropology" in his introduction to the posthumous edited volume of essays by Marcel Mauss, entitled Sociologie et anthropologie.

The French sociological tradition did not distinguish between the two disciplines; on the contrary, Émile Durkheim and his heirs distanced themselves from an "anthropology" that was associated with race during the first half of the century. In order to reclaim this label, and thus institute himself as the founding father of French anthropology, Lévi-Strauss could not merely rely on American cultural anthropology; he had to erase the racial legacy of the French tradition.

This was accomplished in his 1952 UNESCO pamphlet "Race and History". It was a powerful move in the wake of World War Two, especially from one who had to flee Nazi persecutions against Jews. But this was also the eve of decolonization – at a time when Georges Balandier analyzed the "colonial situation" as a sociologist, while Michel Leiris and Aimé Césaire denounced the politics of race in the French empire.

Today's French work on race has to revisit this great divide of the 1950s, not only between anthropology and sociology, but also between the social sciences and race.

**About Éric Fassin:** After teaching in the United States from 1987 to 1994 (at Brandeis University and New York University), and at the École normale supérieure in Paris from 1994 to 2012, Éric Fassin is now a professor of sociology in the Political Science Department and co-chair of the Gender Studies Department at Paris 8 University. He is a founding member of the new Laboratoire d'études de genre et de sexualité – Research Center on Gender and Sexuality Studies (LEGS, CNRS / Paris 8 / Paris 10).

His work focuses on contemporary sexual and racial politics, including immigration issues, in France, in Europe, and in the United States – often in a comparative perspective. He is frequently involved in the French public debates on issues his work addresses – from same-sex marriage and gender parity to the politics and policies of immigration and race, but also on the evolution of the left.
The Sex Myth (2016-03-11 08:00)

I first encountered the work of Rachel Hills in 2012, when she interviewed me for an essay in the Atlantic exploring asexuality. The conversation itself was incredibly stimulating and the ensuing piece of work was the best thing I’ve read about asexuality in the media. I’ve been waiting since then for her book, The Sex Myth, with high expectations of what it will include. It doesn’t disappoint. It’s an engaging and thoughtful overview of what Rachel calls "the gap between our fantasies and realities". The lived space of ambivalence and anxiety in which so many of us dwell, so much of the time, yet which often resists articulation in a sexual culture that offers us an expansive array of ways to talk about sex acts but far fewer to talk about what sexuality itself means to us.

My own interest in this topic stems in large part from my research on asexuality. More specifically, I remember my bewilderment at the clear patterning that could be seen in how those who weren’t asexual had responded to attempts by participants in my research to explain their asexuality to those around them. The same responses came up time and time again: there must be something wrong with your hormones, you’re just a late bloomer, you must have been abused as a child, maybe you just haven’t met the right person yet. Asexuality often proves incomprehensible, at least initially, to non-asexual people: how can someone live without sex? Yet so many do, for significant swathes of the life course, if not as a permanent feature of existence. This prima facie incomprehensibility of asexuality reveals features of a broader sexual culture which often escape notice, at least if we inhabit them unproblematically much of the time.

Throughout The Sex Myth, Rachel's concern is to understand those experiences when people don't inhabit this sexual culture unproblematically. As she puts it, "The Sex Myth fades into the background when we are secure in our choices" but "it is when our footing is less solid that it is most powerful". The uncertainties and stumblings, the private anxieties and unspoken agonies, so often attached to a part of life which is publicly proclaimed to be an unparalleled locus of human fulfilment. She's a considerate interviewer and engaging writer, never failing to produce a readable pen portrait which nonetheless offers important insights into the wider themes of the book. The prevailing impression I was left with by the book was that everyone suffers under the sex myth, as the space in which one can just be contracts in the face of a creeping pathologization that perpetually leads people to ask “am I normal?” I particularly enjoyed her discussion of the politics of kink to this end. She deftly unravels how our neo-libertine culture often imposes unspoken limits on those drawn to kink and places further burdens on those who lack interest in it.

It's reminded me of what had once been my post-doc plans: continuing my interest in a/sexuality studies by exploring the lived experience of sexuality for other groups for whom sexual normativity creates profound problems. But maybe looking at outlier cases misses the point, even if it could prove methodologically productive. What really interests me are the everyday experiences, private moments of quiet shame for failing to live up to a standard one might neither assent to nor fully understand. I’d like to excavate this baggage, understand it better conceptually but also explore the new vocabularies to talk about sexuality and intimacy which I’m familiar with from the asexual community but which can also be found elsewhere. Anxiety pervades contemporary sexuality and I’ve yet to encounter a convincing reason why this needs to be the case.
Two upcoming events @socialontology @sociowarwick (2016-03-12 08:00)

A workshop on the morphogenetic approach:

June 21st, 10am to 5pm
The University of Warwick

This one day workshop is intended for those currently using or planning to use the morphogenetic approach in their research. In the first half of the workshop, Margaret Archer will give an overview of the morphogenetic approach and its development, as well as address conceptual and methodological questions that participants might have. In the second half of the workshop, there will be plenty of time to present work-in-progress or planned projects, get feedback and discuss with others who are doing similar work.

If you'd like to participate then please e-mail mark@markcarrigan.net with a brief biography and description of your project.

A workshop on investigating the internal conversation:

Reflexivity Forum
10am-5pm, May 24th 2016
R1.04, University of Warwick

Following from a successful initial meeting last year, this event will be the first of a hopefully on-going series of events aimed at those investigating human reflexivity through empirical research. The 'internal conversation' was developed by Margaret Archer as a solution to the problem of structure and agency: a mediatory mechanism that accounts for how society's objective features influence its members to reproduce or transform society through their actions. Since initially discussed in Being Human, this account of human reflexivity has been developed through a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

The event is free but registration is essential. If you would like to speak at the event, presenting a work in progress, please register by March 31st with a title and 100 word abstract. If you would like to attend then please register by April 30th.

To register contact mark@markcarrigan.net
The LSE's remarkable archive of public talks (2016-03-13 12:56)

I just stumbled across the LSE's Digital Archive. It's an absolute goldmine. Here are some of the ones I'm planning to listen to in the near future:

1. http://digital.library.lse.ac.uk/objects/lse:dak709yaz
2. http://digital.library.lse.ac.uk/objects/lse:noc448tuv
3. http://digital.library.lse.ac.uk/objects/lse:jaj525vey
10. http://digital.library.lse.ac.uk/objects/lse:nec283vid
11. http://digital.library.lse.ac.uk/objects/lse:dic893san
The Cultural Politics of Automation (2016-03-14 08:00)

The rise of the robots is a recurrent theme of popular culture. Robots are often seen as a threat, heralding the prospect of human beings being replaced by their creations, perhaps to the extent of being deemed useless by them and attacked. Underlying this fear is the reality of automation: technology being more adept at particular tasks and so replacing human beings for this purpose. But automation isn’t new. All manner of what we now consider mundane automated tasks were once undertaken by hand, representing whole categories of employment which have now wholly or largely vanished. For instance, our phone system no longer relies on switchboard operators and withdrawal of money no longer necessitates interaction with a bank clerk. But technological change has often produced new jobs to replace those that have been lost. Human beings are adaptable. As a 1965 NASA report put it, “Man is the lowest-cost, 150-pound, nonlinear, all-purpose computer system which can be mass-produced by unskilled labour”. More often than not, technology has been used alongside human beings to improve their productivity, sometimes as a skilled tool and sometimes as a tool for deskilling, taking a skilled task and breaking it into component elements. In fact, some might argue that the history of scientific management, analysing and dictating workflows to improve economic efficiency, somewhat resembles an attempt to turn human beings into machines: replacing their skilled and situational responses with a pattern imposed by outside experts.

But many are arguing that we are on the cusp of a turning point in automation. This is not a matter of hyper-intelligent robots replicating human capacities but rather of quite specific technological advances facilitating entirely new kinds of automation: what Jerry Kaplan describes as synthetic intellects and forged labourers. The first relies on advances in machine learning and cloud computing to process unprecedented quantities of data at speed, facilitating the rapid development of accumulated expertise in a particular sphere without strictly speaking ‘understanding’ it: the machine can learn from a much greater amount of data than was previously the case and the computational challenge involved in doing so can be distributed through the cloud. The second relies on developments in sensor technology to facilitate much more sophisticated engagements with the environment than has ever previously been possible, moving beyond highly specified tasks under strictly defined circumstances, allowing for entirely new work place designs built around the needs of the robot rather than the humans working alongside it. Rather than organising warehouses in a manner comprehensible to human packers, Amazon warehouses can now order their stock in a manner that seems chaotic to workers because items are located on the basis of imperceptible connections between them (e.g. sales data for this region shows that A and B are frequently shipped together) but allow the robot packers to work ever more efficiently.

One of the most radical developments in the near future is likely to be self-driving cars, such as those currently under development at Google. As Kaplan notes, vehicle accidents cause 4 million injuries and cost over $870 billion annually in the United States alone. Seen in this light, the total switch to self-driving cars looks like common sense. But it will also destroy whole categories of existing jobs upon which millions of people depend, including those such as taxi driver which have traditionally been a reliable open route into the work force for new immigrants.
in many countries. However this has still up till recently be seen as a matter of automating routine jobs. What has seemingly provoked much of the controversy in recent years is the newfound recognition that what are seen to be skilled jobs will themselves be under threat. The most interesting example of this is Narrative Science’s innovative tools to automatically generate stories from structured datasets. Starting with formulaic business stories, they have since moved into sports stories and make a disturbingly convincing case that with enough sophistication about underlying narrative structures, this process can work for any appropriately structured dataset.

This might not lead to all journalists losing their jobs but it certainly does suggest the possibility that much of the routine work of journalism might be automated. On the one hand, this could be seen as unproblematic given the financial challenges newspapers and magazines face at present: if it can be done cheaper, couldn’t this help secure journalism’s future? On the other hand, it’s difficult to see how the journalistic environment won’t suffer if routine entry level jobs are eliminated. Where will the stars of the future, those with sufficient individual expertise to resist automation, get their start? How will they become known? These are questions which have been raised across range of fields even prior to automation, as competitive pressures advantage those with sufficient financial resources and willingness to work for free. But the prospect of automation is likely to intensify this, ratcheting up the already endemic sense of uncertainty under which much of the workforce already labours.

How are people responding to the uncertainty facing occupational futures? Though the basis for his claims is somewhat unclear, I find Zygmunt Bauman’s analysis of this intuitively plausible. He suggests that the spectre of exclusion, the possibility that we won’t make the cut and we will be cast out without hope or prospects, animates a profound need for recognition. We ‘recast ourselves as commodities’ in order to cope under these circumstances, desperately seeking visibility in order to better sell ourselves against a backdrop in which, as the economist Tyler Cowen puts it, average is over. Economic polarisation is becoming the defining feature of the contemporary economy. As Cowen puts it, writing about the United States, "Demand is rising for low-pay, low-skill jobs, and it is rising for high-pay, high-skill jobs, including tech and managerial jobs, but pay is not rising for the jobs in between" (pg 40).

What Bauman is offering constitutes a speculative social psychology of how people respond to this condition of profound polarisation. If we’re aware that opportunities are contracting and that our future security is uncertain
then these fears find expression in a competitive scramble to ensure we are recognised and valued: as commodities, if not necessarily as persons. He suggests that much social media behaviour can be seen as an expression of this impulse (though many, including myself, would object to generalisations about how people in general behave across social media in general). But I nonetheless think it identifies something interesting about the fame-seeking cultures that can be found across many platforms, even if there’s a tendency to "publicize successful outliers to propagate the illusion" in a way that serves the self-interest

of platforms. The growing tendency to be fascinated with wealthy Vloggers, in virtue of the fact they are wealthy through vlogging, embodies something of this. Does the fact some people have seemingly secured their own future through social media visibility help propagate the sense that this is a viable strategy for many others? By definition there can only be a handful of celebrities on any platform. What we do know is how many young people see their future as determined by forces outside of their control, insusceptible to change through the avenues of work and education that older generations claim is a pathway to success.

Could fame culture thrive alongside this fatalism? People pray that they will ‘be discovered’ while also despairing about a future that seems beyond their control? What Furlong and Cartmel call the ‘epistemological fallacy of late modernity’ is a recipe for anxiety: the precise way in which opportunities constrain individuals has become more obscure than ever in a culture of competitive individualism which increasingly lacks the cultural resources to make sense of classed experience, while individuals are made to feel responsible for their biographical outcomes as pure expressions of their own talent and exertion.

Talent becomes fetishised under these circumstances. We can see this when Boris Johnson[5] mocks the 16 % ‘of our species’ with an IQ below 85 and praises the 2 % with an IQ over 130. We can see it in the way that Donald Trump repeatedly proclaims that “I’m, like, a really smart person”, while condemning his rivals as not smart, without explaining what this really means or how it qualifies him for office. It’s why the popularisation of developmental neuroscience is so sinister: it heralds a social imaginary in which ‘talent’ can be understood as hardwired, while still acknowledging that circumstances plays a role in how these characteristics are inscribed in the human i.e. it justifies present arrangements while licensing punitive interventions against parents who fail to raise their children in a way
conducive to the genesis of talent. Looking to the more ridiculous forms this fetishisation of talent takes can help us critique the more insidious and sophisticated variants that are increasingly dominant. This case can be made in particular about the most popular forms of self-help in recent years:

And this is the most remarkable feat of The Secret: its ability to defend inequality. While the 99 per cent has become a worldwide slogan questioning the concentration of wealth, the author of The Secret offers an alternative view of the situation. ‘Why do you think that 1 percent of the population earns around 97 percent of all the money that’s being earned?’, Bob Proctor is asked rhetorically in the book, answering, ‘People who have drawn wealth into their lives used The Secret, whether consciously or unconsciously. They think thoughts of abundance and wealth, and they do not allow any contradictory thoughts to take root in their mind.

*The Wellness Syndrome, Carl Cederstrom & Andre Spicer, pg 80*

What makes The Secret so interesting is how nakedly metaphysical it is. The affluent do it ‘unconsciously’ and that is why they are affluent. Those who are not nonetheless have the choice to do it. If they do it correctly then they too will become affluent. If they do not then they deserve their fate. This bizarre concept of “The Secret” fascinates me because it’s easy to see how it holds the whole picture together: this latent faculty, to which we all have access, allows us to succeed. Some people are disposed to access it already (inherited privilege) but this places no restriction on others. We can all access this latent ability to be a success if only we choose to do so and then use it in the proper way. Or to put it more mundanely: “there are plenty of good jobs out there for those who want them, it’s just that people don’t try”. The idea that differential outcomes can be explained away in terms of the moral failings of individuals means we take the existing state of society and the economy for granted: there aren’t questions to be asked about social structures, just more failings to be condemned in individuals. This is something

These are trends we can already see in contemporary society. My depressing question: how might they intensify under circumstances of widespread structural redundancy? What if the low-wage, low-skill jobs into economic polarisation is forcing much of the workforce rapidly begin to vanish? What will happen if 47% of jobs are eventually automated? It’s possible many new categories of job might open up but, as suggested earlier, there are good reasons to be sceptical about the scale and speed of this replacement. Will those who can’t find work be seen as unfortunate victims of unavoidable change or as moral failures placing a burden on the ‘wealth creators’? Will they mobilise themselves to collectively struggle for the transformation of a social order incapable of providing them access to the good life or will they be mobilised by others through potentially surreptitious means to serve the ends of those who are already wealthy and powerful? Popular culture provides us with many dystopian representations of what this might look like. The graphic novel *Lazarus* paints a bleak picture of a world in which nation states have been superseded by corporations and a small number of families dominate the planet. There are those who serve the families and those who are surplus to their needs, with the former group being composed of those who have been ‘elevated’ from the latter category. The possibility of freedom from insecurity and struggle represents a powerful tool to keep the population in line, coupled with private militaries to enforce this order through violence:
There are many other dystopian representations of a possible future in which there is little work or security for the majority of the population. However there are also popular representations of worlds in which scarcity has been conquered and everyone’s needs are met: ones in which some people still strive for work and adventure because of the intrinsic rewards that these provide. These are only representations but they are the resources we inevitably draw upon, deliberately or otherwise, when imagining the possibilities ahead of us for how these trends will unfold. Both of these categories however tie utopian or dystopian outcomes to the technology itself: seeing it as either liberating us or rendering us redundant. How does this suppress the role of politics – i.e. the tension and conflict between groups with different interests – in determining the outcome of these processes? Does it also preclude the possibility that our future might see a turn against technology, as something deemed to be responsible for systematic disenfranchisement? Would a [7]neo-luddite movement be possible? Or are people too wedded to their devices? Would powerful interests allow such a movement, given the centrality of technology firms to the contemporary economy and the new possibilities for surveillance and control which the internet opens up? These are all open questions but they’re ones which sociology can help us think through in a systematic way, even if not necessarily answer.

2. https://en.wikipedia.org/wiki/Average_is_Over
Let us begin with a story...

A blacksmith is granted three wishes by Jesus and St Peter for his hospitality. The smith had made a previous bargain with the devil, obviously not a great idea! He decided to use his three wishes to get out of the bargain. He wishes that whoever sits in his chair be stuck until he permits them to rise. He wishes that whoever climbs into his tree remains there until he permits them to climb down. He wishes that any persons or things must climb into a sack when he wills it. When the devil comes to fetch the smith those three wishes come in very handy. The smith outwits the devil.
That was a summary of the tale The Smith and the Devil (Hansan 2002). The paper under review proposed that this folktale originated in the Bronze age. The methods used were in relation to folktale archives, archaeological, linguistic and genetic data. Here is an explanation of their terms and methods.

**An explanation of terms**

The paper under review used comparative phylogenetic methods on Indo-European folktales. So let’s look at these terms.

**Indo-European folktales**

Indo-European refers to a family of several hundred related languages and dialects including the major languages of Europe and parts of Western, Central and South Asia. In this instance the study investigated a subsection of folktales: 275 cases of Tales of Magic. This included 50 languages. 275 tales of magic were taken from a larger catalogue of over 2000 folktale types. Basically the heart of this study hinges on whether you agree with the classification and categorisation of these tales from the Aarne Thompson Uther (ATU) Index.

A number of academics have critiqued this Index and in some cases attempted to build and improve on it. The original index was published in 1910. In the 1950s Propp (2015) critiqued the way in which the folktales were categorised. In 1928 Thompson refined the categorisation into 2500 basic plots. Imagine processing so many folktales and plots without a computer. Dundes noted that there were typos, redundancies and censorship in the records (1997: 198). However, the index was, and remains, central to international studies of folklore (Dundes 1997: 200).

The index was finally updated by Uther in 2004. Uther presented several criticisms of the original index. He pointed out that Thompson’s focus on oral tradition neglected older versions of stories, even when written records existed. Uther thought that the distribution of stories was uneven. For instance, Eastern and Southern European, and many other folktale types were underrepresented.

Things to consider: the biases of the index, including gender and ethnic biases as it was invented and revised by White males.

To briefly summarise:

**Aarne** – Finish, White male, folklorist and university lecturer

**Thompson** – American, White male, Harvard graduate

I am also assuming, individuals with enough funds to go to university and be educated in a field like folklore (please share in the discussion any knowledge which contradicts this).

**Comparative phylogenetic methods**

The method could be compared to a cake recipe as follows:

1. Take 275 tales. These can be found in any specialist ‘Tales of Magic’ delicatessen or curiosity shop.
2. Separate the yolks from the whites. In other words the presence or absence of these tales in 50 Indo-European speaking populations.

3. Mix with a smattering of jargon and statistics. I found the paper to be written in a statistical analysis style, therefore not very accessible.

4. While the cake is in the oven draw some language trees. These indicate how populations have historically come into contact over time (population dispersal and the diversification of linguistic lineages).

5. Remove from the oven and cool. Ice the cake by skimming over debates of written versus oral narrative, and the distinctions or overlaps between them.

The written-oral debate acknowledges that there is a difficulty in tracing oral stories because tales are so easily transportable by travellers. There has been interaction of oral and written texts over time, with one informing the other (Bottingheimer 2009, 2014). This basically means that what is an oral folktale, and each tales origins is unclear.

For example, different renditions of Arabian Nights indicated that translators created new stories inspired from oral and literary traditions (Warner 2012: 18). While this demonstrates some of the issues with the paper’s source materials it also illustrates how fearless Graça da Silva and Tehrani (2016) were trying to tackle the complex subject of oral folklore utilising new methodologies.

1. To finish the cake, sprinkle the results with statistics to see whether the 275 tales were more likely to spread generation to generation or across geographical areas due to migration, trade, and encounters between groups of people.

2. Eat the cake.

Findings of the paper

Graça da Silva and Tehrani (2016: 9) proposed that The Smith and the Devil could have arisen in the Bronze Age, further supported by the earliest archaeological evidence we have for metal work. It does them credit that they used a mix of new methods alongside conventional literary-historical, archaeological, ethnography, genetic and linguistic approaches. Mixed and diverse methodology can add unexpected things to our understanding of complex processes. Storytelling research, for example, indicates the challenge of using story to explore social phenomena (Parfitt 2014).

In considering whether or not to accept the results of this paper, here is a quote from The Matrix (Wachowski 1999):

‘it is not the spoon that bends, it is only yourself’

Are the patterns that Graça da Silva and Tehrani (2016) observed real indicators of the oral spread of folktales or was the data set flawed, resulting in a misleading pattern? The paper concluded:
The results of the D analyses suggested that a substantial number of tales (100 of 275) exhibit significant correlations with linguistic relationships that are consistent with vertical processes of cultural inheritance (Graça da Silva and Tehrani 2016: 6-7).

In plain English this means that 36% of the folktales indicated that tales were more likely to be passed from generation to generation than spread geographically. Is this a substantial number? However, in another part of the paper they clarify that only 28% of the folktales were robust enough to suggest this (76 of 275). Thus, I am not surprised that the final results contradict previous findings that geographical spread was higher than generation-generation ‘vertical cultural inheritance’ (Ross et al. 2013). Storytelling traditions might be strengthened through engagement with other cultures and weakened by cultural isolation (Wilson 2014: 129). There are so many tales that demonstrate remarkable similarity in different parts of the world. Cinderella is a well-known example (Cox 2012). We need to ask whether these tales were passed from generation to generation or by the movements of people and stories? It is likely, of course, that both forms of transmission occur. What is interesting is that Graça da Silva and Tehrani (2016) suggest that ‘cultural inheritance’ is more likely than geographical spread.

The validity of their findings will be proven or disproven over time. There are doubts concerning the linguistic categories being correct and unbiased. Especially as with the use of large data, patterns that are perceived might not be accurate. Non mathematicians might expect a larger sample size to make results stronger, this is not the case, after a point it creates the possibility of more error. It does not help that the paper cited the Brothers Grimm, as an example, because of the way the Grimms’ tales of “Germanic origin” were continuously edited to be more German (Ellis 1985, Tatar 1987: 143, Claxton-Oldfield 1988: 52, Zipes 2006: 195). It depends whether we are talking about edited written versions of stories or orality, which also have a complex history with text (briefly mentioned earlier).

It is likely that folktales and their distribution may be related to population histories and geographical proximity (as different groups met and exchanged stories). However, I’m not sure that similarities in word usage described in this paper confirms this without margins of error. An opinion also shared by John Lindow, a folklorist at the University of California, Berkeley (Samoray 2016). Word usage and the way stories are told shift over time in response to a variety of changes: social, technological, political, educational, and so on. I am skeptical of assuming that we
know anything about how stories were exchanged orally as what we can infer from that long ago is largely dependent on written records. The work provides an interesting stepping point for further investigation. A similar analysis has yet to be carried out on all the index to test the robustness of the findings.

Conclusions

If the findings can be replicated then the ancient roots of these 275 tales might be traced to the Bronze Age. Storytelling, folklore, and fairy tale literature suggest that stories have been spread through travel, trade, conquest and literary texts. Dupont (1999) said orality cannot be capture by writing, because ‘all that writing can convey is the absence of a body, a loss of orality.’ Folk and fairy tale texts provide evidence of ‘relationship to writing’ not orality. Thus, basing oral “genetic” research on text may be flawed. The jargon may make it sound professional and scientific, but a little digging reveals that this is not the case. I remain sceptical of the findings. I don’t think the results support their claims, and the claims have been picked up by the press rather quickly without thorough consideration. However, I applaud Graça da Silva and Tehrani’s (2016) use of creative methods. I found it an interesting analysis, and eagerly await being proved wrong!

Creativity inside and outside universities (2016-03-14 12:02)

by Deborah Talbot

The Alternative Academia Network held its second meeting on the 14th February 2016. The aim is to discuss how creativity works inside and outside universities. The following are notes from the presentation by Deborah Talbot, which explores the benefits and drawbacks of different configurations of creative production.

The model of creative production inside academia goes something like this.

From undergraduate degree to Masters degree creativity means learning the canon, or what is and is not an acceptable mode of discourse. It can vary from lecturer to lecturer, but generally, it takes place within narrow confines. The boundaries of acceptability also applies to the form of production, which takes place within the written word. The visual, and sound, seems largely absent (there are some exceptions, as there always are).

At Ph.D. level, there is greater freedom to make an original contribution, either with method, research insights or conceptual innovation. However, constraints are present in the form of writing, where everything must be evidenced and artistic license not encouraged. Rarely is writing flair explored, though of course the ability to write legibly and correctly is helpful. The Harvard system of referencing is I believe an impediment to both creative expression and creative reading (causing interrupted thought).

Then you get to be an academic (if you can jump through the hoops). Because of the demands of the REF, the cycle of journal article production and funding proposals, mostly from the major research councils and charities, need to be pursued. There is autonomy to think and be intellectually independent, but artistic license gets ever narrower. As we have been debating on AAN's Facebook page, the refereeing process may add more impediments to creative breakthroughs and innovation.

The narrowness of the curriculum is exacerbated by the absence of mental space with which to reflect for the academic. There is a rhythm to academic production, which is increasingly speeded up and continuous (monotonous?). Creative or lifestyle lulls are not encouraged.

The advantage, of course, to this long process of training, is a finer grasp of methodological thinking and, for those in the social sciences, research skills. Conceptual development is encouraged and developed. Theoretical awareness cannot be surpassed anywhere outside the academy. And, as [1]Keniston argued, academia is one of the few places left which can carry the weight of policy and governmental criticism.

Compare this to intellectual production outside the university (which I have recently embraced).

There is an almost unparalleled freedom to produce because of the possibilities of the Internet and social media. For the writer or artist, democratic possibilities are opened up by the fact that being known (as part of an existing elite) does not necessarily preclude a breakthrough.

There is also the potential for using different media to express ideas. The visual, sound and word can be combined in a series of endless possibilities.

Free resources are available to use and shape according to need.

4300
Work wise, as it has been noted, is rapidly changing to ‘insecure’ and precarious freelancing, yet precarity seems more like a state of mind when the possibilities of innovation and diversification are endless.

The potential to transform political and policy discourses through creative activity show in the campaigning of Corbyn and the like. There is an army of bloggers writing well-informed material.

Crowdfunding and apps like Patreon offer routes to develop funding structures. Some bloggers, like ‘Brain Pickings’ get money from Amazon per click, and has been enormously successful, but which unfortunately leads to an escalating series of links in the blogs.

Yet there are some downsides.

Monetising your creative activity is difficult, and most opt for the combinations of freelancing contracts to pay the bills leaving ‘free’ time for creativity (I do this). It takes years to build up a sufficient reputation to be worthy of being financially supported as a writer or an artist, though it does happen.

Access to academic research is limited because of copyright. Open Access may alleviate this, but still much academic research is protected by a firewall. There are reactions to this, for example,[2]Sci-Hub, which has pirated and made freely available 47m research papers.

Academic institutions do not take the creative endeavours of ‘outsiders’ seriously and do not encourage them in. With the exception of governmental policy-making, there is very little integrated discursive development. There is a feeling that academics are suspicious of the way creators have to work with the ‘market’, even though it is pragmatic rather than ideological.

Despite some wonderfully informative efforts of writers, who have superior skills of communication and expression, there is often a methodological lack in intellectual production outside the academy; inevitably so as production of articles takes a day not two or more years of sustained research.

There is of course what has been called ‘content shock’ by marketeers; that there is an oversupply of information on the web, and it is hard for writers and artists to be visible.

What is the solution?

Something to discuss in this session?

My initial thoughts, which may not be well-developed, are...

The boundaries between universities and the outside world should be more porous. This is not the same as ‘public engagement’ or notions of ‘impact,' which only favour evidenced forms of impact and then it is only about a one-way relationship between the academic and the ‘outside world', or is about ‘disciplining’ academic inquiry. Quite rightly academics are wary of this.

I mean that intellectual production inside and outside the academy could both benefit from greater interaction. This can mean: a loosening of notions of academic production; a loosening of the ‘full-time’ academic contract (as opposed to being permissive about short-term and zero hours contracts) which would permit more portfolio working; a loosening of the meaning of academic production: access to the civilising forces of academia for those outside; or an opening up of academic production to outside interrogation.
One final thought. It is interesting that Academia Edu, much maligned by some academics as a corporate machine, actually encourages the interaction of academics and independent scholars. The dislike of AE speaks to the lack of porousness in the academy and perhaps, the problem of taking ‘purity’ too far.

[3]This article was originally posted on Driftmine.

Deborah Talbot is a freelance writer and researcher. She spent twenty years lecturing at universities before running for the hills to do something more creative. She founded Driftmine in June 2015 because she was “itching to use her long experience of political engagement, observation and failure to say something about politics today” and “wondered if there were others who wanted to do the same.” She remains concerned that words are a source of fear, cynicism and rigidity, and that it is possible that we need to combine words, images and sounds to escape the fixity of political language.

Stuck in the mess of life: anticipation and disappointment (2016-03-15 08:00)

In recent papers Ruth Müller has offered what I think is the very important concept of anticipatory acceleration to make sense of how subjects, in this case post-doctoral researchers, wilfully participate in social acceleration. Drawing on the work of James Scott, she outlines an attitude of ‘disregard for the present’:

The present figured not as important in and of itself, but as valuable because of its potential to become the future. Discomfort and sacrifice in the present were hence normatively acceptable and reframed as potentially beneficial. If the present is only a moment of transition towards a golden future, no serious attention needs to be paid to the trials and tribulations of the now. Uneasiness with a new system is recast as a period of adaptation, critique is washed away with the final argument of where we need to go.

This immediately makes me think of Ian Craib’s work on disappointment. Craib argues that we are increasingly unable to live with frustrations, denials or uncertainties. We seek to ‘escape the mess of life’ by looking forward when we meet disappointment, rather than recognising that some element of disappointment is an unavoidable facet of human existence. We turn ourselves to the next person, the next job, the next city as a place where we hope that everything will be ok. But it never is because we can’t transcend the nature of our own being-in-the-world simply by trying really hard to arrange the pieces of our life in a perfect configuration that always exists in potentia. When we actualise it and come face-to-face with its imperfection, we go on looking, assuming that we can make the world as we wish it to be by finding the circumstances in which the representation in our minds can match the reality of our lives.
Under these circumstances, the anticipatory acceleration Müller identifies in higher education becomes remarkably alluring. We bring ourselves closer to this imagined future through an “anticipatory orientation that aims to create future possibilities and tentative certainties, and ensure an ongoing trajectory that is somewhat recognizable as a good (future) life”. Or at least we hope to do so. But within higher education, we find those conditions further in retreat because so many others are chasing them:

VOSTAL (2014) proposes that junior scholars, who often work on temporary contracts and aim at establishing themselves in academia, are particularly exposed to the demand to produce more units per time. “It seems that early career academics are particularly vulnerable to the restructuring of higher education in comparison with more established and tenured/permanently employed senior scholars and professoriate” (p.12f.). This includes a heightened vulnerability to the changing temporal frameworks of academic cultures. Similar to the differences between career stages, the focus on speed appears to be pronounced more or less strongly in different fields. While the imperative to “Speed up!” seems to interpellate a wide range of scholars across the disciplines and faculties, fast growing fields that are receiving high policy attention and investments, often due to hopes of economic return, and that are exhibiting high degrees of internationalization and competition appear to be particularly prone to processes of acceleration. One such field is the life sciences. GARFORTH and CERVINKOVÁ (2009) point out that scholars in this field are faced with a growing standardization of possible career trajectories in the context of increasing international competition. This would result in a “rigid, narrow and increasingly formalised career path […] in the biosciences” (p.172) along which particularly junior scholars must run as fast as possible to outpace a growing number of known and unknown, local and international competitors. The article at hand focuses on a distinct category of junior scholars in the life sciences that are, as the empirical work shows, particularly strongly affected by experiences of competition and hence acceleration: postdoctoral researchers

So how do we respond? By going faster and faster. Wilfully hopping with ever more enthusiasm while management heats up the floor (to use the lovely image Will Davies offers). Or we quit. What’s the excluded middle: collective resistance that becomes ever hard because it entails a social hope about potential shared futures, one grounded in a communal attentiveness to the present which becomes ever more unlikely under prevailing conditions of acceleration.

Celibacies: American Modernism & Sexual Life (2016-03-16 08:00)

There is a degree of difficulty inherent in reviewing texts from outside your discipline and certain risks attached to evaluating research areas other than your own. As a sociologist, rather than a literary theorist, who studies asexuality, rather than celibacy, I approached Celibacies: American Modernism & Sexual Life with caution but also fascination. When celibacy manifests itself within asexuality studies it tends to do so negatively, as something that is mistakenly imputed to asexual people and a notion against which they define themselves i.e. celibacy is a choice,
whereas asexuality is not. However the neatness of this dichotomy does not survive critical scrutiny, suggesting an overlap, or at least adjacency, between asexuality and celibacy that deserves further attention.

Kahan observes that there is a 'slipperiness' to celibacy which engenders a tendency to read it as a symptom of something else. In this sense celibacy sits uneasily in relation to sexuality, complicating what counts as 'sex' and 'sexuality'. So too asexuality, with its capacity, as he puts it, to baffle "the hetero/homo binary though its nonengagement with these economies of desire and pleasure" (p. 147). However while Kahan does explore the relationship between the two, with some particularly insightful work that positions contemporary asexuality in terms of historical celibacy, he does so at the cost of truncating asexuality, explicitly ignoring the sizable population of asexual people who pursue romantic relationships and experience romantic attractions, for no reason other than his own analytical convenience. This problematic move, in which vast swathes of the asexual population are rendered strategically invisible so as to not disrupt the theorist's project, constitutes an unfortunate caveat underlying the perspicacious observations Kahan does make about asexuality and the "possibility of theorizing attraction and love without the interference or noise of sex" (p. 146).

It may be the fact that I could not help but read this book through the prism of asexuality, or it may be the aforementioned 'slipperiness' to celibacy, but it was less clear than it could have been precisely what Kahan takes celibacy to be. While the 'indeterminacy' of celibacy is certainly interesting, the text would have benefited from a more explicit statement of the author's own operationalization of it as a concept. From the outset, Kahan declares his intention to use it in both a contemporary sense of abstaining from sexual acts and a more historical sense of being unmarried. The ambiguous relationship between these two senses, unfolding through history, certainly invites historical exploration. But the author's equally ambiguous use of the term (encompassing social identity, political identity, strategic response to homophobia and mode of existence) renders the specificity of 'celibacy' remarkably elusive given this is a dense and sophisticated text devoted to the topic.

The main body of the text is structured around historical case studies, each illuminating different dimensions of celibacy and its attendant politics. From the perspective of asexuality studies, the first of these case studies is particularly fascinating. It is an engaging discussion of the nineteenth century institution of "Boston Marriages": long-term celibate partnerships between women. Other case studies include Andy Warhol, José Martínez, Father Divine, W.H. Auden and Marianne Moore. While these case studies are productively eclectic, some of the discussion tends to meander in a rather frustrating way. The exercise was presented in a way that perpetually raised my historiographical expectations, only to subsequently dash them. The problem here may very well be my own expectations, though it seems likely that others approaching this book from a similar disciplinary background may share them.

Nonetheless, the book is readable and illuminating throughout, deftly threading conceptual discussion through engagingly idiographic analysis of celibate authors, activists and artists. The aspect of the book I found most powerful was its engagement with the politics of celibacy. Despite its predominately historical focus, Kahan skilfully builds upon his discussion of celibacy and modernism to elucidate often overlooked aspects of the sexual politics of late modernity. His analysis demonstrates, albeit not as comprehensively as he seems to assume, the character of celibacy as a "site of radical politics, of feminist organising, of black activism, queer citizenship, and other leftist interventions" (p. 153). The book concludes with a provocative call for this radical legacy to be reclaimed. In doing so, we would refuse to cede celibacy to the political right, instead rethinking (or perhaps deepening) the sexual politics of the left. What Kahan suggests is that the hegemony of what he terms the 'expressive hypothesis' creates a demand that everyone must express sexuality. He seeks to understand how contemporary sexual mores, though often animated by an emancipatory impulse, can nonetheless stigmatise those who do not engage in sexual acts or those who do not experience attraction at all. In seeking to move beyond this politics of 'recovering sexual expression', in which the emancipatory project of ensuring that "one's sexual identities, desires, and pleasures never fall victim to suppression" (p. 5) imposes a homogeneity on sexual experience, Kahan presents us with a provocative vision of a redrawn terrain for sexual politics.
Untangling the American election: two great podcasts (2016-03-17 08:00)

Two superb LSE podcasts with expert analysis of the astonishing events unfolding in America at the moment:

Kieran (2016-03-17 10:30:21)
I've been following the Primaries on The Young Turks via YouTube. The American nomination process is incredibly complicated, but very interesting.

Janet Salmons (2016-03-17 14:25:22)
"Astonishing" is one way to describe things on this side of the pond. It seems pretty horrifying to everyone I know.

**YouTube Conference: Call for Papers (2016-03-18 08:00)**

YouTube Conference: Call for Papers

Keynote speaker: Professor Jean Burgess

Please send an abstract of 350 words plus a short bio of 100 words for single papers or 500 words and individual bios for group panels by email attachment to youtube@mdx.ac.uk.

Deadline for receipt of abstracts is 4 April 2016.

YouTube has just passed its tenth birthday and it is timely to review not only how it has changed in that time, but also its wider influence. By focusing on YouTube as a platform we want to draw together research that is distributed across disciplines to help cross-fertilise knowledge about YouTube and its users, and to identify the research questions and methods that best capture its ever-expanding reach, impact and significance. We plan to include a panel of industry insiders to offer insights into possible futures in the light of current developments alongside the academic papers which we now invite you to propose.

**Keynote Address**

Professor Burgess will consider how YouTube and the broader online video environment have changed in the past decade, and what its competing futures look like. She will also discuss how we might learn to recognise such patterns of change empirically, and the key methodological approaches to studying the co-evolution of proprietary digital media platforms and their cultures of use over time.

**Possible questions to address (but not limited to these):**

4306
How has the institutionalisation of YouTube changed its nature?
Has YouTube accelerated processes of media convergence and transformation?
What is the changing relationship of television to YouTube?
How have production techniques and practices developed as the platform matured?
What communities of practice have been influential in the development of YouTube norms?
How has the development of new aesthetic forms been enabled by YouTube?
What innovations in performance and modes of address can be detected on YouTube?
To what degree do YouTube's affordances operate as a social medium?
What new forms of celebrity and fandom have emerged on YouTube and why?
What wider social, cultural and political changes can be attributed to YouTube's influence?
Why do we need to regulate the corporate power of YouTube's owners Google?
Is YouTube a positive space for self realisation and expression of marginalised identities?
How do concerns over data harvesting and privacy apply to YouTube?
How have conflicts over rights affected the monetization of YouTube activities?
What potential does YouTube have as a repository of curated archives?
What are the genres that have thrived on YouTube and what wider significance does this have? (e.g. education, journalism, advertising and marketing, campaigning and propaganda, entertainment, documentary, drama, comedy and parody, how to ...)
Is the development of specific apps for Music, Kids and Gaming a significant new trend?
What research methods are used to study YouTube? What are their strengths and weaknesses?

Conference organisation team:

Professor Jane Arthurs
Dr Alessandro Gandini
Dr Paul Kerr
Nicola Skinner

Call for Blog Posts: the Eternal Sunshine of the Spotless Sociologist (2016-03-19 12:55)

The notion of 'publish or perish' has become something of a cliché. But its reality is starkly confirmed by the sheer quantity of scholarly literature produced each year, with an [1]estimated 28,100 active scholarly peer-reviewed journals publishing around 1.8-1.9 million articles in 2012. How much of this literature is written as a contribution to knowledge and how much of it is written to be counted? How many of these papers provoke serious engagement and how many are largely forgotten? After all, it's [2]estimated that 82 % of papers in the humanities are never cited, 27 % in the natural sciences and 32 % in the social sciences.

Does keeping up with the literature remain feasible when so much is being produced? Graham Scambler suggests we are seeing a ‘compression of the past’ in which many Sociology papers increasingly make reference to "a
handful of ‘reified’ classics from the past century and a flowering profusion of twenty-first century offerings”. His point is that when we have access to a “a bewildering and heterogeneous assembly of up-to-date sources” we tend to combine uncontentious canonical sources with “what we have most recently digested”. He argues that great bodies of work are lost under these conditions, contributing to a situation that Stephen Mugford describes as the *eternal sunshine of the spotless sociologist*: long studied topics and well developed approaches are ‘invented’ afresh, without reference to the originals, such that endless reiteration and forgetting replaces cumulative intellectual progress.

This special section of The Sociological Review's website seeks short blog posts reflecting on the challenge for scholarship under conditions of abundance. This might include topics such as the following:

- Is it becoming more difficult to keep up with the literature within any given field?
- What role does specialisation play in the explosion of scholarly publishing?
- Do our reading practices need to change under these conditions?
- Is the proliferation of journal articles simply a distraction? Do we need a renewed focus on quality rather than quantity?
- How do the demands of career progression contribute to the proliferation of journal articles?
- Should we place more value on review articles because of their capacity to systematise and condense sprawling literatures?
- Do we need new practices of reflection to consolidate what has been established within a field? Could social media help to this end?

Please contact Mark Carrigan with submissions or any questions relating to the special section: mark@markcarrigan.net. The deadline for contributions is March 31st 2016.

approach and its development, as well as address conceptual and methodological questions that participants might have. In the second half of the workshop, there will be plenty of time to present work-in-progress or planned projects, get feedback and discuss with others who are doing similar work.

If you'd like to participate then please e-mail mark@markcarrigan.net with a brief biography and description of your project.

**Investigating the Internal Conversation**

10am-5pm, May 24th 2016

R1.04, University of Warwick

Following from a successful initial meeting last year, this event will be the first of a hopefully ongoing series of events aimed at those investigating human reflexivity through empirical research. The 'internal conversation' was developed by Margaret Archer as a solution to the problem of structure and agency: a mediatory mechanism that accounts for how society's objective features influence its members to reproduce or transform society through their actions. Since initially discussed in Being Human, this account of human reflexivity has been developed through a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

The event is free but registration is essential. If you would like to speak at the event, presenting a work in progress, please register by March 31st with a title and 100 word abstract. If you would like to attend then please register by April 30th.

To register contact mark@markcarrigan.net

**Writing praxes beyond papers and books (2016-03-20 08:00)**

A really fascinating reflection by Rob Kitchin on ten forms of academic writing beyond scholarly papers and books: fiction, blog posts, newspaper op eds, email correspondence, policy papers, policy consultation, a television documentary script, powerpoint slides, academic papers, and grant application. What makes this so interesting is that all of these were deployed in relation to the same topic, feeding into each other in the process.

**The Meaning of Donald Trump (2016-03-21 08:00)**

A collection of the best essays and articles I’ve found about the rise of Donald Trump:
Two free workshops at the Centre for Social Ontology (2016-03-21 18:06)

The Morphogenetic Approach
June 21st, 10am to 5pm
The University of Warwick

This one day workshop is intended for those currently using or planning to use the morphogenetic approach in their research. In the first half of the workshop, Margaret Archer will give an overview of the morphogenetic approach and its development, as well as address conceptual and methodological questions that participants might have. In the second half of the workshop, there will be plenty of time to present work-in-progress or planned projects, get feedback and discuss with others who are doing similar work.

If you’d like to participate then please e-mail mark@markcarrigan.net with a brief biography and description of your project.

CfP: Ethics as Methods in the Era of Big Data (2016-03-22 08:00)

Ethics as method in an era of big data

Special Issue of Social Media + Society

We invite contributions to a special issue of Social Media + Society devoted to a critical examination of the future of Internet research practices in the era of computational or big data analytics, with particular focus on how ethics can be configured through methodological approaches.

Although we are promiscuously catholic as far as theoretical approaches are concerned, we are especially interested in contributions that pay specific attention to the socio-technical and political economic dimensions of "platform politics" and their ethical implications for research practice, as elaborated in the following questions. These questions constitute only some of the possible entry points into the discussion and we welcome other ideas:

Ethics have been traditionally situated as prior to methods; that is, as philosophical groundings that guide practice. If we situate method in the same time/space as ethics, would a different set of practices emerge? This question becomes relevant in an era when ethics are being reconfigured to better meet the contingencies of particular digital situations. For example, in situations wherein algorithms function with similar agency to humans, our methodological choices for deciding what counts as data or what might be considered a participant in a social interaction have ethical consequences. If every method decision is an ethics decision and vice versa, how might we rethink the relationship between the methodological and axiological?

Ethics are a series of activities that follow from a particular ethos. Etymologically, ethos is about emplacement and orientation. If we take this as a starting point, where is the place from which ethics emerge? What are the ethics of abstraction within this broader understanding of ethos as place? What ontological and more particularly, methodological premises currently guide inquiry practices in the beginning of the 21st century? Are these being transformed in some ways? What levels of abstraction and reconfiguration are involved in the collection of humans (and their data) as data?

How do processes of mediation constitute an ethos of methodological emplacement? All social research entails a particular assemblage of media forms and practices that lay the foundation for methodology. In addition, all practices are situated in particular social, economic, institutional, and disciplinary frameworks. All methodologies, therefore, are situated and mediated. How do ethics get played out over multiple layers of mediation? For example, qualitative researchers commonly abstract lived experience in multiple ways, through inscription of observations, recording of interviews, and often qualitative data analysis software. Quantitative social science likewise depends on methods that extract particular data from the context; sample through variable selection, survey instruments and statistical software packages; and so on. Each assemblage of mediation produces different objects and subjects of research, as well as different definitions of validity, reliability, and so on. What kind of mediations and situations envelop social media platforms and big data analytics? What kinds of research subjects and objects do they suppose and/or propose? What ethical practices do these mediations facilitate, constrain, or require?

If social computing research entails a different configuration of epistemology, ontology and methodology than other modes of empirical research in the human sciences, what are the implications for the model of "informed consent" that is currently the litmus test of the ethics of human subject research? How are we to understand the ethical implications of the power relationship between a corporate entity that is legally construed to be a sovereign subject with the rights of a person (in the US) and the "subjects" of research who are disarticulated from their personhood through a cloud of data analytics?

Should we revisit the old epistemological debates between quantitative and qualitative social science? The dis-
Discussion of corporate research ethics, particularly since Facebook's "emotional contagion" experiments of 2014, exposed many rifts between on the one hand social media platforms and the teams that perform analytics on automatically-generated large data sets; and on the other hand, qualitative oriented social scientists in internet studies. One participant in the debates described the latter group as being comprised of 'those whose research is primarily rhetorical,' in contrast to the social computing researchers whose work is more 'objective' because of its reliance on data driven experimentation. To what extent is the popularity of data- and evidence-driven models returning to modernist criteria for quality such as validity, reliability and generalizability? What might be the ethical consequences of privileging certain kinds of validity? Of particular salience here would be the social computing emphasis on the extremely large number of cases afforded by social media platforms. Does the comparatively huge number of 'cases' in big data analytics necessarily entail a higher degree of validity, however defined? Further, does the employment of A/B experimental models also enhance validity and rigour?

Other thematically resonant topics include (by are no means limited to):

Discussion of epistemological sticking points that might help explain the particular, and some might say peculiar, transformation of human activity to data points that can be analyzed separate from the temporal, textural, and emplaced lived experience.

Emergent ideas of ethics and labor practices involved in the exchange of personal data for platform and interface services.

Discussion or problematization of regulatory driven models of ethical practice that create pre-formed boundaries and regulatory norms; privilege particular activities and methods according to specific definitions of such concepts as informed consent, definition of human subjects, and protection of privacy; and fail to address the complexities of contemporary socio-technical relations of social media platforms.

Primary Editors of the Special Issue:

Andrew Herman, Wilfrid Laurier University, Canada
Annette Markham, Aarhus University, Denmark

Timeline:

Submit 750 word abstract for consideration: May 15, 2016
Receive Invitation to contribute: June 15, 2016
Submit full paper for peer review: November 1, 2016
Receive results of peer review: January 15, 2016
Submit revised manuscript: March 1, 2017

Style/Form of Paper

We encourage a range of style for papers. You might choose to make a position statement, defend a manifesto, or develop new models and tools for thinking. You might choose a creative reporting of an empirical study. We are as promiscuous in style as we are in theory, and seek to make a critical intervention with this special issue. The paper length is somewhat shorter than is typical to compel contributors to make strong but precise arguments.
or critical analyses that might provoke debate and further conversation among readers.

Abstracts (submit by May 15, 2016) should be no longer than 750 words, not including references.

Please submit abstracts via email to ethicasmethod@gmail.com. Attach the submission as a PDF file. Please include proposed title, author name(s), 750 word abstract, and references.

Full papers (submit by November 1, 2016) should be no longer than 6,000 words, including references.

Manuscripts should follow the SM+S guidelines which are available at https://us.sagepub.com/en-us/nam/social-media-society/journal202332 #submission-guidelines

Authors should cite their own work as they would any other author, both in text and in the Reference section, being careful not to indicate that the work they are citing is their own. Manuscripts that use (Author) will be returned.

SM+S uses APA style citation. Guidelines at: http://www.apastyle.org/

Accepted manuscripts will not incur any open access fees.

To submit your manuscript you will need to make an account at https://mc.manuscriptcentral.com/smas You will then login to this account, select Author Center, and then under Author Resources, you will click where it says "Click here to submit a new manuscript." This will begin the submission process.

The system will guide you through the submission process, but here are some instructions for specific questions:

It is imperative that in Step One of the submission page you select “SI: Ethics As Method” for submission type.

In Step Four of the submission process, you will answer “No” to the question “Has this manuscript been submitted previously to this journal?”

If you have any questions, ideas, or want to discuss this in advance, please feel free to contact either of the editors: amarkham [at] dac [dot] au {dot} dk or aherman [at] wlu {dot} ca.

Ontographology Cards: Oblique Strategies for Interdisciplinary Teams (sort of) (2016-03-24 08:00)

This is an early report on a project I'd really welcome feedback on:

This is my first attempt to write up an ongoing project I'm in the early stages of undertaking, as well as solicit much needed feedback on it. It's emerged from the Digital Social Science forum I've put together for the Independent Social Research Foundation. The forum has been setup to develop an interdisciplinary space within which the Digital Social Sciences can thrive. What are the Digital Social Sciences? That's a good question. Part of the problem facing the Digital Social Sciences is the vast array of disciplines and approaches being subsumed under this term: Digital Sociology, Digital Anthropology, Digital Geography, Social Informatics, Human-Computer Interaction, Web Science, The Digital Humanities, Data Science, Critical Data Studies, Platform Studies, Software Studies. The forum is seeking to promote interdisciplinarity in order to bring together varied methodologies from across the social sciences, explore implications and develop innovative approaches to work in the future. In practice this so far involves: a conference stream on Digital Methodologies beyond Big & Small Data, a conference panel on Digital Futures, special issues of various online magazines exploring these themes, an essay competition in Big Data & Society and a workshop on conceptual challenges in interdisciplinary social media research.

Underlying some of this activity has been an interest I've had for some time in the relevance of social ontology to the digital social sciences. I would understand Ontology quite straightforwardly as the study of what exists and what existent things have in common. But I think Tony Lawson's distinction between Ontology in this sense and Ontographology is very useful: the former being the study of things and the latter the study of how those things are theorised. Given their rapid proliferation, comparative Ontographology could be an important exercise in clarifying the internal structuring of the Digital Social Sciences, as well as identifying convergences and divergences in how they conceive of their often overlapping objects. But it could also be a tool of productive criticism, for instance drawing out contradictions between implicit and explicit ontological commitments. This would be a matter of mapping ontological issues being confronted across disciplines and fields, asking fundamental questions of philosophical ontology informed by the questions of regional or scientific ontology already being asked within specific disciplines and fields. The concern here would therefore be taxonomic: bringing clarity across fields of study and elucidating key issues where the impulse towards clarification is contentious. Part of the ambition here would also be meta-theoretical: mapping the diversity of different approaches to these questions and bringing them into the same argumentative space. Rather than their current existence as incommensurable paradigms, not permitting of intellectual advancement through dialogue with alternative understandings.

But what does this look like in practice? I'm not just saying that there are important theoretical questions to be asked about these novel fields of inquiry and the objects the confront. What I'm really interested in is the practical role these questions play in investigation. Many, if not all, affirm the value of interdisciplinary collaboration in social media research, as different disciplinary backgrounds contribute different skills to the analysis of complex socio-technical objects. However such collaborations also entail conceptual challenges, encountered at the level of substantive theoretical commitments but also in terms of taken-for-granted assumptions that inform everyday practice. How can digital social ontology help with the conceptual challenges teams confront when working together in this way? This is what the workshop I mentioned earlier intends to explore, taking place for the first time at Social Media & Society in July, alongside training workshops which have a more familiarly methods orientated focus. There will be a number of speakers (Evelyn Ruppert, Susan Halford, Les Carr and Emma Uprichard) reflecting on their own experiences of
conceptual challenges in interdisciplinary work. But the workshop as a whole will aim both to familiarise participants with common conceptual challenges confronted in interdisciplinary social media research, as well as drawing upon their own experience and understanding to unpack these challenges and explore potential routes beyond them. In doing so, we hope to develop new perspectives on these issues, including the disciplinary origins of these conceptual challenges, which can constitute the basis for further work and the production of practical toolkits to inform interdisciplinary working.

This promise of ‘practical toolkits’ is what has led me to the idea of ontographology cards, though I realise I’ll probably need to give them a catchier name at some point. In essence, I’m thinking of an ontologically inclined version of Oblique Strategies for interdisciplinary teams. For those unfamiliar with this resource, they are one hundred cards created by Brian Eno and Peter Schmidt in which each “contains a phrase or cryptic remark which can be used to break a deadlock or dilemma situation” as Wikipedia\[2\]helpfully summarises. I’m hoping the Ontographology Cards could perform a similar iterative and ad hoc function, being a resource that can be drawn up to mediate between what the [3]philosopher Roy Bhaskar describes as the “new concepts, theories and modes of understanding” required by interdisciplinary work and the “pre-existing cognitive resources drawn from a wide variety of antecedently existing cognitive fields in models, analogies etc”. There’s a positive and negative framing to this: from the problems caused by team members characterising shared objects in different ways to the maximal utilisation of the intellectual resources which each member of a team brings to their work together. The cards aren’t a project I expect to complete any time soon but it’s one which I hope could become something useful, as I develop the system and refine it through interdisciplinary workshops like the one being conducted at Social Media & Society, with the cards themselves hopefully playing an increasingly large role in the content of the workshop itself.

When looking for comparable projects, I came across a really interesting undertaking initially funded by the National Science Foundation in the United States. The Toolbox Project is intended as “philosophical technology” which "abstracts away from specific problems that research teams face" in order to seek common ground across disciplinary divides, understood to be anchored in their shared identity and practice as research scientists. As they describe it, "disciplinary membership is marked by a set of commitments, often unconscious, that condition what one takes the world to be and what one seeks to know about the world" ([4]O’Rourke and Crowley 2013). The intention of the project is to elicit these commitments through an instrument compromising 34 philosophical statements concerning ontology and epistemology, using a Likert scale to record strength of agreement/disagreement with each one. Potentially ambiguous terms are not clarified, with such ambiguities potentially generative of important dialogue in the ensuing workshop. After each collaborator completes the instrument in such workshops, they are invited to discuss their responses beginning anywhere they choose. The workshop lasts for 90 minutes and is lightly facilitated, with the accumulated evidence from its application internationally giving strong grounds to believe there’s much of use to interdisciplinary teams here.

There’s an explicit assumption of disciplinary unity here which I’d take issue with, both in the sense of imputing a artificial homogeneity to disciplines like Sociology and obscuring the excluded heterogeneity of disciplines like Economics. But as I understand their methodology, I don’t think this assumption has practical consequences because the facilitation of the workshop is light touch and any intra-disciplinary heterogeneity obscured by their framing assumptions would likely show up in the open discussion. However I do think there’s an important issue concerning the restructuring of the social sciences, which Felicity Callard and Des Fitzgerald refer to as [5]a shift in the plate tectonics of the human sciences. The social sciences are under external political pressures of varying sorts
across national contexts: the necessity to demonstrate ‘impact’ in the UK, attacks on political sciences in the US, closing social science and humanities departments by ministerial fiat in Japan. Meanwhile, new fields are emerging continuously, often at the intersection of the natural and social sciences: such as “social neuroscience, behavioral economics, evolutionary psychology and social epigenetics” as [6]Nicholas Christakis in a much circulated call to ‘shake up the social sciences’ a couple of years ago. There are both internal and external pressures chipping away at a unity to disciplines which I think the Toolbox Project team have already overstated.

This isn’t so much a critique as an observation about a changing disciplinary environment in which interdisciplinary communication between practitioners from settled disciplines can be assumed to differ in kind from communication between those from unsettled disciplines. It’s communication on these frontiers that interests me, specifically in relation to socio-digital novelty and how we facilitate its investigation across disciplinary boundaries. The novelty of these objects incites their investigation across these boundaries and it also foregrounds the role of their conceptualisation. But in no sense do I think the two approaches are mutually exclusive. One is intended to lay the ground for collaboration in preparation for it, the other is intended to be iterative and ad hoc.

However this is all still rather vague and that’s part of the problem. My concern is with how objects are characterised, implicitly or otherwise, as well as how convergent or divergent characterisations shape practice in ways which help or hinder collaborative endeavours. The obvious thing to do therefore is to start with a focus on objects but this leaves a question of generality. The potential objects are too broad if specified by me in advance and, at least at this stage, they’re likely to reflect my own disciplinary baggage in precisely the manner that I’m suggesting needs to be overcome. Nonetheless for the first workshop, I’m contemplating starting with some generically familiar objects (e.g. Facebook, a tweet, a platform) chosen in a way which will hopefully be jarring for their varying degrees of abstractness or concreteness. At first people will work individually, being asked to draw and/or describe this given object on the Artefact Cards provided:
The limited space afforded by the cards is precisely the point. What are the most essential features? Participants will then be given a list of questions to consider in relation to what they’ve drawn:

1. What is X?
2. What is it similar to?
3. What is it different from?
4. What do we know about it?
5. How do we know this?

Then each group will pool their cards and consider them collectively. Which cards can be grouped together? Which are very different from each other? The idea is to group the cards and discuss why they’re doing this in the process. Each of the smaller groups will then be invited to give an account of why their cards have been categorised in the way that they have, encouraging them to reflect upon the underlying fault lines which find expression in the approach they’ve taken to the same task. The end result of the session will hopefully then be a collection of ‘tweet’ cards, a collection of ‘Facebook’ cards and a collection of ‘platform’ cards, as well as photos taken of how each set of cards have been collated together within the group and an account of the reasons for this.

This is my first sketch of what this part of the session at the workshop will look like. I’m hoping it will provide
a ludic twist on the sequence of speakers and ensuing discussion which constitute the rest of the session. In the meantime, I’m trying to read as much of the literature on interdisciplinarity as I can, particularly that which focuses on the practical reality of day-to-day work across teams. I don’t think I’ll have developed the Ontographology Cards by the workshop, if indeed they ever see the light of day, but I’m hoping that their eventual form will start to take shape through small scale experiments like the one I’m undertaking at the workshop in July.

The Sociological Review Foundation is delighted to announce that we have commissioned Rowena Murray to deliver a Writing Retreat for sociologists.

Murray has devised and delivered structured writing retreats to support academics by providing dedicated writing time done in a group setting. To find out more about this approach see:[1]http://www.rowenamurray.org/aims/references/

The retreat is for academics at all stages of their career, but we especially encourage early career scholars to apply.

The retreat venue is the Black Bull Hotel in the village of Gartmore, near Aberfoyle, in Scotland. All writing sessions and meals (provided) are in the hotel. Minibus transport will be provided between Glasgow train station and the hotel.

14 places are available. The retreat will be free of charge, and there are a number of travel bursaries available for early career researchers.

As places are limited attendance will be by application. We invite applications via this online form:[2]http://goo.gl/forms/WB2LDFXPa1

Please note that due to the cost of each place, successful applicants will be required to make a refundable deposit of £50 to secure their place. ECR means PhD students or postdocs (within 3 years of award of doctorate)

### Contact

For academic inquiries related to this event, please contact Brigit McWade ([3]b.mcwade@lancaster.ac.uk)
For any other queries, please contact Jenny Thatcher ([events@thesociologicalreview.com](mailto:events@thesociologicalreview.com))

**Important Dates**

- Call for applications: **1st March**
- Applications deadline: **30th April**
- Notify successful candidates: **30th May**

Kieran (2016-03-24 21:45:06)
Having been on one of Rowena’s previous writing retreats I can highly recommend.

**Violence as the expression of Trump’s nascent ideology (2016-03-25 08:00)**

I’m sure I’m not the only person who’s been getting a little bit obsessed with Donald Trump in recent months. There’s certainly a risk of overstating the threat that he poses, such that a preoccupation with the man himself risks obscuring the systemic conditions that have facilitated his emerging status, but I’m increasingly convinced we’re witnessing what might be a culmination of sorts stemming from decades-long trends in American politics. Furthermore, it’s one which might lead to an existential change in the system itself, as an epochal realignment of voters and even the disintegration of the GOP begin to seem like possibilities.

This passage from Ezra Klein captures what I think is the ideological heart of this emerging movement and it’s rather sinister:

This is more than an aside; this is the core of Trump’s ideology. The protesters who interrupted his rally, the political correctness that kept the police from cracking their skulls, the press that takes the hippies’ side — this is why America has stopped being great. We were strong, and we were tough, and we didn’t take this kind of shit from anybody. And now we are weak, and we are scared, and we take this kind of shit from everybody.

The Politics of the Platform Society (2016-03-27 08:00)

This is a great talk by José van Dijck. I can't wait for her new book:
There are some excellent responses by Sonia Livingstone, suggesting we need to be critical of an emerging grand narrative of the platform society. It meshes nicely with the observation made by Adrian McKenzie that 'algorithms' have replaced 'discourse' as the master concept of post-structuralism.

**John Oliver on the history of student debt (2016-03-28 08:00)**

Television at its best: extremely funny and genuinely informative:

IFRAME: [1]https://www.youtube.com/embed/P8pjd1QEA0c

1. https://www.youtube.com/embed/P8pjd1QEA0c
While this rightly reveals the problem with for-profit schools in the U.S., it doesn’t reveal, as most do not, how the government actually finances those student loans; which is only slightly less grotesque than the United Kingdom. When a student applies for a loan, it is NOT don't through a bank. The application is made directly to the federal government, who approves anyone whose family makes less than $250,000 per year. The government then sends payment directly to the school. After payment is made to the school by the government, the government bundles a group of loans together, and then sells Treasury bonds on the open market to pay for those loans. With the low interest rates, the government currently pays 1.64 % on those bonds. Meanwhile, the government charges 6 % interest to the students. The government makes 4.36 % in pure profit. This was all set up under the Obama administration. The government has produced about $50 Billion in pure profits from student loans using this method since Obama took office. As Oliver pointed out, one way or another, the government always gets its money. In essence, in granting student loans, the government is essentially lending money to itself, to hand out to students, and then making a profit off of it. I say that it’s only slightly less grotesque than the U.K. because in the U.K., they use a similar method; except that they don’t bundle loans into sovereign debt bonds. Student loans in the U.K. are bundled into derivatives, and sold on the London exchange, similar to the way mortgage backed securities were. I wrote about this last year, when the Fed Funds rate was about 2.6 %, and the government was still making a profit. Here I argue, that student loans should NOT be considered student "aid" at this point. https://daveashelman.wordpress.com/2015/06/25/a-student-loan-is-not-student-aid/

Call for Blog Posts: the Eternal Sunshine of the Spotless Sociologist (2016-03-29 08:00)

The notion of ‘publish or perish’ has become something of a cliché. But its reality is starkly confirmed by the sheer quantity of scholarly literature produced each year, with an estimated 28,100 active scholarly peer-reviewed journals publishing around 1.8-1.9 million articles in 2012. How much of this literature is written as a contribution to knowledge and how much of it is written to be counted? How many of these papers provoke serious engagement and how many are largely forgotten? After all, it’s estimated that 82 % of papers in the humanities are never cited, 27 % in the natural sciences and 32 % in the social sciences.

Does keeping up with the literature remain feasible when so much is being produced? Graham Scambler suggests we are seeing a ‘compression of the past’ in which many Sociology papers increasingly make reference to “a handful of ‘reified’ classics from the past century and a flowering profusion of twenty-first century offerings”. His point is that when we have access to a “a bewildering and heterogeneous assembly of up-to-date sources” we tend to combine uncontroversial canonical sources with “what we have most recently digested”. He argues that great bodies of work are lost under these conditions, contributing to a situation that Stephen Mugford describes as the eternal sunshine of the spotless sociologist: long studied topics and well developed approaches are ‘invented’ afresh, without reference to the originals, such that endless reiteration and forgetting replaces cumulative intellectual progress.

This special section of The Sociological Review’s website seeks short blog posts reflecting on the challenge for scholarship under conditions of abundance. This might include topics such as the following:

- Is it becoming more difficult to keep up with the literature within any given field?
- What role does specialisation play in the explosion of scholarly publishing?
- Do our reading practices need to change under these conditions?
- Is the proliferation of journal articles simply a distraction? Do we need a renewed focus on quality rather than quantity?
- How do the demands of career progression contribute to the proliferation of journal articles?
Should we place more value on review articles because of their capacity to systematise and condense sprawling literatures?

Do we need new practices of reflection to consolidate what has been established within a field? Could social media help to this end?

Please contact Mark Carrigan with submissions or any questions relating to the special section: mark@markcarrigan.net. The deadline for contributions is March 31st 2016.

Why publish? The politics of communication in perishing times (2016-03-30 08:00)

In her inaugural lecture, Professor Sarah Kember asks how a new generation of independent and university presses can reinvent rather than reinforce what counts in scholarly and artistic practice.

In a context of ongoing crisis and policy reform in publishing, in the humanities, and the academy more widely; when it is no longer possible (if it ever was) to earn a living through commercial publishing while at the same time it is obligatory to earn a living (publish or perish) through academic publishing; when publishing is conservative and regulatory; when it is measured, individualised, competitive and anxiety-provoking; when the forms of academic and commercial publishing have become increasingly standardised and when we are not free to write how we would like to (and have in the past) even if we are still free to write what we would like to, this talk will ask: why publish?

The question will not be entirely facetious. What is at stake is not, or not only the future of the publishing industry, the book or the individual's career but the politics of communication inside the academy and beyond.

In as far as the politics of communication is at once negated and strongly enacted through policies oriented exclusively to commercial innovation, what is the value of revitalising strategies of invention and intervention in writing, scholarship and publishing?

There is a new generation of independent and university presses that are online and open access. This talk will consider what they can do to reinvent rather than reinforce what counts in scholarly and artistic practice.

WHEN Tuesday, 26 April 2016 from 18:00 to 20:00 (BST)

WHERE Ian Gulland Lecture Theatre - Whitehead Building Goldsmiths, University of London, New Cross SE14 6AD, United Kingdom
Call for contributions: Lacuna magazine special edition on UK/EU (2016-03-31 08:00)

[1]What has the EU ever done for us?

Lacuna will be looking at the theme of the Europe Union over the next few months. With the In/Out Referendum taking place on 23 June, we want to explore the issues that relate to the [2]themes of the Magazine

You may wish to investigate a particular instance of how the EU operates, to provide commentary, reportage or expert analysis on an EU-connected theme. Or you may wish to review a book, a film, a piece of music, art or theatre relevant to the Union. All forms of writing and visual art will be considered: fiction, non-fiction, poetry, film, animation and photography.

There is no word limit. If you take a look at some of Lacuna’s existing content (follow the links above), you will find submissions of varying lengths which adopt a variety of different styles.

As always we are committed to supporting new writers. This could be students and other people just starting out in their field. We will also support experienced writers who are learning how to write for new audiences; for instance, academics interested in translating their research for a wider audience. Where possible, we will work with prospective authors to help them improve and develop their work.

You can find out more about the call [3]here, and read the concept paper by the editor-in-chief, Prof Andrew Williams, [4]here.

For more information, please contact us [5]here or email Andrew ([6]a.t.williams@warwick.ac.uk) or Alice ([7]a.panepinto@warwick.ac.uk).

I’m an enthusiast about social media for academics. But for all the examples I see around me of social media enriching and enhancing scholarly practice, it’s hard not to be concerned by the broader context within which this is taking place. These problems are hugely worrying in their own right: the casualization of academic labour, the ceaseless ratcheting up of the expectations placed upon academics and the replacement of professional self-regulation by hierarchical audit all contribute to an environment I’ve talked about elsewhere, with my collaborator Filip Vostal, as the ‘accelerated academy’. But what I’m increasingly preoccupied by is how social media for academics doesn’t just take place within this context but rather influence how academics, individually and collectively, shape this context through resisting or reinforcing these pernicious tendencies.

It’s easy to see how social media for academics might fit into the ‘gig economy’ which we’re seeking to explore through this panel. It’s straightforward to imagine how rootless and nomadic academics would make themselves available through their online presence and mobile technology. What was once loftily conceived of as a vocation, though in reality more often simply a career, instead finds itself reduced to an endless iteration of ‘gigs’. In a way, the only thing I find implausible about [1] this Doonesbury cartoon is the lack of digital technology in the world of employment it represents:
Digital technology further fragmenting the academic workforce, scattering overly earnest scholars who seek only to teach and research across the international system, measuring and scrutinising their activity as they are ranked hierarchically to determine who gets first access to gigs that are ever shrinking in number as MOOCs replace the bulk of university teaching. Is this the future we face?

There’s something dystopically intoxicating about this narrative. In fact that’s what makes me suspicious of it. The polarisation of the academic labour market was not something caused by digital technology and there’s no reason to assume it will be intensified by it. In fact, if we look at how doctoral students and early career researchers are using social media, we can see lots of examples of social media being used to enhance the autonomy of younger academics: raising their visibility, helping them create networks and sustain a sense of professional identity when their working lives are split across many institutions.

My point is not to counterpoise a ‘good news story’ to a ‘bad news story’. For what it’s worth, I do think the
picture is pretty bleak. But if we reduce the uptake of social media by academics to an extension of managerial power then we’ll struggle to understand exactly what influence it is having. If we impute too much to the technology then we fail to do justice to the social processes through which any technological influence is necessarily mediated.

Much depends on how social media is taken up by academics. The potential outgrowths of it are diverse: everything from what I’ve elsewhere described as ‘networked solidarity’ (including, though not limited to, satire) to displays of academic incivility which can only fairly be described as ‘trolling’. The key question for me concerns which of these uses become more likely under present circumstances and how these influence might, in turn, feed back into changing that context or reinforcing its existing characteristics.

I wonder if the key issue might simply be why people are turning to social media. My fear is that we are seeing a growing sense in which people feel they have to use social media. There are many potential reasons why this perception might be becoming widespread:

- how central social media is becoming to debates about impact and public engagement
- the growing frequency with which training is offered in universities
- the message this implies about the desirability of engagement
- people seeking contributions for things like collective blogs
- universities, departments and research centres seeking contributions for such projects obviously has an additional dimension to it
- stories about career success founded on an online presence: a sense that this stuff is crucial for career opportunities, without anyone being able to specify quite why this is the case, perhaps propped up by a few mythical cases
- the anxiety about not missing out on opportunities which inevitably abounds within an unhealthy job market.

My fear is that if ‘social media is the new black’, something which everyone is expected to do, instrumental concerns will come to squeeze out the more nebulous joys and satisfactions which can be found at present.

Social media for academics might provide a framework within which the ‘Uberisation of Higher Education’ becomes entrenched. But it might also provide a bulwark against it, facilitating solidarity and collective action between those who are nonetheless dispersed across many workplaces. We simply don’t know yet. But that’s why we have to be careful about how we conceptualise these platforms, the tools they offer for academics and what it means for them to be taken up within a changing landscape of higher education.

The Sociological Review Annual Sociology Lecture (2016-04-02 08:00)

The Sociological Review Annual Sociology Lecture

Friday May 20th 2016, 17.45-21.00 SOAS, University of London **Keynote:** Professor Éric Fassin (Université Paris-8) **Discussants:** Professor Gurminder K Bhambra (University of Warwick, UK and Linnaeus University, Sweden) and Dr Imogen Tyler (Lancaster University) Professor [1]Éric Fassin will bring together the disciplines of anthropology and sociology to demonstrate how the boundaries that were drawn around them were part of an academic struggle for power in which the term ‘race’ and the politics of decolonization were central to the war of disciplinary position. **The Great Divide:** *Sociology, Anthropology, and Race in France since Lévi-Strauss* Claude Lévi-Strauss published the
Elementary Structures of Kinship in 1949 as a sociologist. Only in 1950 was he to appropriate the term “anthropology” in his introduction to the posthumous edited volume of essays by Marcel Mauss, entitled Sociologie et anthropologie. The French sociological tradition did not distinguish between the two disciplines; on the contrary, Émile Durkheim and his heirs distanced themselves from an “anthropology” that was associated with race during the first half of the century. In order to reclaim this label, and thus institute himself as the founding father of French anthropology, Lévi-Strauss could not merely rely on American cultural anthropology; he had to erase the racial legacy of the French tradition. This was accomplished in his 1952 UNESCO pamphlet “Race and History”. It was a powerful move in the wake of World War Two, especially from one who had to flee Nazi persecutions against Jews. But this was also the eve of decolonization – at a time when Georges Balandier analyzed the “colonial situation” as a sociologist, while Michel Leiris and Aimé Césaire denounced the politics of race in the French empire. Today’s French work on race has to revisit this great divide of the 1950s, not only between anthropology and sociology, but also between the social sciences and race.

About Éric Fassin After teaching in the United States from 1987 to 1994 (at Brandeis University and New York University), and at the École normale supérieure in Paris from 1994 to 2012, Éric Fassin is now a professor of sociology in the Political Science Department and co-chair of the Gender Studies Department at Paris 8 University. He is a founding member of the new Laboratoire d’études de genre et de sexualité - Research Center on Gender and Sexuality Studies (LEGS, CNRS / Paris 8 / Paris 10). His work focuses on contemporary sexual and racial politics, including immigration issues, in France, in Europe, and in the United States – often in a comparative perspective. He is frequently involved in the French public debates on issues his work addresses – from same-sex marriage and gender parity to the politics and policies of immigration and race, but also on the evolution of the left.

Using social media to ‘inhabit the attentiveness of another writer’ (2016-04-03 08:00)

There’s a lovely reflection in Les Back’s Academic Diary, [1] released soon by Goldsmiths Press, concerning the role of Twitter in academic life. He suggests that Twitter sometimes facilitates our “inhabiting the attentiveness of another writer” by providing “signposts pointing to things going on in the world: a great article, an important book, a breaking story”. Through the things that others share, we sometimes enter into their world and participate in an economy of “hunches and tips” which is the “lifeblood of scholarship”.

This is a useful reminder of the value that Twitter can hold for those already using the platforms. But it’s also wise guidance for those who have just started and find the whole thing baffling. No idea what to post? Share what you’re looking at, what you’re reading, what’s gripping you and why. Share the ‘hunches and tips’ which animate you and respond to others when they do the same. These exchanges are the value of Twitter for academics and they’re no different in kind from those which take place within universities each and every day.

Using fiction as a resource for social theorising (2016-04-04 08:00)

I was a bit hesitant when preparing this talk because of the risk that I just end up talking about a couple of novels that I really liked and explaining why I liked them. So I won't actually say all that much about Super Sad True Love Story: it depicts a dystopian near future in which credit scores from 400 to 1600 are displayed publicly on 'credit poles' at shops and on the streets, ‘personality’ and ‘sexiness’ are automatically ranked within any social space and ‘mood + stress indicators’ provide public hierarchical rankings within all work places. As the legal theorist Frank Pasquale [1] describes it, the book depicts how “[i]n an anomic world where social mores are adrift, the characters in the novel scramble to ‘find their place’ in the social pecking order by desperately comparing themselves with each other”. In other words: what happens if self-quantification and metrics come to define the fabric of everyday life, against the backdrop of a crumbling economy, entrenched inequality and mass unemployment? It’s not a very nice place but it is a plausible place; a near future in which one can so clearly see our present reality extended and intensified.

In recent months, I’ve found myself thinking about quite how helpful I found the book. It may have just been that I happened to read it a time when I was at a place in my work that left me very receptive to the ideas contained within it. Reflecting on the book helped me in beginning to develop my own particular take on what Nick Couldry calls ‘social analytics’: the sociological investigation of how metrics operate in relation to the experience of diversely situated actors across the social world. It fed into a paper I co-wrote with Filip Vostal, in which we took issue with what Deborah Lupton calls the ‘quantified academic’ being reduced to the internalisation of audit culture, instead suggesting we need to turn our focus towards how metrics come to matter to academics and how this shapes their orientation towards the systems within which they work and to each other. It’s also feeding into a book project I’m in the early stages of working on, seeking to develop a sociology of digital distraction which I ironically enough keep finding myself too distracted to work on properly. There’s a very precise question about the causal relation between human reflexivity and metricisation which the book helped me come to a conclusion on.

To be clear: I didn’t read the book to help me do social theory in general or to answer this particular question. I suspect if I had then I wouldn’t have found it so richly generative. But it nonetheless helped me think through this issue in a way that I’d like to understand better than I do. It’s also had a huge impact on the work I’ve been doing over the last year and plan to do over the coming years. It isn’t the only novel that’s had this effect: The Circle by Dave Eggers is another which has left me preoccupied by clear themes which were previously fragmented interests or abstract theoretical questions. The core interests of my post-phd research agenda is something that’s been germinating through the fiction and graphic novels I’ve read over recent years, as well as much I’d read long before: themes like ‘disruptive’ technology, the political agenda emerging from Silicon Valley, the threat of automation, the potentially contracting horizons of progressive politics and the long term possibilities of techno-fascism, post-capitalism or civilisational collapse.

If Super Sad True Love Story was one fiction that had a big influence on how I approached one question, I’d like to understand the relationship between all the fictions I find sociologically interesting (for lack of a better phrase) and all the questions I address as a sociologist. I think there are very interesting conceptual and methodological questions to be asked about the role of particular fictions in relation to particular research projects: drawing on the former as vignettes or exemplars for the latter, the role of fiction as what Ken Plummer calls ‘documents of life’, formulating research questions which have fictional inspirations or maybe the assumptions we might bring to a particular project based on relevant fiction that we’ve read. But the question I’m asking is a biographical one: how do we understand the role of a trajectory of reading in relation to a trajectory of research? Is it just the same question multiplied over the lifecourse? Or are there additional dimensions to the question which open up when we consider this issue biographically?

One way into this questions to consider the organising function of a trajectory of reading in relation to our ideational life. In my own case, a rich thematic of Digital Capitalism is starting to serve, in way that feels extremely organic, to tie together the work I’m currently doing and that which I’m planning. It’s the first time I’ve ever felt like...
I have a coherent research agenda rather than an omnimaniacal pursuit of a range of disconnected topics. This is a change in how I’m orientated towards my research that I realise now has been deeply shaped by fiction and graphic novels. I’d like to understand this change for its own intrinsic interest (to me at least) but also because it raises important conceptual questions that have practical implications for research.

As an example: through much of the science fiction I’ve read in my life, it’s possible to see a rich vein of technological determinism permeating it: technology might save us or it might doom us, but what the post-scarcity utopia often shares with the techno-fascist dystopia is that its the inexorable unfolding of the inner logic of technology which brings it about. To varying degrees, depending on the sophistication of the text in question, real politics – in the sense of organised struggle over finite resources – gets pushed out of the picture. This is a point which is easy to recognise in relation to particular fictions but I wonder if this influence is more problematic if we think in terms of a trajectory of engagement over time. If a rich vein of fiction that we draw upon shares a common ontological assumption, is it possible this assumption gets ‘baked into’ any use we make of this ideational material? So the problematic assumption gets smuggled into how we think about and frame a particular issue.

I think it’s an interesting exercise in its own right to try and reconstruct the implicit and/or explicit social ontology of a fiction i.e. what does the social world it portrays consist of and how does this fit together? But I’m also suggesting there could be a useful methodological dimension to such an exercise. I find Charles Taylor’s notion of the ‘social imaginary’ useful to think about this: “the ways people imagine their social existence, how they fit together with others, how things go on between them and their fellows”. Fiction is an important part of the social imaginary and it seems obvious to me that social researchers will inevitably draw upon it at times and that furthermore they’re right to do so. But even though these influences are diffuse and in the background, it’s important that we cultivate reflexivity about the influences that fiction has had on our research and be open to the questions posed by this. How does the fictional social imaginary frustrate and facilitate researchers and the research they do over time? How do we conceive of it in a way that does justice to its potential as both problem and resource?

These questions feel really important to me at the moment because so many of the issues I’m preoccupied by concern a future which is still open. The hyper-capitalist dystopia of vast unemployment predicated upon robotics is something which haunts popular culture and I think indelibly marks any attempt to approach this possibility in a sociological way. I agree with [2]John Lanchester’s call for moving beyond dystopic imagery in order to flesh out our heretofore entirely speculative understanding of what might happen if 47% of jobs are lost in two decades (even if most Americans don’t think this will happen to their jobs). We should also seek to recover the latent promise that robotics and computation might prove emancipatory, creating new possibilities for human flourishing in a world liberated from mental and physical drudgery. This suggests to me a need for sociological thinkers to help ‘join the dots’: linking together what we know across a range of fields into broader synthetic accounts that accurately convey conceptually opaque aspects of our present situation and highlight potential trajectories. The enormous value of fiction to such an endeavor seems self-evident to me: as a resource to think with and against as we try and unpack the constellation of future possibilities latent in present day reality.

You can see endorsements of it [1] here and there's a chapter available online [2] here.

Data, Society and the Self: Digital Sociology in Theory and Practice (2016-04-06 08:00)

A two-day postgraduate workshop that explores, defines and practices digital sociological research

Are you curious about Digital Sociology? Consider, or already conducting, a postgraduate study on the subject? Want to explore the relations between Data, Society and the Self? Want to meet digital sociologists? Come and enjoy two days of roundtables, masterclasses, a research workshop and a keynote, with experts from MMU and further afield.
The workshop is aimed at postgraduate students but is open to all.

**26-27 May 2016, The Shed, Manchester Metropolitan University**  
Organised by Tom Brock, Adi Kuntsman and Esperanza Miyake, Digital Transformations Research Network, MMU

**Keynote:** Prof. Patricia Clough, CUNY

**Speakers:**
- Dr. Tom Brock, Department of Sociology, MMU
- Dr. Mark Carrigan, Centre for Social Ontology, Department of Sociology, Warwick University
- Dr. EJ Gonzales-Polledo, Department of Methodology, LSE
- Dr. Adi Kuntsman, Department of Languages, Information and Communications, MMU
- Dr. Esperanza Miyake, Department of Languages, Information and Communications, MMU

Follow us on Twitter: #SocDataSelf

**Call for Papers: Fieldwork - Doing Ethnographic Research (2016-04-07 08:00)**

*Call for papers*

Fieldwork: Doing Ethnographic Research

Friday 24th June, Birmingham City University

**Confirmed Keynotes:**

Professor Elijah Anderson, Yale University

Professor Karen O’Reilly, Loughborough University

4332
Please send an abstract of no more than 250 words to [1]Kehinde.andrews@bcu.ac.uk by Friday 1st April

The cost to attend the conference will be £50 for full time employed; £30 for part time employed and postgraduate students. [2] Click here to book

Ethnography is one of the oldest methods in social research and provides unparalleled access to social life. The Centre for Critical Social Research is organising a one day conference that will bring together ethnographers to discuss developments, challenges and the future of the ethnographic method. We are delighted to have confirmed Professor Anderson and Professor O’Reilly who have years of experience working in the field; with the aim of the day to explore approaches, difficulties and novel ways to conduct fieldwork. We invite papers from established and early career academics exploring a range of themes in ethnography. The method has been used across a range of disciplines and we welcome papers from any subject area including but not limited to sociology, anthropology, education, health studies, migration, politics and activist research.

Beyond the Echo Chamber: a project by the Social Action & Research Foundation (2016-04-08 08:00)

A really interesting project by an inspiring organisation. See more [1]here:

To this end we have built upon the historical tradition of pamphlets and aimed to re-imagine this for a contemporary audience. Pamphlets can provide information and context to a situation, and so present ideas to challenge consensus and open up discussion for alternative futures. Our idea was to make this particularly visual, following Emory Douglas the artist of the Black Panthers, who used graphic design to “inform, enlighten and educate” in order to [2]“create a culture of resistance”.

In order to help shape the content and language of the pamphlet, we held a workshop with a small group of NGO-activists in Manchester and Salford who had experiences that resonated with the report and are involved in developing alternative approaches. The group session created an energy and tone for the content and design of the pamphlet. All participants were direct, honest and fostered a DIY approach in their own way. We tried to reflect that in the design, taking inspiration from the history of hand-made and fanzine publications. We wanted eye grabbing images to back up the sentiment of the words while keeping it positive and accessible with colour and a softer illustrative approach in places. The words and imagery in the pamphlet are not nuanced in the way our full-length report is, but rather designed to provoke an immediate response. In this age of digital, we share the pamphlet online; but the main thing with this particular project is about having these tangible publications that we have made and folded ourselves to be found at community centres in Manchester and Salford and floating around in public places, for people to pick up, feel and think about and maybe do what they have been thinking about for a while.
Theorizing Social Inquiry: Contemporary Debates (2016-04-09 08:00)

Theorizing Social Inquiry: Contemporary Debates

University of Edinburgh, Friday 6th May, 2016, 1-5.30pm

Summary: This symposium will address contemporary theoretical debates about social science as a form of inquiry – as an active, ongoing process of knowledge production. Areas of debate include how the conditions of production shape social scientific knowledge, as well as how to best develop and support inquiry: through the adoption of a dialogic stance, a general framework for research, an innovative writing style, or something else? Some of the issues that will be explored are:

- the external institutional conditions that frame and shape objectivity in inquiry
- the politics of knowledge-production within the academy
- whether innovative writing styles hamper or facilitate inquiry
- how to theorize social inquiry as a dialogic enterprise
- whether or not social theory should try to provide a general framework as the basis for empirical inquiry

Details

- **Date and Time:** Friday 6th May, 2016, 1-5.30pm
- **Venue:** 6th floor staff/common room, Chrystal Macmillan Building, 15A George Square, Edinburgh University, EH8 9LD
- **Entry is free** but please contact Steve Kemp if you are planning to attend on:

  [1]s.kemp@ed.ac.uk

Speakers and Titles

4334
Plenary Speaker: John Holmwood (Nottingham University): "Revisiting Objectivity"

Other Speakers:

Justin Cruickshank (Birmingham University): “Inquiry and the Dialogic Development of Knowledge: From ‘Meta-physics as a Conceptual Science’ in Critical Realism to Gadamer and the Finitude of Being"

Lisa Kalayji (Edinburgh University): "Feminist/Sociology: Knowledge Production under the Spectre of Postfeminism"

Steve Kemp (Edinburgh University): "How important is fallibility to progress in social inquiry?"

Stephen Shirlaw (Independent Scholar): "Bridge-building to create sociocultural theory frameworks: the two challenges of interdisciplinarity and micro-dynamics."

Angelica Thumala (Edinburgh University): "Sociology as literature. Do poetic and other innovative writing styles hamper or advance inquiry?"

[5]Leeds Beckett University

Call for chapter abstracts: Digital Technology and Sustainability (2016-04-11 08:00)

Call for Chapter Abstracts
Working Title: Digital Technology and Sustainability: Acknowledging Paradox,
Digital technologies are hailed as revolutionary solutions to the problems of environmental sustainability; smarter homes, more persuasive technologies, and a robust Internet of Things hold the promise for maintaining our lifestyles and sustaining our ecosystems. Yet, deployments of interactive technologies for such purposes often lead to a paradox: the tools algorithmically "optimize" heating and lighting of houses without regard to the dynamics of daily life in the home; they collect and display data that allows us to reflect on energy and emissions, while raising our expectations for comfort and convenience; we can share ideas for sustainable living through social networking and online communities, yet these same systems enable entirely new forms of consumerism. By acknowledging these paradoxes we make room for critical inquiry into digital technology’s longer-term impacts on ideals of sustainability.

This text brings together diverse scholars, researchers and practitioners willing to study, critique, and reorient dominant narratives and approaches to designing interactive digital technologies that support sustainability.

Objectives
- To articulate and address the conundrums (theoretical, methodological, practical) for digital technology, and sustainable HCI in particular, in a single definitive volume;
- To advance an iterative, interactive process (e.g., virtual workshops and one-to-ones) between scholars in the field;
- Create a touchstone that scholars, students and interested members of the broader public can use to develop their understandings of sustainability in a digital future;
- To initiate accessible and engaging modes of broad dissemination to coincide with the release of the book (e.g., video shorts and animations).

A list of possible content areas for which we are seeking chapter contributions are listed below; but topics are not strictly limited to these. For more information on the content, participants, and the unique
Critical Ethical Reflections - Who Are We To Decide What Is Of Value, What Is Worth Sustaining?
Politics/Economics Fundamental To Any New Tool, Yet Rarely Explicitly Addressed
Shifting Orientations: Lengthening Temporal Scales/Accepting The Unknown: With The Uncertainty And Unpredictability Of Effecting Change.
Shifting The Norms Of IT Development/Practice: Developing Ways Of Fundamentally Shifting Current Trajectories Of ICT Development And Education Proxies For Sustainability (Emissions, Energy, Reliance On Natural Resources), And Approaches For Addressing These Infrastructure Considerations
The Role Of Activism In Scholarly Work Tied To Environmental Concerns Relationships Between Sustainability And Social Justice
Criteria of Excellence: Development of a broad set of expectations for future research in sustainable HCI.

Engines of Knowledge from the First Information Age: Medicine and the Hospital (2016-04-12 08:00)

By Hamish Robertson and Joanne Travaglia

Introduction

While we now live in an era marked by the emergence of big data, this is not the first ‘big’ information age but the [1]second. The first big data information age occurred in the early 19th century, developed exponentially with a rapid increase in the collection, storage and analysis of information from a growing number of primary sources. In particular, traditional and new disciplines emerged that began to adopt strategies of knowledge acquisition. New technologies made new ways of seeing possible and acceptable. New types of data became not only permissible but desirable. This was an age of knowledge factories that preceded our now digital computer age but one which set the scene for these later developments. Matching pace with this earlier surge in analogue data and information was the development of analytical processes associated with quantification in particular, including areas such as applied mathematics and statistics. New forms of abstract and, necessarily, reductive data collection strategies, methods and technologies were created. Many of the professions and disciplines that are now considered the engines of the scientific method developed at this time and were increasingly associated with specific institutional settings such as the university and the research laboratory. This article is the first in series examining some of the 'engines' of knowledge production that developed in this first information period and which continue their relevance into the
present. In this piece we want to explore, using medicine as an example, the argument the knowledge factories did not and do not 'simply' re-present the natural and social worlds but manufacture specific versions of them, versions that could be understood by specific audiences and via approved values systems. **Containing the field** The hospital, the university and the laboratory delineated the acceptable boundaries of knowledge production, by directing focus and resources to particular topics and methods, and especially by claiming the power to authorize what constituted acceptable knowledge in specific fields and what did not. This process can be seen clearly in the field of medicine, for example, which began to take control of both practitioners and practices in order to legitimize and regulate medicine as a field of endeavour. This produced not only a general field of theory and associated praxis, but an extensible basis for claims to authority in society at large and in forms of knowledge production in particular. Newly arising professions and semi-professions began to follow the models of knowledge construction set out by lawyers and the law over the preceding centuries with an emphasis on the empirical and factual. In short, this period was marked by the development of knowledge 'factories' with all the attendant features of formal organisational structures as they are commonly understood today. The rise of hospital as the location for the practice of the science of medicine reflects this shift. What had, in its origins been a place for the care of the slaves and the poor came to, literally and figuratively, 'contain' modern interventional treatment, as well as scientific research and experimentation. In capturing both practice and research, hospitals became an engine of knowledge acquisition as the permissible site for specific activities within specified confines and under particular conditions. In this sense the hospital became a specific territorial claim for and by medicine. The flip side of this was public health where regulatory practices and data collection occurred within the community. Even today public health activities are often located within hospitals and the public health paradigm subordinated to medicine. The hospital also became a replicable, even transportable, locus for the practice of acute and chronic medicine. The quasi-military look of Nightingale wards, the strict hierarchy of and within the professions, and the subordination of the patient to the whole system, reflected both the military concerns and broader Victorian values of the time. Many hospitals sat, where possible, high above the miasmal lowlands (because germ theory was not yet dominant) and assumed a physical presence and prominence in their local communities. Both their architecture and operational activities reinforced this authority. A secular trope of hygiene and risk replaced the theological one of purity and danger that preceded it. Moving knowledge creation and transmission to the university system was yet another technique by which medicine turned itself into a profession, as well as a distinct academic discipline. The Scottish and French universities were pioneers in this regard but English and American medicine quickly pursued similar trajectories. Control of the production, interpretation and transmission of knowledge lay at the heart of these systemic changes and epistemic transformations. **Johansson** and colleagues have argued that medical innovation across the centuries involved a trickle-down effect from the more experimental medicine practiced on the more affluent and prestigious sections of the community. Successful elite medical care gradually became generalized across the profession. **The claims of scientific medicine** Medicine is now considered a science, and historical representations of medicine favour this positioning. However it was not until the 19th century that this representation gained hold, and even then the efficacy and reliability of the 'science' of medicine was tenuous. Medicine did not become 'scientific' in the modern sense until it acquired control not only over the methods of knowledge production, but also over other forms of practice, thereby establishing itself as the authoritative primary form of intervention on the human body. Medical practice which had begun as a highly individual, local and particular art, became increasingly collective and specifically situated expansionary science. These economic and cultural claims to authority (what Bourdieu calls a form of capital) were supported by the adoption of the Hippocratic Oath as the Lydian stone of modern medicine. This association implied that the profession was symbolically aligned with safety, certainty and consistency in practice. Yet as historian [David Wootton](http://www.davidwootton.com) argues, and studies into healthcare quality and safety show, these claims were, and to a significant extent remain, largely aspirational. The addition of technology to the mix brought not new practices but new channels for knowledge production. This was a very gradual strategy, and today we find it hard to imagine just how recently much of this techno-medicine and innovation mantra began to pay off. **The creation of expertise** The accumulation of experts, expertise and information strengthened the characteristic of the hospital as a knowledge factory, one which encompassed numerous smaller engines, including those which generated knowledge about everything from germ theory to the statistical analysis of mortality rates (Florence Nightingale's often forgotten contribution to the field). From infectious disease the hospital gradually extended its
brief to include to chronic diseases, rehabilitation, and innumerable other specialties and subspecialties across disciplines, fields and professional and organizational endeavours. As this shift unfolded, a combined process of clinical specificity (e.g. patient disease progression) and quantitative generalisability emerged (e.g. causes of death). Each specialty became a micro-factory for expert information about cancer, heart disease, neurology and so on. Even the subordinate disciplines like nursing, pharmacy and pathology gradually developed their own specialist knowledge in both tacit and explicit forms. The ability to produce these kinds of specialised knowledge took on a form of self-authorisation. A legitimate discipline was one which was able to generate, disseminate and advocate for this specialist knowledge. Medicine began path re-writing some of its history in favour of prevailing Victorian values (rationality, objectivity, progress, science and management) while aligning the profession to the growing esteem of science in part through the presence of the white lab coat, which denoted a symbolic and practical shift away from the profession’s lineage of the surgeon/barber. The generativity of science and technology were such that they became, and in large part remain, the driving forces of legitimate knowledge production under modernity. The knowledge producing ‘expert’ acquired authority and license through a claim to produce certain kinds of knowledge, through processes that were only rarely open to the purview of the layman. Thus expertise became a close correlate of authorized knowledge and practice as the knowledge produced, and the engines and engineers of knowledge acquired status. Disruptors to the knowledge claims of the profession could be viewed as threats to the collective, so much so that those like Simmelweiss who used scientific methods to collect data to argue against the craft practices of their profession (and gender), were completely ostracized. The objectively excluded Expertise positions the expert as the official gatekeeper to some particular knowledge domain. The 19th century saw the development of a particular discourse around subjectivity and objectivity that has become an enduring trope. [12]Daston and Gallison have charted the journey of ‘objectivity’ to its status as an epistemic virtue, one which is still used to validate and privilege specific forms of scientific knowledge and knowledge creation methods over others. In comparison, medicine’s epistemic virtues continue to coalesce around the doctor-patient relationship, which in its idealized form, is considered as a valid engine of knowledge production in and of itself. [13]William Osler developed the clinical ward round a century ago and, with it, the mechanics and the performativity of this approach to clinical knowledge acquisition and transmission. Medicine made and still makes claims to a special one-to-one relationship between the doctor and patient, a claim that is supported by both structure and regulation in most countries. A patient’s discharge from hospital largely remains in the remit of the medical practitioner. And of course the status of the ‘patient’ – including who is and who is not – becomes a signature power of the medical practitioner and the medical system. This requires the emergence of a form of definitional authority along with its concepts, methods and tools. The medical philosopher Georges Canguilhem, Foucault’s doctoral supervisor, published On the Normal and the Pathological in the mid-1960s, based on his own doctoral research. This explored how medicine’s ideas about what was normal and what was pathological were generated and became modified over time, and more specifically explored whether quantitative knowledge could be reconciled with the individual clinical encounter. Foucault’s own Birth of the Clinic took the large teaching hospital as its platform for examining not only the medical gaze but the broader methodology of knowledge production in and through the clinic. Both showed that the epistemic positions of those who produce and legitimize knowledge can have significant ontological effects. One example of this is the way in which the taxonomic indexation of diseases, operated as a way of codifying and legitimizing knowledge in a way which, by its very structure, seemed to reproduce the scientific methods of their day. Examples include the International Classification of Diseases (ICD, formalised in 1900) and the Diagnostic and Statistical Manual of Mental Disorders (DSM, first published in 1952), which remain two major contemporary engines of knowledge legitimisation in medicine. One governs the ontological ‘canon’ of physical diseases and the other dictates what is determined a mental illness and what is not. The ICD was preceded by the Bertillon Classification of Causes of Death and the medical statistical research of William Farr and Marc d’Espine. These types of taxonomies with their Linnaean processes of conceptualizing, naming and classifying of organisms acted not only to capture the ontology of diseases, but to create medico-social ‘problems’, as Foucault and Illich argued, as a way of increasing power, prestige and authority invested in medicine. Both taxonomies were and are shaped by and reflect socio-cultural ideologies and mores of their era, in particular, but not solely, in relation to gender and ‘gendered’ behaviour (e.g. hysteria), ethnicity/race (e.g. drapetomania, the pathological desire for freedom shown by slaves in the US) and sexual ‘deviance’ (e.g. homosexuality). Discussions over the blurred social-scientific boundaries of such
classifications continue into the present day. Knowledge production quite clearly legitimizes both actions taken and who is acted upon. **Conclusion** Medicine is created by a series of inter-related engines of knowledge which legitimise both the profession and its accepted practices. While these engines have been deliberately aligned to scientific (read objective, quantitative and therefore 'reliable') forms of knowledge, this positioning is not now, nor ever has been, unproblematic nor uncontested. The use of scientific methods by the profession (and other critics) against itself, would indicate that the social authority and influence built on the 'engines of knowledge' strategy within medicine had one major advantage, in that it could operate in both upwards and downwards. The hospital became and remains as an approved site for the production of knowledge about health, illness, disease and patients. The twin epistemic strategies of the individual patient encounter and the aggregate, quantified data about both patients and their conditions continue to produce medically approved knowledge. The conflict between these has largely been reconciled by favouring a particular version of scientific medicine, but at its inception in the 19th century, this framework proved enormously beneficial for medicine, the medical profession and the social phenomenon of the hospitals. The locus of the hospital became a valuable site for not only data collection (individual and general) but a site for the production of growing volumes of data and its deployment by an expanding system of experts. It seems clear that authority, both then and now, is hugely enhanced by the capacity to establish a knowledge factory, to generate exclusive expert knowledge and to control its application and oversight.

» Engines of Knowledge in the First Information Age: Botany and the Garden Part 1 The Sociological Imagination (2016-08-25 08:01:10)

[...] is the second in a series of short essays exploring what I have called 'engines of knowledge' in the first quantitative. [...]
So what is ‘networking’? (2016-04-13 08:00)

This is an extract from [1]Social Media for Academics by Mark Carrigan

To talk of ‘networking’ raises the inevitable question of what your ‘network’ is and why it matters. This is a theme which cuts through the book given that the network is so crucial to social media: without a certain critical mass of users, it’s difficult for social media platforms to be useful to anyone. What’s the point of sending 140-character messages, sharing audio clips or self-publishing articles if no one is going to find them? Social media offer endless opportunities to communicate with your network and expand it in the process. But this doesn’t really answer the question of what the value of this actually is. In part, it can simply be a matter of the enjoyment of sharing things you’ve produced, something which the media scholar [2]David Gauntlett (2011) conveys powerfully in his book on creative production, Making is Connecting, which situated this aspect of contemporary digital culture in terms of a much longer history of craft.

One of the difficulties with the notion of ‘networking’ is that it can seem to imply that such an activity is extrinsic to scholarly activity, such that one does one’s real work and then (reluctantly) looks outwards towards their connections. What this leaves out is the vast majority of academic work that involves collaboration in one form or another. Gauntlett expresses this nicely, suggesting three ways in which ‘making is connecting’:

- Making is connecting because you have to connect things together (materials, ideas, or both) to make something
• Making is connecting because acts of creativity usually involve, at some point, a social dimension and connect us with other people

• Making is connecting because through making things and sharing them in the world, we increase our engagement and connection with our social and physical environment

While Gauntlett is talking about creative production in general, the same points can be extended to scholarship. In fact his discussion of ‘craft’, a term not often used to apply to the work that goes on within the academy, offers a useful reminder of the genuinely creative work that is undertaken by academics (albeit frequently within conditions which frustrate that creativity or at least make it difficult to experience it as such). By this he means a process of discovery, often involving new ideas which emerge through acts of creation. This helps bring people together through their shared acts of creation, consolidating bonds between collaborators which take on a life of their own in the outcomes of this work together. This language of craft, which [3]Sennett (2008) talks about in terms of doing things well for their own sake, provides a nice counterweight to some of the instrumentalising tendencies which the contemporary academy can give rise to.

Talk of ‘networks’ and ‘networking’ can be off-putting. I like Gauntlett’s account because it captures how networks are integral to creative work: making is connecting. It follows from this that connecting can be a preliminary to making. As [4]Weller (2011: loc 172) puts it, ‘[n]etworks of peers are important in scholarship – they represent the people who scholars share ideas with, collaborate with on research projects, review papers for, discuss ideas with and get feedback from’. Networks are integral to scholarship. The possibilities which social media open up for networking can have hugely important implications for your scholarship, though they also pose challenges which we’ll discuss. But first, it’s important not to forget your existing network when you begin to engage with social media.

DEADLINE TOMORROW: Sex and Sexualities in Popular Culture: Feminist Perspectives 2016 (2016-04-14 08:00)

Sex and Sexualities in Popular Culture: Feminist Perspectives 2016

Call for Papers for a 1-day postgraduate symposium hosted by the Digital Cultures Research Centre

Abstract deadline: April 15th, 2016

Conference date and location: September 3rd, 2016, Digital Cultures Research Centre, The Watershed, Bristol

Eligibility: Postgraduate students (MA/MSc onwards) and creative practitioners
Send abstracts to: [1]popsex.conference@gmail.com

Keynote speaker: Cheryl Morgan

The second annual Sex and Sexualities in Popular Culture: Feminist Perspectives symposium is returning to the Bristol Watershed in September 2016. Following an exciting inaugural symposium in 2015, this year’s event will continue our tradition of offering a safe, inclusive space for postgraduate students and creative practitioners to meet peers, share work and learn from each other. We are delighted to welcome Cheryl Morgan as the keynote speaker for PopSex16. Cheryl is a Hugo award-winning science fiction critic and publisher. She is the owner of Wizard’s Tower Press and the Wizard’s Tower Books ebook store. Previously she edited the Hugo Award winning magazine, Emerald City (Best Fanzine, 2004). She also won a Hugo for Best Fan Writer in 2009. She is a Co-Chair of Out Stories Bristol and lectures regularly on both trans history and science fiction and fantasy literature. We continue to be interested in how representations of sex and sexualities in popular culture shape feminist – and anti-feminist – issues and discourses. Since our 2015 event, we have seen both the box office success and backlash against films such as Mad Max Fury Road (noted for strong feminist themes and female leads in a traditionally male-dominated franchise) and Star Wars: The Force Awakens (which upset “Men’s Rights Activists” through its failure to feature a straight, white, male hero). MRAs have also made abortive attempts to organise away from the keyboard. Eddie Redmayne, the cisgender male actor cast as the lead in The Danish Girl, has drawn criticism for his claims that the movie has brought trans issues to the mainstream. Fanfiction has received even more mainstream coverage with speculation that pressure from fans may move Disney to make one of the leads in the latest Star Wars trilogy canonically gay. And of course many aspects of sex and sexualities remain silenced and unrepresented in popular culture. We welcome, among others, proposals which examine these trends and take the (mis/under)representations of sex and sexualities in popular culture as a starting point to theorise the links between popular culture and real-world feminist issues and activism. We aim to create a space safe for experimentation – both with new ideas and with presentation formats. We therefore encourage a range of submissions, including workshops, discussions, pecha kucha, as well as the traditional 20-minute paper format. Possible topics include but are not limited to:

- Representations of women’s desire and sexualities in popular culture
- Non-cis- and heteronormative sexualities in popular culture, especially beyond “gay and lesbian”
- Representations of sex work
- Infertility and sexual dysfunction
- Sexual intersections, including race, disability, religion, class and socioeconomic status, gender, etc.
- Sex and sexualities in gaming
- Sexual pleasure in popular culture
- Invisibility: (a)sexualities unrepresented
- Sex, sexualities and social media
- Sex and sexualities in fan and transformative works

Please submit a 300-word abstract and a 100-word bio to [2]popsex.conference@gmail.com by April 15th, 2016.
The Aristocracy of the Digital Celebrities and the Magical Thinking That Props It Up (2016-04-15 08:00)

This is possibly the most depressing blog post I've ever read. It's the earnestness with which the author conveys the message that “influencers are rarely the people who move the needle in our life”, as if this was a genuine personal revelation that he now feels the need to convey in as gentle as tone a possible:

After scrolling for several hours, I came to a conclusion.

Some people—including me that night—spend too much time following top influencers.

If only I can get their attention, we think, then I'll make it big.

As I scrolled, I thought about how hopeless some people may feel when they can't catch the attention of that one influencer. I imagined how nervous that person might have felt as they crafted their Instagram pitch to Cuban, Vaynerchuk, or John.

Not everyone feels this way about connecting with influencers, of course.

But many do.

At the end of the day, influencers are rarely the people who move the needle in our life. Our success hardly depends on their attention.

Our success ultimately depends on the attention we give to our work, not the amount of attention our work gets for us.

By definition there can only be a handful of celebrities. As Goffman describes it on pg 68 of Stigma, by 'fame' we “refer to the possibility that the circle of people who know about a given individual, especially in connection with a rare desirable achievement or possession, can become very wide, and at the same time much wider than the circle of those who know him personally”.

The Challenge of Public Engagement Projects and the Role of New Intermediaries Like @Soc_Imagination and @TheSocReview (2016-04-16 08:00)

In a recent article on the LSE Impact Blog, [1]Martha Henson reflects on the challenges which typify digital projects and the implications this has for the uptake of social media in higher education. She highlights a pattern which occurs with depressing frequency, in which “a failure to understanding digital marketing, and a failure to invest any serious time and effort in promotion” lead to otherwise laudable digital initiatives failing. The lesson she takes from this is

4344
an important one: "stop wasting money on digital projects if you aren't prepared to promote them properly". On one level, it’s hard to argue with the conclusions she has drawn:

Do NOT embark on any digital project if you aren’t going to at least make a decent effort to tell people about it or otherwise figure out how people are going to see it.

If you are going to make an in-gallery app but only have room for a small piece of signage and no budget or space for print promotion, do not bother. If you are going to create a game and put it on your website and think maybe your organisation might be able to muster up a single tweet and facebook post about it, give up now. If you are creating an amazing interactive video experience but the entire budget is going on production and you’ve run out of money to market it, stop.

Furthermore, if you think that a digital experience, be it mobile or online, game, video, or guide, is going to sell itself, and thereby itself be marketing for your TV show or exhibition, you are going to be sorely disappointed. Actually, I suspect this attitude is partly to blame for some of the failures in this area. There seems to be some confusion over whether these digital add-ons are marketing themselves but, by and large, it doesn’t work this way, things just don’t magically "go viral".

But perhaps we need to interrogate these difficulties a little further. I’m sure Henson is correct in her diagnosis that in many cases “these digital projects *are* just seen as add-ons”, with the promotional activity therefore falling to the production team for the project. But in the context of higher education, I think there’s a more diffuse problem of what Oili-Helena Ylijoki calls ‘project time’:

First, project time entails a strict timeframe, defined in the research contract. Every project starts and ends at given dates, and there are milestones in-between. Thus, the project has an internal clock that determines how long research can take, what stages there are and what results need to be gained by certain dates. In this way, project time has fixed, pre-set temporal boundaries, which separate not only different phases within a given project but also one project from another, making it an entity of its own with a logo, an acronym and web pages ([4]Vermeulen 2010).

The dominance of project time within higher education compounds the problem that Henson identifies (as I suspect it also will in other fields where the temporality of projects is dominant) because it means that building an audience falls within the temporal horizons of the project itself. It’s a time consuming task that is unlikely to succeed within the window of a project. Furthermore, it’s one which benefits from activity that engages with multiple audiences in a variety of ways i.e. something to which most projects will be unsuited. It’s labour intensive, iterative and long term.

Obviously, this is why promotional activity of the sort Henson bemoans the absence of is important. But this is also why the new intermediaries of social media for academics become so important: websites like The Sociological Imagination, The LSE Impact Blog, The Sociological Review and Open Democracy (and many more) have pre-aggregated a specialised audience relevant for many of the interesting projects that are emerging all around us. This
leaves them obviously valuable as promotional partners but I’m suggesting we need to see them in a more fundamen-
tal way as platforms for public engagement. Initiatives like these are not something peripheral to the mainstream of 
public engagement but rather are a crucial component of any engagement project which seeks to utilise social media.

Shared Sociology (2016-04-17 08:00)

by Les Back

We all know we are struggling within the institutions in the academy where metrics and audit culture is tied to the hierarchies of a value. Even if you did well in REF 2014, success is followed quickly by an impending sense of falling and failing. ’Pay wall sociology’ is hostage to the prestige of journals that count, status, measured and accu-
mulated quantitatively and individually. More often than not, the ‘impact agenda’ put us on the side of the powerful.

Does the crisis of the academy mean that the sociological imagination has been dealt a fatal blow? Absolutely not! Does creativity endure? Of course it does. There is so much brilliant work being done that can be celebrated and read with a sense of wonder. At the risk of you all laughing at me – and it’s good for intellectuals to be laughed at I think as George Orwell once commented - how about building a sociological future out of foregrounding our best scholarly virtues... of sharing hunches, passing on leads and suggesting ideas. ’You really have to read this book... you would love it.” This will sound weak I am sure but I think one way to survive the current academic conjuncture is to cultivate a kind of intellectual generosity.

I can imagine a few of you might be thinking well that all right for you to say? On some can afford to be gen-
erous. I would argue against this position for I agree with Ros Gill when she argued that institutionalised self-interest is toxic and licenses cruel judgments. Equally you might think: shouldn’t the first principle of generosity be a willingness to reciprocate it? Maybe so.

Two dimensions come to mind. Firstly, to argued for a broadened sense of the space of sociology. John Holmwood (2010) captured something important when he called sociology an “exporter discipline”. Equally, I would say in my mischievous moments, that we have imported things worth celebrating. We have imported Franz Fanon, the most anti-methodological thinker of the 20th century. We have imported Judith Butler and Angela Davies and Paul Gilroy, and of course W.E.B. Du Bois who was in and beyond sociology from the very beginning. I often use John Scott’s book of biographical portraits of contemporary social theorists as an example of what I would like to call a shared sociology. The second point I want to make is about the possibilities sharing and passing on the immaterial things of sociology. There are more opportunities for circulating in sociology through social media and online magazine and publications than ever before. There can be some unpleasant dimensions including the dark arts of academic
impression management too but I would still argue the possibilities are there. It draws into the conversation the non-specialistic, school teachers, GCSE students and sometimes people who are just plain curious (often in more ways than one). It isn't always comfortable but I think it is often vital. Today, by contrast, the atmosphere on university campuses rewards and encourages competitive self-interest. Like many of you I am an avid listener to Laurie Taylor's Radio 4 programme *Thinking Allowed*. Laurie's great gift is his capacity to bring the very best out of his guests. He has cost me a fortune in buying books from a wide variety of fields that I wouldn't have otherwise known about. I am thinking of books like Marek Korczynski's brilliant ethnography *Songs of the Factory* (2014) or Rachel Hurdley's wickedly seditious study of the homing strategies of university office workers (Hurdley 2015). After listening to the programme I often feel compelled to Google the email addresses of the featured sociologists. I email them just to say how amazing their work is, or sometimes to beg a few .pdfs from esoteric journals not available in the Goldsmiths library. I think authors recognize sincere appreciation that isn't a 'networking opportunity'. They almost always reply favorably more often than not with emails loaded with bountiful attachments. It shows a small aspect of what I mean by a shared sociology, or living by the best values of scholarship. **Bibliography**

Do we need to reorientate Sociological thought? Or are perpetual calls to do this part of the problem? (2016-04-17 12:59)

Re-orienting Sociological Thought?

Glamorgan Council Chamber, Glamorgan Building,

Cardiff University, School of Social Sciences

Cardiff University
2pm to 4pm, Wednesday, May 11th 2016

In recent years, we’ve seen the proliferation of calls to reorientate sociological thought around new concerns, 4348
methodologies and approaches that can ground the discipline in changing times. This symposium brings together advocates of prominent approaches with the hope of a dialogue concerning these calls. What do they have in common? How do they differ? Are their proliferation a sign of the discipline’s weakness or of its vitality? Do we need to throw our energies into one, embrace the multitude or somehow synthesise them into a broader project of disciplinary renewal?

Mark Carrigan – Why Public Sociology is Becoming Digital Sociology (and vice versa)

June 21st, 10am to 5pm
The University of Warwick

This one day workshop is intended for those currently using or planning to use the morphogenetic approach in their research. In the first half of the workshop, Margaret Archer will give an overview of the morphogenetic approach and its development, as well as address conceptual and methodological questions that participants might have. In the second half of the workshop, there will be plenty of time to present work-in-progress or planned projects, get feedback and discuss with others who are doing similar work.

If you'd like to participate then please e-mail mark@markcarrigan.net with a brief biography and description of your project.
Are you coming to @thesocreview’s Annual Lecture? (2016-04-17 13:37)

The Sociological Review Annual Sociology Lecture

Friday May 20th 2016, 17.45-21.00

SOAS, University of London

This event is free but it is essential to register. To reserve a place, please email Jenny Thatcher [events@thesociologicalreview.com].
Keynote: Professor Éric Fassin (Université Paris-8)

Discussants: Professor Gurminder K Bhambra (University of Warwick, UK and Linnaeus University, Sweden) and Dr Imogen Tyler (Lancaster University)

Professor [1]Éric Fassin

will bring together the disciplines of anthropology and sociology to demonstrate how the boundaries that were drawn around them were part of an academic struggle for power in which the term ‘race’ and the politics of decolonization were central to the war of disciplinary position.

The Great Divide:

Sociology, Anthropology, and Race in France since Lévi-Strauss

Claude Lévi-Strauss published the Elementary Structures of Kinship in 1949 as a sociologist. Only in 1950 was he to appropriate the term “anthropology” in his introduction to the posthumous edited volume of essays by Marcel Mauss, entitled Sociologie et anthropologie. The French sociological tradition did not distinguish between the two disciplines; on the contrary, Émile Durkheim and his heirs distanced themselves from an “anthropology” that was associated with race during the first half of the century. In order to reclaim this label, and thus institute himself as the founding father of French anthropology, Lévi-Strauss could not merely rely on American cultural anthropology; he had to erase the racial legacy of the French tradition. This was accomplished in his 1952 UNESCO pamphlet "Race and History". It was a powerful move in the wake of World War Two, especially from one who had to flee Nazi persecutions against Jews. But this was also the eve of decolonization – at a time when Georges Balandier analyzed the "colonial situation" as a sociologist, while Michel Leiris and Aimé Césaire denounced the politics of race in the French empire. Today’s French work on race has to revisit this great divide of the 1950s, not only between anthropology and sociology, but also between the social sciences and race.

About Éric Fassin

After teaching in the United States from 1987 to 1994 (at Brandeis University and New York University), and at the École normale supérieure in Paris from 1994 to 2012, Éric Fassin is now a professor of sociology in the Political Science Department and co-chair of the Gender Studies Department at Paris 8 University. He is a founding member
of the new Laboratoire d’études de genre et de sexualité – Research Center on Gender and Sexuality Studies (LEGS, CNRS / Paris 8 / Paris 10). His work focuses on contemporary sexual and racial politics, including immigration issues, in France, in Europe, and in the United States – often in a comparative perspective. He is frequently involved in the French public debates on issues his work addresses – from same-sex marriage and gender parity to the politics and policies of immigration and race, but also on the evolution of the left.

Please note that tickets are strictly limited. Please give sufficient notice of cancellation.
Are you studying the internal conversation? Get in touch soon for a free workshop (2016-04-17 19:12)

Investigating the Internal Conversation

We still have one place left for this workshop. Get in touch very soon if you'd like to take part:

Reflexivity Forum  
10am-5pm, May 24th 2016  
R1.04, University of Warwick

Following from a successful initial meeting last year, this event will be the first of a hopefully ongoing series of events aimed at those investigating human reflexivity through empirical research. The 'internal conversation' was developed by Margaret Archer as a solution to the problem of structure and agency: a mediating mechanism that accounts for how society’s objective features influence its members to reproduce or transform society through their actions. Since initially discussed in Being Human, this account of human reflexivity has been developed through
a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

The event is free but registration is essential. If you would like to speak at the event, presenting a work in progress, please register by March 31st with a title and 100 word abstract. If you would like to attend then please register by April 30th.

To register contact mark@markcarrigan.net

How to ‘network’ without chipping away at your soul (2016-04-18 08:00)

‘Networking’ is a horrible term. I’m sure I’m not the only person who hates it. It nonetheless refers to something important, albeit perhaps pervasively misunderstood. The usual connotations of the term ‘networking’ are insincerity, instrumentalism and general creepiness. There have been a few occasions when I’ve been conscious of being ‘networked’ by someone else in a way that made me deeply uncomfortable. It’s worse when someone is really good at it, projecting enthusiasm for their encounter with you while nonetheless failing to engage with anything you’re actually saying: smiling plausibly while looking over your shoulder to check if anyone more useful has entered the vicinity.

In fact I think ‘useful’ is the key term to understanding the problem here. If you see ‘networking’ in terms of people being ‘useful’ to you then it will be a soul-destroying activity. You’ll either succeed in building a collection of ‘useful’ people around you (and destroy your soul in the process) or your confidence will be crushed by the feeling you’ve pervasively failed to do things properly (though your soul may very well be intact).

Rather than ‘useful’, we should think in terms of ‘interesting’: arousing curiosity or interest. Who do you find interesting? What do you share with them? What differences and commonalities are there in how you approach a shared interest? Setting out to build a network of people you hope might one day be useful to you is creepy and disturbing. Approaching academic life with the intention of having as many friendly conversations as you can with people who share your interests is incredibly rewarding. Plus social media takes so much of the awkwardness out of it. But that’s an entirely different post.

Using Social Media to Manage Information (2016-04-19 08:00)

From a Culture of Connectivity to a Platform Society (2016-04-20 08:00)

Cyberparty: popular politics in digital times - Fri May 13 2016, Centre for Digital Culture, King’s College London (2016-04-21 08:00)

// Cyberparty: Popular Politics in Digital Times //

In recent years - and in particular since the explosion of the financial crisis of 2008 - we have witnessed the rise of an array of new political parties - sometimes described as ‘digital parties’, ‘internet parties’ or ‘network parties’ - that attempt to utilise digital communication technologies as means to construct new forms of political participation and organisation against a background of widespread political disaffection with mainstream politics.

From the 5 Star Movement in Italy, to Podemos in Spain, and the Pirate Party in Iceland, Sweden and Germany, to the municipalist formations that recently won the mayoralties of Barcelona and Madrid, the signs of this surprising revival of the political party in digital times are growing. These new political organisations that are entering the political arena in a number of countries in Europe and beyond make use of the tools and practices that typify the present digital era, from Twitter channels and Facebook pages to Whatsapp groups and decision-making platforms. Furthermore, they embody the new demands that reflect the ways of life, fears and desires of an era of mass digital connectivity: demands for free information, privacy, connectivity and basic income.
What is the meaning and what the implications of these emerging digital parties? How do they reflect and respond to the current phase of economic and political crisis? What are the new issues and policies they bring to the fore? What are their forms of organisation, participation and leadership?

The Cyberparty conference hosted by the newly formed Centre for Digital Culture at King’s College London will explore these issues by bringing together experts and activists from the forefront of political innovation. It will ask what is specific to the emerging ‘digital party-form’ underpinning these formations, how it compares with the mass parties of the industrial era and the electoral-professional parties of the neoliberal era and to what extent it can become a vehicle for social and political change. Furthermore, it will inquire in which ways more traditional political phenomena such as the Labour party under the leadership of Jeremy Corbyn and Bernie Sanders’ campaign in the US are trying to adopt some of the emerging organisational structures and practices coming from digital parties.

Different aspects of digital parties will be examined: their forms of communication and propaganda; their decision-making platforms; their policy platform and social base, with dedicated panels on these issues.

The conference will also host a special panel on digital activism in Eastern Europe.

// Confirmed speakers include

Birgitta Jonsdottir (Pirate Party), Davide Barillari (5 Star Movement), Bernardo Gutierrez (journalist and activist), Arnau Monerde (Universidad Oberta de Catalunya), Francesca Bria (Nesta), Jodi Dean (Hobart and William Smith Colleges), Andrew Chadwick (Royal Holloway), Sofia de Roa (Podemos), Miguel Ongil Lopez (Podemos), Richard Barbrook (Westminster), Emmy Eklundh (King’s), Emiliano Trere (Autonomous University of Queretaro), Marco Deseris (Northeastern University), Cristian Vaccari (Royal Holloway), Aaron Bastani (Novara Media), Paolo Gerbaudo (King’s), Francisco Jurado (Podemos), Alex Williams (City University), and Alex Clarkson (King’s).

Academic Social Media in the Research Economy (2016-04-22 08:00)

It is increasingly hard to move without encountering the idea that social media is something of value for academics. The reasons offered are probably quite familiar by now. It helps ensure your research is visible, both inside and outside the academy. Many of us might be sceptical of the dominant discourse of impact within which such a concern for visibility tends to be expressed. I certainly am in many ways, worrying that this is irrevocably tied up in the instrumentalisation of research, the declining autonomy of researchers and the marketisation of the Academy within which research takes place. Nonetheless the imperative to make and demonstrate impact is already an entrenched characteristic of the research economy and looks likely to stay that way.

In this short talk, I will make the case that social media in general and blogging in particular represent a way to expand academic autonomy, improve the quality of our scholarship and nonetheless meet the demands of what I have elsewhere called the Accelerated Academy, all at the same time. This might seem implausible, so please bear with me. If it seems overly optimistic, let’s talk about this at the end because my actual view of the research economy is pretty grim and depressing. My enthusiasm for social media comes in large part because I see it as something that can, at least potentially work to ameliorate a whole series of problems that afflict those within the contemporary research economy.
A good way into this is to consider some of the other benefits increasingly held to obtain through academics using social media. I already mentioned visibility, internal to the academy and outside of it. Related to this, is the chance to practice communication with nonspecialist audiences. It’s a faster way to get your research findings out. It allows you to build an audience for future publications, in advance of their actual release. In doing so, it allows you to find people who share your research interests, as connections more or less inevitably form on the basis of what you publish and what you read online.

But the advantage that I’m most interested in and the one that will be key to the argument I’m making here, is that the more you write, the easier writing gets. The more you think, the easier thinking gets. My enthusiasm for social media in general, as well as blogging in particular, stems from the endless occasions they offer for thinking and writing.

But isn’t thinking and writing what we do anyway? Well yes, on one level, it is. Though I think there are important questions to be asked about how the accelerating pace of working life in contemporary universities impacts on the time and energy available for thinking and writing. But talk today is not about that.

It’s this presumably everyday quality to academic thinking and writing which has increasingly left me confused about one of the most common concerns, even objections, to academic social media: isn’t it just one more thing for already busy people to do? On the surface, this makes complete sense. This is certainly true for some people. It’s almost certainly true for everyone at least some of the time. But much of what academics do on social media should not be something extrinsic to their scholarship but instead should be constitutive of it. As the sci-fi author, digital rights activist and blogger Cory Doctorow puts it: blogging is “my major way of thinking through the stuff that matters to me”. This is true of myself as well. I think it’s true of many academics using social media, even if they don’t recognise it. Furthermore, I think much of the value that social media has for academics within the contemporary research economy won’t be actualised until this has become a ubiquitous feature of how we talk about the way we can use social media as researchers.

There’s a lovely extract of [1]the Academic Diary in which Les Back reflects on the life and work of the social theorist Vic Seidler. Remarking on the vast range of topics on which Seidler has written, Les suggests that this deeply committed man “writes not because his academic position expects it but because he has something to say and communicate”. For someone like Seidler, writing is something a person does because they are “trying to work something out”.

This captures what I see as the promise of academic social media. It’s a platform for trying to work things out. More so, doing it in the open grants each of these attempts a social existence, one that comes with undoubted risks but also enormous rewards. Little bits of thought shrapnel, brief attempts to make some sense of the ‘feel of an idea’, come to enjoy their own existence within the world. They’re mostly forgotten or even ignored from the outset. But there’s something quite remarkable about occasions when these fragments resurface as someone sees something of value in them, perhaps when you saw no value in them yourself.

In this way, it attunes you to the impulse to write because you have “something to say and communicate”. This isn’t always the case and I worry that the metricisation of scholarly blogging will prove immensely destructive of it. But there is at least for now something deeply rewarding about seizing on an inchoate idea, developing it and throwing it off into the world to see what others make of it. For no other reason than the pleasure inherent to it. Whether this non-instrumental exploration of ideas remains the norm or could be sustained in the long term is a different question – as I’ll come on to, I think there are reasons to worry that the research economy is inimical to this.

What does this all mean practice? I’m talking about quite straight forward practices which all of those conducting research engage in to differing degrees. I’ve often used the term ‘public notebook’ and the existence of non-public notebooks is the most obvious point of comparison here. Prior to starting a research blog early in my PhD, I use to
scribble notes in a succession of moleskin notebooks – ones I would later struggle to decipher due to my scrawled handwriting. The radical sociologist C Wright Mills wrote a wonderful appendix to his famous The Sociological Imagination about scholarly craft: he argued for the necessity of keeping a ‘file’ in order to ‘keep one’s inner world awake’.

These are activities we all engage in but which, rather interestingly, tend not to feature in public discourse: the daily minutiae of scholarship. Notebooks, filing cabinets, file cards, newspaper clippings, print outs, drawings, marginalia in books, annotated papers, reading lists etc. Modern digital equivalents involve tools like Evernote or OneNote. These have many of the advantages of using social media – they can also of course be integrated with them, for instance by quickly sharing notes from Evernote or automatically clipping content you discover on social media into the appropriate Evernote folder. But as with social media use, they have the advantage of mobility, in so far as that one can use them across devices and across contexts – rather than the careful work of keeping physical files or the necessity of ensuring one always has one’s physical journal and never, under any circumstances, lose it.

The features I discussed earlier might all sound individualistic. But it’s in considering how the use of social media differs from contemporary alternatives like Evernote that it becomes apparent how the benefits of social media are intrinsically social. Later in the book I mentioned earlier, Les Back suggests that Twitter sometimes facilitates our “inhabiting the attentiveness of another writer” by providing “signposts pointing to things going on in the world: a great article, an important book, a breaking story”. Through the things that others share, we sometimes enter into their world and participate in an economy of “hunches and tips” which is the “lifeblood of scholarship”. These provide pathways through the literature, allowing others to use them as guides into and through often difficult bodies of work.

It’s in this sense that I’m arguing social media increases the autonomy of researchers, both individually and collectively. If we accept the argument that metrics necessarily entail the evisceration of self-governance, with hierarchical regulation replacing horizontal norms, then this new horizontal space of collaboration and cooperation begins to looks exceedingly valuable. It’s a new kind of space and one which could be easily destroyed if we too easily accept that what we do within it should be measured and incorporated into the logic of career advancement.

The kinds of scholarly communities of practice we can see perpetually coming to life online are obviously not confined to the digital sphere. But academic social media is at present profoundly generative of them, whereas the broader research economy is increasingly characterised by a competitive individualism which works to preclude them. However I think this not just important within the academy but also in the relationships between academia and other institutional spheres. For instance, academic social media is changing how journalists and academics interact: it’s easier to identify academics, but it’s also easier to make demands upon them which might be unreasonable or unwelcome, often with only a cursory understanding of what they hope to achieve through such a potential collaboration. It’s also changing the relationships between social scientists and the communities they research, as organised groups increasingly monitor and engage with academic research, in ways that can throw up all such of problems. This is why the nature of the ‘third space’ of academic social media is so important.

There are all sorts of instrumental gains to be had through engaging with social media: increasing your visibility, expanding your network, ensuring your work is widely read, engaging with non-academics publics and making an impact outside of the academy. But there are gains to scholarship which are more important and perhaps more diffuse than this. What increasingly interests me is the tension between them the two tendencies: how the instrumental use of social media, encouraged within the contemporary research economy, might imperil the gains which I’ve suggested can be made on the level of craft and collaboration.

I’ve not spoken much today about the practicalities of academic social media. This is particularly because none of this is very technically demanding & I can happily direct anyone who e-mails me towards whatever ‘how to’ guides they need (or to awkwardly try and self-market... you could buy my book). These broader issues seem much more important to me than the minutiae of how to use particular digital tools. What do we want do and why do we
want to do it. The practical questions of how are secondary. It’s in this sense that I think social media for academics opens up some deeply pressing questions about academic labour, scholarship and the research economy.

A contagion of pivots reveals the hollowness of the sharing economy (2016-04-23 08:00)

Interesting [1] analysis of the difficulties that many platform firms are facing now that venture capital is starting to dry up. I also love the phrase “a contagion of pivots” more than I can express:

A contagion of pivots began happening among other sharing economy startups. Companies like Cherry (car washes), Prim (laundry), SnapGoods (gear rental), Rewinery (wine), HomeJoy (home cleaning) all went bust, some of them quietly and others with more headlines. Historical experience shows that [2] three out of four startups fail, and more than nine out of 10 never earn a return. My favorite example is SnapGoods, which is still cited today by many journalists who are pumping up the sharing economy (and haven’t done their homework) as a fitting example of a cool, hip company that allows people to rent out their spare equipment, like that drill you never use, or your backpack or spare bicycle—even though SnapGoods went out of business in August 2012. It just disappeared, poof, without a trace, yet goes on living in the imagination of sharing economy boosters.

The rather provocative conclusion drawn is that the so-called sharing economy ultimately amounts to nothing more than a series of digitally mediated niche temp agencies:

A pattern has emerged about the “white dwarf” fate of many of these once-luminous sharing startups: after launching with much fanfare and tens of millions of VC capital behind them, vowing to enact a revolution in how people work and how society organizes peer-to-peer economic transactions, in the end many of these companies morphed into the equivalent of old-fashioned temp agencies (and others have simply imploded into black hole nothingness). Market forces have resulted in a convergence of companies on a few services which had been the most used on their platforms. In a real sense, even the startup king itself, Uber, is merely a temp agency, where workers do only one task: drive cars. Rebecca Smith, deputy director of the National Employment Law Project, compares the businesses of the gig economy to old-fashioned labor brokers. Companies like Instacart, Postmates and Uber, she says, talk as if they are different from old-style employers simply because they operate online. “But in fact,” she says, “they are operating just like farm labor contractors, garment jobbers and day labor centers of old.”

Social Research and Intellectual Neglect: The Promise in Explicating the Philosophical Ethics Underpinning Our Research (2016-04-23 15:07)

by John-Paul Smiley

This brief piece is a rallying call of sorts – for researchers to more clearly make explicit the fundamental philosophical ethics underpinning their research. Most research, as [1]Kinsella (2006) points out, ‘...is informed by philosophical underpinnings that originate in unacknowledged and implicit philosophical traditions' (Kinsella: 2006: p. 1). What is often left unstated, however, is that these philosophical underpinnings are of a profoundly ethical nature. For example, social researchers often make recommendations in their research papers, either implicitly or explicitly, suggesting that some course of actions ought or should follow from their work, in order to bring about some form of change deemed desirable. Though arguably present in all research, this is especially the case in researchers whose work is of a more political nature and those which touch upon matters of policy. But comments and suggestions regarding what ought or should be, questions concerning how and why policy takes a particular format, who gets to be involved, what role there is for the public at large, what role government is to play (or should play) – these are fundamentally ethical-normative questions which are contestable and negotiable and so require articulation and explication of criterion for support.

Recognition of this is unfortunately uncommon in much social research, though it is established in policy studies literatures, with scholars such as [2]Fischer (1980), for example, arguing the need for policy analysis studies to have some manner of criterion for arbitration between competing values. This is necessary because ethics, like other areas of human inquiry, are contested – there are numerous differing schools of thought. It is no coincidence that one of the greatest intellectual projects of human philosophy has been the establishment of ethical criterions and systems, from the ancient Chinese and Greek philosophers, through to [3]Kant’s (1797) Deontological ethics, [4]Mill’s (1863) Utilitarianism, and [5]Dewey and Tuft’s (1932) Pragmatic ethics, to name but a few. This is important because in research, ‘Ethics’, ‘theory’, and ‘values’ form a mighty triumvirate underpinning research methodology... [6](Ransome: 2013: viii), with personal notions of value deriving from cultural sources of value, which are inextricably embedded in already-existing, often tacit ethical systems. The ethical presuppositions a researcher has adopted, knowingly or not, influence and shape the sorts of research questions and approaches they deem ‘worthy’, the types of methods they believe ‘appropriate’, and the forms, standards, and types of evidence and proof they are likely to be willing to accept. There are thus very real practical implications for the judging of research, as the perceived ‘value’ accorded to any particular piece will be underpinned by a researcher’s presuppositions. This, though arguably true regardless of the field of study under consideration, holds particularly for the social and political sciences, for,
as Schwandt (1996) has reminded us, ‘...social scientific knowledge is not presuppositionless but is instead shaped by moral and political values and concerns’ (Schwandt: 1996 reprinted in Seale [ed]: 2004: pp. 432 – 433).

The point here is that social researchers cannot assume that other researchers subscribe to their particular branch of ethics and so it is incumbent upon them to make their own position clear. This need not entail a lengthy treatise - it could be as little as a few sentences - but it should be clear, as much for the researcher’s benefit as for any readers’. Such explications could reveal fundamental cleavages and points of difference, and may well lead to a position where an impasse is considered reached, with researchers perhaps believing their position to be incommensurable with others. But even if this is the case, a greater, genuine understanding between all parties involved would have been achieved. The continued failure to do this, however, has led to a situation in academia in which many authors and readers are, in effect, talking past each other, with the potential for meaningful criticism and engagement between differing parties reduced. Genuine intellectual debate, and the possibility of any honest and sincere exchanges of ideas, requires an appreciation of the foundational ethical assumptions underpinning other’s perspectives. Without such, the integrity and substance of academic debate is compromised.

Furthermore, there is additional practical value of such explications in providing greater robustness and transparency in public political discourse. This is important as there are real, practical consequences and implications for political discourse which follow from the adoption of particular ethics. Knoweringly or not, by doing so, social actors are contributing to discourses which in turn either buttress or challenge prevailing social orders. By making the philosophical underpinnings clearer and more visible, more fruitful, nuanced and sophisticated discourse becomes possible, with all parties involved having more sensitive appreciation of the other’s positions and their ethical underpinnings. This in turn offers the potential to reenergize civic engagement with a more informed citizenry. The potential risk of intellectual myopia is also mitigated against with both the individual and the broader social collective benefiting as, through being forced to confront alternative ethical presuppositions, policy-formulation and political debate at large would have to more deeply confront its foundational, tacit assumptions, leading to more robust and self-aware decision-making. It is arguably academic researchers, as members within their polities with more time and resources to allow reflexive consideration of such matters, who have a greater responsibility than other social actors to ensure that due consideration is given to this issue.

The potential prize for explicating our ethical presuppositions is thus great. So, the next time you sit down to write a paper, judge that research, or to prepare that conference presentation, ask yourself ‘What are the philosophical ethics underpinning my thoughts here?’ and ‘How might someone adopting a differing branch of philosophical ethics approach the matter?’. Such questions are extremely challenging and it is understandably far easier to avoid or ignore them, or to pretend that they are irrelevant. But addressing such questions significantly strengthens a researcher’s own intellectual positions, and increases the potential for real and sincere conversation and debate on important matters of social and political dispute. Attention to such philosophical matters is important then, because, in the end, social researchers are also always philosophers, whether they know it or not, and whether they like it or not.

Two free workshops at the Centre for Social Ontology @SocioWarwick (2016-04-24 08:00)

The Morphogenetic Approach
June 21st, 10am to 5pm
The University of Warwick

This one day workshop is intended for those currently using or planning to use the morphogenetic approach in their research. In the first half of the workshop, Margaret Archer will give an overview of the morphogenetic approach and its development, as well as address conceptual and methodological questions that participants might have. In the second half of the workshop, there will be plenty of time to present work-in-progress or planned projects, get feedback and discuss with others who are doing similar work.

If you'd like to participate then please e-mail mark@markcarrigan.net with a brief biography and description of your project.

Investigating the Internal Conversation
10am-5pm, May 24th 2016
R1.04, University of Warwick

Following from a successful initial meeting last year, this event will be the first of a hopefully ongoing series of events aimed at those investigating human reflexivity through empirical research. The 'internal conversation' was developed by Margaret Archer as a solution to the problem of structure and agency: a mediatory mechanism that accounts for how society’s objective features influence its members to reproduce or transform society through their actions. Since initially discussed in Being Human, this account of human reflexivity has been developed through a trilogy of books reporting on empirical studies into the distinct modes through which reflexivity operates. This body of work has been used in projects across a range of disciplines and been the topic of much theoretical and methodological debate.

The event is free but registration is essential. If you would like to speak at the event, presenting a work in progress, please register by March 31st with a title and 100 word abstract. If you would like to attend then please register by April 30th.

Re-orienting Sociological Thought?

Glamorgan Council Chamber, Glamorgan Building,

Cardiff University, School of Social Sciences

Cardiff University
2pm to 4pm, Wednesday, May 11th 2016

In recent years, we’ve seen the proliferation of calls to reorientate sociological thought around new concerns, methodologies and approaches that can ground the discipline in changing times. This symposium brings together
advocates of prominent approaches with the hope of a dialogue concerning these calls. What do they have in common? How do they differ? Are their proliferation a sign of the discipline’s weakness or of its vitality? Do we need to throw our energies into one, embrace the multitude or somehow synthesise them into a broader project of disciplinary renewal?

Mark Carrigan – Why Public Sociology is Becoming Digital Sociology (and vice versa)

Des Fitzgerald – Lively sociology and the sociology of life

William Housley – Disruptive Technologies and Socio-Digital Transformation

Emilie Whitaker – Between Thanatos and Natality: considering sociological reorientations through trans/post humanist understandings of death

Pre-booking is required by May 4th. Reserve a place via [1]https://www.eventbrite.co.uk/e/re-orienting-sociological-thought-tickets-24594058491

1. [https://www.eventbrite.co.uk/e/re-orienting-sociological-thought-tickets-24594058491](https://www.eventbrite.co.uk/e/re-orienting-sociological-thought-tickets-24594058491)

The Political Socialisation of Presidents and Politicians (2016-04-25 08:00)

Barack Obama quoted in The Deep State, by Mike Lofgren, pg 63. The demands of fundraising for US politicians are exceptional but I assume a similar process can be found elsewhere, as an elite gradually becomes one’s reference group if this was not already the case. How else to explain the belief of UK MPs that they are poorly paid?

Increasingly I found myself spending time with people of means—law firm partners and investment bankers, hedge fund managers and venture capitalists. . . . I found myself avoiding certain topics during conversations with them, papering over possible differences, anticipating their expectations. . . . I know that as a consequence of my fund-raising I became more like the wealthy donors I met, in the very particular sense that I spent more and more of my time above the fray, outside the world of immediate hunger, disappointment, fear, irrationality, and frequent hardship of the other 99 percent of the population—that is, the people that I’d entered public life to serve.

And intelligence agencies contribute to that socialisation as well. From pg 87 of the same book:

Perhaps the most telling example of the relationship between President Obama and the Deep State comes from a March 2015 interview of John Brennan, his frequently embattled CIA director. Obama has shown Brennan great loyalty through two presidential terms. How did Brennan repay that loyalty—with a humble demonstration of gratitude and respect, perhaps? Obama, he said, did “not have an appreciation” of national security when he came into office, but with tutelage by himself and other experts “he has gone to school and understands the complexities.” The tone of headmasterly condescension is unmistakable, giving the listener ample grounds to wonder who is really in charge, the president or his national security complex. It is the inner workings of that national security complex that we shall turn to next.
Call for Conference Committee Members for the Work, employment and society Conference 2018 (2016-04-25 15:41)

We are seeking 4 committee members to join the Work, employment and society conference committee to serve for two years six months from June 2016 to November 2018. Applications must be submitted by Friday 6 May 2016, 17:00 (GMT).

About the newly formed Conference Committee (CC)

At the September 2015 Board meeting, a new model of WES Conference organization was agreed upon and the method of recruiting its members and the decision making remit of the conference committee agreed.

The Conference Committee will be formed of the following members:

- 4 Editorial Board members
- 2 Associate Board members
- 2 BSA Members (Editor, Associate Board Member, other BSA member)
- 1 co-opted member, connected to the venue that conference is being held in

Members of the CC will make all major decisions about the conference between Board meetings (location, speakers, etc.). The CC will report to the Board at every meeting and may seek Board feedback by email between meetings.

Decisions that should be addressed/discussed with the Editorial Board before action: whether a conference will be internationally based or locally based. The spending of WES conference funds (i.e. what budget from the conference funds is available for a conference). It is anticipated that these questions would be addressed by the CC and the Board in the early planning stages of any particularly conference. For example, for the 2018 conference, these discussions would take place at the January 2017 Board meeting.

The CC should plan to meet four times a year. Successful applicants will be invited to attend the next Editorial Board meeting, at the WES Conference in Leeds September 2016.

In the first round of elections 4 CC members are to be elected and their initial task will be to identify a venue for the 2018 conference. The 4 members will comprise of 2 Board members, 1 associate board member and 1 BSA member.

To apply please complete the downloadable form

You will be asked to provide the following information
Name, affiliation, contact details

Proposer (must be a BSA Member)

Relationship to WES and BSA: (tick those that apply)

1. a) Editorial Board / Associate Board Member
2. b) Attendance at previous WES conferences
3. c) Publications in WES
4. d) WEEL Study group member
5. e) BSA Member

Five research interests

Conference or other events that you have arranged/organised

CC members must maintain BSA membership during their term.

Applicants need not be a BSA member in order to apply.

If you have queries about the role or about your eligibility, please contact Elaine Forester BSA Events Team [events@britsoc.org.uk] and in the title please indicate your e-mail is relating to the WES Conference Committee 2016 - 2018

If you would like to apply please ensure your application arrives no later than Friday 6 May 2016, 17:00 (GMT). The application form is available on the BSA website: [http://www.britsoc.co.uk/publications/publications-vacancies.aspx](http://www.britsoc.co.uk/publications/publications-vacancies.aspx)

Would you like to recommend Social Media for Academics to your library? (2016-04-26 08:00)

I’d be ever so grateful if you did :-) There’s an online form which you can use to recommend the book [here]. Get touch if you have any questions or I can help with anything.

The Promise (and Threat) of Algorithmic Accountability (2016-04-27 08:00)

This is a superb talk by what I think are the two top people working on this anywhere:

The Sociological Review Annual Sociology Lecture

Friday May 20th 2016, 17.45-21.00

SOAS, University of London

This event is free but it is essential to register. To reserve a place, please email Jenny Thatcher [events@thesociologicalreview.com]
Keynote: Professor Éric Fassin (Université Paris-8)

Discussants: Professor Gurminder K Bhambra (University of Warwick, UK and Linnaeus University, Sweden) and Dr Imogen Tyler (Lancaster University)

Professor [1]Éric Fassin will bring together the disciplines of anthropology and sociology to demonstrate how the boundaries that were drawn around them were part of an academic struggle for power in which the term 'race' and the politics of decolonization were central to the war of disciplinary position.

The Great Divide:

Sociology, Anthropology, and Race in France since Lévi-Strauss

Claude Lévi-Strauss published the Elementary Structures of Kinship in 1949 as a sociologist. Only in 1950 was he to appropriate the term “anthropology” in his introduction to the posthumous edited volume of essays by Marcel Mauss, entitled Sociologie et anthropologie. The French sociological tradition did not distinguish between the two disciplines; on the contrary, Émile Durkheim and his heirs distanced themselves from an “anthropology” that was associated with race during the first half of the century. In order to reclaim this label, and thus institute himself as the founding father of French anthropology, Lévi-Strauss could not merely rely on American cultural anthropology; he had to erase the racial legacy of the French tradition. This was accomplished in his 1952 UNESCO pamphlet “Race and History”. It was a powerful move in the wake of World War Two, especially from one who had to flee Nazi persecutions against Jews. But this was also the eve of decolonization – at a time when Georges Balandier analyzed the "colonial situation" as a sociologist, while Michel Leiris and Aimé Césaire denounced the politics of race in the French empire. Today’s French work on race has to revisit this great divide of the 1950s, not only between anthropology and sociology, but also between the social sciences and race.

About Éric Fassin

After teaching in the United States from 1987 to 1994 (at Brandeis University and New York University), and at the École normale supérieure in Paris from 1994 to 2012, Éric Fassin is now a professor of sociology in the Political Science Department and co-chair of the Gender Studies Department at Paris 8 University. He is a founding member
of the new Laboratoire d’études de genre et de sexualité – Research Center on Gender and Sexuality Studies (LEGS, CNRS / Paris 8 / Paris 10). His work focuses on contemporary sexual and racial politics, including immigration issues, in France, in Europe, and in the United States – often in a comparative perspective. He is frequently involved in the French public debates on issues his work addresses – from same sex marriage and gender parity to the politics and policies of immigration and race, but also on the evolution of the left.

Please note that tickets are strictly limited. Please give sufficient notice of cancellation.

The ‘marketplace of ideas’ is a term I found irritatingly trite when I first heard it. I’ve since come to think it captures something important, namely the environment in which ideas of whatever sort are communicated and received. It is incidental as to whether your share my initial irritation or begrudging acceptance of this terminology, what’s more pressing here is the question of how this environment is changing and how academics could, or should, respond to the new pressures which these changes bring. Academics are far from being the only professionals whose working lives are subject to new pressures. In early 2014 an internal report on digital strategy produced by the New York Times was leaked and became the subject of widespread analysis online. It began with the claim that while the venerable newspaper was ‘winning at journalism’ it was failing at ‘the art and science of getting our journalism to our readers’. What concerned the authors of the report was not the familiar fear about the long-term consequences of digital technology to journalism itself, but rather their capacity to ensure their quality journalism thrives in a marketplace of ideas saturated by digitally native publishers.

This is a much bigger topic than social media alone. But it is nonetheless an important element in it, with implications for how academics utilise social media and the environment they encounter when they do. The key question here is how what [3]van Dijck (2012) calls the popularity principle might influence the behaviour and practices of academics as they embrace social media. As she defines it, the popularity principle holds that ‘the
more contacts you have and make, the more valuable you become, because more people think you are popular and hence want to connect with you’ [4](van Dijck 2012: loc 310). This concept is coded into the architecture of social media platforms in a way that is impossible to avoid, reflecting the broader attention economy in which ‘attention means eyeballs or (unconscious) exposure, and this value is an important part of Internet advertising in the form of banners, pop-ups, and paid ad space on websites’. There’s money to be made from popularity, or rather turning popularity (often, as van Dijck points out, equated with values of truth, trust and objectivity) into a quantifiable commodity [5](van Dijck 2012: loc 1281). It might feel like you would be immune to this, but if you encounter a popular Twitter feed, previously unknown to you, how does the high follower count influence your perceptions of it in the absence of any other information? At the very least, it’s likely to factor into a sense that there’s something authoritative or valuable about the account. After all, surely those followers must have arrived for a reason? The popularity principle is insidious and it is built into social media platforms themselves. Value comes to be quantified in terms of the accumulation of followers, likes, retweets and reblogs. Yet as [6]van Dijck (2012: loc 1360) notes, the ‘concept of “liking” pushes popular ideas or things with a high degree of emotional value … “difficult sociality’, only adds to the pressures inherent in the popularity principle around which social media platforms are structured [7](van Dijck 2012: loc 1391).

The centrality of the popularity principle may be most pronounced in the case of Facebook but it’s far from being unique to it. One of Amazon’s most ground-breaking innovations was the extension of their initial Hot 100 bestseller list to encompass everything on the site, drawing authors into a neurotic fixation with where they ranked on this all-encompassing list [8](Stone 2013: 75). The choices YouTube users make are heavily guided by selection mechanisms, including search engines and ranking algorithms, which inevitably favour some producers over others. Selection of the 'most popular' videos is the most pronounced manifestation of this but the guiding of user choices is built into the interface of the platform itself[9] (van Dijck 2012: loc 2328). In part this can be fairly attributed to the practical challenge of dealing with the sheer scale of the content uploaded to YouTube. Without filtering it would be difficult to find relevant content in the 3000 hours of video that have been uploaded in the ten minutes or so I’ve been writing this paragraph, let alone the entire content of the site’s archive. But contrary to the rhetorical focus on the blurring of boundaries between viewers and producers, evidence suggests that the site’s architecture is designed to favour their official partners, allowing some professionalised amateurs to make a living out of the system and entrenching a sense of possibility that one will be ‘discovered’ through YouTube [10](van Dijck 2012: loc 2396–2610). The most obvious example however is the ranking facilitated by Google, a service which has sought to identify the most popular content from the outset. As [11]Vaidhyanathan (2012) asks, ‘Does anything (or anyone) matter if it (or she) does not show up on the first page of a Google search?’. The simplicity of the interface and the objectivity of its ordering belie the biases (‘valuing popularity over accuracy, established sites over new, and rough rankings over more fluid or multidimensional models of presentation’) that are built into it [12](Vaidhyanathan 2012: 7).

However, perhaps the most pertinent examples for academics using social media can be seen with Twitter. As [13]van Dijck (2012: loc 1569) puts it, ‘[t]he sheer number of followers has become a barometer for measuring popularity and influence, ascribing more power to few users in the twitterverse’. The potential implications of this can be seen by examining what might initially seem to be an extremely obscure feature of the culture emerging around academics using social media. One of the most striking developments in the last year has been the emergence of natively academic viral marketing accounts. I discussed two of these, Nein Quarterly and Shit Academics Say, in terms of their distinctive approach to but important” is not a judgement prompted by social media sites’. In using social media, academics are entering into an attention economy heavily structured around the popularity principle. What are the implications of this attention economy for scholarship? The risk is that, as the political blogger [14]Ezra Klein (2015) puts it, ‘[t]he incentives of the social web make it a threat to the conversational web’. The increasing reliance upon social media to drive traffic to blogs encourages certain ways of writing posts. The most obvious manifestation of this can be seen in the rise of viral content websites but there are more subtle manifestations as well. Klein’s point is that ‘the social web’ encourages an atomisation of content because individual posts circulate...
on their own rather than relying on readers' repeated visits to the author’s blog. He presents this as a negative thing because it mitigates against the intensely conversational style that used to characterise the political blogosphere in which arguments were developed through mutual engagement across whole sequences of blog posts. While he may be undervaluing the conversations which emerge on social media in response to blog posts, he nonetheless makes an important point about the implications of content needing to ‘travel’ in a way that was not formerly the case. Obviously these pressures aren’t inexorable but their influence can be surprisingly effective, as the obvious desire of bloggers to gain an audience for their posts gradually chips away at a principled opposition to changing how they write in order to better solicit a readership. The growing reliance upon social media to drive traffic to blogs, something which is compounded by Facebook's desire to be ‘a gateway to social content, a toll road to a data infrastructure that facilitates all forms of online commercialized communicating visually and what can be learnt from it. The former is inarguably aphoristic in a manner that has a clear philosophical pedigree, utilising social media as part of ‘[a]n aesthetic and intellectual experiment only slightly less pretentious than it sounds’. In contrast, the latter relies upon viral content of a form likely to be familiar from non-academic contexts, though the selection and execution of it is undoubtedly hugely effective. Yet a recent account with a comparable approach, Grad School Elitist, found itself embroiled in controversy at the point I was completing this book. Accused of plagiarising the content on the account, accusations backed up with substantial evidence, the person controlling the account began to block anyone who questioned their authorship of the material they posted (including myself). My point here is not to intervene in this debate, which is likely to be tedious to the overwhelming majority of people who are less immersed in social media than I am, but simply to highlight this trajectory and what it might suggest about the tensions between scholarship and the logic of popularity built into social media platforms.

Each successive academic viral marketing account seems to have less intellec-tual value than the last, relying mechanically upon content likely to have the most impact through retweets and favourites, thus contributing to the progressive growth of its follower counts. Virality can soon become an end in itself. The problem arises because, as [15]van Dijck (2012: loc 1569) notes, users 'quickly learned how to play the system and accumulate a lot of clout on Twitter'. In some cases, discussed further in the next section, this might involve straightforwardly copying and pasting content that can be seen to be popular – a judgement that’s easy to make because each tweet has its metrics incorporated into its own presentation. But the more subtle aspect of this concerns the manner in which popularity accumulates in a winner-takes-all-manner: 'the more people follow someone, the trendier he or she becomes; the more people retweet a quote, the more impact it has in the twitterverse' [16](van Dijck 2012: loc 3227). It’s in the interests of social media platforms to ensure the prominence of those users with a proven capacity to generate engagement on their site. After all, this amounts to more traffic for advertising, more buzz to draw users into the site, and higher statistics with which to appeal to the markets for more capital. These incentives, and the ease with which they can be accommodated within algorithms which serve other more immediately practical purposes, leave some users objectively positioned as more valuable than others within the platform [17](van Dijck 2012: loc 2353).

This doesn’t mean that all roads inevitably lead to BuzzFeed. It also doesn’t mean that academics using social media will inevitably entail the deterioration of

scholarly standards, as a neurotic preoccupation with the accumulation of influence (as measured in follower counts and retweets) increasingly encourages simple communication likely to prove popular at the expense of complex ideas which may not thrive because of their difficulty and ambiguity. Using social media doesn’t mean academics will inevitably come to talk in TED soundbites and forego things of intellectual worth. But the risk of a drift in this direction is there and that’s why it’s important to be aware of this at the outset, not least of all in order to reflect on your motivations if you find yourself engaging online with some regularity. It also helps us to be critical of the rhetoric of democratisation, such that it is assumed social media will ‘disrupt’ the hierarchies of academia. It won’t. It might however make them more complex, as influence and esteem accumulate through a more diverse set of mechanisms than was formerly the case. But, as I discuss later in this chapter, it’s easy to see how academics might
get drawn into the logic of self-evaluation through metrics: if your h-index can be understood as tracking success then is it really a stretch to imagine the same being true of your quantity of Twitter followers? More worryingly, it’s easy to imagine managers embracing such measures as an attempt to evaluate a capacity for impact and engagement.

Emmet Fox (2016-05-02 13:31:09)
"More worryingly, it’s easy to imagine managers embracing such measures as an attempt to evaluate a capacity for impact and engagement“ - I have already seen this occur

Emmet Fox (2016-05-02 13:47:14)
Also reminds me of the emerging external threats to relevant autonomy of university field that Bourdieu talks about in Homo Academicus from journalistic popularity, with some academics latching on to this new principle of legitimacy for the definition of the intellectual. And also the emerging dynamic between intellectual journalists and journalist intellectuals.

Mark Carrigan (2016-05-05 13:31:50)
must read that

What does integrity mean in a digital age? Self-branding, promotion and why Mark Zuckerberg probably doesn’t like you (2016-05-02 08:00)
As a teenager I was captivated by Harper Lee’s To Kill a Mockingbird. I’d enjoyed fiction prior to this but there was a certain quality to the story that left it lodged in my mind long after I read it. Looking back on this much later, it’s hard to pinpoint exactly what that quality was, though I think one of the features that resonated so strongly with me was the intensely memorable character of Atticus Finch (see below). One particular line that stuck in my mind for years has been Miss Maudie’s praise for Atticus Finch as being ‘the same in his house as he is on the public streets’. The plausibility of the politics underlying this seems less obvious to me in hindsight, but I can easily see how this characterisation captured the attention of my impressionable teenage self. It’s such a clear account of what’s taken to be a virtuous character trait, treating all people the same in all circumstances, and presenting a consistent identity to the world under all conditions. My ageing copy proclaims over 30 million sales, a number which has presumably only grown since I bought it as a high school student. Coupled with the fact that it was required reading in UK high schools, as well as I imagine in the United States, it seems likely there were many others similarly taken with this portrayal of integrity as a matter of being ‘the same in the house as on the public streets’. But was Mark Zuckerberg, Facebook founder and CEO, among them? After all he famously claimed that ‘[h]aving two identities for yourself is an example of a lack of integrity’ when defending Facebook’s restriction of users to their real identities. Leaving aside the evidence that neither Facebook, nor Zuckerberg himself, live up to these lofty standards of integrity, it’s worth contemplating this particular view of identity which has been proving so influential within the digital sphere, to the extent that it is built into many of the platforms themselves.
If ‘having two identities’ constitutes a ‘lack of integrity’, it must be important to act in ways which ensure consistency between your behaviour ‘in your house’ and ‘on the public street’. But in practice this takes work. As the ethnographer Alice Marwick points out in her Status Update, the practical requirement of ‘being authentic’ is emotional labour and a lot of it. As she goes on to write, ‘authenticity is judged over time, in that people’s authenticity is determined by comparing their current actions against their past for consistency’. This already begins to sound rather tiring, not least of all because there are particular qualities of social media (the persistence, visibility and searchability of online content) that make it much easier for people to compare past actions and present behaviour to evaluate your integrity than would have been the case for Atticus Finch. Imagine the same dynamic playing out in the present day and Miss Maudie’s dismay upon, say, discovering that Atticus Finch has an additional existence as a prolific troll on YouTube comments threads.

When considered in personal and political terms, the desirability of Zuckerberg’s ideal soon appears questionable. As the sociologist Nathan Jurgenson observes, ‘we know that anonymity is also used by the most vulnerable and least powerful’. It is easy for people to have integrity in Zuckerberg’s sense when they’re in a position of power and their ‘real’ identity enjoys widespread social acceptance. Particularly when we consider how authoritarian governments around the world are coming to use social media, the peculiarly self-righteous way in which this policy of real identities is enforced begins to look rather unseemly. Even within a more liberal climate, this policy causes profound problems for anyone who needs to keep part of their life from those around them, leading PJ Rey to ask if social media have led us to build a society without closets? As someone who has studied the sociology of sexuality, the implications for queer youth are the most obvious to me, but it’s not hard to think of other groups for whom the need to maintain two identities can be a necessity of getting by as opposed to what Zuckerberg sees as a lack of integrity.

But what about in the professional sphere? Marwick’s wonderful ethnography, Status Update, of the tech scene in Silicon Valley shone a spotlight on the exhausting labour necessary to ensure the appearance of ‘integrity’ in such a media-dominated world. Entire careers and vast libraries have been built to cater to the anxieties created by this demand, with the LinkedIn founder Reed Hoffman’s The Start-Up of You representing one of the most prominent
expressions of this trend. It’s a fascinating and strange book, which I began to read out of a sense of morbid curiosity but was unable to persist with, providing a jarring insight into the developing norms of the professional world within which it has been studied intensively. Unfortunately what was once limited to Silicon Valley has long since spread beyond it – something which Marwick attributes in part to the capacity of social media to facilitate such branding because it simply wasn’t possible in any meaningful sense until there was widespread access to the communicative possibilities it affords. As Marwick writes, ‘[b]efore the internet, a prospective self-brander was limited to putting up fliers at grocery stores, knocking on neighbours’ doors, buying advertisements in the local paper, or attending potentially inaccessible industry-only events’ (pg 185: 185). The other part of the story is the growing armies of freelancers, contractors and consultants for whom this self-promotional activity is a necessary step for winning clients. While some have seen this in an optimistic light, heralding the dawn of a ‘Free Agent Nation’, the reality is considerably more ambivalent. This self-branding activity can involve vast amounts of unpaid work likely motivated by the desire to escape economic redundancy, current or potential.

Gender, class and the politics of ‘privacy’ (2016-05-03 08:00)

A [1]wonderful article by Lisa Mckenzie reflecting on the exposures of the Panama Papers in terms of the broader gendered and classed politics of privacy:

Working-class single mums claiming benefits will be asked very personal questions about what for anyone else would be private matters. They have to disclose the name of the child’s father, his address, where he works, so that the Child Support Agency can chase him up. If you cannot answer these questions (without good reason) your benefits are stopped. Benefit officials may look into your garden and check your washing line doesn’t have any men’s clothes on it, or use credit checks to see who may or may not be living at your address.

The moral argument for this treatment is that if you are taking public money you have to be open and accountable, so there can be no privacy if you are a poor woman. But taking public money or depriving the rest of us of public money by creating shell companies in faraway sunny places like the Bahamas or Panama? That’s different – it means you have good “tax management”, aspiration, and you are clearly a high achiever.

Call for Papers: ‘Consuming Gender’ (2016-05-04 08:00)

Call for Papers: ‘Consuming Gender’

This special issue of Assuming Gender – an online, peer-reviewed academic journal from Cardiff University – seeks to explore the way gender is both presented and consumed through popular media and advertising. As Ann Herrmann points out in the article ‘Shopping for Identities’, commodities ‘are characterised by their dual nature: material composition and symbolic meaning’ (Herrmann 2002: 539). Consumer culture plays a significant role in constructing valid (and normative) identity categories with which consumers are encouraged to identify.

Scholars as diverse as Americus Reed, Laura C. Nelson, and Henry Jenkins have theorised the ways in which identity and consumer culture are intertwined. Reed, for example, claims in ‘Activating the Self-Importance of Consumer Selves’ that ‘[s]ocial identities are mental representations that can become a basic part of how consumers view themselves’ (Reed 2004: 286). In a later article on ‘Identity-Based Consumer Behaviour’, Reed and others use the example of athletics to illustrate their point: ‘if consumers view themselves as “athletes”, they are likely to behave in ways that are consistent with what it means to “be” an athlete’ (Reed, Forehand, Puntoni and Warlop 2002: 310). Consumption thus becomes defined by identity, and identity becomes defined by consumption.

While the construction of identities based on athleticism seems relatively benign, the case quickly becomes more complicated when consumer identities are racially, economically, or sexually coded. In addition to delineating the borders between various interest groups, consumer culture plays a significant role in establishing and maintaining binary identity distinctions (male/female, gay/straight, black/white), undermining the validity of those identifying across or in-between one or more categories, or who refuse categorisation at all. Those identities not classified as valid consumer groups are not seen as valid identities at all.

For this special issue of Assuming Gender, we invite articles that focus specifically on the idea of ‘Consuming Gender’. How has consumer culture constructed (and how has it been constructed by) gender through the ages?

Suggested topics include, but are not limited to:

- Consuming gender/gendered consumption
- Historical contexts of gendered consumption
- Feminist/postfeminist approaches to consumption
- Consumption and intersectionality
- Queer consumption
• Media constructions of (gendered) consumer identities

• Post/colonialism and gendered consumption

Please send a proposal of roughly 500 words to Megen de Bruin-Molé, Akira Suwa and Daný van Dam at [gender@cardiff.ac.uk](mailto:gender@cardiff.ac.uk) under the subject line 'CFP Consuming Gender', including your name, e-mail institutional affiliation (if any), and a biographical note (100 words maximum). We welcome papers from scholars of all backgrounds, disciplines, and career stages. The deadline for proposals is 16 October, 2016, and completed papers of 5000 to 8000 words will be expected no later than 16 April, 2017. Assuming Gender is an electronic journal dedicated to the timely analysis of constructions of gendered texts, practices, and subjectivities. This journal seeks to continue and shift debates on how gender is problematized in contemporary discourses as well as participate in the dialogue and tensions that maintain the urgency of such conversations. Prior issues can be viewed on [www.assuminggender.com](http://www.assuminggender.com/).
The London Radical Book Fair at Goldsmiths, this Saturday 7th May (2016-05-05 13:40)

Radical booksellers, publishers, artists and activists of all stripes are setting up in the Great Hall at Goldsmiths University to host the 4th London Radical Bookfair.

With over 130 exhibitors and 20 guest speakers, this will be a unique gathering of progressive readers, thinkers and doers, in a celebration of radical publishing and politics.

The free event is organised by the Alliance of Radical Booksellers (ARB), which formed in 2011 to raise awareness of the radical book trade. The fair provides an annual opportunity to bring Britain’s radical booksellers together to meet in person with publishers and the reading public.

And it’s also an opportunity for us to host award ceremonies for the ARB’s two annual book prizes — the Bread and Roses Award for Radical Publishing and the Little Rebels Children’s Book Award. Shortlisted authors from the two
awards will give talks and participate in panel discussions throughout the day.

As in previous years, we’ll be showcasing the depth and breadth of radical publishing. While there are currently other book fairs dedicated to progressive titles, they tend to focus on tightly defined political traditions. The aim of the London Radical Bookfair is to be a broad church that brings together these traditions and make them accessible to a wider audience.

This year’s bookfair is supported by the Centre for Cultural Studies, with the Departments of English and Comparative Literature, Media and Communications, Politics and International Relations, Sociology, Visual Culture, and Goldsmiths Press. Goldsmiths, University of London. [1]http://www.gold.ac.uk/

Crafting an online identity (2016-05-06 08:00)

The powerful thing about telling a story is that it gets beyond the level of simply listing facts about yourself. Not that there’s anything wrong with this; in a way it’s like a story because you choose which facts you present and the order in which you present them. But telling a story places them in a wider context, giving meaning and direction to things which people come to know about you. Nonetheless, listing facts is important. Yet what sort of facts are likely to be relevant for these purposes? Here are some suggestions:
• Your institutional affiliation
• Your research interests
• Other accounts you’re involved with
• Your personal interests
• Hashtags you contribute to
• An institutional disclaimer
• An additional website

Sustaining your focus throughout the working day (2016-05-07 08:00)

An extract from [1]Social Media for Academics

In recent years we’ve seen the notion of ‘internet addiction’ enter the popular consciousness. As a self-description it’s sometimes invoked facetiously, sometimes desperately and occasionally in a way which combines the two. It would be silly for me to try and take a stance on such a complex subject here. So I’ll restrict myself to suggesting that we should be cautious about this term given a wider context in which the medicalisation of everyday life is rapidly intensifying. Having got that out of the way, let’s turn to an experience which will be familiar to most: finding yourself lost in a repetitive cycle of clicking from web page to web page, checking your e-mail every couple of minutes or passively skimming through a Twitter feed while paying little attention to what you’re reading in it. These are those times when what social media companies describe as ‘thumb stopping’ (ceasing your endless scroll in order to focus on something you’ve chosen as worthy of attention) becomes unlikely and you just keep on skimming in an increasingly detached way.
The popular comedy Portlandia describes this as a ‘technology loop’ – being caught in a frenzied cycle of overstimulation, unable to drag oneself away from the internet and the torrent of interesting things to do, read and watch which it’s impossible for any one person to keep up with. The political theorist Jodi Dean in *Blog Theory* describes this as getting ‘stuck doing the same thing over and over again because this doing produces enjoyment. Post. Post. Post. Click. Click. Click’. It’s not necessary to accept the psychoanalytic ideas underpinning Dean’s account to recognise the experience she describes. I found myself doing it on Facebook a few minutes ago before a track change on the music I have playing in the background jolted me back into attention and reminded me that I’m supposed to be writing a chapter about sustaining your focus in an age of social media. The more general problem is a distractedness produced by digital technology in an age of informational abundance. The issue here is not only the multiplication of distractions, it’s also the sheer scale of what we’re missing out on and our growing awareness of all the other things we could and perhaps should be doing.

The most obvious way to prevent this is simply to recognise that you’re doing it. Putting a name to the experience makes it easy to identify what you’re doing and so help you drag yourself out of an impending technology loop. If you find yourself drifting into such a state repeatedly, even as you pull yourself out each time, perhaps it’s worth taking a break or at least shifting to a different activity? The website[3]www.donothingfor2minutes.com offers a helpful antidote to the frenzied hyperactivity which characterises the technology loop. There are also more preventative means which can be taken: using tools like Anti-Social and Freedom or switching off the WiFi if you’re having this problem at home (it’s presumably not feasible to do this at a coffee shop or in an office but I must admit I’ve never tried). More indirectly, it can help to minimise distractions by turning off pop-up notifications (pop up e-mail alerts are effectively designed to fracture your focus) and maybe isolating your social media use to another device such as writing on your laptop and only using Twitter on your smart phone. Alex Pang’s *Distraction Addiction* offers a really thorough discussion of the range of tools available for these purposes, as well as a philosophy of ‘contemplative computing’ in terms of which we can understand their utility.

All these suggestions are basically preventative though. This problem can be tackled in a different way by thinking about how you approach your work. Do you have a strategy for managing your time and attention? One
such strategy can be seen in the Pomodoro Technique, a popular working method which is predicated on the understanding that ‘taking short, scheduled breaks while working eliminates the “running on fumes” feeling you get when you’ve pushed yourself too hard’. It involves working on a larger task through small chunks of intense work punctuated by repeated breaks: you work intensively for a set period of time, take a break and then do another chunk of work. Any extraneous tasks, whether connected to your present focus or something else entirely, should be recorded on a piece of paper before you immediately return to the task at hand. Its developer Francesco Cirillo suggests 25 minute-long sessions of work followed by 5 minute-long breaks.

However these are optional really, as is the tomato-shaped timer which he sells via his website (though I must admit writing this has left me tempted to finally buy one of these). There are many apps which can do the same thing and which have the advantage of recording your results in a way that can be useful for measuring your own productivity as well as filling out timesheets if necessary. The idea of this is to minimise task interruption and to ensure frequent breaks to prevent the depletion of attentional energy. This sounds deceptively easy but it’s remarkable how easy it is to get distracted in the space of 25 minutes.

Committing to working for a specific period of time helps heighten your awareness of all the distraction events which intervene and can so chronically drag your attention away from the task at hand: committing to not checking your e-mails for 25 minutes helps you notice those often imperceptible whims arising – ‘I’ll just check my e-mails quickly and see if I’ve got a response from earlier’. This point holds for other forms of distraction as well but it would be a mistake to overlook e-mail given the concerns of this chapter. We don’t tend to think of e-mail as social media. It’s certainly not an example of what used to be called web 2.0 before that term largely gave way to that of social media. But in the broader sense addressed in this book of media that are social then e-mail surely falls into this category. It’s also a pervasive source of stress and concern across the academy, as Ros Gill points out in her insightful account of the ‘hidden injuries’ of the contemporary academy:

‘Addiction’ metaphors suffuse academics’ talk of their relationship to e-mail, even as they report such high levels of anxiety that they feel they have to check e-mail first thing in the morning and last thing at night, and in which time away (on sick leave, on holiday) generates fears of what might be lurking in the inbox when they return. Again, inventive ‘strategies’ abound for keeping such anxiety at bay e.g. putting on your ‘out of office’ reply when you are actually in the office.

However, it is not only the always-on culture of e-mails that has led to the marked intensification of our workloads and the almost constant experience of high levels of stress. In fact it is paradoxical, given how much time we spend on it, that e-mail is mostly experienced as what stops us getting on with our ‘real’ work.

I’ve tried to clear my inbox on a daily basis simply because it largely removes the stress from the process. I recognise this won’t be possible for everyone but I’d also maintain it’s nowhere near as unfeasible for many people as might first seem to be the case. The time spent avoiding e-mail and being stressed out by e-mail is time that could be spent getting it out of the way in one go. I don’t recall it ever taking me more than an hour to entirely clear my inbox, even if this can be quite dispiriting when it immediately leads to a rapid expansion of my to-do list. It works most effectively when I do e-mail first thing in the morning. Replies are the exception rather than the rule before 8am, whereas trying to clear my inbox in the middle of the day can produce despair as replies and new e-mails hurtle into my inbox faster than I can clear the backlog. The description of the ‘stupid e-mail ritual’ offered by the protagonist of Cory Doctorow’s novel Homelandis quite apt: ‘Download download download. Spam spam spam. Delete delete delete’. I find it hard to read about things like e-mail apnoea – breath-holding or shallow breathing associated with checking e-mail – without wondering about the psychosocial costs of our communications system. The stress caused by e-mail is so widely recognised as to make discussion of it a cliché. But it’s something which
crops up time and time again, at least if you make a habit of reading academics blogging about academic life.

One final useful suggestion comes from the social media scholar danah boyd (2011) who describes how she takes an occasional e-mail sabbatical in order to cope with its intrinsically Sisyphean nature. While many people can step back from social media (though not everyone! – see the Potential Pitfalls box above), it’s far more difficult to do this with e-mail. This is getting worse because, as [7]Pat Thompson suggests, the e-mail auto-responder is becoming pretty useless in the contemporary academy. Being ‘out of office’ while retaining internet access means continuing to respond to e-mails or watching them build up in a way which quickly undermines any of the potential benefits of ‘disconnection’. There are other strategies it’s possible to adopt: I recently bought a pay-as-you-go phone for when I really want to get away from the internet, and have sometimes deleted the mail settings on my iPhone when I want to disconnect but nonetheless retain the capacity to consult Google Maps when, as so often happens, I get lost on my way somewhere.

I found Cal Newport’s book Deep Work extremely thought provoking with regard to this

Kriss (2017-02-21 22:12:02)
Another solution that works for me (but only for certain kinds of work) - print everything out, go and sit in a room without a computer or phone.

The Social Ontology of Law, Politics, and Human Rights (2016-05-07 18:15)

The Social Ontology of Law, Politics, and Human Rights

Friday 20th May, 2016
St. Cross Room, St. Cross College
University of Oxford

Speakers:
Dr. Maria Cahill (UCC)
Prof. Christian List (LSE)
Prof. Andrea Sangiovanni (KCL)
Dr. Laura Valentini (LSE)

For more info contact: samuel.bruce@stx.ox.ac.uk
The 7th ESRC Research Methods Festival (2016-05-07 18:18)

The 7th ESRC Research Methods Festival (RMF) is a great opportunity for everyone interested in understanding the numerous, tangled and ever-changing ways of looking at the world from social science perspectives. Every two years the National Centre for Research Methods (NCRM) organises this three-day event, full of seminars, activities and lively discussions about established and new methods used in social science research.

Each Festival attracts visitors from academia, government, charity and private sectors, hosts a wide range of speakers and covers interesting methodological themes relevant to both emerging and established researchers. This year the Festival moves from Oxford to another beautiful historical city. The 2016 RMF will be held at the University of Bath from 5th to 7th July 2016. The main themes are: international knowledge exchange, cohort and longitudinal methods, analysis of complex data sets, pedagogy of methods, careers and skills development.

The international knowledge exchange theme sees expert social researchers from Africa, South and North America, Australasia and across Europe joining us at the Festival to discuss cutting-edge methodological developments. World leading international speakers will participate in sessions addressing, amongst other topical subjects: researching comparative urbanism, studying elites in Africa and achieving rigour through face to face surveys.

The cohort and longitudinal methods theme tackles methodological issues in collecting and analysing quantitative and qualitative data from individuals and households over time. Issues covered include the methodological challenges in administrative data linkage and in comparing data across and within longitudinal studies, combining social science and molecular genetic research to examine inequality and the life course, and the age, period and cohort problem.

Sessions in the analysis of complex data sets theme address a range of methods for tackling complex forms of data with linked and time dependent structures and associated issues. These include projects from the NCRM's own research programme such as methods for the assessment of quality of data collection in sample surveys, working across qualitative longitudinal studies, accounting for informative item nonresponse in biomarkers, and the anatomy of disclosure risk in linked population data.

The pedagogy of methods theme includes sessions that provide insight into the teaching and learning of advanced social science research methods. Find out whether statistics anxiety is a convenient myth, and consider the pedagogical underpinnings of learning about social science research methods.

The career and skills development theme provides opportunities for doctoral, early career and more experienced researchers to find out about new methods, and develop their methods and communication skills. The ever-popular 'What is...?' sessions will cover diary methods, action research, discrete choice experiments, policy evaluation, biosocial research, statistical eBook, mobile methods, big data, and mass observation. Festival participants will also be able work on honing their skills in reading and writing critically, expanding their methodological comfort zone, disseminating their research, and developing effective research proposals, as well as to attend an interactive workshop on making the most of media.

The Festival will also welcome distinguished keynote speakers, setting the tone for the event. Professor Jane Elliott (Chief Executive of ESRC) will talk about bridging the qualitative—quantitative divide in our approaches to ‘big data’. Professor Andrew Gelman (Columbia University) will consider whether statistics can dig its way out of the
paradoxical hole of creating a sense of certainty where none should exist. And Professor Emeritus Aaron Cicourel (University of California) will be in conversation with Professor Malcolm Williams (Cardiff) and other colleagues about the continuing challenges and relevance of arguments he first advanced in his influential book 'Method and Measurement in Sociology' (1964).

The 'festival' mood will be enhanced by a range of social activities such as PhD student poster exhibition, Festival reception, film screening and tours in the city of Bath.

Have a look at the full programme and book your tickets at www.ncrm.ac.uk/RMF2016.

Where Are We Now? Temporalities of Globalisation

Third Annual ACGS Conference

Where Are We Now? Temporalities of Globalisation

Amsterdam, 15-16 December 2016

Confirmed speakers: Amy Allen (Pennsylvania State University), Louise Amoore (Durham University), Rolando Vazquez (Utrecht University)

Extended deadline for abstracts: 1 June 2016

Globalisation is often seen as a single process, unfolding in a single timeframe that serves as a universal measure. This synchronic, or perhaps better still, monochronic conception of globalisation's temporality creates problematic distinctions between the 'contemporary' and the 'archaic', between the 'modern' and the 'traditional' and between globalisation's GMT and cultures, subjects and areas that are seen to remain out of time. Such a vision of the temporality of globalisation, and its underlying 'denial of coevalness' (Johannes Fabian), entails a perpetuation of the dominant narrative of modernisation and modernity as progress and temporal advance, as the integration (or lack thereof) in the universalising timeframe of the contemporary (Amy Allen). Today, we witness many cultural practices that challenge, refute or problematise this narrative: from new forms of cultural translation (including a validation of the untranslatable) and the proliferation of decolonial altermodernities to the emergence of Euro-American populist nostalgia; from accelerationism and hyper-temporalities (such as that of climate change), to renewed appraisals of slowness and reflection on the end of temporality (Fredric Jameson).

The 2016 Amsterdam Centre for Globalisation Studies conference highlights the urgency to reconsider globalisation from the perspective of today's multiple temporalities. We want to explore new conceptualisations of the multiple, differentiated temporalities of globalisation. What if still dominant representations of globalisation as an unfolding process - an agent of sorts that is alternatively embraced, resisted, missed out on; that homogenises or pluralises - are simply inadequate to grasp what we refer to as globalisation today? We call for contributions that investigate globalisation as the simultaneity of different and radically divergent temporalities. Emerging decolonial temporalities (Walter Mignolo), Euro-American populist withdrawal, re-emerging imperialisms (U.S., Europe, Russia, Middle East, China), the project of de-imperialisation, de-Cold War and de-colonisation (Chen Kuan-Hsing), 24/7 neo-capitalism (Jonathan Crary), the hyper-temporality of climate change, imperial ruination (Ann Laura Stoler), the
exclusion of states and regions (i.e. Africa, Greece) from the rhythms of neoliberal capitalism (Maurizio Lazzarato), high-speed financial trading, revelations of global economic warfare, aging workforces (Europe, Japan): all these examples demonstrate that globalisation, in its present, singular tense, no longer covers our fractured and multi-temporal present.

We invite theoretical and empirical interventions to analyse the ways in which globalisation's manifold temporalities – and their problematization – appear in the socio-cultural realm: from decolonial cinema and novels flaunting their untranslatability to the way news and social media 'chase' each other; from the use of extreme duration in theatre and contemporary art and the fashionability of yoga classes and mindfulness to the global boom in plastic surgery and expressions of imperial nostalgia; from the seeming endlessness of crisis to regressive and progressive attempts to find a 'way out of here'.

The 2016 ACGS conference welcomes papers that explore the complexity and radical heterogeneity of today's planetary temporalities. Possible topics include:

- decolonial temporalities
- cultural translation and untranslatability
- out-of-timeness and 'backward' peripheries within globalised economic spheres (i.e. the Greek crisis, North Korea, Belarus)
- differences between and intersections of urban/rural temporalities
- chronotopias, from the Western metropolitan yearning for 'slowness' to dreams of fully automated market transactions
- affective temporalities, i.e. burn-out, exhaustion, YOLO/FOLO, things-to-do-before-you-die/bucket lists
- ecology: the hyper-temporality of climate change
- the temporal dimensions of neo-imperialisms, for example the Ukraine crisis, Euro-American interference in the Middle East
- debris of empire, imperial ruinations
- cycles and crisis: social, financial, personal
- discourses of contemporaneity, i.e. the managerial/neoliberal rhetoric of 'this is no longer of today'
- utopias of timelessness, i.e. the Islamic State, populism, communism
- theories and representations of end times, i.e. biological extinction, the end of capitalism, the end of the welfare state, eschatological imaginaries in popular culture
- temporalities of precarity (flexibility, just-in-time, absent futures)
- the withering away of 'the future' as universal telos in culture and theory
- entropy in culture, economy and ecology
- temporalities of security (pre-emption and precaution)
- uneven development and creative destruction
- homogenisation of time as effect and condition of the logic of capital

Please submit an abstract (200-300 words) and short bio (max. 100 words) by 1 June 2016 to [1]acgs-fgw@uva.nl. Notice of acceptance will be given by 15 June 2016. Conference fee: 50 Euros (25 Euros for PhD students). Conference dinner: 25 Euros.

Organisers: Joost de Bloois, Marieke de Goede, Yolande Jansen, Jeroen de Kloet, Esther Peeren, Kati Röttger.

Warwick University June 13th-14th - [1]abstract submission deadline May 13th

Key Notes:

Kathryn Yusoff (Queen Mary) ‘Geopower: biopolitics and matter after life’
Celia Lury (Warwick) ‘Better than you: a topological imaginary’

Call for Papers:

Biopolitical Matters: What is biopolitics today? What are its discontents? Is there life after biopolitics?

The Authority & Political Technologies (APT) network at Warwick aims to foster and support work in the critical social sciences that is informed by Foucauldian, Deleuzian and cultural-theory perspectives. In particular we are interested in work that carries forwards these traditions, but which takes seriously the arguments concerning their failure to speak to the ethical and political demands of the present; that is to say work that is striving to refigure and reinvent the ethical and political dimension of these perspectives for contemporary problematics.

In this our second biannual symposium we address transformations in what constitutes ‘biopolitical matters’ – including changing practices of how forms of life are understood, measured, hierarchized, produced and controlled - and their relevance in contemporary theoretical and political debate. We invite papers that explore plural and divergent accounts of biopolitics, from its original treatment by Michel Foucault, through its expanded use in an array of settings to address the merging of life and politics, to contemporary approaches that question the ‘bio’ as the frame of politics. This includes new regimes of police and security; environmental catastrophe in the Anthropocene, and new questions about ‘big data’ and its increasingly powerful behaviouralism. We encourage submissions from a range of disciplines including, but not limited to, sociology, politics, philosophy, law, history, geography, cultural
studies and anthropology. In addition to standard conference papers we welcome proposals for panel discussions, films, exhibits and performance.

The deadline to submit proposals is Friday 13th May. Please follow this link to submit an abstract.

For further info and updates please see the symposium website.

Organisers: Illan Wall, Amy Hinterberger & Claire Blencowe.

Supported by the Institute for Advanced Studies, Sociology, Law and the Social Theory Centre University of Warwick.

Digital Health/Digital Capitalism on 4th July 2016 at Leeds Beckett University. Tickets are £20 and can be purchased here:
[1]http://onlinestore.leedsbeckett.ac.uk/browse/extra_info.asp?compid=1&modid=2&deptid=4&catid=2&prodid=490 Details are below. Please contact Chris Till c.till@leedsbeckett for more info. Plenary speakers Nick Fox – Professor of Sociology, The University of Sheffield ‘The micropolitical economy of posthuman health’ Graham Scambler – Emeritus Professor of Sociology, University College London ‘Digital sociology or sociology of the digital? A case study on health.’ Digital technologies have had a profound impact on the ways in which people live their lives, relate to one another and think about themselves and their capacities. This event will bring together scholars who are interested in the impacts of the digital on ideas and practices of health and the workings of capitalist economies and how the two come together. The generation and management of vast amounts of health data has been enabled through digital means. In particular this has enabled fine grained analysis of particular types and groups of people in relation to a diversity of factors. Private and profit making enterprises have become increasingly involved with personal health data through partnerships with health services and the generation of new kinds of data through commercial devices apps and websites. Digital capitalism has produced new approaches to work and profit generation. Human bodies are now intensively digitised due to the (self) tracking and monitoring conducted by commercial enterprises. New digital ways of working have freed some workers from the office while increasing the amount of time and attention they are expected to dedicate to work tasks and the length of time spent sedentary. The productivity and activity levels of some workers are closely monitored leading to increasing physical and psychological stress. Papers ‘Citizen Science in Biomedicine in Midstream’ - Lorenzo Del Savio, Christian-Albrechts-Universität zu Kiel ‘Integrated Care and Collaborative Competition: exploring the limits of digital healthcare’ - Lynne Pettinger, University of Warwick; Ewen Speed, University of Essex; Andrew Goffey, University of Nottingham ‘In what ways does the drive towards digital health increase the potential for a shift from public to private provision?’ - Caroline Molloy openDemocracy ‘Disruptive innovation in digitally-enabled medical research. Research ethics, privacy and power’ - Tamar Sharon, Maastricht University ‘Autonomy, Automation and Care for the Self: Temporalities of Health in Digital Capitalism’ - Dr David Hill,
Help support @DiscoverSoc (2016-05-08 08:00)

Dear Colleague,

I hope that you have come across Discover Society the online magazine which publishes pieces based on social science research for a wide audience - you may even have written for us - but if not do check it out at [1]discoversociety.org

As Editors we are committed ensuring that the magazine continues to be free at the point of access and to keeping our costs low, but we want to develop the magazine further and need to cover the costs of doing so.

Discover Society is approaching its third anniversary and is definitely a success – with over 25,000 hits on the site every month, close to 9,000 followers on Twitter, and a steady stream of people wanting to write pieces. If you enjoy Discover Society/ think it is useful for getting sociological research out there and you would like to help it to flourish please support it (either individually or as a Department) by becoming a ‘Friend of Discover Society’ and donating a small amount (or larger if you like!).

Your support would mean that we could:

- Fund the increasing costs of hosting and maintaining the website
- Fund the continuation of the Discover Society Internship
- Host Discover Society Lectures and other events to increase the reach of the magazine and the impact of the contributions
- Increase our support for making social science research more accessible

If you would like to help us to do these things, and more, please support the magazine by becoming a Friend of Discover Society via the Donate button on the front page at [2]discoversociety.org.

All good wishes

Sue Scott

“Please, sir, may I go home?” (2016-05-09 08:00)

An interesting snippet from Losing The Signal, by Jacquie McNish and Sean Silcoff, concerning the lengths to which overzealous managers would go during the early days of Research In Motion. From pg 39:

One RIM manager became so obsessed with deadlines he issued an edict requiring engineers to ask permission before leaving at night. Lazaridis reversed the decree, but his company’s aggressive, need-it-yesterday approach fostered what would become a robust cynicism. “It got to the point that when schedules were made up I didn’t bother to read them,” says Wandel. “They were so made up, a fantasy.”

While it’s nice this wasn’t enforced indefinitely, it’s nonetheless reflective of a peculiar culture of intensified work. The famous office perks of Google et al represent a domestication of this impulse: why would you want to go home when we’ve provided all these nice things for you? Add to that an element of self and social selection, such that only those willing to subordinate themselves in this way are likely to get there in the first place.

But what was once a peripheral phenomenon, confined to the run up to deadlines and struggling start ups, now defines the working culture of much of the tech industry. The managerial culture this breeds can be toxic, as illustrated by this [1]notorious op-ed about the ‘wage-slave attitude’ in game production:

A wage-slave attitude exhibits itself in several tragic ways. I’ve known a lot of stupid self-made millionaires — really, hundreds of them — and they’re usually young as well. I’m talking about kids who made some of the worst games you can imagine and got rich accidentally, working in their parent’s basement in the Florida Everglades. They make their first game, get rich, and they’re gone, never having attended a single networking event at the Game Developers Conference, done. Contrast the dozens and dozens of these kids with the many game industry veterans I know that have long storied resumes listing dozens of triple-A console titles they have “labored” on, who decry the long working hours they are expected to invest in the games they are employed to work on. These people are smarter, more experienced, more talented, better trained to produce amazing games and they’re still working for paychecks and whining about avoiding long crunch hours to finish big titles or about not being paid fairly by some big employer. Listening to them complain about it, you would they think that they are trapped in some disenfranchised third-world country forced to dig for blood diamonds to feed their families.

The Social and Cultural Politics of Debt – A Workshop at Keele University (2016-05-09 12:40)

The Social and Cultural Politics of Debt – A Workshop at Keele University

Wednesday, 18th May, 3pm-5.30pm (CM0.012)

Workshop Schedule

3pm-3.20pm: Mark Featherstone – Ecologies of Indebtedness

3.30pm-4.10pm: Mark Davis - Futureproof: The Cultural Politics of Indebtedness in Neoliberal Societies

4.20pm-5.00pm: Ole Bjerg – Debt Drive and Compulsive Money Creation

5.00-5.30pm: Questions and Answers

Steve Fuller on information overload (2016-05-10 08:00)

An [1] interesting talk by Steve Fuller on information overload. He starts with the academic context in which much of what’s published is not read, much of what’s read is not cited and yet academics are pressured to continually publish more. For whom is this a pathological condition? He argues that the implicit standpoint here is that of a decision maker i.e. this situation is pathological because it precludes the deployment of academic knowledge in informed decision making. Obesity metaphors obtain here, argues Fuller, because it’s a matter of having more information than you know what to do with, as opposed to more energy than you’re able to expand through activity.

The point he ends on is a really important one: is the concern for managing information actually one of managing free expression? Is the unstated problem one of there being too many authors? I assume he’s talking about this in relation solely to natural science, but I’m sure this can be generalised.

How to write essays for A Level Sociology exams (2016-05-11 08:00)

This is very much geared towards the specific format of A level exams in the United Kingdom but it might be useful for others:

Assess/Evaluate/Discuss the view...
To what extent are .......

On one hand...
For:

On the other hand...
Against

IFRAME: [1]https://www.youtube.com/embed/GrFLfVsJ578
Part Four: Evaluation

- The key to good evaluation is your ability to formulate critical questions about sociological arguments and perspectives.
- Try to formulate a list of questions/criteria that might help you to evaluate sociological theories.
June 21st, 10am to 5pm
The University of Warwick

This one day workshop is intended for those currently using or planning to use the morphogenetic approach in their research. In the first half of the workshop, Margaret Archer will give an overview of the morphogenetic approach and its development, as well as address conceptual and methodological questions that participants might have. In the second half of the workshop, there will be plenty of time to present work-in-progress or planned projects, get feedback and discuss with others who are doing similar work.

If you'd like to participate then please e-mail mark@markcarrigan.net with a brief biography and description of your project.
The Great Divide: Sociology, Anthropology, and Race in France since Lévi-Strauss

The Sociological Review Annual Sociology Lecture

Friday May 20th 2016, 17.45-21.00

SOAS, University of London

This event is free but it is essential to register. To reserve a place, please email Jenny Thatcher [events@thesociologicalreview.com]
**Keynote:** Professor Éric Fassin (Université Paris-8)

**Discussants:** Professor Gurminder K Bhambra (University of Warwick, UK and Linnaeus University, Sweden) and Dr Imogen Tyler (Lancaster University)

Professor [1]Éric Fassin will bring together the disciplines of anthropology and sociology to demonstrate how the boundaries that were drawn around them were part of an academic struggle for power in which the term ‘race’ and the politics of decolonization were central to the war of disciplinary position.

**The Great Divide:**

**Sociology, Anthropology, and Race in France since Lévi-Strauss**

Claude Lévi-Strauss published the *Elementary Structures of Kinship* in 1949 as a sociologist. Only in 1950 was he to appropriate the term “anthropology” in his introduction to the posthumous edited volume of essays by Marcel Mauss, entitled *Sociologie et anthropologie*. The French sociological tradition did not distinguish between the two disciplines; on the contrary, Émile Durkheim and his heirs distanced themselves from an “anthropology” that was associated with race during the first half of the century. In order to reclaim this label, and thus institute himself as the founding father of French anthropology, Lévi-Strauss could not merely rely on American cultural anthropology; he had to erase the racial legacy of the French tradition. This was accomplished in his 1952 UNESCO pamphlet "Race and History". It was a powerful move in the wake of World War Two, especially from one who had to flee Nazi persecutions against Jews. But this was also the eve of decolonization – at a time when Georges Balandier analyzed the “colonial situation” as a sociologist, while Michel Leiris and Aimé Césaire denounced the politics of race in the French empire. Today's French work on race has to revisit this great divide of the 1950s, not only between anthropology and sociology, but also between the social sciences and race.

**About Éric Fassin**

After teaching in the United States from 1987 to 1994 (at Brandeis University and New York University), and at the École normale supérieure in Paris from 1994 to 2012, Éric Fassin is now a professor of sociology in the Political Science Department and co-chair of the Gender Studies Department at Paris 8 University. He is a founding member of the new Laboratoire d’études de genre et de sexualité – Research Center on Gender and Sexuality Studies (LEGS, CNRS / Paris 8 / Paris 10). His work focuses on contemporary sexual and racial politics, including immigration issues, in France, in Europe, and in the United States – often in a comparative perspective. He is frequently involved in the
French public debates on issues his work addresses – from same-sex marriage and gender parity to the politics and policies of immigration and race, but also on the evolution of the left.

Please note that tickets are strictly limited. Please give sufficient notice of cancellation.

**Book Review: Diversity, Equality and Achievement in Education (Knowles & Lander, 2011)**

reviewed by Sadia Habib

[1] *Diversity, Equality and Achievement in Education*

by Gianna Knowles and Vini Lander (Sage, 2011)

Intentional and unintentional racism is very much still a part of today’s society experienced by people of colour in everyday situations and through structural/institutional inequalities, even if some politicians and media commentators attempt to project an image of a post-racial world. Educational guides are needed now more than ever to help new teachers to reflect and act upon stereotypes, inequalities and discriminations encountered by their students. This book, [2] *Diversity, Equality and Achievement in Education*, focuses on the significance of schools and teachers learning about student diversities, identities and differences in order to ensure students are reaching their potential and progressing in education.
As well as discussing the various old and new racisms relevant to schooling and education - including stereotypes and assumptions about Gypsy, Roma, Traveller students, and refugee and asylum seeker students - the book also usefully provides educationalists with insight into the identities and diversities that matter when teaching looked-after children, also known as Children in Care (CiC), as well as issues of gender, social class and disabilities. The increasing policy emphasis on inclusion in the last two decades, Knowles argues, has brought great benefits to students and schools. Lander highlights that intersectionality means that social categories, for example gender, need to be considered in conjunction with other social differences and social identities, such as class or race/ethnicity.

The chapter on ‘Enabling Equality and Achievement for Children with Disability’ informs the reader about the marginalisation and bullying encountered by disabled young people, and encourages the reader to critically examine school policies regarding students with disabilities and develop ways to ensure learning is personalised to help the students to participate confidently in education: ‘... it can be very tempting to plan and organize something for children that we believe they will find motivating and interesting’, thus it is better and ‘can be a very illuminating experience to talk to children about what they do actually find interesting about their learning and in what ways they think it could be even more stimulating’ (p146).

Particularly poignant is Lander’s chapter on Gypsy, Roma and Traveller students – ‘Living on the Margins’ – which outlines a socio-historical perspective on these distinct social groups who come to be homogenised through policy and political discourses. Lander reveals powerful details about the origins of these groups, and explains more about the stereotypes, assumptions and prejudices that lead to their mistreatment and suffering in contemporary society, thus showing the reader the necessity of representing their voices. Lander has also written a chapter on the significance of hearing the narratives of refugee and asylum seeker children – ‘to develop a nuanced concept of the children that are part of this group and to begin to understand that their individual stories will illuminate their fears, hopes and needs’ (p123). In the further reading list, Lander includes[3] Benjamin Zephaniah’s Refugee Boy, a novel which I found resonated with the multicultural school students I taught in London.[4] I have written at length about the emotional and social benefits of exploring Refugee Boy with school students.

Knowles' chapter on looked-after children, also known as Children in Care (CiC), explores themes of attachment, loss and resilience. Intersectionality matters again, as these young people will have individual and unique experiences according to their gender, and even whether they also have a refugee or asylum seeker status. Thus we can read the chapters in this book in conjunction with one another, for the advice is not discrete, but interweaves through all the chapters to stress the need for educationalists to understand more about students’ intersecting identities. For example, we might also consider the shifting social class experiences of refugee and asylum seeker students who might once have experienced a middle class lifestyle before they embarked upon their extremely difficult and disturbing journeys, eventually arriving in the UK to seek sanctuary. Thus, how would their previous and new encounters impact upon their identities, belongings and achievements in education?

The authors have helpfully provided engaging, detailed and powerful case studies, interesting discussion points and extra activities to allow readers to ponder over key themes. These additional study sections also enable readers to personalise the insights about diversity and inclusion, and make them relevant to their own experiences and observations of education. Some of the activities, in my view, could be modified by trainee teachers to use with their own classes of students when exploring identity and diversity in lessons. The reading lists and website lists in different chapters also provide helpful avenues to explore for those wanting to do further reading.

The reading lists and additional activities are particularly important for student teachers, as my reading and research has shown that they lack sometimes confidence when dealing with diversity and discrimination. Thus, this book is very useful for new/experienced teachers and teacher trainers, as well as sociologists and psychologists of education, who are keen to know more about key connections between identity, diversity, equality and achievement, increase their knowledge and understanding of child development, and interrogate their own personal positionality regarding ethnicities, cultures and religions.
How to do Sociology with ... Music (2016-05-13 08:00)

A lovely video with occasional SI author Les Back (HT Dave Beer):

IFRAME: [1]https://www.youtube.com/embed/gWXamya7o4Y

Cedric Bongle (2016-05-13 21:30:34)
Great ... but where was the music?
Interested in the internal conversation? Come to this symposium @SocioWarwick on May 24th (2016-05-13 12:00)

Following on from a successful event this time last year, we’re organising another reflexivity forum. We potentially have one more speaking slot available but we’re still keen for others to come along for the discussion. Here’s the programme for the day:

<table>
<thead>
<tr>
<th>Time</th>
<th>Session 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>10am to 10:15am</td>
<td>Welcome and introduction (Mark Carrigan)</td>
</tr>
<tr>
<td>10:15am to 11:30am</td>
<td>Relational Reflexivity (Margaret Archer)</td>
</tr>
<tr>
<td>11:30am to 11:45am</td>
<td>Coffee Break</td>
</tr>
<tr>
<td>11:45am to 12:45pm</td>
<td>Michelle Farr: <em>Collective Reflexivity</em></td>
</tr>
<tr>
<td></td>
<td>Julius Elster: <em>The role of reflexivity in the formation of young people's identities: a phenomenological interpretation of reflexive orientations</em></td>
</tr>
<tr>

21st Century Salute to my Heroine Quartet (2016-05-16 10:51)

by Natty Mark Samuels

On this Saturday evening, I sit relaxing in joyful thought, wishing that the next time I go to Ghana, I get to hear Dr. Rabiatu Deinyo Ammah speak. I wish I could have been there, at that January 2016 Accra lecture, when she spoke about the end of year national elections, with the hope that the populace, or certain segments of it, would not be used as aids to coercive voting, by the campaigning politicians.

Speaking specifically to the Muslim community, she said "we are people of peace, so we must emulate Prophet Muhammed (SAW) who thrived on peace." I would love to hear her speak at the University of Ghana, where she is a lecturer in Religious Studies (as well as a visiting lecturer worldwide). She has also undertaken research, on behalf of her sisters in faith, looking at issues such as domestic violence and HIV/AIDS. She is part of the great umbrella, FOMWAG - Federation of Muslim Woman Associations Ghana. Many have recognised her wisdom, such as President Mahama, who gave her a place on the Council of State, the body that advises the Presidency and other constitutional bodies.

I salute Dr. Rabiatu Deinyo Ammah.

Last time I went to Ghana, I was content just to be there, but next time, I want to research the pioneering teacher/activists - spiritual descendents of Nana Asma'u of Nigeria and Dada (Grandmother) Masiti of Somalia - because there is a frustrating lack of online access, to biographical information, about these stalwart women of the Black Star country. We have been told of earlier teachers, such as Solomon Bagayogo and Al-Hajj Umar of Kete-Krachie, but not of their later, female counterparts.

It would be good to sit and talk with Hajia Mariam Obeng, to hear about her education, her favourite subjects and teachers; to hear about her work as chairwoman of another essential umbrella, the GMMWF – Ghana Muslim Mission Women's Fellowship. Whether organising leadership workshops, interspersed with skills training – or gathering and donating crucial supplies to a hospital, she is there on the frontline, of empowerment and transformation. I hope that at the end of the day, there is someone to oil and rejuvenate her tired feet. I know of the monumental Yaa Asantewaa: I saw the cell in Kumasi Fort where they held her.

I salute Hajia Mariam Obeng.
Now, I need to know of those in the present, of equal brilliance and potential, such as Deputy Minister for Women and Children’s Affairs, Hajia Hawawu Boya- Gariba. Her clarion call to all, is to upgrade the thinking, funding and facilities, concerning the education of girls. She supports the work of those such as Hajia Mariama Mohammed, Headmistress of the Tamale Girls High School, in Dagomba, northern Ghana. Talking of the sad statistics of female enrolment, at a 2012 speech she gave at the school, she said "This calls for concerted efforts by all stakeholders and meaningful Ghanaians - and for that matter the Northerners, to get involved in getting females enrolled and retained in school".

Other issues she has fought against, include the witch labelling and subsequent societal banishment - to ‘witch camps’, where children are imprisoned also, forced to leave their communities with the accused parent. I remember that the colonial authorities labelled the enslaved - future Jamaican national heroine - Ashanti Maroon called Nanny, a witch, to discredit her. As well as the moral reasoning, she mentions the United Nations decree, which calls for the elimination of all discrimination against women, which Ghana has signed up to. She calls for the closing of the camps as “a national disgrace” - and to community leaders, to facilitate the re-integration of these women and children, back into their home communities.

I salute Hajia Hawawu Boya Gariba.

The other member of my Heroine’s Quartet, is also an eliminator of ignorance – and a reducer of a form of cancer. The Al-Hayaat Foundation, a home grown NGO, was set up by Hajia Hanatu Abubakar. Working with the Ghana Health Service and universities, her self-imposed remit, is to bring widespread awareness – to men, as well as women – about cervical cancer, focusing on aspects, such as forms of transmission and early screening. Thinking back now, to my work in the Kumasi Children’s Home, I wonder how many were there, due to the ignorance of their parents? She advocates for healthier lifestyles, including the avoidance of smoking and multiple partners. She organises, co-ordinates and speaks at seminars nationwide, because cervical cancer is on the increase.

I salute Hajia Hanatu Abubakar.

I feel proud that the country where my roots lie, has produced women such as this, sometimes against all the odds. So it is time we knew, what we should know. Recognise them now, while their physical presence still emanates. After all, they say we shouldn’t put off for tomorrow, what we can do today.

Time to salute.

Natty Mark Samuels is a poet and the founder of African School, a Cultural Education project based in Oxford. This initiative provides teaching in African Studies with a focus on pre-colonial sub-Saharan and Islamic cultures and early Black journalism. Formerly a Visiting Tutor at Ruskin College and other academies, Natty Mark also tutors on the Oxford Study Abroad Programme.
more specific details on the workshop. It will be composed of two main blocks. First, Sanjay Seth and David Martin will lead a workshop on Subaltern Studies. Second, Rosalba Garza and Rolando Vazquez will lead a workshop on the Modernity/Coloniality/Decoloniality project. Bios here: [1]http://www.gold.ac.uk/politics/staff/seth/ [2]http://www.gold.ac.uk/politics/staff/martin-david/ [3]http://www.iss.nl/iss_faculty/profiel_metis/1100534/ [4]http://www.ucr.nl/about-ucr/Faculty-and-Staff/Social-Science/Pages/Rolando-V%C3%A1zquez.aspx This will be a fantastic opportunity to workshop with scholars who not only have contributed to IR but who are leading figures within postcolonial/decolonial debates in their own right. *************** PLEASE NOTE: deadline for applying to the workshop is 27th May. Please email Robbie Shilliam: [5]r.shilliam@qmul.ac.uk

Higher Education & Race Inequalities (2016-05-18 17:04)

Tenure Denied

At Dartmouth, an Asian-American professor receives unanimous English department backing and is rejected at higher levels. The same happened to a black historian at the college. Many see a disturbing pattern.

If you liked this video, you might like [2]these podcasts on the Sociological Review's website about the experience of housing insecurity in the UK.

The Rise and Fall of Fantasy (2016-05-20 08:00)

Once we paraded grand visions of the future, now such goals are more typically left to the fanatical fringe. With economic and cultural growth in the East what vision does the West have to offer? Do we need new fantasies to meet the challenges of the 21st century or is our scepticism a sign of wisdom rather than decline?

Using social media to map scholarly literatures (2016-05-21 08:00)

At a time when [1] there are more than 28,100 active scholarly peer-reviewed journals publishing around 1.8-1.9 million articles per year, finding ways to navigate scholarly literatures are more important than ever. This is one of the most exciting ways in which social media can be used to directly enhance scholarly practice.

There are many forms this can take, from the indirect (e.g. writing accessible blog posts which someone else uses as a guide to a literature) to the direct (e.g. tweeting about what you think are the most important papers on a given topic). But perhaps the most useful is sharing comprehensive reading lists.

Here’s a wonderful example of what this could look like, produced by members of the [2] Social Media Collective at Microsoft:

The Accelerative Ethos of Steve Jobs (2016-05-22 08:00)

From the [1] Commencement address Steve Jobs gave on June 12, 2005:

When I was 17, I read a quote that went something like: “If you live each day as if it was your last, someday you’ll most certainly be right.” It made an impression on me, and since then, for the past 33 years, I have looked in the mirror every morning and asked myself: “If today were the last day of my life, would I want to do what I am about to do today?” And whenever the answer has been “No” for too many days in a row, I know I need to change something.

Remembering that I’ll be dead soon is the most important tool I’ve ever encountered to help me
make the big choices in life. Because almost everything — all external expectations, all pride, all fear of embarrassment or failure — these things just fall away in the face of death, leaving only what is truly important. Remembering that you are going to die is the best way I know to avoid the trap of thinking you have something to lose. You are already naked. There is no reason not to follow your heart.

Life is short. This is why it's important to fill life with as much of value and interest as possible. The good life is the full life. Don't hesitate or waste your time when you could be living fully.

Computational Social Science and the Collapse of Sociology (2016-05-23 08:00)

An interesting footnote in On Sociology by John Goldthorpe speculates on the possibility of Sociology's collapse. From pg 9:

Such a collapse could conceivably come about through a series of 'secessions'. For example, some university departments of sociology have already became in effect departments of 'cultural studies', and this
could then prompt sociologists committed to quantitative analysis and ‘theory-for-explanation’ to seek new homes within social-sciences faculties that would allow them to work more closely with economists, political scientists, demographers, or social statisticians. However, what chiefly militates against such a scenario is sociology’s previous institutional success and the very fact that sociology departments do now exist. Changing the disciplinary organization of a university is, as a colleague once remarked, like ‘moving a cemetery’.

Do these conditions still obtain? Yes but I think their influence is waning. We’re currently seeing a shift in the underlying plate tectonics of the disciplinary system, one driven by but not reducible to computational innovation. I suspect that the emergence of computational social science could be the initiating factor which, as the conditions elucidated by Goldthorpe continue to wane in their influence, leads to these ‘secessions’.

Obama’s Best Comebacks and Rebuttals (2016-05-24 08:00)

Imagine a comparable round up for President Trump, produced circa 2020?

iframe: [1]https://www.youtube.com/embed/2oGMV7H7z4I?version=3 &rel=1 &fs=1 &autohide=2 &showsearch=0 &showinfo=1 &iv_load_policy=1 &wmode=transparent

2. https://www.youtube.com/embed/dByWuNkYaUs?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent
3. https://www.youtube.com/embed/Wfo0Nl6-qYM?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent
4. https://www.youtube.com/embed/ER0wkPYkNE?version=3&rel=1&fs=1&autohide=2&showsearch=0&showinfo=1&iv_load_policy=1&wmode=transparent
What messages can we take from this speech? It's Obama at his most self-consciously inspirational, addressing 'young people' pursuing social change. I think it can also be taken as an attempt to outline a worldview in the broadest terms. Here’s some suggestion about the content of what I’ve come to think of as the ‘liberal imagination’:

- Social decay and fragmentation are partly perceptual. We should understand why people appear to see these trends but we should reject their putative reality.

- The idea we are "gripped by forces we can’t control" is a reflection of an underlying pessimism, rather than an objective assessment of a challenge.

- Things are always improving. Now is the best time to be alive.

- Our capacity to shape the world is unmatched: tools, freedoms, knowledge.

- We must always reject pessimism and cynicism. Progressive is not inevitable and these things are the foremost obstacle to it.

- Pessimism often reflects, at least in part, a failure of generational imagination: just because we can’t see the change doesn’t mean future generations won’t enjoy it.

Call for Papers (CfP): VI. International Conference on Critical Education (2016-05-25 17:42)

VI. International Conference on Critical Education

10-13 August 2016,

London, UK

Dialogue, Solidarity and Resistance against Neo-liberalism and Neo-conservatism in Education
The International Conference on Critical Education (ICCE), previously held in Athens (2011, 2012), Ankara (2013), Thessaloniki (2014) and Wroclaw, Poland (2015), is a forum for scholars, educators and activists committed to social and economic justice. The 6th ICCE: Dialogue, Solidarity and Resistance against Neo-liberalism and Neo-conservatism in Education will take place in London at Middlesex University, 10 - 13 August 2016.

At a time of economic crisis, when education is under siege by neoliberal capitalism and by neo-conservatism and aggressive nationalism, when teachers and academics are being proletarianized, youth criminalized, civilised and caring societies being stripped of welfare and benefits and rights, schools and universities turned into commodities, at such a time, critical education, as a theory and as a movement, as praxis, is clearly relevant. International communities of critical educators and activists are working together, and with other movements, to build active resistance to these processes and are engaged in fostering educational and social change leading to a more just, equal and fair society.

The current economic, social, and political crisis, that has been ongoing for 30 years, is manifesting more deeply in education on a global scale.

The crisis- part of, and resulting from, dominant neoliberal and neoconservative politics that are implemented and promoted internationally as 'the only solution', under the slogan 'there is no alternative' (TINA), have substantially redefined the sociopolitical and ideological roles of education. Public education is shrinking. It loses its status as a social right. It is projected as a mere commodity for sale while it becomes less democratic, de-theorised, de-critiqued.

Understanding the causes of the crisis, the particular forms it takes in different countries and the multiple ways in which it influences education, constitute important questions for all those who do not limit their perspectives to the horizon of neoconservative, neoliberal and technocratic dogmas. Moreover, the critical education movement has the responsibility to rethink its views and practices in light of the crisis, and in the light of social, political and educational resistance in different countries- the paths that this crisis opens for challenging and overthrowing capitalist domination worldwide.

The International Conference on Critical Education (ICCE) - regularly attended by between 300 and 400 participants, provides a vibrant and egalitarian, non-elitist, platform for scholars, educators, activists, students and others interested in critical education and in contesting the current neo-liberal/ neo-conservative/ nationalist hegemony, to come together and engage in a free, democratic and productive dialogue. At this time of crisis when public education is under siege by neoliberalism, neo-conservatism and nationalism, we invite you to submit a proposal and to attend the Conference. We especially welcome new and emerging scholars/ scholar-activists.

PhD student workshop: Collecting and analysing social media data (2016-05-26 08:00)

PhD student workshop: Collecting and analysing social media data

The ESRC-funded "Social Media – Developing Understanding, Infrastructure & Engagement" (ES/M001628/1) award based at the University of Aberdeen is organising a workshop for PhD student researchers in the social sciences to come together to explore the challenges of collecting and analysing social media data. The workshop will run over two days (June 16-17) and will commence at 11am on day 1, and conclude at 5pm on day 2.

The workshop will cover tools, techniques and methods of social media data analysis equipping participants with a toolkit that will allow them to select, obtain, process, analyse and present a social media data set. Activities during the workshop will be grounded in case studies, and hands-on sessions will use data sets from recent research at Aberdeen. Topics will include data collection and transformation, ethics, analysis and visualisation.

The event is targeted at PhD student researchers in Social Science disciplines (i.e. those whose research would be funded by ESRC).

The workshop venue is the MacRobert Building at the University of Aberdeen.

Practical sessions will involve participants obtaining data from different social media platforms, a tour of available software tools (including those developed at Aberdeen), and analysis of real datasets. The sessions are designed to be 'hands on' and will involve active participation from attendees. We are asking participants to bring a laptop with them, if at all possible.

Attending the workshop is free. Funding is available to support travel to Aberdeen, some accommodation costs, all lunches during the event and dinner for all participants on day 1. Due to the source of funding only UK based PhD students are eligible for funding. Applications from non-UK based researchers will be considered if there are places available and they can fund their own travel and subsistence.

An application for funding to attend the workshop is part of the online application form. The deadline for applications is 4pm Thursday 26th May.

Link to the webpage about the workshop: [2]http://www.dotrural.ac.uk/ social-media-data-training-workshops/ Places are limited, so please apply early. If you have any queries relating to the event please contact Dr Jennifer Holden ([3]j.a.holden@abdn.ac.uk, 01224 274238). Please pass this announcement on to colleagues that you think may be interested.
Sociology and Fiction: a @thesocreview Special Feature (2016-05-26 14:16)

I think this is come out really well. Get in touch if you’d like to contribute something further:

A special @thesocreview feature on the rise of the Superstar Professor (2016-05-26 14:16)

I’m really pleased with this special feature I just finished for The Sociological Review’s website:

- [1] Is it a bird? Is it a plane? No, it’s a SUPER PROFESSOR!

1. http://www.thesociologicalreview.com/blog/is-it-a-bird-is-it-a-plane-no-it-s-a-superprofessor.html

Reclaiming 'aspiration' for the left (2016-05-27 08:00)

This is powerful stuff from Jeremy Corbyn, leader of the UK’s Labour Party, in his [1]recent LSE lecture:

I am not talking here about the aspiration of the delusional Del Boys – “This time next year Rodney, we’ll be millionaires” – not the importation of the individualist American Dream. (As an aside, the US comedian George Carlin once said “They call it the American Dream, because you have to be asleep to believe it.”) But real aspiration is the aspiration for a secure home, a secure job, a productive job that satisfies and enriches life, the security of knowing your loved ones will be well cared for when they get old or fall sick, the security of knowing your children, nieces or nephews will attend a good school, the aspiration to know your family, friends and neighbours are getting on OK too, and that you have the time, opportunity and the facilities to enjoy some decent leisure time.

These are the things that make the good life and democratic government has both the responsibility, and the capacity, to guarantee them. A government that runs as little as it can get away with has no industrial strategy, has privatised key parts of the economy necessary for a decent life, has abdicated its social and economic responsibilities.

People will not trust, and will not have faith in a government that abdicates its responsibilities through privatisation, deregulation and neglect. People know that to change things you need power
when government appears powerless to change things. People won’t have faith in it to change things when government gives its powers away. People lose faith in it.

The EU: a flawed democracy whose failures are fuelling the rise of fascism? (2016-05-28 08:00)

A [1]powerful polemic by Paul Mason in the Guardian arguing that the post-democratic character of the EU is intimately connection to the reemergence of fascism across Europe:

All this suggests that those of us who want Brexit in order to reimpose democracy, promote social justice and subordinate companies to the rule of law should bide our time. But here’s the price we will pay. Hungary is one electoral accident away from going fascist; the French conservative elite is one false move away from handing the presidency to the Front National; in Austria the far-right FPÖ swept the first round of the presidential polls. Geert Wilders’s virulently Islamophobic PVV is leading the Dutch opinion polls.

The EU’s economic failure is fuelling racism and the ultra right. Boris Johnson’s comparison of the EU with the Third Reich was facile. The more accurate comparison is with the Weimar Republic: a flawed democracy whose failures fuelled the rise of fascism. And this swing to the far right prompts the more basic dilemma: do I even want to be part of the same electorate as millions of closet Nazis in mainland Europe?

The EU, politically, begins to look more and more like a gerrymandered state, where the politically immature electorates of eastern Europe can be used – as Louis Napoleon used the French peasantry – as a permanent obstacle to liberalism and social justice. If so – even though the political conditions for a left Brexit are absent today – I will want out soon.

Martyn Everett (2016-05-30 17:32:03)
This is an interesting post, but to be really rigorous, this study should also compare the average number of citations per year since publication.

Astonishingly, in the description of method on the LSE blog, the author seems to have omitted sociology from the realm of social science!
Let’s Talk Vice-Presidents! Steve Fuller’s Guide to the 2016 US Party Conventions (2016-05-31 05:01)

So the 2016 US presidential race will pit Democrat Hillary Clinton against Republican Donald Trump. Who should be their respective running mates for the vice-presidency? To be sure, there’s some grim historical truth to John Garner’s remark that the role wasn’t worth ‘a warm bucket of spit’. (He was FDR’s vice-president for his first two terms, largely to keep Texas on side for the Democrats.) However, some astute politicians have managed to use it as a basis to get into the Oval Office, and even those who haven’t – notably Al Gore in recent times – have used to the office launch successful post-political careers. To be sure, the current vice-president, Joe Biden, is best understood as having earned the post as a crowning achievement for his distinguished career as a Congressional wrangler, a skill that came in handy during Obama’s turbulent attempts to get legislation passed. It’s unlikely that Biden would have got the post in terms of his presidential potential. However, in 2016 the vice-presidency opens up new possibilities which might entice prospective candidates.

Hillary Clinton needs to appease Bernie Sanders' large number of supporters, if not the man himself. In fact, it looks like Sanders will not very gracefully concede defeat to Clinton. Moreover, US politics has form in the history of spoilers which only serve to condemn the winner to ultimate defeat. Think [1]Eugene McCarthy in 1968. (No relation to the Red-baiting Joe McCarthy, but someone whose name you'll find popping up in some of the music of the time: Gene McCarthy was a very righteously charismatic guy, just like Bernie.) I'm surprised that more people have not made the comparison. Like Hillary Clinton today, the 1968 Democratic nominee, [2]Hubert Humphrey, was a decent, very accomplished politician with a strong civil rights record, etc., but as LBJ's vice-president he had been implicated in some of the most disastrous decisions made with regard to US involvement in the Vietnam War. Even though Humphrey's Republican opponent, Richard Nixon, had a lot of negatives of his own, Humphrey couldn't overcome both his association with the war and McCarthy's failure to endorse Humphrey strongly. Humphrey's running mate, Edmund Muskie, was another decent liberal but not the sort of guy who would galvanize the people who voted for McCarthy.

What is the lesson for Hillary? Pick a VP who Bernie Sanders' people could not possibly object to and would be a strong campaigner – strong enough to get Bernie's people to vote. My personal choice is [3]Elizabeth Warren, Senator of Massachusetts, who herself made an early bid for the Democratic nomination. Sanders' social media campaign has been marked by 'Bernie Bros', who are male vocally anti-establishment yet viscerally misogynistic types who one could easily imagine going for Trump if Bernie doesn't give a strong steer otherwise. Now, assuming that Bernie won't give a strong steer – other than say 'Don't vote Trump' – then it's up to Hillary to prevent the dissipation of Sanders' support. Clinton and Sanders disagree more on what counts as feasible means than on ultimate goals. Warren could represent Sanders' position in Hillary's campaign, in which case his supporters would be properly tested on whether they can support two women fronting their common view. And of course, it would be a direct challenge to Trump's even worse gender politics. Could Trump manoeuvre effectively in that space? More generally, of course, one might ask why America has found it so much easier to accept a non-White (Obama) than a non-male (Hillary Clinton) president?

Now, as for Trump, things take a somewhat more bizarre turn. If I were a Trump advisor and I thought Trump had a good shot of winning the election carrying on as he has during the Republican primaries, then I would recommend a running mate crazier than him, simply as an insurance policy against assassination attempts. To be honest, it's amazing that so far no one has tried to take down Trump, but were he to become president, the incentive to do so – especially in the land of the Second Amendment – would be still stronger on the part of aggrieved parties. In that case, if the person lined up to replace Trump would be seen as worse, then the assassination threat might be removed. Think Sarah Palin, or maybe even Ted Cruz. On the other hand, if I didn't know what Trump's advisors were advising but I were an ambitious Republican politician more reasonable than Trump yet relatively close to Trump's policy positions, I would lobby to become the vice-presidential candidate, precisely because there would be a good chance that Trump would be taken out by an assassin and I would then become president! New Jersey Governor [4]Chris Christie would fit the bill perfectly. You may call it cynical, but that's just Realpolitik, which if nothing else I
think Christie understands.

What may put all of these speculations by the wayside is that the cast of characters (minus Palin and Cruz) are all from my home region of the US, the Northeast. Such regional concentration is generally not allowed in American politics. In any case, the vice-presidential choices of both candidates in 2016 may do more than the usual work in determining who wins the election and the character of the presidency that follows.

Data Fetishism (2016-05-31 08:00)

I find this argument from loc 270 of Rob Kitchin’s *The Data Revolution* extremely compelling. It reminds me of Roy Bhaskar’s argument about the fetishisation of facts from his *Reclaiming Reality*. This is what Kitchin says:

Moreover, just as we think of bricks and mortar as simple building blocks rather than elements that are made within factories by companies bound within logistical, financial, legal and market concerns, and are distributed, stored and traded, so we largely do with data. Consequently, when data are the focus of enquiry it is usually to consider, in a largely technical sense, how they should be generated and analysed, or how they can be leveraged into insights and value, rather than to consider the nature of data from a more conceptual and philosophical perspective.

This “conceptual and philosophical perspective” is a necessary, though insufficient, condition for a critical one. Only if we consider the social ontology of digital data does it become possible to reflexively incorporate critique of the originating platforms into the digital social science that those platforms facilitate.

Coping with acceleration: triaging strategies and the new empiricism (2016-06-01 08:00)

My concern in this short talk is not to diagnose the underlying conditions which generate an acceleration of social life, or indeed the various experiences which differently placed actors have of such acceleration. Instead, I’m interested in the novel and deeply reflexive cultural forms arising under these conditions, as what we might think
of as temporal strategies, originally grounded in the lived experience of coping with intensified demands, instead become commodified and take on a relative autonomy vis-a-vis their application.

The most familiar manifestation of this commodification is the self-help industry, estimated as an [1] $11 billion industry in 2013. This is a market that has changed a lot in recent years, as depressing incomes have constrained a previously buoyant market of live events and the challenge of digital media has encouraged many self-help gurus to give away ‘taster’ content online as they attempt to build up a brand. It’s easy to become preoccupied with the highest profile speakers and their global best sellers: for instance The Secret has sold more than 19 million copies and the 7 Habits of Highly Effective People has sold more than 25 million copies. But there’s also a buoyant coaching market ([2]estimated $1.5 billion world wide) and public seminars market (estimated $308 million in the United States) which need to be recognise as part of the broader self-improvement or self-help industry.

My concern is with a more recent addition to this landscape: productivity culture. The most influential text of productivity culture, Getting Things Done by David Allen Green, has sold 1.6 million copies. The category of ‘productivity’ has become a central feature of apps, with many thousands available for the many millions of iPads and iPhones in circulation, as well as comparable availability for other mobile platforms. There’s a whole movement towards what the technologist Alex Pang calls ‘contemplative computing’: designing software that minimises distraction and facilitates immersive productivity. The popular blog Life Hacker reaches over 20 million people each month and has helped spawn a much wider ecosystem of productivity orientated content online.

It’s within this broader ecosystem that we can see a rich flourishing of what I’ve come to think of as triaging strategies: ways of coping with an intensity of demands placed upon the self by calibrating our responses to our environment and establishing new priorities. We have to treat these strategies carefully because they’re being promulgated: some people might simply be reflecting upon their experiences for anyone who happens to take an interest but many are selling books, coaching services and webinars. In fact people can move from one category to the latter, as the fact of having accumulated an audience for one’s musings on these issues holds out an inevitable temptation of ‘monetising’ this audience through the production of a book. In this sense, the promulgation of a triaging strategy can itself be a triaging strategy i.e. it’s a scheme to escape the ‘rat race’ and find a new direction in life, one more satisfying and rewarding than the present reality.

One further methodological caveat. We shouldn’t infer a common outlook from a common action. Just because someone buys a particular book or read a particular website, does not mean that they do so for the same reason or react in the same way to the cultural content they are engaging with. Someone might buy a book for idle curiosity, a deep sense of need, to fill time, to critique or for any number of other reasons. Someone might then devote their life to the principles expounded in the book, react with a disinterested curiosity about the different ways in which one can live life, throw the book away at the first opportunity, forget it all together or any number of other reasons. Recognising this variability of responses is crucial to understanding the phenomenon of triaging strategies: these are cultural resources, usually though not always offered as commodities by those seeking to sustain themselves through this activity, susceptible to being picked up and put down, applied in many different ways or not at all. These are technologies of the self. But we misconstrue them if we fail to consider the diverse range of ways in which differently situated selves might draw upon them, how their characteristics will be inflected through the ensuing context, as well as how such actions will aggregatively lead to the transformation or reproduction of the cultural form e.g. contributing to rising sales figures through word of mouth or changing public perceptions of it.

My suggestion is that the 7 triaging strategies I offer can be usefully analysed in terms of the nexus of work and life. This is the terminology that occurs frequently within the literature but these are also useful analytical categories to understand the lived experience of intensifying demands. We occupy multiple social roles and there are many factors leading to an intensification of demands upon each one of them e.g. constant connectivity at work, rising expectations of parental activity, automation leading to the outsourcing of ‘shadow work’ to consumers etc.
There are many factors, each of which could be a talk in their own right. My concern here is not to elucidate them but rather to consider how intensifying expectations within clusters of social roles that we can loosely categorise as ‘work’ and ‘life’ create problems for the subject. As Margaret Archer puts it, “roles are greedy”. There’s no logical limit to how much of ourselves we can invest in them but there are temporal, physical, psychological and socio-economic constraints on the choices that we make. It requires reflexivity to negotiate between these competing demands, something which itself requires time and space. My argument will be that these 7 triaging strategies can be usefully conceptualised as different solutions to the increasingly problematic relationship between ‘work’ and ‘life’ under digital capitalism. My suggestion is that this is usually experienced as personal life being consumed by working life, the concerns of the self being subordinated to the imperatives of the workplace. But a crucial part of the investigation which I’m still in the early stages of undertaking is to analyse the different ways the underlying dilemmas conceived of and represented in this literature.

1. If personal life is being consumed by working life, one solution is to seek a job that perfectly expresses yourself. Thus I believe we can see the contemporary resurgence of the notion of the vocation as something expressive of an underlying impulse towards finding personal fulfilment in working life by blurring boundaries between the two domains. As well as the macro-economic untenability of this strategy for most under contemporary capitalism, much scholarship in cultural policy and the sociology of work reveals how this discourse of ‘passion’ – doing what you love – goes side-by-side with exploitative and worsening working conditions, growing expectations of unpaid work and spiralling working hours.

2. An equally familiar solution is to instrumentally calibrate the demands of working life and personal life. This is most frequently expressed in terms of the notion of the work/life balance, but in sectors defined by a project based knowledge work we increasingly see the notion of the work/life merge: a wilful collapse of temporal boundaries, using mobile computing to both work and life in a more or less spontaneous sequencing over the course of the day. The extent to which this is chosen or enforced remains a pressing question.

3. Another solution is to minimise the demands of personal life and working life. The most extreme expressions of this lifestyle minimalism represent a form of moral athleticism, in which advocates compete to see who most radically reduce their possessions into a set number of objects. It’s correspondingly hostile to ‘clutter’ and imbues it with almost magical capacities to shape one’s psychic life. It sometimes celebrates nomadism – of a very privileged sort – including a permanent home within the category of ‘stuff’ that constrains our lives. But it is driven by an underlying concern for quality over quantity: reclaiming core experiences by dispensing with that deemed ‘unnecessary’. It’s striking how completely dominated the online discourse of lifestyle minimalism is by childless white men in their 20s to 40s, usually seeming to be without attachments. This is asceticism for a certain demographic rather than a strategy for all.

4. Perhaps the most novel solution is the concept of lifestyle design: instrumentally reducing the demands of working life in order to focus on personal life. Propounded most successfully by Tim Ferris, whose book The Four Hour Work Week has sold well over a million copies, it encourages a strategic mobility: exploiting currency differentials in order to live richly without necessarily being rich, outsourcing as many tasks as possible to virtual assistants operating out of Indian cities and taking ‘mini-retirements’ to focus intensively on certain skills or experiences. It almost represents a kind of hipster neo-colonialism, a strategy utterly dependent on global power relations defining contemporary digitalised and financialised capitalism.

5. A fifth solution is to seek to dispense with working life to the greatest extent possible. A superb recent book by the Cardiff sociologist David Frayne presents interviews with a diverse range of movements sharing a common orientation to the refusal of work: reducing hours to their minimum, giving up work entirely or otherwise seeking to escape from working life.

6. We can see a novel form of temporizing emerging in extreme early retirement: embracing a rigid asceticism for many years, intricately monitoring spending and income, in order to ensure the possibility of retiring by a fixed
point in time. This represents a solution of sequencing: solving the problems of the relation between work and life by working now in order to live later. It’s interesting to consider the assumptions this makes about the future calculability of digital capitalism e.g. if this is reliant on pensions and investments, how will predicted long term declines in average returns lead to a gradual ratcheting up of the early retirement age and how will practitioners of extreme early retirement react to this?

7. Finally, I think self-optimisation can be included here, particularly when it involves open-ended projects of self-improvement using self-tracking technologies. Not all self-tracking practices are concerned with self-optimisation: we need to distinguish here between goal orientated self-tracking, experimental self-tracking and ongoing projects to perpetually optimise oneself. But an ongoing project to become more productive in work and life, to optimise oneself for the conditions in which one lives and works, seeks to solve the dilemma by improving performance on both sides of the dichotomy. The problem arises because demands are not static and learning to be quicker inevitably incites one to do more: choices that might formerly have been made on the basis of practical necessity now become live options, risking an intensification of demands and rendering further self-optimisation necessary in order to cope.

This is by no means an exhaustive list and each of these strategies presented is just a brief outline of a complex phenomenon. My claim is that these need to be recognised in their specificity and that the ‘greedy’ relationship between the role clusters of ‘work’ and ‘life’ represents a useful analytical framework through which to understand the purpose of these strategies and how they can be taken up by subjects struggling to cope with the intensified demands of digital capitalism.

2. [http://www.slideshare.net/jonlar/the-us-self-improvement-market](http://www.slideshare.net/jonlar/the-us-self-improvement-market)
framework across different disciplines and subfields, but principally within historical studies. Loss and absence are slowly being recognized as significant factors in historical processes, particularly in relation to the material world. Archaeologists, anthropologists, philosophers, literary scholars, sociologists and historians have increasingly come to understand the material world as an active and shaping force. Nevertheless, while significant, such studies have consistently privileged material presence as the basis for understanding how and why the material world has played an increasingly important role in the lives of humans. In contrast, Understanding Material Loss suggests that instances of absence, as much as presence, provide important means of understanding how and why the material world has shaped human life and historical processes. Speculative and exploratory in nature, Understanding Material Loss asserts that in a period marked by ecological destruction, but also economic austerity, large scale migration and increasing resource scarcity, it is important that historians work to better understand the ways in which humans have responded to material loss in the past and how such responses have shaped change. Understanding Material Loss asks: how have humans historically responded to material loss and how has this shaped historical processes? The conference will bring together a range of scholars in an effort more to begin to explore and frame a problem, than provide definitive answers. Confirmed keynote speakers include:

- Professor Pamela Smith, History, Columbia
- Simon Werrett, Science and Technology Studies, UCL
- Professor Maya Jasanoff, History, Harvard
- Professor Jonathan Lamb, English, Vanderbilt
- Professor Anthony Bale, English and Humanities, Birkbeck
- Astrid Swenson, Politics and History, Brunel

Understanding Material Loss seeks to uncover the multiple practices and institutions that emerged in response to different forms of material loss in the past and asks, how has loss shaped (and been shaped by) processes of acquisition, possession, stability, abundance and permanence? By doing so it seeks to gauge the extent to which ‘loss’ can be used as an organizing framework of study across different disciplines and subfields. Understanding Material Loss seeks papers from across a variety of time periods and geographies. Although open and speculative in nature, this conference will focus on three broad topics within the wider rubric of loss, in order to facilitate meaningful conversations and exchanges.

Conceptualising ‘distraction’ (2016-06-04 08:00)

What does it mean to be distracted? For the last year, I’ve been telling people that I’m working on a new project about digital distraction and everyone seems to immediately grasp what I mean by this. But conceptualising precisely what we should take ‘distraction’ to mean is slightly more complex than I realised at the outset of the project. The dictionary offers a good starting point, with two definitions:

1. a thing that prevents someone from concentrating on something else.
2. extreme agitation of the mind

Looking at these definitions, it’s easy to infer a causal relation between the phenomena they designate: we might assume that (1), if encountered to a sufficient degree under conducive circumstances, leads to (2) through sheer accumulation of distraction. In other words: lots of *distractions* lead to *distractedness*.

In a recent piece of work, I tried to analyse the rise of (1) in terms of *constant connectivity*. Interruptions
have always been part of human experience, in so far as that there are always contingencies which might emerge in order to disrupt an activity that’s in process. But the ‘triple revolution’ of mobile computing, wireless internet access and social networks have contributed to a proliferation of interruptions, as have the second order effects when this multiplication of communication channels lead to the qualitative and quantitative escalation of communication e.g. people trying multiple means to contact someone in the absence of governing norms about appropriateness, strategic communication that seek to shock and surprise in order to be heard above the din.

Analysed in this sense, talk of interruptions leads rather inevitably to the consideration of reflexivity. What does it mean to ‘prevent someone from concentrating on something else’? It means there was something else they were trying to do and the external event, which we label as a distraction (1), has interrupted their action towards this end. Distraction needs to be conceived of as relational: there is the distracting object, but it only has this power in relation to an existing activity undertaken under conditions that leave someone conducive to being distracted.

What we’re being distracted from might have been routine action, e.g. I get a phone call when making a cup of coffee, but the very act of interruption engenders an awareness of that from which we were interrupted. Consider a distraction (1) significant enough to completely disrupt our previous action: when we ask ourselves “now what was I doing before he phoned?”, this is an incitement to reflexivity, albeit one that reflects a prior failure thereof. So rather than seeing distraction (1) and reflexivity as antithetical, we have to recognise a more complex relationship between them. Distractions impede reflexivity but also highlight it. Persistent distractions engender reflexivity, when we recognise something as a ‘problem’ and begin to ask what it is we might do about it?

It’s for this reason that I don’t think we should consider distracted people as somehow a-reflexive people. Distracted people are those who live within a socio-technical environment sufficiently productive of distraction (1) that we might talk of them as being characterised by distraction (2): it’s an ‘agitation of the mind’, rather than an absence of reflexivity, a difficulty articulating and sustaining courses of action rather a lack of capacity to reach conclusions about what a desirable course might be. Distraction is something which operates on a number of levels simultaneously:

1. A distracting environment renders time and space for reflexivity unlikely: the conditions for internal conversation are often not in place and where they are, they’re unlikely to last.

2. A distracting environment supplies more stimuli about potential courses of action and potential projects: under these conditions, ‘bounding’ variety becomes increasingly difficult, rendering internal conversation more necessary than ever.

3. A distracting environment militates against sustained trajectories of action, because interruptions to action become more likely (with the cognitive costs they entail) as do interruptions to reflexivity exercised about those actions.

Distracting environments are characterised by the proliferation of distractions but the causality of how this leads to distractedness is more complex than I initially realised & I’m still trying to clarify my views on this.
Becoming a Channel Swimmer (2016-06-05 08:00)

A great video from Karen Throsby, who [1]we interviewed almost 6 years ago, as the first of our many podcasts.

Practical Sociology: Agenda for Action A half-day workshop (2016-06-06 08:07)

BSA Sociologists outside Academia, in collaboration with Sage Publishing Ltd and the Sociological Imagination

Practical Sociology: Agenda for Action

A half-day workshop
How come – at least in the UK – you don’t come across people with 'sociologist' in their job title working in industry, business, the civil service, or pretty much anywhere outside academia or independent research organisations?

Sociologists seem to all reside in universities, unlike psychologists and economists, who have colonised many kinds of workplaces.

Most sociologists believe our subject is essential for understanding the world around us, or to resolve contemporary problems, from gender violence to climate change. We have the concepts (like 'cultural capital', 'intersectionality) and the theories (social mobility, moral panic). But where are the practical sociologists?

So what would it take to establish a ‘practical sociology’ in the UK and elsewhere, with sociologists employed to use sociology concepts and models to address problems in industry, business, government, education or health? This half-day workshop aims to establish an agenda for practical sociology.

The workshop will explore pressing questions about how a practical sociology may apply its expertise, skills and knowledge to problems at work or in the community.

- What has prevented the emergence of practical sociology in the UK?
- What are the core knowledge and models that are needed to solve the problems that organisations, businesses and the public sector face?
- What kinds of skills would be needed to work as a practical sociologist?
- How would a practical sociology career pan out?

This workshop will be of interest to sociologists and others who are keen to see the application of sociological concepts, models and theories in practical settings in the public, private and third sectors. Please come along and help us set an agenda for developing practical sociology.

Registration

BSA Members £5; Non-members £8; BSA Concessionary members and full-time students £3.

Tea and coffee will be provided: please bring your lunch.

On the Militarisation of Everyday Life (2016-06-07 08:00)

By Hamish Robertson

Introduction

We live in a world that increasingly applies military solutions to problems ranging from local ‘threats’ to the geopolitical disruptions as the norm. Across the political spectrum there is an increasing acceptance of the belief that military strategies provide solutions to complex problems. Those who protest this vision of the world gain limited traction. Such is the scope of this vision of the world and so pervasive its effects that we have reached a state that can be described as the militarisation of everyday life. Everywhere we look we can see states, peoples and splinter groups committed to the idea that an adequate military strategy, mainstream or insurgent, will resolve some particular problem of the day, decade or generation, resulting in the progressive encroachment of militarism on daily lives.

So where does this perception come from and why does it persist? What needs to change to ‘demilitarise’ everyday life? This article is a short introduction to and exploration of some of the issues at stake presented in two parts. This exploratory article is in three parts. This, the first, examines the enduring and progressive nature of the militarization of civil and civic life. In the second part, we consider the way in which the modern state co-opts us into its militarized strategies, supported by these historical processes and emerging regulatory and surveillance technologies. The third and final part considers the way in which militarisation becomes hegemonic through its normalization in society and in social institutions once seen as distinct from if not immune to such practices.

The nation state is a relatively recent and frequently unstable construction. It intersects with a variety of both historical and modern concepts of collective governance that are complicated by the fluidity and uncertainty of language, discourse and geography. Calls to ‘ethnic’ states or to ethnus, race, biology, language and history almost always involve a reductionist fiction of sharing enforced at ‘other’s’ expense. One of the features of the 20th century has been the continuing re-invention of the nation state as a singular entity bent on controlling diversity within its boundaries. This has frequently involved the creation of authority through a hyper focus of the threat ‘within’ or closely external to the territorial state.

After a century or more of this dichotomous strategy of inclusion by exclusion, it is possible to map the increased use of militarism as a mechanism for maintaining the fiction of the singular people in the singular nation state. Each new – or old but refurbished for our time - conflict raises the stakes in a discourse increasingly centred on the claimed ‘values’ of the state and the nation. So where does all of this come from and why is it so persistent? Our suggestion is to start with the Victorians, or at least the Victorian period, to reprise the art of governance that we have inherited and its instruments of authority and control.

Scouts, sports, schools and symbols - a very brief context to militarisation

In the 19th century the British state began to expand and extend its model of social conformity for the upper and upper-middle classes to the nation as a whole. Uniformity in education and the rise of quasi-military or military-inspired organisations like the Boy Scouts saw the spread of this concept of uniformity. Team sports expanded in this period, located at the meeting point of growing leisure time (Veblen anyone?) and activities that could keep the masses safely entertained in an orderly fashion and expressing solid bourgeois values. In many boys' schools, both traditional and emergent, cadet systems were introduced, and persist, in various settings but more particularly in many of the more ‘elite’ private schools. The association between masculinity, militarism and social conformity was a central feature of the period and one whose values are still present in part because educational systems (public or private) and the state are mutually constitutive. This issue has recently been taken up by the [Society of Friends](Quakers) in the United Kingdom in what they have termed ‘the new tide of militarisation’ including
the stifling of opposition to wars, and the promotion of the ‘unseen march’, that is the increasing militarisation of education. The First World War saw the refining of a number of these strategies in ways that have proven remarkably persistent over the past century, especially in legitimising military responses to social and civil problems. Indeed, the nation state’s ability to effectively mobilise (i.e. both conscript and militarise) the whole population provided the opportunity for testing methods and processes that continue to illustrate how readily uniformity and indoctrination work together across a variety of social domains, particularly when enforced by the authority of the state. As well as the rise of propaganda and the criminalisation of pacifism and dissent, the end of WW1 saw the emergence of the communist-anticommunist trope of wars which characterised the remainder of the century. Identifying, locating and attacking ideology become a mainstay of some streams of contemporary geopolitics, political and religious discourse. The ability to enforce conscription and to punish resistance to military service on the basis of personal or religious beliefs has proven extremely effective in managing forms of dissent in many contemporary societies. Even the concept of ‘patriotism’ has become intimately tied to support for militarism rather than the more specific notion of the defence of one’s own country. This has the dual aspect of making all war ‘patriotic’, even when deemed illegal by the United Nations, and resistance to any war as a potential or actual unpatriotic act. As a result failure to support the state’s military actions is becomes, by definition unpatriotic. With resistance stigmatized, passive acquiescence becomes a form of support. Universal conscription also operated, and operates, as a strategy for taking young men, and more recently women, and acculturating them to systems that included a coercive hierarchical approach to both behavior and thought. These same systems stand largely outside civil processes when it comes to regulation and punishment, with their own institutional logics. After a century or so of this active process of militarism and militarisation, elements of both these experiences and logics been normalised by individuals in positions of power and influence, and in and through knowledge systems such as science and technology. The symbolism of nation-building, especially in colonial contexts, has often relied on an extension of militarism to establish and validate the origins of the contemporary state. In Australia, for example, these various militaristic and symbolic threads have been linked through the Australia and New Zealand Army Corps (ANZAC) mythology. More specifically, this mythos places the founding of the ‘modern’ Australian nation on the shores of Gallipoli in Turkey, in the midst of an extended, bloody and ultimately failed, military campaign. The conflation of symbolic military with civil virtues continues to perpetuate and confuse exactly what a contemporary democratic state is meant to look like and how it is meant to function. The multiple historical exclusions (Indigenous peoples, people with disabilities, GLBTI, and women to a large extent) continue to be largely absent in the reification processes of such mythologies. The symbolic birth of the Australian identity, crafted on the beaches of Gallipoli is represented exclusively in both ‘fact’ and fiction, by young, healthy, white, males. Female munitions workers, nurses or Black/Indigenous/minority (take your pick) soldiers are located in parentheses, that is bracketed or presented incidentally, and as incidental, to the main argument. Even the elderly survivors of this and other conflicts are seen in the light of the specific time – specific moment even – of their military engagement. All lives before and after, are lost to the creation of claims to a collective identity based on experiences shared by a relative few for a relatively brief period of time. Representations of valor are tied to those soldiers who, if not killed ‘in the prime of their lives’ while ‘making the ultimate sacrifice’, are discharged by virtue of physical, but not mental, suffering and sacrifice. This almost impenetrable discourse has been refined for a century or more such that its lack of tangible meaning is made even more difficult to expose by the enormous affective symbolism attached to it. A Wider Sociology of Militarisation? It is one thing to have a sociological analysis of these historical elements of what we can call creeping militarisation but perhaps what we also need is an overarching sociological theorisation of the process itself, in addition to the study of its constituent parts. Obviously the process is not the same everywhere but there are similarities that exist across the neoliberal economies and their societies. Militarisation, which has long been transportable and adaptable, is becoming increasingly so under neoliberalism which posits itself not simply as an ideology but as of value to society as a self-evident truth. When the largest weapons traders in the world are at the centre of determining what wars are legitimate or not then clearly we have a need for analysis that goes beyond the atomistic claims of the nation state or that remark on the trouble with the internet being that terrorists can access information that they need to commit atrocities. Perhaps attendant here is a need for a sociology of escalation? The state tells lies about how open and liberal it is, how tolerant and reasonable it is and yet the consequences of defending these claims progress in the opposite direction. We have
been actively sold a discourse linking freedom, innovation and exploitation since the late 1970’s such that several cohorts have grown up with these conditions as the norm. The consequences seem to be escalating, with demands for more security, more uniforms, more regulatory powers, more privatisation and more barriers to designated ‘others’. This pattern requires of us a sociological analysis. Political theory may make a critique but is unlikely to offer either solutions or even alternatives under prevailing conditions. Conclusion This first part of my discussion is aimed very briefly at showing the continued impact of militarization in through what [5]Raymond Williams termed residual (historical symbolism), dominant (normalisation of military logics and actions) forms of culture. In the next part of this series, I will discuss the most current (dominant culture in Williams’ parlance) convergence of state, industry, democracy and military components of our societies through the rise of neoliberalism. Power and practice go together rather nicely as can be seen in the massive growth in ‘think tanks’ under neoliberalism. If we are to re-think the language, practices and outcomes of this everyday militarisation, we need not just alternative ideas but alternative means of distribution for such ideas and discussions.

The role of militarized science and technology (2016-06-09 08:00)
By Hamish Robertson

Introduction
In the first part of this exploratory essay, I explored some of the links between state power over the past two centuries or so and the rise of militarism as an accepted social norm. In this second part, I want to connect this argument to some of the more overt aspects of militarised science and technology and the assumptions that underpin the extension of military violence into various civil domains, including the surveillance and control of public spaces, and the increasing disassociation with violence and death. In the third and final piece I want to show how the expansion of compulsory military service, the rise of uniforms and uniformity, and the role of increasingly militarised policing has contributed to this general concept of a militarization of everyday life - a term that I did not invent but which seems to helpfully connect so many of these otherwise disparate happenings and trends in the neoliberal regimes.

Science and Technology

The intersection of the techno-scientific with the military paradigm is now so familiar and so extensive that we find it hard to imagine any other version of events, even though this too is largely a product of the last century. This process started with the 'need' for the application of scientific methods to warfare, but the technological innovation spiral that resulted extended outwards in a numerous directions. Today we are surrounded by the civilian versions of technologies that were initially funded through military research and contracting programmes including the increasingly pervasive global positioning systems (GPS) technology and its various applications, ‘tough’ laptops, retail Humvees and all the rest.

The development of not only nuclear weapons but the incipient space programmes following World War II produced the missile technologies to inflict mass death on now legitimate civilian targets (once reviled, now normalised), as well as the computers and computer programmes needed to ‘deliver’ (i.e. effectively navigate) those missiles to civilian targets. The Cold War programme linked notional political ideology, techno-science, militarism and industrial power into one tidy bundle. This reached its apotheosis in the creation of the neutron bomb concept that aimed to kill 'targeted' populations while leaving their physical infrastructure and assets relatively intact.

Currently we can see how governments will privilege the military on the one hand while constraining their civil obligations on the other in a process that re-affirms the military role of the military to an exclusion of other possibilities. This includes advancing certain forms of advocacy for the military and their families, making them beholden at a certain level to executive political, rather than democratic, power. Not only does this create additional forms of recompense including access to integrated healthcare and high quality education, but these privileges are enacted in systems that run parallel but separate to those available to civilian populations.

The differential nature of the split between what ordinary citizens can expect to access and what specific groups of individuals can access that is the interesting point of differentiation. If the rationalization for such privileges is duty in the face of danger then the comparison between the ongoing provision of healthcare to armed service personnel, compared to, for example first responders during the events of 9/11 in the US, such as firefighters, police and the public, must be made. In addition, of course, is the question of how citizens are made to accept and pay for these differential entitlements for specific groups of the population, which in the light of the same dangers and potential consequences (including injury and death) do not extend to them or their families.

The French sociologist Emmanuel Todd has also written of the difficulty of taking an alternative public position on acts of terror in the midst of such events, illustrating how we are increasingly coerced into either agreement with or silence on official responses. These public discourses almost always emphasise some sort of claim to exalted values. The state is acting to protect ‘our’ values by whatever means necessary. And these domestic values that don’t necessarily apply in foreign policy, business practice or other ‘excluded’ contexts. Thus liberal democratic countries with large arms industries dissociate their weapons exports and consequences from their domestic claims to public virtue and judicial process.
The aim, I suggest, is to create classes of people whose actions and behaviors cannot be questioned or, if questioned are excused, and about whom it becomes far riskier to voice such concerns publicly. This in turn makes it harder to question the authorities who direct our military in a process of upward unaccountability – if the base of the pyramid is virtuous then so too is the hierarchical apex. The language of ‘un-[insert nation here]’ illustrates how dissent from these new orthodoxies is increasingly framed as disloyalty and even treasonous behavior in the new neoliberal state, a state that is always at war with someone – often including sections of its own citizenry.

The Surveillance and Control of Public Spaces

One of the correlates we can see with this process is the growing geographic analysis of how public spaces are managed and regulated. The transfer of knowledge between the securitised state and its military, and back again, is hardly surprising but some aspects can get if not ridiculous then at least quite repugnant. Clearly we are increasingly subject to technical surveillance while going about our daily lives by CCTV and related technologies. These can make us safer or perhaps at least make some prosecutions easier to pursue. Police drones are already on the rise so surveillance will be increasingly active, even prospective, rather than passive or reactive. This of course brings its own issues in that prevailing ideas of who is likely to act in a criminal manner is already a deeply socially embedded construct. The people and locations which will be monitored most closely will probably (and probabilistically) come as no surprise.

Public spaces can, [4] once again, be regulated through the design and placement of infrastructure such as seats and benches, gates, fences, wire and even [5] spikes. Many of these are directed at the [6] homeless who inconvenience us by their presence and their need for places to rest and sleep. So the response, yet again, is to address the socially constituted problem by constructing the environment defensively against these groups in what is now called [7] hostile architecture. In addition, the ‘broken windows’ strategy adopted by Giuliani in New York, and elsewhere, saw a massive upswing in police numbers and the implementation of much closer community-level policing than was common at the time. In this context, crime is represented as a distinct [8] ontological entity, completely separate to social context, politics and economy. This justifies not only work for criminologists, psychologists, social workers and the like but it is the preferred authoritarian moral response of politicians to social concerns.

Psycho-Social and Cultural Strategies

Another dimension to this process is the contribution of the media to the familiarisation and even desensitisation of the public to military actions and their consequences. The normalisation of military deaths and also atrocities (by military or civilian personnel) against civilian populations is now an established part of the modern news cycle. The televised horrors of mass killings of civilians were both a commonplace and even integral aspect of the war in Vietnam (running totals of death counts of the ‘enemy’ as though war is a sports event with scores and ‘wins’) and the many wars associated with the decolonisation of African, Middle-Eastern and Asian countries by European powers in the 1960’s and 1970’s and their often equally awful consequences. Even today we see in the extended [9] post-colonial (yet hardly ‘post’) conflicts in the Middle East and Afghanistan, that televising killing of combatants and non-combatants alike, is considered legitimate news material with some additional hand-wringing on the side about the ethics of it all.

This can also be interpreted as being extended through the arming of civilian populations in countries such as the United States, which appears the have one of the worst levels of armed violence against its own citizens by other citizens. This includes attacks on generally unarmed civilians in schools, shopping centres and the like as well as more structured or directed attacks on military bases and government offices. Hinton’s new [10] book discusses how mass incarceration in America was directly linked to so-called ‘progressive’ social polices from the Kennedy era onwards and long preceded its escalation under Regan’s ‘war on drugs’. That the physical and social cost to the population is now accepted as part of an ideology of ‘rights’, ‘security’ and ‘self-protection’ illustrates just how deeply entrenched this particular notion of the militarization of civilian life has become.
Dissociative Violence

One of the features of the contemporary neoliberal state is that it likes to offer its citizens an emotional disconnect between political decisions and their human consequences. Similar to the ‘deniability’ common in American politics, our governments now like to implement violent and inhumane policies at the expense of particular groups while offering citizens a form of deniability – ignorance of the facts being the main strategy. Thus ‘illegal’ immigrants can be placed in quasi-legal incarceration for extended periods or, as is being done in Australia, [11]‘off-shored’ for political convenience. This removes such people from the public gaze and the strategy is usually implemented with the collusion of the media and other supports who effectively operationalise the language of the state and its accomplices. The term ‘illegals’ being an obvious attempt to criminalise people not proven to actually be criminals by a court of law but who are instead defined by a political entity with increasingly limited accountability and the power to change the rules at its own convenience. This pattern is hardly unique in history but the dissonance between the values our governments claim to support and the ones they actually implement seems to be growing.

An expanding feature of this surveillance and dissociative violence can be seen in the implementation of military drone strategies. This technology, like so many, has both military and non-military uses but the military ones tend to combine surveillance and force along with the seemingly inevitable ‘collateral damage’. Now even some drone operators have spoken out about the strategic and individual psychological effects of the United States’ [12]drone strategy in the Middle East and Afghanistan. The logic is that as intelligence systems fail to prevent major terror attacks yet more technology represents a solution to these and various other [13]problems. Drones are another product of the huge development in spatial technologies spurred on by the Cold War and the innovations that occurred in satellites, navigation, diversification (GPS etc.), which have increasingly merged with computer technologies to include miniaturisation and now [14]automation. They too are a direct consequence of our militarizing world.

Conclusion

We can see here that science and technology support and enable, intentionally or not, the kinds of dissociative violence favoured in the emergent neoliberal state. Technology is seen as both compensatory, it adds functionality to systems that often fail, and as extensible, it helps expand surveillance types and parameters. Satellite imagery that enables and supports UAV/drone deployment by remotely located operators has all the appearance of clinical efficiency and detachment that a government PR or communications director could possibly hope for. There is no violence so suitable for the media as violence viewed from several thousand metres. Here, the high definition view, while militarily beneficial, runs the potential risk of making the collateral victims of such strategies a little too real for media consumption. And that is most definitely not a desired aspect of the dissociative strategies discussed here.

This is a semi-personal, semi-professional post from one of our editors:

I keep hearing warnings about how book-chapters are bad for your research career. Well, our current publishing and peer-review system makes so little logical sense that I’m not inclined to be complicit with it. I love reading edited collections because they present multiple facets of a topic in a thoughtfully curated context. I may not read all ten chapters from a collection, but if there are one or two useful ones, I tend to look through the others as well.

I’ve heard concerns about access and quality, which are apparently better for journal articles and worse for chapters, and which apparently underpin the the REF. But these make little sense. Most edited books are now available online, like journal articles, and the names of book editors are public, I see no reason why they should be regarded as inferior to journals. Journals are inaccessible without a subscription anyway, so researchers not attached to universities, and the general public, have a bigger chance to read something on google books (many edited books end up there) than in a journal article. Besides, I put my (decent) stuff out for everyone to read anyway - and hopefully there will be an ArXiv ([1]https://arxiv.org/) for social sciences at some point soon. So, doomsters and edited-book-haters, your advice falls on deaf ears. I’m writing three book chapters at the moment. At least my stuff will be in good company of related themes and I’ll enjoy my own work. If some university doesn’t want me because my texts are printed between the wrong covers, that’s just as silly as judging an academic by their gender or by their clothes, and it is their problem, not mine.

Yours, Idle Ethnographer

Adam Wood (2016-08-10 21:28:16)
Yes, totally agree! Thanks. This is the temporary home at least of SocArXiv.org https://osf.io/view/socarxiv/

On Digital Data (2016-06-10 08:00)

One of my favourite [1] XKCD cartoons ever:

CfP: Feminist Media Histories, special issue on "Data" (2016-06-11 08:00)

CALL FOR PAPERS
Feminist Media Histories: An International Journal

Special Issue on "Data"

Guest Editors: Miriam Posner (UCLA) and Lauren Klein (Georgia Tech)

"Data" has enormous cultural currency in the world today. Most of us understand that corporations are encoding and analyzing our habits, preferences, and behaviors on a massive scale. Personalized music suggestions, predictive policing, and Amazon recommendations are all part of this pervasive data regime. Discussions of this regime, and of data more generally, tend to focus on the present. But the concept of data also has a history, one embedded in a range of cultural, political, and material contexts. Building upon recent feminist scholarship that has drawn our attention to the various ways data shapes twenty-first-century life—how data affects our experience of gender, how the effects of gendered data are felt differently across racial lines, and what feminist theory might bring to data and its visualization, to name only a few—this issue seeks to model how feminist histories of data might help us chart a range of unexplored futures. We ask not only how gender and identity can be brought to bear on the concept of data and its emergence, but also how theories and methods associated with feminist scholarship might be employed to illuminate the historical and cultural complexities of data.

We seek both scholarly essays and born-digital works on topics including but not limited to:

- Data and media. Is data "media"? If so, what are its features and/or how is it expressed?
- Data and history. How does a renewed attention to certain historical subjects or events enrich our understanding of data, past or present?
• Data and narrative. What are the stories we tell about the history of data, and how can a feminist approach offer an alternative narrative of the concept?

• Data and gender. What are the ways in which gender is, or could be, represented as data? What are the gender effects of its visualization?

• Data and method. How can feminist methods inform a history or critique of data?

• Data as concept. What can the concept of "data" bring to feminist media history? What does the concept of "data" elide?

• Data as politics. How is data complicit in structures of power? How does data become part of how power is practiced, experienced, or expressed?

• Data as agent. How has data-driven decision-making influenced the history of media, particularly as it relates to gender?

• Data in the world. How can an intersectional feminist approach to data allow us to better understand its global impact?

Potential contributors should send short proposals of 300-500 words to the guest editors directly (mposner@humnet.ucla.edu and lauren.klein@lmc.gatech.edu) by no later than June 30th, 2016. Contributors will be notified by July 15th, 2016, with completed articles/projects due October 1st, 2016. All contributions, including digital projects, will be sent out for peer review shortly thereafter. The issue is scheduled for a Summer 2017 release (Feminist Media Histories 3.3). We welcome proposals for nontraditional digital projects, although Feminist Media Histories itself cannot host these projects. Should a digital project be accepted, we will publish a 500-1000-word author’s statement in the volume, which will include a link to the externally-hosted project. Feminist Media Histories is a peer-reviewed scholarly journal devoted to feminist histories of film, video, audio, and digital technologies across a range of periods and global contexts. Intermedial and transnational in approach, Feminist Media Histories examines the historical role gender has played in varied media technologies, and documents women’s engagement with these media as audiences and users, creators and executives, critics and theorists, technicians and laborers, educators and activists. Feminist Media Histories is published by the University of California Press. More information is available here: http://fmh.ucpress.edu/content/submit
The video clip “[2]Eksponat” (showpiece) released by the Russian rock group ‘Leningrad’ became a viral sensation within days. A catchy tune with Leningrad’s trademark obscene language tells the story of a woman who is going to various cultural events like the Mariinsky theatre and a Van Gogh exhibit wearing Chistian Louboutin shoes (‘na Labytenah’) and ‘f****** awesome pants’, where she is supposed to be the exhibit’s ‘showpiece’, at least compared to the rest of the women there. The video clip with more than 30 million views became an instant sensation and even created a minor [3]PR scandal when managers of the actual Van Gogh exhibit in Moscow offered women wearing high heel shoes free tickets. There are different opinions on the video: some consider it anti-feminist, some just tragicomic, but there is no doubt that the creators of the video managed to capture the essence of a number of issues and maladies of Russian post-Soviet society.

The video itself shows a woman who is preparing for a date with a seemingly wealthy man. She vigorously engages in painful beauty procedures, trying to lose wait in two hours before the meeting, screaming at her mother for giving birth to her ‘with such a big ass’, and badgering her female friend to bring her ‘Labuteny’ – a knock-off of an expensive French shoe brand. In order to pass off as a young woman of ‘status’, she applies lots of makeup, fake eyelashes and even paints the soles of the shoes red to pass off as the real deal. In the end pride comes before the fall: after putting on the ‘Labuteny’ the heroine falls, loses consciousness and injures her leg. Despite a bleeding nose and inability to stand on her feet, she fixes her makeup, crawls to the door and answers the caller at the door, while having day dreams of marrying the man she is about to meet for the first time.

No country for feminism

An international audience unfamiliar with Russian social mores might very well be shocked by how shallow...
women are represented in the clip. The heroine seems to care only about the way she will look for her date, lies about her 'rich daddy', strives to marry a wealthy man and doesn’t know anything about art, misnaming pastel colours. The fact that the heroine’s dreams seem to be reduced to a marriage with a seemingly rich man reflects a popular Western stereotype of Russian 'mail order brides' and Russian society’s stigmatization of unmarried women.

The lyrics, even though performed by a female singer, are also quite misogynist. The protagonist calls other women in the Mariinsky theatre 'tyolki' (female cows), which is the way men usually call sexually attractive women. This term is particularly galling because of the recent 'tyolka-gate', when an oppositional and liberal mass media outlet Meduza referred to women using this term. It sparked an intensive debate in Russian-language digital media, with numerous male journalists wondering why women should get offended if they are only referenced through their sexual appeal.

Footage of the heroine’s futile attempts to fit into the ‘f******* awesome pants’ also show that she has a hard time fitting into the beauty standards and the persona that she strives to emulate. At the same time, the language of the heroine and of the song reflect a very poor command of Russian, and the profusion of obscenities combined with shabby accommodation suggest an underprivileged upbringing. In contrast to the female protagonist, who needs more than two hours to become ‘worthy’ of her date, including a number of sadistic beauty procedures and home remedies that even make her throw up, the man she will be meeting doesn’t need to prepare for the date: he is shown at the office, working (the only character in the video to have a job), and one assumes that he will simply pick her up on the way.

Hello, World

The video shows that Russians live in a very westernized and globalized world. A sign of an 'elite' partner is his or her awareness for brands: the most important part of the outfit is the French luxury company. Even the heroine’s idol is Victoria Beckham – a British pop star and designer. Ultimately, the fact the heroine falls from her shoes can also be regarded as a metaphor for a colossus on clay feet: she cannot maintain her status as a rich woman and gets badly hurt in the process. This also shows the fragility of a female construct: just a few years stand between the heroine’s tireless beauty procedures and her becoming a stay at home wife with rollers in her hair – just like her mother.

The heroine’s room is supposed to look stereotypically ‘female’ with many stuffed toys, projecting the heroine’s immaturity and childishness. Moreover, the room is only half renovated: the one that the heroine shows to her ‘future husband’ on Skype looks minimalist and European, while the rest of it shows typical Soviet artefacts and furniture. This could also be seen as a metaphor for Russian society: seemingly reformed, but with a lingering Soviet legacy.

Another passing theme is the heroine’s disgust to bread that made ‘her ass too big’. Her mother’s response is that she won’t tolerate this kind of attitude to bread as her own mother survived the siege of Leningrad. This short interaction shows that even in questions of diet the traumatic memory of the Great Patriotic War comes to the fore. Another lasting effect from the war is the skewed demographics: the shortage of men as a result of the war caused a fierce competition among women. The legacy of this phenomenon is still visible in Leningrad’s video.

Moscow, we have a problem

The most disturbing part of the video is that it is a very convenient tool in inward misogyny, i.e., women shaming women. Being a part of a macho patriarchal culture is hard, so a lot of women side with the desirable and hierarchically higher in-group - men - and re-affirm female objectification and disparagement. Another popular example of women shaming is the LiveJournal blog by Lena Myro, where a supposedly female author constantly engages in rants about ‘inferior’ women, that she calls ‘kuricy’ (hens), who, like the heroine of the Leningrad's video
are intellectually challenged and primarily concerned with marriage. Especially telling in both cases are animal metaphors: women are ranked even lower than primates.

Thus, what this video and its popularity show is that Russian society is rife with patriarchal culture and woman shaming is an acceptable practice. Moreover, even though the video mocks misogynist stereotypes and consumerist values, whereby a person’s worth is based on the type of brands he or she wears, it is still a very common point of view. A glimpse of hope in this video is still present: in order to be an elite partner one has to be a connoisseur of culture. The fact that the protagonist goes to the theatre and art exhibit is an important indicator that wearing ‘Labuteny’ is luckily not enough.

Elizaveta Gaufman received her PhD in Political Science from the University of Tübingen. Her research focuses on the exploration of verbal and visual enemy images through big data analysis, combining international relations theory with media and cultural studies.

Iwan Glasnow (2019-08-05 21:14:11)
"loose wait" this shows the quality of this "scientist". Peinlich, dass sowas finanziert wird. It is a shame that this women calls herself "scientist". She would be more in place with the rainbow press.

Coercion and Co-option in the Militarised Neoliberal State (2016-06-12 08:00)

By Hamish Robertson

Introduction

In this final part of this three part series, I would like to briefly explore some aspects of how our ruling elites and governments help reproduce these intersectionalities to their own advantage. More particularly, I look at how
we are co-opted and coerced into a denial of our participatory role in state violence enacted in our names. I do this by connecting current trends to more established historical ones, including logical connectors to how various racisms have been institutionalised and regulated in favour of established socio-political orders. I then conclude this by suggesting that we need a more incisive sociological imaginary to unpack and, where possible, repudiate the ways in which contemporary states and their servants co-opt us into their regimes of power and dissociative violence. This is perhaps one strategy for beginning the process of civil demilitarisation.

The role of visual authority

The visual authority of the state was once fully uniformed and accessible to all. The soldier was a soldier, the policeman was a policeman, the nurse a nurse and so on. The uniforms were known and familiar to everyone because they were public knowledge but things have become much more complicated in recent decades. In particular, under neoliberal regimes, the state has seen fit to privatise many once public functions, processes and activities. We saw this with the extension of the ‘Gulf War’ into an increasingly global strategy shared by governments of various persuasions. [1]Outsourcing, once an industrial cost-saving strategy that delivered manufacturing jobs from the developed to the developing world (and destabilised established employment patterns), has now become part of the scope of military activities - similar to mercenaries but with more deniability. Prisons have been privatized to a much greater degree as crime and its management have become 'monetizable'. Security businesses abound and operate both onshore and off-shore, including the operation of asylum-seeker facilities and the like. The wicked problems of our age appear to have lost their potential for solution (where's the profit in that?) and instead are treated very like those that supposedly avail themselves of [2]military solutions, and with similar consequences.

What we see then is a gradual privitisation of state violence and its consequences. This often involves the uglier, public relations-unfriendly kind of violence that the state is increasingly committed to – forms that frequently negate the purported values of the liberal democratic state. The argument seems to be that we don't have to hide the nasty stuff quite so much if we privatise it, the corporation will do that for us – that is, on our behalf, because we are still complicit in these processes and their outcomes whether we like it or not. Thus we and our societies are complicit in drone attacks, illegal detention and torture, [3]off-shore ‘processing’ and the fairly appalling geopolitics that seem to be producing and reproducing these circumstances. And of course in many places simply not counting the consequences of state violence and the violence perpetrated by the servants of the state is a sufficient [4]strategy in an equation that is also on the rise and which can best be summarized as ‘no data, no problem'.

Loïc Wacquant has been writing for some years now on how the United States perpetuates the traditional modernist war against the poor through its welfare and [5]prison systems, with the added dimension of ‘race’ being fundamentally central to the whole equation. The regulation of African-Americans was big business under slavery, then [6]after slavery and it remains big business today through poverty, crime, the drug trade and the associated regularisation and regulation of these ‘social’ problems. The institutionalisation of race and racism to justify this regulation is now so deeply a part of the American political fabric that it appears normal to that society. Policing race is a major part of the American judicial system and its associated infrastructure. A less well-known but very interesting aspect of this policing [7]regime is that it emerged shortly after the Civil War (the Black Codes) and has only extended and refined itself since then. Even now prisons are closely associated with entrepreneurial [8]capitalism because they possess a captive labour force that can't go on strike, change jobs or seek welfare.

Outside of the United States, it is also the case that many other colonial settler states have criminalized the remnants of their indigenous peoples and, having waged actual wars of dispossession against them, followed this with social-policy driven strategies that often include physical removal, child theft (acculturation is for their own good), concentration (reserves, ghettos etc.), economic dependency, welfare dependency and then a strategy of self-destruction through alcohol, drug use and suicide. While the patterns are rarely precisely the same, there is a frightening level of similarity across many sovereign states in both the inputs and outputs of such systems. Typically indigenous imprisonment rates, and even deaths in custody, in countries like [9]Australia and [10]New Zealand, are
usually far above those of the settler populations. [11]Private prisons (see above) can have worse death rates than publicly run prisons, assuming that these people actually make it to prison alive in the first place. And this is far from guaranteed because there is a general acceptance of the use of greater state and non-state violence against such populations. One suggestion to consider is that in many settler states indigenous peoples continue to be punished because their presence and their historical treatment negate the founding myths of such states. Or to put it more simply, they are punished for managing to survive colonisation. Here too the modality is often a war without end and no intention of a peaceful resolution.

One odd thing is that we have a tendency in these regimes to criminalise resistance of any kind, from the moderate to the extreme. Thus criminality is almost always disproportionately associated with the colonised. These scenarios can become almost ridiculous in their analysis by certain parties, with [12]genetics even being dragged in (as of course it has in the past) to 'explain' the criminality of the colonised (science yet again explains 'their' deviant behaviour). The same argument is rarely turned back on the colonisers themselves because they are the imposed norm and only occasionally is 'criminality' examined as a toll of socio-political ordering and control. As with militarism and policing we seem to accept the [13]ontology of crime unquestioningly. More problematic still we find the idea that our systems have their own powers of generativity (armies need conflict, police need criminals, prisons need prisoners, hospitals need patients etc.) difficult to accept and continue to portray them as simply reactive to external, independently generated problems. The problem being that while many scientists rightly criticise this type of extrapolation, there is an established history of using race (racism's major tool for heavy lifting) to justify the treatment of marginalised others. Curiously in a kind of inversion of this, these groups are often recognised in the settler societies for their military contributions more than they are for their civil accomplishments. 'Bad' genes may be acceptable in one domain but not in another.

These scenarios also almost always involve similar geographical strategies because the [14]geography of social regulation and exclusion often relies on a quasi-military approach to territorial management and control, with the added dimension of self-regulation that social stigma can bring to the equation. The linking of violence to geography was such that African Americans who needed to travel across the Jim Crow South relied on the [15]Green Book for information about safe places to eat and stay – because they were physically and psychologically at risk in many places. Forced spatial containment on 'reserves' and the like has been a characteristic of historical approaches that have their modern civil [16]equivalents. Such groups were traditionally expected to linger in rural areas and, furthermore, to keep to their own 'spaces' if and when they settled in urban centres. Many public housing projects in many countries still reflect this spatial strategy. Not all policing, it is clear, involves or indeed requires the physical immediacy of a police force. Normalising in-group and dominant group forms of violence serve to reinforce many of these situations to the point where it becomes difficult to visualise an alternative.

**Militarism, Policing and Social Order**

The transfer of knowledge and practices between military and civil domains continues apace. Big data and related predictive analytics are gaining momentum across both domains. Originally linked to military mapping, social mapping emerged in the [17]Victorian era with poverty, disease and crime as the main foci. Crime mapping has become a commonplace in civil policing in recent decades and yet it is frequently dissociated from other congruent social domains such as poverty, unemployment or public health. Now we see both advanced [18]geographic information systems analysis and big data [19]analytics being used to 'predict' where crimes will occur and, increasingly, who (at the group and individual level) will commit them. Policing is increasingly using technology in its extended role as social regulation, and science and technology are seen to make these processes 'objective'. At the same time, facial recognition systems and software fail the application test on a variety of 'minority' groups flagging at the same time the limits of the presumed objectivity and ability of such technology to track 'typical' individuals, and of course, the notion of the embodiment of the archetypical individual.

One of the features of the past few decades that illustrates this rising tide of military and quasi-military sym-
bolism in our societies is the [20]**militarization** of police forces. Traditionally, the military were the model for a variety of [21]**uniformed** civilian services with which we have all become familiar, typically including ambulance staff, fire services, postal workers, public transport workers, immigration personnel (recently rebranded as ‘border forces’ a title worthy of deconstruction in and of themselves) and police. Most of these services were established in the 19th century when the possibility of directing civilians into behaving in a more ‘orderly’ fashion was already, as noted above, gaining rapid [22]**appeal**. Here to we have to accept that the state sees its citizenry as partial (some are in and others are out) while policing has traditionally had and continues to involve some degree of covert surveillance work against selected citizens and other non-state actors. In many places this pattern was well-established prior to the development of the universal franchise and the claims to civil society which we now readily accept because of their unquestioning repetition (we were always democratic apparently). In recent years however, we have frequently seen the role of police become more intensively focused on (a) civil surveillance and (b) para-military tasks associated with gun violence, terrorism and related threats to the state. Their use against organized labour and labour protests was already well-established by the 1980s. This obviously includes armed police services or sections thereof and, in some countries, the acquisition of equipment that makes police look more like a scaled down extension of the military (tear gas, rubber bullets, water cannon, armoured cars, helicopters). Some commentary has emerged on this in the wake of the Ferguson incident in the United States and there is a growing [23]**academic critique** of the use of such weaponry against citizens. While not all countries follow exactly the same trajectory, we can see this general pattern in the neoliberal economies where the eternal trade-off seems to rest between scaling up the physical and moral authority of the state and the associated dilemma, under neoliberal precepts, of paying for all of this security.

**Conclusion** This brief series of pieces is an exploration of a number of growing issues and their possible connections associated with what I see as the continuing, expanding and diversifying encroachment of militarization on society at large. I see the militarisation of everyday life as a creeping form of oppression that relies on tried and tested historical methods in combination with new and emerging techniques and technologies. The discourse around this process is almost always one of **protection** in the neoliberal, notionally democratic societies in which many of us live. And it is ultimately tied to dominant values which can be questioned to a degree but which resistance to is increasingly criminalised. That these processes now draw on new digital as well as conventional analogue methods means that we are subject to an expansion of the entire paradigm. Connecting these seemingly often disconnected parts is a major issue for a more historically nuanced sociology of our times.

Popular Culture and New Media: The Politics of Circulation (2016-06-13 08:00)

David Beer reads an introduction to his book [1]Popular Culture and New Media:
Let's cut the bullshit! (2016-06-14 08:00)

I [1] study the work of mathematicians. I don't call them informants but participants, because "informants" is a horrible word. Some of my participants enjoy being part of the research and take pains to explain and verbalise stuff to make it clearer to me, in the hope that I can then relay it to other non-mathematicians in an understandable way; and that maybe I can even manage to tell them something INTERESTING and NOT WRONG about themselves. Others are sceptical about what sociology can do. Yet others have rather wrong ideas of what sociology is about, so I have to explain. Yet others know about quantitative sociology, but have no idea what qualitative methods can do and why they have some advantages and how qualitative "data" is collected and used. But all of them, even the most polite ones, basically suspect that sociology tends to overcomplicate things, even when things can be simplified (though they do acknowledge that of course there are some things that are complex and need to be discussed in a complex way). I agree with them. In fact, before I started this project I was very disheartened by all the bullshit. This research has given me some of my lost hope in sociology. It has shown me that I’m not crazy or stupid simply because I don’t like bullshit, and because I am convinced that social scientists must be committed to explaining stuff in a variety of possible ways, from the simple to the nuanced, according to what’s most appropriate, and that we must not use more nuance where less will suffice.

So, I think many of the mathematicians would applaud the spirit of Kieran Healy's article below, called "Fuck Nuance". It is tongue in cheek, but it makes an important point.

(Though the mathematicians probably won’t read the article itself, because it exemplifies the very fault it is criticising, by being very long and full of... let’s be polite and call it "nuance". Here is the place to admit that I also couldn’t read it).

---

Call for Papers: The Accelerated Academy (2016-06-15 08:00)

From the 1980s onward, there has been an unprecedented growth of institutions and procedures for auditing and evaluating university research. Quantitative indicators are now widely used from the level of individual researchers to that of entire universities, serving to make academic activities more visible, accountable and amenable to university management and marketing. Further demands for accountability in academia can be related to general societal trends described under the heading of the audit society (Power 1997), and the evaluation society (Dahler-Larsen 2011). As part of broader transformations in research governance, indicators on publications and citations are now permeating academia: from global university rankings to journal-level bibliometrics such as the journal impact factor and individual measures like the h-index. Yet, it is only recently that considerable interest has been directed towards the effects that these measures might have on work practices and knowledge production (c.f. de Rijcke et al. 2015), and the role they might be playing in accelerating academic life more generally (c.f. Vostal 2016).
The Accelerated Academy draws together a number of cross-disciplinary conversations about the effects that acceleration towards metric forms of evaluation is having upon research, and the implications this holds for living and working in contemporary academia (Felt et al. 2009). Building on the successful maiden edition of the Accelerated Academy series in Prague in 2015, this year’s Leiden conference will be especially focussed towards the following questions:

- What does acceleration mean in different research contexts?
- What are the implications of digitally mediated measurement and tools for quantifying scholarly performance?
- What are the knowledge gaps regarding the effects of metrics on scientific quality and societal relevance of research?
- How can we harness the positive and minimize the adverse effects of performance measurement in universities?

Confirmed keynote speakers include Peter Dahler-Larsen (University of Copenhagen), Ulrike Felt (University of Vienna) and Michael Power (LSE).

We invite submissions for presentations of around 20 minutes. The deadline for submitting abstracts will be August 31st 2016. Please send two pages or 800 words describing your contribution including a short biographical note to: [1]a.e.reyes.elizondo@cwts.leidenuniv.nl.

Conference organisers

[2]Sarah de Rijcke, Centre for Science and Technology Studies, Leiden University
[3]Björn Hammarfelt, University of Borås, Sweden | Leiden University
[4]Alex Rushforth, Centre for Science and Technology Studies, Leiden University

Scientific committee

[5]Mark Carrigan, University of Warwick
[6]Tereza Stöckelová, Czech Academy of Sciences
[7]Filip Vostal, Czech Academy of Sciences
[8]Paul Wouters, Leiden University
[9]Milena Kremakova, University of Warwick

Event registration will be free of charge. In addition, a limited number of travel and accommodation support bursaries will be made available for researchers especially inhibited by the costs of travel. Please contact the conference manager [10]Andrea Reyes Elizondo for more information.

Value and Values (2016-06-15 17:24)

“Value and Values”
Saturday December 3rd 2016
9.30-18.30, followed by a wine reception at 18.30
Goldsmiths, University of London

This event is the final symposium for the ESRC Professorial Fellowship project “Value and Values” (ES/K010786/1) conducted between 2013-2016 by Bev Skeggs and Simon Yuill.

Facebook represents a new form of capitalist capture, one based on monopolization and rent that shapes our current connectivity as it monetises us and opens us up to forms of financialization, including increased indebtedness. This form of capitalist capture moves us into a new regime of accumulation, of profit without production, in which the command of surplus value is via the control of surplus information.

Speakers:
Will Davies, Natalie Fenton, Mark Fisher, Matthew Fuller, Olga Goriunova, Sarah Kember, Gholam Khiabany, Costas Lapavitsas, Adrian MacKenzie, Johnna Montgomerie, Alberto Toscano and Joanna Zylinska.

Project website: https://values.doc.gold.ac.uk

This event has been sponsored by the: ESRC, Goldsmiths, University of London and The Sociological Review Foundation.

This event is free but it is essential that you register. To register please go to: [1]https://www.eventbrite.co.uk/e/value-and-values-final-symposium-for-the-esrc-professorial-fellowship-project-tickets-26071878691

For event organisational enquiries, please contact Jenny Thatcher: events@thesociologicalreview.com

Practical Sociology: Agenda for Action (2016-06-16 08:00)

BSA Sociologists outside Academia, in collaboration with Sage Publishing Ltd and the Sociological Imagination
Practical Sociology: Agenda for Action

A half-day workshop

British Psychological Society meeting rooms, Tabernacle St
London EC2A 4UE
Monday 17 October 2016, 12.30 – 4.30pm

How come – at least in the UK – you don’t come across people with ‘sociologist’ in their job title working in industry, business, the civil service, or pretty much anywhere outside academia or independent research organisations?

Sociologists seem to all reside in universities, unlike psychologists and economists, who have colonised many kinds of workplaces.

Most sociologists believe our subject is essential for understanding the world around us, or to resolve contemporary problems, from gender violence to climate change. We have the concepts (like ‘cultural capital’, ‘intersectionality) and the theories (social mobility, moral panic). But where are the practical sociologists?

So what would it take to establish a ‘practical sociology’ in the UK and elsewhere, with sociologists employed to use sociology concepts and models to address problems in industry, business, government, education or health? This half-day workshop aims to establish an agenda for practical sociology.

The workshop will explore pressing questions about how a practical sociology may apply its expertise, skills and knowledge to problems at work or in the community.

- What has prevented the emergence of practical sociology in the UK?
- What are the core knowledge and models that are needed to solve the problems that organisations, businesses and the public sector face?
- What kinds of skills would be needed to work as a practical sociologist?
- How would a practical sociology career pan out?

This workshop will be of interest to sociologists and others who are keen to see the application of sociological concepts, models and theories in practical settings in the public, private and third sectors. Please come along and help us set an agenda for developing practical sociology.

Registration

BSA Members £5; Non-members £8; BSA Concessionary members and full-time students £3.

Tea and coffee will be provided: please bring your lunch.

Evan (2016-06-22 16:39:59)
Will there be resources available for one not able to attend? Perhaps a video recording of the event? I’m a US student and would love to attend, but I believe I’ll have class on that day.

Mark Carrigan (2016-06-25 09:31:47)
no idea, sorry

Varoufakis on contemporary capitalism’s preposterous reversal of the truth (2016-06-17 08:00)

This isn’t a new idea but I’ve rarely encountered it [1]expressed so concisely:

The idea that individuals create wealth and that all governments do is come along and tax them is what Varoufakis calls “a preposterous reversal of the truth”.

“There is an amazing myth in our enterprise culture that wealth is created individually and then appropriated by the state to be distributed.

“We are conceptualising what is happening in society as if we are an archipelago of Robinson Crusoes, everybody on an island, creating our own thing individually and then a boat comes along and collects it and redistributes it. It’s not true. We are not individual producers, we produce things collectively.”

He points to an iPhone.

“This machine, inside of it, contains technologies that were created collectively. Not only through collaboration but a lot of public funding. Every single technology in there was created by government grant.”

bbhurdle (2016-06-18 06:10:48)
This seems like a really interesting article and I’d love to read it but the page has expired....Is there any other link I could use?
In the heat of Brexit, it may seem inopportune, if not entirely irrelevant, to recite poetry, when so much “real stuff” hovers over our heads. Yet, there is something about the lyrical outbursts of [1] poets that can alert us to the possibility of thinking beyond and across boundaries, in our last-ditch attempt to decide whether to “leave” or “remain”. A few verses from John Donne’s, [2] ‘No Man is an Island’,

should suffice to convince us that no nation is ‘entire of itself’, but also recognise that ‘if a clod be washed away by the sea, Europe is the less’. What could be more pertinent than such [3] devotions (prayers) upon an emergent occasion, which can also be rewritten as a devotion (loyalty) to the UK’s place as a ‘piece of the Continent’, and ‘a part of the main’, especially when we realise that both the EU and the UK will be smaller and weaker if they part ways.

This may seem especially true as we escape the high planes of poetic sensibility, to return to the pedestrian terrain of politics. What greets us on our return is an artificially polarised debate, which shores up multiple scenarios, dilemmas, and confusions, while also revealing the hypocrisy, short-sightedness, and prejudices that inform it. These run into familiar refrains that warn us against weak levels of EU integration among its member states, poor national regimes of (self)regulation (especially the PIIGS), the German dominance of the EU, and the (now visible) destructive consequences and effect of the Eurozone crisis.

These distressing signs of Europe’s ill-health, as it currently stands, translate into three main scenarios that stress decay and stagnation, while also nurturing hopes for the cosmopolitanisation of Europe. The decay scenario laments the EU’s collapse under the weight of its own internal and external contradictions, the stagnation scenario blames jealously guarded national interests for the failure of successful integration, while the cosmopolitanisation scenario envisages a post-national Europe, whose identity lies between rather within European nation states. The latter scenario, developed by [4] Ulrich Beck and Edgar Grande
who also came up with the other two, may in fact be Europe’s only hope to reform itself in accordance with its principles and values, but requires more political commitment, and less economistic calculation at a moment when the opposite trend prevails.

In Beck and Grande’s “manifesto” for a (more) cosmopolitan Europe, such initiatives involve strengthening an EU-wide ‘civil society based on universally shared constitutional norms’, and forging a ‘new post-national model of democracy which instead of incapacitating European citizens, accords them an active role in the decision-making process’. This in turn calls for a ‘cosmopolitan approach to integration’ which no longer strives to overcome but rather acknowledge national difference, while simultaneously establishing Europe as ‘the driving force of a global cosmopolitanism, and a member of the new transatlantic security community’. Inspired though all this may sound, it is plagued by its own idealism, unless it becomes applied policy or second nature to the citizens of Europe.

Faced with such recurrent plot lines in “the EU-runs-amok” and “the EU-needs-you” genre, many (rightfully) read them as a dilemma between opting out to escape the clutches of an ill-fated union, and staying put to ensure that the European project has the legs to run with a little help from its members. This sense of ambivalence towards Europe, not as a geographical entity but as a political enterprise, expresses both admiration as well as misgivings, especially in countries, like the UK, who have historically displayed a sense of remove from and reluctance towards the possibility of “an ever closer union” with its European partners. Such discontent with “the Continent” could be described as “the Bolingbroke syndrome”, where much like the character from Shakespeare’s Richard II, anything distinct from the British Isles is treated unenthusiastically at best.

This disjointedness however leads to distortions and confusions, the most important of which being the tendency to blame any political dissatisfaction on the EU and treat it as specific to it, when its roots may be closer to home that we care to admit. Such a sullen attitude reeks of hypocrisy, demonstrates our short-sightedness, and exposes our prejudices, making us rather unpleasant allies. Armed with a pre-packaged suspicion of the EU we appear so eager to nod approvingly at any remark that disparages it, displaying a “me-first” ethos, and a lack of vision for a union of which we are members. In doing so we allow nationalist vendettas to sully our relationship with our fellow-members, clinging to some peculiar notion of exceptionalism which reminds the world how different we are compared to everybody else, without perhaps realising how cocooned we are in our mental fortresses.

Such attitudes do not only encourage divisiveness and polarisation, and cultivate alarmism and escapism, but also turn our attention away from home-grown problems. Faceless bureaucrats do not exclusively reside in Brussels but can be found in Westminster and Whitehall too, political representation and democratic accountability is a problem here as much as it is elsewhere, especially if one thinks of the current electoral system or such hangovers from the past like the unelected House of Lords. Even if these are dismissed as negligible footnotes in comparison to the “European superstate”, concerns about the future of public funding, aggressive anti-immigration policies and tactics, and calls to replace the Human Rights Act with an English Bill of Rights should raise an eyebrow or two, especially when all the above are entrusted to the hands of the present government.

Pursuing national interests sounds sensible, if not the “right” thing to do, but we might be taking a very narrow view of it often mistaking sovereignty for power, and union with uniformity, in a world where wealth creation (via
economic opportunity), social cohesion (via civil society), and political freedom (via legislation) press against the limits of “the nation”. The choice then is between remaining in a union which changes as it develops, or leave when we might be most needed as Brits of the Continent, and parts of the main.

Dr Lambros Fatsis is Lecturer in Sociology and Criminology at the University of Southampton. This article was written in preparation for the [8] Free University Brighton’s forthcoming EU referendum discussion at the Brighton Dome

Call for Papers: Migration and Crisis in Europe (2016-06-20 08:00)

Dear Colleagues,

Sociology is pleased to announce the theme of its 2018 special issue: Migration and Crisis in Europe. The issue will be guest edited by Nick Dines, Nicola Montagna and Elena Vacchelli, all at Middlesex University, UK.

The editors are currently calling for papers to be submitted to the issue and relevant topics might include the following:
- Response of migrants and migrant organisations to the economic crisis.
- New forms of labour mobility and the transformation of migrant labour markets.
- Border struggles, migration solidarity movements and/or anti-migration politics in light of the current 'humanitarian crisis'.
- Migration and social reproduction in a context of economic crisis and welfare restructuring.
- Interpreting the transformation of EU migration and border management through the perspective of crisis.
- Changing internal and external borders in the light of current migratory flows.
- The politics of humanitarianism and/or securitization.

For more information on the aims and scope of the special issue, please see the full call for papers [1]on the BSA website. To submit your article please visit: [2]http://mc.manuscriptcentral.com/soc. The submission deadline is 13 March 2017.

For any queries regarding the special issue, please contact:
Nick Dines ([3]nick.dines@uniroma3.it)
Nicola Montagna ([4]n.montagna@mdx.ac.uk)
Elena Vacchelli ([5]e.vacchelli@mdx.ac.uk).

**Can Sociology Make a Difference? Social research and social justice (2016-06-26 19:25)**

How can social research make a difference? This event will showcase examples of exciting research being conducted by Warwick Sociology in partnership with people and organisations who are directly engaged in social justice work.

We want to share our research findings and lessons learnt from conducting collaborative research, and we also want to hear from people who have worked with university researchers in the past, or may do so in the future. What are the advantages of working together? What are the challenges? Can partnerships between universities and social justice organisations be fruitful for all involved, or are there too many competing priorities?

Please join us to discuss these issues and more. All are welcome and the event is free, but please register so we can keep track of numbers.

Speakers include:

[1]Alice Mah, on her research project 'Toxic Expertise: Environmental Justice and the Global Petrochemical Industry'.

Industry' which includes research with participants as diverse as global petrochemical companies and environmental NGOs, and people living in polluted areas.

We hope to see you there. The discussion will be accompanied by wine, juice and snacks.

Trans/Gender-Nonconforming College Students Project (2016-06-26 20:45)

Trans/Gender-Nonconforming College Students Project

Abbie Goldberg, a Professor of Psychology at Clark University in Worcester MA, is conducting a survey of trans/gender-nonconforming college students (including recent graduates) regarding their perspectives and experiences on a range of topics, including trans advocacy and needed supports/services on college campuses. Students with non-binary gender identities are particularly encouraged to participate, as their experiences are rarely represented in research. Students may participate if they identify as trans, gender-nonconforming, gender questioning, genderqueer, agender, or anywhere on the gender-nonconforming spectrum. The survey, which was informed by focus groups and consultation with trans/gender nonconforming college students, takes about 25-30 minutes to complete. All responses are anonymous. Individuals can elect to be entered in a lottery for one of 10 $50.00 Amazon gift cards; individuals' names and email addresses will not be connected to or traceable to the data that they provide.

Please contact the principal investigator of the study, [1] Abbie Goldberg, with any questions or feedback, or to request to be informed of study findings: [2] agoldberg@clarku.edu. Feel free to learn more about her [3] research on sexuality, gender, and families. Or visit the project Facebook page: [4] www.facebook.com/transgncc.
This study has been approved by the Clark Committee for the Rights of Human Participants in Research and Training Programs (IRB). Any questions about human rights issues should be directed to the IRB Chair, Dr. James P. Elliott:[5](508) 793-7152 or by e-mail ([6]humansubjects@clarku.edu).

To participate, please follow the link:

Digital Health/Digital Capitalism One-day conference 4th July last chance for tickets (2016-06-27 09:31)

The Digital Health/Digital Capitalism event is at Leeds Beckett University on 4th July (blurb below) and tickets are still available [2]here for £20. There are plenaries by Nick Fox ('The micropolitical economy of posthuman health') and Graham Scambler ('Digital sociology or sociology of the digital? A case study on health') and details of the full itinerary [3]here.

Digital technologies have had a profound impact on the ways in which people live their lives, relate to one another and think about themselves and their capacities. This event will bring together scholars who are interested in the impacts of the digital on ideas and practices of health and the workings of capitalist economies and how the two come together.

The generation and management of vast amounts of health data has been enabled through digital means. In particular this has enabled fine grained analysis of particular types and groups of people in relation to a diversity of factors. Private and profit making enterprises have become increasingly involved with personal health data through partnerships with health services and the generation of new kinds of data through commercial devices apps and websites.

Digital capitalism has produced new approaches to work and profit generation. Human bodies are now intensively digitised due to the (self) tracking and monitoring conducted by commercial enterprises. New digital ways of working have freed some workers from the office while increasing the amount of time and attention they are expected to dedicate to work tasks and the length of time spent sedentary. The productivity and activity levels of some workers are closely monitored leading to increasing physical and psychological stress.
The Tourist: Uncalled for observations and gross generalizations - PART 1 (2016-06-27 17:01)

by Jonathan J.B. Mijs

Jonathan J.B. Mijs is a Doctoral Candidate in Sociology at Harvard University. When he is not writing about himself in third person, he is studying how (young) people come to see and explain setbacks in their own lives and that of others, which is the topic of his dissertation.
Even at its height, European colonialism had to be rationalised and reified in all manner of different ways to ‘make sense’. Indeed, its contemporary reproductions, which here will collectively and generously be called ‘interventions’, are similarly ‘marketed’ in what we may call the *shifting justificatory discourse of colonialism*. This describes the ability of colonialism to regenerate and attach itself to the current zeitgeist in order to successfully manufacture consent. In addition, belying this shifting discourse is a reductive binary logic which States attempt to naturalise, pretending that alternatives to intervention, other than non-intervention, simply do not exist. The combination of the two begin to illustrate how States have managed to legitimate their expansionist and destabilising wars through the ages, in an effort to (in-)directly exercise influence over regions and help illustrate a lineage from contemporary military interventions to historic colonialism.

Lord Thomas Babington Macaulay, a former British colonial statesman and historian demarcated the ‘known world’ into the ‘civilised’ and ‘barbarians’, with the British at the apex of this imaginary intelligentsia spectrum. In his *Minute on Indian Education*, he stated, ‘it is...no exaggeration to say that all the historical information which has been collected from all the books written in the Sanskrit language is less valuable than what may be found in the most paltry abridgement used at preparatory schools in England.’ It was this demarcation or binary, arguably pre-empting Samuel Huntington’s now [1]dismissed ‘Clash of Civilisations’ thesis, that garnered substantial support at home for the British Empire’s ironically barbaric ‘civilising mission’ (what the French called *la mission civilisatrice*), painting the rapaciousness of colonialism with a palatable altruistic overlay.

From the civilising mission came the doctrine of ‘Containment’ in the Cold War, (for the French, *cordon sanitaire*) which employed much the same strategy. According to the former US diplomat George Kennan, *containment* was the US foreign policy to extinguish the ‘Communist threat’, leading to the infamous Truman Doctrine and the formation of NATO. A direct line can be drawn from Macaulay’s demarcation to Truman’s doctrine which he shaped as a fight between ‘totalitarian regimes’ and ‘free peoples’.

‘Democratisation’, underlined by a spirit of universalism was the rationalisation in Iraq’s apocalypse. The US-led invasion of the former intellectual capital of the world, was tied to the categorical imperative of ‘bringing in’ democracy to awaken a dormant Iraqi populace. The only effect was to ‘return’ the country (and similarly Libya) to a ‘state of nature’ where life is now ‘solitary, poor, nasty, brutish, and short’. Around about the same time, emerged the popular policy of humanitarian intervention. Its success lay in an impenetrably altruistic guard of human rights rhetoric. Such types of intervention were tough to respond to but was in effect no different from the antiquated ‘civilising’ lines, only the barbarians were now reduced to the Heads of State. Retrospective labelling of interventions of the French in Syria or the US occupation of Haiti are interesting given their clear colonial undertones, but modern day invocations of HI included the NATO bombing of Yugoslavia and the British military campaign in Sierra Leone. Of course the often convincing rationalisations of HI have been easily undone by commentators and academics who highlight the fundamental contradictions that blights an intervening nation’s ignorance and unwillingness to intervene in other, more destructive areas of the world. Honesty here is the key.

The most recent reproduction of the *shift and binary* has been for Empire to ‘support revolutions’ (spearheaded from the academy by the likes of Bernard-Henri Levi). Indeed, legitimate grievances in Syria, Libya and elsewhere in the ME have resulted in societies in flux and fluidity that are often exploited by imperial forces with the aim
of creating vacuums to establish proxy or direct power. Thus, revolutions have become the new front of imperial wars.

A line can arguably be traced therefore, from modern day interventions to colonialism. From civilising to containment, humanitarianism to democratisation and assisting revolutions, the marketing discourse has shifted to reflect current popular sentiments and tie itself to a particular historical moment (anti-Communism, human rights etc). In addition, wars and ‘imposed binaries’, which present conflict as either-or choices, supplement this shifting discourse. For us to emerge from this requires breaking the simple binaries that characterise this discourse so that that the contradictions are exposed.

Tanzil Chowdhury is a Doctoral Researcher in the School of Law, University of Manchester, interested in Critical Legal Studies. His current research looks at using temporality as a novel way to distinguish between different forms of adjudication and subjectivity. Twitter: @tchowdhury88

**Digital capitalism and the imperative to be noticed** *(2016-06-28 08:00)*

In Ross Perlin’s *Intern Nation*, he writes of how interns voluntarily subjugate themselves in order to ‘be noticed’, even if they have little expectation that their internship will lead to a permanent job. From loc 1997:

> There is rarely much reason to believe that internships in the public sector or at nonprofits will convert directly to permanent employment—they seldom do—so the best one can hope for is to make an impression, be noticed, position yourself for something down the road.

This coheres nicely with arguments Bauman has made recently about social media. The imperative to be noticed, the extroverted mirror image of the spectre of uselessness, thrives in an environment when occupational opportunities contract. People find themselves locked in an upward spiral of competitive escalation in their desperation to claim what are correctly felt to be a diminishing number of possibilities to claim the life long security and stability which post war capitalism was able to offer most of their parent’s and grandparent’s generations.

What I mean by ‘contracting opportunities’ is best conveyed by a U.S. treasury official (and former intern) the author quotes on loc 2063: “There’s so much demand for this kind of career path and such a limited supply, so we’re able to dictate how to get into the process.” Internships can be an escape strategy, a desperate attempt to break out of a cycle of precarious work – with the number of job shifts by young people continuing to increase – into the receding upper echelons of secure and rewarding employment. But internships themselves reflect this precarious work, as hopeful interns are increasingly forced to undertaken chains of unpaid or barely paid internships in the hope of breaking into full time work.

Part of the problem with internships is they further intensify this problem, making ensuing jobs more glamorous and exciting by allowing the transfer of administrative functions to the interns, as well as contracting the supply of *entry level* positions as organisations replace permanent staff with interns. Plus, as he succinctly observes
on loc 3035, the internship system as a whole allows privileged children access to opportunities denied to others:

For well-to-do and wealthy families seeking to guarantee their offspring’s future prosperity, internships are a powerful investment vehicle, an instrument of self-preservation in the same category as private tutoring, exclusive schools, and trust funds.

A comparable strategy to internships and social media self-promotion is discussed on loc 2519:

Staking everything on a career-launching internship, as sociologist Mark Granovetter points out, is not unlike working unpaid for shares in a Silicon Valley start-up: “There are a surprising number of people willing to work just for 50 or 60 thousand shares of a company that may never see the light of day ... Unless they think that what the company is doing is the best thing since sliced bread, then they probably have no better alternative.” Interns at start-ups, such as “Nora,” often work for the possibility of getting an equity share in a company.

Something comforting(ish) to watch about #Brexit (2016-06-29 08:00)

Time to call in the clowns (2016-06-30 08:00)

by Ralf Wetzel, Vlerick Business School

Managers going off hands

“Panama papers”. As whether it all would happen in a bad American movie. A law company with a name a bit too clandestine, international politicians feeling a bit too safe, a business network operating a bit too silent, a mass media outcry a bit too loud – and a public audience a bit too shocked. It could be taken simply as a flimsy movie quickly to be forgotten, wouldn’t we just have gone through similar cases like the Volkswagen emission scandal still trying to find its global limits, the LIBOR fraud unveiling how far such limits can be amongst competitors and a global subprime crisis with global economic consequences taking several years to recover. This is just covering the history of
let’s say the last five years we are just experiencing the next moral catastrophe of the modern management. Strikingly, the lessons learned from previous scandals are almost zero, on both, on the public as much as on the corporate side. For an informed observer, both sides surprise by being surprised, since years. This is weird. Corporations don’t want to change behaviour as the public does not want to really react on such a corporate ignorance. Surprise and shock are most convenient for both.

Decline and dilemma of management

This happens during a situation, in which management as a social function has almost completely lost its former myth. The times are truly over in which the most popular courses at universities and business schools have been named “management” and students strongly identified themselves with managing. As much as the big corporation is in a structural reputational crisis, its management is too. One core reason might stem from a role problem. The old role pattern of the hero, who can overlook the problems of the past by his own mind and create a desirable future with his own hands (the masculine notion here is no coincidence) has shifted from the one steering a big corporation, being unavoidably involved in micropolitics and informal alliancing to two contrasting light figures still remaining innocent of ‘dark management’: the entrepreneur (doing all on his own) and the leader (focusing only on vision-building and motivating others). There is no role model for the one doing the dirty daily job anymore, especially not a role model incorporating the conditions of the current situations, including being trapped in insecurities, own weaknesses and insufficiencies. No wonder, that no one wants to become a manager anymore and no wonder that there is either a focus on the past (the old hero) or the future (the leader). There is neither a present for management, nor a presence. Management is absent in the present, and it has lost its innocence.

The instruction of a forgotten stranger

"Clowns are born when society has a need for them. Remember that Chaplin and Keaton were most popular during Depression. And that the Indians say that clowns appear when the leaders get out of hand!"

This quote by the Canadian clown trainer Richard Pochinko comes not by accident. In the midst of the refugee crisis displaying political helplessness and hopelessness, one figure celebrates a comeback – the clown. This figure now enters refugee camps in Lesbos as much as in Berlin and in Anderlecht, spreading joy, laughter and playfulness in the middle of trauma, despair and boredom. It is the clown who is one of the last reliable figures trusted to contain hope, empathy and innocence, after traffickers, border guards and bureaucrats have done their job. After an inexorable decline of the Circus as one of his natural habitats, the Clown is back, probably stronger than ever. And the reasons for that are very simple. First of all, the clown is innocent, he has no interest. Whatever emotion he is driven by, the clown shows it. There is no veil nor hiding. The clown is naked in his emotionality. Second, the clown only exists in the here and now. There is no past, he is bound to and there is no future he longs for. He exists only in the here and now. Third, the magic, he is born by is the connection to the audience, in the here and now. If there is no one watching, the clown just doesn’t exist and disappears. If the clown is unable to connect emotionally to this audience, his performance will be witnessed as a flaw and a fake, the most horrible thing to happen. And finally, much of the charisma of the clown is in his unavoidable confrontation to failure. Whatever he does is always at risk and it is the innocent and unveiled struggle that turns him adorable for the audience. The innocence, emotional connection with the audience, the presence the clown is in and the existential struggle is the essence of what that figure still brings to the world. And he is back at an essential moment.
The desire for something else

There is no role model yet for a management being present, vulnerable, connected and innocent. And I hope that such a role model won't be shaped by the industry of management fashion, residing in an questionable alliance of consulting, business schooling and managing. An exploration needs to take place far away from the beaten tracks of management science and practice. Fortunately enough, there are already sensitive discussions going on, including the instructions from arts and European and Far Eastern philosophy. The managerial crisis won't be solved from within management science and practice. The clown might be a role model for both academics and practitioners to board that journey. By becoming naïve and innocent observers, by desperately searching for a true connection to an audience and by making themselves vulnerable there might be a chance. It’s a hard jump. But not jumping is somehow not an option anymore, if we don’t want to pretend being surprised about the next shabby movie.

Ralf Wetzel began his career as an electrician. He joined Vlerick Business School as a Professor of Organization and Management after extensive work experience in management and organization research and after being a head of a joint research and consulting group. His career path led him from Germany to the UK, via Switzerland to Belgium. He applies art-based research like improvisation principles and theatre play in his work, especially for inquiring into topics like organization theory & behaviour, change management, consulting, leadership, organization & society. Aside of his academic writing, he loves to turn research results into art-based forms like fiction, accessible for non-academic readers. Twitter: @RalfWetzel

7.7 July

RIP Alvin Toffler, sociologist of the future (2016-07-01 09:00)

I first read Alvin Toffler’s books Future Shock (1970), The Third Wave (1980) and Powershift” (1990), the last two co-authored with his wife Heidy Toffler, in an samizdat-type Bulgarian translation in 2000, as a first year student at the Sofia University. The Tofflers may have exaggerated the extent to which people are experiencing a “shock of the future” and the acceleration of a post-industrial society, and some of his claims were controversial, but they were bold, well argued and inspiring. And even though at the turn of the century they were already a bit dated, those were important books and I’m glad to have read them. My course was in European Studies, but the Tofflers' critical discussion of contemporary society was among my first windows onto sociology and contributed to it later becoming my chosen direction. Sadly, Alvin Toffler passed away on 27 June.

__________________________
Downtown baby

I sit down next to a young couple. His jeans are ripped and have holes at the knees. He lets his head hang low. She reeks of alcohol, and she’s constantly squinting her eyes. It takes three times for them to notice someone sitting across saying, 'sir, you dropped your wallet', and another two for him to pick it up from the subway floor.

On the next stop, three generations of Middle Eastern women walk in: a young girl, around 7 years old, her mother, and her mother’s mother. The girl carries a baby doll. They look for three seats but have to settle for two. A stranger separates mom from grandma. As they are about to sit down, I notice that the woman next to me has stood up and is moving over to them. 'Take my seat', she says, dragging her boyfriend with her to free up three adjoining seats. The three thankfully take the seats next to me, replacing the young couple.

The girl cheerfully talks to her mom all the while holding the baby doll close to her chest. Grandma watches them, smilingly.

The couple, now seated across from me, are struggling to stay awake. They look like they’re falling apart; going down after a long, druggy, trip. Then the woman notices the baby doll. It triggers something in her. There is a sparkle in her eyes. She recovers somewhat, sits upright. Says to the little girl, 'you have a cute baby there!' A short pause, then, 'I want a baby.' The girl looks at her mom, who smiles back at her. Then she looks to the women, beaming. 'What's her name?', the woman continues. The girl's mother translates. 'What language are you speaking?' asks the woman. 'Arabic, but she understands English.'

'Nathalie,' the girl says, 'Nathalie!' She gets up, walks over to the woman sitting across, hands her the doll, and returns to her seat. The woman is startled for a moment, then says 'thanks, that's a pretty name' and looks at the baby doll. For a moment she disappears into thoughts. When she recovers she pokes her boyfriend. He half-opens his eyes for just a second before closing them again. She smiles and says 'Thank you for letting me hold your baby'. She sighs, inhales deeply, and gets up to return the doll. The girl takes the doll back, but then stands up and again gives the woman her baby.

'For you: pink baby.' The woman sits there in silence looking at the doll for about a minute, then says, 'thanks, but... no, it's yours.' The girl responds, no—you!' pointing at the woman. 'But... you'll miss it.' The girl smiles sagely, and says, 'She will buy me new one,' looking up at her mom. Mother rubs the girl's hair as if to say 'yes, honey, I will.'
The train stops at the next station. The girl, her mother and grandmother get out, leaving behind a seriously startled woman, her drugged out boyfriend, and her plastic newborn. That—and a car full of spectators smiling broadly.

Jonathan J.B. Mijs is a Doctoral Candidate in Sociology at Harvard University. When he is not writing about himself in third person, he is studying how (young) people come to see and explain setbacks in their own lives and that of others, which is the topic of his dissertation.

TransForming Research Practice: Towards ‘Best Practice’ in Transgender and Non-binary Inclusive Social Research (2016-07-02 08:00)

by Ellis Morgan and Yvette Taylor, University of Strathclyde

On 9th May 2016, we hosted the cross-sector seminar ‘TransForming Research Practice: Towards ‘Best Practice’ in Transgender and Non-binary Inclusive Social Research’ at Strathclyde University. The seminar was conceived in thinking through issues of access, accountability, practice and ‘publics’ – how to make a difference in ‘transgender and non-binary’ inclusive social research? How to stretch research categories and subjects and implicate everyone in the doing of these, rather than as done by certain researchers for certain researched groups (the perpetually ‘hard to research’).

The event was made possible by joint funding from British Sociological Association and Scottish Transgender Alliance, uniting professional-practice groups. In planning the seminar, we initially paused on questions of ‘best practice’, quickly agreeing to scare quote this phrase. But in an age of ‘impact’ and perpetually making a difference, is such a tentative phrasing appropriate, recognisable or rendered vulnerable and failing – what did you find? What impact did you have?

The seminar brought together over 30 people including academic researchers, voluntary sector professionals, transgender community groups and activists to pool their thinking on shaping the future of transgender and non-binary inclusive social research. Because this is an ongoing future, and a joint effort, it is arguably necessarily incomplete and even ‘failing’, which is not to undermine real efforts but to return again to questions (and to return to and press for resources).
The seminar responded to a social context in which transgender and non-binary people are in the public eye more than ever before but rates of suicides, hate crime and school and workplace bullying leave no doubt that widespread social marginalisation persists. The premise of the event was that this cultural complexity produces important responsibilities for those of us seeking to represent transgender and non-binary people’s experiences in our research and asked how we can best equip ourselves as researchers to meet this responsibility. And how to stretch this research responsibility beyond sexualities and gender studies to wider sociological agendas, and the interface between ‘social science’ and ‘science’ agendas.

In the first half of the event Dr Zowie Davy gave a keynote presentation on ‘Research Assemblages and Epistemological Commitments’. This paper provided a backdrop to the day, focussing on the enduring medicalisation of transgender and the critical need this creates for researchers to pay attention to the ‘social within the scientific’ in the assemblages of our trans and non-binary inclusive data.

Following the keynote a panel of researchers gave insightful presentations on their own experiences of producing research with transgender and non-binary communities. The panel comprised Ben Vincent (Leeds University), Kate Norman (Edinburgh University) and James Morton (Scottish Transgender Alliance). Each of the panellists offered reflections on the methodological challenges they had faced in designing and carrying out research that purposefully avoided reproducing the forms of marginalisation experienced by trans and non-binary individuals in other arenas. With the evoked notion of ‘perfection’ implicit in the very idea of non-marginalising research, our discussion led to how we might move forward in ways that allow for us to take risks and engage in expansive ways of thinking whilst holding ourselves accountable for unknowable outcomes.

In the second half of the event a panel of voluntary sector organisations formed to spark thinking about ways of working collaboratively across sectors. The panel comprised Serge Nicholson (Galop), Michelle Ross (CliniQ), Gemma Rae Moncrief (Non-Binary Scotland) and Vic Valentine (Scottish Transgender Alliance). The panel drew on their collective experiences of providing key services to trans and non-binary communities, often acting as community gatekeepers in relation to research participant requests and frequently depending on trans inclusive research to develop and secure funding for their own services. The panel stimulated discussion in which the ever present notions of insider/outsider statuses shaped questions around constraint and ideological ‘fit’; how do we include ‘our’ work in ‘their’ spaces, and vice versa? What constraints do we accept as part of an explicit agenda to work to the priorities of an ‘impact’ agenda? How do we ensure that preconceived directionals of that impact do not lie untroubled? But alongside these potential hesitancies, what opportunities do we bring each other in melding our interests, approaches and knowledges as we bring ourselves into each others spaces? For after all, whilst a call to perpetually make impact carries within it a necessary future ‘failure’ it also promises the potential of future ‘worth’.

The delegation ended the day by pooling their thinking on practical ways of applying and extending the learning from the day, as a deliberate attempt to move away from ‘closing conference comments’ to something beyond the room. Our discussions made clear important issues that are pressing concerns for many researchers in today’s social climate, where a desire to represent and include trans experiences in research exists alongside a deep concern to ensure an ethical, sensitive and ultimately beneficial approach for trans individuals and communities. Participants at the event made various calls in their closing remarks for the TransForming Research Practice initiative to find ways of continuing to provide a forum for sharing on this topic and take forward the rich potential for facilitating further collaborative working.
As a result of the day Ellis Morgan and Prof. Yvette Taylor have produced a paper offering some foundational thinking on how such ‘Collaborative Foundations in Trans and Non-binary Inclusive Research’ might be taken forward and the paper can be found on the website of the Scottish Transgender Alliance ([1]www.scottishtrans.org/)[2]see here

If you would like to find out more about the TransForming Research Practice initiative then please feel free to get in touch with us at [3]ellis.morgan@strath.ac.uk or [4]yvette.taylor@strath.ac.uk.

Brexit Shows That 'Generation' Needs to Be Added to Race, Class and Gender (2016-07-02 10:00)

Shortly after it was announced that those in favour of leaving the European Union had won the UK referendum, I was among the first to pounce on the fact that attachment to the European Union directly varied with age cohort: The older the voter, the lower the attachment. And the fact that (per usual) voter turnout also directly varied with age cohort – the older the voter, the more likely to vote — explained the 'Vote Leave' win: Had voter turnout been consistent across age cohorts, the 'Vote Remain' campaign would have won.

At the time, I argued that it speaks to the need to include ‘generation’ as a foundational category of sociological analysis, alongside race, class and gender. This is not a new idea. It was a cornerstone of Karl Mannheim’s sociology of knowledge, which could be used to explain, for example, why the very old and very young found Hitler an attractive leader, despite the consternation of the middle age population who flourished – however fitfully - under the Weimar Republic.

The basic intuition of generational analysis is that people at the same stage in their lives experience the same public events in similar ways. Of course, this is not meant as an overriding explanation of human behaviour, but it provides an orthogonal slice of the sociological pie from that offered by race, class and gender. The rise of ‘broadcast’ media from the mass circulation newspaper onward has generated a steady stream of such publicly experienced ‘events’ which serve as a common frame of reference in terms of which people’s judgements can be compared. The point is epitomized in the question: ‘Where were you when Kennedy was shot?’

Perhaps the most notable feature of the social media fallout from Brexit with regard to generational analysis has been the antagonism between ‘old’ and ‘young’: The former castigating the latter for shirking their civic duty of voting; the latter accusing the former of selfishness and narrow-mindedness. Whatever one makes of these charges, it points to a real problem that not everyone is equally invested in the outcomes of a democratic process. In the case of irreversible decisions, as Brexit is purported to be, the young who voted against it will live with its consequences much longer than their elders who supported it. What constitutes intergenerational justice under the circumstances?
The fact that proportionally fewer young people voted is an irrelevance when answering this question. The failure of the young to represent themselves adequately is not grounds for exploiting them. It is easy to forget that democratic theory is very much preoccupied with the relationship of age to political participation: age to vote, age to serve in elected office, etc. 2500 years ago Plato famously argued that the then quite old age of fifty should be the threshold for political office because by then you would be impervious to corruption. Friedrich Hayek believed people should vote just once, at a hypothetical halfway point in life, when you had the optimal combination of wisdom from the past and stake in the future. My own view is that votes should be weighted by how long the voter would need to live with the consequences of the electoral outcome. This means that your vote would come to mean less as you grow older, and a premium would be placed on politicians projecting long-term horizons to appeal to the youth, who would always hold the balance of power in each election.

In any case, it’s time to return ‘generation’ to the front line of analytic categories in sociology.

CfP: Cultural studies in the context of object-oriented philosophy and object-oriented ontology (2016-07-03 08:00)

You are encouraged to submit articles for the new issue of “Cultural Studies Review” (“Przegląd Kulturoznawczy”) devoted to cultural studies in the context of object-oriented philosophy and object-oriented ontology (OOP, OOO).

The last decades in critical humanities elapsed under the banner of a return to materiality. The ecological crisis, tensions within the capitalist system, and exhaustion of the energy of poststructuralism have forced a reassessment of the notion of matter. While the twentieth-century critical theory organized the political debate around epistemological issues, the materialistic tendencies, more and more strongly present in the humanities of the twenty-first century, are currently re-introducing metaphysics into the area of political reflection.

It appears that none of the new trends in materialistic reflection have generated as many controversies as speculative realism in its various guises (object-oriented philosophy or object-oriented ontology). The third issue of “Cultural Studies Review” will be an occasion to use the dictionary of object-oriented philosophy in the field of cultural studies. Ever since speculative realism emerged in the area of contemporary philosophy—largely as social ferment on scientific blogs—its findings, insights, and methodological suggestions have been quickly applied to reflections on technology, material culture, and contemporary art. The dOCUMENTA festival (12) has established object-oriented philosophy as one of the most significant trends in contemporary reflections on the aesthetic experience and on the condition of the art market. Jussi Parikka and Levi Bryant find use for OOO/OOP in the archeology of media and in the contemporary studies on technology. OOO/OOP appears as a methodological
basis in reflections on such different phenomena as the ecological crisis, immaterial labor, algorithmization, or post-digital aesthetics. Its emphasis on the study of relationships allows cultural studies to readdress the issue of agency, work, and ideology.

Speculative realism appears to be the most radical and promising attempt at transcending poststructuralism. The sources of this impulse may be sought in works by A. Badiou or Q. Meillasoux, and inspiration may be found in the works of, among others, M. Heidegger and, notably, of K. Twardowski. Speculative realists (including A. Toscano, G. Harman, L. R. Bryant, I. Bogost, R. Brassier) refute the basic relationship that has organized philosophical debates concerning our thinking of reality from the times of Kant: the subject-world relationship. They introduce the concept of the object, which can be man, Pegasus, or an atom. The anti-humanism of speculative realism thus allows us to locate this project within broadly-understood posthumanism, in close proximity to the actor-network theory or STS (science, technology and society studies); however, its (seemingly?) nihilistic provenance generates a number of critical opinions, which, in the anti-humanism of OOP, discern the dangerous anti-critical turn reproducing the spirit of contemporary cognitive capitalism. The criticism of object-oriented philosophy resonates strongly in contemporary feminism, queer theory, new materialism, and psychoanalysis in the context of debates on the political nature of the theories and the concept of agency.

In the next issue of "Cultural Studies Review" we would like to discuss the proposals of object-oriented philosophy in the context of cultural studies. We are interested in the following issues:

— object-oriented philosophy as the super-science of culture?
— object-oriented philosophy and actor-network theory in cultural studies;
— "aesthetics as the first philosophy"—aesthetic experiences in the face of object-oriented philosophy;
— object-oriented philosophy and material culture;
— object-oriented philosophy and immaterial and affective labor;
— criticism of speculative realism—is critical theory possible without a subject?
— object-oriented philosophy and the materialistic theory of media;
— object-oriented philosophy and the philosophy of science and technology;
— object-oriented philosophy in the face of emancipatory projects.

Editors of the issue: Michał Gulik, Samuel Nowak
Deadline for submission of articles: July 31st, 2016*

Date of publication: October/November 2016

S M (2017-06-14 10:31:18)
Very interesting! Is this issue already published, and if so, where could I find it please?

**Why we voted leave: voices from northern England** (2016-07-03 13:51)

HT [1]Lance Dyer:

https://vimeo.com/172932182

1. http://www.twitter.com/Lance63/

Fascinating video. A real insight into the thoughts of people in deprived communities who voted Leave. However, it was also chilling from the point of view of democracy. None of the participants could give a concrete or valid reason why their plight was caused by the EU or how leaving the could improve their situation. The EU is much more redistributive than any Westminster Government and has done a lot to help deprived areas. Access to single market has also encouraged investment in areas such as Sunderland. It feels like the Out vote has been the equivalent of smashing a smug rich person’s window to serve them right. Ironically Brexit will damage these communities the most.

Samuel Shoesmith (2016-07-04 03:10:09)
So refreshing to see this. I concur with her - the media narrative, both mainstream and YouTube-esque has undertones of xenophobia especially when referring to parts of northern England. I think it is a series wholly more complicated and complex issues than this.

**The Emerging Lessons of Brexit for Aspiring Democracies** (2016-07-03 21:41)

The following first appeared on [1]Al Rasub, a Dubai-based news website.

***

The recent referendum resulting in a 52-48 vote for the UK to leave the European Union ('Brexit') is causing substantial political and economic ripple effects across the world, which are unlikely to end soon. Although the vote was close in percentage, it was decisive in raw numbers, with 1.3 million votes separating the two sides. Indeed, the 17.4 million
votes in favour of Brexit were the most ever cast for anything or anyone in a British election.

However, writing as someone who wants the UK to remain in the EU, I am struck by the many different levels on which the very idea of democracy has been put to the test by this referendum. Four in particular stand out. I organize them in a list because each is quite striking in its own right, and taken together their interrelations are complex. At the end, I shall make some general remarks about the distinctive nature of British democracy, whose weaknesses the Brexit vote reveals.

1. Immediately after the polls closed, the generational character of the voting demographics became apparent. The older the voter, the likelier to vote. Moreover, the older the voter, the likelier to favour Brexit. Yet, the younger the voter, the longer s/he will need to live with the consequences of the vote. The default UK response has been to blame young people for not voting, especially since Brexit would not have won had the turnout of the young been at the levels of their elders. However, one might also take seriously that in the future votes should be weighted inversely to age, since those who are likely to be around longer have a larger stake in the outcome. As it stands, the Brexit vote manifests a geriatric version of democracy, in which the old have a disproportionate say over matters in which the young are mainly affected.

2. The failure of the party-based system of democracy is striking. No major UK party has called for a second referendum on EU membership since the last (and only) one took place in 1975. However, about twenty years ago, the UK Independence Party (‘UKIP’) was formed expressly with this purpose, scapegoating the EU for various socio-economic problems that continued to plague a seemingly prosperous UK. UKIP gradually gathered support, receiving four million votes in the 2015 general election and coming close to winning seats from both the Tory and Labour Parties. Mindful of UKIP’s rise, Prime Minister David Cameron promised an EU referendum in the 2015 Tory Party manifesto, which he then duly delivered, thinking that the result would defeat the ‘Brexiters’ once and for all. Of course, events proved him wrong. Meanwhile the Labour Party responded to its 2010 general election defeat to Cameron (after three successive wins under Tony Blair) by involving party members more directly in the selection of the leader. This has led to a schism between Labour parliamentarians and ordinary members, as manifested in its current leader, Jeremy Corbyn, a retro-socialist who is much beloved by the party hard core but loathed by his fellow parliamentarians, who are more concerned with winning elections, which involves appealing to ‘floating voters’. The ongoing turmoil meant that Labour failed to mount a coherent campaign against Brexit.

3. The profound failure of expertise to influence voter opinion was striking, even though the referendum campaign was rather long by British standards (four months). 90% of UK academia, all the major business leaders and world politicians wanted the UK to remain in the EU. Moreover, they made their voices heard very clearly. However, their efforts were successfully spun by opponents as ‘Project Fear’, since most of the expert arguments were framed in terms of the benefits that would be lost or put at risk by leaving the EU. In contrast, it would seem that 52% of the British electorate did not feel these ‘benefits’ sufficiently. Their experience of the EU was in terms of migrants taking jobs from natives and the sense that the UK paid too much into the EU without getting enough in return. Both impressions – which really drove the electoral outcome – were false. Indeed, nine of the ten UK regions that benefit the most from the EU’s redistributive style of finance voted for Brexit and now are likely to suffer most in the aftermath. The irony of the situation is captured well in the British expression, ‘Turkeys voting for Christmas’. In effect, the Brexiteers flattered the electorate into thinking that they knew more of the UK’s relationship to the EU than they really did. Indeed, they explicitly asked people to trust their feelings over the opinions of experts far removed from their everyday lives.

4. But most striking of all is the ‘populism’ that has allowed the Brexit vote to trump parliamentary authority. From a strictly constitutional standpoint, the UK is a representative democracy: Parliament, not the people, is sovereign. This means that a referendum has the legal standing of a consultative exercise, the outcome of which Parliament may choose to enact, subject to further deliberation or outright reject. However, during the
campaign, much – too much – was made of the EU referendum as expressing the ‘will of the people’. Indeed, this rhetorical framing helps to explain the unprecedented voter turnout. However, given that roughly three-quarters of current Members of Parliament – across all parties and regions – wanted the UK to remain in the EU, they could easily halt the momentum towards Brexit. They may still do that, but it is telling that they are not yet raising that possibility. One suspects that parliamentarians are eager to enrol ‘the people’ in however they dispose of the Brexit vote because they doubt their own legitimacy to make judgements on behalf of their constituents and the national interest.

The UK is the world’s oldest major democracy – but one without a written constitution. Writing as a US national who has lived and thrived in the UK for the past quarter-century, I find it a marvel to behold. But its luck may have run out. UK parliamentary politics is basically a circulation of elites who are very clever but who treat ‘the people’ as a resource in a long power game. It is to the elites’ collective advantage to keep the rules of the game as loose as possible, which explains the ad hoc character of UK legislation. It is to the great credit of these elites that they have forged a welfare state that exceeds the expectations of what even liberal US politicians normally entertain. However, it was a fatal mistake for David Cameron to ‘break frame’ and voluntarily cede sovereignty from Parliament to ‘the people’ in the EU referendum. A written constitution would have never allowed Cameron to be so reckless on a matter so fundamental to the UK’s parliamentary democracy. What happens next remains to be seen.

Making the Most of Social Media (2016-07-04 08:00)

Social media has changed a lot since I began my PhD. But what’s notable about this is that I didn’t start my PhD particularly long ago. When I began in 2008, my blogging was a personal hobby which I couldn’t possibly conceive of as relevant to my research. But by the time I finished in 2014, social media had come to shape every aspect of my developing research career. It’s possible I’ve been an outlier in this respect, but the same transition can be seen within my discipline. At my first British Sociological Association conference, the event’s hashtag felt like it was dominated by digital tumbleweeds and a few lonely voices speculating about how few sociologists were using Twitter in the UK. By the time of the most recent British Sociological Association conference, the event’s hashtag had become a thriving hub of activity, as scores of sociologists attending the conference live tweeted their way through the event. These are personal experiences, grounded in my own career and my engagements with my discipline in the UK, but they are representative of a broader transition. What was once a fringe pursuit, regarded with disinterest at best or suspicion at worst, increasingly finds itself seen as a central part of what academics are expected to do. What might once have been a curiosity about how a particular academic conducts themselves looks increasingly likely to be incorporated, formally or otherwise, into the expectations to which academics are subject in their professional lives.

This is a recipe for anxiety. Something that moves so fast, as can be seen in the hypnotic resource that is Internet Live Stats for which I’ve only attached a screen shot, can be bewildering. So much happens in what we might call an ‘internet minute’ that it can be hard to make sense of the sheer scale of the activity, let alone determine how to make the most of it. But it’s this speed and scale which has created so much attention because of the sheer size of the audiences which can be found through social media. On paper, the possibilities seem tremendous: free, open,
accessible platforms that allow us to access hundreds of millions of users. In practice, the reality is more complex: how can we actually ensure that we’re heard above all that noise? How do we negotiate the already competing demands upon our time when engaging on social media is added to them? How do we square the requirements of visibility online with the most conventional expectations about how researchers comport themselves offline? In other words: how do we make the most of social media?

Unfortunately, there are no universal right or wrong answers to these questions. There are general tips which apply to all researchers engaging online, as well as common issues that those in the academy face when they use social media. But so much still depends on the individual scholar, what they’re comfortable with, what they hope to achieve and the environment within which they’re working. What I’ll do today is to offer some general tips & address these common issue. But my main focus is on how to address these deeper underlying question of why you want to use social media and what you want to do with it, because I firmly believe that if you address these questions of ‘what’ and ‘why’ then the ‘how’ questions become much clearer. Deciding on which platform is right for you, how you wish to use it and how you wish to combine these as part of a much broader range of activities you’re committed to becomes much easier once you’re animated by a clear understanding of what you’re setting out to achieve and why it matters to you. Ultimately, existing platforms change so fast and new ones spring into being with such rapidity, that a preoccupation with the platforms themselves can just be confusing. Plus remember MySpace as a timely reminder of the capacity of hugely popular social media platforms to die.

Instead, I think it’s useful to think in terms of scholarly activities and the various ways in which different sorts of technologies are used to enact these, helping or hindering them in the process. The radical sociologist C Wright Mills wrote a wonderful appendix to his famous The Sociological Imagination about scholarly craft: he argued for the necessity of keeping a ‘file’ in order to ‘keep one’s inner world awake’. These are activities we all engage in but which, rather interestingly, tend not to feature in public discourse: the daily minutiae of scholarship. Notebooks, filing cabinets, file cards, newspaper clippings, print outs, drawings, marginalia in books, annotated papers, reading lists etc. My favourite example from my own experience is the fixation on Moleskin notebooks which dominated the early stages of my PhD. I loved these notebooks, still do in fact. I would enthusiastically scrawl ideas as I was travelling, record notes of what I was reading and try to develop a research journal to track my engagements over time. I’d then proudly place these notebooks on a shelf, admiring the odd sense of solidity they conveyed when I stacked them up near my computer. In my more pretentious moments, I found myself thinking about the weight of the ideas contained within them and how satisfying this was.

The problem was that I could rarely read my own hand writing, couldn’t search them and as much as I admired them aesthetically, they were pretty useless to me as a research journal. Plus as many people will tell you, they are by definition quite easy to lose if you carry them with you all the time. I never experienced this because I didn’t carry them with me all the time. This in itself caused problems because I’d often find that I had an idea or insight that I wanted to record, but I didn’t have my current notebook with me. I’d sometimes record it on a scrap of paper, hoping that I’d add it into the notebook when I got home but I rarely succeed in this. On other occasions, I’d hope I remembered the thought once I was home. I never did. In contrast, the research blog I soon started, replacing my older blogs filled with rants about politics and song lyrics I liked, could be found wherever I had internet access. The very fact of other people, at least in principle, reading what I wrote forced me to elaborate upon fleeting thoughts in order to make them legible for others. Tagging and categorising these notes, as blogging platforms encourages you to do, quickly built up a living archive of my scholarly engagements that I’ve since got into the habit of frequently tracing back. It enabled me to connect with others that shared my interests, as well as building up an audience for publications long before I’d actually published anything. It became for me how one of my favourite science fiction authors, Cory Doctorow, describes his own blog: “my major way of thinking through the stuff that matters to me”. This is exactly what I hoped my Moleskine notebooks would do but they never quite did.

But this isn’t for everyone and my point in telling this story is not say that you should all use blogs as research journals. Many people, including myself, wouldn’t be comfortable blogging about field work and data in such a
Many people would prefer to fully work out their thoughts before making them public, though I do think the risks entailed by this are overstated because, as the philosopher Daniel Little puts it, people enjoy seeing 'ideas in motion'. Many people would prefer the option to share a note on social media, something which digital journals like Evernote provide very effectively, rather than sharing by default. I think it's a mistake to assume social media platforms and digital tools are necessarily an improvement. In fact, I don't think such a judgement makes sense in the abstract. A particular social media platform is only going to be useful to someone in a particular context for a particular purpose. The key to negotiating the world of social media as an academic is to develop clarity about what you're doing and enough familiarity with social media platforms and digital tools then you can think clearly about how they might help or hinder particular tasks. These tasks are manifold: locating literature, reading literature, analysing data, conducting field work, networking within your field, engaging with publics outside the academy and many more. Social media can be used for all of them, in all manner of ways, but how to do this is likely to be confusing unless we're specific about what we want to do and why we want to do it.

But I think there are other, more hands on, pointers which apply to most if not all:

1. Use the opportunities afforded to you as an ESRC funded researcher. Sign up to their e-mail alerts and engage with the digital opportunities contained within them. Engage with the ESRC on social media platforms. For instance, add your status to your Twitter profile and they'll follow you back. Tag @ESRC when you're discussing your activities and making announcements.

2. Share what you care about online. In a recent book, the Sociologist Les Back suggests that Twitter sometimes facilitates our “inhabiting the attentiveness of another writer” by providing "signposts pointing to things going on in the world: a great article, an important book, a breaking story". Through the things that others share, we sometimes enter into their world and participate in an economy of “hunches and tips” which is the "lifeblood of scholarship". These provide pathways through the literature, allowing others to use them as guides into and through often difficult bodies of work. If you consistently share what you care about then other people to whom this matter will find you online. It’s in this subtle way that I think everyday use of social media can help mitigate the competitive individualism which dominates the academy.

3. Try not to get hung up on the ‘right’ and ‘wrong’ ways to behave on social media platforms. These norms are not so different from the rest of your life, something which the contrived opposition of ‘offline’ and ‘online’ often works to obscure. Are social media platforms ultimately that different to an academic conference, albeit on where the words linger on in the room after being spoken? Each profile is a spot on the internet that’s staked out as yours. What you do with it is up to you. Some people choose to wander over to their podium every now and again, make an announcement and then wander off. Some people give their presentation at the podium and then leave, only returning when they want to give another. Some do their presentation but thrive on the Q &A afterwards. Some might not like the feel of the podium and eschew a formal presentation to go and chat more directly with their audience. Likewise some people just want to listen and ask questions of other speakers. Others would rather ditch the conference and go straight to relaxing at the pub.

4. But if you’re unsure about how to behave, the best thing to do is to seek out exemplars, both positive and negative. Do you like how someone engages on a particular platform? Try and articulate precisely what you like about it and whether it’s right for you. Conversely, if someone frustrates or bothers you, don’t just get irritated. Instead try and clarify exactly what it is you don’t like in order that you’re better able to avoid this. In this way, it becomes easier to develop a deliberate sense of how you feel you ought to behave online, rather than be plagued by a diffuse anxiety that you might be ‘doing it wrong’.

5. When in doubt, connect! The capacity of social media to flatten academic hierarchies is vastly overstated but there’s a kernel of truth to it: unless you’re a remarkably outgoing and talented networker, it’s much easier to approach well known academics online then it is in person. If you find yourself hesitating about whether to make
contact with them, err on the side of connection. At worst they'll ignore you & the architecture of social media is built from the ground up to encourage people to interact as much as possible. Furthermore, use community resources like hashtags to connect with others at a similar stage to you. As well as #PhDChat, which I found almost indescribably comforting at many points during the last year of my PhD, there's #ECRChat and #ESRCPhD as well as many other localised to particular fields of practice. Plus don't forget all the people you already know. Add your social media profiles to your e-mail signature and look for your friends and acquaintances when you try a new platform.

6. Tell a story about yourself using your profile. This can feel narcissistic but in an information saturated world, these snippets of biographical information are key to allowing people to know where you’re coming from. This isn’t just a matter of people within the academy. Social media radically increases the ease with which academics can be found by those within the media, government and civil society. But they need to know who you are and why they might want to talk to you for those conversations to begin.

Much as there are practical tactics which work for most, if not all. There are common issues academics face when they engage online. Social media collapses the boundaries between the different groups which we engage with and poses the question of how to manage overlapping relations between them: for instance, are you ok with your students reading material you’ve shared with your friends? One response to this problem is never to say anything online that you wouldn’t be happy with everyone in your life hearing. Another is to try and mark out particular material as being for different audiences, perhaps even by having separate profiles. My own approach has been to assume everyone in my life realises there are different facets to me and if something I share online seems confusing to them, they probably weren’t my intended audience. But then again, this might be why all my non-academic friends unfollowed me on Twitter a long time ago.

There’s also the more unpleasant side to social media. Sometimes, this might be a matter of getting drawn into pointless arguments. For instance, I’m as enthusiastic about Twitter as one can be, yet I’ve never seen any evidence that meaningful debate is possible within 140 characters, though it’s certainly possible to have constructive discussions amongst people who share things in common. As a general rule, if it feels important to you that someone on the internet is wrong, that’s the time to step away from social media. On the other hand, there’s a much darker world of online harassment, far beyond the simple matter of academic egos and cantankerousness. This is a big topic, one which most social media platforms are failing to do enough about. The only general advice I can offer is to be aware of the issue, particularly if you’re working on a very politicised topic. Also familiarise yourself with the facilities each platform offers to ban and block and don’t hesitate to use them if you feel the need.

There’s the ever present risk of time wasting. I think this issue can be overstated and it’s often framed in terms of an assumption that social media is just ‘one more thing to do’: scholarship is assumed to be something prior to what scholars do on social media. But the more that you’ve embedded social media in your everyday activities, the less this is true because what you’re doing on social media is scholarship. Nonetheless, sometimes it can be a bit compulsive and tools like Anti-Social, Freedom and Rescue Time all provided effect mechanisms for carving out time away from social media to immerse yourself in other things.

But the most important thing is to try and enjoy it. You’re unlikely to make the most of social media if you don’t. My experience has been that the promise of academic social media lies in its use as a platform for trying to work things out. More so, doing it in the open grants each of these attempts a social existence, one that comes with undoubted risks but also enormous rewards. Little bits of thought shrapnel, brief attempts to make some sense of the ‘feel of an idea’, come to enjoy their own existence within the world. They’re mostly forgotten or even ignored from the outset. But there’s something quite remarkable about occasions when these fragments resurface as someone sees something of value in them, perhaps when you saw no value in them yourself.
In this way, it attunes you to the impulse to write because you have "something to say and communicate". This isn't always the case and I worry that the metricisation of scholarly blogging will prove immensely destructive of it. But there is at least for now something deeply rewarding about seizing on an inchoate idea, developing it and throwing it off into the world to see what others make of it. For no other reason than the pleasure inherent to it. Making the most of social media can help develop your career, build your network and make an impact. But more importantly, it can deepen your enjoyment of what you do, keep you connected to the curiosity which animates your research, help you connect with others who care about the same things as you do and build up opportunities to work together enjoyably in an environment otherwise dominated by competitive individualism.

PhD studentships in complexity/policy (2016-07-05 08:00)

A number of PhD studentships are available via the newly established [1]'Centre for the Evaluation of Complexity Across the Nexus' (CECAN), a £3m national research centre hosted by the University of Surrey, and led by Professor Nigel Gilbert, addressing some of the greatest issues in policy making and evaluation.

Please subscribe to the email list and circulate the studentships widely - [2]http://www.cecan.ac.uk/join-us.

How many neoliberals does it take to screw in a light bulb? (2016-07-05 09:33)

A brilliant joke passed on by Frank Pasquale on Twitter:
But it raises a serious point: why are neoliberals taken so seriously? Does popular opposition sometimes inadvertently buy into neoliberal's self-mythology of hard nosed pragmatism? Do we sometimes need to remind ourselves that the emperor has no clothes?

Among the most striking features of the aftermath of the Brexit vote has been the speed with which the victorious politicians promoting Brexit have rowed back from their more extravagant promises about the extra funds and fewer migrants which would follow from leaving the European Union. For their part, anti-Brexit politicians have been busily mounting legal challenges to show that the referendum is not binding, or at least not the last word on the topic. And indeed, legally speaking, the anti-Brexit politicians may be correct. But had they – specifically, UK Prime Minister
David Cameron – presented matters this way at the outset, it is unlikely that the referendum would have received the highest turnout of any election in British history.

In effect, one bunch of politicians promised the electorate the moon after the other bunch of politicians had persuaded them that the moon was at stake. Little surprise, then, yet another wave of the familiar 'All politicians are liars' sentiment has been unleashed. My lesson here is that when people 'trust' politicians in a parliamentary democracy, they should do just that – that is, trust the politicians not their words.

This judgement sounds harsh, maybe even cynical. But that's only because people, as well as many politicians, don't appreciate that democracy is the ultimate 'work in progress', especially if we think of it as involving 'the masses'. Before the Enlightenment, the only stable democracies were ones whose members were rough cognitive and material equals – i.e. the city-states associated with 'republican' democracy, in which citizenship was an elite privilege. However, the Enlightenment took seriously that the scope of democracy could be extended across the population by sophisticated ideas of 'representation' allied to educational policies designed to trigger people's innate capacities for self-representation. Thus, someone like Wilhelm von Humboldt, the founder of the modern university, envisaged a telos to democracy that started with Parliament's paternalistic representation of its constituents and ended with a general assembly of well-educated equals, for whom 'representation' would amount to a direct administration of their collective will. The famous Marxist expression, 'the withering away of the state', originated in this context.

But exactly where are we on this trajectory?

Some would say that we are still very close to the start of the process because the trajectory itself is a product of wishful thinking: Democracy doesn't scale. To be sure, much of Silicon Valley's interest in politics is precisely about trying to fast forward to Humboldt's end-state through one or another technological fix, something which the journalist Evgeny Morozov has derided as 'solutionism'. Morozov may doubt the purity of Silicon Valley's motives, but the deeper grounds for scepticism are epistemological: Can the mass of people ever be expected to be sufficiently 'trained' to arrive at a sense of self-interest which converges with the national interest, so as to enable collective deliberation to occur within a tolerable range, resulting in only win-win situations? If not, then maybe the second best solution is for the people to trust the judgement of politicians, who without being infallible or blameless nevertheless are – or at least are supposed to be – their epistemic and moral superiors. If not, then of course there is always the next election to replace them.

But once again, to trust politicians need not mean trusting their words – at least in terms of their providing a transparent representation of either the state of the nation or, for that matter, the state of their own mind. Does that make them liars? No, it simply means that politicians don't trade in what philosophers used to call 'ordinary language'. Just as scientists are allowed 'technical usage', and priests and theologians are allowed 'symbolic usage', politicians engage in proleptic usage. 'Prolepsis' is the trope deployed to conjure up the presence of events before they actually happen. In classical culture, it was invoked by prophets to express adumbration, 'the shape of things to come', as H.G. Wells memorably put it in the twentieth century. But politicians – as purveyors of hope and fear – are also in the same business. Thus, their words are always just proxies for what they're really trying to say.

Once this point is appreciated, we can begin to understand Machiavelli's infamous declaration that in politics 'the ends justifies the means'. He was regarded as blasphemous in the early sixteenth century but not because he made politicians look cynical – today's interpretation. Rather, it was because he would arrogate to humans – specifically 'the prince' – a perspective that only God could legitimately command. But what is this perspective which permits one to indulge in proleptic rhetoric?

Suppose we believe in an overarching creative deity whose transcendent status enables it to operate everywhere all the time. This may be a difficult starting point in today's secular world, but it has made perfect sense to
Christians down through the ages. In that case, the deity’s actions will often appear strange or even perverse in terms of human expectations, which admittedly are based on decidedly inferior knowledge. Integral to this cast of mind, which by the early eighteenth century Leibniz called ‘theodicy’, is the belief that such moments of strangeness are resolved in the fullness of time as we come to realize the greater divine ends that they serve. All modern secular utopias have retained features of this sense of what the US historian Carl Becker called ‘the heavenly city’ in the distance – often inspiring both significant sacrifices and significant disappointments.

Now suppose you can imagine yourself as a vehicle of divine agency in the above sense. Moreover, you don’t feel the need to secure the approval of the Pope or any other religious authority purported to have more direct access to the deity than you. In that case, you’re ready to enter politics! So then, what are you doing when you communicate with your constituents? Consider a concrete example.

Suppose you say that your policies will raise income levels. But income levels as such aren’t really the thing that matters. They are simply the means to express some larger sense of the quality of life. So, if your opponents or events beyond your control disable you from delivering on the relevant income levels, you admit this, apportion blame as necessary and carry on with your general vision by appropriating the next most expedient vehicle. Of course, it’s unfortunate if some people actually believed in your quite specific policies for raising incomes on which you failed to deliver. But if these people are politically savvy, they – like you – will be able to roll with the punches and subscribe to the next set of promises you offer, as long as they believe that you’re going in the right general direction.

In short, people – politicians and non-politicians alike – can cope with the world of politics if they can adequately trade off their short term against their long term interests. This requires a capacity to convert one’s immediate ends into means by which some further, and perhaps quite distant, ends might be pursued. Some might regard this move as ‘selling out’, if not a polite admission of outright failure. However, such behaviour simply reflects the long time horizon over which politics is played out. So not surprisingly, politicians will do all they can to keep their vision appear steady, even as they launch and abandon ships with alarming regularity.

Because science operates on a still longer time horizon than politics, we are more forgiving of the shifts in position that diligent scientists invariably make as they pursue the ‘truth’, which once revealed is often profoundly different from what had been initially expected. Perhaps we should extend the same charity to politicians.

Digital Ontology (2016-07-05 19:52)

A really interesting series from [1]Cultural Anthropology:

[2]Is There an Ontology to the Digital?

by Hannah Knox and Antonia Walford

4. [https://culanth.org/fieldsights/834-databasing-danish-schools](https://culanth.org/fieldsights/834-databasing-danish-schools)
I’ve been a devoted user of [1]Omnifocus for going on five years. At this point, I struggle to imagine how I could work without it, as I’m so utterly reliant on it to transform the hyperactive clutter within my mind into an ordered archive outside of it. But it’s hard to use. It took me well over a year to get to grips with it. It’s also hard to explain. If you’re nonetheless instinctively curious about it, you should read this [2]great introduction offered by the Thesis Whisperer:

My background in architecture offices has given me a range of time and project management skills that are helpful in my second career as an academic. I think I’m pretty good at working multiple projects with complex dependencies, but moving into a management role at ANU has pushed me to my limit.

For years I’ve been using a simple to-do list system based on [3]Cal Newport’s “How to be a straight A student”. I’ve been coping using this simple pen and paper method (just), but in January I hit crisis point. Two valued staff members left within a couple of months and I temporarily added their work to my already over burdened to-do list. My friend and extreme productivity guru [4]Dr Jason Downs listened to my whingeing and suggested Omnifocus2. I’ll admit that I was initially skeptical. I’ve tried many project management tools, such as [5]Producteev, [6]Freedcamp and [7]Trello, but, after an initial period of enthusiasm, I abandoned each one. Like being on a strict diet, complying with the digital tool made me feel … constricted.

Jason told me Omnifocus2 was different because it is built around the famous [8]‘Getting Things Done’ (GTD) by David Allen. This interested me. I read Getting Things Done years ago and implemented a few of the suggestions to great effect. For example, the folders on my hard drive relate to what I do: administration, writing, researching, teaching, supervising, blogging. My email has a similarly lean file structure, as you can see in the image below. While I have folders for automated feeds, the vast majority of emails end up in one folder called “archive”. If I need to find an email from a person, I just use the search function.
An Interview with Sociologist Patricia Leavy (2016-07-07 08:00)

An Interview with Sociologist Patricia Leavy on the Release of her 20th book and The Rewards of Writing Social Fiction

Ashleigh Watson: Patricia, you’re a best-selling author and award-winning arts-based researcher, you’ve had a remarkable career in sociology and gender studies, you’re the editor of the pioneering Social Fictions series celebrating its fifth anniversary in July, and you’ve just released your twentieth title – an anniversary edition of American Circumstance – so let me ask, why do you write?

Patricia Leavy: I love writing more than anything else. I have since I was a kid. When I’m writing I lose track of time, even forgetting to break to eat. I become completely immersed and engaged. Had I been braver when I was younger, I would have studied creative writing and pursued a career as a novelist or columnist or something. You face so much rejection and critique with that career path, with such slim chances for success, that I didn’t feel emotionally able to handle it. As it turned out, it probably worked out for the best that I pursued an academic career as a sociologist first because it’s given me so much to write about, and a different perspective from which to write. I write because it’s my passion. It’s not like a job, but rather something entirely intrinsic to who I am and that’s always the main motivation.

How do you write? With a pen and a journal in a café? On a laptop in a book-lined home office? A sharp pencil and loose sheets of paper in some warm, sunny, outdoor location?

All of these ways. I always note-take and draft first with a pen and journal or loose sheets of notebook paper. There’s something about the process of writing by hand that’s critical for me. It’s how I get to know what I am writing. Then I usually move to my desktop or laptop. I have a beautiful home office with its own balcony where I do most of my work, but a couple of times a week I grab a notebook and head to a local café for a change of scenery. I live on the coast of southern Maine and in the summer I bring a little lap desk to the beach or a pool and work by hand looking at the sea. While I have my favorite color-coded Moleskin notebooks and those sorts of things, I can work with any materials. I’ve scribbled some of my favorite lines on old napkins and the backs of envelopes. The only thing I find I absolutely need to write is music. I always have my iPod in my bag in case I write outside of the house. I typically listen to female musicians while I work.

How does the process of storytelling come together for you? You’ve written three social fiction novels – Low-Fat Love, American Circumstance, and Blue – was the craft similar for each book or did you find them totally different experiences?
There are constants and yet each experience was also quite unique. In each instance I began with the central characters and getting to know them. My novels are very character-driven and in some ways I think of them as character studies. So I always begin with the surface level of who the character is or appears to be, and from the get-go I start going behind the surface so I can see them in their multi-dimensionality, their true fears, motivations, and positive attributes. Then I start deciding how I will let those aspects of the character slip out. For each book that has been different. For example, in [7] Low-Fat Love we mostly learn about the complexity of the characters from the narrator. In [8] Blue it comes out through character dialogue. Another constant was that I remained open during the process. I didn't create rigid storylines, but rather allowed the plots to evolve naturally, as secondary to who the characters are. I did know the major plot points, including the ending for each book right from the start, but I didn't know each scene in between and how we would get from A to B. I would close my eyes and let each scene unfold like a movie playing out in slow motion in my mind's eye. So I would see someone open a refrigerator and then I would see what was in it, and that would lead me to the next moment and so on.

In other ways the storytelling experiences were quite unique, because I was trying to tell each story in a different way. [9] Low-Fat Love was very challenging, I'm sure largely because it was my first experience writing a novel. I focused a lot on the power of third-person narrator voice coupled with interior dialogue to make micro macro links. I also focused on providing detailed descriptions of scenes, character's homes, and those sorts of things so there is a lot of description in that book. In [10] American Circumstance I really wanted to play with the power of time and interiority for getting to know characters. This brought its own challenges. For example, I had to figure out how to bring a four decade past into the narrative in the beginning, and then bring the reader into the present. I also had to find the balance between third-person narrator voice, showing characters in action and dialogue, and representing their inner thoughts. This was all vital to the subject matter of that book, appearance versus reality. [11] Blue was very relationship-driven and so dialogue drove most of the plot, which was yet another way to try to tell a story. I really loved that approach because I found I got to know the core of the characters through their interactions with others.

That complexity definitely comes through in each story. Once you've settled on a writing style or have found a focus in terms of storytelling, how do you decide what each book 'needs', in terms of research and narrative? Can you reflect on your arts-based research practice and how you actually navigate the doing of reading, writing, and research?

My fiction develops organically. Before writing [12] Low-Fat Love I had already collected interview research with women, and some men as well, about their relationships, identities and body image issues, without the intent to write fiction. Because I was frustrated with traditional academic formats I turned to fiction, armed with my interview data as well as my own cumulative insights into these topics based on my professional and personal experiences. So a bulk of the formal research for that book was "already there" so to speak. I have continued to conduct interview research since, with my questions largely informed by readers’ responses to [13] Low-Fat Love. Both the older and newer interviews have informed my other novels. While I’m writing I immerse myself into the pop culture worlds of the characters. In the case of [14] Blue, there’s a running narrative about 1980s popular culture and art. I was obsessed with all things 80s while working on the book, not only to select appropriate references, but to fully engage with the feel, look and layered meanings I could tease out of the art from that time. I also did extensive research on the color blue and how it appears in art, which is the kind of research any novelist undertakes. Currently I’m collaborating with a visual artist and together we’re working on a collection of first-person short stories with visual art, based directly on new interviews I conducted. For that project I’ve been reading a slew of books by popular feminist scholars about relationships, love and self-esteem, which are all a part of the backdrop for the book. I’ve read several bell hooks books as well as books by Gloria Steinem, Cheryl Dellasega, Mary Pipher and others. It’s all necessary just to write these short little stories. There’s often much more that goes into a project than meets the
Let’s talk about American Circumstance in particular. This June you’re releasing an anniversary edition of the text which includes a brand new epilogue. Can you talk about how you first developed this book, and what it was like to revisit it? What effect has time had on the story and the character’s lives?

American Circumstance explores appearance versus reality – how our lives and relationships appear to others versus how they are experienced. It’s a subject that I’m endlessly fascinated with. I decided to focus on social class, and the ultra-wealthy, because I thought it would be a good way to explore how the front stage and back stage are not always the same. It also allowed me to provide a window into the replication of wealth, power, and privilege in the US, with implications abroad. Given all of the economic changes in the years before I wrote the book, I wanted to look at the complex ways that social class shapes identity, relationships, and even the codes of friendship, such as what we do and do not say to each other.

When I first wrote the novel I wanted to mirror the experience of an impressionist painting which can look very different from a distance than it does close up, where you can see all of the little specks of paint. So I used the style of literary impressionism. Accordingly, the novel is divided into three parts, with the first (and longest) covering moments over an expanse of four decades. The second part unfolds over a period of a few months, and the final part transpires over just a few days. The idea is that you see a more distant view, and then an increasingly close up view, and all of this is enhanced by having a narrator voice dominate the beginning of the novel and increasingly representing the interiority of characters by the end.

This is the second time I’ve revisited a novel to put out a better version and it’s a really interesting experience. I find you really have to let go of your ego and look as objectively as you can at your work. I believe writers always improve and so it makes sense that you’re better equipped to write the story once time has passed. I really took a red pen to the book, in order to tighten it. Beyond improving as a writer, I think what time really does for me is give me insight into readers’ perspectives. I make a point to chat with readers at book events and conferences. I also routinely Skype into book clubs and college classes that use my novels so I learn what resonates with readers, what questions they have, and where they put their emphasis. All of that impacts how I approach revising as well as the new content, in this case an afterword, questions for further engagement and the epilogue.

Without giving away any secrets, what does the new epilogue bring to the story?

The epilogue continues the impressionist theme I developed in the book, going from the longest expanse of time to the shortest. The epilogue carries this through by unfolding over the course of just twenty-four hours. The chapter is called “The Road Trip” and takes place a couple of months after the conclusion of the novel. What I love about it is the glimpse it provides into how cultural biases are experienced across America. The novel as a whole is meant to play with readers assumptions—what we assume about people based on status characteristics like social class or gender. The epilogue takes this further by looking at how these characteristics might be viewed and experienced across the country, and consequently, how place matters. I actually wrote the chapter at the time I originally finished the novel and held on to it to release at a future time. I’m so glad I did that because I look at the transphobia happening in the US right now with these fear-based bathroom laws, and I think, wow, this was really the right time to release this
short story about cultural differences, identity and safety in America. The epilogue is one of my favorite parts of the book.

**What is the most rewarding aspect of writing social fiction from (and as) research? What kinds of spaces, representations, or ways of thinking has this opened up?**

It's been enormously freeing. I can get at things I can't access in any other form. I'm able to create layers of meaning, and tap into something in our humanness, and express those things in ways that affect readers.

This July is the fifth anniversary for the [Social Fictions](#) series. Over the past five years, the series has carved out a very exciting and radical space within academic publishing. What was the biggest challenged you faced when getting the series off the ground?

First I had to find an academic publisher willing to take it on. I spent several months going back and forth with a different publisher who eventually passed on it, afraid he'd lose money. While I was heartbroken at the time it worked out for the best. [Sense Publishers](#) turned out to be the ideal publisher for the series, although they weren't sure about it either, afraid they'd lose money. I actually invested my own funds in the beginning, paying to produce the first book, my novel [Low-Fat Love](#). After that the challenge became marketing, which to some extent remains our biggest challenge. For example, it's been tough to convince professors that the books can both be substantive and well-written. This comes from an assumption that art and scholarship are antagonist. I've worked hard to select books that are intellectually engaging and good pieces of art. They're good reads. As our books have gained legs and received various accolades, those biases have begun to erode. Marketing to general, non-academic audiences is an ongoing challenge as well. This is true for any publisher of fiction, but more so for an academic press not positioned to market to broad audiences. As a goal of the series has always been public scholarship, we've made great efforts in this direction with increasingly optimistic results.

**And what has been the most rewarding part of being Editor of the series?**

Publishing beautiful, innovative, brave books that ought to be published but likely would not be if our series didn’t exist. It’s been especially exciting working with authors for whom this was their first book or first published work of fiction. Seeing the impact on the field, and even the adaptation of my term "social fiction" has also been wonderful. There’s been enormous growth in the field in a short period of time which is very promising and I’m honored to be a part of it.

The series has published many brilliant texts, and I’m sure it’s hard to pick any favourites. Instead, can you tell us a text from the series that surprised you, one that challenged you, and one that really moved you?

[If the Truth Be Told: Accounts in Literary Forms](#) by Ronald Pelias definitely surprised me. His intent was to play with readers’ sense of fact and fiction and to trouble those assumptions. He succeeded. Of all readers, I am well situated to accept the validity of fiction as creating credible, authentic accounts and I read tons on the subject. Yet I was captivated by his unique, beautifully written book and to your question, as I suspect other readers will be, he surprised me more than once.

[Critical Plays: Research for Embodied Change](#) by Anne Harris and Christine Sinclair definitely challenged
me on a personal level. The protagonists are two art education professors, one of whom was an artist first who turned to teaching to earn a stable living, with the hopes of continuing to be an artist. The character struggles and in a brilliant monologue dares to say what many artist-researchers think and fear, in different ways: whether they are living the life they really want to, whether they are true artists, and whether they've sold out. As someone who wanted to be a writer and first became an academic, I was challenged being confronted with some of my own inner thoughts over the years.

When you asked about one that really moved me two immediately sprang to mind. [22] Blackeyed: Plays and Monologues by Mary Weems is a powerful collection of plays and monologues about Black experiences. It’s absolutely gripping. Mary was actually one of the first people to submit a proposal to the series, although at the time I couldn’t publish her work. She sent in a short play called "Meat" about the murders of Black women. It’s so powerful and moving that although I could not publish it at the time for various reasons, I never forgot it. Years later when the series was a success I emailed Mary and offered her a blank contract. That is how Blackeyed came to be. "Meat" is a part of the collection and recently won a Cleveland Arts Prize. I was also deeply moved by [23] Arts-Based Research, Autoethnography, and Music Education: Singing through a Culture of Marginalization by Miroslav Pavle Manovski. I first read it when it was a dissertation up for an arts-based educational research dissertation award given by the American Educational Research Association. I was on the awards committee. It was our unanimous first choice because we were all so moved by it. In short, it’s about the systematic bullying and tormenting the author faced, largely for being gay, and how music and music education provided a path through the pain. I was so moved by it that after he received the AERA award I emailed him and offered him a publishing contract. Amazingly his manuscript had been rejected by several publishers. I believe he is our only author who never had to submit a formal book proposal.

You’re a vocal proponent of public scholarship and public sociology in particular. At its best, what do you believe work like the Social Fictions series has the potential to achieve?

I think it will help us reach the potential of sociology, which you captured beautifully in your recent article about novel writing in sociology. Social fiction is helping to show sociologists what is possible. This is a discipline meant to live outside of the academy, but there's always been a disjuncture between that goal and the reality of how research has been conducted and disseminated. Social fiction raises the bar because it calls on us to engage with new forms, those that have a chance at meeting the promise of our discipline. More people outside of the academy have access to sociological work because of social fiction, and I think there is enormous potential for that to increase as these formats continue to gain legitimacy and students are more empowered to work with them.

What impact do you see work like this having on Sociology in the future, as a professional academic discipline?

In your article you wrote eloquently about a couple of things that I think really speak to this. First, the benefits to those committed to public sociology. Second, the ability to link the micro and macro levels, providing a panoramic and personal viewpoint, and to place readers within those imagined realities. This is the "sociological imagination" realized. I think as more sociologists become aware of this approach and teach with social fictions in their courses, they will understand the real potential of this work and it will help push the discipline forward. We need more publications and more professors teaching with this work in order to have a largescale impact on the field. I hope that happens.

And finally, where do you hope to see Social Fictions in another five years? What are you aiming for your-
I'm not sure. I'm open to what comes next. We surpassed my initial vision long ago and since then I've just remained open. A year ago I was thinking about an ending point for the series and even thought book number twenty might be it. But here we are releasing the twentieth book with several others under contract and coming down the pipeline. Recently we've had some interest in foreign translations. That's very exciting to me and something I'm actively pursuing. As for myself, I want to continue to push myself and to hone my craft. I have plans for more novels, in the genre I've written in as well as other genres. I want to explore what else social fiction might be used for.

[28]Patricia Leavy, Ph.D. is an independent scholar (formerly Associate Professor of Sociology, Chair of Sociology & Criminology and Founding Director of Gender Studies at Stonehill College). She is widely considered an international leader in the fields of arts-based research and qualitative inquiry. Her twenty published books include [29]Method Meets Art: Arts-Based Research Practice (first and second editions), [30]The Oxford Handbook of Qualitative Research, [31]Fiction as Research Practice, [32]Essentials of Transdisciplinary Research and the best-selling novels [33]Low-Fat Love (first and second editions), [34]American Circumstance (first and second editions) and [35]Blue. She is series creator and editor for seven book series with Oxford University Press and Sense Publishers, including the ground-breaking [36]Social Fictions series. Known for her commitment to public scholarship, she is frequently called on by the US national news media and has regular blogs for [37]The Huffington Post, [38]The Creativity Post and [39]We Are the Real Deal. For her work advancing arts-based research she has received numerous awards including the New England Sociological Association 2010 New England Sociologist of the Year Award, the American Creativity Association 2014 Special Achievement Award, the American Educational Research Association Qualitative SIG 2015 Egon Guba Memorial Keynote Lecture Award, and the International Congress of Qualitative Inquiry 2015 Special Career Award (she is the youngest recipient). Hip hop culture, philanthrocapitalism and getting shit done (2016-07-08 08:00)

I’ve been fascinated in recent months by the relationship between hip hop and tech. In some cases quite explicitly, senior figures in technology find cultural inspiration for the approach they take to management in contemporary hip hop. I’m interested in the notion of ‘business for punks’ for the same reason.

In essence, I thought this was a product of focusing on ‘disruption’: seeking cultural resources to help motivate oneself to be disruptive. But this fascinating extract from No Such Thing as a Free Gift, by Linsey McGoey, loc 100-118 suggests it might also be a shared concern with ‘getting shit done’:

It took place, reportedly, in New York, where Gates had been hanging out at the back of a bar with Bono and other friends when P. Diddy approached their table. He stood before Gates and nodded. ‘You are a motherfucker’. Gates’s eyes darted at the man. It’s doubtful the world’s most generous philanthropist hears comments like this too often –at least not to his face. Diddy continued his train of argument: ‘You are a motherfucker. What you are doing on immunization in Botswana? Motherfucker’. Gates leaned back in his chair. He realized that Diddy was offering him a high compliment. The encounter is reported by Matthew Bishop and Michael Green in their book Philanthrocapitalism: How the Rich Can Save the World. The book has become something of a bible for a new breed of philanthropist vowing to reshape the world by running philanthropic foundations more like for-profit businesses. In this world, Gates is hailed as the ‘MacDaddy’ of the new philanthropy. Bishop and Green offer a quote from Bono on the appeal of Gates’s charitable work: ‘Jay-Z, all of the hip-hop guys, kind of adore him. Because he is not seen as a romantic figure –well, maybe romantic in the sense that Neil Armstrong is romantic, a scientist but not a poet. He gets shit done’. 8

Are exploitative professors breaking the law by recruiting student interns? (2016-07-09 08:00)

Based on the cases I’ve seen in person, I suspect there’s a growing subterranean practice in the UK of exploitative professors recruiting students to work as unpaid research assistants with the promise of a ‘letter of reference’ in lieu of payment. In one case that particularly bothered me, the first year UG student in question explained to me how the ‘research’ was tedious data entry and she felt she learned nothing from the experience.

This is clearly wrong, but is it illegal? Apparently, it depends on whether the student would be classed as a worker rather than a volunteer. This is what Gov.Uk says:

2. Worker

A person is generally classed as a ‘worker’ if:

they have a contract or other arrangement to do work or services personally for a reward (your contract doesn’t have to be written)
their reward is for money or a benefit in kind, eg the promise of a contract or future work
they only have a limited right to send someone else to do the work (subcontract)
they have to turn up for work even if they don’t want to
their employer has to have work for them to do as long as the contract or arrangement lasts
they aren’t doing the work as part of their own limited company in an arrangement where the ‘employer’ is actually a customer or client

Voluntary workers

Workers aren’t entitled to the minimum wage if both of the following apply:

they’re working for a charity, voluntary organisation, associated fund raising body or a statutory body

they don’t get paid, except for limited benefits (eg reasonable travel or lunch expenses)

Could anyone clarify about legality? My impression had been that complaining within academic structures was the best way to curtail this practice. But I wonder if it would be more effective to directly contact HR departments and ask them to confirm the role offered is actually legal.

This is the legal situation in the U.S., detailed on loc 1260 of Intern Nation:

The broad outlines of a broken paradigm are clear. Unless substantial training is involved, an intern is considered to be an employee, however temporary or inexperienced, and entitled to minimum wage and other protections under the Fair Labor Standards Act (FLSA), the central piece of federal legislation that addresses the rights of American workers. It doesn’t matter whether it’s at a blue-chip company or a small business, whether it’s full-time or one day a week, whether the goal is academic credit or a midlife career change—by law, there are very few situations where you can ask someone to do real work for free.

Kieran (2016-07-09 10:05:46)
I’ve ended up doing free teaching quite a few times. Usually my PhD supervisors or other academic colleagues will ask for my or my PhD colleague help, but explain they can’t pay us - usually ‘departmental budgets’ are vaguely mentioned as an excuse, and the benefit of ‘experience’ offered up as a secondary prize to actual wages. Unlike other universities we aren’t compensated for teaching via our stipend. In fact for my first year my stipend was about half that of other universities (about £600 a month)
despite being a full-time PhD. I often wonder about the legal basis of this practice.

Social media for academics and the risk of becoming ‘TED heads’ (2016-07-10 08:00)

One of the anxieties I’ve regularly encountered about social media for academics is that it might lead to a devaluing of academic culture. What if I were to tell you that the spectre haunting the imagination of academics is the TED talk?

There’s a lovely expression used by Linsey McGoey in her No Such Thing as a Free Gift, ‘TED Heads’:

> amiable entrepreneurs and executives who congregate at exorbitantly priced TED events around the world, flocking to headline events (‘speaking innovation to power’; ‘branding for good’) with the earnestness of a Grateful Deadhead on his fifth tour.

Vacuous thought leadership, nuggets of easy digestible platitudes, perfect for cultivating vast audiences of overly-influential idiots. It’s a compelling vision, as far as fears go. It’s one founded on a [2]conflation of simplification and being simplistic. But it’s nonetheless something which advocates of social media for academics need to do more to counter substantively, rather than merely dismiss.
Max Weber’s triad – status, class and party – in light of Brexit: A call to party harder (2016-07-10 10:04)

Max Weber famously presented three principles of social ‘stratification’ (‘organization’ would be better): status, class and party. The ongoing saga of Brexit brings to light some interesting features of the last category, which otherwise tends to be neglected or treated as subordinate to the other two.

At the outset, it is worth recalling that Weber conceptualised these three principles as alternative ways in which the law channels power in society. His own presentation stressed the mutually orthogonal character of the three principles, resulting in three distinct dimensions through which power relations can be understood. This way of framing matters enabled Robert Merton to coin the phrase ‘sociological ambivalence’ in the 1970s for conflicts in role-expectations generated by these rather different sources of personal identity.

My own take on Weber’s tripartite conception is that they correspond to the three major lived temporal horizons: past (status), present (class) and future (party). Their grounds for legitimizing power relations are symbolized by, respectively, the hereditary entitlement, the balance sheet, and the public relations campaign. Let me explain each briefly before focusing on the last category.

Status is a principle grounded in the inheritance of acquired traits. Thus, my status is both a privilege and a burden based on the achievements and/or failures of my ancestors. ‘Honour’ is thus the name of the standard that I qua descendant am compelled to meet or exceed by virtue of my status. The strength of a status-based social system may be measured by the extent to which any subsequent failure on my part to uphold this legacy is localized to me or allowed to contaminate the entire lineage’s status.

Class is a principle grounded in ongoing relations to the means of production in society, which are stabilized by the ‘state’, an entity whose very name implies a capacity to hold change in check, thereby establishing a common sense of the present. The ‘egalitarian’ character of Marxism is founded on the idea that all existing classes are equally valuable to society, such that were the proletariat to withdraw its labour the system would collapse. When Marxists speak of a ‘classless society’, they really mean ‘class’ in a sense closer to ‘status’, that is, something into which one is born and cannot change.

Party is a future-oriented principle for organizing social life. Thus, a party system forces conservatives to campaign for the idea that the future should be as much as possible like the past, rather than simply have society take it as the default pattern of existence. In this respect, parties are inherently aspirational. Parties emerge in a world of periodic elections which invite people to reinvent their political affiliation in the name of providing society with a collective direction. The assumption is that people are sufficiently competent and compliant both to represent their own opinions and to execute the electoral outcome. This is a big assumption!

The bigness of the assumption is reflected in the extent to which the sort of objections that were raised against party
politics before its widespread institutionalization have been reinvented in our own time. In the seventeenth century, the objections were grounded in a Christian conception of human fallibility at once moral and epistemic, but in any case resulted in a corruption of judgement: People are both too easily swayed by self-indulging bad arguments and not swayed easily enough by self-limiting good arguments. Nowadays, the same case is made by evolutionary psychologists, decidedly without the original theological spin.

So then, what promotes the party mentality?

The short answer is the belief that people can be other – and typically more – than they have been. Parties enter politics as formally recognised social movements, which aim to get people to alter their sense of self. Even those who promote a status- or class-based social order are forced through the party system to envisage that people might wish to shift position. Thus, parties are incompatible with castes. Indeed, one of the more alarming features of parties for many who value social order is that they prey on the plasticity and fickleness of the electorate. Party politics stagnates if people’s votes become too predictable based on indicators other than the pitches produced in a particular electoral cycle.

More than Weber, his older contemporary Vilfredo Pareto was the master theorist of party-based politics. (For more on Brexit related to this conception, see [1]here.) For Pareto, it was all about the ‘circulation of elites’, which pertains mainly to the speed of circulation and the openness of the process. These two dimensions are orthogonal to each other. Pareto was mainly concerned with the speed of circulation. Following Machiavelli, he posited two party-types: the ‘Lions’ who appeal to authority to maintain an orderly succession, and the ‘Foxes’ who play on intrigue and chance to speed up the process. Generally speaking, Lions rule by default and Foxes in the exception.

However, the modern period’s extension of the vote to the masses introduced a second dimension to party politics, which Pareto only began to explore: It’s the relative openness of the elites to new entrants, who are then brought into the circulation process. Greater democratization has meant greater openness, but there is then the question of whether the masses are incorporated at a steady pace or all at once. The former route is the one preferred by social democratic regimes, which stagger entry into the elites over several generations through education, etc., resulting in the long march known as ‘upward social mobility’. The latter route is the more populist one, which disdains the very idea of meritocracy and would incorporate masses literally en masse.

We might call this general openness to the incorporation of the masses into the elites, ‘Left Paretian’, adherents to which then differ over whether it happens slowly (Lions) or quickly (Foxes). The ‘Right Paretians’ are those who think the difference between the elites and the masses should always be clear. Thus, while some people may manage to migrate from the masses to the elites, there shouldn’t be explicit government policy to encourage such migration. The idea underwriting the Right Paretian position is that the volatility entailed by the circulation elites works best when fewer players are in the mix so the people can be treated as ‘masses’ in the literal sense of relatively inert resources to deployed in the elite power play.

Parliamentary democracy is the modern site for playing out Pareto’s vision. And while the UK is famously known as the home to the oldest major parliamentary democracy, it was founded before the convention of written constitutions. This has meant that the relation between the people and their elected representatives has been always left open. Thus, there is no formal rhetorical space for parliamentarians to exert their superiority over the people who elected them. This means that the exact sense of ‘authority’ which parties can exert over their membership is ambiguous and left to relatively tacit understandings.

Nevertheless, it is clear that Members of Parliament from the UK’s major parties – Tory and Labour – are Left Paretian in their self-understanding and, if the antipathy of most of them to Brexit is an indicator, on the ‘Lion’ side of the Left. But party members seem not to be so inclined, and this has led to increasing internal tensions in both
parties. The members see their elected officials as empowered to administer their collective will, not as exercising judgement in ways that serve the people's interests – which may involve 'sublimating', if not nullifying, the collective will.

If the UK learns nothing else from Brexit, it should be that a parliamentary democracy can work only if it becomes self-consciously Paretian and lays down explicit rules to the game by which Parliament plays – which in turn means a written constitution.

Social media and academic labour (2016-07-11 08:00)

In recent years, we've begun to see social media move from the periphery to the mainstream of academic practice. But what does this mean for academic labour? While much of the discussion concerns the possibilities for scholarly communication, what about the possibilities for an expansion of managerial control? Social media might vastly extend the range of communicative options available to academics, but does it similarly expand the expectations placed upon academics to communicate? What does academic freedom mean in a communications environment where academics can both engage with and potentially be harassed by, larger audience than have ever previously been the case. These are amongst the questions this talk will address, drawing on recent work on the acceleration of higher education to consider the implications of social media for academic labour.

Listen to the podcast from my talk in Leeds a couple of weeks ago [1]here.

"Platform Health" and digital privatisation (2016-07-11 09:15)

A couple of weeks ago I went to a conference about the UK government's new digital strategy which is spearheaded by a department of the civil service called the [1]Government Digital Service. Central to the strategy is a new "platform" system for all public services and one of the key targets of the next 15 years was highlighted as a move towards "platform thinking". Here I will reflect on what I think might be some of the consequences of this for health.

Under this new approach users will be provided with a single digital identity through which they can access all government services. This, we were told, is a response to the reality of the digital world and is necessary in order to keep up with public expectations. It is part of a move from government of the industrial age to government of the
Central to this was the government’s new "[2]verify" and "[3]pay" systems. These are ways of proving your identity and paying for government services or transactions in a secure way online. They were compared at this event to Google and Facebook’s methods of verifying identity which are used across different platforms; this was seen as the model for the government service.

The introduction of this platform system is, however, also a means of stimulating and creating markets. As can be seen in the quotation below from the [4]GDS blog, platforms are seen as being inherently connected to the constitution of markets and competition.

Platforms stimulate markets, and markets drive innovation

Government’s current siloed approach stifles innovation, and leads to various problems such as:

- rent-seeking behaviour from incumbent suppliers
- new suppliers being excluded, even if they have newer, more innovative ideas
- encouraging proprietary activity and technology

If we create platforms based on open standards and interoperability, we automatically create competition and drive innovation. That means more providers and lower costs. We can boost a nascent market of providers, building upon our open services - a market that has, until now, been held back by the contracts that locked us into those closed, proprietary systems. Companies, charities, clubs and co-ops can use the same infrastructure to set up additional services that government can’t justify, or can’t afford. For example: look at [5]GOV.UK Verify, which is stimulating the identity services market. It is setting standards, aggregating demand across government and government services, building a whole new market for identity services in the UK. New identity services are springing up and moving from "clever idea" to "commercial product" very quickly. Programme Director Janet Hughes explains it brilliantly in the [6]presentation she gave recently at the [7]Follow the Entrepreneur conference: without that market influence, if government had tried to procure a solution a few years ago, the specification would already be hopelessly out of date. The market brings innovation, and innovation brings better identity services.
It is clear from the discussion around the introduction of this "platform thinking" that the real target is not technological but cultural. As the Minister for the Cabinet office Matt Hancock stated in his speech to the national digital conference in June 2016:

"... Everyone here knows that digital is the easy part of digital transformation. The hard part is the transformation. It’s easier to write new software than to rewrite an organisational culture. Easier to upgrade to the latest device going to upgrade to the latest skills. Old technology can be replaced but old habits die hard."

Later he stated that "... The most important aspect of business transformation is transforming the way we think about delivery". This platform approach is intended is to be disruptive and to create new markets and opportunities in new methods of procurement of public services.

One of the visions for this platform approach to government was presented at the event I attended by a representative of Nesta (who are a charity who advocate for the expansion of innovation capacity in the UK).

As part of their "connected councils" vision they suggest that within a few years we could be engaging with council services through "personalised portals". Their "[2025 vision] is that "Like the best tech companies future councils will be lean, agile and data driven".

Amongst the benefits of this approach will be greater "market segmentation" and "algorithmic content" enabling "hyperlocal content". This system would work on a similar principle to Amazon's recommendation system with only the most specific local council information being directed towards you based on knowledge of your location and previous interactions with the system.

The digital strategy for healthcare is also clearly built around a commercial model as stated in the "[2020 framework for action]:
"In other parts of our lives, we see the benefits of technology, one on the way we book our travel and holidays, manage our bank accounts and utility bills, buy groceries, connect and communicate with our friends and family."

A recent report by the Nuffield trust bemoaned the fact that the NHS is stuck in the pre-Internet and pre-mobile phone era. But as is also stated in the report

"**Culture change is crucial.** The majority of the issues faced by the journey of transformation of people problems, not technology problems. This means that organisations need to invest least as much into the programmes of organisational change and transformation as they do in the technology itself"

But what is this change they describe? One of the speakers at the event I attended recounted a story they had heard from a nurse which they saw as being instructive of this kind of change.

The nurse told of an incident in which a patient came in to accident and emergency and upon being told there is a significant wait ahead of her asked if the nurse could send her a text message when her turn was coming up so that she could pop across to New Look in the meantime. This was presented by the speaker as indicative of the kinds of demands which the NHS should now welcome and adapt to.

Although I am not an expert on either it seems to me that both the government and the NHS have a somewhat patchy record of implementing large new systems. The extent to which this new "platform" approach seems to ape that of Google, Facebook, Microsoft, et cetera seems to me to open up a potential for a player of their kind to enter this field.

It is certainly conceivable that in a few years time the government will realise that they do not have the capabilities to properly implement this kind of approach and will look to the "experts" in this for help. The emphasis which has been placed so far on changing the culture and organisation of government, and health, services into a form which is similar to that of large tech companies (and crucially one which is focused on markets, disruption and innovation) seems to make this an even more desirable field of intervention for these kinds of companies.
I expressed this concern to a civil servant working for the Department of Health at the event who stated this kind of access for big tech companies was not possible due to the protections on patient data. I mentioned Public Health England's new "One You" initiative a central part of which is the "One You Health Hub" which is hosted on Amazon. I have described on the Cost of Living Blog how this largely consists of bland health advice and links to pages to enable users to buy Fitbits and Wi-Fi enabled bathroom scales.

This seems to me to be consistent with the "platform" approach to health. I also mentioned the access which Google have been granted to over 1.5 million health records in London (I have since learned of access they have got to NHS eye records). They had not heard of either of these cases and expressed disbelief as to how Google were allowed this especially considering how difficult it was for them to move data from one department to another.

While privatisation of health and the NHS has an established history this "platform" approach to public services seems to be producing a different kind of privatisation. The cultural change which is seen as crucial to the implementation of new digital technologies might also be a softening up of the services specifically for the encroachment of digital industries.

7 Propositions about Transformative Horizons (2016-07-12 08:00)

1. Our perception of transformative possibilities is culturally constructed. Certain ranges of possibility are foregrounded and others backgrounded. Our sense of viability is the most cognitive dimension to this, informed by implicit and explicit ontological assumptions about how the social world works. But perceived transformative possibilities are also shaped by much less conscious factors, ranging from the cultural raw materials with which we conceive of the future to the futurity entailed by conditions of our everyday lives.

2. Nonetheless, what concerns us are real possibilities inherent in actually existing states of affairs. The susceptibility of social formations to transformative change reflects a complex constellation of causal factors: some serving to reproduce the existing social order and others latently contributing to its potential transformation.

3. It’s because of this complexity that transformative horizons elude the ambitions of any one corporate agency. The very fact of different socially transformative and reproductive projects means that the social change that does occur is inevitably characterised by unintended consequences.

4. This chaotic character of social change too rarely finds itself considered in the cultural construction of transformative horizons. Instead, we think and dream in terms of collective agents carrying forth projects of change, rather than of change as something resulting chaotically from the clashes between such collective agents in circumstances not of their choosing.

5. Wilful withdrawl from this complexity can be read psychoanalytically as a refusal of the Real. What I’m describing (ontologically) as the chaotic nature of social change has its (epistemic) corollary in the fact that real horizons of possibility elude our capacity to fully symbolise or conceptualise them.

6. This is why dreaming of possible worlds or refusing Utopianism is so psychically charged: we fall into a tendency to over symbolise or under symbolise Real horizons of change because of the affective dilemmas involved in a continual engagement with reality, negotiating between what is and what could be.

7. The materiality of our action means that these negotiations between what is and what could be are themselves contributions to the reproduction or transformation of social formations. The landscape is continually changing as we are orientating ourselves within it.

CfP: Countercultures of Data (2016-07-13 08:00)

Call for Papers for "Philosophy and Technology"’s special issue on Countercultures of Data

Guest Editor
About the Issue
25 years ago, Sandra Harding—in her influential book *Whose Science? Whose Knowledge? Thinking from Women's Lives*—detailed and extended critical debates surrounding knowledge production and practices in science and technology. Collectively, these "countercultures of science" confronted the "problematics, agendas, ethics, and consequences" of scientific and technological production head on. Today, these same perspectives offer insight into the realm of data science, as philosophers, scholars, and practitioners alike grapple with ethical questions in a world where discourse, design, and governance increasingly revolve around "big" data and quantifiable knowledge.

This special issue will bring together rigorous conceptual and theoretical perspectives on what might best be called—following Harding—emerging "countercultures of data." In particular, this issue will further critical and philosophical thinking about the theories, methods, institutions, and technological arrangements that underwrite or support data science in various industries and forms. Combined, contributions to the special issue will put forward a more realistic assessment of possible futures for a data driven world.

We invite submissions related (but not limited) to:

- Race and Data Science
- Theories of Property, Labor, and Data
- Political Economies of Data
- Data and Imperialism
- Feminist Perspectives on Data Science
- Data, Bodies, and Disability
- Data, Infrastructure, and the Environment
- Data, Philosophy, and the Law
- Communities and Data
- Data and Queer Subjects
- Data and/as Human Subjects in Research
- Data Science and Epistemic Justice

Timetable for Submissions
October 24, 2016: Deadline for paper submissions
December 21, 2016: Deadline reviews papers
February 6, 2017: Deadline revised papers
2017: Publication of the special issue

Submission Details
To submit a paper for this special issue, authors should go to the journal’s Editorial Manager [1]http://www.editorialmanager.com/phte/ The author (or a corresponding author for each submission in case of co-authored papers) must register into EM. The author must then select the special article type: "COUNTERCULTURES OF DATA" from the selection provided in the submission process. This is needed in order
to assign the submissions to the Guest Editor. Submissions will then be assessed according to the following procedure:
New Submission => Journal Editorial Office => Guest Editor(s) => Reviewers => Reviewers’ Recommendations =>
Guest Editor(s)’ Recommendation => Editor-in-Chief’s Final Decision => Author Notification of the Decision. (The
process will be reiterated in case of requests for revisions.) About the Journal The journal addresses the expanding
scope and unprecedented impact of technologies, in order to improve the critical understanding of the conceptual
nature and practical consequences, and hence provide the conceptual foundations for their fruitful and sustainable
developments. The journal welcomes high-quality submissions, regardless of the tradition, school of thought or
disciplinary background from which they derive. The journal’s Editor-in-Chief is Luciano Floridi (Oxford). Contact For
any further information please contact: Anna Lauren Hoffmann - [2]annalauren@berkeley.edu

Three computational sociologies (2016-07-14 08:00)

An [1]interesting post by Fabio Rojas on the different ways in which the label 'computational sociology' has been used:

• Statistics – for the baby boomer generation of social scientists, "computing in socioal science" meant
  applied statistics. Remember, it requires a lot of knowledge and skill to store data and estimate
  models on computes with limited computing power.

• Agent based models – in the 1980s and 1990s, "computational" meant running simulations.

• Big data/CS techniques – currently, the term seems to refer to either (a) large data generated by
  online behavior and/or (b) using computer science techniques (e.g., topic models or sentiment anal-
  ysis) to study social science data

My concern is that 'computational sociology' of the final sort risks leading to a computational social science that is
not recognisably sociological: though this raises the obvious question of why this is a bad thing and what it means
for something to be 'recognisably sociological'.

A brilliant job for those interested in social media and higher education (2016-07-15 08:00)

The LSE Impact Blog is recruiting for a new editor:

The LSE Impact Blog is an award-winning, highly popular blog aimed at academics, researchers, and HE professionals. It publishes regular blog posts on scholarly publishing, research methods, and maximizing the impact of academic research. Reaching an audience of over 80,000 unique visitors a month, the blog is widely recognised as a world leader in new forms of academic communication.

The post is suitable for someone with experience working with academic writing and a keen interest in the social sciences and academic impact. The individual must be interested in debates around the future of academic communication, measuring academic impact, social media and metrics, non-traditional academic outputs, and knowledge exchange.

The Editor will be responsible for all aspects of the day to day running of the blog. The role involves commissioning blog posts from a wide range of internal and external contributors; editing copy and giving feedback to contributors in a constructive and positive manner; maintaining a regular flow of a minimum of 3 blog posts per week; publishing contributions using WordPress; and utilising social media to disseminate posts and boost engagement.

Part of the role will also involve assisting in an exciting side project which aims to help LSE understand the impact of its public-facing blogs. Working with the project’s Research Assistant and the Social Media Manager, tasks may include event planning, promotion of the project through social media, and working with colleagues to shape project direction.

In addition to a good salary, the benefits that come with this position are a defined benefits pension scheme, generous annual leave and excellent training and development opportunities.

For further information about the post, please see the job description and the person specification.

To apply for this post, please go here or to www.lse.ac.uk/LSEJobs. If you have any queries about applying on the online system, or require an alternative format for the application, please e-mail: hr.jobs@lse.ac.uk quoting reference 1481958.

£27,657 – £32,013 (depending on experience)

This is a fixed term appointment with funding confirmed until 31 July 2017

Closing date for receipt of applications is 13th July 2016 (23:59 UK time). Regrettably, we cannot accept any applications received after this date.

Interviews are envisaged to take place in w/b 18th July 2016.

Call for blog posts: the lived experience of interdisciplinarity in social research (2016-07-17 16:06)

Following on from our successful workshop at Social Media & Society 2016, the Digital Social Science Forum is seeking blog posts describing and reflecting on the lived experience of interdisciplinarity in social research. The workshop itself sought to explore conceptual challenges in interdisciplinary social media research, encountered at the level of substantive theoretical commitments but also in terms of taken-for-granted assumptions that inform everyday practice. But our intention for this project is broader, seeking reflections on any aspect of the lived experience of conducting research across and through disciplinary boundaries.
Our primary focus is on digitally orientated research, e.g. social scientists and computer scientists working together, but we warmly welcome contributions from other areas. These might reflect upon things like:

- The role of 'boundary objects' in facilitating work across disciplinary boundaries.
- How a lack of clarity about mutual definitions can both support and hinder interdisciplinary collaboration.
- The importance of reclaiming 'the human' as a shared focus in interdisciplinary research.
- Coping with the challenge of an imperialistic naturalism i.e. forceful assertions of the failure of the social sciences and the necessity of remaking them along the lines of the natural sciences.
- The messy reality of working in interdisciplinary teams.
- What does conceptual development mean in collaborative work across disciplinary boundaries?
- The role of personal relationships in facilitating successful interdisciplinary work.
- Failures and frustrations of interdisciplinarity.
- Getting beyond the motif of the 'attic scholar' and socialising the research process.
- The role of doctoral pedagogy in hindering successful interdisciplinary collaboration.
- Organisational helps and hindrances to working across disciplinary boundaries.

These are just suggestions. Our interest is in how these sometimes obtuse issues are worked out at the level of everyday co-operation: how is the messy reality of interdisciplinarity lived and how should this shape our approach to it? These blog posts will be compiled at the Digital Social Science forum, organised thematically and circulated on social media channels as a public resource.

Contributions should be short (500-1500 words) and will be accepted on a rolling basis. Please send as a word document to mark@markcarrigan.net. Feel free to get in touch to discuss a potential contribution.

Vintage social media (2016-07-18 08:00)

by Jonathan J.B. Mijs

In service

I saw her today and it was freaking scary A Thursday afternoon at JP Licks She was not even smiling but
Jonathan J.B. Mijs is a Doctoral Candidate in Sociology at Harvard University. When he is not writing about himself in third person, he is studying how (young) people come to see and explain setbacks in their own lives and that of others, which is the topic of his dissertation.

"I am not afraid to speak" - Victims of Violence (2016-07-18 14:07)

by Lisa Gaufman

The Russian and Ukrainian language segments of the Internet are being rocked by hashtags #небоюсьсказать #небоюсьсказать – [1] I am not afraid to speak that were started by a Ukrainian activist [2] Anastasia Melnychenko. Under these hashtags women share their experiences of abuse, be it physical, sexual, moral, or verbal. Most of these stories are simply terrifying: not only because they show how women can be randomly sexually assaulted, but also because these stories are routinely discarded by the women’s bosses, parents or friends. It’s just "boys being boys", "you should be happy that such a prominent man paid attention to you", "it’s your fault anyway – you drank too much". The latter one – victim-blaming – is a particularly common refrain in the comment section to these heart-wrenching posts, and not just from men, with a lot of them seeing an unconscious woman as a legitimate sexual prey – like in the [3] Stanford rape case. It’s also women who think that these stories only happen to you if you behave inappropriately: your skirt is too short, or drink is too long.

The problem is that it happens more frequently than many people think. [4] Statistics of domestic violence in Russia are disturbing: according to Russian Ministry of Internal Affairs, around 12,000 women die annually of domestic abuse, while approximately 60-70% of incidents of abuse never even get reported. A headline for an article on domestic violence in Rossiyskaya Gazeta reads [5] 'If he kills you, then report it’. In other words, law enforcement officials routinely discard the claims of domestic assault brought forward by women. The catchphrase ‘sama vinovata’ - it’s your own fault – is a common refrain on social media. Even women who suffered from domestic violence usually tend to justify it or reconcile with their offenders and continue to tolerate the abuse. This 'normalcy' of violence against women is usually explained by heteronormative culture in Russia, but sexual violence is even
more underreported because of the stigmatization associated with it. Moreover, some men even consider the #Iamnotafraidtospeak campaign a [6]'festival of home-made porn', accusing women of using their genitals for career advancement.

No Woman, No Cry

The Eastern Orthodoxy Russia adopted from the Byzantine Empire equated a female image with Eve, the temptress that led to the Fall and expulsion from Eden. Moreover, the female ideal in Russian culture is associated with motherhood: even the name of mother of God in Russian is "bogoroditsa" – the one who gave birth to God, and not Madonna – my lady. Hence, it has no Troubadour connotations of admiration of a woman in a platonic and/or sexual way. A woman can be either a mother or a sinful temptress, and the latter may be legitimately abused as she is by definition evil and inferior.

There is a whole strand of truisms related to the acceptability of violence towards women. The roots of this concept could be traced to [8]Domostroi, a Russian 16th century collection of household advice, that recommended beating the wife ‘politely’ on her body, avoiding her eyes and face. Domostroi-inspired logic can be seen in a popular saying "byot, znachit lyubit" (if he beats you, it means he loves you) that even justifies violence from a standpoint of a healthy relationship. Another Domostroi-motivated truism even argues that beating a wife improves on her character: “Bey babu molotom — budet baba zolotom” (if you beat your wife with a hammer, she will be golden).

Back to the future What is more, cases of sexual abuse of men were rarely discussed in this campaign, but men get even more stigmatized if they become victims of abuse. In a gender-polarized culture, a person meeting the criteria of "correct masculinity", should always dominate; he can be killed but not humiliated. From this perspective, rape is among other things, humiliation and the establishment of a victim’s inferior status. That is why it will take a lot of time before it will be acceptable for men to speak out about the abuse they endured, especially given how much vitriol the women speaking out now have to deal with. But what is also important, it made many men in Russia think what women next to them have to deal with every day: catcalling, unwanted advances, constant threat of sexual and non-sexual violence that make them carry their keys in their hands or not wearing headsets late at night. Why is there so much victim-blaming that surrounds the #Iamnotafraidtospeak campaign? It may be explained with a belief in a just world: people want to believe that, if they do all the right things, follow the rules, nothing wrong will ever happen to them. Wrong things happen only to wrong people – a variation of “you reap what you sow”.

According to this concept, however, it is the victim that is responsible for the action, and the aggressor is styled as some sort of uncontrollable force. Blaming the victim helps an individual to hide his or her own fear of helplessness in a chaotic world, a compensatory attempt to ensure that you are able to control everything around you. However, despite the “it’s your own fault” camp voices, many men and women realized that being a victim of violence is not a choice, only dismissing the victims of violence is. It is hard not to be afraid, but at least it has become a bit easier not to be afraid to speak. Elizaveta Gaufman received her PhD in Political Science from the University of Tübingen. Her research focuses on the exploration of verbal and visual enemy images through big data analysis, combining international relations theory with media and cultural studies. MeToo | Duck of Minerva (2017-10-17 18:35:49)

[...] No, it isn't. But that is what a relatively famous Russian actress Lyubov Tolkalina had to say about the Hollywood scandal. Even though in the same article about Russian movie industry attitudes to Harvey Weinstein there were other opinions, including from men who sympathized with the victims of sexual assault and derided the hypocrisy of the movie industry in Russia and the US, so far the response to the Hollywood revelations in Russia have not necessarily been #MeToo. The underlying issue here is not just the patriarchal culture, but also the internalized misogyny and victim blaming that go with it, or, as Lyubov Tolkalina puts it, "A woman is always guilty in male sexual assault". Being a part of a macho patriarchal culture is hard, so a lot of women side with the desirable and hierarchically higher in-group – men – and re-affirm female objectification and disparagement. Moreover, this kind of responses mirror the pushback against the social media campaign #IamNotAfraidtoSayIt (#янебоюсьсказать) initiated by a Ukrainian activist in 2016 where women in Post-Soviet space shared the horrifying stories of sexual abuse. [...] 

feshop-s1.ru (2018-03-14 17:45:55)

I really did not expect that so many people I know — women and girls — have been victims of violence and harassment, many from a very young age.

Using @IFTTT and Twitter to curate material for research projects (2016-07-19 08:00)

Two new projects I’m in the early stages of working on both necessitate engagement with phenomena that are developing rapidly. This poses an obvious question: how to identify relevant material and then archive it in a useful way? I’ve written a lot about the [1]curation process before and I won’t rehash it here. Instead, I want to explain a new strategy I’m using. Every time I tweet with the hashtag #Distraction or #DigitalElites, the service [2]IFTTT automatically saves the tweet to a text file in my DropBox. For those unfamiliar with it, there’s an explanation of how IFTTT works [3]here.
This lets me share the item I've found, as well as briefly reflect on it. It also facilitates conversation at each stage of the project, adding to my engagement with the item I've shared. In doing so, I hope it will help avoid the 'graveyard of links' problem, where a vast archive of once useful material becomes intractable when it lacks context and hasn't been filtered through prior engagement.

_______________

**Trumpism 101 (2016-07-20 08:00)**

HT to [1]Steve Fuller for this introduction to Trump syllabus put together by the Chronicle of Higher Education:

This course will explore the phenomenon that is Donald Trump's presidential campaign. We will take an interdisciplinary approach, gathering insights from history, literature, philosophy, political science, psychology, and beyond. The course will be taught by Jeremy Adelman, Elizabeth Anderson, Jennifer Burns, Robert Greene II, Hans Hansell, Steven F. Hayward, Marc Hetherington, Philip Jenkins, Michael Kazin, Jill Lepore, Harvey Mansfield, Kevin Mattson, Dan McAdams, Wilfred M. McClay, Kim Phillips-Fein, Nancy Rosenblum, Michael Tesler, and Alan Wolfe.

Lisa Durff (2016-07-20 23:56:43)
Insights from history - may I suggest Adolf Hitler?

These young adults need an education. Please stop this nonsense

**The Big Data Trap (2016-07-21 08:00)**

A really interesting reflection on the limitations of 'big data' from the FT's Tim Harford:
During a recent PhD upgrade interview at the University of Warwick I was asked to defend my assumption that the study of death, dying and grieving was sociologically based. This took me aback as I had not been expecting to have to justify this aspect of my research. "Of course it belongs in sociology departments" my inner voice was shouting – death happens within society, grief doesn't just affect individuals, it affects wider groups, and is always influenced by the social context within which it happens. The events in Orlando on June 12th bring this sociological context into focus. Public displays of grief have recently become public displays of solidarity, as demonstrated by the worldwide response to the attacks in Orlando and the Paris attacks in 2015.

Social media has played an important part in these social demonstrations of mourning and solidarity: The hashtag #JeSuisCharlie was used over 5 million times in just 3 days following the deadly attack on the offices of Charlie Hebdo, and Facebook introduced a French flag meme for their users to incorporate on their profile page following the Paris attacks. Few would argue that social change is at the heart of the discipline of sociology, and the trending on Twitter of the hashtag #TwoMenKissing, following the atrocity in Orlando, is a clear example of social media being used in an attempt to change negative attitudes – in this instance - toward the LGBT community.

Grief is often viewed as psychological stages to be worked through with the possibility of “getting over” the death of a loved one. However, grief is far more complex than this, it is entwined and embedded within issues of gender, race, class and culture – within a social context. It is not just social grief that is context specific, individual or private grief also happens within a social context that is being made visible by social media.

Grieving is not a purely psychological phenomena to be studied and researched within psychology departments it belongs in sociology department too – I only wished I could have been more eloquent in my defence of my stance during my interview!

Debra Bassett is a PhD Candidate at the University of Warwick. Her research interest lies in whether digital immortality being offered by social media platforms - through the creation of digital messages - will affect how people grieve.
The size of social networks and the size of nation states (2016-07-23 08:00)

A [1]really interesting way of looking at this:

![Diagram showing the size of social networks compared to the size of countries by population](https://www.weforum.org/agenda/2016/04/facebook-is-bigger-than-the-worlds-largest-country)

1. [https://www.weforum.org/agenda/2016/04/facebook-is-bigger-than-the-worlds-largest-country](https://www.weforum.org/agenda/2016/04/facebook-is-bigger-than-the-worlds-largest-country)

Fino (2016-08-02 15:01:44)
What kind(s) of bias can you see in this comparison between a "country" and a "social networks" by looking only at the population raw numbers?
What happens in an internet minute? (2016-07-24 08:00)

1. https://twitter.com/simonlindgren

1. https://twitter.com/simonlindgren
This is quite interesting. I wonder how many blog posts, podcasts, or other sharing of user-generated content occurs outside the major commercial platforms in an Internet minute?

The Accelerated Academy (2016-07-25 08:00)

30th November to 2nd December 2016, Leiden, the Netherlands

From the 1980s onward, there has been an unprecedented growth of institutions and procedures for auditing and evaluating university research. Quantitative indicators are now widely used from the level of individual researchers to that of entire universities, serving to make academic activities more visible, accountable and amenable to university management and marketing. Further demands for accountability in academia can be related to general societal trends described under the heading of the audit society (Power 1997), and the evaluation society (Dahler-Larsen 2011). As part of broader transformations in research governance, indicators on publications and citations are now permeating academia: from global university rankings to journal-level bibliometrics such as the journal impact factor and individual measures like the h-index. Yet, it is only recently that considerable interest has been directed towards the effects that these measures might have on work practices and knowledge production (c.f. de Rijck et al. 2015), and the role they might be playing in accelerating academic life more generally (c.f. Vostal 2016).

The Accelerated Academy draws together a number of cross-disciplinary conversations about the effects that acceleration towards metric forms of evaluation is having upon research, and the implications this holds for living and working in contemporary academia (Felt et al. 2009). Building on the successful maiden edition of the Accelerated Academy series in Prague in 2015, this year’s Leiden conference will be especially focussed towards the following questions:

- What does acceleration mean in different research contexts?
- What are the implications of digitally mediated measurement and tools for quantifying scholarly performance?
- What are the knowledge gaps regarding the effects of metrics on scientific quality and societal relevance of research?
- How can we harness the positive and minimize the adverse effects of performance measurement in universities?

Confirmed keynote speakers include Peter Dahler-Larsen (University of Copenhagen), Ulrike Felt (University of Vienna) and Michael Power (LSE).

We invite submissions for presentations of around 20 minutes. The deadline for submitting abstracts will be August 31st 2016. Please send two pages or 800 words describing your contribution including a short biographical note to: [1]a.e.reyes.elizondo@cwts.leidenuniv.nl.

Conference organisers

[2]Sarah de Rijcke, Centre for Science and Technology Studies, Leiden University
Scientific committee

[5] Mark Carrigan, University of Warwick
[6] Tereza Stöckelová, Czech Academy of Sciences
[7] Filip Vostal, Czech Academy of Sciences
[8] Paul Wouters, Leiden University
[9] Milena Kremakova, University of Warwick

Event registration will be free of charge. In addition, a limited number of travel and accommodation support bursaries will be made available for researchers especially inhibited by the costs of travel. Please contact the conference manager [10] Andrea Reyes Elizondo for more information.
In August 2011, 29-year-old Mark Duggan was shot and killed whilst being arrested by armed police in Tottenham, London. This incident ignited a riot that escalated into a week of the worst civil unrest in recent British history. This film explores the life and death of Mark Duggan, and features his childhood friends, Marcus and Kurtis, as they struggle to come to terms with the death of their friend - whilst also waiting to see if the inquest into his shooting will provide them with a satisfactory version of the truth.

"Moving and insightful documentary about the controversial shooting of Mark Duggan " [2]https://film.list.co.uk/

2. https://www.facebook.com/l.php?u=https%3A%2F%2Ffilm.list.co.uk%2F&h=bAQE22z9G&enc=AZM0Fk7v6smimcm4SoirUZXdncL9i2ouVb09o5wVXl1QPE3Nh4FKIaQCVRmKa3VaUXs&s=1
Sunspring: a film written by algorithms (2016-07-26 08:00)

It’s weirdly powerful. But it’s interesting to consider how much interpretive effort must have been necessary to turn this raw script into something cogent. This could be taken as a dismissal of algorithmic culture but it could also point towards the power of team work, as algorithmic creations fuel human creativity by offering unpredictable raw material, derived from existing culture but entirely escaping its explicit patterns.

How waking up every day at 4.30am can change your life (2016-07-27 08:00)

This slightly disturbing TED talk speaks volumes about contemporary cultures of sleep:

https://www.youtube.com/watch?v=qOEB1Fr0_MM

It’s spirituality for aspirant TED heads. This is a phrase used by Linsey McGoey in her No Such Thing as a Free Gift:

amiable entrepreneurs and executives who congregate at exorbitantly priced TED events around the world, flocking to headline events (‘speaking innovation to power’; ‘branding for good’) with the earnestness of a Grateful Deadhead on his fifth tour.

Murmuration and Complex Systems (2016-07-28 08:00)

Watching this is enough to make me temporarily rethink my long standing hostility to ‘global brain’ speculation. It's remarkable what beautiful order can arise in a purely aggregative way and it’s something I've tended not to recognise in my theorising of collectivity.
The Soyuz Research Network for Postsocialist Cultural Studies announces the opening of its first Article Prize competition for the best article related to the culture, history, politics of postsocialism by a junior scholar. This prize recognizes significant contributions to the advancement of scholarly understandings of postsocialism, broadly defined.
Articles published in 2015 and 2016 by a scholar who has earned a PhD within the past six years (2010 or later) are eligible. Scholars from any discipline with any geographic area of interest are encouraged to apply.

Submissions should be sent electronically to Jennifer Carroll at jennifer_carroll@brown.edu no later than September 1. Please include “Soyuz Article Prize” in the subject line.

Please circulate this announcement to your colleagues!

Best
Jennifer Carroll

Symposium: Anxiety and Work in the Accelerated Academy (2016-07-29 11:13)

Friday September 23rd at the University of Warwick, 9:30am to 6:00pm
The culture and organisation of knowledge production are undergoing dramatic transformations.

Neo-managerialist models for the management of research and teaching, the expansion of audit and academic rankings, and the recasting of universities as service providers and students as consumers are just several of the main features of the ongoing marketisation of science, higher education and academia. Further important structural changes include the casualisation of academic labour and the "acceleration" of academic life.

These transformations concern the mathematical, natural and social sciences and humanities in equal measure, if perhaps in different ways. The careers, working lives and identities of scholars, researchers and higher education teachers are all affected.

In this symposium, we bring together international and UK-based scholars who study science, higher education and academia. We focus on a particular aspect of neoliberal academia, namely its anxiety-inducing environment - not as an object in itself, but as a symptom of what Ros Gill called "the hidden injuries of neoliberal academia" and of the need for meaningful change. We will discuss what is happening to the work, careers, lives, identities and epistemic communities of scientists, while the scientific institutions are changing.

We invite everyone interested in issues of work, labour and employment in the sciences and academia - scholars, students, practitioners, administrators - to join the symposium and take part in the discussions.

Speakers:

Liz Morrish - *Metrics, Performance Management and the Anxious University*
With responses by Gurminder K. Bhambra & Maria Ivancheva

Maggie O'Neill - *Pace, Space and Well-Being: Containing Anxiety in the University*
With responses by Vik Loveday & TBC

Filip Vostal - *Beyond the dichotomy of slow and fast academia: On temporal multidimensionality of science*
With responses by Mark Carrigan & Milena Kremakova

Each speaker will talk for thirty minutes, with responses of fifteen minutes each, before an hour's open discussion.

---

Eileen Hogan (2016-07-29 13:59:09)
Greetings from Ireland! Is this being live-streamed by any chance? I would love to attend, but sadly...
Afraid not sorry, we’ll be stretched to our organisational capacities on the day - will record it though if I’ve worked my way through my backlog of podcasts by then (easy to record, much more time consuming to edit unfortunately) & will definitely be live blogging and tweeting.

**Ford’s Sociological Department (2016-07-30 08:00)**

A fascinating snippet from *No Such Thing as a Free Gift*, by Linsey McGoey, loc 932:

The Ford Motor Company established its own Sociological Department, employing an initial team of fifty and then a total of 160 ‘investigators’ tasked with circulating in the community and paying impromptu visits to the homes of Ford’s workers, each of whom needed to be confirmed as sober, thrifty (through making regular bank deposits), and ‘clean of person’ to qualify for the new five-dollars-a-day remuneration scheme.

**Why I’m not Afraid or Ashamed of Cosmopolitanism (2016-07-30 10:06)**

This piece is another one of my several articles inspired by Brexit. Here I bring together two issues that Brexit has placed in harsh juxtaposition: Cosmopolitanism as a distinct ideology – whose ‘elitism’ [1]Peter Mandler and [2]Ross Douthat have recently cast in an unfairly negative light – and the future of socialism as a coherent ideology.

My own view is that socialism needs to be cosmopolitan. However, this is not as easy as it sounds. To be sure, forty years ago I was taught that ‘national socialism’ (i.e. Nazism) was a contradiction in terms, perhaps even a piece of cynical political rhetoric. But that was at the height of the Cold War, when the Soviet Union – and to a lesser extent China – was seen as ‘exporting’ socialism across the world to match the free market capitalism being somewhat more covertly spread by the US intelligence services. Strange as it may sound, this framing of international politics as a global ideological struggle may have been the best PR that cosmopolitanism has ever received. (Take a bow, James Bond.)

Post-Cold War, geopolitics looks rather different. Successful ‘socialist’ regimes are now generally seen as having had a clear sense of boundaries. Thus, the Scandinavian welfare states from which Hitler took some inspiration are regarded as the best version of ‘national socialism’: i.e. a protectionist domestic policy (including a strong dose of eugenics) coupled with a generous overseas development policy. This would enable other parts of the world to develop their own welfare states, which would in turn discourage endless streams of migration and the de-stabilizing effects they bring to all concerned. Indeed, such an orientation helps to explain the strong Scandinavian presence in the formative years of the United Nations.

Given what I’ve said so far, the European Union clearly operates more like the Cold War adversaries – for better or worse, and for worse if Brexit is any indication. There is no hiding that the European Union aspires to be a
‘federalist superstate’, a ‘United States of Europe’ joined in a common economic and political culture. To be sure, Jürgen Habermas – to his credit – realized early that this ‘culture’ was inherently ‘cosmopolitan’ in the original Kantian sense of the term, more about which below. The signature feature of this cosmopolitanism is the insistence on the free movement of both labour and capital. Brexit happened because British voters decided they wanted the latter without the former.

Cosmopolitanism is premised on the itinerant character of humanity. The modern idea is due to Immanuel Kant, who famously never strayed far from his home town, the Baltic port of Königsberg (today’s Kaliningrad, Russia). But equally famously, he welcomed various luminaries to his home, turning it into a provincial East Prussian version of an Enlightenment salon. For Kant, cosmopolitanism was all about hospitality: i.e. the welcoming of strangers to your home in the spirit of allowing and expecting them to leave at some point – preferably in a better state for having made the visit. It is the ethic that post-Kant has been commodified in the hotel and the airport lounge.

The cosmopolitan sees people as dynamic: People never really belong where they are, but if you allow them a certain freedom – ‘give them space’, as we nowadays say – they will benefit from their estrangement. ‘Tolerance’ is an unduly negative attitude to invoke in this context, as it suggests that the host is burdened by the presence of the guest. On the contrary, whatever inconveniences the cosmopolitan host bears is compensated by whatever (unexpected) benefits s/he receives from the visitor.

The intuition informing the cosmopolitan relation is that it is mutually enriching for people to encounter each other as strangers with an open mind, even granting a certain inevitable failure on both sides to recognize – or even respect – the other’s point of origin or frame of reference. Tellingly, aristocrats and those travelling in their circles have been touted as the original cosmopolitans. The operative phrase here is the double-edged idea of noblesse oblige, which implies both a generosity to others and a relative indifference to how those others respond to that generosity, presumably because one is sufficiently secure in one’s being, regardless of what others make of it.

The interesting philosophical and political question is whether cosmopolitanism can be scaled up to become a universal social ethic. This is quite a tall order because it would mean removing the privilege that people normally accord to familiarity. However, Christianity has form in this matter, most strikingly in the parable of the Good Samaritan, which invites the audience to see God in even the most abject of the strangers they encounter.

The Christian version of love, agape, involves a two-step move which results in a cosmopolitan mentality. On the one hand, Jesus decries the tendency of people to simply take care of their immediate family and friends while neglecting the larger sense of misery in the world. On the other hand, he re-inscribes a deeper notion of ‘family and friends’ in the idea that we are all descended from the same God, in whose image and likeness we are created – regardless of how different we may appear to each other in the initial encounter.

There are two secular residues of this theological horizon in modern cosmopolitanism: a sense of species closure under the ‘human’ and a sense that under the right conditions any individual’s full humanity might be realized. Taken together they constitute the Enlightenment’s conception of ‘human nature’ as a kind of ‘universal brotherhood’ (which was sometimes extended to sisterhood). This conception of human nature, though still in popular usage, lost its scientific basis with the Darwinian revolution in biology, which denies both the natural reality of species and the natural plasticity of organisms. But let’s set aside Darwin’s challenge to this entire way of thinking for the rest of this discussion.

The political home of the cosmopolitan mentality lies in ideas of ‘upward social mobility’, ‘meritocracy’ and ‘aspiration’. All these phrases are associated with the UK-based Fabian style of socialism that at the dawn of the 20th century was in productive dialogue with emerging US Progressivism, European social democracy and what became Leninist socialism in Russia.
It is generally known that Fabian socialism was the ideology of the Liberals who split to form the Labour Party in 1900. What is generally not known – or at least not appreciated – is that the soul of the Labour Party, in keeping with its Fabian origins, has always been closer to Tony Blair than Tony Benn. Whenever the Labour Party has veered to the sort of soft Marxism espoused by Benn, it has been an electoral failure. But this is more than just a point about winning elections. It goes to the soul of socialism itself.

Consider the idea of ‘upward social mobility’. It was invented in a positive spirit: People should always be upwardly mobile. Moreover, the idea wasn’t simply about increasing income or alleviating poverty. It was also about getting ‘better’ jobs. Implied here is that ‘working class’ jobs, while tolerable under the right pay conditions, are not ideal for any self-respecting human being. Thus, a responsible working class parent would want their children to attend university so they can leave their socio-economic background and even their place of birth.

I make this line of thinking so explicit because it suggests where Fabians and Marxists potentially differ over the best way to realize socialism. What I’ve described is the Fabian story, a version of which migrated across the Atlantic – courtesy of Graham Wallas’ *The Great Society* – to make Progressivism the dominant US political ideology for the seventy year period prior to Ronald Reagan’s presidency. The bottom line is that over time a ‘great society’ streamlines if not outright eliminates the livelihoods of blue collar workers. Social progress is marked by successive generations not being employed in jobs which historically have been protected by labour unions.

Fabian socialism is rightly seen as ‘technocratic’. For Fabians, an important job of politics is to eliminate drudgery in the human condition, and the best way is to apply human reason to end wasted effort in tasks which can be automated or otherwise mechanized. Thus, humans are left to do those things – if anything (!) – that only humans can do. (H.G. Wells, a Fabian fellow-traveller, played with the ambivalence of this prospect for most of his career.) Absent here is any sentimental attachment to the ‘guild socialism’ mentality which lingers in those forms of Marxism wedded to a literalist version of the labour theory of value.

From this standpoint, the rise of ‘cultural studies’ in the 1960s can be understood as a quasi-Marxist push-back against the Fabian presumption that working class people need to be provided opportunities to ‘prove’ themselves, as if they weren’t already proving themselves in their normal everyday lives and jobs. In this context, the concept of ‘culture’ was re-appropriated to provide the relevant sense of ‘proof’. (Take a bow, Raymond Williams.)

The Fabians struck back by fetishizing of ‘knowledge’ as a defining feature of the socio-economic order. It was already present in the work of the US sociologist Daniel Bell in the early 1970s but it reached its peak in the UK in the Blair-Brown years. Whatever warm fuzzy feelings the soft Marxists cultivated for locally meaningful forms of labour came to be offset by the urgency with which this new generation of Fabians insisted that people had to ‘scale up’ and ‘scope out’ their epistemic horizons by getting one or more university degrees. The fixation on ‘competitiveness’ – be it with the Soviets or (after the fall of the Berlin Wall) fellow capitalists – was a signature feature of their rhetoric. There is no such thing as ‘standing still’ without losing ground in the process.

What makes this Neo-Fabian move specifically ‘cosmopolitan’? Clearly knowledge is being treated as something akin to capital, indeed, ‘human capital’ as economists put it. Like any other form of capital, it is both mobile and protean – it can be acquired in many different ways and work in many different places. It is not the sort of ‘situated knowledge’ that continues to fascinate sociologists, but rather the ‘credentials’ which confer sufficient value on their possessors to excuse them of any situation-specific failures in their performance. In effect, credentials provide the passport for the free mobility of labour. And this may be a point on which the Brexiteers and the Eurocrats can agree.

It should be clear from the above that cosmopolitanism helps to fill in the background psychology that is needed to sustain a world-view which would have people always trying to move to ‘someplace better’ – whatever that may mean in terms of space-time coordinates. It involves an openness to the strange but also to the transient, which when taken together is palatable. The mistake that critics of cosmopolitanism typically make is to suppose that it
is about some meta-level elite form of authority when in fact it is about establishing the material conditions under which people can be recognized as free agents.

Of course, it does not follow that the cosmopolitan strategy works perfectly. After all, it suggests that if you get the right credentials, you’ll be treated as an equal of others with similar credentials. But this is true only to a limited extent, for reasons that sociologists have explored in lugubrious detail. What this suggests that the devil is in the details when it comes to cosmopolitanism – but it remains an attractive ideal for the human condition.

Black women in the academy: ‘inclusion’ or erasure from the social sciences? (2016-08-01 12:52)
BSA Regional Postgraduate Event:
Black women in the academy: ‘inclusion’ or erasure from the social sciences?
Date: Tuesday, 20th September 2016, Ballroom, Keele University
Keynote speakers: Professor Claire Alexander (University of Manchester) and Professor Kalwant Bhopal (University of Southampton)

Event Outline
"Much of the Eurocentric masculinist worldview fosters Black women's subordination. But placing Black women's experiences at the center of analysis offers fresh insights on the prevailing concepts, paradigms, and epistemologies of this worldview" – Patricia Hill Collins, 1990.

The category 'Black' during the 1980s homogenised the struggles of Caribbean and Asian communities in racist Britain. However, the applicability of this categorisation towards British Asians has been contested (Modood, 1994) and even its use towards African diasporic communities (Kwesi, 2015). Despite these contestations, the UK welcomes a Black Studies degree to Britain at Birmingham City University in September 2017, signalling the importance of disrupting historically White spaces and decolonising knowledge. This conference day will bring together academic scholars who identify as black, to provide an intellectual space to discuss about the impact of 'race' and gender on their academic work. This day is unique in also providing a reflective space for scholars' experiences of survival at the margins (hooks, 1990). Women of colour working within the social sciences in the UK are often still marginalised and face other, intersectional challenges not illuminated under traditional inequalities' discourse. We invite scholars, intellectuals and activist women of colour to contest Eurocentric, male and heterosexual epistemologies. The margins should not solely be seen as a site of disadvantage; rather, this event is shaped by an understanding that black women academics' liminal position in historically White spaces offers the "opportunity/obligation to transcend their either/or way of knowing" (Dunbar, 2008:86).

Confirmed established academics' panelists: Professor Farzana Shain (University of Keele), Dr Denise Noble (Birmingham City University), Dr Lorna Roberts (Manchester Metropolitan University), Dr Shirin Housee (University of Wolverhampton), Dr Lisa Palmer (Birmingham City University, TBC)

Call for papers
We invite paper contributions from doctoral, early career, to established academics writing in the following thematic areas:
-Black academics or students in Higher Education;
-Black cultures in Britain;
-'Race', ethnicity and (black) girl/boyhood;
-Black communities in popular culture;
-Migration and narrative stories from black communities
-Queer studies or trans studies related to black communities

Please email abstracts (up to 250 words) to Nadena Doharty (n.doharty@keele.ac.uk) by Friday, 26th August 2016 indicating any special technological requirements. Each panelist will have a maximum of 15 minutes to present.

Registration
BSA Member registration £10, Non-Member Registration £25
Caribbean lunch provided, though please make sure you indicate any special dietary requirements. Places limited so please book quickly.

Any queries about the event to be sent to Nadena Doharty: n.doharty@keele.ac.uk

Call for papers: Moral Economies of the Digital (2016-08-04 08:00)

Call for papers

Special issue of the European Journal of Social Theory

Moral Economies of the Digital

Digital technologies have opened up new opportunities for novel forms of economic practice and for the economic empowerment of individuals and communities. But what happens when they encounter the mesh of pre-existing social, cultural, and economic relations? We invite papers that explore the moral economies underpinning the use of digital technologies, and examine how they encourage or constrain the use of technologies to renegotiate existing power structures and economic practices. Papers may, for example, address one or more of the following issues:

- To what extent is the digital economy dependent upon ethics, norms, and communicative interaction, and does this open up awareness of different approaches to the economy?

- Can social theory help us to explain the development, operation and consequences of the digital economy?

- Does the ‘new’ sharing economy offer a new type of moral economy and how does it impact existing communities?

- What processes and circumstances allow digital technologies to be incorporated successfully (or not) into the moral economies of subaltern communities?

- How do value propositions associated with the introduction of digital technologies, such as disintermediation, or the death of distance, play out in practice?

While empirically oriented papers are welcome as well as more theoretical papers, empirical papers should employ a theoretical framework, show how it contributes to the analysis of the empirical case(s), and consider the consequences of the analysis for the framework concerned.

Papers should be 6,000-9,000 words in length, and should be submitted via Scholar One by 30 September 2016. The special issue is likely to be published early in 2018. For further details of the submission process and guidelines, see 4539
The Return of the Riot (2016-08-05 08:00)

From Joshua Clover’s [1]Riot. Strike. Riot pg 2. He argues that the return of the riot reverses a long term trend observed by Charles Tilley, in which the riot had given way to the strike as the foremost tactic in socially available repertoires of contention:

As the overdeveloped nations have entered into sustained, if uneven, crisis, the riot has returned as the leading tactic in the repertoire of collective action. This is true both in the popular imaginary and the realm of data (insofar as such matters give of statistical comparison). Regardless of perspective, riots have achieved an intransigent social centrality. Labor struggles have in the main been diminished to ragged defensive actions, while the riot features increasingly as the central figure of political antagonism, a specter leaping from insurrectionary debates to anxious governmental studies to glossy magazine covers.

Kieran (2016-08-13 07:59:46)
I’m a strong believer in the need for riots to remind the government that there are far more of us than there are of them. Civil disobedience is great, but the UK government just ignores it - start burning down police stations, on the other hand... (a joke, sort of).

Call for Papers: The End of the World as We Know It? (2016-08-06 08:00)

The End of the World as We Know It?
CALL FOR PAPERS

The online abstract submission system for the ESS annual meeting is now open at [1]https://www.meetingsavvy.org/ess or through the website at [2]http://essnet.org. The ESS welcomes submissions, drawing on every methodology, addressing any and all issues of interest to sociologists. In addition, ESS president John Torpey (CUNY Graduate Center) has proposed that the 2017 meeting will focus on the theme “The End of the World as We Know It?”. Our world is caught up in rapid but ambiguous change. With improvements in health care and nutrition, global populations are both growing and aging; by 2050, the world is expected to have some 9 billion people or more, perhaps a quarter of whom will be over 60 years of age. More than half of the world’s population lives in cities, a proportion expected to rise to two-thirds by 2050. Interstate violence has been declining for decades. Technology is revolutionizing everyday life: powerful hand-held computers are ubiquitous, communications are much easier, and commercial drones will soon fill the skies. Yet the consequences for social life are contradictory. People can be in touch with many more people, yet they are often not fully present in personal interaction. Racism and class inequality persist or worsen. The life-long career with one employer may be giving way to a “gig economy,” in which people offer their own assets or temporary labor for hire. Social safety nets and public education systems – the bedrock of social citizenship – are under challenge. Climate change threatens global patterns of habitation and livelihood, and indeed life on the planet itself. Sociologists know a lot about these developments, as well as about their dark underside. How are different social groups affected by these changes? What measures should be taken to mitigate the negative effects of these changes and to maximize their usefulness to people? Are we as sociologists paying attention to the right things? What do our analyses of society tell us about where we go from here? We hope that scholars who participate in the meeting will bring a broad range of additional questions and approaches to issues raised by a focus on major social change. Although the ESS particularly encourages submissions related to this year’s theme, we welcome submissions on all sociological topics, drawing on all methods and formats, including:

- Individual papers (please include abstracts of 250 words or less; longer drafts are also welcome via email to the program committee)
- Wholly constituted sessions (with names and affiliations of all presenters)
- Thematic conversations (panels of two or more scholars engaged in debate or exchange)
- Workshops on specific topics and techniques
- Special sessions organized around prominent scholars and their work
- Roundtable and poster session presentations

Proposals for mini-conferences are encouraged by August 15, 2016 and should be sent to easterns2017@gmail.com Paper submissions and session proposals are due by October 15, 2016 and should be submitted through our abstract system,[3]https://www.meetingsavvy.org/ess Questions should be sent to easterns2017@gmail.com Program Committee Chair: Richard E. Ocejo, CUNY, John Jay College of Criminal Justice
Genuine cosmopolitanism is a rare thing. It requires comfort with real difference, with forms of life that are truly exotic relative to one’s own. It takes its cue from a Roman playwright’s line that "nothing human is alien to me," and goes outward ready to be transformed by what it finds.

The people who consider themselves “cosmopolitan” in today’s West, by contrast, are part of a meritorocratic order that transforms difference into similarity, by plucking the best and brightest from everywhere and homogenizing them into the peculiar species that we call "global citizens.”

This species is racially diverse (within limits) and eager to assimilate the fun-seeming bits of foreign cultures — food, a touch of exotic spirituality. But no less than Brexit-voting Cornish villagers, our global citizens think and act as members of a tribe.

They have their own distinctive worldview (basically liberal Christianity without Christ), their own common educational experience, their own shared values and assumptions (social psychologists call these WEIRD — for Western, Educated, Industrialized, Rich and Democratic), and of course their own outgroups (evangelicals, Little Englanders) to fear, pity and despise. And like any tribal cohort they seek comfort and familiarity: From London to Paris to New York, each Western “global city” (like each “global university”) is increasingly interchangeable, so that wherever the citizen of the world travels he already feels at home.

The Big Deal about Big Data (2016-08-08 08:00)

A rich and thought-provoking lecture by Gary King about the implications of big data for the social sciences:

https://www.youtube.com/watch?v=5h6MTLybccs &t=3643s

The idiocy of corporations on Twitter (2016-08-09 08:00)

A lovely feature by John Oliver about the idiocy of corporations on Twitter:

https://www.youtube.com/watch?v=-gsg7ZtM3NM

For a deeper analysis of corporations on Twitter, see this great essay on weird corporate twitter:

We all know that a corporation’s Twitter account is managed by a social-media worker (despite Denny’s claims on Twitter to be an “egg” rather than a social-media guru). Social media managers for corporate brands tend to be young people steeped in digital culture, who may be junior in status but are tasked with building a newly “hip” brand essence for the social media reading public. So does the frisson of reading these weird corporate tweets happen because we are rating the social-media manager’s performance on Twitter, like an Olympic judge holding up a score at the end of each tweet (and supplying important metrics to the brand at the same time)? Or does the Denny’s brand’s mewling Twitter intimacy make us feel paternal, bound to support and foster our corporate brand children as they speak to us through the web, learning our native medium?

Symposium: Anxiety and Work in the Accelerated Academy (2016-08-10 11:14)

Friday September 23rd at the University of Warwick, 9:30am to 6:00pm

The culture and organisation of knowledge production are undergoing dramatic transformations.

Neo-managerialist models for the management of research and teaching, the expansion of audit and academic rankings, and the recasting of universities as service providers and students as consumers are just several of the main features of the ongoing marketisation of science, higher education and academia. Further important structural changes include the casualisation of academic labour and the “acceleration” of academic life.

These transformations concern the mathematical, natural and social sciences and humanities in equal measure, if perhaps in different ways. The careers, working lives and identities of scholars, researchers and higher education teachers are all affected.

In this symposium, we bring together international and UK-based scholars who study science, higher education and academia. We focus on a particular aspect of neoliberal academia, namely its anxiety-inducing environment - not as an object in itself, but as a symptom of what Ros Gill called "the hidden injuries of neoliberal academia" and of the need for meaningful change. We will discuss what is happening to the work, careers, lives, identities and epistemic communities of scientists, while the scientific institutions are changing.

We invite everyone interested in issues of work, labour and employment in the sciences and academia - scholars, students, practitioners, administrators - to join the symposium and take part in the discussions.

Speakers:

Liz Morrish - Metrics, Performance Management and the Anxious University
With responses by Gurminder K. Bhambra & Maria Ivancheva

Maggie O’Neill - Pace, Space and Well-Being: Containing Anxiety in the University
With responses by Vik Loveday & TBC

Filip Vostal - Beyond the dichotomy of slow and fast academia: On temporal multidimensionality of science
With responses by Mark Carrigan & Milena Kremakova

Each speaker will talk for thirty minutes, with responses of fifteen minutes each, before an hour’s open discussion.

Call for blog posts: the lived experience of interdisciplinarity in social research (2016-08-11 08:00)

Following on from our successful workshop at Social Media & Society 2016, the [1]Digital Social Science Forum is seeking blog posts describing and reflecting on the lived experience of interdisciplinarity in social research. The workshop itself sought to explore conceptual challenges in interdisciplinary social media research, encountered at the level of substantive theoretical commitments but also in terms of taken-for-granted assumptions that inform everyday practice. But our intention for this project is broader, seeking reflections on any aspect of the lived experience of conducting research across and through disciplinary boundaries.

Our primary focus is on digitally orientated research, e.g. social scientists and computer scientists working together, but we warmly welcome contributions from other areas. These might reflect upon things like:

- The role of ‘boundary objects’ in facilitating work across disciplinary boundaries.
- How a lack of clarity about mutual definitions can both support and hinder interdisciplinary collaboration.
- The importance of reclaiming ‘the human’ as a shared focus in interdisciplinary research.
- Coping with the challenge of an imperialistic naturalism i.e. forceful assertions of the failure of the social sciences and the necessity of remaking them along the lines of the natural sciences.
- The messy reality of working in interdisciplinary teams.
- What does conceptual development mean in collaborative work across disciplinary boundaries?
- The role of personal relationships in facilitating successful interdisciplinary work.
- Failures and frustrations of interdisciplinarity.
- Getting beyond the motif of the ‘attic scholar’ and socialising the research process.
- The role of doctoral pedagogy in hindering successful interdisciplinary collaboration.
- Organisational helps and hindrances to working across disciplinary boundaries.

These are just suggestions. Our interest is in how these sometimes obtuse issues are worked out at the level of everyday co-operation: how is the messy reality of interdisciplinarity lived and how should this shape our approach to it? These blog posts will be compiled at the Digital Social Science forum, organised thematically and circulated on social media channels as a public resource.

Contributions should be short (500-1500 words) and will be accepted on a rolling basis. Please send as a word document to mark@markcarrigan.net. Feel free to get in touch to discuss a potential contribution.
the videos of the opening presentation at this event (online at http://dynamicofvirtualwork.com/darmstadt-programme/) discuss the history of interdisciplinarity in the study of technology and work

A fantastic podcast discussion about social media for academics (2016-08-12 08:00)

This is one of the best discussions about social media for academics I’ve heard: [1]Episode 58 of This Week In Health Law.

Academic video blogs: 5 tips for getting started (2016-08-13 08:00)

A really useful resource produced by jobs.ac.uk:
The tragically incompetent elites of the centre left (2016-08-14 08:00)

This critique by Thomas Frank, on loc 2729 of his *Pity the Billionaire*, applies as well to proponents of the ‘third way’ within the Labour Party as it does to the leaders of the Democratic Party in relation to whom they originally articulated the notion:

Sometimes when I watch the Washington Democrats in action, my mind goes back to the tragically incompetent British general staff of World War I, ordering assault after gigantic assault, only to see their armies annihilated one after another. But still they kept at it, ordering up another round of the exact same thing, playing by the gentlemanly rules of combat, never doing anything remotely clever, and always completely surprised when the other side introduced them to twentieth-century warfare in some brutal new way.
The Washington Democrats will no more acknowledge the possibilities of other tactics than they will abandon Georgetown and move en masse to some burned-out quarter of Baltimore. Instead they deride their liberal critics as impossible dreamers—or as “fucking retarded,” in Rahm Emanuel’s famous phrase—and try what worked for Clinton yet again. That their own habitual deference to expertise leaves them wide open to the decades-long conservative assault on “elites” never occurs to them.

There’s an increasingly zombie-like repetition of strategic impulses whose purchase, if any, relied upon a social and economic conditions that have been in rapid decline for nearly a decade. Yet still they soldier on, professionally socialised into an understanding of politics most, if not all, seem incapable of repudiating. If modernisation meant anything, it meant adapting a party to changing circumstances, yet they seem weirdly incapable of recognising the fact that it’s no longer 1997.

---

CfP: The Accelerated Academy (2016-08-15 08:00)

30th November to 2nd December 2016, Leiden, the Netherlands

From the 1980s onward, there has been an unprecedented growth of institutions and procedures for auditing and evaluating university research. Quantitative indicators are now widely used from the level of individual researchers to that of entire universities, serving to make academic activities more visible, accountable and amenable to university management and marketing. Further demands for accountability in academia can be related to general societal trends described under the heading of the audit society (Power 1997), and the evaluation society (Dahler-Larsen 2011). As part of broader transformations in research governance, indicators on publications and citations are now permeating academia: from global university rankings to journal-level bibliometrics such as the journal impact factor and individual measures like the h-index. Yet, it is only recently that considerable interest has been directed towards the effects that these measures might have on work practices and knowledge production (c.f. de Rijcke et al. 2015), and the role they might be playing in accelerating academic life more generally (c.f. Vostal 2016).

The Accelerated Academy draws together a number of cross-disciplinary conversations about the effects that acceleration towards metric forms of evaluation is having upon research, and the implications this holds for living and working in contemporary academia (Felt et al. 2009). Building on the successful maiden edition of the Accelerated Academy series in Prague in 2015, this year’s Leiden conference will be especially focussed towards the following questions:

- What does acceleration mean in different research contexts?
- What are the implications of digitally mediated measurement and tools for quantifying scholarly performance?
- What are the knowledge gaps regarding the effects of metrics on scientific quality and societal relevance of research?
How can we harness the positive and minimize the adverse effects of performance measurement in universities?

Confirmed keynote speakers include Peter Dahler-Larsen (University of Copenhagen), Ulrike Felt (University of Vienna) and Michael Power (LSE).

We invite submissions for presentations of around 20 minutes. The deadline for submitting abstracts will be August 31st 2016. Please send two pages or 800 words describing your contribution including a short biographical note to: [1]a.e.reyes.elizondo@cwts.leidenuniv.nl.

Conference organisers

[2]Sarah de Rijcke, Centre for Science and Technology Studies, Leiden University
[3]Björn Hammarfelt, University of Borås, Sweden | Leiden University
[4]Alex Rushforth, Centre for Science and Technology Studies, Leiden University

Scientific committee

[5]Mark Carrigan, University of Warwick
[6]Tereza Stöckelová, Czech Academy of Sciences
[7]Filip Vostal, Czech Academy of Sciences
[8]Paul Wouters, Leiden University
[9]Milena Kremakova, University of Warwick

Event registration will be free of charge. In addition, a limited number of travel and accommodation support bursaries will be made available for researchers especially inhibited by the costs of travel. Please contact the conference manager [10]Andrea Reyes Elizondo for more information.

Book Review: Social Media for Academics (2016-08-16 08:00)

by Andy Tattersall, [1]originally posted on the LSE Review of Books

Academics engaging in social media as a means to communicate their research and interests have a variety of experiences. There are those who have taken to it like a duck to water and then there are those who are like a
newborn giraffe taking their first steps in the world – awkward and open to prey. In the meantime, the majority of academics have had little or no interaction with what social media has to offer, for a variety of reasons. Therefore a book that sets out its stall as Social Media for Academics has a lot of ground to cover and a huge potential audience.

Attempts to engage academics with anything above a mild interest in social media, whether at institutions, workshops or via the web, have at times felt like applying a big hammer to a very small nervous nut. What Mark Carrigan has set out to do is bring a more relaxed, engaging and easier approach to how academics can engage with social media. Anyone who has seen the author give a talk will no doubt be aware of his keen interest in the data that underpins social media use, and his book sets out by highlighting those ever-changing stats as a sign that change is afoot.

From the start, Carrigan gives the reader an insight into his own world; yet, despite being a social media champion, he is clearly not here to deliver a sermon. This is what makes the book different from many other guides you may come across: less dry but with plenty of academic rigour. Very often social media guides are aimed at the intermediate user; whilst this title will appeal to the most novice, it also adds weight to arguments by experts in the academic community.

The book is structured around two clear themes, those being social media activities and social media challenges. It starts with asking what existing activities could be enhanced by social media? However, the challenges of social media are many, and Carrigan is keen not to shy away from them as he offers an honest appraisal of the technologies and their pitfalls.

Social Media for Academics is very much a book of two halves, the first part being the foundations to practical social media use in academia. Readers are given four practical areas where they can apply social media within their research. Under the chapter heading pretext of 'Using Social Media', the reader can explore how to publicise their work, build their network, ensure public engagement and manage information. Each chapter is broken down into the evidence around each theme, opportunities and, where applicable, the pitfalls. Whilst this is not the step-by-step guide with diagrams that some academics would desire, it explores many of the possibilities in a way that is less fearful for the first-time social media user.

Carrigan explores the opportunities that can be found in creating social networks with a strong focus on Twitter. From conference Tweeting to Twitter Chats, we find out how these can lead to real-life networks. Public engagement is something that is increasingly appearing on academic wavelengths, and Carrigan also covers this theme to include students, the media and policymakers in his definition of the term. Whilst the risks are explained, Carrigan focuses on the idea of proper engagement rather than purely broadcasting messages. Many academics have latched on to the benefits of discourse around their research with the public rather than one-direction communication. Carrigan does point out that some of this can be achieved outside of social media.

The second part of the book is focused more towards the personal and professional challenges that can come with social media. Considering that some readers may be a little dubious or worried about picking up such a title, the author focuses on the positives over the problems, but never shies away from the issues over the course of the book. Being exposed to more information on the web seems almost inevitable for the majority of academics, so the book aims to offer ways to curate that content and turn that information into useful knowledge.

These careful considerations in the second part of the book show the detail of knowledge and expertise underpinning the title as a whole. One area that is often not given enough coverage when talking about academia and social media is the issue of the relationship between the personal and professional identity. All too often little thought is given to how we may appear to different audiences and how this may have negative effects in some of those camps.
Nevertheless, it is an essential discussion to have, as most academics will either have had their own internal chat or one with colleagues about the issue of personal boundaries at some point in their career. Carrigan explores the various dilemmas we have using social media professionally, from our relations with friends and family to those with our students and colleagues. Each one is turned into a case study with practical advice on crafting a good social media profile.

In the final chapter the author explores what lies ahead – again, with more possibilities come more problems. With any book like this it will always have its limitations; technology is moving faster than ever, so is our relationship with it and each other. Future iterations will no doubt be very different, but for today, this book is timely and relevant. Carrigan has set out a clear and concise book on practical things that the reader can do to engage with this ever-changing online landscape. Carrigan’s experience as a hybrid academic who carries out academic work but with a strong professional element positions him in an ideal place to understand the practicalities and problems that social media brings to academia. This is no doubt in part due to his extensive experience as a blogger and podcaster. In that sense, the book is very much the author putting their money where their mouth is.

Social media stirs up an awful lot of anxiety in the academic community and, to a large extent, rightly so. Yet it does offer a world of possibilities that are not without challenges, but Carrigan addresses many of these in a way that has a good balance. His pragmatic approach will hopefully chime with readers who have begun exploring social media as part of their work. For those yet to dip their toe into social media, Carrigan offers plenty of evidence-based advice as to the wheres and whys of how to start, but more importantly, how to avoid getting it wrong in the first place. Social media platforms can be a bit like going to a new restaurant for the first time – if you have a bad experience, you might not go back again. Social Media for Academics is a balanced and thoughtful academic TripAdvisor that shows you the best dishes and the dirty kitchens in one guide.

**We need to understand why it is the beach is full of dying kids (2016-08-16 20:17)**

[https://www.youtube.com/watch?v=FNqum__SRhY](https://www.youtube.com/watch?v=FNqum__SRhY)
His young life was as delicate as the wing of a butterfly
And as fragile as a spider’s web
For him we cry
Because when he dies
We all do

Did Ahmed not deserve a life?
Ahmed never hurt a fly
Ahmed never knew the politicians he was murdered by
Certain times Ahmed wished that he could be a bird and fly
Beyond the sky
Escape the curse of birth that he was burdened by
Ahmed never grew to let your racism internalise
Water poured from every pore in his corpse while the nurses cried
Ahmed was a beautiful person like you or I
But are we?..
Ahmed could have been a doctor, lawyer or an engineer
Could have been a superstar but his life ended here
Guess he was a shooting star burn bright and disappear
To some he seems to represent a menace in this hemisphere
Let me here make the very essence of this message clear
He was precious, many die like him every year
Ahmed was a victim of resentment and relentless fear
Now his soul surfs the waves I wish we could have kept him here

The sea, the sea, the sea, it holds our secrets (holds our secrets)
The sea, the sea, the sea, it holds his soul (holds his soul)
They call him Ahmed
The sea, the sea, the sea, it holds our secrets (holds our secrets)
The sea, the sea, the sea, it holds his soul (holds his soul)
They call him Ahmed

Ahmed’s ancestors introduced to Europe Greek philosophy
Brought with them irrigation, mathematics and astronomy
Symbolically, irony of this horror isn’t lost on me
Trying to get to Europe via Greece where he’s lost at sea
Ahmed not Achmed, it’s Ahmed
He’s that dead
Toddler lying lifeless on the beach with his back bent
Arms spread, reaching the direction that his dad went
If he made it here would have been bullied for his accent
He was captured by the ocean
Paralysed and frozen
While these parasites sat and typed, analysing clothing
Now for resources we all compete
Beyond the talk of war and peace
And talk of porous border there is corpses on the shore of Greece
They found a teddy next to where his body was found
The sea swallowed him, politics has swallowed him now
And those responsible, Ahmed's ghost will follow them now
To the family all we can say is we are sorry he drowned
Because...

The sea, the sea, the sea, it holds our secrets (holds our secrets)
The sea, the sea, the sea, it holds his soul (holds his soul)
They call him Ahmed
The sea, the sea, the sea, it holds our secrets (holds our secrets)
The sea, the sea, the sea, it holds his soul (holds his soul)
They call him Ahmed

They say let him drown, let him drown, let him drown, What have you done, don't let him drown, don't let him drown
No what have we become, don't let him drown
No, don't let him drown
And they say
Let him drown, let him drown, let him drown
What have we done, don't let him drown, don't let him drown
No, what have we become, don't let him drown
Please, don't let him drown

Ahmed could of been you, and Ahmed could of been me
We need to understand the policies that put him in the sea
We need to understand why it is the beach is full of dying kids
A colonial Metropole people want to reside in
If he did would he make it or fall to something that's deeper
End up like like Jimmy Mubenga or Khaled Abu Zarifa
A picture by Javier Bauluz on the beaches of Tarifa
Made me see, some would grieve more if Ahmed was a creature, with four legs, then they would consider him legitimate
Those like him braving barbed wire burning off their finger tips
Balfours alien act, that mentality still exists
Is privilege the difference between an ex-pat and an immigrant?
For, Ama Sumani and Osman Rasul Mohamed, when you take others humanity
It’s only yours that’s stunted, not a swarm
They’re our sisters and brothers, that’s the sum of it!
The cockroaches here are in the media and the government
Not the sea
The sea, the sea, it holds our secrets (holds our secrets)
The sea, the sea, the sea, it holds his soul (holds his soul)
They call him Ahmed
The sea, the sea, the sea, it holds our secrets (holds our secrets)
The sea, the sea, the sea, it holds his soul (holds his soul)
They call him Ahmed

Ahmed never knew the politicians he was murdered by
Ahmed never knew the politicians he was murdered by
Ahmed never knew the politicians he was murdered by
And they all laugh at him...

The coordinates of the austerity consensus are disintegrating (2016-08-17 08:00)

From Corbyn: Against All Odds, by Richard Seymour, pg 22. There’s a huge opportunity for the Labour left but also a huge risk, as momentum has built for an anti-austerity platform that might no longer be relevant:

“It is not clear what will happen to the debt/speculation economy, or the ‘property-owning democracy’ where large numbers of people supplement their income by borrowing against the rising value of their homes. When even George Osborne gives up his threatened ‘emergency’ austerity budget, abandons his ‘fiscal rule’, and leading Tory candidates openly talk down austerity, one going so far as to propose a massive borrowing and spending programme, the coordinates of the old consensus are clearly disintegrating. This is one of those moments when a degree of political imagination and initiative will make a decisive impact for the next few years at least”

As Seymour goes on to observe, “in the context of a generalised crisis of politics and the established way of doing things, anyone who has some ideas about how to change things can gain a hearing.” The book on the American right I’ve just read, Thomas Frank’s Pity the Billionaire, makes a compelling case that the resurgent free-market right capitalised on precisely this opportunity, despite the fact their ideas were inane and contradictory.

The ideological function of open data (2016-08-18 08:00)

I was at an interesting symposium on Big Data hosted by Sage earlier this year where a number of participants discussed the limitations on implementation of the government’s open data initiative: data is often published in an
unhelpful or even outright unusable format. A number of people suggested that there were structural reasons for this, from a lack of awareness of the data they have through to a lack of expertise in the civil service.

But reading Shadow State, by Alan White, it strikes me that these structural impediments must be read in an ideological context. Open data is bound up in the marketisation of public services under the sign of ‘transparency’. From loc 4050:

> The government will tell you that this is part of an ongoing process to ‘push’ all the data out to the public: the former Cabinet Office minister Francis Maude said he wanted to remove the need for Freedom of Information by using open data. His successor, Matt Hancock, has argued that open data not only gives more transparency and accountability, but can be used to improve the performance of public services, citing the way that publishing contract data allowed one of his officials to spot ‘£4 million in savings in just ten minutes’.

The Importance of Disappointment (2016-08-19 08:00)

There’s a lovely passage by Olivia Lang, quoted in this [1]review of her recent book, which reminds me of what Ian Craib called the importance of disappointment:

> There is a gentrification that is happening to cities, and there is a gentrification that is happening to the emotions too, with a similarly homogenising, whitening, deadening effect. Amidst the glossiness of late capitalism, we are fed the notion that all difficult feelings — depression, anxiety, loneliness, rage — are simply a consequence of unsettled chemistry, a problem to be fixed, rather than a response to structural injustice or, on the other hand, to the native texture of embodiment, of doing time, as David Wojnarowicz memorably put it, in a rented body, with all the attendant grief and frustration that entails.

Craib’s argument extends beyond our relationships with others, but I think it’s here that his analysis is most incisive. Our relationships, particularly romantic ones, involve an “emotional attachment and interlocking that makes ... control difficult” and yet we strive for such control all the more in its experienced absence. An inability to live with the disappointments relationships bring, a reflection of Lang’s ‘emotional gentrification’ in which difficulties and disappointments are seen as problems to be solved rather than an ineradicable feature of the life we share with others, engenders a deep fear of things ‘not being ok’: this self, this relationship, this life. But in doing so, our capacity to sit with experiences of disappointment gradually finds itself hollowed out. Feelings that might otherwise be fleeting come to be seen as inarguable incitements to action. We must act. Now. Because things are not ok. But our capacity to experience things as ‘ok’ is reliant upon our sustained engagement and ability to live with entanglement,
in spite of all the threats to autonomy and constraints on control that implies. The more we habitually feel the need to run in the face of things not being 'ok', the less able we are experience and enjoy precisely that which we are inclined to see ourselves as running towards.

Though Craib makes no allusions to Buddhism, it strikes me his argument has such connotations. The 'powerful self' he describes operates under the illusion that if only we can arrange the pieces of our lives in the right order, we can escape disappointment and enjoy a perpetual sense of contentment. But in doing so, we gradually disfigure ourselves, as what Craib calls "our primitive fantasies of complete satisfaction" come to constitute the plate tectonics of our adult lives. In doing so, we seek "the protection of a fragile self, one that cannot be risked in the reality of a relationship and one that cannot bear to know itself". The possibilities to move beyond that fragility, for it to grow into the simple vulnerability which characterises all of us, relies on our ability to live with disappointment. Not necessarily to live with this disappointment, Craib isn't advocating passivity, but with disappointment as such. To the extent that we do this, relationships with others of whatever sort cease to be experienced as latent threats and drains on the self, instead opening up to the possibility of acts of "love that can actually strengthen the self, reinforce one's own sense of inner goodness and the ability to do good".

This doesn’t entail the endless expression of disappointment. To express it can be another form of escape, avoiding the difficult experience of sitting with disappointment by articulating it, perhaps in a way directed at the object of that disappointment. It robs us of the opportunity to understand the character of the particular disappointment, the possibility of distinguishing between an antipathy to a situation that might have to change and a generalised reluctance to live with any feelings of antipathy. For the fragile self to expel the disappointment through speech can serve the same purpose as fleeing from it through activity. Both reflect what Craib describes as a "desire to get out of the mess of life". We can seek such an escape in others and turn on, or from, them when they fail to provide it. But we’ll never escape disappointment because such ‘mess’ is an ineluctable part of human existence. It resides in those experiences of "being together in the same place, living together in the same home, undergoing the same events together" and, in so far as we flee disappointment, we turn from the possibility of such sharing taking a sustained form. Our fragile selves cannot exist for long in such shared realities and that is why we need to move beyond them.

Biographical Approaches to Studying Digital Capitalism (2016-08-20 08:00)

In the early pages of Douglas Rushkoff’s *Throwing Rocks at the Google Bus*, he offers a cogent analysis of how initial public offerings lock tech companies into a growth imperative which ultimately proves destructive of the value they create. As he puts it on loc 169, "Having taken in this much new capital, however, Twitter now needs to produce. It must grow." Problems emerge because what constitutes enough growth is something now defined by the investors who must justify the amount of money that’s been put into the company.

It’s easy to see this in systemic terms but what intrigues me is the biographical element. The problem arises because, as Rushkoff puts it, shareholders “expect to win back one hundred times their initial $20 billion bet” and to do this “Twitter must grow into a corporation bigger than the economy of many entire nations” (loc 184). Who are these investors and how do they come to be in a situation where they’re both able and inclined to make such an investment, with these sets of expectations? What about the founders themselves, how did they come to occupy
these positions and what commonalities and differences can we find in their motivations?

My suggestion is that what Rushkoff calls “the growth imperative” can be usefully analysed in terms of the biographical entanglement between two distinct groups: aspiring founders and aspiring investors. The social dynamics can’t be reduced to individual biographies but these lived lives are, in an important way, the most basic social unit through which the dynamics become operative and are therefore key to understanding it. This of course entails that we understand the context within which these aspirations develop and each group sets out on this path, but the capacity of such groups to transform that context is something that is activated through the lives of individuals.

An exciting new journal: Frontiers in Sociology (2016-08-21 08:00)

A really exciting launch: [1]Frontiers in Sociology:

Frontiers in Sociology is a new peer-reviewed, open-access journal launched in February 2016.

The first social-sciences journal of the “Frontiers in” series, Frontiers in Sociology will foster cross-disciplinary work as well as fairness, transparency, and objectivity in the review process. Further specialty sections will be added as the journal continues to develop, some of which are already under discussion and include:

- Economic Sociology;
- Political Sociology;
- Medical Sociology;
- Science and Technology Studies;
- The Sociology of Education; and
- The Sociology of Race, Ethnicity and Migration.

The launch of a new journal is always an exciting venture, and we would be happy to hear your thoughts or answer any questions you may have.

Part of a much broader Open Science project which you can hear more about below:
The Sociology of 'Streaming' (2016-08-22 08:00)

The popularity of “streaming” - the practice of broadcasting live gameplay across the internet to an audience - is a rapidly growing social and cultural phenomenon. If any readers are in doubt about the contemporary popularity - and indeed the need for sociological investigation - of streaming, David Pearson’s [3]recent piece is quite an illustration. Discussing his children’s engagement with media through platforms like YouTube, he argues that it “follows them everywhere”. He explains that his two children have “developed a habit of living out their lives as if there’s an imaginary camera trained on them, just like their favorite YouTubers”. For context, the fastest growing audience for digital video is children aged 11 and younger, and many of this new generation are growing up as streaming natives. There has been limited research so far on the phenomenon of internet streaming, whether the more general vlogging, the live unboxing of commodities, or gameplay streaming on platforms like Twitch (which has now recently added social eating as a category), or engaged with more theoretical questions about the implications of this culture form. As Pearson’s daughter often interjects in her imaginary streaming: “Don’t forget to subscribe”, a timely reminder that with growing audiences there are increasingly large sums of advertising money involved.
Our research focuses predominantly upon streaming games and the Twitch.tv platform.

In five years Twitch has grown to become a world leading platform for streaming content, becoming the fourth-highest website in peak Internet traffic in the USA.

The Alexa traffic rank for the website is the 60th most popular in the UK (and 103rd globally).

Last year there were an average of 1.7 million broadcasters streaming each month, creating a total of 459,366 years of content. The highest number of concurrent viewers was over 2 million with an estimated 27 million unique viewers for the ESL One Counter-Strike "eSports" (professional gaming competition) tournament that was live-streamed. The Twitch platform has facilitated the creation of new online celebrities, offers the possibility of new careers paths, has popularised previously-obsolete video games like Rocket League, and has the potential to transform the entertainment and advertising industry. This potential was clearly recognised by Amazon, resulting in the purchase of the Twitch platform for almost $1 billion. A rival bid from Google, which owns YouTube, fell through; for comparison, the average Twitch viewer watches 421.6 minutes per month, whereas YouTube viewers watch to 291.0 minutes. These figures demonstrate how important and integral to the online lives of many users Twitch has quickly become, and this makes it an essential object for digital sociology research.

The astronomic growth of Twitch, now supported as a subsidiary of Amazon, is set to continue.

The individual streams attract viewership through the performative labour of the broadcasters, which involves creating a live dialogue with the viewers while playing a game. Communication is two way as the game footage is streamed along with webcam footage, while viewers respond by text chat. This has resulted in new ways to engage users and players by encouraging a form of co-production in which players and spectators of the game form new communities around their game activities. These new communities, numbering in the millions, are comprised of gamer-spectators, including gamers, game broadcasters, and viewers. An individual may be in all three of those categories or a combination. Those that engage in broadcasting can turn a profit from the activity or even make a living through donations and monthly subscriptions. This interaction between players and viewers through money, commentary, and community is highly distinctive, yet speaks to a range of established sociological questions over the role of the internet in contemporary life, play and sociality, online interaction, and the social impact of interactive broadcast media. This current research project therefore aims to investigate Twitch and the phenomenon of streaming for three key reasons: it is an organisation of exemplary success in the digital economy; the process of co-creating digital content is forging new relationships between content producers, consumers, and companies which requires research attention; and the popularity of streaming has new social and cultural implications which are not understood.

We’re both currently postdoctoral researchers based in the United Kingdom. Mark’s research background is in science & technology studies, and he is especially interested in the relationship between the material aspects of streaming and the communities that emerge around it, and the affordances of systems (such as donating, chatting, webcams, etc) that structure the experience. He is also a former professional gamer and a multiple game world record holder, and consequently has a particular interest in the broadcast of competitive gaming on Twitch, and how Twitch and eSports have become mutually co-constitutive social elements in an emerging and gradually formalizing ecosystem. Jamie’s background is in the sociology of work, with interests in the labour process, digital labour,
and workplace resistance. His research interest in Twitch began as a case study that combines forms of paid and unpaid labour, blurring the lines between work and play. He intends to examine the relationships of co-creation (for example, between the platform, streamers, viewers, and other actors including advertisers) and analyse the political economy of streaming.

Streaming has not just affected how existing games are played: there is even now a game about streaming, entitled *Youtubers Life*, which allows players to simulate the career of a professional streamer. The game allows players to “become the world’s greatest video blogger in history”, in which it is promised you can ”broadcast yourself, edit and publish videos, expand the amount of fans and turn yourself into a wealthy fellow!” . So, in an unusual turn of events, it is now possible as a researcher to watch someone watching another person streaming themselves playing a game about people streaming their gameplay to other people. As represented by this rather labyrinthine Borges-esque example, there is an important phenomenon unravelling, and one that we seek to understand: how is streaming changing the ways content and play is produced, distributed, consumed, and monetised in the digital economy? We aim to produce a number of papers and conference presentations in the coming months and hopefully years on this topic, and for more information, you can visit our homepages at [4] www.ultimaratioregum.co.uk/about-me

We welcome any and all comments on the work and potential future research directions, and look forward to developing this rich emerging area of social research.

**Using micro-podcasts to profile participants at a workshop (2016-08-23 08:00)**

I recently helped out with an event by the [1]Survivor Research Network which was being supported by The Sociological Review. We were keen to profile participants at the event in a way that gave a sense of the range of people involved, as well as how this shaped what people brought to the complex topic of survivor research. To do this we used [2]AudioBoom, a free app which records & publishes up to 10 minutes of audio, to do short interviews with a number of participants at the event:
The Spook Who Sat By The Door (2016-08-24 08:00)

By Hamish Robertson

4564
This year has seen an extraordinary upswing in revelations about the kinds of violence that are seemingly endemic in American society. In particular, the persistence of an often deadly mixture of readily accessible weapons and prevailing racism, has seen several very high profile killings of unarmed African Americans usually, but not exclusively, young African American men (this is not to ignore the experiences of other groups such as the [1]disabled). The [2]Black Lives Matter movement makes it clear that these events are part of a larger pattern and reflective of other structural issues in American society, including how various systems, such as the judiciary, police and prisons, operate in a prejudicial manner. What seems difficult to understand is, half a century after the civil rights movement gained momentum, that many of these issues seem as bad as or even worse today.

We know these issues have a long, complex and often ugly history and yet we are still asked to see them as singular and unique, which of course they are for each affected individual and their families. But perhaps it is time to revisit the aims and gains of the civil rights era and to reflect on what has not been achieved and what has occurred which should have by now. After endless antiracism, EEO and diversity courses, there is a distinct flavour to much of what we see on the evening news and that is the repetitiveness of the pattern of individual tragedies. This is not the first time that African Americans, and others, have pointed directly at the problems with American society. The endemic problems associated with race and its regulation were addressed in very direct terms by the African American writer Sam Greenlee nearly 50 years ago when this particular tangent on the American Dream was just taking shape.

Sam Greenlee died only two years ago aged 83. His most famous book was [3]The Spook Who Sat By The Door (1968) which was eventually made into a film in 1973. It was largely ignored by the movie industry for 30 years and is now a ‘cult classic’. Greenlee was an extremely interesting man in his own right who travelled widely in the late 1950’s and 1960’s. He condensed many of his domestic and international experiences in the book, which focused on one African American man’s efforts to start a revolution in the United States. And this proposition gives us a reason to read the man’s work and to re-visit the issues he raised at that particular time and place.

The Spook Who Sat By The Door was part satire, with multiple targets, and part a call-to-arms for a better world for African Americans in which they didn’t have to keep trying to become white to get what they wanted, needed or were entitled to. His scathing analysis of mainstream American society was summed up in the priceless phrase “Whitey’s chrome plated shit pile”. He talks about race and racism, coercion and co-option and the sheer magnitude of the role played by various forms of violence in American society – with and without weapons. It can be enjoyed for its anger, its bluntness and his withering view of people who went along to get along, often selling out the very things they claimed to believe in and the communities they claimed to represent. It was a hugely interesting take on things of its time and so many issues that clearly do not appear to have been resolved decades later.

Written against the background of the 1960’s civil rights movement, including the Chicago riots, and his own personal experience of American ‘race relations’, he had a number of targets. In fairness it would have been hard to say enough about the hypocrisy of every group he saw presenting their self-interest as the public good without a much longer and perhaps very different book. And as a result it has in some ways a series of caricatures as characters, voicing the common narratives of the time through these individuals but, even so, his targets still seem highly relevant today. While he positioned the book in relation to the particularly American versions of race and racism, many of his themes were about the universals of power without accountability and the imposition of one groups’ empty stereotypes as societal reality, with the enduring consequences this processes have for everyone.
The central character, Dan Freeman (!), leads a double, even triple, life in which he quietly builds his revolutionary strategy while acting the 'acceptable' black man to whites, but also to other middle-class blacks who have bought into "Whitey's chrome - plated shit pile", now dissociating themselves from their broader community through the merits of social class, education and income (count the ironies, this is real sociology!). Irony exists too in that Freeman gets Chicago councilmen to support weapons training for his 'at risk' youth group because, according to white racist conservatives, weapons training teaches discipline! Of course, the training is part of Freeman's plan to teach his trainee revolutionaries how to start and maintain a revolt in the knowledge that Freeman himself might not survive once the white establishment joins the dots.

It was a manual for a revolution of sorts at the time because it catalogued a long series of continuing injustices of both thought and deed in American society. In the context of recent events in the United States, and elsewhere, it seems as timely now as the day it was published. His concerns were genuine, his targets real and his focus on violence and contempt as the pivotal realities of racist societies seem as relevant now as they were then. Time then, I propose, to read and remember Sam Greenlee and *The Spook Who Sat By The Door* as a memoriam to the author and to a revolution that hasn't happened – yet!

Engines of Knowledge in the First Information Age: Botany and the Garden Part 1 (2016-08-25 08:00)

by Hamish Robertson

Introduction

This is the second in a [1]series of short essays exploring what I have called ‘engines of knowledge’ in the first quantitative, ‘big data’ information age (there have been [2]others ), which emerged in the early 19th century. The Victorian period is marked by a range, rate, quantity and variety of methods for information production that have fundamentally changed the world as we know it. Many of the knowledge engines that produced this flood of information (such as engineering, manufacturing, metallurgy, chemistry) were themselves part of new and emergent scientific and technological activities, and central to the transformational knowledge that they produced.
Other knowledge engines were embedded in deeper connections to the past and represent a more gradualist perspective to the creation of knowledge. These engines re-examined and re-imagined existing ‘knowns’ to produce new knowledge domains and practices by applying emerging knowledge syntheses. One of these longer established ‘engines’ emerged from the intersection of the historical enterprise of gardening, in its broadest sense, and the emergent science of botany, which itself led to new understandings of the nature of the world in which we live. In this piece I explore some of these connections in an effort to examine how these changing circumstances and the growth in analogue quantification resulted in the recasting of existing information into new forms of knowledge.

Deep History, Nature and the Garden

The garden holds a special place in many cultures in part because it involves a particular and localised form of engagement with nature, especially within the traditional conceptual construct of the microcosm-macrocosm. Christianity and Islam both took the (originally Sumerian) Biblical symbol of the perfect, paradisal garden (also linked to knowledge) and applied their own symbolic and experimental understandings to gardening and the garden. Through the garden these religions came to produce a larger conceptual, informational and experimental base that connected a variety of early scientific activities in highly developmental ways.

Many cultures have a tradition of using gardens for as a site and mechanism for the curing of disease and the creation of health. The garden as a site for cures is recognisable even today, in the deliberate cultivation and utilisation of medicinal herbs. Chinese traditional medicine looked to the ‘medical mountain’ as a supply of medicinal plants and herbs, often differentiated by distinct microclimates associated with altitude, orientation and localised ecosystems. This kind of knowledge is still known and studied in fields such as

[4] ethno-botany

. The origins of numerous modern medications lie in remote communities, localised cultures and their (exploited) ethnobotanical knowledge. It is in the synthesis of such compounds that modern chemistry and pharmacology have expanded what is accessible as both knowledge and product,

Another dimension to the garden as a mechanism for health can be seen in the experience of nature as a healing experience. The garden is not just a place but provides a process of engagement with nature as a therapeutic experience in and of itself (e.g. [5] forest bathing

in Japan). Many European philosophers recommended walking in nature as a contemplative act with therapeutic properties. Indeed, the idea of particular landscapes and locations as [6]therapeutic exists down to the present day and by the mid-Victorian period the idea of cleaner, greener and healthier cities emerged in response to the epidemic cities of [7]Chadwick and Snow.

Knowledge and Power in the Garden

The gardens of the Renaissance took aspects of Roman gardens, the Christian monastic and medical (or [8]physic ) garden tradition, and the Islamic celebratory and symbolic garden, to produce a platform for a variety of scientific practices ranging from botany to applied hydrology. The [9]Villa d’Este in [10] Tivoli
near Rome, is an example of how hydrological engineering, architectural design and artistic creativity were intimately connected in and through the garden during this period. At the same time, it was also a physical statement in relation to contemporary Vatican politics. Gardens could be and often were both religious and political statements. Italian universities at Pisa, Padova, Firenze and Bologna established medical research gardens early in their histories. The gardens of Europe illustrate not just successive aesthetics of landscape but a broad swathe of experimental sciences in the making that paralleled other industrial and artistic developments.

This connection of gardening to state power and symbolism produced its own enduring consequences, including the rapidly developing engineering science of the 18th century. The Canal du Midi and the Versailles Gardens in France, for example, are two significant examples of a trend in state formation through landscape management and control. The emerging modern state began to re-write the very landscape and its connections with both modern capital, as Marx noted, and population. The impact of this process can be seen in the 19th century depopulation of Ireland and the Scottish Highlands, which resulted in the production of ahistorical landscapes now often acclaimed for their ‘naturalness’.

Elsewhere an ideology of landscape management and control emerged that was used to justify a variety of colonial practices under incipient capitalism including the draining of wetlands and the ‘proper’ uses of land for agriculture and capital forms of production. This includes the introduction of new species of plants and animals, many of which overwhelmed previously pristine landscapes. To contain the land and to understand it through the manipulation of its elements comes through to us today as an established geography of power. Knowledge therefore gained in and from the garden could also inform ideological developments that had their own consequences. This became more overt under colonialism and as natural philosophy gave way to science and technology.

**Botanic Gardens and Experimental Science**

As the 18th century progressed into the 19th, the botanic garden began to develop as a key site of experimental and academic knowledge about plants and about nature more generally. The utility of the garden, I suggest, lies in its bounded nature, its accessibility and the room it provides for experimentation at varying speeds. The gardener then, as now, can trial and test things in the garden that would be far more difficult in the wider natural world. More importantly such experimental efforts can be documented, repeated and modified over time to assist in building a specific knowledge base about particular plants or techniques, such as grafting or hybridising, or the effects of water, soil and sun on particular plants. The garden is by its very nature a kind of laboratory, potential or actualised, for building our understanding of how nature, biology and botany work in the world. And this makes the botanical garden a form of not only applied laboratory but also a specific engine of knowledge within broader botanical science.
Kew Gardens, in London, was established in 1840 and built on the pre-existing Kew Park exotic gardens. Not only was and is botanical research conducted at Kew but we can also see how the ideas connecting the garden to human health and wellbeing was translated out into more accessible constructs such as the public park or the national park. The more pressure we understood as being placed on nature by human intervention the more some people worked to ameliorate those effects by re-introducing nature to the city. One of the logics of the 19th century information revolutions in particular was that these laboratory efforts could be documented, counted and quantified, making for rapid development in the quantity of data available to researchers and their networks.

Conclusion

In this first part of a two-part essay I have outlined some of the knowledge production issues linked to the garden, gardening and to botany as both an experimental practice and emergent science. The focus has been on briefly exploring the role of the garden as both a long-term cultural paradigm for knowledge production and the development of the garden as a pivotal experimental 'laboratory' in the 19th century. The ideas generated in this period about issues such as human health and disease went on to produce a variety of innovations in urban living (public parks, green belts and so on) but also in the development of deeper understandings of nature and the connections between human society and nature. The garden as a bounded natural laboratory, contained and manageable, set the scene for some very important new engines of knowledge including evolutionary theory and genetics which I describe in part two of this essay.

Engines of Knowledge in the First Information Age: Botany and the Garden Part 2 (2016-08-26 08:00)

by Hamish Robertson

Introduction

In the first part of this essay I alluded to the garden as a developmental engine of knowledge that canvassed both a deep cultural history and a highly modernist locus for new, innovative knowledge production. In the first instance the symbol of the garden as a place of health and knowledge, exists across many cultures and has long been a means by which the relationships between humanity and nature could be theorised and practically explored. In the second, the religious and medical garden, common until the 19th century, also diversified in variety and form to produce not only public botanical gardens but also private scientific experimental gardens such as those of Charles Darwin and Gregor Mendel. Thus, I suggest, the garden can be seen as an engine of knowledge at multiple levels with a proven utility that extends down into the present day. In this second part of the essay I explore this idea of the garden as a particular type of engine of knowledge in more detail by pointing to some of the more revolutionary ideas that emerged from gardens and gardening experiments in the 19th century.

Gardens, Gardening and Knowledge Production

We can see then that the garden and the activity of gardening are a locus for knowledge production across time and cultures. As with agriculture more broadly, the garden provided an experimental laboratory in which methods of cultivation, grafting, soil management and other techniques could be tested, refined, documented and recorded visually, with plant illustrators and botanical art coming into their own. The Victorian period in particular saw a huge expansion in both amateur and professional gardeners, botanists and botanical artists, including both men and [1]women of various social backgrounds. The advent of photography added to this capability by expanding and speeding up the capture and transfer of botanical information. In this way technology and knowledge production became mutually constitutive in was that we now consider quite modern.
